| | VOL. | PAGE, | |
| A | | | |
| ASSEMBLY—continued :— | | | |
| Motion made (<i>Mr. Copeland</i>) that Sir Henry Parkes be now heard, 100. | | | |
| Motion made (<i>Mr. Thompson</i>) that Sir John Robertson be now heard, 100. | | | |
| Motion made (<i>Mr. Garrett</i>) (1) That the Ballot-papers, Electoral District of Young, be laid upon the Table, (2) That the Clerks at the Table examine the ballot-papers taken at No. 2 Booth, Young, and the Speaker report the result—Mr. Speaker ruled that paragraph (2) cannot be put,—amended motion withdrawn, 94. | | | |
| Motion made (<i>Mr. Harold Stephen</i>) that the ballot-papers, Electoral District of Young, be laid on Table, and negatived on Division, 278. | | | |
| Motion made (<i>Mr. Thompson</i>) that the dignity and honor of this House will be conserved by taking steps to prevent the sale of intoxicating drinks in the Parliamentary Refreshment Room, except at meal-times, and House counted out, 314. | | | |
| Motion made (<i>Mr. Heydon</i>) for Committee of the Whole to consider the necessary steps to be taken to make provision in the Estimates for the Payment of Members of the Legislative Assembly, 155; Order of the Day postponed, 175; House in Committee and progress reported, 185; leave given to sit again on "Tuesday" next, after amendment "Wednesday" had been proposed and withdrawn, 186; House in Committee and progress reported, 194; Call of the House to consider the Question, 197, 264, 265(2), 268; House in Committee, <i>Point of Order</i> reported and decided, Committee resumed, and Resolution reported, 265; Order of the Day postponed, 278, 296; resolution received, read 1 ^o , 2 ^o , and agreed to, 333. | | | |
| Motion made (<i>Sir Henry Parkes</i>) that the ruling of the Speaker given on Saturday, 10th July, a.m., "is" contrary alike to the letter of the Standing and Sessional Orders and to the practice of Parliament as established by former Speakers of this House, and has a direct tendency to curtail the privileges of Parliament, and to undermine the just protection of minorities,—amendment moved (<i>Sir Patrick Jennings</i>) to omit all words after "is" and to insert in their place—"consistent with the right understanding of the Rules, Orders, and Usages of Parliament; is warranted by precedent; and tends to preserve and protect the due course of Public Business without infringing the rights of minorities; and this House endorses and confirms the ruling accordingly"—amendment and motion as amended carried on division, 389, 390. | | | |
| Motion made (<i>Mr. Garrett</i>) that the Resolution agreed to on the 14th July, 1886, in reference to "Mr. Speakers' Ruling—Continuous Sitting," be rescinded, 544; and negatived, 545. | | | |
| Motion made (<i>Mr. Foster</i>) that the removal and exclusion of the honorable and learned member for Morpeth from the House by the "Speaker" without the order or resolution of the House, were contrary to the law and usages of Parliament and the privileges of this House; amendment moved (<i>Mr. Want</i>) to substitute other words after "Speaker," 402; and amendment carried, 403. | | | |
| Motion made (<i>Mr. W. J. Fergusson</i>) for Committee of the Whole to consider whether it be referred to the Standing Orders Committee that members serving on Select Committees on Private Bills be paid, and that to provide therefor parties applying for Private Bills be required to deposit an additional £25, 413; Order of the Day postponed, 425, 572, 658. | | | |
| Motion made (<i>Mr. G. A. Lloyd</i>), for a Return giving particulars of cost of printing and binding Parliamentary Papers and <i>Hansard</i> , for Session 1883-4, 489. | | | |
| Ministerial advice to the Governor and resignation of the Ministry—correspondence laid on Table and read by Clerk, 111 | 2 | | 7 |

| APPEAL TO PRIVY COUNCIL—CASE OF BARTON v. TAYLOR:— | | |
| Proceedings in, laid on Table, 253. | 2 | 13 |
| CASES TAYLOR v. BARTON AND OTHERS:— | | |
| Motion made (<i>Mr. Abigail</i>) for copies, in detail, of the whole of the costs to the country in, 394. | | |
| REMOVAL FROM THE HOUSE OF THE HONORABLE MEMBER FOR MORPETH BY ORDER OF:— | | |
| Motion made (<i>Mr. Foster</i>) that the, without the Order or Resolution of the House was contrary to the Law and Usages of Parliament and the Privileges of this House,—amendment moved, (<i>Mr. Want</i>) to substitute other words, 402; amendment and motion as amended carried, on division, 403. | | |
| RULING—CONTINUOUS SITTING:— | | |
| Motion made (<i>Sir Henry Parkes</i>) that the ruling given on Saturday, 10th July, a.m. "is" contrary alike to the letter of the Standing and Sessional Orders and to the practice of Parliament as established by former Speakers of this House, and has a direct tendency to curtail the privileges of Parliament, and to undermine the just protection of minorities,—amendment moved (<i>Sir Patrick Jennings</i>) to omit all words after "is," and to insert in their place—"consistent with the right understanding of the Rules, Orders, and Usages of Parliament; is warranted by precedent; and tends to preserve and protect the due course of Public Business without infringing the rights of minorities; and this House endorses and confirms the ruling accordingly"—amendment and motion as amended carried, on division, 389, 390. | | |
| Motion made (<i>Mr. Garrett</i>) that the Resolution agreed to on 14th July, 1886, be rescinded, 544; and negatived, 545. | | |

| | | VOL. | PAGE. |
| S | | | |
| SPEAKER—continued:— | | | |
| RULINGS OF:— | | | |
| Motion made (<i>Mr. Thompson</i>) that House dissent from, and negatived, 309. | | | |
| That the House ought not to adopt a Report of a Select Committee of a previous Parliament, 51. | | | |
| That Resolution—That Ballot-papers, Young, be examined by Clerk, at the Table, and result reported by Speaker to the House—cannot be put, 94. | | | |
| That a motion referring to Ministerial advice to the Governor to dissolve Parliament, submitted by Sir Henry Parkes, was not entitled to be regarded as <i>Privilege</i> , 110. | | | |
| That an amendment cannot be proposed in Committee of Ways and Means which would increase the burdens of the people without the direct or indirect sanction of the Crown, 249. | | | |
| That one Member cannot move the second reading of a Bill for another, with the only exception of one responsible Minister for another Minister, 257. | | | |
| That the Title of the Barristers Bill did not correspond with the Order of Leave, and the Clauses of the Bill were not covered by the Title, 257. | | | |
| That an amendment submitted in Committee on Payment of Members, and rejected as out of order, was not identical with any proposition already disposed of by the Committee, 265. | | | |
| That it should be left for the decision of the House whether a motion in reference to Ballot Papers, Electoral District of Young, be put, 278. | | | |
| That an honorable member is not in order in quoting from a speech made in a previous debate of the present session,—motion made (<i>Mr. Thompson</i>) to dissent from the ruling of the Chair, and negatived, 309. | | | |
| That the Committee of the Whole (Customs Duties Bill) was properly sitting,—The House, through that Committee being in continuous sitting, and that it was not proper nor incumbent on him to interrupt the still existent sitting by taking the Chair at 4 o'clock p.m., 380. | | | |
| That, a clause of the Customs Duties Bill referring to Schedule A being under consideration, the items of that Schedule could not be discussed in anticipation, nor until the Schedule itself was under consideration, 380. | | | |
| Upholds opinion of Chairman, that words proposed to be inserted in clause 4 of the Stamp Duties Act Amendment Bill (No. 3) were properly before the Committee, as not imposing a tax or duty but being rather of the nature of a penalty, 457. | | | |
| That the Regulation of Factories and Workshops Bill having been brought in by an unofficial Member, and proceeded with by such Member as a Responsible Minister without being accepted as a Government measure, was rather a matter of constitutional propriety than of Order, 502. | | | |
| Upholds the opinion of the Chairman as to the inadmissibility, on the ground of inconsistency, of a proposed amendment to clause 6 of the Income Tax Bill, 511(?). | | | |
| That the 1st and 3rd Sessional Orders do not come into operation in cases where the House is already sitting at 4 o'clock p.m., and engaged in the despatch of Business, but have reference only to fresh meetings of the House, and not to sittings extending over twenty-four hours, and that it was therefore not right for him to call on the business for the new day, and thus begin a fresh sitting, 533. | | | |
| Upholds the opinion of the Chairman that a question (Centennial Exhibition) already decided by the House, during the present Session, cannot be submitted as an amendment upon a resolution before the Committee of the Whole, 567. | | | |
| That the Chairman had taken the usual and proper course in proposing the question in Committee of Supply without the Minister in charge moving the resolution, 583. | | | |
| That it is incompetent for an Honorable Member, who had already spoken to the main question, to propose an amendment, 593. | | | |
| SPECIAL ADJOURNMENT:— | | | |
| Motion made for, and passed, 51, 53, 69, 72, 82, 103, 123, 126, 137, 199, 265, 345, 630. | | | |

| TARGETT, MR. W. S. (See also "PRIVILEGE") | | |
| Proposed as Chairman of Committees, 45. | | |
| Do do and negatived on Division, 143. | | |
| TARIFF (See also "FINANCE") | | |
| PETITIONS PRESENTED FROM — | | |
| Bootmakers and saddlers, advocating the imposition of a twenty per cent. duty on all goods imported of such industries, 142 | 3 | 1105 |
| Residents of the Murrumbidgee Electorate, that the taxation falls unduly on the poor man, 164 | 3 | 1151 |
| The New South Wales Farmers Union, disapproving of the financial policy of the Government, and praying for the imposition of a duty on all agricultural products, 177 | 3 | 1135 |
| Residents of Orange in opposition to the proposals now under consideration, and in favor of the stimulation of Colonial Industry by a protective tendency, 193 | 3 | 1145 |
| Farmers and others of Bowan Park, near Cudal, urging the inclusion of Agricultural Produce in the list of articles for taxation, 205 | 3 | 1139 |
| Public meeting at Molong, in opposition to present Tariff, and advocating a system of Protection to remedy the existing depression in the Colony, 232 | 3 | 1149 |
| G. Peacock, complaining of the proposed definite duty on Pulp Fruit imported, and that such duty, if carried, will close the large industry carried on by him, sacrificing his manufacturing plant, and throwing a number of men out of employment and praying that he may be heard at the Bar of the House on the subject, 236 | 3 | 1157 |
| Amendment moved (<i>Mr G A Lloyd</i>), on going into Committee of Ways and Means, that Counsel be heard at the Bar, and negatived on Division, 246 | | |
| Fruit-growers at Pennant Hills and Castle Hill, against the levying of the proposed duty upon Pulp Fruit, 246 | 3 | 1141 |
| Fruit-growers at Ryde and Gladesville, against the levying of proposed duty upon Pulp Fruit, 246 | 3 | 1153 |
| Persons in the Publishing, Lithographing, Engraving, and other kindred trades, representing that the present Tariff is inimical to their interests, and praying relief, 253 | 3 | 1113, 1115, 1119. |
| Merchants, Traders, Artisans, and others, in opposition to the alterations and amendment proposed in the Tariff, more especially to the <i>ad valorem</i> Duties, and praying that some other scheme may be devised to meet the deficit, 261, 277, 281, 284, 317, 325, 359 | 3 | 1117 |
| Chairman and members of the Newcastle Chamber of Commerce, to the same effect, 317 | 3 | 1113 |
| Merchants, Traders, and others, in Newtown, Petersham, and elsewhere, to the same effect, 276 | 3 | 1117 |
| Do do do in and about Newcastle, to the same effect, 317 | 3 | 1147 |
| Public Meeting of Citizens of Sydney, that much injury will be done to the commerce of the country if the alterations and extensions of the Customs Tariff submitted be passed into law, and praying the House not to pass the Customs Act, 268 | 3 | 1121 |
| Certain Producers, Traders, Artisans, and others, urging that before new burdens of Taxation are imposed material reductions in the expenditure should be made, suggesting the adoption of a system of direct taxation upon property, and praying the House not to pass any Bill to extend the present Customs Tariff, 281 ⁽²⁾ , 284, 291 ⁽⁴⁾ , 295, 305 ⁽⁹⁾ , 309, 313, 317, 318, 321, 325, 331, 338, 343 ⁽³⁾ , 349 ⁽⁴⁾ , 373, 402 | 3 | 1121, 1123 |
| Certain Producers, Traders, Artisans, and others, in district of Molong, with similar prayer, 281, 300 | 3 | 1123 |
| Do do do Gundaroo do 305 | 3 | 1125 |

1885-6.

NEW SOUTH WALES.

RAILWAYS OF NEW SOUTH WALES.

(PROGRESS REPORT OF COMMISSIONER FOR 1885.)

Presented to Parliament pursuant to Act.

The Commissioner for Railways to The Honorable the Secretary for Public Works.

Department of Public Works, Railway Branch,

Sydney, 17th May, 1886.

SIR,

In submitting a Progress Report upon the Railway Transactions for the past year, I have to express my regret that those transactions should show a considerable fall in the net return to the capital expended. The causes of this decline are not far to seek; the bad seasons and consequent depression in the producing interests of the Colony have affected very materially the Railway traffic, and the unproductive character of some of the extensions—in most cases, I believe, temporarily unproductive only—has contributed to the result which is a decrease, as compared with the return for the year 1884, of .83 per cent., the return to capital expended having been for the past year 3.37 per cent. as against 4.20 in 1884.

The tables and returns, which are being compiled to show the transactions in detail, will not affect the result, but will enable me to demonstrate that it is due to the causes I have stated.

CAPITAL ACCOUNT.

During the year 1885 a further sum of £2,909,715 was expended on account of capital, increasing the gross expenditure to £24,962,972. Of this sum £21,839,378 have been expended upon lines in operation, and the balance, £3,123,594, invested in unproductive lines in course of construction.

Of the sum of £2,909,715 expended during last year, £1,751,138 were expended upon lines in operation, swelling the expenditure under that head to £21,839,378.*

The amount of £1,751,138 was made up as under :—

| | |
|--|----------------|
| Invested in the construction of 114 additional miles of railway opened during 1885 | ... £1,148,334 |
| Additions and improvements to works and stations, &c. | ... 182,791 |
| Additional rolling-stock, machinery, and work-shops | ... 420,013 |
| | <hr/> |
| | £1,751,138 |

The

* Includes cost of old Pitt-street Tramway and value of rolling-stock used on Camden Tramway.

The following extensions were opened during 1885 :—

| | | |
|--------------------------|------------------|----------|
| Tarago to Bungendore... | ... 20 miles ... | 4 March. |
| Murrumburrah to Young | ... 18 ,, ... | 26 ,, |
| Byrock to Bourke | ... 48 ,, ... | 13 Sept. |
| Orange to Molong | ... 22 ,, ... | 22 Dec. |
| Hurstville to Sutherland | ... 6 ,, ... | 26 ,, |

—
114 ,,

Which, added to the 1,618 miles in operation at the close of 1884, increased the total mileage opened for traffic to 1,732. There were, in addition, 408 miles in course of construction, 9 of which have been brought into operation during the currency of the present year.

REVENUE AND EXPENDITURE.

| | | |
|--|--------|------------|
| The gross earnings for 1885 should have been, had the rate of earning in 1884 per mile of line been maintained | | £2,422,774 |
| They realized only | | 2,174,368 |
| Showing a decline of | | £248,406 |
| The working expenses were | | £1,458,153 |
| And the net earnings | | 716,215 |

The following is a summary of the gross earnings, working expenditure, and net earnings for 1885 as compared with 1884 :—

| | 1885. | 1884. | Increase. | Decrease. |
|------------------|-----------|-----------|-----------|-----------|
| | £ | £ | £ | £ |
| Gross earnings | 2,174,368 | 2,086,237 | 88,131 | |
| Working expenses | 1,458,153 | 1,301,259 | 156,894 | |
| Net earnings | 716,215 | 784,978 | | 68,763 |

NET EARNINGS.

The percentage of net earnings to capital expended in 1885, as against 1884, was as under :—

| | No. of miles opened. | Capital invested. | Net earnings. | Percentage of interest to capital. |
|----------------|----------------------|-------------------|---------------|------------------------------------|
| 1885..... | 1,732 | £ 21,831,276* | £ 716,215 | 3·37 |
| 1884..... | 1,618 | 20,080,138* | 784,978 | 4·20 |
| Increase | 114 | 1,751,138 | | |
| Decrease | | | 68,763 | ·83 |

* Excludes cost of old Pitt-street Tramway, &c.

I have the honor to be,

Sir,

Your most obedient Servant,

Chas. A. Fodehap

Commissioner for Railways.

The Honorable

The Secretary for Public Works.

NEW SOUTH WALES.

RAILWAYS OF NEW SOUTH WALES.

(REPORT FOR 1885.)

The Commissioner for Railways to The Honorable the Secretary for Public Works.

Department of Public Works,
Railway Branch,

SIR,

Sydney, 15th July, 1886.

Following upon the Progress Report made to you on the 17th May last, I have now the honor to submit a statement, more in detail, of the transactions of this Department for the year 1885.

No. 1.—RAILWAY CAPITAL AUTHORIZED.

The total amount which has been authorized to be raised by loans is £40,207,161. At the close of 1885 the total value of Debentures issued was £24,615,400. The amount still to be raised is £15,591,761, which will probably bear interest at the rate of 3½ per cent. Railway Debt. Appendix Nos. 8 and 9, pp. 93, 99.

The Railway capital bears interest at the rate raised and to be raised, as follows:—

| | | |
|---|-----------------|----------|
| £7,062,300—5 per cent. | annual interest | £353,115 |
| £12,053,100—4 „ | „ | £482,124 |
| £5,500,000—3½ „ | „ | £192,500 |
| £15,591,761—3½ „ ... (still to be raised) | „ | £545,712 |

2.—RAILWAY CAPITAL EXPENDED.

At the close of 1885 there had been expended on lines open for traffic £21,839,378,* and on lines in course of construction £3,123,594; in all, £24,962,972, of which amount the sum of £2,909,715 was expended in the year 1885, as under:— Capital expended. Appendix Nos. 10 and 11, pp. 100, 110.

| | |
|---|------------|
| Construction | £2,476,981 |
| Rolling stock and machinery, &c. | 420,013 |
| Trial surveys | 12,721 |
| | £2,909,715 |

The sources from which the money expended on Railway Lines open for traffic have been obtained, are:—

| | |
|-------------------|--------------|
| From Loans | £21,091,136 |
| „ Revenue | 740,140 |
| | £21,831,276† |

If,

* Includes cost of old Pitt-street Tramway, taken up in 1867, and £3,223 cost of rolling stock used on Camden Tramway
† Excludes do do do do

If, in apportioning the net revenue, the interest bearing capital alone were considered, the return would give for the year 1885, 3·49 per cent.; but distributing it over the whole amount of capital expended on lines in operation without regard to the source from which it has been obtained, the percentage which the net revenue gives is reduced from 3·49 to 3·37.

3.—LINES OPEN AND IN PROGRESS.

Of the sum of £2,909,715 expended in 1885 for construction, the sum of £1,280,566 was expended on lines open for traffic, and the balance £1,629,149 invested in unproductive lines in course of construction.

Additions to Capital Account—Lines open for traffic.

In the year 1884 the capital invested in lines open was £20,080,138.* During 1885 a further sum of £1,751,138 was added, making the total capital invested £21,831,276.

Additions to
Capital
Account.

The amount of £1,751,138 was made up as follows, viz.:—

| | |
|--|----------|
| Amount transferred from Construction Account, &c. | £470,570 |
| Expenditure during 1885 on Construction, &c. | 677,764 |
| Additions and Improvements to Works and Stations, &c. | 182,791 |
| Additional Rolling Stock, Machinery, and Workshops, &c. | 420,013 |

See detail in
Appendix 10a,
page 102.

Lines open.
Appendix No.
4, page 70.

The year 1885 opened with the mileage divided into the various lines as under:—

Southern.

| | | |
|--|---|-----|
| Main Southern Line—Sydney to Albury | M | 388 |
| South-Western line—Junee to Hay, and Narrandera to Jerilderie | | 232 |
| Darling Harbour Branch | | 1 |
| Cooma Branch | | 20 |
| Illawarra Branch | | 9 |
| | | 650 |

Western.

| | |
|---|-----|
| Main Western Line—Granville to Byerock | 442 |
| Richmond Branch—Blacktown to Richmond | 16 |
| Mudgee Branch—Wallerawang to Mudgee | 85 |
| | 543 |

Northern.

| | |
|---|-----|
| Main Northern Line—Newcastle to Glen Innes | 323 |
| North-Western—Werris Creek to Narrabri | 97 |
| Branches—Morpeth, Bullock Island, &c. | 5 |
| | 425 |

Grand total 1,618
The

* Excludes cost of the old Pitt-street Tramway, and cost of Rolling Stock used on the Camden Line, for which latter see Tramway Returns.

The following extensions were opened during the year 1885 :—

Extensions
opened during
1885.

| SOUTHERN. | Date. | Miles. |

| Orange to Molong | 25th December, 1885 ... | 22 |
| | | 70 |
| Total | | 114 |

Making altogether a total of 1,732 miles in operation at the close of the year. The average mileage in operation for the whole period was 1,663.

Since the close of the year the following extensions have been opened, making a total of 1,774 miles in operation at the present date :—

9th March, 1886—Sutherland to Waterfall ... 9 miles

1st June, 1886—Cootamundra to Gundagai ... 33 „

42 miles.

The extension to Waterfall, on the Southern Coast Line, is one of considerable importance, as it not only brings us nearer to the coal-fields and rich district of Illawarra, but makes easy of access the great National Park of the Colony, a magnificent heritage of 36,000 acres, secured to the people principally through the instrumentality of Sir John Robertson, K.C.M.G. A small branch line runs into the Park—which has a frontage of 9 miles to the railway, with an ocean frontage of nearly 8 miles—where a station has been formed, named “Loftus,” from which place roads and foot-paths radiate leading to the picturesque views and scenery that are to be found in all parts of this great public domain. It is from the anticipated excursion traffic which the popularity of this pleasure ground for the people must induce that the Illawarra Line, between the immediate Suburban area and the coal-fields area, will be, for many years, mainly supported.

The following contracts have been let since the date of my last report :—

Illawarra Railway.

Fourth section—10 miles.

Tenders for this length were opened on the 27th January last; nine tenders in all were received, and the lowest, Messrs. Mooney & Co., for £93,719 19s., accepted.

Illawarra
Railway—
fourth section.

The line is to be completed on the 31st January, 1887.

Homebush to Waratah Railway.

Hawkesbury Bridge.

The Hawkesbury Bridge is intended to carry the Homebush-Waratah Railway by a double line across the River Hawkesbury. It will be the largest bridge in the Southern Hemisphere, the river at the point of crossing being close upon 3,000 ft. wide.

Hawkesbury
Bridge.

In

In one feature this bridge is without a parallel, viz., in the depth to which the foundation has to be carried. In some parts of the river-bed sound bottom is only reached at a depth of 170 ft. from water level, while a clear headway of 40 ft. above water level has, according to the specification, to be given.

The mode in which this stupendous work should be carried out was a subject of anxious deliberation by the Government, and it was finally resolved that competition for its construction and erection should be thrown open to the whole world, and that, instead of calling for tenders in the usual way to the design made by the Engineer-in-Chief, manufacturers should be asked to submit their own designs, and to tender to them, a procedure which is not uncommon in America, but, although adopted to some extent in England by the Admiralty in respect of warships built by private firms, is otherwise very unusual in the latter country.

To secure the best form of structure as regards stability, durability, and scientific perfection, the Government determined that the tenders and designs should be submitted for the examination and report of a Board of eminent professional men, and the following gentlemen were nominated for the purpose:—Sir John Hawkshaw, C.E.; Captain Galton, R.E.; W. H. Evans, Consulting Engineer of New York; and if the last-named were unable to act, T. Harrison, C.E., of the North-Eastern Railway, England, was to be nominated.

Sir John Hawkshaw and Mr. Evans declined the appointment, the former on account of professional engagements, the latter by reason of ill-health, and Mr. Harrison, for reasons not stated, did not accept the nomination.

Ultimately the Board was constituted as follows:—Douglas Galton, late Captain R.E., C.B., D.C.L., F.R.S.; W. H. Barlow, C.E., Past President of the Institute of Civil Engineers; G. Berkley, C.E., Vice-President of the Institute, Consulting Engineer to the Great Indian Peninsular and Natal Railways.

It was also arranged that the Government Consulting Engineer in London (Sir John Fowler) should furnish an independent report upon the tenders and designs, and that the whole should be subject to the final recommendation of the Engineer-in-Chief in the Colony.

The proposals in connection with this bridge were received with much interest by the scientific world, both on account of the magnitude and unique character of the work to be undertaken, and of the novelty of the plan adopted by the Government of allowing manufacturers to tender to their own designs.

Tenders were invited in accordance with the resolution of the Government, and fourteen tenders were received.

The following is a brief summary of the tenders and designs which the Board of Engineers considered eligible.

| Name of Tenderer. | Amount. | Time. | Main features of Design. | |
|--------------------------------|-----------|---------|--|--|
| | | | Piers. | Superstructure. |
| Edgemoor Iron Co..... | £ 296,350 | 2 years | 20 Cylinders, in pairs, 20 feet diameter at base. | American lattice type, pin fastenings; span, 292 ft. |
| Union Bridge Co. | 327,000 | 2½ „ | 6 caissons, 52 feet x 24 feet at base, with semicircular ends. | American lattice type, pin fastenings; span, 415 ft. |
| Fforde & Young | 377,500 | 3 „ | 20 cylinders, 10 ft. 6 in., in pairs, to full depth. | Cantilever, lattice type. |
| Royce & Co., and Butterley Co. | 403,367 | 3 „ | 24 cylinders, 16 feet, in pairs ... | Riveted lattice, curved upper boom; main spans, 238 ft. 6 in. |
| A. Handyside & Co..... | 456,000 | 3 „ | 22 do 15 do ... | Riveted lattice, straight top; main spans, 262 ft. |
| Arroll Brothers | 580,000 | 4 „ | 7 caissons, 70 ft. by 33 ft., elliptical. | Riveted lattice, curved upper boom; main spans, 432 ft. |
| Reichenbach, Godfrey, & Jones. | 466,032 | No time | 8 caissons, rectangular, 54 ft. 3 in. by 22 ft. | Cantilever lattice, continuous, 392 ft. and 311 ft. alternately. |
| John Dixon | 486,100 | 2 years | 36 cylinders, 10 ft., in groups of four. | Riveted lattice, curved upper boom; spans, 251 ft. |
| R. M. Parkinson | 584,898 | 4 „ | 8 cylinders, 40 feet in diameter | Riveted lattice, continuous throughout; spans, 338 ft. |
| Fives-Lille & Co..... | 515,004 | 4 „ | 6 caissons, circular, 57 ft. 5 in. diameter at base. | Bow strong, with stiffened arc; spans, 550 ft. |
| D. Munroe | 702,384 | 3 „ | 20 cylinders, 14 feet, in pairs ... | Fish belly, in lattice type; spans, 389 ft. 6 in. |

Several of the firms included in this statement submitted alternative designs and tenders, but as the designs were ineligible or otherwise inadmissible they need not be specially noted here.

Besides the foregoing the Phoenix Bridge Co., of Philadelphia, U.S.A., the Dominion Bridge Co., of Montreal, and P. & W. MacLellan, of Glasgow, tendered, but as the bridge of the Phoenix Company was designed for iron instead of steel, and the other tenders were not for the entire structure, as required by the specification, they were excluded from consideration.

It will be seen that, of those which were considered to be eligible, the tender of the Edgemoor Iron Bridge Co. (£296,350) is the lowest, but the Board of Engineers appointed to deal with the matter reported that with sundry alterations and additions, which they specified, the stability of the piers of the Union Bridge Company's design would be much greater than those of the Edgemoor Company's, and that if the suggested alterations could be carried out without increasing the price of the bridge beyond £124 per foot run, their recommendation would be that the tender of the Union Bridge Co. should be accepted.

Sir John Fowler, who as before stated, was to submit an independent opinion, without reference to any conclusion the Board might arrive at, reported that the Union Co. proposed six piers and the Edgemoor Co. ten, but as each pier in the latter case consisted of two cylinders the Edgemoor Co. had practically twenty separate piers to sink against six by the Union Co.'s scheme; that from his own experience of the difficulty of sinking cylinders and caissons the reduced number and larger size of the Union Bridge Co.'s caissons was a distinct advantage, and that the larger spans of their superstructure had a substantial superiority over the smaller spans of the Edgemoor Co. He therefore recommended the acceptance of the Union Bridge Co.'s tender of £327,000, subject to a proper specification and contract being prepared, together with a schedule of additions and deductions at prices based upon the lump sum.

The recommendation of the Engineer-in-Chief was also in favor of the Union Bridge Co.'s design and tender, but he proposed certain modifications of and additions to their design and estimated the further amount to be paid to the Company in respect of these alterations at £22,800. This amount

amount was subsequently reduced to £13,000, so that the price for the whole structure is £340,000.

The Union Bridge Company agreed to accept the contract upon the conditions suggested, and a recent mail brought intelligence that the contract had been duly executed by the Agent-General and the Company and that ample securities have been given by the Company for the due performance of the contract, which is to be completed within thirty months from the date of signing the contract, viz., by the 20th November, 1888. The contractors are to receive by way of premium £250 a week for every week they complete the work within the contract time, and to pay the like amount as ascertained liquidated damages for every week the completion of the work is delayed beyond that period.

The maintenance of the bridge for twelve months after its completion is an obligation of the contractors.

In the Appendix will be found lithograph drawings of the various designs submitted. Sir John Fowler in his report bore testimony to the large amount of labour and expense which the persons tendering must have incurred, and suggested that the Government should, in communicating their final decision to the competitors, recognize by some mark of their appreciation the careful and laborious work manifested in the preparation of the designs. Effect has been given to this suggestion.

It may be mentioned that although the construction of this important work has been secured by an American Bridge Company to its own design, the material of which it is to be composed is to be obtained, by the decision of the contractors themselves, from English manufacturers. The manufacture of the steel superstructure (with the exception of the eye-bars) has been undertaken by Messrs. Arrol and Co., the contractors of the Forth Bridge. The steel-plates and bars will be rolled by Messrs. Colville, of Glasgow, and the steel for the eye-bars by the Steel Company of Scotland. The manufacture of the steel work and iron work of the caissons has been undertaken by Messrs. Head, Wrighton, & Co., of Stockton-on-Tees, and the whole of the cement will be supplied by Messrs. Burge and Barrow, of Rainham, Kent, who are in the first rank of cement manufacturers.

Sir John Fowler, in giving the above particulars, takes occasion to say that in entrusting the work to the above firms the contractors have been greatly guided by his experience and knowledge as to the character of the firms and the excellence of the material they supply, and not merely by the price quoted.

There is every guarantee therefore that this, the largest structure of the kind in Australia, will fulfil the desire of the Government, that it shall possess scientific perfection of design, stability in all its parts, and the durability which, united to the above qualities, is obtained from the employment of the best material.

Cooma Railway.

Michelago to Cooma—39 miles.

Tenders for this extension were opened on the 18th August, 1885. Six tenders were received, and that of Messrs. Walker & Swan, for £314,116 being the lowest, was accepted. The works are to be completed by the 30th June, 1888.

Northern

Northern Line.

Tenterfield to Queensland Border—11 miles.

Tenders for this continuation of the Northern Line to connect with the Queensland Railways at the border were opened on the 19th January last. Six tenders were received, and the lowest, Stevens & Co., for £79,673, accepted. The contract is to be completed by the 31st December next.

At the present time the following lines are under construction :—

| Line. | Sections. | Length. | Date of Completion. | Remarks. |
|-------------------------|----------------------------------|-------------------|---------------------|---|
| | | Miles. | | |
| Illawarra | Second Section | 21 | 31 Dec., 1887 | Part opened, 11 miles. |
| | Third Section..... | 26 | 30 June, 1886 | |
| | Fourth Section | 10 | 31 Jan., 1887 | |
| Homebush to Waratah ... | Homebush and Hawkesbury | 29 | Time expired | |
| | Hawkesbury Bridge | $\frac{1}{2}$ | 20 Nov., 1888 | } Pearce's Corner to North Shore not yet let. |
| | Hawkesbury to Gosford | 14 | 30 Sept., 1886 | |
| | Gosford to near Waratah..... | 49 | 31 July, 1886 | |
| Cooma | Bungendore to Michelago..... | 48 | 30 June, 1887 | |
| | Michelago to Cooma | 39 | 30 ,, 1888 | |
| Murrumburrah to Blayney | Young to Cowra..... | 47 | 30 ,, 1887 | |
| | Cowra to Blayney | 45 | 30 ,, 1887 | |

The following is a summary of the Railways open, under construction, and authorised :—

| | |
|--------------------------|-----------------------|
| Lines open | 1,774 miles. |
| Under construction | 386 $\frac{1}{2}$ „ |
| Authorised | 1,260 $\frac{1}{2}$ „ |
| Total | 3,421 miles. |

4.—LAND TAKEN FOR RAILWAY PURPOSES.

The particulars of the whole of the land resumed to 31st December, 1885, for Railway purposes, will be found in Appendix No. 5, page 72.

Land resumed, appendix No. 5, page 72.

The claims outstanding on the 31st December, 1884, were 695, to which 188 were added during 1885, making a total of 883 claims; of these 334 were settled in 1885, leaving at the close of the year 549 in various stages of adjustment, a large number of which have been settled during the present year.

5.—IMPORTATION OF RAILWAY MATERIAL.

Appendix
No. 6, p. 75.

In the Appendix will be found a return of the Permanent-way materials, locomotives, and miscellaneous articles imported during the year under review.

The following is an abstract of the returns :—

| Number of Ships employed. | Number of Tons of Goods shipped. | Value of Goods shipped. | Amounts paid for Freight and Insurance. | Average rate of Freight and Insurance per ton. |
|---------------------------|----------------------------------|-------------------------|--|--|
| 165 | 40,030 | £ s. d. 591,740 6 11 | £ s. d. *35,080 17 10 †4,769 16 11 | s. d. 17 6 2 4 |

* Freight. † Insurance.

In the foregoing are included :—

| | Weight in Tons. | Value. |

| | | £ s. d. |
| Permanent-way materials for authorized extensions | 19,561 | 128,632 2 10 |
| " " renewals and doubling line | 8,831 | 65,171 17 4 |
| " " Tramways | 390 | 3,108 3 6 |
| 59 Locomotives | 2,965 | 163,127 4 10 |
| 20 Motors... .. | 277 | 27,303 15 6 |
| Miscellaneous items | 8,006 | 204,397 2 11 |
| | 40,030 | 591,740 6 11 |

6.—EXISTING LINES.

*Maintenance of Ways and Works.*Maintenance
of ways and
works.Appendix
Nos. 1 and 10,
pp. 1 and 102.

During the year a large number of works were carried out, details of which will be found on reference to Appendix No. 1. Those charged to the Capital Account have been scheduled, and the cost of each is shown in Appendix No. 10a.

The report of the Engineer will be found in Appendix No. 1. He states that the whole of the works were maintained in good condition.

The renewals of both rails and sleepers on the line between Sydney and Picton, the whole of the expense of which has, of course, been charged to revenue, have been heavy, and must continue to be heavy until the whole line (53 miles in length) has been relaid.

On the extensions beyond Goulburn, and from Bathurst to Wellington, the sleepers used, when the lines were constructed, were of the timber obtainable in the districts through which the railway was taken. This timber was known to be of inferior quality, but the object sought in allowing its use was to make the first cost of the lines less severe than would otherwise have been the case. The sleepers, as a natural consequence, have had comparatively but a brief life, and in renewing them (the cost of which has been charged to working expenses) it has been considered true economy to use sleepers of ironbark. The first renewal cost comes earlier upon "maintenance" than it otherwise would, but in replacing the sleepers with durable material the maintenance cost in the future will be proportionately reduced.

The working expenses have also been largely encroached upon by being debited with the cost of ballasting caused by the subsidence of many of the banks on the newly opened extensions which were made up originally during

continuous

continuous dry weather. It may be worthy of mention that it is not an unusual practice in other countries to charge to the construction fund, the expense of remedying defects arising from the cause stated, upon the reasonable ground that "maintenance" should not be saddled with the cost of work which is not occasioned by fair wear and tear, or is not an incidence of traffic operation, but it has been the practice here to debit current revenue with the cost of such works, and I am not, on broad grounds, prepared to depart from that practice although its observance necessarily decreases the return of interest which the net earnings give to the capital invested.

Locomotive and Carriage Division.

A large addition to the rolling stock was made in 1885, 1,164 vehicles having been added, particulars of which are given below :—

ABSTRACT of Rolling Stock on hand on 31st December, 1884, and the number and description of Vehicles supplied in 1885. Appendix No. 7, p. 92.

| Locomotives. | | Passenger. | | | | | | | | | | | Goods. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Rolling Stock on hand, 31st December, 1884. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 31 | 141 | 164 | 336 | 2 | 1 | 10 | 106 | 100 | 248 | 16 | 7 | 9 | 22 | 98 | 58 | 99 | 776 | 6 | 223 | 224 | 311 | 430 | 1 | 304 | 23 | 3 | 125 | 250 | 26 | 395 | 390 | 18 | 1 | 1 | 150 | 159 | 23 | .. | 6938 | 8050 | | |
| Rolling Stock received during 1885. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 6 | 18 | 30 | 54 | .. | .. | 2 | 15 | 9 | 12 | 2 | .. | .. | .. | 6 | 19 | .. | 15 | 80 | 1 | 8 | 10 | 35 | 386 | 30 | 19 | .. | 118 | .. | 10 | 26 | 36 | 6 | .. | .. | 148 | 5 | 178 | 14 | 1030 | 1164 | | |

The capital expenditure in new stock during the year was £319,580, and a sum of £163,482, charged against revenue, was expended in repairing and renewing existing stock.

The following extracts are made from the report of the Locomotive Engineer, which is published in the Appendix :—

"As reference has been made on more than one occasion to our working expenses not having been debited with the cost of the proper repairs and renewals of our stock, I would take the liberty of stating so far from such being the case we are continually making improvements in our stock irrespective of repairs and renewals, and thereby adding to their value as an asset of the Department, and the entire cost has been charged to working expenses.

"As bearing on this I would mention that when renewing wheels, axles, and draw-gear, we give a much improved article, which enables a much heavier load being carried in the vehicles, thus adding to our train-mile earnings, and the entire cost is charged to working expenses. Then again, the improvements to our sheep and cattle trucks, recommended by the Board appointed to inquire into our live stock traffic, have been similarly charged. In fact the cost of every improvement introduced in our existing stock is borne by working expenses."

7.—REVENUE AND EXPENDITURE.

The gross earnings in 1885 were £2,174,368, the working expenses £1,458,153, and the net earnings, £716,215. Gross and net earnings and working expenditure.

To earn the above amount 158,002 trains were run 6,638,399 miles, equal to 42 miles per train. The number of trains averaged 505 per working day. In

Particulars of
coaching
traffic.

In the following tables are given the particulars of the Revenue and Expenditure for 1885 compared with 1884:—

In the tonnage carried there was

A decrease of 81,608 in merchandise.

An increase of 222,642 in coal.

" 7,624 in wool.

A decrease of 79 in live stock.

148,579 total increase.

Per average mile of line open, the result shows :—

A decrease of 168 tons in merchandise.

" 38 " coal.

" 1 " wool.

" 8 " live stock.

215 total decrease.

The

The receipts show—

| | | |
|----------------|---------|-------------------|
| A decrease of | £35,574 | in merchandise. |
| An increase of | 9,241 | in coal. |
| „ | 26,140 | in wool. |
| „ | 3,774 | in live stock. |
| A decrease of | 689 | in miscellaneous. |
| | <hr/> | |
| | £2,892 | total increase. |

Per average mile of line open, the receipts show—

| | | | | |
|----------------|-------|----|----|-------------------|
| | £ | s. | d. | |
| A decrease of | 109 | 13 | 4 | in merchandise. |
| „ | 7 | 4 | 3 | in coal. |
| An increase of | 2 | 4 | 11 | in wool. |

| „ | 1 | 1 | 5 | in miscellaneous. |
| | <hr/> | | | |
| | £128 | 10 | 9 | average decrease. |

The average receipts per train mile show—

| | |
|----------------|-------------------------|
| | d. |
| A decrease of | 1·74 for merchandise. |
| An increase of | 0·63 for coal. |
| „ | 1·66 for wool. |
| „ | 0·30 for live stock. |
| A decrease of | 0·04 for miscellaneous. |
| | <hr/> |
| | 0·81 total increase. |

It will be seen from a careful perusal of the foregoing figures that while the coaching traffic receipts exceeded those of 1884 by £85,239, the receipts from the goods traffic increased only by the sum of £2,892, and that this latter result was due to the great depression in trade, there being a decrease in the General Merchandise offered for carriage of no less than 81,608 tons.

As compared with 1884, the receipts per mile of line in operation decreased £21 4s. 7d. for passenger traffic, and £128 10s. 9d. for goods traffic, together £149 15s. 4d. Had the same earning power per mile of line been maintained the increase in Revenue, instead of being £88,131, would have been £248,406, and the return to capital invested 4·50 per cent. instead of 3·37 per cent.

Working Expenditure.

The particulars of the whole of the expenditure are given in the following table:—

| Particulars of working expenditure. | 1884 | | | 1885 | | | |
|--|--------------------------------|-----------|-----------|-----------|---------|-----------|---------|
| | S & W | North | Total | S & W | North | Total | |
| Gross working expenses | Maintenance of way, &c . . . | £ 295,876 | 71,441 | 367,317 | 374,791 | 78,294 | 453,085 |
| | Locomotive power, &c | 349,131 | 80,589 | 429,720 | 360,730 | 85,057 | 445,787 |

| | Do Goods | 0 04 | 0 02 | 0 03 | 0 04 | 0 03 | 0 04 |
| | Miscellaneous | 1 43 | 2 58 | 1 65 | 1 80 | 3 40 | 2 12 |
| Total | 47 84 | 52 54 | 48 77 | 51 92 | 55 97 | 52 72 | |
| Proportion of expenditure to gross receipts. | Maintenance of way, &c | % 18 30 | 15 25 | 17 61 | 21 95 | 16 74 | 20 84 |
| | Locomotive power, &c | 21 59 | 17 20 | 20 60 | 21 14 | 18 19 | 20 49 |
| | Repairs of carriages & waggons | 4 09 | 2 90 | 3 82 | 3 62 | 2 95 | 3 47 |
| | Traffic charges | 17 18 | 21 10 | 18 06 | 17 99 | 23 52 | 19 19 |
| | Compensation—Personal | 0 14 | 0 09 | 0 13 | 0 41 | 0 04 | 0 32 |
| | Do Goods | 0 04 | 0 02 | 0 04 | 0 05 | 0 03 | 0 05 |
| | Miscellaneous ... | 1 88 | 2 90 | 2 11 | 2 34 | 3 98 | 2 70 |
| Total | 63 22 | 59 46 | 62 37 | 67 50 | 65 45 | 67 06 | |

The total working expenditure, compared with 1884, increased—

£129,637 or 12·68 per cent. for South and West lines

27,257 or 9·78 „ North line.

156,894 or 12·06 „ all lines.

The expenditure per average mile of line open—

Decreased £47 for South and West lines.

„ £3 for North line.

„ £32 for all lines.

The expenditure for train mile shows as follows—

An increase of 4·08d. for South and West lines.

An increase of 3·43d. for North line.

An increase of 3·95d. for all lines.

The proportion of expenditure to gross receipts from all sources shows—

An increase of 4·28 per cent. for South and West lines.

„ 5·99 „ North lines.

„ 4·69 „ all lines.

It will be seen that although there was an increase of £156,894 in the working expenditure for 1885, as compared with 1884, there was an actual decrease of £32 per mile of line in operation, which represents a total decrease under that head of £53,232

Net

Net Earnings.

The percentage of net earnings to capital expended in 1885, as against 1884, was as under:—

Percentage of net earnings to capital.

| | 1884. | | | 1885. | | |
|-----------------------|---------------|-------------------|-------------------------|---------------|-------------------|-------------------------|
| | No. of Miles. | Capital invested. | Percentage of interest. | No. of Miles. | Capital invested. | Percentage of interest. |
| South and West | 1,193 | 15,136,785 | 4.23 | 1,307 | 16,765,769 | 3.43 |
| North | 425½ | 4,943,354 | 4.12 | 425 | 5,065,507 | 3.19 |
| All Lines | 1,618½ | 20,080,139 | 4.20 | 1,732½ | 21,831,276 | 3.37 |

The subjoined abstract furnishes the percentages which the gross earnings, the working expenditure, and the net earnings bear to the capital expended on lines in operation for 1885, as compared with 1884.

Percentage of gross earnings, working expenditure, and net earnings to capital.

| | | 1884. | | | 1885. | | |
|--|----|---------|---------|---------|---------|---------|---------|
| | | S. & W. | North. | Total. | S. & W. | North. | Total. |
| Net receipts from all sources ... | £ | 594,967 | 190,011 | 784,978 | 554,749 | 161,466 | 716,215 |

| Decrease for 1885... .. | 40,218 | 28,545 | 68,763 |

Sectional returns.

8.—DIVISION OF THE RAILWAY LINES INTO SECTIONAL AREAS.

In the following statements are given the capital expenditure, the gross earnings, the working expenditure, the net earnings, and the return which the net earnings give to the capital invested in each section.

It will be observed that the section from Sydney to Granville, which for 1884 returned 8·51 per cent. on its capital, returned for the past year 7·57 only. This was wholly caused by the decreased traffic from the lines in the interior, a portion of the revenue derived from which is credited to the Suburban Line for the use which such traffic makes of it.

The

The section Granville to Albury returns 3·56 per cent. on its capital as against 4·32 per cent. for 1884. This falling off is partly due to the increased capital expended on the line towards Cooma, 20 miles of which were opened for traffic in 1885 in excess of the number in operation in 1884. The revenue from goods traffic decreased by the sum of £34,976. There can be very little doubt that the great depression in trade and the protracted drought were the causes of diminution of traffic.

Although there was an increase of £64,959 in the gross earnings of the section from Granville to Bourke, owing to the greater mileage in operation, the earnings per mile fell considerably, the cause in a large measure being due to the extension of the line further into the sparsely populated interior.

The section from Newcastle to Glen Innes shows a loss of interest to capital of ·85 per cent. as compared with the return for 1884. The earning power of this line per mile of line opened decreased from £1,473 in 1884 to £1,304 for the past year. The extension of the line into only partly developed country will in some measure account for this falling off, but in a large degree it is to be attributed to the drought, the disastrous effects of which were more severely felt in the Northern Districts than in any other part of the Colony.

In the return for 1884 the transaction of the South-western line, Junee to Hay and Narrandera to Jerilderie (which latter line had been opened three months only), showed an improvement over the transactions of 1883. This improvement has not only not been maintained, but owing to the limited traffic on the line from Narrandera to Jerilderie the loss in working has increased from £1,055 in 1884 to £13,041 in 1885; of this loss the Jerilderie line is answerable for £10,631. As the capital expended in that branch amounts to £414,179 the interest and loss on working represents the sum of £27,198, which charged against the net earnings derived from the self-supporting and from the less unprofitable lines, serves to reduce materially the returns which they give to the whole railway capital.

The following are the sections which do not pay their working expenses:—

| Section. | Loss on working. | Capital expended. | Total working loss expenditure and interest upon capital at 4 per cent. |
|-----------------------------------|------------------|-------------------|---|
| | £ | £ | £ |
| Junee to Hay and Jerilderie... .. | 13,041 | 1,435,263 | 70,452 |

Appendix No.
52, p. 168.

In the Appendix will be found returns of the tare of vehicles, and the amount of ton mileage they run during the year with which this Report deals.

10.—WOOL TRAFFIC.

Wool traffic.

In my Report for 1884 I had to deplore the large falling off in the wool traffic which the returns for the season of 1884-5 disclosed, a decrease solely attributable to the extreme severity of the drought, and the disastrous effect it had produced upon the sheep depastured over the face of the Colony. In the year 1884 the number of sheep in the Colony decreased from 37,916,000 to 31,600,000, a loss in twelve months of no less than 6,250,000, or over 17 per cent. It is gratifying to find that during the year 1885 this loss has been almost entirely recouped. The following return on the subject is compiled from the Report of the Chief Inspector of Stock.

No. of sheep
in the Colony.

| Districts. | Number of Sheep, 1st January, 1885. | Number of Sheep, 1st January, 1886. | Increase, 1st January, 1886. | Decrease, 1st January, 1886. |
|----------------|--|--|---------------------------------|---------------------------------|
| Border | 5,420,042 | 6,889,780 | 1,469,738 | |
| Northern... .. | 7,822,971 | 8,571,004 | 748,033 | |
| Southern... .. | 10,723,765 | 12,492,274 | 1,768,509 | |
| Western | 7,693,543 | 9,867,848 | 2,174,305 | |
| Total | 31,660,321 | 37,820,906 | 6,160,585 | |

It will thus be seen that the Colony has repossessed itself, within comparatively a mere fraction, of the total number of sheep it had lost.

Appendix No.
31, page 139.

With this large increase in the fleece-yielding stock and the further extension of our railways to the waters of the Darling at Bourke, and through the south-western country to Jerilderie, it would be only reasonable to expect that the wool returns for 1885-86 will show a considerable increase. In this

we

we are not disappointed, as the following table of increases and decreases in the wool received from the various districts throughout the Colony discloses:—

| Sections. | 1884-5. | 1885-86. | Increase. | Decrease. |
|--------------------------------------|--------------|----------|-----------|-----------|
| Sydney to Goulburn | Bales 30,807 | 29,235 | | 1,572 |
| Bredalbane to Albury | „ 49,928 | 59,603 | 9,675 | |
| Junee to Hay | „ 35,637 | 35,924 | 287 | |
| Jerilderie Line | „ 1,659 | 6,463 | 4,804 | |
| Parramatta to Dubbo | „ 37,803 | 40,244 | 2,441 | |
| Narramine to Bourke | „ 49,216 | 79,619 | 30,403 | |
| Mudgee Line | „ 6,669 | 10,497 | 3,828 | |
| Newcastle to Murrurundi | „ 8,627 | 10,001 | 1,374 | |
| Doughboy Hollow to Glen Innes | „ 35,907 | 40,309 | 4,402 | |
| Breeza to Narrabri | „ 34,273 | 32,802 | | 1,471 |
| Totals | 290,526 | 344,697 | 57,214 | 3,043 |

The net increase shown is 54,171 bales—nearly 57 per cent. of which is due to the large increase from the section between Narramine and Bourke, the number of bales sent having jumped from 49,216 to 79,619.

11.—COAL TRAFFIC.

The coal traffic during the year has been very evenly maintained, the quantity carried during 1885 showing but a slight increase upon that carried in 1884. Coal traffic, Appendix No. 34-41, pp. 143-150.

The following is a return of the coal carried on the Northern Line during 1884 and 1885:—

| | Tons. | Freight. |
|-----------------|-----------|----------|
| 1884 | 1,614,200 | £75,840 |
| 1885 | 1,640,601 | £77,603 |
| Increase | 26,401 | £1,763 |

The following were the quantities shipped for Foreign and Intercolonial ports:—

| | Tons. | Value. |
|-----------------|-----------|----------|
| 1884 | 1,550,395 | £835,070 |
| 1885 | 1,552,136 | £832,495 |
| Increase | 1,741 | |
| Decrease | | £2,575 |

The largest Intercolonial shipments were to Victoria; they amounted to 544,005 tons, as against 507,082 tons for the previous year. There was a decrease in the shipments to New Zealand and South Australia.

The largest Foreign shipments as distinguished from Intercolonial were to San Francisco, but as compared with the previous year's shipments there was a falling off, the quantity exported in 1885 amounted to 118,053 tons as against 128,419 tons in 1884, and the shipments both to Hongkong and India were each over 100,000 tons for the year.

The coal traffic on the Southern and Western Lines has continued to increase, and the quantity of shale carried in 1885, which for the two previous years exhibited a decline, shows a slight increase.

The

The following is a return of the coal and shale traffic on the Southern and Western Lines for 1884 and 1885:—

| | COAL. | | SHALE. | |
|-------------|---------|----------|--------|----------|
| | Tons. | Freight. | Tons. | Freight. |
| 1884 | 159,705 | £55,528 | 20,642 | £6,991 |
| 1885 | 184,750 | £63,010 | 21,293 | £7,142 |
| Increase... | 25,045 | £7,482 | 651 | £151 |

In addition to the above there were 171,196 tons hauled for the Department, the freight on which would have amounted to £74,852; as this coal was used for our own purposes, no credit has been taken for it in the returns of traffic.

12.—ACCIDENTS.

Accidents,
Appendix No.
55, page 199.

The mortality and casualty list for last year is heavy as compared with that of 1884, the increase under this head being mainly due to the lamentable catastrophe at Salt Clay Creek, near Cootamundra, on the night of the 25th January, 1885, by which seven lives were lost and twenty-five persons injured. The total number of persons killed on the railway during 1885 was forty-one, of which no less than thirty-two were attributable to the victims own want of caution—seven of the number were passengers, twenty were servants of the Department, and fourteen were trespassers. In the previous year there were but twenty-three fatal cases. The number of persons injured during 1885 was seventy-three, of whom forty-four were passengers, twenty-five servants of the Department, and four trespassers. Of these cases thirty-nine were due to want of caution on the part of the sufferers. The Cootamundra accident swelled the total to the extent of twenty-five; this disaster, it will be well remembered, was caused through the sweeping away of the railway embankment at Salt Clay Creek by an abnormally heavy flood, whose swollen torrent was increased by the sudden bursting away of large dams in the immediate vicinity of the accident; into the chasm so made the train from Melbourne to Sydney fell with a terrible crash. Neither in regard to providing a sufficiency of water-way, nor the energy displayed by the local officers and men to avert the disaster when it became imminent, could any negligence be shown, and the result of the test action in the Supreme Court, which was brought to establish negligence in these respects, was to acquit the Department of responsibility.

13.—RETURNS.

In addition to the Returns given and referred to in the Report, several others will be found in the Appendix which serve further to illustrate the Railway transactions for the past year.

Annexed to the Appendix are thirteen coloured diagrams showing the particulars of the capital invested, the revenue received, the working expenditure, the net revenue, and the return which the net revenue gave to the capital invested for each of the thirty-one years, from 1855 to the end of 1885.

A Railway map of the lines constructed, under construction, and authorised, is appended, and also a map of Australia, showing in the same way the Railways of the various Colonies.

14.—RECAPITULATION.

The transactions during the year are thus summarized:—

The total expenditure for construction was £24,962,972, of which the sum of £21,839,378 was expended for lines opened for traffic.

At the close of the year 1,732 miles of line were opened for traffic, and 407 miles were in course of construction.

The rolling stock consisted of 390 locomotives, 856 coaching, and 7,968 goods, vehicles.

The value of the railway materials, in the conveyance of which 165 vessels were employed, amounted to £591,740, including freight and insurance of £39,851.

During the year 158,002 trains were run a distance of 6,638,399 miles; the earnings amounted to £2,174,368, and the working expenditure to £1,458,153. The number of passengers who travelled was 13,506,346, of whom 2,435,204 were first class, 6,033,348 second class, and 5,037,794 season-ticket holders.

The merchandise traffic consisted of 2,120,955 head of live stock, 361,118 bales of wool, 1,996,547 tons of coal, and 1,139,724 tons of general merchandise.

The earnings per mile open were £1,307, the expenditure was £877, and the net earnings were £430.

The net earnings were £716,215, yielding 3·37 per cent. to the capital invested on lines in operation.

I have the honor to be,

Sir,

Your most obedient Servant,

Commissioner for Railways.

The Honorable William John Lyne, Esq.,
 Secretary for Public Works,
 &c., &c., &c.

TRAMWAYS OF NEW SOUTH WALES.

Department of Public Works, Railway Branch,
Sydney, 15th July, 1886.

Sir,

Having submitted to you in April last a Progress Report upon the transactions of the Tramways for the year 1885, it now only remains to me to furnish the information in detail.

The following is a Return showing the Capital Expenditure on the Tramways to the 31st December, 1884, and subsequent expenditure to 31st December, 1885 :—

| Lines and Sections. | Total Expenditure to 31 December, 1884. | | | Amount expended in 1885. | | | Total expended to 31 December, 1885. | | |
|--|---|-----------|-----------|--------------------------|-----------|----------|--------------------------------------|-----------|-----------|
| | £ | s. | d. | £ | s. | d. | £ | s. | d. |

| Total cost of construction..... | 555,638 | 12 | 11 | 64,293 | 18 | 9 | 619,932 | 11 | 8 |
| Tramway Workshops for all Lines..... | 45,520 | 11 | 6 | 6,194 | 6 | 4 | 51,714 | 17 | 10 |
| Rolling Stock..... | 175,903 | 11 | 2 | 30,452 | 14 | 4 | 206,356 | 5 | 6 |
| Machinery..... | 4,799 | 7 | 7 | 73 | 6 | 6 | 4,872 | 14 | 1 |
| Furniture..... | 2,111 | 13 | 9 | | | | 2,111 | 13 | 9 |
| Trial surveys..... | *5,371 | 9 | 3 | 363 | 18 | 9 | 5,735 | 8 | 0 |
| Total Tramways..... | *789,345 | 6 | 2 | 101,378 | 4 | 8 | 890,723 | 10 | 10 |

* Reduced by £153 18s. 6d. credits during 1884. † This amount appears in Return of 1884 as £5,377 18s. 9d.; it is now reduced by £6 9s. 6d., that sum having been carried to the Randwick Extension.

Eliminating from this Return the expenditure incurred for other than the City and Suburban Lines opened for traffic, the total capital expenditure upon lines opened to the 31st December, 1885, was £708,109. The difference

difference between that amount and the total capital expenditure, £890,724, shown in the Return, is made up as follows:—

| | £ |
|---|----------|
| Tram Line, Campbelltown to Camden | 40,398 |
| North Shore, Cable Line (in part) | 35,692 |
| Circular Quay to Kent-street, land, &c., taken for proposed Tram Line | 100,217 |
| Newtown to Cook's River | 297 |
| Harris-street to Pymont... .. | 276 |
| Trial Surveys | 5,735 |
| | £182,615 |

With the exception of the first item (the cost of the tram line from Campbelltown to Camden), the whole of this expenditure has been unproductive, and consequently has not been included in the return of capital expended on lines in operation, nor treated as capital for which the net Tramway revenue had to be debited with interest.

As regards the capital expenditure on the Camden Tramway the returns show a satisfactory result, which will be referred to in a subsequent portion of this Report.

Confining my observations to the capital expenditure upon the City and Suburban Tram Lines opened for traffic, I have to report that the amount expended to the close of 1884 was £643,236. During the year there was added the sum of £64,873, making the capital value £708,109, as under:—

| | £ |
|---|----------|
| Expended to the end of 1884 | 643,236 |
| Additions and improvements to Existing Lines... .. | 28,153 |
| Additional Rolling Stock, Workshops and Machinery | 36,720 |
| | £708,109 |

This expenditure was distributed as under:—

| Lines opened for Traffic. | Length in Miles. | Total Cost. | Cost per Mile. |
|--|------------------|-------------|----------------|
| Railway Station to Circular Quay..... | 1 $\frac{3}{4}$ | £ 61,156 | £ 34,946 |
| Liverpool-street to Randwick and Coogee..... | 5 $\frac{1}{4}$ | 105,239 | 20,046 |
| Darlinghurst Junction to Waverley and Woollahra... | 3 $\frac{1}{2}$ | 48,767 | 13,933 |
| Crown-street Junction to Cleveland-street | $\frac{3}{4}$ | 6,530 | 8,707 |
| Newtown (Glebe Junction) to Marrickville | 3 $\frac{1}{4}$ | 59,101 | 18,185 |
| Glebe Junction and Forest Lodge | 2 $\frac{3}{4}$ | 37,990 | 15,196 |
| Railway Station Junction to Botany..... | 6 $\frac{3}{4}$ | 76,756 | 11,371 |
| Forest Lodge Junction to Leichhardt | 2 $\frac{1}{2}$ | 31,104 | 12,442 |
| Waverley to Bondi | 1 $\frac{1}{4}$ | 19,959 | 15,967 |
| Average cost of construction..... | 27 $\frac{1}{2}$ | 446,602 | 16,240 |
| Tramway workshops | | £51,715 | |
| Rolling stock | | 202,808 | |
| Machinery | | 4,873 | |
| Furniture | | 2,111 | |
| | | 261,507 | |
| Average cost per mile, including all charges... | | 708,109 | 25,749 |

No additional lines of Tramways were opened during 1885.

FIRST

FIRST CABLE LINE IN THE COLONY.

The cable line of Tramway adopted for the North Shore, the contract for which was to have been completed and opened for traffic in October last, was not completed till the 22nd May of this year. The delay has to be accounted for in various ways. An extension of two and a half months was granted on account of the time found to be necessary in deciding upon the detail drawings and specification which, in terms of the contract, had to be furnished by the contractor. Then, further time had to be allowed owing to the non-arrival of the rails from England, and finally a substantial deviation in the course of the route at Milson's Point, and the delay in completing the substituted arrangements for obtaining a water supply, further postponed the day of opening. It is too early yet to form an opinion upon the probable financial result of working this line of cableway; it has an immense capital—looking to the short length of line in operation—to pay interest upon, and it will be only by the exercise of rigid economy in the working expenditure, and by the liberal patronage of the residents of the North Shore of the facilities it affords that this, the first constructed cable-road in the Colony, can be made self-supporting.

Cable Tramway, North Shore.

TRAMWAY FROM NEWCASTLE TO PLATTSBURG.

The construction of this line has been postponed from time to time from various causes. There was a good prospect of its being completed in 1885; but after all the preliminaries had been taken, prior to tenders being invited, it was found that, subsequently to the laying out of the line, a colliery had been opened in the midst of it, necessitating a deviation of the route. It was not till December of 1885 that the Department was in a position to invite tenders, which were opened on the 2nd February of this year. Messrs. Johnston and Billing's was the lowest for the sum of £30,855, and it was accepted on the 4th March. The length of the line to be constructed is 7 miles 30 chains, and the contractors have undertaken to complete the work by the 31st January, 1887, or forfeit £50 a week for every week they are in excess of that time. The work, so far, is progressing satisfactorily, and there is every prospect of its being completed in contract time.

Tramway, Newcastle to Plattsburg.

REVENUE AND EXPENDITURE.

The total earnings derived from the City and Suburban Tramways during the year were £223,340, an increase of £3,398 over the earnings of 1884; the expenditure was £207,995, a decrease of £7,172 upon the expenditure of the preceding year. The net earnings were £15,345, as against £4,775 in 1884, and the return to capital invested increased from 0·76 to 2·17 per cent.

Revenue and Expenditure.

As 4 per cent. is the rate at which the Tramway capital has been raised, the transactions for 1885 show a loss of 1·83 per cent., equal to a sum of £12,979; the loss in 1884 was 3·24 per cent., and represented the sum of £20,427.

Although this improvement in the financial affairs of the Tramways is gratifying, it is not so satisfactory as it should be, nor as it can be made to be, by a judicious curtailment of the number of trams run during certain parts of the day when the traffic is too limited to make them otherwise than most unprofitable.

Without in any way interfering with the convenience or requirements of the public, the number of miles run upon the City and Suburban Tramways in 1885 was reduced by 22,000 as compared with the number run in the preceding year; and to this reduction a sensible saving in the working expenditure is to be attributed.

It

It will be seen from the sectional returns which follow that the lines worked at a profit are—

| | | | | | | |
|-------------------------------------|-----|-----|-----|-----|--|-------|
| Railway Line | ... | ... | ... | ... | Gain per cent. on Capital expended. | 5·94 |
| Randwick and Coogee Bay Line | ... | ... | ... | ... | | 2·39 |
| Waverley, Woollahra, and Bondi Line | ... | ... | ... | ... | | 11·19 |
| Newtown and Marrickville Line | ... | ... | ... | ... | | 5·97 |
| And the lines worked at a loss are— | | | | | Loss per cent. on Capital expended. | |
| Crown-street Line | ... | ... | ... | ... | | 5·81 |
| Waterloo and Botany Line | ... | ... | ... | ... | | 2·73 |
| Glebe and Forest Lodge Line | ... | ... | ... | ... | | 13·85 |
| Leichhardt Line | ... | ... | ... | ... | | 3·47 |

The difficulties which attend the withdrawal of facilities and conveniences once granted to the public are almost insuperable, but when it has been proved by a somewhat lengthened experience that the residents of the non-paying districts have obtained a tram service altogether disproportionate to the population, and to their ability to maintain such service, and that the result financially is so disastrous, it is reasonable to expect they will co-operate with and assist the Department rather than oppose it in bringing about some measure of reform, even if it have the effect of curtailing in some degree, not the facilities, but the redundancy of the facilities for travelling which have been afforded them.

If the Tramways were in the hands of private owners the time-tables for tram-running would of course be regulated or proportioned to the ascertained number of persons to be accommodated, and if it were found, after the establishment of the service, that the number of trips provided was in excess of the requirements of the traffic, that excess number would be immediately abolished.

It is only by a firm adherence to the practice which would prevail if the Tramways were to pass into the hands of private owners that they can be made a commercial success, and give a proper return to the capital invested; and I have for some time past been endeavouring to induce the several Ministers who have presided over the Department of Public Works to consent to a reconstruction of the Tramway time-tables, with a view to the number of trams being proportioned to the requirements of the various suburbs to which tramway accommodation has been extended.

It is estimated that without unduly inconveniencing the patrons of the Tramways, a reduction of fully 200,000 miles of running can be made, which represents about 16 per cent. of the present running; and the saving in the working expenditure that this measure of reform will effect will equal an amount which will make the Tramways self-supporting.

That they are considered to be a source from which large profits may be made is evidenced by the fact that more than one responsible offer has been received to purchase them from the Government at cost price, or to lease them on terms, which would not only pay interest upon the capital invested but realise a profit beyond.

In the following statements are given the capital expenditure, the gross earnings, the working expenditure, and the return which the net earnings give to the capital invested on each section:—

CITY

CITY AND SUBURBAN TRAMWAYS—1885.

ALL SECTIONS.

All sections.

| Expenditure. | | | | Earnings. | | |
|---------------------------|-----------|----------------------|-----------------------|---|-----------|--------------------------|
| All Sections— | | | | All Sections— | | |
| Miles open | 27½ | Cost per train mile. | Per cent. to earnings | Miles open | 27½ | Earnings per train mile. |
| Train mileage..... | 1,220,500 | | | Train mileage ... | 1,220,500 | |
| Locomotive expenses ... | £ 120,706 | d. 23·74 | 54·05 | Earnings from all sources | £ 223,340 | d. 43·91 |
| Permanent-way do ... | 37,298 | 7·33 | 16·70 | | | |
| Traffic do ... | 40,565 | 7·98 | 18·16 | | | |
| General do ... | 9,426 | 1·85 | 4·22 | | | |
| | 207,995 | 40·90 | 93·13 | | | |
| Balance, net earnings ... | 15,345 | | | | | |
| | £ 223,340 | | | | £ 223,340 | 43·91 |
| Capital expended— | | | | | | |
| Construction ... | ... | £446,602 | | | | |
| Rolling stock, &c. ... | ... | 261,507 | | | | |
| | | £708,109 | | Per cent. per annum return on capital ... | ... | 2·17 |

NOTE.—In the amount given above as permanent-way expenses there is included $\frac{1}{4}$ th of the relaying expenditure on the Redfern line during 1882, viz., £2,387 10s., in addition to the actual expenditure of 1885. During 1883 the greater portion of the Crown-street line was relaid with steel rails, and $\frac{1}{2}$ of that cost is also included above, although in the books, owing to the custom of voting annual supplies, the whole cost was charged to the accounts of 1883.

RAILWAY STATION LINE.

| Expenditure. | | | | Earnings. | | |

CAMPBELLTOWN AND CAMDEN TRAMWAY.

Campbelltown
and Camden
Tramway.

The subjoined return of the transactions of the Campbelltown and Camden Tramway is very satisfactory. The capital expended upon this line has been—for construction, £36,850; and for rolling stock, &c., £6,771; together, £43,621. For the year 1883 the loss sustained in working this line was £2,456, which, with interest on the capital invested at 4 per cent., was swelled to £4,100. The working expenditure for that year was, however, exceptionally heavy, owing to the large sums which had to be paid for compensation for personal injuries, amounting to £2,161. The expenditure under this head for the succeeding year, 1884, was reduced to £43, and in consequence of this, aided by increased earnings and decreased working expenses, the 6 per cent. loss on capital sustained in 1883 was converted to a net return to capital of 2·38 per cent., leaving the sum of £700 only to be recouped out of the General Revenue. The return for 1885 is still more favourable. There was for that year complete immunity from accident, and although a slight falling off in the coaching traffic took place, the increase in the goods traffic, combined with economy in the working expenditure, resulted in a net return to capital of 3·07 per cent., leaving the sum of £405 only to be recouped out of the General Revenue to meet the balance of interest upon the capital outlay.

* Includes £3,223, value of railway rolling stock used on Camden Line.

ACCIDENTS.

The following were the accidents for the years 1884 and 1885, together ^{Accidents.} with the number of passenger fares collected :—

| Years. | Accidents. | | | | | | Total. | | Number of Passenger Fares. |
|----------------|------------|----------|-------------|----------|------------------------|----------|---------|----------|----------------------------|
| | Servants. | | Passengers. | | Other than Passengers. | | Killed. | Injured. | |
| | Killed. | Injured. | Killed. | Injured. | Killed. | Injured. | | | |
| 1884 | | 9 | 6 | 18 | 8 | 19 | 14 | 46 | 30,202,303 |
| 1885 | 1 | 6 | 2 | 7 | 3 | 9 | 6 | 22 | 39,594,753 |
| Increase | 1 | | | | | | | | 9,392,450 |
| Decrease | | 3 | 4 | 11 | 5 | 10 | 8 | 24 | |

In the conduct of a service of this kind, the motors running in the midst of the ordinary vehicular traffic and for the most part through crowded streets, it is rather a matter of surprise that the accidents should be so few. The fatal accidents to other persons than passengers amounted to *three only* during the year; and in that time no less than 328,658 separate trams were run. The fatal accidents to passengers were *two*, averaging one to every 20,000,000 passenger fares collected. In the past *two* years only *one* servant of the Department out of a total of 988 has lost his life by accident in the performance of duties which oftentimes expose them to risk.

In concluding this Report it affords me pleasure to state that for the first six months of the present year the Revenue derived from the Tramways is larger than it was for the corresponding period of last year, and that there is a reasonable prospect of the net return for 1886 paying a higher percentage of interest to capital invested than the net returns for 1885 paid.

I have the honor to be,

Sir,

Your most obedient servant,

Commissioner for Railways.

The Honorable William John Lyne,
Secretary for Public Works.

APPENDIX TO REPORT ON RAILWAYS—1885.

No. 1.

The Engineer for Existing Railways and Tramways to The Commissioner for Railways.

Sir,

Railway Department, Office of Engineer for Existing Lines, Sydney.

I have the honor to submit my Annual Report from January 1st to December 31st, 1885, on the condition of the Existing Railways and Tramways under my charge.

SUBURBAN RAILWAYS.

Sydney to Granville Junction—Double Line—Length, 13 miles 16 chains.

GREAT SOUTHERN AND SOUTH-WESTERN RAILWAYS.

Granville Junction to Albury—Single Line—Length, 373 miles 4 chains.

Albury to the River Murray—Single Line—Length, 1 mile.

Juncce Junction to Hay—Single Line—Length, 167 miles 29 chains.

Narrandera to Jerilderie—Single Line—Length, 64 miles 49 chains.

Joppa Junction to Tarago—Single Line—Length, 19 miles 71 chains.

Tarago to Bungendore—Single Line—Length, 19 miles 19 chains—Opened for public traffic, 4th March, 1885.

Murrumburrah to Young—Single Line—Length, 17 miles 57 chains—Opened for public traffic, 26th March, 1885.

THE maintenance of the permanent-way and works on these sections has been carefully attended to during the year, and the whole kept in good working order.

The renewals of both rails and sleepers on the portions, Sydney to Granville and Granville to Picton, have been heavy, and must continue so until the entire distance has been relaid.

From Picton to Goulburn the ballast has been renewed in considerable quantities, and from Goulburn to Albury the renewals have been chiefly confined to the sleepers, large numbers of which have been replaced by ironbark sleepers during the year.

Between Albury and the River Murray the permanent-way is in very fair order, and will be easier to maintain when the large heavy bank has been strengthened, which is now being done.

The timber bridges have been carefully maintained during the year, but at considerable expense, and are all in safe running order. In a few places, viz. :—At 22 miles 40 chains, 23 miles, and 24 miles 10 chains, and at Argyle-street, Moss Vale, the timber structures are being replaced by iron, and the work is being pushed on as rapidly as practicable.

The culverts and flood-openings have been kept in good condition.

Extensive repairs and renewals of fencing have been carried out on the whole of the Southern Line.

From Granville southerly the old fencing has been replaced where necessary by about 23 miles of barb-wire, and about 3 miles of buckthorn-wire fencing, erected under contract.

On the South-western and Jerilderie Lines the permanent-way has been maintained in good order, although in places long stretches of soft banks occur. The heavy banks near the Murrumbidgee, on the Jerilderie Line, have given most trouble.

The timber bridges and culverts have been well maintained, and a close watch has been kept for white ants. The charring remedy adopted appears to be effectual in checking the ravages of these insects.

Between Joppa Junction and Tarago the permanent-way is now in first rate order, but a large quantity of ballast was required to attain this result in consequence of the subsidence of the banks, which were made up originally during continuous dry weather.

From Tarago to Bungendore the permanent-way and works are in good order. The banks have not settled to the same extent as on the section Joppa Junction to Tarago.

The permanent-way between Demondrille Junction and Young is in good running order, but has given considerable trouble during the year. The banks have been troublesome to maintain, and will, I am of opinion, be found difficult to keep in good repair for some time yet.

The following works, exclusive of ordinary repairs, have been carried out during the year:—

Darling Harbour—

Stairs at overbridge refixed.
 Bridge lengthened in connection with new sidings.
 Signal to protect Glasson's siding erected.
 Appliance for unloading dump-cars erected.
 Old signal-box removed from Homebush and re-erected for office for cattle-yards.
 Ten-ton crane erected.
 Culvert lengthened in connection with additional siding accommodation.
 Patent weighing-machine attached to steam-crane.
 Guard rails fixed at old crossing.
 Hay-gauge erected.
 Gas laid on to semaphore signals.
 Buffer-stops and gates re-erected in connection with new offices.
 Buffer-stops fixed to dead-end siding.
 Cart-weighbridge erected.

ILLAWARRA

ILLAWARRA LINE.

Eveleigh to Hurstville—Double Line—Length, 9 miles 40 chains.

DURING the year this line and the several works thereon have been kept in good order and repair.

The embankments, where showing signs of settlement, have been made up, the line lifted and ballast renewed where required, and the permanent-way is now in good working order.

The following works have been carried out during the year:—

Erskineville—

New platform and waiting-shed erected.
Gas laid on to new signals.
Closet and urinal accommodation provided.
Water laid on to platforms.
Water laid on to porter's house.
Blackboards supplied and fixed.
Fence removed and refixed at porter's house.

St. Peter's.

Water laid on to urinal.
Water laid on to tanks.
Lamps fixed on steps.
Office fittings supplied.
Additional kerosene lamps fixed.
Gate-house fenced.

Marrickville—

Underground tanks lined at gate-house and station.
Box erected for gatekeeper at siding.
Office fittings supplied.
Additional kerosene lamps fixed.
Approaches to station rolled and blinded.
Urinals altered at station.
Wicket-gates erected up and down side.
Underground tank lined with brick at Marrickville road crossing.
Lamp erected at crossing.
Lamp erected at wicket-gate.

Tempe—

Office fittings supplied.
Lamps erected on up and down platforms.

Arncliffe—

Lamp fixed.
Office fittings supplied.
Steps erected up embankment to Station-master's residence.
New wicket-gate erected.

Rockdale—

Lamps erected on up and down sides and over steps at station.
Turntable fixed for Tramway Co.
Wicket-gate fixed at down side entrance.
Shed erected over pump.
Office fittings supplied.
Roadway fenced off.

Kogarah—

Office fittings supplied.
Wicket-gate erected.
Lamps erected on up and down platforms.

Hurstville—

Lamps fixed.
Office fittings supplied.
Picket fence and bye posts fixed around open drain.
Lamps erected on up and down platforms, and wicket-gate fixed with lamp over it.
Fence erected around Station-master's house.
Turnstiles fixed.

MISCELLANEOUS.

Notices erected at level crossings.
Stop-blocks fixed at stations and sidings.
Private crossing closed 5m. 40ch.
Spikes fixed on top of picket fence, Erskineville.
Gates refixed at 5m. 40ch.

The following sidings have been laid in during the year:—

Rockdale—

| | Length in feet. |
|--|-----------------|
| Junction of Saywell's Tramway with main down line | 509 |
| Through road to do | 158 |

Hurstville—

| | Length in feet |

| Compound cross-over road | 331 |
| Total... .. | 998 |

The following sleepers have been used in new sidings laid in during the year:—

| | |
|---|-----|
| Junction of Saywell's Tramway, Rockdale... .. | 221 |
|---|-----|

The following quantity of ballast has been used for maintenance of the line during the year:—

| | |
|-------------------------------|------------------|
| Eveleigh to Hurstville | 961 cubic yards. |
|-------------------------------|------------------|

GREAT

GREAT WESTERN RAILWAY.

Granville Junction to Parramatta—Double Line—Length, 1 mile 9 chains.

Parramatta to Byrock—Single Line—Length, 439 miles 26 chains.

Byrock to Bourke—Single Line—Length, 48 miles 40 chains. Opened for public traffic, 3rd September, 1885.

Wallerawang to Mudgee—Single Line—Length, 85 miles 18 chains.

Orange to Molong—Single Line—Length, 22 miles 50 chains. Opened for public traffic, 21st December, 1885.

The permanent way and various works on these extensions have been well maintained throughout the year.

From Granville to Springwood the work of renewing the sleepers and relaying with steel rails has been steadily continued where required, and on the Blue Mountains considerable numbers of sleepers have been replaced by new ones. At Dargan's Creek 3 miles 55 chains of line has been relaid with re-rolled iron rails.

The timber bridges and culverts between Granville Junction and Bathurst have been kept in safe running order.

The fences are not in a satisfactory state, and extensive renewals will have to be made during the ensuing year.

The permanent way, from Bathurst to Nevertire, is in good order, but between Bathurst and Orange, and Orange and Wellington, the renewals of rails and sleepers have been heavy, and it is anticipated that further expenditure in this direction will have to be incurred in 1886.

The timber bridges, and culverts, &c., have been well maintained, but the piles and braces of some between Dubbo and Nevertire have been attacked by the white ants. Measures have been taken to prevent damage by these insects.

The fencing between Bathurst and Orange badly requires renewing. A portion (13 miles) has been taken in hand.

The permanent way and other works on the section, Byrock to Bourke, are in very fair order.

On the Mudgee line the permanent-way is in good running order, but the cuttings between Capertee and Ilford require constant watching, the strata, through which some of them pass, being of a shaly nature, crumbling after exposure to the weather, and falling down with the vibration of the traffic. Other cuttings are through loamy and gravelly soils in which large stones are imbedded, and as the rains wash away the soil from around these stones they threaten to fall. An extra gang of twenty men was engaged during the greater part of the year in removing loose and dangerous rocks and debris, but as the work progressed the number of men was reduced.

The embankments at Brogan's Creek settled considerably after the rains which fell towards the end of the year.

The slip at Hunt's Cutting, near Mudgee, has been removed by the Construction Branch, and traffic resumed over that portion of the line.

The timber bridges, &c., are in good order, though in a few places the white ants made their appearance but were promptly checked.

From Orange to Molong the permanent-way, bridges, buildings, and other works are in good order.

The following works have been done during the year in addition to ordinary repairs, and renewals of a minor nature :—

Parramatta—

Roof of station renewed.
Gas laid on to up and down distant signals.
Drainage provided for abutments to four bridges.
Foot-bridge, Benevolent Asylum, erected.
Waiting-shed, Domain platform, re-erected.
Gas laid on to new interlocking signals.
10-ton crane erected.

New cart weighbridge erected.

Penrith—

Pipe lowered, locomotive water supply, Nepean River.
 Turnstiles erected at Heard's Crossing.
 Covering over pump connected with patent gas apparatus erected.
 Platform erected alongside the viaduct.
 Tank fixed in new lamp-room.
 Foundations of centre pier of tank under-pinned.
 Closets converted into dry-earth-closets at gate-house.
 Closets at station-master's house and engine-drivers' quarters converted into dry-earth-closets.
 Additions to refreshment-room provided.

Emu Plains—

Old station removed.
 Signals altered and new signals erected.
 Windows fixed and concrete floor laid.
 New goods-shed erected.
 Shed erected over copper at Station-master's house.
 Gutter altered, main roof of station.
 Tank and stand fixed at Station-master's house.
 Fencing and gates erected (new station).
 Weatherboard erected fence around Station-master's yard (new station).
 Galvanized iron fence on platform erected (new station).
 Fence at Sydney end of platform reset.
 Gate erected at Hudson Brothers' siding.
 Closets converted into dry-earth-closets.

Lucasville—

Box lined at bottom points.

Glenbrook—

Tank fixed at Station-master's residence.

Springwood—

Underground water-tank and cesspit constructed by contract.
 Excavation for new sidings carried out by contract.
 Seats provided in waiting-room.
 Two patent scotch blocks fixed.
 Fence erected on new platform.

Faulconbridge—

One patent stop block fixed.
 Platform lengthened and buildings renewed.

Linden—

Two patent scotch blocks fixed.
 New tank supplied to No. 8 gate-house.
 New concrete dam constructed for water supply.

Lawson—

Patent scotch blocks fixed.
 Additional ash-pit constructed.
 Floor of front room renewed, and picket fence erected in front of Emphon's house.

Wentworth Falls—

Patent stop-blocks fixed.
 Platform lengthened and widened.

Katoomba—

Signals erected at Gladstone Coal Co.'s siding.
 Patent scotch blocks fixed.
 Buffer stops and scotch blocks fixed.
 Two new home signals erected, up distant and present home signals removed.

Medlow—

Patent scotch blocks fixed.
 Guard rails laid at level crossing.

Blackheath—

Patent scotch blocks fixed.
 Level crossing removed and re-erected at different site.
 Goods-shed, 20' x 15', erected.
 Portion of bank at siding removed.

Mount Victoria—

Patent scotch blocks fixed.
 Pump and generator of gas-machine covered in.
 Alterations effected to telegraph and parcels office.
 New 50-foot turn-table laid in.
 Alterations and additions to passenger station in progress by contract.
 New underground tank constructed by contract.

Hartley Vale—

Signals erected for protection of New South Wales Shale and Oil Co.'s siding.
 Gate erected at New South Wales Shale and Oil Co.'s siding.
 Patent scotch blocks fixed.

Mount

Mount Wilson—

Patent scotch block fixed.
Small goods-shed erected, with shed for horses and vehicles.

Clarence Siding—

Patent scotch blocks fixed.

Zig-Zag Top Points—

Lamp and post erected.

Zig-Zag Bottom Points—

Lamp and post erected.
Foundation for water-crane constructed.

Esk Bank—

New residence for Station-master, erected by contract.
Paling and picket-fence erected around, and Venetian blinds fixed in, Station-master's residence.
Signal-box constructed for interlocking at Mort's siding and Vale of Clwydd siding.
Catch points put in at Mort's and Vale of Clwydd sidings.

Lithgow—

Signal-box for interlocking erected.

Bowenfels—

Level crossing at 98 miles 53 chains removed 110 feet further west.
Patent scotch blocks fixed.

Marrangaroo—

Foundations for pumping-engine constructed.
Coal platform and shoot erected.

Wallerawang—

Grant's patent filters fixed.
Two lamps and posts erected.
Door erected to urinals.
Bathroom constructed under loco. tank.
Interlocking signal-boxes erected.
Hay gauge erected.
New hydrant fixed for public water supply.
Water laid on from main to employés houses.
Eight lockers fixed in engine-shed.

Rydal—

Patent scotch blocks fixed.

Sodwalls—

Patent scotch blocks fixed.

Tarana—

Patent scotch blocks fixed.

Locksley—

Patent scotch blocks fixed.

Brewongle—

Patent scotch blocks fixed.
Additional bedroom erected to Station-master's residence.

Raglan—

Patent stop-block fixed.

Kelso—

Carriage-dock altered.
Stove fixed in Station-master's residence.

Bathurst—

Water-closets converted into dry-earth-closets.
Partition erected and window put in guard's room.
2 lamps and posts erected on platform.
Signal-box B raised 4 feet.
6 new lamps erected at station; old ones removed.
Alterations made in ladies' room.
Notice-boards for sub-way and platform fixed.
Alterations made in parcels office.
Approach to station improved.
Additions erected to foundry.
Gas laid on locomotive-sheds, &c.
Gas laid on to station.
Water laid on to ashpit at turntable-road.
New brick dock constructed.
Additional improvements effected to ladies' room.
50 feet ashpit constructed in carriage-shed.
Cesspit replaced by dry-earth-closets, &c., at guard's barracks.
Foundations for 3 water-cranes constructed.
Drainage of yard improved.
Alterations of roads in carriage-shed carried out.
Combined fire and locomotive tanks and bath approaching completion, partly done by contract.

Perth—

House erected for gatekeeper.
Up distant-signal erected.
Commissioner's land fenced in.

Wimbledon—

Gates removed and fence restored.
Yard pitched, &c.
Alterations, &c., effected to station buildings.

Neubridge—

Commissioner's land fenced in.
Gate put in fence to give access to church ground.
Two box-drains put in at 164 miles 6 chains.
Two box-drains for level crossing put in at 165 miles 25 chains.
Two box-drains for level crossing put in at 165 miles 35 chains.
Two box-drains for level crossing put in at 166 miles 2 chains.
Two box-drains for level crossing put in at 166 miles 35 chains.
One box-drain for level crossing put in at 167 miles 22 chains.
Two box-drains for level crossing put in at 168 miles 69 chains.
Wicket-gate and wall-lamp erected.
New brick culvert at 167 miles 12 chains.

Blayney—

New well sunk, 16 feet internal diameter, 40 feet deep.
Grant's patent filter fixed.

Blayney—

Blayney—

New loading-stage constructed.
 Portable fence and lamp erected at dock.
 Boiler and engine-house erected.
 Junction of Murrumburrah to Blayney line laid in.
 Station-master's residence nearly completed by contract.

Millthorpe—

Gates put in fence.
 Do at 179 miles $2\frac{1}{2}$ chains replaced by 15 feet gates.

Spring Hill—

New station erected and new underground tank constructed by contract.
 New stove fixed in Station-master's residence.

Huntley—

Two signals and gate erected to siding.

Orange—

Down distant and auxiliary signals removed 200 yards eastward.
 New up home-signal erected.
 House, 30 feet \times 16 feet \times 9 feet, erected over pumping machinery, and old house removed.
 Approaches to footbridge drained.
 Junction of Orange to Molong line laid in.

Kerr's Creek—

Drawer fitted in office.
 Additional 60 feet added to loading-stage.

Warne—

Wicket gate erected.
 15' gate and posts erected.

Store Creek—

Small office and temporary platform erected.

Ironbarks—

Stockyard of portable hurdles erected.

Mumbil—

Up and down distant and semaphore signals erected.
 Temporary platform erected.
 Temporary residence for porter in charge erected.
 Level crossing gates and fences erected.
 Temporary offices erected.

Springs—

New wicket gate erected.
 Road from platform to gates formed.

Wellington—

Grant's patent filter fixed.
 Alterations and additions to ladies room made.
 Timber overbridge erected at 248 miles 44 chains.
 Temporary additions made to refreshment-room.
 Shelving fixed in Examiner's house.
 New quarters for drivers erected by contract.
 Fittings provided in new quarters for drivers.
 Private crossing gates at 248 miles 44 chains removed.

Wellington—continued.

Alterations made in telegraph-office.
 Buffer stops erected.
 21 feet of new boxing laid.
 Two new home-signals erected.

Mary Vale—

New 18" drain 90 feet long constructed.
 Two box drains made for level crossing at 258 miles 75 chains.

Ponto—

Temporary platform constructed.
 Two signals erected.
 Station offices erected.

Murrumbidgee—

Hay gauge erected.

Dubbo Stock Yards—

Alterations made to flaps of sheep-yard.

Dubbo—

Buffer-stops erected.
 Shed 12' \times 12' erected for storing casks.
 Pile-bridge 20' \times 5' erected.
 Timber-flume erected.
 Fittings fixed in Traffic-foreman's and Station-master's offices.
 Alterations and additions to signals carried out.
 Improvements made to drain opposite Messrs. Thoms & Co.'s property.
 Alterations of roads effected for new water cranes.
 Three new home-signals erected.

Narromine—

Grant's patent filter fixed.
 New house for pumpers erected.

Trangie—

Wicket-gate put in fence opposite Campbell's Hotel.
 New concrete platform erected.
 Bath-room constructed under locomotive tank.
 Goods-shed 30' \times 20' erected.
 House removed from Rylstone and erected as residence for porter.
 New brick house erected for porter in charge.
 New house for pumper erected.
 Drainage of ponds carried into tank.

Nevertire—

Grant's patent filter fixed.
 Shower-bath constructed under tank.
 New house for pumper erected.

Mullengudgerly—

House removed from Rylstone and erected for porter-in-charge.
 Earth-closets and urinals erected.
 Residence of porter-in-charge fenced in.
 Notice boards erected.
 Side cuttings filled in.

Nyngan—

Grant's patent water-filter fixed.
 Reservoir piled.
 Verandah and fences erected to Government cottages.

Nyngan

Nyngan—continued.

Picket fence and wicket gates erected.
 Refreshment-rooms erected by contract.
 Temporary additions made to old refreshment-room.
 New house for pumper erected by contract.
 Permanent protective works to dam and bridge carried out.
 Stock-yards pitched with 9" stone—288 sup. yards.

Wilga—

Stove fixed in office.

Coolabah—

Timber platform erected.
 Station buildings erected.
 Two temporary offices removed from Byrock to Mann, Carey, & Co.'s siding, at 426 miles 30 chains.

Glenariff—

Office converted into waiting-room.

Piper's Flat—

Box office from Hunt's Cutting erected.

Ben Bullen—

Two patent stop-blocks fixed.

Capertee—

One patent stop-block fixed.

Carlo's Gap Coal Co.—

Two signals erected.

Ilford—

Two distant and one home signal erected.
 Stock-yards removed to Lue.
 Three patent stop-blocks fixed.

Rylestone—

Two 12-foot gates erected.
 Two patent stop-blocks fixed.
 Bank at Tong Bong (163 miles 60 chains) piled.

Lue—

Two distant and one home signal erected.
 Wicket-gate fixed.
 Gate at 174 miles 47 chains made to close across the line.

Bumberra—

Semaphore signal erected.

The following sidings have been laid in during the year :—

| | feet. | | feet. |
|--|-------|---|-------|
| <i>Parramatta—</i> | | <i>Blacktown—</i> | |
| New cross-over road to "down" line and goods siding | 81 | Main "up" line between 21 and 22 miles | 205 |
| New through roads to main lines | 352 | Through road to main line | 169 |

RICHMOND LINE.

Single Line—Length, 16 miles 11 chains.

The Permanent-way has been kept in good running order during the year; but between 25 $\frac{1}{4}$ and 37 $\frac{1}{4}$ miles the line will very shortly need relaying, the rails being too light for the traffic. Extensive renewals of sleepers throughout the line will also be necessary before long.

The bridges, culverts, and other works are in good condition.

The following works have been carried out during the year:—

Windsor—

Turnstiles erected.
Fence, gates, and partition erected.
Fence dividing Gas Co. from station renewed.
Residence erected for station-master by contract.

Richmond—

Windows lowered and new ones provided at engine-house.

MISCELLANEOUS.

Planks fixed outside the sleepers on bridge at 28 miles 55 chains.

Clarendon—

Platform for unloading horses renewed.

LIST

LIST OF MACHINERY IN PERMANENT-WAY WORKSHOPS ON 31ST DECEMBER, 1885.

AT REDFERN.

Carpenters' shop—

- 1 30-h.p. semi-portable engine.
- 1 dimension planer.
- 1 wood-turning lathe.
- 2 circular saw benches.
- 2 tenoning machines.
- 1 horizontal boring machine.
- 1 cross-cutting machine.
- 1 band-saw machine.
- 1 fret-saw machine.
- 1 variety worker.
- 2 mortising machines.
- 1 surface planing machine.

Fitting-shop—

- 2 12-inch lathes.
- 1 10½-inch lathe.
- 2 10-inch lathes.
- 1 6-inch lathe.
- 1 small hand power drilling machine.
- 6 vertical drilling machines.
- 1 radial drilling machine.
- 2 slotting machines.
- 5 planing machines.
- 2 screwing machines.
- 1 shaping machine.
- 1 stone-dressing machine.

Fitting-shop—

- 1 25-h.p. semi-portable engine.
- 1 planing machine.
- 1 slotting machine.
- 1 shaping machine.
- 1 vertical drilling machine.
- 1 screwing machine.
- 1 10" centre lathe.
- 1 6" centre lathe.
- 1 Sturtevant's blower.

Carpenters' shop—

- 1 combination dimension planing machine.
- 1 band-saw.
- 1 mortising machine.
- 1 universal wood-worker.
- 1 sash and door machine.
- 1 wood-turning lathe.
- 1 large circular saw bench and 4 feet saw.

Blacksmiths' shop—

- 1 punching machine and shears.
- 1 steam hammer.
- 1 oliver.

Fitting and Turners' shop—

- 1 30-h.p. double cylinder engine and boiler.
- 1 12 feet planing machine.
- 1 10-inch slotting machine.
- 1 12-inch shaping machine.
- 1 12-inch slide and screw-cutting lathe.
- 1 7-inch do do
- 1 screwing machine.
- 1 large drilling machine.
- 1 small do
- 1 No. 5 blast fan.
- 1 8-h.p. winding engine and boiler.
- 1 4-inch double acting Tangye's pump.

Smiths' shop—

- 1 12-h.p. portable engine.
- 1 16 fires fan.
- 1 20 fires fan.
- 2 punching and shearing machines.
- 2 steam hammers.
- 1 wood-turning lathe.
- 1 10-h.p. semi-portable engine.
- 1 plate-bending machine.

Plumbers' shop—

- 3 burring machines.
- 3 swedging machines.
- 2 folding machines.
- 1 punching machine.
- 1 guillotine machine.
- 1 set tinsmiths' rollers.
- 1 washer-punching machine.
- 1 pipe-punching machine.
- 1 pipe-screwing machine.
- 1 curving machine.
- 1 wiring machine.
- 1 thick edge machine.

Testing room—

- 1 100 tons Tangye's iron testing machine and pumps.
- 1 cement testing machine.

AT GOULBURN.

Carpenter's shop—continued.

- 1 small circular saw bench and saws.
- 1 saw gummer.
- 1 band-saw setting and filing machine.
- 1 planing machine knife grinder.

Smiths' shop—

- 1 14-h.p. semi-portable engine.
- 1 punching and shearing machine.
- 1 steam hammer.
- 1 screwing machine (hand power).
- 2 vertical drilling machines (hand power).

Tinsmiths' shop—

- 1 corrugated iron curving machine.
- 1 pair rollers.
- 1 folding machine.
- 2 burring machines.
- 2 wiring machines.
- 1 grooving machine.

AT BATHURST.

Plumbers' shop—

- 1 lead washer punching machine.
- 1 thick edge machine.
- 2 burring machines.
- 1 swedging machine.
- 1 folding machine.
- 1 setting down machine.
- 2 pairs rollers.

Carpenters' shop—

- 1 planing machine.
- 1 moulding and planing machine.
- 1 general joiners' machine.
- 1 band saw.
- 1 circular saw bench for 30" saw.
- 1 mortising machine.
- 1 tenoning machine.
- 1 turning lathe.
- 1 emery stone grinder.

ACCOUNT of Permanent-way Rails turned, renewed, and broken, from the opening of the various Extensions Great Southern, South-western, Western, and Richmond Lines, to 31st December, 1885.

Bullock Island Branch—Double Line—Length, 1 mile 43 chains.

Morpeth Branch—Single Line—Length, 4 miles.

North-western Branch, Werris Creek to Narrabri—Single Line—Length, 96 miles 45 chains.

The permanent way throughout these sections has been kept in very good running order.

From Murrurundi to Tamworth the road, which, on account of the softness of the formation, has given considerable trouble during the last few years, has been much improved, and is now in good order. The rails on this section are wearing out very rapidly.

The timber bridges and culverts, &c., throughout the line have been well maintained during the year. The wooden structure over Throsby's Creek, near Waratah, has been removed, and an iron bridge on brick piers substituted.

All the buildings and other works are in a very satisfactory condition.

The following works have been carried out during the year :—

Newcastle—

Residence erected for Traffic Manager by contract.

Gas laid on and Venetian blinds supplied to Traffic Manager's residence.

Underground tank, and tank for bath and pantry, &c., erected at Traffic Manager's residence.

Fence erected around Traffic Manager's residence.

Yard levelled at Traffic Manager's residence.

Residence for station-master, erected by contract.

Gas laid on, and Venetian blinds supplied to, Station-master's residence.

Underground tank constructed at do. do.

Erecting fence around do. do.

Yard levelled at do. do.

Glass roof erected over ticket office.

Shelving fixed in parcels' room.

Gas lamp erected at Market-street crossing.

Honeysuckle Point Workshops Yard—

Four box offices erected for Store Department.

Switches made for Burwood Coal Company.

Brick office erected for Store Department.

Honeysuckle

- Honeysuckle Point Station*—
 Parcels' room erected, "down" platform.
 Waiting-room erected, "up" platform.
 Up platform extended.
 Footway made from Hannell-street crossing to station.
- Bullock Island Junction*—
 Additional water supply for Locomotive Department, pumping engine-house, &c, erected.
 Two stop blocks erected.
 Office for overseer of coal traffic erected.
- Bullock Island Branch*—
 Twenty-ton weighbridge erected.
 Junction laid in for Maryville Coal Company.
 Gas laid on to berthing-master's residence and office.
- Hamilton*—
 Parcels' room, lamp-room, and urinals erected.
 Planked footway made across rails.
- Hexham Station*—
 Waiting-room erected, "up" platform.
 Closets and urinal erected do
- Tarro*—
 Two home and two distant signals erected.
 Two lamp posts erected on platforms.
 Two do do do
 Box for stores supplied.
- Woodford*—
 Box for stores supplied.
 Platforms extended, and level crossing removed and re-fixed.
- East Maitland*—
 20,000-gallon tank, &c., erected for locomotive water supply.
 Closets and urinals erected, "down" platform.
 King-street extended.
 Fixed seats substituted for chairs in ladies' room.
- Morpeth*—
 Flaps fixed on sheep stage.
- High-street*—
 Additional rooms erected to Station-master's residence.
- West Maitland*—
 Kitchen and servant's room erected to Station-master's residence.
 Fence erected at station.
- Farley*—
 General waiting-room converted into ladies' room.
 Platform extended 60 feet.
 Letter-box, &c., fixed.
- Allandale*—
 Ladies' waiting-room erected.
- Greta*—
 Loading wharf constructed.
 Underground tank constructed.
- Branxton*—
 Stock-yards improved.
- Rix's Creek*—
 Waiting-shed and platform erected.
- Glennie's Creek*—
 Closet and urinal erected.
 Residence for officer-in-charge erected by contract.
- Musclebrook*—
 Loading wharf constructed.
- Aberdeen*—
 Verandah to Station-master's residence erected.
 Platforms connected.
- Wingen*—
 Fire-place fixed in ladies' room.
 Parcels room erected.
 Stove fixed in Station-master's residence.
 Closet erected to ladies' room.
- Murrurundi*—
 20,000-gallon tank, &c., for locomotive water supply erected.
 Coal stage re-erected.
 Telegraph office converted into office for Station-master.
 Wicket gate erected.
 House for engine-men erected.
- Doughboy Hollow*—
 Residence for officer-in-charge erected by contract.
 Fence erected round officer's house.
- Willowtree*—
 Improvements to stock-yard.
- Quirindi*—
 Additions to office.
- Werris Creek*—
 Refreshment-rooms erected by contract.
 Venetian blinds supplied to refreshment-rooms.
 Fence erected at refreshment-room.
 Pump connected to kitchen, refreshment-room.
 Platform extended 100 feet.
- Currabubula*—
 Waiting-room erected.
- West Tamworth*—
 Corrugated fence erected at Traffic Inspector's residence.
 Locomotive water supply, erection of pumping engine house, &c.
- Tamworth*—
 Underground tank constructed at gate-house, White-street crossing.
 Underground tank constructed at Station-master's residence.
 Gas-lamp erected, Fitzroy-st., by Gas Co.
 Lamp-post erected, Denison-street.
 Marius-street extended.
- Tentin hull*—

Tentinhull—

Waiting-shed and platform erected.

201 miles 40 chains—

Siding laid in and platform erected for Mr. George Farquharson.

208 miles—

Signal-box and signals erected.

Signalman's residence erected.

Macdonald River—

Residence erected for officer-in-charge.

Platform and waiting-shed erected.

Signals erected.

Booking office erected.

Closet and urinals erected.

Walcha Road—

Fence erected.

Stockyards improved.

Armidale—

Loading stage erected.

Parcels room converted into refreshment-room.

Fence erected to protect trees.

Cooking stove fixed in Station-Masters residence.

Gas laid on to station.

Guyra—

Lamp-room provided.

10-ton dray weighbridge erected.

Additional room erected to station.

Stockyards improved.

Gates erected.

291 miles 40 chains—

Level crossing constructed.

Llangothlen—

Waiting-shed and platforms erected.

Glencoe—

Level crossing removed and re-erected.

Stonehenge—

Waiting-shed and platform erected.

Glen Innes—

House for enginemen erected.

House for guards erected.

10-ton dray weighbridge erected.

Wicket gate erected Lambeth-street.

Points and crossing laid in at Proudfoot's Siding.

Counter in Telegraph Office shifted.

Furnace constructed for hot water for feet warmers.

Window put in goods-shed office.

Desk made for head porter.

Platform extended to crane.

NORTH-WESTERN LINE.

Breeza—

Level crossing constructed.

Curlewis—

Kitchen and verandah erected and weatherboards substituted for corrugated iron at officer's house.

Closet and urinal erected.

Baan Baa—

Residence erected for officer in charge.

Closet and urinal erected.

Booking offices and goods-shed erected.

Narrabri—

Gates altered to close across line.

MISCELLANEOUS.

Thirteen 400-gallon tanks and stands supplied to gate-houses between Tamworth and Armidale.

Lamps fixed on stations between Armidale and Glen Innes.

Thirteen 400-gallon tanks supplied to gate-houses between Armidale and Glen Innes (263 miles 50 chains to 321 miles 10 chains.)

CULVERTS constructed during the year.

| Newcastle to Murrurundi, including Morpeth and Bullock Island Branches | 0·83 |
| Murrurundi to Tamworth | 1·07 |
| Tamworth to Glen Innes | 0·90 |
| Werris Creek to Narrabri | 0·90 |

GENERAL REMARKS.

RAILWAYS.

A VERY considerable amount of work of every description has been carried out during the year, as the accompanying returns will show.

The Permanent-way on all the lines is in good order.

Immense numbers of new sleepers have been put in in a great many places, and the renewals of rails have been heavy. The quantity of ballast used during the year has also been large.

There are still many sleepers in the road which must be replaced during the ensuing year.

Considerable improvements have been made in the traffic accommodation at Darling Harbour, the lines and wharf having been extended to near the Pyrmont bridge; but this place will soon be crowded, and it is high time that some other place should be fixed on for the export of coal. In a very short time the Illawarra and Northern Lines will be completed, and no definite scheme, so far as I am aware, has been decided upon to provide for the wharfage accommodation which must necessarily be required if we are to conduct a coal traffic of any magnitude.

The repairs to all the timber bridges on all the lines have been well kept up, except the approach to the Wagga bridge, which is in the same state as regards the supports as when the Royal Commission examined it; as are also the iron bridges. Several of the old timber bridges are now being renewed with iron and brick.

A great improvement is being carried out in the widening of the Redfern tunnel, which will be completed before the close of 1886.

The system of interlocking points and signals has progressed satisfactorily, twenty-three places having been completed during the year, making a total of fifty-one stations, &c., at present at work on the several lines.

The Locomotive Workshops at Eveleigh are progressing; four of them, 300' × 60' each, have been completed. The foundations of twenty-two buildings of a similar size have been completed, and contracts have been let for the roofing, columns, &c., some of which are on the ground.

I have, &c.,

GEORGE COWDERY,

Engineer for Existing Railways.

Metropolitan Lines.—During the year these lines have been maintained in good order and repair, combined with a minimum outlay for working expenses. It is always a difficult matter to maintain tram lines in good order without incurring heavy expenses, but, considering all circumstances, I think it will be found that the expense of maintaining the permanent way and works per mile has been less this year than what it used to be; at least the greatest vigilance has been exercised in supervision to ensure this result.

In my Report of last year I expressed my opinion about the defective construction of the permanent way of our Tramways. I still adhere to that, and no time should be lost in remedying the state of affairs, more especially as regards the lines within the city boundaries. The cost of maintaining the line from Macquarie-street for instance is out of proportion altogether.

It has been decided to relay a portion of this line with 70-lb. rails as an experiment, but I do not think this will be a success, because the shape of railway rails is not adapted to tramway rolling stock, more especially on curves. What is required is a deep girder rail, which will bring the sleepers well below the surface of the street, and something of this kind will have to be done in order to reduce the working expenses.

The maintenance of the lines, however, has been carried out as effectually as possible, and during the year only one or two accidents, attributable to the state of the permanent way, have occurred, a result which must be considered satisfactory.

It is worthy of notice that after a thorough overhaul in 1884 and the beginning of 1885, the wooden pavements in George-street West and Oxford-street have required but little repairs and attention.

During

During the year the wooden pavement in Newtown Road was completed, and it is gratifying to know that this work does not show the least sign of going or wanting repairs.

A new boiler shop has been erected at Randwick, which has been handed over to the Locomotive Department, and is now being fitted up for their use.

No other works of importance have been carried out during the year, and no new lines have been constructed.

Portions of the Botany and Leichhardt lines have been relaid with steel rails. These lines were originally laid with iron rails from the Eskbank Company, but as these are now fast wearing out the work of renewing with steel rails will be continued as occasion demands.

Campbelltown to Camden Tramway.—During the year this line has been maintained in good order and repair. Beyond the construction of a bridge where the Sydney water supply crosses the tramway and Camden Road at Kenny Hill, and which is now approaching completion, no works of importance have been carried out during the year.

North Shore Tramway-Cable Line.—The work of constructing a cable tramway from Milson's Point to the Reserve at North Shore, with all equipments and appendages, was let to Mr. H. G. Carson Woods during the year. The works are in an advanced stage, and to all appearances the line will be finished and ready for traffic about the end of April next. The work is being carried out in strict accordance with the specification.

A survey for a line from Forest Lodge to Gladesville, *via* Balmain and the Parramatta River Bridges, is nearly completed, and will shortly be submitted. Owing to the steep gradients through Balmain an auxiliary cable and dummies will have to be provided for a part of it, *viz.*, between Johnston's Bay and the Five Dock Bridge, in order to haul the trams up Gordon and Weston Streets.

Returns showing in detail works carried out during the year, permanent-way relaid, &c., are appended.

I have, &c.,

GEORGE COWDERY,

Engineer for Tramways.

Redfern to Macquarie-street—

Pits on Nos. 4 and 5 roads, Pitt-street yard, lengthened.
Fencing replaced, Pitt-street yard.
Elizabeth-street and Liverpool-street junction relaid.
Closets, Bridge-street yard, connected with sewer.
Roof of running-shed, Pitt-street yard, lined and renewed and ironwork painted.
Floor renewed and additional joist fixed, platform, Bridge-street.
Stop-blocks fixed, Bridge-street yard.
Platform replaced and guard-rails fixed on fence. Pitt-street yard.
Drain constructed from closets and urinals direct to sewer at workshops, Pitt-street yard.
Box erected for pointsman, Elizabeth-street.
Lamp fixed in waiting-room, Hunter and Elizabeth Streets.
Fringe fixed on verandah of waiting-room, Hunter and Elizabeth Streets.
400-gallon tank renewed.

Randwick to Coogee—

Waiting-shed lifted, asphaltting renewed, and kerb and gutter fixed, Randwick.
Drain diverted from engine-sheds, Randwick.
Platforms extended and gates and steps altered opposite racecourse, Randwick.
Gas laid on to waiting-shed, Coogee Bay.
Brick pit built in connection with water supply, Randwick.
Coal-stage altered, Randwick.
Two cesspits constructed with about 4 chains of 4-inch drain-pipes to take the water from urinals, Randwick.
Drain-pipes extended and gully-shaft constructed, Cowper-street, Randwick.
House erected for engine and dynamo for electric light, Randwick.
Floor of electric light engine-room, Randwick, asphalted.
Waiting-room erected at Coogee by contract.
New smith and boiler shops erected by contract at Randwick.

Darlinghurst to Waverley and Woollahra—

Stop-blocks fixed at siding, Waverley tanks.
Stand-pipes fixed at water-tanks, Darlinghurst.

Parramatta-

Paramatta-street to Newtown and Marrickville—

New closet and urinal erected and fenced, motor-shed, Newtown Bridge.

Glass replaced and battens fixed, Tram-motor shed, Newtown.

278 square yards asphalt blocks laid by contract.

Wooden pavement laid, Newtown-road, by contract.

Leichhardt Line—

Tanks erected for motor water supply, Leichhardt.

Stones substituted for gratings at junction of Norton-street and Parramatta Road, Leichhardt.

Leichhardt Line—continued—

Lamp erected at tanks, Norton-street, Leichhardt.

Waiting-shed erected, Johnson-street, Leichhardt.

Redfern to Botany—

Fence and gates erected at waiting-shed, Waterloo.

Campbelltown to Camden—

Chock blocks fixed at sidings, Camden.

Miscellaneous—

Inside of small running salt water tank painted with asphaltum paint by contract.

No. 2.

The Locomotive Engineer to The Commissioner for Railways.

Department of Public Works, Railway Branch,

Sir,

Locomotive Engineer's Office, Sydney, 21 May, 1886.

I have the honor to submit my Report upon the working of the Locomotive and Carriage and Wagon Branches during the year ending 31st December, 1885.

Eveleigh.

As the question of suitable shop accommodation and machinery has such a very important bearing on the economical and efficient working of the Branch, I will briefly refer to that at present afforded; also that approved and in progress. The want of space to erect any further machinery in our old shops at Sydney has further demonstrated the necessity for the Eveleigh shops being pushed on as speedily as possible.

The running shed at Eveleigh, which will accommodate 126 engines, has been completed and in use. It is now used, both as a running shed and a temporary repairing shop. The relief afforded by this shed has been incalculable. The buildings for smithy, boilermakers' shop, and foundry having been roofed, they are being fitted with the necessary steam cranes, machinery and tools, &c., as rapidly as possible, so that we confidently hope to occupy them at an early date. The works connected with the repairing shops have not advanced as rapidly as I expected, but I am glad to see that more rapid progress has been made lately.

I regret to say that only the foundations of the carriage and wagon shops have been completed; however we will receive much benefit when the traversers, which are in hand, are complete, as we shall then be enabled to make use of the roads in these shops, and thus facilitate the removal of trucks to and from traffic, which have been repaired, or may require repairs. I am pleased to say that the accommodation afforded by the shed put up for the carriage trimmers has been a great boon.

Shop accommodation—other Depôts.

I will now briefly refer to the shop accommodation at Newcastle and other Depôts.

At Newcastle the accommodation is totally inadequate, and the entire place wants re-arranging. The new boiler-shop, when completed, will afford partial relief, but until a proper running shed is provided I do not see how the work can be economically performed.

More extended shop and yard accommodation is much required at Singleton.

The alterations to the Bathurst shops now in hand will be a great convenience in the working of that depôt.

The new shed at Wellington is well advanced towards completion. It is in every respect a suitable building for the purpose.

The new running shed at Goulburn has been completed, but has not yet been brought into use owing to the traversers not working satisfactorily.

Great Southern and Western Lines.

The locomotive engines and tenders have been maintained in efficient working order, and notwithstanding that we had not sufficient to properly work the traffic with a due regard to obtaining the best results, we were enabled, through using a portion of the new running shed as a repairing shop, to pull up some of the arrears of work from previous years. This clearly demonstrates that when we have the increased accommodation and appliances that will be available when the works at Eveleigh are complete, we shall be in a healthy state.

At the end of the year 1884 we had twenty-one engines laid up for general repairs, whereas we have now only thirteen, being a reduction of eight in the year.

There were forty-five new locomotives added to our stock during the year, of which twenty-five were built in England and twenty in America, so that we now have 315 engines on the Southern and Western Lines, inclusive of the two Camden Line engines.

The

The number of new engines appears large for one year's supply, but it must be borne in mind that a considerable number of additional miles (114) of lines have been opened, and the engine mileage has increased 343,378 miles over the year 1884, which is equal to about 7,630 miles per engine of the additional forty-five engines, although we had only the use of them for about four months in the year.

I desire to mention that searching investigations in England clearly show that it is not true economy to overwork locomotive engines, that in fact it can only be done by increased consumption of stores per mile; consequently I felt it my duty to recommend that further additions be made to our hauling power on this ground more particularly to meet requirements of further extensions to be opened at an early date; therefore 12 passenger engines have been ordered from the Vulcan Foundry Company of England, their tender being the lowest. Tenders were invited in the Colonies and in America and England for these engines. Besides the foregoing we have ordered 6 tank engines from Mr. Vale, of the Auburn Works near Parramatta.

The following brief statement will admit of some idea being formed as to the nature and quantity of the work done to locomotive engines during the year, exclusive of ordinary light repairs:—

131 engines received a thorough overhaul.

4 entirely new boilers were put in.

8 boilers were extensively repaired.

28 boilers had the tubes removed and thoroughly repaired and renewed.

4 engines had new cylinders.

9 engines had new crank axles.

1 engine had a new set of driving wheels and axle.

There were 205 entirely new tires put on engine and tender wheels.

32 engines and tenders were thoroughly painted.

3 engines had the Westinghouse brake fitted to them.

We fitted 66 engines with my approved spark arrester, in the smoke-boxes, and 14 engines have had an arrangement fitted to the ash-pans to prevent as far as possible any burning matter from falling out when the engines are in motion.

In addition to the foregoing, which of course were all charged to working expenses, the 20 new American and 4 English engines were erected at our shops.

Having made reference in my Report for the year 1884 to the fact that some of the new engines then under order were being fitted with the "Joy's Valve Gear," I am pleased to say that the engines so fitted have given general satisfaction.

Our passenger and goods stock has been maintained in very good order, and notwithstanding the want of shop accommodation and machinery, a very large amount of stock has been repaired and renewed in a satisfactory manner; but as usual in such cases the cost has been high, and until we get into our new shops we cannot hope for much improvement in this respect.

We have had sixty new passenger vehicles added to our stock, which number is not equal to the demand, consequent on increased traffic by opening of new extensions, &c.

There were 829 new vehicles added to our goods stock, so that we were for the first time able to meet the wants of the freight branch.

Of the passenger stock, 366 vehicles received a thorough repair, and 297 had a general overhaul and extensive repairs. In addition to 571 tires having been turned up, sixty-three entirely new tires were issued and fitted on wheels. Also ninety-two new axles and 319 new brasses were fitted as renewals. Extensive painting work was performed, ninety-five passenger vehicles having been thoroughly painted inside and outside. There were seventy-nine carriages retrimmed, 122 had new carpets and floor-cloths in addition to which 755 new cushions and 140 new curtains were supplied and fitted.

Besides the above, 150 improved "Turton" buffers were fitted to stock as occasion admitted of it.

The following will, I submit, afford ample proof that our goods stock has, as far as practicable, received proper attention in regard to repairs and renewals:—

Over

Over 3,000 vehicles had a general overhaul, and nearly 1,300 were thoroughly repaired and painted. In addition to 978 tires having been turned up in the laths, seventy-nine new wheels and 415 new tires, besides 1,755 new brasses, were supplied and fitted, the entire cost of which was charged to working expenses.

As reference has been made on more than one occasion to our working expenses not having been debited with the cost of the proper repairs and renewals of our stock, I would take the liberty of stating so far from such being the case we are continually making improvements in our stock irrespective of repairs and renewals, and thereby adding to their value as an asset of the Department, and the entire cost has been charged to working expenses.

As bearing on this I would mention that when renewing wheels, axles, and draw-gear, we give a much improved article, which enables a much heavier load being carried in the vehicles, thus adding to our train-mile earnings, and the entire cost is charged to working expenses. Then again, the improvements to our sheep and cattle trucks, recommended by the Board appointed to inquire into our live stock traffic, have been similarly charged. In fact the cost of every improvement introduced in our existing stock is borne by working expenses.

Great Northern Railway.

All the locomotive engines and tenders have been kept in good running order and condition.

Four passenger and five goods engines have been added to the stock during the year, the total number now being seventy-seven. Of this number there are, however, three, viz.,—Nos. 5, 8, and 17, totally unsuited for our present traffic, as they are of too light a type to pull the loads now prevailing, so they have been replaced (at the cost of working expenses) by more powerful engines, specially adapted to the work to be performed.

The engine mileage has increased 24,329 miles over the year 1884. The new passenger engines did not commence to run until late in October, and the goods engines late in August. The mileage run to the end of the year by these new engines was 79,521 miles, equal to about 2,600 miles per engine per month.

The following statement will show that the repairs and renewals to engines were both extensive and very important :—

Thirty-eight engines received an entire overhaul, and three were very extensively repaired.

One new boiler and two new cylinders were made and fitted complete. Three crank axles and seventy-six tires, and one pair of wheels, were replaced by new ones.

Thirty-five engines had improved spark arresters fitted to them.

The Westinghouse Automatic Brake having been adopted for the Northern as well as the Southern and Western lines two engines were fitted with it during this year, and the remainder will be done as early as practicable.

The passenger and goods stock have been maintained in efficient running order although there have been many difficulties to contend with, in the way of adequate shop accommodation and machinery not being available, and which have been particularly referred to before.

During the year twenty new passenger and 201 new goods vehicles have been added to our rolling stock. Of the existing stock twenty-one passenger vehicles received a thorough repair, and thirty-seven got a general overhaul. In addition to 122 tires having been turned up, fifty-eight entirely new tires and 100 new brasses were used in renewals.

The painting work done was considerable, as fifty-five vehicles were thoroughly painted, besides which thirteen were retrimmed, and sixteen had new carpets, &c., laid in them. There were 126 new cushions supplied to carriages also, and improved draw-gear was made and fitted to forty-nine vehicles.

The following repairs and renewals were effected to the goods stock :—

20 vehicles were entirely renewed.

58 vehicles were thoroughly repaired and painted.

67 vehicles had a general overhaul.

In addition to 264 tires having been turned up, there were 28 new tires and 226 new brasses fitted to existing stock.

20 trucks had improved draw-gear fitted to them, and 79 had improvements made to them of an important character.

Water

Water Supplies.

The continuance of dry weather has been a source of much anxiety and expense through several of our supplies for locomotives having failed. In several districts we have been compelled to run water trains at considerable cost. The following will afford some idea of the work done in connection with our locomotive water supplies during the year :—

Richmond.—A new boiler was supplied.

Liverpool.—A new 6-h.p. engine with boiler complete, and a pair of 6-inch deep well pumps were supplied to replace the old machinery, &c., which was unsuitable.

Lithgow Zigzag.—A new pillar crane was erected.

Picton Lakes.—A new pillar with connecting pipes.

Marangeroo.—A 14-h.p. Tangye horizontal engine, with 6-inch geared pump.

Granville.—Twenty-thousand gallon tank supplied; a Tangye pump, 8" × 4" repaired and removed to Narrandera, and 8" × 6" pump removed from Narrandera to Granville.

Blayney.—A Tangye steam pump, 9" × 6" with 8-h.p. boiler and connecting pipes, supplied.

Goulburn.—Two water cranes, with hydrants and connecting pipes, supplied.

Wentworth Falls.—A Tangye steam pump, 8" × 6", and line of new pipes, supplied.

Bathurst.—Three pillar cranes supplied.

Eveleigh.—Pipes laid from tank to new workshops, Nos. 1 to 4.

Orange.—Supplied with a 8-h.p. engine and boiler, and a pair of 6-inch deep well pumps to replace old ones worn out.

Jerilderie.—Supplied with a Tangye steam pump, 8" × 4", and new 4-inch pipes.

Wellington.—Pipes laid from tank to new running shed, and ash-pits.

Menangle.—Engine boiler and pumps thoroughly repaired.

Dubbo.—Pumping engine removed.

Narrandera.—Removing and repairing Tangye pump, 8" × 4", to Granville; replaced by a Tangye pump, 8" × 6", from Granville.

Bullock Island Junction.—A 14" × 12" Tangye geared pump and boiler has been fixed in place of No. 1 pump, removed to Tamworth.

East Maitland.—This is an additional watering station intended to relieve West Maitland, and provide a more reliable supply for engines on the Morpeth Branch than could be obtained at Morpeth. No. 12 pump has been removed from Murrurundi and fixed at this station, and a new 20,000-gallon tank and pillar crane have also been erected.

Tamworth.—This supply has been improved, and pumping appliances augmented by the transfer of No. 1 pump from Bullock Island Junction.

The necessary improvements required to be made to the supply at West Maitland have been approved of, and when these are completed the water supplies on the Northern Lines will be ample for all requirements as far as can be seen at present.

Gas-works.

As this is the first year we have had control of fitting up the necessary apparatus for lighting our passenger vehicles by gas, as also the making of the gas used in the same, I desire to state that the taking of this matter entirely into our own hands upon completion of the Castner contract has been a great advantage to the Department, both in respect to the cost, which shows a considerable saving on prices paid to the contractor, and the quality of the fittings in the carriages, as also the quality of the gas supplied.

Redfern Gas-works.—The entire plant is in good order and condition. During the year 12,000,000 cubic feet of gas have been made, of which 4,000,000 have been supplied to carriages, and 8,000,000 to station premises, including locomotive, permanent-way shops, and traffic yards. Fifty-six vehicles have been fitted with gas apparatus, which made a total of 480 vehicles fitted on the Southern and Western Lines. In addition to the foregoing, seventy-four steel cylinders, sixty-seven regulators, one compressing cylinder, and 526 stops and cocks were made at the Redfern Gas-works. Exclusive of renewals to plant, &c., 1,200 lin. feet of piping intended for a high pressure main have been laid in the Sydney yard in an improved form. Thirteen first-class carriages have been fitted with improved lamps, which give a much better light. One 5-h.p. engine has been added to the plant.

Newcastle

Newcastle Gas-works.—The plant is in good order and condition. There were 650,000 cubic feet of gas made and supplied to vehicles, there being 146 now fitted with gas apparatus. One compressing gas cylinder has been renewed, and two benches for retorts have been erected. The water at present in use is unsuitable for boilers. We shall be benefited when the municipal supply is available.

Bathurst Gas-works.—These works are in good order. The quantity of gas made was about 170,000 cubic feet per month. Provision has been made for supplying the station premises, shops, &c., which will show satisfactory results when compared with prices paid to the contractor. A main has been laid to afford the additional lights required. One bench for two retorts has been erected.

June Gas-works.—The plant is in good working order. The quantity of gas supplied amounts to about 175,000 cubic feet per month. A new high-pressure main has been laid, with proper stops, cocks, &c., to supply carriages. One bench of two retorts has been erected. The boiler has been thoroughly overhauled and repaired, and a new high-pressure cylinder has been supplied for the compressing pump.

The following tabulated statements will readily show the particulars of the daily supply of gas to the several descriptions of trains:—

1st. The average daily supply of compressed gas to railway carriages.

2nd. The particulars of vehicles fitted with gas apparatus, showing the number of lights and cylinder capacity in each.

No. 1.

AVERAGE daily supply of Compressed Gas to Carriages.

| No. | Trains. | Carriages on each Train. | Total number of Carriages. | Number of lights. Total trains. | Number of hours lit up. | Quantity to each Carriage. | Total amount of Gas compressed. |
|-----|-------------------------------|--------------------------|----------------------------|---------------------------------|-------------------------|----------------------------|---------------------------------|
| 12 | Suburban | 6 | 72 | 212 | 6½ | cubic feet. 53 | cubic feet. 3,816 |
| 3 | Illawarra | 4 | 12 | 36 | 5½ | 53 | 686 |
| 2 | Mails, South and West | 6 | 12 | 60 | 6 | 95 | 1,140 |

| 10 | " Saloon | 3 | 15,300 | 9 | 114,444 |
| 3 | " Three compartment carriages | 2 | 9,202 | 4 | 66,837 |
| 16 | " Carriages | 3 | 11,590 | 6 | 89,624 |
| 3 | " Clemisons | 6 | 15,300 | 9 | 114,444 |
| 2 | " State carriages | 4 | 11,590 | (4) 6 | 358,496 |
| 13 | Composite Redfern types | 5 | 15,300 | 9 | 114,444 |
| 40 | " Carriages | 3 | 11,590 | 6 | 89,624 |
| 37 | " Cars | 2 | 9,202 | 4 | 66,837 |
| 9 | Second-class Redfern type | 6 | 23,107 | 12 | 172,835 |
| 86 | " Carriages | 3 | 11,590 | 6 | 89,624 |
| 37 | " Cars | 2 | 9,202 | 4 | 66,837 |
| 3 | " Cleminsons | 7 | 15,300 | 9 | 114,444 |
| 9 | Mail-vans | 3 | 11,590 | 6 | 89,624 |
| 36 | Brake-vans | 4 | 11,590 | 6 | 89,624 |
| 121 | Goods brake-vans | 4 | 5,641 | 3 | 42,194 |
| 480 | | | | | |

All first-class carriages and compartments, brakes and mail-vans, have No. 1 burners, consuming, when running, 1½ cubic feet per hour per burner.

All second-class and second-class compartments and goods brakes have No. 0 burners, consuming, when running, about 75 cubic feet per hour.

I am pleased to testify that the contractors for the supply of new rolling stock have given very general satisfaction, both as to the quality of the workmanship and material, and also the expedition displayed in the delivery of our orders.

I regret that I cannot report our usual immunity from accidents. The sad catastrophe at Cootamundra, in which seven lives were lost, gave us very unwelcome experience in this respect. It is however a subject for congratulation that the causes were entirely beyond the control of the Department. Considering all the circumstances the damage sustained by the engines and rolling stock was inconsiderable.

Herewith I forward a complete list of returns furnished in connection with your Annual Report, as shown below :—

1. Abstract of rolling stock on hand, 31st December, 1885, and the number and description of vehicles supplied in 1885.
2. Rolling stock on hand 31st December, 1885.
3. Statement of the number and class of rolling stock manufactured by the different contractors during the year 1885.
4. Weights of locomotive engines and tenders, empty and loaded, on 31st December, 1885.
5. Weights of locomotive engines and tenders and mileage run by each engine.
6. Abstract of total and average weights of rolling stock, empty.
7. Statement of the number and classification of persons employed in Locomotive Branch.
8. List and condition of locomotive engines and tenders on 31st December, 1885.
9. List of machinery on all lines, 31st December, 1885, and list of machinery added to stock during the year 1885.
10. List of machinery in workshops 31st December, 1885.

I have, &c.,
W. SCOTT,
Locomotive Engineer.

No. 3.

The Superintendent of Tramway Rolling Stock to The Commissioner for Railways.

Sir,

Tramway Motor Branch, Randwick, 7 April, 1886.

I have the honor to report as follows on the maintenance and general condition of the rolling stock, machinery, &c., under my supervision during the year ending December 31st, 1885:—

On January 1st, 1885, sixty-nine engines (independent), six engines (combined), ninety-four cars (double-decked), fourteen cars (single-decked), sixteen service trucks, and two watering tanks were in stock.

An addition has been made to the stock of engines by the arrival of twenty from the Baldwin Locomotive Works, Philadelphia, of the independent type. Five of these commenced running in April, five in May, and the remaining ten in August.

The number of engines maintained in steam for all purposes daily, during the year, has been fifty, and ninety-two cars have been in use daily to meet traffic requirements.

The wear and tear of the engines continued to be very heavy during the year, and although our facilities for performing the work are still limited, yet the engines and cars have been kept in as good working order as possible under the circumstances, and at a slightly less cost than in previous years.

Without entering too much into details, the following statement will show what work has been performed during the year at Randwick and Pitt-street shops.

At Randwick, eight engines were fitted with new boilers; sixty engines received a complete overhaul; fifty-seven received extensive repairs, being in the shops for about one month each; forty-four received extensive repairs, being in the shops for about three weeks each; seventy-one received extensive repairs, being in the shops for about two weeks each; and seventy-nine received repairs, occupying different periods under one week each, making a total of 431 engines repaired.

At Pitt-street shop, thirteen engines received a complete overhaul; eleven engines received repairs, occupying from two to ten days; 1,126 engines received repairs, occupying under one day, making a total of 1,137 engines repaired.

In the above general overhaul is included the fittings of forty-four new steel axles, 160 new steel tires, and retubing of six boilers.

504 steel car wheels have been bored in the machine departments, fitted to axles, and issued to the carriage department.

The above work has been done in addition to the repairs effected by the night staff.

The mileage of engines under steam during the year was as follows:—Seven ran from 25 to 30,000 miles; twenty-four from 20 to 25,000 miles; nineteen from 15 to 20,000 miles; twenty-two from 10 to 15,000 miles; and twenty-three under 10,000 miles. This mileage, done with 2ft. 6in. and 2ft. 11in. wheels will, I think, be found to compare favourably (apart from any consideration of road) with the mileage of engines doing railway service, the latter being done with 3ft. 9in. to 6ft. wheels.

In the carriage department the following work has been executed at Randwick, independent of trifling repairs effected at Bridge-street yard. Cars thoroughly overhauled, eighteen; cars stopped for repairs, occupying under one day, six hundred and fifty-seven; cars stopped for repairs, occupying under two days, three hundred and fifteen; cars stopped for repairs, occupying under three days, sixty-three; cars stopped for repairs, occupying under four days, twenty-four; cars stopped for repairs, occupying under five days, seventeen; cars stopped for repairs, occupying under six days, fifteen; cars stopped for repairs, occupying over one week, thirty.

In this report I would again urge upon the Commissioner the advantage of a terminal cleaning shed as advocated in my last, and for the reasons as therein given. The erection of the machinery in the carriage department is still deferred, pending a final decision on this matter, as, if approved, a rearrangement of the shops will be necessary.

The new boiler and smith-shop has been partially occupied for some time by the spring smiths and when the contracts let are completed, which will be about June next, the whole will be fully occupied by the two branches.

The

The whole of the machinery in the turning and temporary boiler-shops, together with the boiler and engine for driving same, have been kept, and are now, in efficient working order.

During the past year experiment was made of lighting a portion of the running shed at Randwick by electricity ; it was done at the expense of the Australasian Electric Light Power and Storage Association. The result was considered satisfactory, and a contract was given to the Association referred to to fit up the whole of the shed ; this has been carried out, and the nightly repairs are now effected by the aid of the electric light instead of gas.

The plant of this work consists of 20-h.p. semi-portable compound engine, by Messrs. Marshall, Sons, & Co. (Limited), one brush dynamo for the arc, and one Victorian brush dynamo for the incandescent lights. There are five arc lights fixed at different parts of the yard, twelve groups of four incandescent lights fixed in the shed, fifty-four incandescent lights to jointed brackets for fitters benches, and ninety-four incandescent lights (portable) for use in engine-pits.

Attached are the usual detail returns of engines, cars, and other rolling stock and machinery in workshops, &c.

I have, &c.,
GEO. DOWNE,
Superintendent, Tramway Rolling Stock.

The claims outstanding on the 31st December, 1884, were 695 to which 188 were added during 1885, making a total of 883 claims, of these 334 were settled in 1885, leaving at the close of the year 549 in various stages of adjustment, a large number of which have been settled during the present year

No. 6.

RETURN OF PERMANENT-WAY MATERIAL, RAILS FOR RENEWALS, AND MISCELLANEOUS ARTICLES IMPORTED DURING THE YEAR ENDING 31st DECEMBER, 1885.

Table with columns: Date of Invoice, Name of Ship, Rails (No, Tonnage), Fishplates (No, Tonnage), Bolts and Nuts (No, Tonnage), Spikes (No, Tonnage), Screws (No, Tonnage), Name of Contractor, Rate per ton, Invoice Cost, Freight, English Charges, Colonial Charges, Total Cost, Cost per ton, Date of Arrival. The table includes detailed entries for various materials and contractors from 1884 to 1885.

Indent for Permanent-way Materials required for 647 mles of Railway Extensions, including Sidings Indent dated 9th October, 1882.

| Granville to Bourke | 490 | 4,991,762 | 10,187 |
| Wallerawang to Mudgee | 85 | 945,924 | 11,129 |
| Blacktown to Richmond | 16 | 169,696 | 10,606 |
| Goulburn to Bungendore | 40 | 440,000 | 11,000 |
| Orange to Molong | 22 | 191,620 | 8,710 |
| Murrumburrah to Young | 18 | 209,988 | 11,666 |
| Sydney to Sutherland | 15 | 225,000 | 15,000 |
| Newcastle to Glen Innes | 323 | 3,826,526 | 11,847 |
| Werris Creek to Nairabri | 97 | 552,990 | 5,701 |
| Bullock Island Branch | 1 $\frac{1}{2}$ | 58,610 | 39,073† |
| Morpeth Branch | 4 | 57,602 | 14,401 |
| Average cost of construction | 1,732 $\frac{1}{2}$ | 18,421,188 | 10,633 |
| Pitt-street Tramway | | £ 4,878 | |
| Rolling Stock | | 2,853,210 | |
| Machinery | | 140,958 | |
| Workshops—Redfern and Eveleigh | | 413,576 | |
| Furniture | | 5,568 | |
| | | 3,418,190 | |
| Average cost per mile, including all charges | 1,732 $\frac{1}{2}$ | 21,839,378 | 12,606 |

In rolling stock the cost of the Carriages and Waggon used on the Camden Line is included, as the vehicles were those originally provided for Railway service. Total value of stock so used, £3,223

* Between Sydney and Granville, including the Darling Harbour Branch, there are 47 $\frac{1}{2}$ miles of sidings, the cost of which is included in the amounts shown

† On the Bullock Island Branch there are 6 $\frac{1}{2}$ miles of sidings, the cost of which is included

No. 12.

TABLE showing the number of MILES OPENED per annum, and the annual and average daily MILEAGE of TRAINS, from the commencement, on 26th September, 1855, to 31st December, 1885.

| Year. | Opened per annum. | Total opened | Total Train Mileage | Average Daily Mileage. |

Live Stock Rates and Conditions—1 February, 1884.

SMALL CONSIGNMENTS.

| ¼ Truck, i.e., 4 Cows or Oxen, or 10 Calves, 1 Deck of Sheep, or 30 Pigs. | ½ Truck, i.e., 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs. | Single Cow or Ox. | Sheep or Pigs, when less than ¼ Truck. | Calves, when less than ¼ Truck. |
|---|--|-------------------------|--|---------------------------------|
| 6d. per mile..... | 4d. per mile..... | 3d. per mile | ½d. each per mile..... | 1d. each per mile. |
| Minimum, 10s..... | Minimum, 7s. 6d. | Min., 7s. 6d. each..... | Min., 1s. 6d. each..... | Minimum, 2s. each. |

When the number of animals or the space occupied exceeds the limit for ¼ or ½ truck, each one in excess will be charged at the mileage rates enumerated above for single animals until the ½ or full truck rate, as the case may be, is reached.

In ascertaining what portion of a truck is to be charged for, i.e., ¼, ½, or full truck, regard will be had to the space actually occupied more than to the number of animals; but in no case must the number of animals stated above be exceeded.

Mixed stock will be carried together in the same truck, provided the whole consignment belongs to one person, and the Commissioner is relieved of all responsibility. When mixed stock cannot be loaded together, each kind will be charged for separately, with the following exception:—On Thursdays single animals conveyed to Sydney in the same trucks, although belonging to different owners, will be charged at a proportion of ¼, ½, or full truck rate, plus 25 per cent.; for example, should there be two cows, each owner will be charged half of the ¼ truck rate, plus 25 per cent., and should there be three animals, the owners will be charged the ½ truck rate equally between them, plus 25 per cent. It is absolutely necessary that each animal be legibly addressed.

When the charge per head for live stock exceeds that for ¼ truck, or when the charge for a part truck exceeds that for a full one, only the lesser amount will be collected.

BULLS.

The charge for bulls is 7d. each per mile up to 100 miles, and 4d. for every additional mile, plus the charge for 100 miles; if more than one in a truck, 4d. each per mile; for ½ truck and upwards, cattle rates. Minimum, 12s. 6d.

VALUABLE RAMS AND EWES.

If less than ½ a truck load, will be charged 2d. each per mile; for ½ a truck and upwards, sheep rates. Minimum, 5s.

HORSES.

See full truck rates. No less charge than for a full truck load will be made for any number.

When live stock is returned from Sydney or Homebush to country stations, in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the above rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

No. 53—continued.

Live Stock Rates and Conditions—1 February, 1884—continued.

Herts, Flocks, &c., when in consignments of not less than one full Truck load.

GREAT SOUTHERN, WESTERN, AND RICHMOND LINES.

| Musclebrook | 2 13 4 | 2 1 4 | 2 0 0 | 1 18 8 | 1 16 0 |

Other distances to be charged—For the first 80 miles, 8d. per truck per mile; from 80 to 100 miles, 6d. per truck per mile; for every mile exceeding 100 and not exceeding 150, 4½d. per truck per mile; for every mile exceeding 150 and not exceeding 200, 4d. per truck per mile; for every mile over 200, 3½d. per truck per mile. For single-decked truck only two-thirds of these rates will be charged. Minimum charge, 15s. per truck.

GREAT SOUTHERN, WESTERN, AND RICHMOND, AND NORTHERN LINES.

HORSES.

The Commissioner will carry horses in cattle trucks if requested to do so, but only under special contract, relieving him of all responsibility. The charge for horses so carried will be the same as for cattle in full truck loads.

PIGS—Same as cattle. Minimum, 15s.

(When a double decked waggon is occupied, 50 per cent. will be added.)

Under the foregoing Herd and Flock Rates for Cattle, Sheep, Horses, and Pigs, no less charge than for one full truck will be made for each and every truck used.

1st October, 1885.

SMALL CONSIGNMENTS.

| ¼ truck, i.e., 4 Cows or Oxen, or 10 Calves, or 1 Deck of Sheep, or 30 Pigs. | ½ Truck, i.e., 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs. | Single Cow or Ox. | Sheep or Pigs, when less than ¼ Truck. | Calves, when less than ¼ Truck. |
|--|--|------------------------|--|---------------------------------|
| 6d. per mile | 4d. per mile | 3d. per mile | ½d. each per mile..... | 1d. each per mile. |
| Minimum, 10s. | Minimum, 7s. 6d. | Min., 7s. 6d. each ... | Min., 1s. 6d. each ... | Minimum, 2s. each. |

When the number of animals or the space occupied exceeds the limit for ¼ or ½ truck, each one in excess will be charged at the mileage rates enumerated above for single animals until the ¼ or full truck rate, as the case may be, is reached.

In ascertaining what portion of a truck is to be charged for—i.e., ¼, ½, or full truck—regard will be had to the space actually occupied more than to the number of animals; but in no case must the number of animals stated above be exceeded.

Mixed stock will be carried together in the same truck, provided the whole consignment belongs to one person, and the Commissioner is relieved of all responsibility. When mixed stock cannot be loaded together, each kind will be charged for separately with the following exception:—On Thursdays single animals conveyed to Sydney in the same trucks, although belonging to different owners, will be charged at a proportion of ¼, ½, or full truck rate, plus 25 per cent.; for example, should there be two cows, each owner will be charged half of the ¼ truck rate, plus 25 per cent., and should there be three animals, the owners will be charged the ½ truck rate equally between them, plus 25 per cent. It is absolutely necessary that each animal be legibly addressed.

When the charge per head for live stock exceeds that for a quarter truck, or when the charge for a part truck on market days exceeds that for a full one, only the lesser amount will be collected.

BULLS.

The charge for bulls is 7d. each per mile up to 100 miles and 4d. for every additional mile, plus the charge for 100 miles; if more than one in a truck, 4d. each per mile; for half a truck and upwards, cattle rates. Minimum, 12s. 6d.

VALUABLE RAMS AND EWES.

If less than half a truck load, will be charged 2d. each per mile; for half a truck and upwards, sheep rates. Minimum, 5s.

HORSES.

See full truck rates. No less charge than for a full truck load will be made for any number.

When live stock is returned from Sydney or Homebush to country stations in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the above rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

When live stock in waggons is conveyed by passenger train the charge will be as for a full horse-box for every truck.

When single-decked trucks are loaded with sheep, two-thirds of the above rates will be charged in all cases, but it is optional for senders to wait for sheep-vans. When, in order to complete a consignment, a half-waggon load is sent, the charge for such will be two-thirds of the above rates. For small consignments, see page 179.

For single-decked trucks, same rates to be charged as on page 180.

GREAT SOUTHERN, WESTERN, AND RICHMOND, AND NORTHERN LINES.

HORSES.

The Commissioner will carry horses in cattle trucks if requested to do so, but only under special contract, relieving him of all responsibility. The charge for horses so carried will be the same as for cattle in full truck loads.

For the rates for horse-boxes see Coaching Rate Pamphlet.

PIGS—same as cattle.

(When a double-decked waggon is occupied, 50 per cent. will be added.)

Minimum, 15s.

GENERAL CONDITIONS AND REGULATIONS.

The Commissioner will not receive live stock for conveyance on Sunday, Good Friday, Christmas Day, or any proclaimed holiday.

Live stock will be conveyed only from and to such stations as have accommodation for loading and unloading (see following page), and herds and flocks only at convenient times to be previously arranged with the Traffic Manager.

The number of animals must be so limited that the gross weight in any one truck shall not exceed 6 tons.

The Commissioner does not guarantee arrival at any particular time or for any particular market.

All orders for conveyance of live stock per stock or goods trains are to be made to the Traffic Manager on the printed form provided for that purpose. Those sent by telegram, letter, or through a station-master or other railway officer, will be subject to the same conditions as if made on the printed form.

Each order must be accompanied with a deposit of 20s. per truck ordered.

An order once lodged with the Department can only be withdrawn or the number of trucks reduced at any time (not being less than four clear days before the date of conveyance) by forfeiting the deposit of 20s. for each truck so withdrawn.

An order cannot be withdrawn or reduced or altered within four days of the date of conveyance.

All trucks ordered and not used on the date and at the station specified in the order will be charged for as if used.

Trucks must be loaded and ready for despatch at a time fixed by the Traffic Manager, which will be ascertained on application at the Traffic Manager's Office, or the station-master at the loading station, two clear days before the stock is to be loaded. If not loaded by the time specified, the Department reserves the right to remove the waggons, and charge full rates.

Sundays are not included in the number of days to be reckoned.

All live stock must be loaded and unloaded by the senders and consignees respectively, by whom also the truck doors must be secured and opened, fastenings attended to, &c.

All live stock must be unloaded within three hours after arrival, otherwise it will be unloaded by the Commissioner, and a charge made of 2s. per truck.

All live stock must be removed from the railway premises immediately after unloaded; or if left, will remain at the owner's risk and expense, and may be sent to agistment or livery, the cost of which shall be paid by the owner, and such cost must be paid on demand as part of the authorized charges; and such stock, if not removed within seven days, may be sold by auction, by order of the Commissioner, within the railway premises, and the proceeds applied in payment of all expenses incurred, and the balance thereof handed over to the owner on demand.

When a truck is only partly occupied by a consignment, the Commissioner will have the right to fill it up to its full carrying capacity with other stock.

One *bonâ fide* drover will be allowed to accompany each consignment of not less than three full trucks, travelling distances over 60 miles, to give the stock whatever attention may be necessary during transit. He will be furnished with a return free pass, available for three days for distances over 60 and under 200 miles, for four days for distances over 200 and under 350 miles, and for six days for distances over 350 miles, and must ride either in the guard's van or a 2nd class carriage. In cases where the stock is conveyed by more than one train, a pass will be issued for each train. The drover must travel by the same train as the stock, otherwise a pass will not be issued.

The following are the rates at which live stock can be insured :—

NEAT CATTLE (including Bulls.)

| | |
|------------------|--|
| 1 to 50 miles, | 2 per cent. on the declared value above £15. |
| 51 to 100 " | 3 " " " " |
| 101 to 150 " | 4 " " " " |
| 151 and upwards, | 5 |

No. 53—continued.

Live Stock Rates and Conditions—1st October, 1885—continued.

The same percentage charge to be made for Pigs and Sheep (including valuable Rams and Ewes) on the declared value above £2

Under no circumstances will the Commissioner be responsible for loss or injury to live stock, insured or uninsured, occurring during loading or unloading, whether such services be performed by either the servants of the Department or the owner. Nor will he under any circumstances be responsible for loss of or injury to any live stock during transit, arising from fear or restiveness, or through any of the animals being suffocated or trampled upon

Single bales over 4 cwt to be charged 15 per cent on above charges for every cwt or portion of cwt in excess of 4 cwt. When wool is consigned in quantities, and the average weight per bale is over 4 cwt, the charge will be for as many bales as there are 4 cwt. or portion of 4 cwt. in the total weight. Wool in bags and pockets charged actual weight at first-class rates. Wool in bales from places not enumerated to Sydney, Newcastle, or Morpeth, will be charged *pro rata*, 3d. per bale being added for every 10 or portion of 10 miles to the rate from the nearest station shown on the *up side* thus —

TURRAWAN TO NEWCASTLE.

| | |
|---|------------------|
| Rate from Boggabri.. | 9s 3d. per bale. |
| „ Turrawan to Boggabri (20 miles) | 6d. „ |
| Through rate | 9s 9d. „ |

But in no case will the charge be in excess of the rate from the station immediately beyond from which a rate is quoted

Wool in bales, carried to stations other than Newcastle, Morpeth, and Sydney, and places where there are wool-washing establishments, will be charged actual weight at first-class rates.

No. 53—continued.

Rates for Carriage of Wool—1st October, 1885—continued.

DUMPED WOOL.

An allowance of 15 per cent. will be made on above rates for bales properly dumped and hooped with iron, and for all bales not exceeding 250 lb. in weight.

No. 53—*continued.*Parcels Rates—*continued.*

See General Regulations relating to insured parcels.

Fresh meat, fish, poultry (dead), dairy produce, eggs, fruit, vegetables, and game, under 1 cwt., 25 per cent. reduction on parcel rates; minimum charge, 3d.

Bread, half parcels rates.

Musical instruments, packed in cases, 25 per cent. added to above rates.

Pictures in frames, packed or unpacked, double rates. Mirrors, double rates.

Furniture and sewing-machines, packed in cases, ordinary rates, but when unpacked double rates will be charged.

Bath chairs, perambulators, velocipedes, and bicycles, requiring a carriage truck for their conveyance, will be charged as for a two-wheeled carriage (see page). Bath chairs and perambulators (adults) carried in Break Vans will be charged double the rate for children's perambulators.

Corpses, 1s. per mile; minimum charge, 5s.

Newspaper parcels, one-quarter parcels rates; minimum charge, 3d.

Passengers' excess luggage, parcels rates.

Commercial travellers' excess luggage, parcels rates on down journey and free on up journey, on production of Railway receipts certifying that full trainage has been paid on down journey.

Gunpowder and other explosives will not be conveyed by Passenger Trains.

The maximum rates for the conveyance of parcels between Sydney and any Station on the Southern and South-western Lines are as follows:—

| 3 lb. and under. | Over 3 lb. to 7 lb. | Over 7 lb. to 14 lb. | Over 14 lb. to 28 lb. | Over 28 lb. to 56 lb. | Over 56 lb. to 84 lb. | Over 84 lb. to 112 lb. | Every additional 28 lb. or part thereof. |

Exchange of Parcels, &c., Traffic between New South Wales and Victorian Lines.

Parcels, excess luggage, and commercial travellers' samples are booked through between New South Wales and Victorian Stations at the undermentioned rates:—

For those parcels booked through between Sydney and Melbourne the rates are—

| | | | | | |
|------|-----|-----|---------------|-------|--------------|
| Over | 3 | but | Not exceeding | 3 lb | s. d. 2 0 |
| " | 7 | " | " | 7 " | 3 0 |
| " | 14 | " | " | 14 " | 4 6 |
| " | 28 | " | " | 28 " | 6 0 |
| " | 56 | " | " | 56 " | 10 0 |
| " | 84 | " | " | 84 " | 12 0 |
| " | 112 | " | " | 112 " | 14 6 |

and 2s. 6d. for every additional 28 lbs. or part thereof.

All other parcels, &c., from New South Wales Stations to Victorian Stations are booked to Wodonga, and those from Victorian to New South Wales Stations are booked to Albury at the rates named below.

Between Albury and Victorian Stations the ordinary Victorian rates are charged (189 miles from Melbourne), and, in addition, the following charges for the New South Wales Department are added:—

| | | | | | |
|------|-----|-----|---------------|-------|--------------|
| Over | 3 | but | Not exceeding | 3 lb | s. d. 0 3 |
| " | 7 | " | " | 7 " | 0 4 |
| " | 14 | " | " | 14 " | 0 6 |
| " | 28 | " | " | 28 " | 0 8 |
| " | 56 | " | " | 56 " | 0 10 |
| " | 84 | " | " | 84 " | 1 0 |
| " | 112 | " | " | 112 " | 1 2 |

and 3d. for every additional 28 lb. or part thereof, and for the purposes of charging parcels, &c., from New South Wales Stations to Wodonga, the latter station is regarded as 388 miles from Sydney, and the charges calculated accordingly, plus the rates named above.

Parcels between Albury and Wodonga are charged double the above rates.

Press parcels are charged one-fourth the above rates—minimum, New South Wales Line, 3d.

Packed parcels in hampers, crates, bags, cases, or other packages are charged quadruple the above rates, and the onus of proving that parcels are not packed rests with the consignors or consignees.

When two or more parcels are consigned to one person the above rates are charged on each parcel separately.

Bicycles, feathers, furniture, glass, hats, bonnet or hat boxes, cases of millinery, straw bonnets, mirrors (loose), musical instruments, perambulators, sulkies in pieces, pictures, sewing-machines, wicker-work, wire cages (loose), or other articles light or fragile, are considered admeasurement goods, and are charged 50 per cent. additional on the above rates. Parcels containing articles and property of a description not mentioned or specified in the following clause, such articles and property being over £10 in value, are, in addition to the amount chargeable by the foregoing scale of rates, charged a further sum equal to 1 per centum upon the declared value thereof.

Parcels

No. 53—*continued.***Parcels Rates.—*continued.***

Parcels containing any of the following articles are charged the following increased rates, viz. :—Over £10 and under £50 in value, double, and over £50 in value, quadruple, parcel rates, viz. :—Gold or silver coin of this realm, or of any part of Her Majesty's dominions, or of any foreign state, or any gold or silver in a manufactured or unmanufactured state, or any precious stones, jewellery, watches, clocks, or time-pieces of any description, trinkets, bills, notes of any banks in Her Majesty's dominions, or of any foreign bank, order, notes, or securities for payment of money, whether foreign or otherwise, stamps, maps, writings, title-deeds, paintings, engravings, pictures, gold or silver plate, or plated articles, glass, China, silk in a manufactured or unmanufactured state, and whether wrought up or not wrought up with other materials, furs or lace or any of them contained in any parcel or package.

The trainage on all parcels conveyed under bond must be prepaid.

Horses, carriages, and dogs from New South Wales to Victorian stations are booked to Wodonga at Albury rates, and from Victorian Stations to Albury at Wodonga rates, plus the following charges :—

| | s. | d. |
|---|----|----|
| One horse | 2 | 0 |
| Two horses | 3 | 0 |
| Three horses belonging to same owner | 4 | 0 |
| Carriages, gigs, dog-carts, and vehicles of a similar description | 4 | 0 |
| Dogs | 0 | 6 |

Corpses are booked in a similar manner, with 4s. added for conveyance between Albury and Wodonga.

Rates for conveyance of Library Exchanges.

Books forwarded for exchange to and from subscribers to recognized Circulating Libraries only will be carried at one-fourth parcels rates, under the following conditions, viz. :—

1. The sender's name must be legibly inscribed on each parcel.
2. Each parcel must be open at both ends.
3. Each parcel must be declared on the consignment-note to contain books only.

Gold Dust and Bullion, and Gold and Silver Coin.

The Commissioner for Railways will not be responsible for the safe conveyance of Gold Dust and Bullion, Bank-notes and Bills, Orders, Notes, and Securities for the payment of Money, and Gold and Silver Coin, or any of the other articles mentioned above, as the following charges are made, and the Gold Dust and Bullion and Coin carried, on condition of its being in charge of owners and at their risk.

| | Distance not over 55 miles. | Distance not over 100 miles. | Distance not over 150 miles. | Distance not over 200 miles. | Distance not over 250 miles. | Distance not over 350 miles. | Distance over 350 miles. |
|---|-----------------------------|------------------------------|------------------------------|------------------------------|------------------------------|------------------------------|--------------------------|
| | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. | s. d. |
| Gold Dust and Bullion, per 100 ozs..... | 2 0 | 3 6 | 4 3 | 5 0 | 5 6 | 6 0 | 6 6 |

Pigs.

Same rates per truck as cattle. Minimum, 15s.
Under the foregoing rates for cattle, sheep, horses, and pigs, no less charge than for one full truck will be made for each and every truck used.

SMALL CONSIGNMENTS.

| $\frac{3}{4}$ Truck, i.e., 4 Cows or Oxen, or 10 Calves, or 1 deck of Sheep, or 30 Pigs. | $\frac{1}{2}$ Truck, i.e., 2 Cows or Oxen, or 5 Calves, or 20 Sheep, or 15 Pigs. | Single Cow or Ox. | Sheep or Pigs, when less than $\frac{1}{2}$ Truck. | Calves when less than $\frac{1}{2}$ Truck. |
|---|---|------------------------|--|--|
| 6d. per mile | 4d. per mile | 3d. per mile. | $\frac{1}{2}$ d. each per mile. | 1d. each per mile. |
| Minimum, 10s..... | Minimum, 7s. 6d..... | Min., 7s. 6d. each. | Min., 1s. 6d. each. | Min., 2s. each. |

Bulls.

The charge for bulls is 7d. per mile up to 100 miles, over 100 miles 4d. per mile
Minimum, 12s. 6d.

Valuable Rams and Ewes.

If less than half a truck-load, will be charged 2d. each per mile; for half a truck and upwards, sheep rates. Minimum, 5s.

When live stock is returned from Sydney or Homebush to Country Stations in those neighbourhoods to which cattle trucks and sheep vans are being sent empty, half the foregoing rates will be charged, provided the owners wait the requirements of the Department, but not otherwise.

Rates for Fresh Meat in van loads.

To be loaded and unloaded by Owners.

In the case of beef, the van-load will be limited to 12 carcasses, but this number may be increased provided that a van-load shall not be held to consist of a greater total weight than 4 tons. Where a consignment of beef does not amount to 4 tons, senders will be allowed to make up the van-load with carcasses of mutton, pork, or veal. Any weight above 4 tons, whether the number of carcasses be more or less than 12, will be charged for at the rate of $\frac{1}{2}$ d. per cwt. per mile.

| Distance. | Beef, Pork, or Veal. | Mutton. | Distance. | Beef, Pork, or Veal. | Mutton. |

| 75 " " ... | 50 0 | 37 6 | Every mile over 150... | 0 6 | 0 5 |

Smaller quantities charged actual weight at 3rd class rates. Minimum charge for use of van, 10s.

Goods Trucks.

| | |
|-----------------|---------|
| 100 miles | £2 11 0 |
| 150 " | 3 3 6 |
| 200 " | 4 4 4 |
| 300 " | 6 6 0 |

In the event of the Department not being able to supply sheep trucks it does not undertake to provide goods trucks.

Every sheep or lamb, up to 3, carried any distance not exceeding 24 miles, by goods trains only

And for each mile beyond that distance.....

Over 3 and up to 10 sheep or lambs, half sheep truck rate; over 10 animals, full truck rate.

Minimum Charge:—Sheep truck, 40/-; goods truck, or half-truck, 20/-; exclusive of a terminal charge of 2/- per truck for sheep trucks, and 1/- per truck for goods trucks.

Store sheep in lots of not less than two truck loads, to be carried from Newmarket to country stations at $\frac{2}{3}$ published rates, and store cattle at $\frac{1}{3}$ published rates, full terminal, provided the trucks are required to load on the up-journey, again from the Line to which such store cattle and sheep are consigned.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RAILWAYS.

(REPORT OF SIR JOHN FOWLER ON SYSTEM OF LIGHT LINES.)

Ordered by the Legislative Assembly to be printed, 7 April, 1886.

[Laid upon the Table of the House in accordance with promise made by the Honorable the Secretary for Public Works in answer to Question No. 12 on Votes and Proceedings, No. 40, of the 6th April, 1886.]

Sir John Fowler to The Secretary for Public Works.

Sir,

Sydney, 23 March, 1886.

I beg to acknowledge the receipt of your request, conveyed to me through Mr. Rae, that I should furnish you with a report on the subject of light railways as feeders to the trunk lines, in the Colony of New South Wales.

It is fortunate, in some respects, for the Colony that the decision on this important question has not been required until after considerable experience has been obtained in solving a similar problem in other countries.

The question generally presents itself, as in the case of New South Wales, at a time when the more important trunk lines have been carried out.

The permanent way on trunk lines, in every country, will nearly always be found to be adequate for the employment of heavy and powerful goods or passenger engines.

The time however inevitably arrives when it becomes a question of the highest public importance to adopt a policy of light and cheap railway extension into thinly populated districts, to serve as branches and feeders to the trunk lines.

It may be that the traffic for such extension is so small as to be barely remunerative, and yet the circumstances are frequently such that the general interests of the country, and especially the indirect public advantages which are certain to follow, completely justify their adoption.

Probably in no country, in the world is this problem of light and cheap railway extension so important as in the Colonies of Australia, in consequence of its vast and valuable interior.

I have ventured on this short common-place introduction even with the risk of being supposed to be writing platitudes familiar to every public man, and I have done so for the reason that, although the principles may be perfectly simple, and of universal recognition, it has been found that it is possible to err greatly in the practical work of giving effect to them.

It may be taken for granted that nearly all proposed railway extensions as feeders to trunk lines are divisible, and it will be convenient to divide them into the three following categories, viz. :—

- 1st. When the line *must* always be worked in connection with and by the rolling stock of the trunk line adjacent.
- 2nd. When by their length and position the new lines can be treated as distinct systems, so far as regards the engines to be employed in working the traffic.
- 3rd. When the position of the new lines is such that it would obviously be a great economy and convenience at some future time to use the ordinary rolling stock of existing lines in working them.

With regard to the *first* category the decision will generally be easily made, as their length and local position will almost of necessity settle the question in the only one possible way, and as such lines will usually be short no further observations need be made with reference to them.

The *second* and *third* categories are of equal importance, and very careful consideration must be given to the condition of each case.

On the one hand the object of minimum expenditure would not be obtained by adopting the exact permanent-way of the trunk lines on the ground that you are thereby certain to be safe, and on the other hand it is necessary to avoid the reckless feeling which sometimes finds expression in the words, "Oh! we *must* have a very light, cheap railway, whatever happens afterwards as regards its cost of working or reconstruction."

As

As both these mistakes have been made within my knowledge—and they are very serious mistakes—I have ventured to mention them. I will assume, however, in your case that due and careful consideration has been given to the subject by yourself and your experienced and responsible engineers and traffic officers, and you have decided that certain extensions may be safely treated as distinct systems as regards the weight of engines to be employed.

I mention engines because I think the permanent-way should always be of such strength and character that wagons and carriages can pass everywhere without change.

The preliminary question having been settled, the line has to be surveyed, and the works and permanent-way determined upon.

Let me here take the liberty of advising that with your light railways more than usual pains should be taken by the responsible engineers to obtain the best gradients and curves with the least possible work. I call attention to this point because it was far too common until recently to treat light railways in a very light and careless manner, and to make the formation level below the flood line of valleys, and apparently forgetting that even light railways have to be maintained and worked, have actually laid sleepers without proper ballast or regular gradients. I need hardly say that the result has always been a great waste of money, and the permanent distortion of the rails. No doubt such a proceeding has never taken place without exceptional ignorance, and it is not likely to be often repeated; but as such things have happened it is well to be guarded against them. The line having been carefully surveyed, and the gradients fixed (which in your future extensions will generally be of a favorable character), the important decision of the permanent-way has to be arrived at.

The saving which might be effected by adopting a rail below 50 lbs. per yard in weight has not been found to be true economy under any circumstances.

With a 50-lb. well designed flat-bottomed rail you have sufficient strength, with about 2,000 sleepers per mile, to carry without injury or rapid wear a 24-ton locomotive on six wheels, and such a rail will have at the same time a sufficient amount of wearing material to last for many years before renewal.

The permanent road and these engines would be capable of carrying all profitable goods and passenger traffic on the line included in the *second* category in a very efficient and economical manner, and waggon and carriages of every description now used might be worked over them.

Local sleepers of every description, except from trees of an inferior kind, would of course be used, and of dimensions slightly less in section (but not in length) than those now in use.

The cost per mile of such a railway cannot be easily estimated without detailed plans and sections, and local information as regards sleepers, ballast, fencing, bridges, and culverts; but, assuming the line to be over nearly a level plain, which I believe many of the extensions will be, and the facility for procuring sleepers, ballast, &c., fairly favorable, I think you will be able to complete a railway of the light but efficient character I have indicated, for about £2,500 per mile, without land or the railway charges on existing lines for the conveyance of materials.

For railways under the third category, or where it is probable that at some future time it may be found desirable to use all the existing rolling stock, except specially heavy engines, I would advise a slight modification in the permanent way I have suggested for the second category.

I would here propose 60-lb. flat-bottomed rails, with sleepers of the same size as for the trunk lines (which I may observe are rather small, especially in length) and of the same number per mile. The additional cost of such a permanent way would be about £200 per mile over the 50-lb. permanent way, and if made suitable at any time for the ordinary engines, a further cost of about £200 per mile would be required for extra sleepers, &c.

When I say that with the additional sleepers the ordinary engines may safely run over the line (excepting as before mentioned, a few of the very heavy ones) of course I mean for the limited number of trains which might be expected on such lines, and not that a 60-lb. permanent way would be a proper one for trunk lines having numerous as well as heavy trains.

The permanent way I have indicated in both cases must be understood as the minimum. I would recommend, and I would venture to suggest for your very serious consideration, whether it might not be prudent, if the present very low price of rails continues, to adopt a 60-lb. rail for all your light lines. The additional cost would be small, whilst the advantage and convenience would be considerable.

I have, &c.,

JOHN FOWLER.

1885-6.

Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith, and so forth,—

To Our trusty and well-beloved—

GUSTAVUS ALPHONSE MORELL, Civil Engineer; W. C. KERNOT, Professor of Engineering, University of Melbourne; W. McD. COURTNEY, Civil Engineer, M.I.C.E., M.I.M.E.; W. H. WARREN, Civil Engineer; and OWEN BLACKET, Esquire.

Greeting:

Know ye that We, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do by these presents authorize and appoint you, or any three or more of you, as hereinafter mentioned, to make a diligent and full inquiry into the stability of certain Iron Bridges constructed on the Existing Lines of Railway, and also of the Timber approaches to the Bridge over the Murrumbidgee River, at Wagga Wagga, in Our Colony of New South Wales: And We do by these presents give and grant to you, or any three or more of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority under the Act 44 Victoria No. 1, to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient; and to visit and inspect the same at the offices or places where the same or any of them may be deposited, and to inquire of the premises by all lawful ways and means; also, to visit and inspect the Bridges to ascertain the character of the materials and workmanship therein: And Our further will and pleasure is that you, or any three or more of you, after due examination of the premises, do and shall, within the space of four months after the date of this Our Commission, or sooner if the same can reasonably be, certify to Us, in the Office of Our Secretary for Public Works, under your or any three or more of your hands and seals, what you shall find touching the premises: And We hereby command all Government Officers and all other persons whomsoever within this the Colony of New South Wales, that they be assistant to you and each of you in the execution of these presents: And We appoint you, the said GUSTAVUS ALPHONSE MORELL, to be President of this Our Commission.

In testimony whereof, We have caused these Our Letters to be made Patent, and the Great Seal of Our Colony to be hereunto affixed.

Witness the Right Honorable SIR AUGUSTUS WILLIAM FREDERICK SPENCER LOFTUS (commonly called LORD AUGUSTUS LOFTUS), Knight Grand Cross of the Most Honorable Order of the Bath, a Member of Her Majesty's Most Honorable Privy Council, Our Governor and Commander-in-Chief of Our Colony of New South Wales and its Dependencies, at Government House, in New South Wales aforesaid, this twenty-third day of April, in the year of Our Lord one thousand eight hundred and eighty-four, and in the forty-seventh year of Our Reign.

By SIR ALFRED STEPHEN, Lieutenant-Governor, acting by virtue of a Deputation under the Great Seal, from His Excellency the Governor, now absent from the Colony.

By His Excellency's Command,—

ALEXR. STUART.

Entered on Record by me, in REGISTER OF PATENTS, No. 12, pages 67-8, this twenty-fourth day of April, one thousand eight hundred and eighty-four.

(For the Colonial Secretary and Registrar of Records),

CRITCHETT WALKER,

Principal Under Secretary.

WHEREAS

WHEREAS it is necessary to extend the time by which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the said Commissioners are to make such report to and for the period of four months beyond the time in and by the said Commission appointed for such purpose.

Given under my hand at Government House, Sydney, this nineteenth day of August, one thousand eight hundred and eighty-four.

AUGUSTUS LOFTUS.

By His Excellency's Command,—

ALEXR. STUART.

Entered on Record by me, in REGISTER OF PATENTS, No. 12, pages 105-6, this twenty-ninth day of August, one thousand eight hundred and eighty-four.

(For the Colonial Secretary and Registrar of Records),

CRITCHETT WALKER,

Principal Under Secretary.

WHEREAS the time appointed for the return of the Commission in the above matter was by an Instrument dated the nineteenth day of August last extended for a period of four months: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council extend the time within which the Commissioners are to make their return to and for a further period of four months beyond the time in and by the aforesaid Instrument appointed for such purpose.

Given under my hand, at Government House, Sydney, this twenty-second day of December, one thousand eight hundred and eighty-four.

AUGUSTUS LOFTUS.

By His Excellency's Command,—

WILLIAM BEDE DALLEY.

Entered on Record by me, in REGISTER OF PATENTS, No. 12, page 186, this tenth day of January, one thousand eight hundred and eighty-five.

(For the Colonial Secretary and Registrar of Records),

CRITCHETT WALKER,

Principal Under Secretary.

WHEREAS the time appointed for the return of the Commission in the above matter was, by an Instrument dated the twenty-second day of December last, extended for a period of four months: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the Commissioners are to make their return to and for a further period of two months beyond the time in and by the aforesaid Instrument appointed for such purpose.

Given under my hand, at Government House, Sydney, this twenty-second day of April, one thousand eight hundred and eighty-five.

AUGUSTUS LOFTUS.

By His Excellency's Command,—

WILLIAM BEDE DALLEY.

Entered on Record by me, this twenty-second day of April, 1885.

(For the Colonial Secretary and Registrar of Records),

CRITCHETT WALKER,

Principal Under Secretary.

WHEREAS the time appointed for the return of the Commission in the above matter was, by an instrument dated twenty-second April last, extended for a period of two months: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the Commissioners are to make their return to and for a further period of two months beyond the time in and by the aforesaid instrument appointed for such purpose.

Given under my hand, at Government House, Sydney, this twentieth day of June, one thousand eight hundred and eighty-five.

AUGUSTUS LOFTUS.

By His Excellency's Command,—

ALEXR. STUART.

Entered on record by me, in REGISTER OF PATENTS, No. 12, pages 199-200, this twenty-sixth day of June, one thousand eight hundred and eighty-five,—

(For the Colonial Secretary and Registrar of Records),

J. J. M. BEATTY,

For the Principal Under Secretary.

RAILWAY BRIDGES INQUIRY COMMISSION.

EXTRACTS FROM MINUTES OF PROCEEDINGS.

WEDNESDAY, 14 MAY, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

A letter was read from Professor Kernot, acknowledging the receipt of a copy of the Commission forwarded by the Secretary, and stating that he hoped to leave Melbourne on the 6th June, for the purpose of attending the meetings of the Commission.

The Commission authorizing the Inquiry was read by the President.

The Secretary was instructed to forward the usual form of notice to each member of the Commission before any meeting of the Commission was held.

The President explained the circumstances connected with the appointment of the Commission originally gazetted, and the reasons which had led to the cancellation of that Commission, and to the appointment of the present one.

Various documents explanatory of the subject submitted to the Commission for inquiry were laid upon the table by the President, and read.

Mr. Blacket moved,—“That the first matter to be inquired into by the Commission be the timber approaches to the Wagga Wagga Bridge.”

The motion was seconded by Mr. Courtney, and agreed to.

Professor Warren moved,—“That the Commission be supplied with the plans and specifications of the timber approaches to the Wagga Wagga Bridge.”

The motion was seconded by Mr. Blacket, and agreed to.

The Commission read and deliberated upon the papers before them relating to the approaches to the bridge at Wagga Wagga.

FRIDAY, 16 MAY, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President informed the members of the Commission that Mr. Charles Lyne had been appointed Secretary and shorthand-writer to the Commission.

Plans and specifications of the timber approaches to the Wagga Wagga Bridge were laid on the table.

The Commission resumed the consideration of the papers before them relating to the approaches to the Wagga Wagga Bridge, and carefully examined and conferred upon the plans.

Mr. Blacket moved,—“That in future, unless otherwise ordered, the Commission meet on Monday, Wednesday, and Friday in each week, at a quarter past 2 o'clock p.m.”

The motion was seconded by Mr. Courtney, and agreed to.

The Commission resolved to apply to the Colonial Treasurer, through the Minister for Works, for the sum of £500 to be placed to the credit of the Commission, for the purpose of meeting expenses connected with the inquiry.

MONDAY, 19 MAY, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission continued their consideration of the papers and plans relating to the approaches to the Wagga Wagga Bridge.

The Secretary was instructed to obtain a statement giving the length and weight of the heaviest trains passing over the Wagga Wagga viaduct, specifying the weight, length, and wheel-base of each locomotive, and load on each axle, and weight, length, and wheel-base of each carriage and truck when loaded.

WEDNESDAY,

WEDNESDAY, 21 MAY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered the subject of the approaches to the Wagga Wagga Bridge, and decided upon the formula to be used in calculating the strain upon the different parts of the span.

FRIDAY, 23 MAY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President, referring to the discussion at the last meeting of the Commission upon the design of the approaches to the Wagga Wagga Bridge, pointed out the necessity of the same data being taken by each member of the Commission for calculating the load which each span of the viaduct could carry with safety; and laid before the meeting a statement showing the data upon which the members of the Commission should work and compare their results.

The Secretary was instructed to have the document printed, for the use of members of the Commission.

A comparison of calculations with reference to the strain upon the approaches to the Wagga Wagga Bridge was made, and the Commission discussed the matter at length.

Sketches of plans for taking the deflection of the girders of the approaches to the bridge were submitted by Mr. Courtney and Mr. Blacket.

MONDAY, 26 MAY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President stated that in his recommendation for the calculation of strains on the Wagga Wagga Viaduct he had been guided by the experiments in Colonial timbers made at the Sydney Branch of the Royal Mint in 1861, and also by his own personal experience of many years in calculations for Colonial timber girders and bridges.

The members of the Commission submitted their calculations with reference to the timber approaches to the Wagga Wagga Bridge, compared the results, and, with the aid of the plans, carefully discussed the question of strains upon the approaches to the bridge.

It was decided that each member of the Commission should, by the next meeting, tabulate a statement showing the strains upon the top girder, the bottom girder taken in two ways, and the cross-girders.

WEDNESDAY, 28 MAY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The members of the Commission present submitted statements of calculations with reference to strains upon the Wagga Wagga Viaduct, in accordance with the arrangement at the last meeting.

A discussion took place upon the data submitted by the President, and it was resolved that the calculation should be revised according to the new data proposed, and compared at the next meeting.

The subject of visiting Wagga Wagga and testing the strength of the approaches to the bridge was considered, and it was decided that one member of the Commission should proceed to Wagga Wagga in advance of the others to make all the necessary arrangements for the testing.

FRIDAY, 30 MAY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission resolved that Professor Warren should proceed to Wagga Wagga to make the preliminary arrangements for the inspection and testing by the Commission of the approaches to the Wagga Wagga Bridge.

The

The question of employing a draftsman to prepare tracings of plans or other drawings required by the Commission was considered, and it was resolved that Mr. M. B. Halligan should be appointed draftsman to the Commission.

The analysis of strains and safe working load on the approaches to the Wagga Wagga Bridge was submitted by each member of the Commission present in accordance with the decision at the last meeting, and examined and compared; and it was resolved that the particulars should be tabulated, as a record of the calculations made.

MONDAY, 2 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The question of having the £500, applied for by the Commission to meet expenses, paid into a Bank, was brought before the meeting by the President, and it was resolved, on the motion of Mr. Blacket, seconded by Professor Warren,—“That the money be paid into the Bank to the credit of the President of the Commission, and that all cheques be signed by the President, and countersigned by the Secretary.”

A further comparison of calculations with reference to the strains upon the approaches to the Wagga Wagga Bridge was made, and the Commission agreed upon a tabulated form to be used in recording the calculations of each member.

The Commission deliberated upon the best method of testing the approaches to the Wagga Wagga Bridge, and upon the order of proceeding with reference to the visit to Wagga Wagga, and the examination of witnesses directly interested in the question of the strength of the approaches to the bridge.

WEDNESDAY, 4 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President laid upon the Table a copy of the form to be used in tabulating the calculation of the members of the Commission with reference to the Wagga Wagga Bridge.

The President brought before the Commission the subject of examining witnesses, and it was resolved, on the motion of Mr. Blacket,—“That John Whitton, Esq., Engineer-in-Chief for Railways, W. B. Wade, Esq., District Engineer, and J. W. Drewett, Esq., Assistant Engineer, should be summoned for examination on Friday, the 6th instant.

The Commission deliberated upon the plans of the approaches to the Wagga Wagga Bridge, in relation to the arrangements necessary for testing the strength of the structure.

FRIDAY, 6 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The President laid upon the Table a statement from the Locomotive Engineer of the Railway Department with reference to the weight and length of the heaviest trains passing over the Wagga Wagga viaduct, the weight, length, and wheel base of each locomotive, and load on each axle, and weight, length, and wheel base of each carriage and truck when loaded.

It was resolved that the document be printed.

Mr. John Whitton, Engineer-in-Chief for Railways, Mr. W. B. Wade, District Engineer, and Mr. J. W. Drewett, Assistant Engineer, were examined.

The Commission resolved that Mr. George Cowdery, Engineer for Existing Lines, and Mr. R. D. Stephens, District Engineer, should be summoned for examination on Monday, 9th instant.

MONDAY, 9 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A form of receipt, received from the Treasury Department, to be signed by the President of the Commission before the amount of £500 to meet expenses connected with the Commission could be paid into the Bank, and undertaking to furnish the Audit Office within six months from date with accounts of expenditure properly vouched and received, was signed and directed to be returned to the Colonial Treasurer.

On the motion of Mr. Blacket, seconded by Mr. Warren, it was decided that a plan of the appliances for measuring the deflection of the approaches of the Wagga Wagga Bridge should be prepared by the draughtsman of the Commission previous to the Commission visiting Wagga Wagga.

Mr. George Cowdery, Engineer for Existing Lines, was examined, and at his request, and there being no objection on the part of the Commission, Mr. Pigott, solicitor, was permitted to be present during the examination.

The Commission were informed that Mr. R. D. Stephens, District Engineer, was prevented by illness from attending for examination, and it was resolved that his examination should be postponed until Wednesday, the 11th instant.

WEDNESDAY, 11 JUNE, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|--|--|---|
| W. C. Kernot, Esq., Professor of Engineering, W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |
|--|--|---|

The minutes of the previous meeting were read and confirmed.

The President reported that he had received a communication from Mr. Cowdery informing him that Mr. R. D. Stephens, District Engineer, was still unable through illness to attend for examination.

On the motion of Mr. Blacket, seconded by Professor Warren, it was resolved that the Secretary should telegraph to Mr. R. D. Stephens, requesting him to inform the Commission if he would be able to attend for examination on Friday, and in the event of his being prevented by illness from attending, to forward a medical certificate to that effect.

Printed copies of the statement supplied by the Locomotive Engineer respecting the weight and length of the heaviest trains passing over the Wagga Wagga Viaduct were laid upon the Table by the President and distributed among the members of the Commission.

A letter to the Commission from Mr. Cowdery, with reference to the reports of the latest date before the Commission, on the approaches to the Wagga Wagga Bridge, and submitting for the consideration of the Commission remarks in relation to those reports, together with documents showing the period during which the approaches to the Wagga Wagga Bridge had been under the charge of Mr. Cowdery as Engineer for Existing Lines, and giving the weight of locomotives running on the New South Wales Southern and Eastern Railways, were laid upon the Table.

It was resolved that the document giving the weight of locomotives should be printed.

FRIDAY, 13 JUNE, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., President.

| | | |
|--|--|---|
| W. C. Kernot, Esq., Professor of Engineering, W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |
|--|--|---|

The minutes of the previous meeting were read and confirmed.

Printed copies of the statement giving the weight of locomotives and tenders in use on the Southern and Western Lines were laid upon the table and distributed amongst the members of the Commission.

A telegram and letter, accompanied by a medical certificate, representing the inability of Mr. R. D. Stephens to attend for examination at this meeting in consequence of illness, were laid before the Commission by the President.

The Commission resolved that Mr. R. D. Stephens, should be examined on some future day; that the visit of the Commission to Wagga Wagga be deferred until after his examination; and that until his evidence has been obtained the further consideration of the subject of the approaches to Wagga Wagga Bridge be postponed.

The Commission discussed the circumstances necessary to be considered in relation to the inquiry into the stability of the iron bridges, and on the motion of Professor Warren, seconded by Mr. Blacket, it was resolved,—“That the plans and specifications and all other information relating to the Menangle and Wollondilly Bridges be laid on the table for consideration.”

A diagram with reference to the statement giving the weight of locomotives and tenders in use on the Southern and Western Lines was received from Mr. G. Cowdery, and it was decided to have it photolithographed for the use of the Commission.

MONDAY, 16 JUNE, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|--|--|---|
| W. C. Kernot, Esq., Professor of Engineering, W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |
|--|--|---|

The minutes of the previous meeting were read and confirmed.

The Commission took into consideration the papers before them with reference to iron bridges.

A letter was received from the Engineer-in-Chief for Railways, forwarding, for the information of the Commission, six drawings, and the specification of the viaducts over Barber's Creek, Boxer's Creek, Wollondilly River, and Mulwaree Creek; also the specification of the Menangle Bridge—all on the Great Southern Railway, Picton to Goulburn section.

The drawings and specifications were examined and considered.

On the motion of Mr. Blacket, seconded by Professor Kernot, it was resolved, “That photographs be obtained of the railway bridges at Menangle, Wollondilly, Wagga Wagga (and approaches), Penrith, Solitary Creek, Bathurst, Wellington, Aberdeen, Peel River, Peel-street, and M'Donald River, and any other bridges, the photographs of which might be of use to the Commission.” On

On the motion of Mr. Blacket, seconded by Professor Warren, the Commission resolved that Mr. R. D. Stephens should be requested to inform the Secretary of his fitness to attend before the Commission for examination immediately his health was sufficiently improved to permit of his coming to Sydney.

WEDNESDAY, 18 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|---|---|
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

A letter was received from the Engineer-in-Chief for Railways forwarding the following drawings for the information of the Commission:—Menangle Viaduct, Great Southern Railway: No. 1, General elevation of bridge; No. 3, plan and elevation of iron bridge; No. 4, sections and elevation of masonry piers; Nos. 5, 6, and 7 ditto; No. 8, timber openings on south side of the river; no numbers. Construction of timber piers, ditto, showing double line of timber viaduct and timber openings on north side of river. Wagga Wagga Bridge, Great Southern Railway: No. 1, block diagram showing erecting marks on main girders; No. 2, general elevation; No. 3, erecting marks on pilasters; No. 4, elevation at centre of bridge; No. 7, details of cylinders, bolts, &c.; three tracings showing erecting marks and shipping numbers, and one printed specification.

The drawings were examined and considered.

A discussion took place upon the information contained in the papers before the Commission with reference to the iron bridges.

It was resolved that a visit should be paid by the members of the Commission on Friday, the 22nd instant, to the Railway Locomotive Works, Redfern, in order to meet Mr. Scott, Locomotive Engineer, for the purpose of making further inquiry connected with the information given on the diagram supplied by the Engineer for Existing Lines with reference to the weight of locomotives and tenders in use on the Southern and Western Lines.

FRIDAY, 20 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|---|---|
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

A letter was received from Mr. John Rae, Under Secretary for Public Works, informing the Commission that photographs of the various railway bridges, as required by the Commission, would be supplied as early as possible.

A letter was received from Mr. R. D. Stephens, informing the Commission that he would be able to attend for examination on Tuesday, 24th instant.

The Secretary was instructed to write to Mr. R. D. Stephens and request him to attend for examination on Wednesday, 25th instant, at a quarter past 2.

The Commission then proceeded to the Railway Locomotive Works at Redfern, where, in an interview with Mr. Scott, Locomotive Engineer, they obtained further information respecting locomotives and tenders running on the Southern and Western Lines; and afterwards examined the different kinds of engine used on those lines for goods and passenger traffic.

MONDAY, 23 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|---|---|
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

The Commission discussed the question of visiting and inspecting the bridges at Menangle and the Wollondilly River, and also the bridge at Wagga Wagga and its approaches.

On the motion of Mr. Blacket, seconded by Professor Kernot, it was resolved,—“That the Commission leave Sydney by the 9.8 a.m. train on Friday, 27th instant, to examine the bridge at Menangle.”

Mr. Blacket moved, and Professor Warren seconded,—“That Mr. Whitton and Mr. Cowdery be invited to accompany the Commission on their visit to the Menangle Bridge, and in the event of either not being able to attend, to send a representative officer, and to bring with them, or send with the officers representing them, any persons they might desire to have examined in reference to the bridge; and that Mr. Cowdery be requested to instruct Mr. Hilzinger to accompany the Commission.”

The motion was agreed to, and it was decided that the Commissioner for Railways should be asked to send with the Commission a workman with the necessary tools for testing and cutting out rivets.

On the motion of Professor Warren, seconded by Mr. Blacket, the Commission resolved,—“That plans and specifications of the bridges at Penrith, Solitary Creek, Bathurst, and Wellington be obtained for the use of the Commission.”

The Commission further resolved,—“That in order to ascertain the changes that have taken place in the iron bridges since their construction, Mr. Whitton be requested to supply the Commission with the

the following information respecting the bridges at Wagga Wagga, Menangle, and Wollondilly River in the South; Aberdeen, M'Donald River, Peel River, and Peel-street in the North; and Penrith, Solitary Creek (five bridges), Bathurst, and Wellington in the West:—

1. The date of completion.
2. The date of opening for traffic.
3. A description of main girders.
4. Number of spans and dimensions.
5. The camber given to the main girders (if any).
6. The name of the superintending officer in charge during erection.
7. The name of the contractors.
8. The test each bridge was subjected to, and how applied.
9. The deflection noted at the time of testing.

WEDNESDAY, 25 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|---|---|
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

Mr. R. D. Stephens, District Engineer, Railway Department, Goulburn, was examined.

FRIDAY, 27 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|---|---|
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The Commission met at the Railway Station, Redfern, at 9.8 a.m., and, accompanied by Mr. W. B. Wade, District Engineer, representing Mr. Whitton, Engineer-in-Chief for Railways, Mr. G. Cowdery, Engineer for Existing Lines, and Mr. F. M. Avern, District Engineer, stationed at Bathurst, left by train for Menangle, where they inspected the Menangle Bridge.

Inspector Rose and Inspector Hilzinger, of the Department of the Engineer for Existing Lines (the former being the inspector who first reported on the condition of the bridges, his report having been sent in immediately after Mr. Cowdery took charge of the Existing Lines Branch of the Railway Department), were present during the inspection, and were examined respecting the finding and removal of loose rivets from the bridge.

A copy of the first report upon the condition of the bridge from Inspector Rose to the Engineer for Existing Lines was handed to the President by Mr. Cowdery, who was requested to supply the Commission with the original report.

It was resolved that each member of the Commission should write an independent report, giving his opinion upon the examination of the riveting of the bridge, the reports to be compared and discussed when submitted.

It was also resolved that the plans or copies of plans of the Menangle Bridge as erected should be obtained from the Engineer-in-Chief for Railways, and that Professor Warren should visit the bridge on Saturday, 5th July, to see that the plans agreed with the bridge as erected.

MONDAY, 30 JUNE, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

| | |
|-------------------------------|---|
| W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering, |
| | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

The Commission discussed the circumstances connected with their visit to Menangle and their inspection of the Menangle Bridge.

A letter was read from Mr. William Scott, Locomotive Engineer, forwarding particulars of locomotive engine No. 207.

On the motion of Professor Warren, seconded by Mr. Blacket, it was resolved that the document be printed.

A letter was received from the Engineer-in-Chief for Railways, forwarding plans and specifications of the following bridges:—Penrith, Solitary Creek, Bathurst, and Wellington, as per detailed list attached.

It was resolved that the Engineer-in-Chief for Railways be requested to furnish the Commission with all the information recorded in his office relative to the design of the bridge at Menangle, and to the testing of the bridge at the time of opening it for traffic, mentioning the camber and deflection in the centre of the girders and at point of contra flexure.

The Secretary was instructed to ascertain from the Government Printer if his photographer could be sent to the Railway Yard, Redfern, for the purpose of photographing four engines, of different types, to be pointed out by Mr. Scott, Locomotive Engineer.

The Commission proceeded to examine the plans of the Wollondilly Bridge, and to discuss the circumstances connected with that bridge.

THURSDAY,

THURSDAY, 3 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

Attention was drawn to the great inconvenience to which members of the Commission were subject, by reason of the Board-room in which the Commission holds its meetings being occupied, at various times, by other persons, including the members and officials of the Water Conservation Commission, and it was resolved that the Colonial Secretary should be communicated with, and requested to have arrangements made by which the room should be used exclusively by the Commission.

The Commission discussed the plan on which the uniform system of recording the calculated strains, the actual sections, and the deflection in reference to each bridge under consideration should be shown by diagram, and fixed upon the system to be adopted.

MONDAY, 7 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

On the motion of Professor Warren, seconded by Mr. Courtney, it was resolved,—“That the members of the Commission should be provided with free railway passes, to enable them to inspect any one or more of the railway bridges on any day that may be deemed desirable, and in any locality,” and the Secretary was instructed to write to the Commissioner for Railways, requesting him to cause such passes to be issued.

The Commission decided to postpone the production of the reports to be submitted by the members of the Commission, on the subject of their visit of inspection to the Menangle Bridge, and the discussion upon them, until the next meeting.

The Commission proceeded to examine the plans of the Penrith Bridge, and discussed its design and construction.

Instructions were given to the draughtsman of the Commission with regard to the preparation of certain tracings necessary for each Commissioner in dealing with this bridge, and the Commission then adjourned.

FRIDAY, 11 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A statement was laid before the Commission that Mr. B. Barnes, who had built the Railway bridge at Dubbo, was anxious to be examined by the Commission with reference to that bridge and to bridge construction generally.

It was resolved that Mr. Barnes should be informed that the Commission would be glad to have his evidence, and that as he was about to leave Sydney he should be requested to inform the Commission of the date of his intended departure, so that a day for his examination before that time might be appointed.

On the motion of Professor Warren, seconded by Mr. Blacket, it was resolved,—“That the Engineer-in-Chief for Railways be requested to forward, for the information of the Commission, any reports or statements which he may have received at different times relative to the various iron railway bridges of the Colony, and which he may desire to have submitted for the consideration of the Commission.”

A letter was received from Mr. W. H. Quodling, Chief Clerk in the Department of the Engineer-in-Chief for Railways, forwarding further papers relating to the design, testing, &c., of the railway bridge at Menangle.

Further discussion took place upon the design and construction of the Penrith, Wollondilly, and Menangle Bridges.

A report was received from Professor Kernot upon the visit made by the Commission on 27th June, to the Menangle Bridge. The report was read.

Reports were also handed in and read by Mr. Courtney and Mr. Blacket.

It was arranged that the reports from the President and Mr. Warren should be produced and read at the next meeting of the Commission, and that the discussion upon the whole of the reports should then take place.

WEDNESDAY, 16 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was received from Mr. W. H. Quodling forwarding some reports and statements received at the office of the Engineer-in-Chief for Railways relative to various iron railway bridges of the Colony.

On the motion of Mr. Blacket the papers were received.

The reports of the President and Professor Warren upon the visit of inspection made by the Commission to the Menangle Bridge were handed in and read. The President explained the uniform system he proposed to be adopted by the Commission for recording the strains and sections of the lattice girder bridges under consideration according to design, and to show also on the diagrams the actual section and deflection at the same points.

MONDAY,

MONDAY, 21 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Benjamin Barnes, Railway Bridge Contractor, was examined.

The President brought under the notice of the Commission the statements made in the documents received at the last meeting from Mr. W. H. Quodling relative to various iron railway bridges of the Colony, and it was resolved that the following persons should be summoned to attend before the Commission for examination on Friday, 25th instant:—Joseph Dunn, Samuel Maddock, Charles Sherdon, Edwin Massey, and George Mills.

FRIDAY, 25 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, C.E., Esq., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. W. H. Quodling, forwarding, for the information of the Commission, a tabulated statement setting forth the particulars asked for in the minutes of the meeting of the Commission of the 23rd ultimo, respecting certain iron bridges on the Great Southern, Great Western, and Great Northern Railways.

It was resolved that the document should be printed.

Mr. Samuel Maddock, Inspector of Bridges, Mr. Edward Massey, boilermaker, and Mr. George Mills, boilermaker, were examined.

It was decided that the witnesses Edward Massey and George Mills should be paid the expense they had incurred by attending before the Commission for examination.

WEDNESDAY, 30 JULY, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Thomas Smithyman, boilermaker, and Mr. Joseph Dunn, boilermakers' holder-up, were examined.

MONDAY, 18 AUGUST, 1884.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E. (in the Chair).
 W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Professor Kernot stating that he would leave Melbourne for Sydney on the 22nd instant.

A letter was read from Mr. W. H. Quodling, enclosing reports from Mr. Robert T. Ewing with respect to rivets, also forwarded from the Menangle and Penrith Bridges.

It was resolved, on the motion of Professor Warren, seconded by Mr. Blacket,—“That this Commission, in view of the extensive nature of the inquiry it has been directed to undertake, and the impossibility of concluding its labours within the period for which the commission was originally issued, requests the Colonial Secretary to extend the time for a further period of four months.”

It was resolved, on the motion of Mr. Blacket, seconded by Professor Warren—“That curves of areas be plotted for the southern and western bridges in a manner similar to that carried out by Professor Warren and under that gentleman's supervision.”

The Commission examined the rivets sent by Mr. Quodling and agreed in the main with Mr. Ewing's report.

The Secretary was instructed to telegraph to Professor Kernot that the Commission were making arrangements to inspect the Wollondilly bridges, and to request Professor Kernot to meet them at Marulan on Saturday.

WEDNESDAY, 20 AUGUST, 1884.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E. (in the Chair).
 W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission considered the question of visiting and inspecting the Wollondilly bridges, and the Secretary was instructed to inform the Minister for Works that the Commission would visit the bridges on Saturday, Monday, and Tuesday, the 23rd, 25th, and 26th instant, and request that one of the heaviest engines in use on the Great Southern Railway be placed at the disposal of the Commission for testing purposes, and that all passing trains on the dates mentioned be directed to proceed over the bridges slowly.

The

15

The Secretary was also instructed to inform Mr. Whitton, Engineer-in-Chief for Railways, and Mr. Cowdery, Engineer for Existing Lines, that the Commission would visit the Wollondilly bridges on Saturday, Monday, and Tuesday.

Mr. M. B. Halligan, draughtsman to the Commission, was instructed to procure the necessary apparatus for testing the bridges.

It was decided that Mr. Courtney, accompanied by the draughtsman, should leave for Marulan on Thursday night, in order to have everything ready for testing the bridges on Saturday.

SATURDAY, 23 AUGUST, 1884.

MEMBERS PRESENT :—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The Commission met at Marulan for the purpose of inspecting the Wollondilly bridges, and spent Saturday, Monday, and Tuesday in testing and carefully examining the bridges at Barber's Creek, Carrick, Wollondilly, Boxer's Creek, and Mulwaree Creek.

During the inspection Mr. Cowdery and Mr. W. B. Wade were present with the Commission.

THURSDAY, 28 AUGUST, 1884.

MEMBERS PRESENT :—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering. |
| W. M'D. Courtney, Esq., C.E., | |

The minutes of the two previous meetings were read and confirmed.

Mr. Courtney and Professor Warren reported the results obtained by the inspection of the Wollondilly bridges on the 23rd, 25th, and 26th instant, and a long discussion took place upon the subject.

The Commission considered the question of making another visit of inspection to the bridge at Menangle, but decided to postpone any decision in the matter until the next meeting, when all the members of the Commission could be present.

FRIDAY, 29 AUGUST, 1884.

MEMBERS PRESENT :—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

A telegram was read from Professor Kernot informing the Secretary that as he was at Menangle preparing for experiments he would not be able to attend this meeting of the Commission.

Documents, forwarded to the Commission on 10th July, by Mr. W. H. Quodling, relating to the design, testing, &c., of the railway bridge at Menangle, being copy of Inspector Morgan's report dated 23rd May, 1863, extract from Mr. Whitton's note-book, dated 29th June, 1863, and copy of article published in the *Engineer* of 18th December, 1863, were read by the Secretary.

The Commission further considered the subject of making another visit to Menangle for the purpose of examining and testing the Menangle Bridge.

The Secretary was instructed to write to Mr. Whitton, asking whether as the drawings from which the Menangle Bridge had been erected had not been forwarded to the Commission, he could procure for the Commission as soon as possible the section of the girders, top and bottom boom, and the web, at the points marked upon an appended diagram; and stating that the drawings of the Wollondilly bridges forwarded to the Commission had been found to be incorrect.

MONDAY, 1 SEPTEMBER, 1884.

MEMBERS PRESENT :—

| | |
|---|---|
| G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering, |
| W. C. Kernot, Esq., Professor of Engineering, | Owen Blacket, Esq. |
| W. M'D. Courtney, Esq., C.E., | |

The minutes of the previous meeting were read and confirmed.

The subject of again visiting and testing the Menangle Bridge was further considered, more particularly with reference to the extent to which the bridge should be tested.

The Secretary was instructed to write to the Under Secretary for Public Works stating that it was the intention of the Commission to visit the bridge at Menangle on Friday, the 5th instant, and requesting that one Mogul engine and two express passenger engines be sent to Menangle for the use of the Commission on Friday morning.

WEDNESDAY, 3 SEPTEMBER, 1884.

| G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering, |
| W. C. Kernot, Esq., Professor of Engineering, | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

A letter was read from Messrs. Ibbotson Brothers & Co. to the Chairman and Members of the Commission on the subject of rail-fastenings on bridges and ordinary nuts and bolts on bridges.

The Secretary was instructed to acknowledge the receipt of the letter.

A

A letter was read from the Principal Under Secretary enclosing a document extending the time during which the Commission shall report the result of their enquiry to four months beyond the date originally fixed.

A letter was read from Mr. W. H. Quodling, forwarding, for the information of the Commission, the particulars regarding the Menangle Bridge as required by the minutes of the meeting of the Commission on 29th August, and asking for the return of the drawings relative to the Wollondilly Bridges.

The Commission discussed the method of testing the Menangle Bridge, and also the subject of the Wollondilly Bridges, and the inspection and test that had been made of them.

The Commission decided to meet at the Redfern Railway Station at a quarter to 9 o'clock on Friday, the 5th inst., in order to proceed to Menangle.

FRIDAY, 5 SEPTEMBER, 1884.

MEMBERS PRESENT:—

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | | Owen Blacket, Esq. |

The Commission met at the Railway Station, Redfern, at a quarter to 9 a.m., and proceeded by the ordinary train to Menangle, where they further examined and tested the Menangle Bridge.

MONDAY, 8 SEPTEMBER, 1884.

MEMBERS PRESENT:—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | |
| W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering, |
| | Owen Blacket, Esq. |

The minutes of the two previous meetings were read and confirmed.

The visit of the Commission to Menangle on Friday, 5th instant, and the results obtained from the examination and the testing of the bridge were taken into consideration and discussed.

Mr. Blacket laid before the meeting a diagram showing the results of the deflection experiments made during the testing of the Menangle Bridge.

It was resolved that before anything further be done with regard to the Menangle Bridge the notes taken during the examination and testing of the Wollondilly Bridges on the 23rd, 25th, and 26th August be classified, and arrangements made for a report upon those bridges.

The Secretary was instructed to write to Mr. W. Scott, Locomotive Superintendent, and request him to forward to the Commission the weight of each of the engines used in testing the bridge at Menangle on Friday, 5th instant, as follows:—

Engine 265—Express passenger (Dubs & Co.), tender full, with full charge of coal.

Engine 212—Mogul engine (Beyer and Peacock), tender filled to within 2 feet from top with water, coal three-quarters full charge.

Engine 269—Express passenger (Dubs & Co.), tender filled to within 2 feet from top with water, with full charge of coal.

WEDNESDAY, 10 SEPTEMBER, 1884.

MEMBERS PRESENT:—

| | |
|--|--------------------|
| G. A. Morell, Esq., C.E., President. | |
| W. M'D. Courtney, C.E. (in the Chair at the opening of the meeting). | |
| W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

It was resolved that Mr. Courtney and Professor Warren prepare a report upon the Wollondilly Bridges.

The Secretary was instructed to write to Professor Kernot requesting him to forward all the information in his possession with reference to the Wollondilly Bridges, and to calculate and plot according to the following scale:—Vertical scale of areas 20 square inches to 1 inch, horizontal scale one-eighth of an inch to a foot.

The Commission considered the subject of the scale to be adopted in the diagrams to illustrate the strains, sections, and deflection of the bridges.

FRIDAY, 12 SEPTEMBER, 1884.

MEMBERS PRESENT:—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | |
| W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering, |
| | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

A discussion took place upon the design of the Wellington Bridge.

Diagrams were submitted of stresses and areas of the Wellington Bridge.

Mr. Blacket laid before the Commission a diagram showing the deflections of the Wollondilly Bridges, taken during the recent visit of inspection to those bridges.

MONDAY,

MONDAY, 15 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The subject of inspecting and testing the Wagga Wagga viaduct was taken into consideration, and it was decided that a preliminary visit of inspection should be made to the viaduct on Friday, 19th inst., the Commission to leave Sydney on Thursday, 18th instant.

The Commission agreed finally upon the method to be adopted in calculating the strength of the iron bridges.

WEDNESDAY, 17 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. W. H. Quodling, expressing regret that the original drawings of the Wollondilly bridges had been forwarded to the Commission in error, and that a slight alteration in design had been forgotten, and enclosing, for the information of the Commission, a copy of Mr. Fowler's letter of 26th June, 1866, describing the alteration in question, and a statement of the sectional areas of iron work of the bridges for 60 feet and 130 feet spans.

A telegram was read from Professor Kernot, Melbourne, informing the Secretary that he would comply as soon as possible with the request that he should forward all information in his possession relating to the Wollondilly bridges.

Mr. Courtney and Professor Warren submitted a report of the Wollondilly bridges, in accordance with the minutes of the meeting on the 10th instant, and the report was considered.

The Commission also took into consideration the question of calculating the deflection of the bridges generally.

THURSDAY, 18 SEPTEMBER, 1884.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The Commission met at the Railway Station, Redfern, at 9 p.m., and proceeded by the ordinary train to Wagga Wagga, where, on Friday and Saturday, the 19th and 20th instant, they made a preliminary inspection of the Wagga Wagga viaduct.

MONDAY, 22 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the two previous meetings were read and conferred.

A letter was read from Professor Kernot, forwarding information with regard to the Wollondilly bridges.

A letter was read from Mr. W. Scott, Locomotive Engineer, forwarding, in accordance with the request of the Commission, a return, showing the weight of the engines used in testing the Menangle bridges on the 5th instant. It was decided that the document should be printed.

Mr. Courtney, Professor Warren, and Mr. Blacket, reported the circumstances connected with the preliminary visit of inspection made by them to the Wagga Wagga viaduct, and a long discussion took place upon the subject.

Professor Warren submitted proposals and sketches for testing timber in connection with the Wagga Wagga viaduct, and it was decided that certain experiments should be made, and that Professor Warren should visit Granville and ascertain if a site could be obtained there for carrying out the tests.

The Secretary was instructed to procure the copy of a book shown to the Commission at Wagga Wagga by the maintenance man at the Wagga Wagga bridge, and containing the number of each span, and a description of the timber used in each of the piles of the viaduct.

WEDNESDAY, 24 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren reported that he had visited Granville, and had found there everything necessary for carrying out experimental tests in connection with the Wagga Wagga viaduct.

The Commission discussed at considerable length the manner in which the tests should be made.

FRIDAY, 26 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The subject of the experimental tests in relation to the Wagga Wagga viaduct was further considered.

Professor Warren brought under the notice of the Commission the fact that the drawings of the bridges over Solitary Creek were the same as those shown for the Wollondilly bridges.

The plans of the bridges at Bathurst and Wellington were taken into consideration, the examination and discussion being directed principally to the cover-plates and joints of these bridges.

MONDAY, 29 SEPTEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, C.E., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Courtney laid before the Commission a diagram showing the strains brought on a span of 130 feet by loading the bridge with three locomotive engines.

The detail of construction of the Bathurst and Wellington bridges was brought under examination, and a discussion took place on the joints and cover plates to see whether a sufficient number of rivets had been put in the joints, and which of the joints had been treated with a double shear applied to the rivets.

The Secretary was instructed to obtain from the Engineer-in-Chief for Railways the drawings and specifications, and all other information available relating to the bridges at Aberdeen, Tamworth, Peel River, Peel-street, and Macdonald River.

WEDNESDAY, 1 OCTOBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. Cowdery, forwarding a copy of a book, in the possession of Charles Cook at Wagga Wagga, containing the number of each span and a description of each pile in the Wagga Wagga viaduct.

The detail of construction of bridges at Bathurst and Wellington was further considered.

FRIDAY, 3 OCTOBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission considered the details of construction of the Penrith and other Bridges on the Western Railway, and discussed the subject at considerable length.

Plans and specifications relating to the bridges over the Peel and Macdonald Rivers, and to the Aberdeen and Peel-street bridges of the Great Northern Railway were received from the office of the Engineer-in-Chief for Railways and examined.

The Commission discussed the subject of a final visit to Wagga Wagga, for the purpose of inspecting and testing the Wagga Wagga viaduct, and it was decided that the visit should be made in the following week.

MONDAY, 6 OCTOBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. W. H. Quodling, forwarding drawings of bridges on the Great Northern Railway, and a paper giving data for the calculation of strains on certain bridges on the Great Northern Railway.

Plans and specifications of bridges at Solitary Creek, Peel River, and Peel-street Crossings were examined and discussed in detail.

It was resolved, on the motion of Professor Warren, to apply to the Railway Department for sections to the Wagga Wagga iron bridge, similar to those already supplied of the bridges over the Peel and Macdonald Rivers.

WEDNESDAY,

WEDNESDAY, 8 OCTOBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission discussed the calculations of the plate girders in the Wellington Bridge, and of the bridge at Peel-street, Tamworth, and also with reference to the webs of plate girders.

The Commission decided to visit Clyde on Friday, 10th instant, to make arrangements for experiments in connection with the Wagga Wagga viaduct.

FRIDAY, 10 OCTOBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The Commission met at the Railway Station, Redfern, and proceeded by train to Clyde, where they made an examination of the ground and of the appliances and material that could be used in the testing of an experimental girder. Sketches were made of the plan to be adopted, and it was resolved that a letter should be forwarded to Mr. J. H. Royce, asking for the use of his traveller; to the Engineer for Existing Lines, asking that the Commission may be supplied with some of the timber in stock for use as an experimental girder; and to the Government Store Department, to ask for the loan of iron rails and other material necessary to make the test intended.

MONDAY, 13 OCTOBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the two previous meetings were read and confirmed.

A letter was read from Mr. W. H. Quodling, forwarding, for the information of the Commission, a table of sectional areas of the railway iron bridge at Wagga Wagga.

A general discussion took place with reference to the Western and Southern bridges, and the details of the calculations relating to these bridges were compared.

WEDNESDAY, 15 OCTOBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren submitted a diagram of stresses produced by varying the positions of the live load on the Wagga Bridge. The diagram was examined and considered, a discussion taking place upon the application of similar diagrams to other bridges of one span, as at Tamworth, and of three spans, as at Bathurst, Wellington, and Aberdeen, and with reference to the relative economy of three or more spans in continuous girders.

MONDAY, 20 OCTOBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Blacket submitted to the Commission a sketch plan of the proposed testing of an experimental girder at Clyde, with reference to the Wagga Wagga viaduct.

Professor Warren's diagram of stresses produced by varying position of live load on the Wagga Wagga Bridge was further considered.

FRIDAY, 7 NOVEMBER, 1884.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. M'D. Courtney, Esq., C.E.,
 W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The Secretary was instructed to write to the Principal Under Secretary, informing him of the bridges that the Commission intended to visit.

Various matter of detail in connection with the testing of the bridges were discussed.

TUESDAY,

TUESDAY, 11 NOVEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. M'D. Courtney, Esq., C.E.,
 W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The matter of the visit of the Commission to Wagga Wagga to test the timber viaducts, and then to proceed to Albury to inspect the bridges, was discussed. The Secretary was instructed to secure the services of two plate-layers with a trolley, to be placed at the disposal of the Commission on Thursday, Friday, and Saturday, also to get two of the heaviest locomotive engines used on the Great Southern Line placed at their disposal for Saturday morning, and to obtain authority for the requisite testing gear to be taken by the ordinary mail train on Wednesday night.

Mr. Courtney moved, and Professor Kernot seconded,—“That the Engineer-in-Chief for Railways and the Engineer for Existing Lines be informed of the intention of the Commission to visit and test the Wagga Wagga viaduct, but that they wished to be perfectly independent in their action and did not desire the presence of any officers from either department.”

The Secretary was instructed to summon certain witnesses to attend and be examined at Wagga on Saturday, November 18, at 2 o'clock p.m.

SATURDAY, 15 NOVEMBER, 1884.

Meeting held at the “Commercial Hotel,” Wagga Wagga.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

Mr. George F. Chapman and Mr. Charles Cook were each called in, sworn, and examined.

Memo. :—Professor Kernot and Mr. Courtney went to Wagga by the mail-train on the night of November 12 to make final arrangements for testing the Wagga viaduct. On the 13th Mr. Morell, President, and Professor Warren, left for Wagga also, and were joined there on the 14th by Mr. Blacket and the Secretary. The preliminary arrangements having been made, the Commission proceeded on the 14th to make a thorough examination of the viaduct and iron bridge and fixed upon the spans for testing on the following day. Two heavy engines, Nos. 257 and 259, arrived from Sydney on the 15th, and the Commission proceeded immediately to test the viaduct. Twenty-four experiments were recorded with instruments, and in the evening the Commission examined two witnesses as above. On November 16 the Commission proceeded to Albury, and on the 17th made an inspection of the Albury iron bridge and bridge approaches, after which they returned to Sydney.

FRIDAY, 21 NOVEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the two previous meetings were read and confirmed.

The Secretary was instructed to write to Mr. Scott, Locomotive Superintendent, requesting him to furnish the Commission with the weights of the engines, Nos. 257 and 259, used in testing the Wagga viaduct and bridge, each with a full load of coal and water.

The diagrams showing the results of the testing of the timber viaducts at Wagga were discussed in detail.

WEDNESDAY, 26 NOVEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The diagrams showing the deflections of the various viaducts at Wagga were examined and discussed. It was resolved, on the motion of Professor Warren, seconded by Mr. Courtney, that each member of the Commission should write a report of his opinion with regard to the testing of the Wagga bridges.

The Secretary was instructed to write to the Engineer-in-Chief for Railways requesting him to supply the Commission with sections of the river at Penrith, Bathurst, and Wellington, showing the bridges.

MONDAY, 8 DECEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. W. H. Quodling, forwarding sections of the river Macquarie at Bathurst and Wellington.

The Commission discussed the subject of testing wooden girders similar to those used in the Wagga Wagga viaduct.
 Professor

Professor Warren moved, and Mr. Blacket seconded, and it was resolved,—“That a Committee be appointed to make arrangements for the testing of wooden girders similar to those used in the timber approaches to the Wagga Wagga viaduct, and that the Committee consist of Mr. Courtney, Mr. Blacket, and the mover.”

It was further resolved that the first meeting of the Committee should be held on Wednesday, 10th December.

WEDNESDAY, 10 DECEMBER, 1884.

Meeting of Committee appointed on 8th December to make arrangements for the testing of wooden girders.

MEMBERS PRESENT :—

| | | |
|-------------------------------|--|---|
| W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |
|-------------------------------|--|---|

Mr. Blacket submitted sketches illustrating the manner of testing wooden girders, such as those used in the Wagga Wagga viaduct, and after consideration it was resolved to prepare drawings and specifications, and to call for tenders for the erection of the necessary testing apparatus.

FRIDAY, 12 DECEMBER, 1884.

Meeting of the Committee.

MEMBERS PRESENT :—

| | | |
|-------------------------------|--|---|
| W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |
|-------------------------------|--|---|

The minutes of the previous meeting were read and confirmed.

Mr. Courtney submitted drawings from the draftsman of the Commission, and specifications of the apparatus for testing wooden girders similar to those used in the Wagga Wagga viaduct; and, after consideration, he was authorized to obtain from contractors an estimate for the iron-work required.

The Secretary was instructed to write to Mr. Cowdery, and ask him to have selected from the timber he has in stock that which was required by the Commission for the testing experiments.

MONDAY, 15 DECEMBER, 1884.

MEMBERS PRESENT :—

| | | |
|--------------------------------------|--|---|
| G. A. Morell, Esq., C.E., President. | | |
| W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |

The minutes of the meeting on 8th December were read and confirmed.

It was resolved,—“That, as the further extension of time granted to the Commission for the purposes of their inquiry will expire on the 24th instant, the Colonial Secretary be requested to grant another extension of four months.”

Mr. C. E. Nicholas, District Engineer, Railway Department, and Mr. R. D. Stephens, District Engineer, Railway Department, were examined.

TUESDAY, 16 DECEMBER, 1884.

MEMBERS PRESENT :—

| | | |
|--------------------------------------|--|---|
| G. A. Morell, Esq., C.E., President. | | |
| W. M'D. Courtney, Esq., C.E., | | W. H. Warren, Esq., Professor of Engineering, Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

The Commission discussed the subject of visiting the bridges on the Great Western Railway, and whether, as the Wollondilly bridges had been found different from the drawings supplied to the Commission, it would not save time and expense if Mr. Whitton were requested to certify that the bridges in the west and also in the north had been erected according to the plans supplied to the Commission, or forward to the Commission other plans, showing the difference between the bridges as designed and as erected.

On the motion of Mr. Blacket, seconded by Professor Warren, it was resolved,—“That the Commission, having found that the bridges over the Wollondilly River—five in number—have not been carried out as shown in the drawings supplied to the Commission, the Engineer-in-Chief for Railways be requested to certify that the following bridges in the west and north have been carried out in accordance with the drawings of those bridges sent to the Commission; or if there is any difference between the design of those bridges and the bridges as erected, to supply the Commission with drawings showing that difference, and with a statement of the reasons for it:—Penrith, Solitary Creek (five bridges), Bathurst, Wellington, Aberdeen, M'Donald River, Peel River, and Peel-street, Tamworth.

The Secretary was instructed to forward a copy of the resolution to the Engineer-in-Chief, and at the same time to return the plans of the bridges referred to.

Mr. Alfred Cecil Brayne (Railway Inspector), Mr. John Thomas Rowlands (Sub-Inspector of Railway Timber Bridges), and Mr. John Giddy (Sub-Inspector of Railway Timber Bridges), were sworn and examined.

TUESDAY

TUESDAY, 23 DECEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The minutes of the meeting on 12th instant of the Committee appointed to make arrangements for the testing of wooden girders were also read and confirmed.

The Commission considered the tenders sent in with reference to the testing of wooden girders, and it was decided to accept the tender of Messrs. Waugh and Josephson, the work to be delivered on 5th January.

The Commission considered the subject of making a visit of inspection to the bridges on the Great Western Railway.

On the motion of Professor Warren, seconded by Mr. Courtney, it was resolved,—“That the Engineer-in-Chief for Railways be requested to supply the Commission by next Tuesday, 30th instant, with the information asked for in the Secretary's letter of the 16th instant, as far as it relates to the Bathurst and Wellington bridges, and the information with reference to the other bridges mentioned in the Secretary's letter, as early as possible.”

A letter was read from Mr. C. A. Goodchap, Commissioner for Railways, giving the weights, with full loads of coal and water, of engines Nos. 257 and 259, used by the Commission in testing the Wagga Wagga bridge and viaduct.

Professor Warren read to the Commission from the minutes of the proceedings of the Institution of Civil Engineers, Vol. LXXII, an article “On the preservation of iron bridges, by E. Paschen.” (Glaser's Annalen, Vol. XII, 1883, p. 47).

TUESDAY, 30 DECEMBER, 1884.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. John Whitton, certifying that to the best of his knowledge and belief the iron bridges on the River Macquarie at Bathurst and Wellington were carried out strictly in accordance with the drawings previously furnished to the Commission, and now returned.

The Commission further considered the subject of inspecting the bridges on the Great Western Railway, and it was resolved that Mr. Courtney and Professor Warren should proceed on the 31st instant to Bathurst and Wellington for the purpose of making the necessary arrangements for an inspection and testing of the Bathurst and Wellington Bridges by the Commission.

The Secretary was instructed to see Mr. Cowdery and have arrangements made for all necessary assistance to the Commission from the District Engineer at Bathurst and Wellington, and for the use of any materials in the possession of the Railway Department required for testing purposes.

FRIDAY, 16 JANUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President read a letter from the Colonial Secretary stating that the time of the Commission had been extended for a further period of four months.

On the motion of Professor Warren, seconded by Mr. Courtney, it was resolved,—“That Professor Kernot having been absent from the visit paid by the Commission to the western bridges, he be requested at his earliest convenience to examine those bridges, and assist the Commission in the discussion in reference to the testing of the strains of the same, and the diagrams obtained from them.”

It was resolved, on the motion of Professor Warren, seconded by Mr. Courtney,—“That Mr. Blacket be requested to make a sample of the new testing apparatus, and that if the sample be approved the whole set be completed.”

Various matters of detail in connection with the testing apparatus were discussed at length.

The Secretary was instructed to obtain from the Engineer-in-Chief for Railways particulars of the cost of all the bridges on the Southern, Western, and Northern lines. Also from the Engineer for Existing Lines the cost of the repairs for the same bridges since they have been in charge of his department.

Memo. :—On December 31st Mr. Courtney and Professor Warren left Sydney for Bathurst and Wellington to make arrangements for the examination and testing of the Bathurst and Wellington Bridges by the Commission.

On January 7th they were joined at Bathurst by Mr. Morell (President), and the bridge at Bathurst was carefully inspected and tested. On January 8th the Commission was joined by Mr. Blacket, and the bridges at Wellington and Dubbo were inspected, and on January 9th the Wellington Bridge was carefully tested. Inspector Hilzinger was examined at Bathurst.

WEDNESDAY,

WEDNESDAY, 28 JANUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, C.E., | | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

Mr. Blacket submitted for the approval of the Commission a deflection apparatus, which was examined.

A letter was read from Mr. John Whitton, stating that the bridges at Penrith, Solitary Creek, Aberdeen, Macdonald River, Peel River, and Peel-street, Tamworth, had been carried out, to the best of his belief, in strict accordance with the drawings now furnished, and expressing regret that the correct drawings of the bridge over the Wollondilly River were not in the first instance forwarded to the Commission.

On the motion of Professor Warren, the name of Professor Kernot was added to those of the Committee appointed on December 8th.

The Commission discussed their recent visit of inspection to the bridges on the Western Railway, and it was resolved that each member of the Commission should write a report upon the subject for the consideration of the Commission at a future meeting.

On the motion of Professor Warren, it was decided that Mr. Blacket should be requested to have the testing apparatus for the contemplated experiments at Clyde put in order.

A letter was read from Mr. G. Cowdery, stating that certain timber had been forwarded to Finegan's Siding, near Granville, and stacked with other material for the use of the Commission.

On the motion of Professor Kernot, seconded by Mr. Blacket, the Secretary was instructed to write to the Under Secretary for Public Works, reminding him that the photographs of the bridges on the different railways, asked for in a previous letter, had not yet been supplied to the Commission, and requesting him to have them supplied at his earliest convenience; and also to write to Mr. Scott, Locomotive Superintendent, requesting him to supply the Commission with photographs of the following engines, with the total weight of each engine and tender when in full steam, and having a full load of coal, mentioned on the photographs,—No. 265 or 269, No. 212, No. 257, or 259, and No. 134, 137, or 140.

The Commission discussed the subject of a visit of inspection to the bridges on the Great Northern Railway, and then adjourned the discussion until the next meeting.

FRIDAY, 30 JANUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

Professor Warren reported to the Commission what had been done with regard to the preparations for carrying out the intended experiments at Clyde, and it was arranged that immediately the preparations were complete the Commission should be summoned to Clyde and the experiments made.

The proposed visit of inspection to the bridges on the Great Northern Railway was further considered, and it was resolved that Professor Kernot and Professor Warren should proceed to the North and make the necessary preparations for the inspection of the bridge by the Commission.

WEDNESDAY, 4 FEBRUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | | Owen Blacket, Esq. |

The Committee appointed on 8th December, having completed arrangements for the testing experiments at Clyde, the Commission met at Clyde and the experiments commenced.

THURSDAY, 5 FEBRUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | | Owen Blacket, Esq. |

The Commission met at Clyde and continued their testing experiments.

FRIDAY, 6 FEBRUARY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President :—

| | | |
|---|--|---|
| W. C. Kernot, Esq., Professor of Engineering, | | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | | Owen Blacket, Esq. |

The Commission met at Clyde, and continued their testing experiments.

SATURDAY,

SATURDAY, 7 FEBRUARY, 1885.

MEMBERS PRESENT:—

W. C. Kernot, Esq., Professor of Engineering, | W. M'D. Courtney, Esq., C.E.,
 W. H. Warren, Esq., Professor of Engineering.

The Commission met at Clyde and continued their testing experiments.

MONDAY, 9 FEBRUARY, 1885.

MEMBERS PRESENT:—

W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering
 W. M'D. Courtney, Esq., C.E. | Owen Blacket, Esq.

The Commission met at Clyde and continued their testing experiments.

TUESDAY, 10 FEBRUARY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The Commission met at Clyde, and continued their testing experiments.

WEDNESDAY, 11 FEBRUARY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq. C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The Commission met at Clyde and concluded their testing experiments.

THURSDAY, 12 FEBRUARY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meetings, from 30th January, were read and confirmed.

A letter was read from the Principal Under Secretary, forwarding photographs of Railway bridges.

A letter was read from Mr. W. H. Quodling, forwarding, for the information of the Commission, a return with reference to the cost of iron bridges.

The Secretary was instructed to write to Mr. Cowdery, reminding him that no answer had been received from him to a letter of 29th January with reference to the cost of repairs to bridges.

Professor Warren explained to the Commission the exact nature of the experiments that had been carried out at Clyde, and Mr. Courtney submitted a report of the meetings held by the Committee which had been appointed to make the arrangements for the experiments.

It was decided that the report should be included among the papers of the Commission.

The Commission deliberated upon the subject of visiting and inspecting the bridges on the Great Northern Railway, and it was resolved that Professor Kernot and Professor Warren should leave that night for Newcastle, and make the necessary arrangements for the inspection of the bridges by the Commission, forwarding a report to the members of the Commission remaining in Sydney by Monday.

MONDAY, 16 FEBRUARY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A report was read from Professors Kernot and Warren at Aberdeen concerning the arrangements they had made for the inspection and testing by the Commission of the bridges on the Great Northern Railway.

It was resolved that the report should be filed.

The Commission deliberated upon the best time to leave in order to join Professors Kernot and Warren, and it was resolved that they should leave Sydney for Aberdeen on Wednesday night.

The Secretary was instructed to inform Professors Kernot and Warren of the intention of the Commission to leave Sydney on Wednesday night and to make the necessary arrangements with the Locomotive Engineer at Newcastle and the Traffic Manager at the same place for engines for testing the bridges.

FRIDAY, 27 FEBRUARY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren reported to the Commission that he and Professor Kernot left Sydney on Tuesday, 12th instant, and arrived on the following morning at Aberdeen, where they inspected the railway bridge and made the necessary arrangements for the testing of it by the Commission, including the marking of positions for deflecting apparatus. On the same night a report was forwarded to the

Commission

Commission in Sydney. The following day they thoroughly inspected the Aberdeen Bridge, examining the rivets and the work in the bridge, and left at night for Tamworth. On Monday morning they inspected the bridge at Tamworth, and marked positions for deflecting apparatus, after which they returned again to Aberdeen to await the arrival of the Commission from Sydney.

The President reported that the Commission left for Aberdeen on Wednesday, 18th instant, and on the 19th the Aberdeen Bridge was tested by the whole of the members of the Commission. At 9 o'clock on the following morning a meeting of the Commission was held at Tamworth, and the Commission then tested the bridge on the Peel River and that over Peel-street. On the 21st instant the Commission proceeded to the M'Donald River and tested the bridge there. On the 23rd the bridge over the M'Donald River was again visited, and Mr. Bewick, Superintendent of Permanent Way, Mr. Robt. Ewing, Inspector of Bridges, and Mr. Hilzinger, Inspector of Bridges, were examined. The Commission then returned to Tamworth, and on the bridges examined Mr. Ewing and Mr. Hilzinger. On the 24th the Commission returned to Aberdeen and examined on the bridge Mr. Ewing, Mr. Hilzinger, and Inspector Morrison. The same day the Commission left Aberdeen for Newcastle, and returned to Sydney on the morning of the 25th.

The Commission discussed the results from their visit to the Northern bridges, and the Secretary was instructed to write to Mr. T. Boag, Locomotive Foreman at Newcastle, for the total weight of each type of engine and tender in the numbers 222 and 237 (Beyer & Peacock), and 261 (Dubbs & Co.) when in full steam and having a full load of coal and water, and the weight on each wheel, and the exact distances between the wheels. The Secretary was also instructed to write to Mr. Whitton, Engineer-in-Chief for Railways, requesting him to supply the Commission with the detail of main girders at Peel River, Tamworth, and M'Donald River, showing development of boom plates and joints, and sizes of lattice bars.

The Secretary was instructed to summon Mr. W. B. Wade, Mr. J. W. Drewett, Inspector Parkinson, and if possible Mr. W. Russell, for examination at a meeting of the Commission on Wednesday, 4th March.

MONDAY, 2 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren submitted for the consideration of the Commission the plotted deflections from the experiments made at Clyde, and the subject was discussed.

The Commission took into consideration a letter received from the Under Secretary for Public Works with reference to the time when the Report of the Commission would be submitted to the Government, and a general discussion took place as to when a Progress Report should be made.

The subject of the recent visit of the Commission to the Northern bridges was brought before the meeting, and a discussion took place with regard to the proper form in which the results of the inspection and testing of the bridges should be recorded.

WEDNESDAY, 4 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren handed in the following report relating to the experiments in the testing of wooden girders at Clyde:—

- Feb. 5.—Commenced experiments on timber at Finnegan's siding, and levelled the experimental beam. In order to represent the conditions existing in bridge eight rails were slung from the cantilevers 8 feet 7 inches from centre of tressles and ten rails placed in cage and deflection noted. The deflection of compound beam with 12-inch transoms was also noted when loaded with forty-two rails. Six experiments were made.
- Feb. 6.—Experiments 6 to 34 to compare 9-in. transoms with 12-in. and with 6-in.
- Feb. 7.—Experiments 35 to 57 relating to the effect of corbels.
- Feb. 9.—Completing corbel experiments, and commenced to break 29 feet 6-in. beam on tressles with sixteen rails, increasing four rails at a time.
- Feb. 10.—Breaking 29 feet 6-in. beam.
- Feb. 11.—Experiments 78 to 102, which related to 26 feet compound beam with 6-in. transom spaces loaded in every respect as in bridge, including the effect of various loads on deflection, and the increased deflection produced by slackening bolts.

Mr. W. B. Wade, District Engineer, Department of Engineer-in-Chief for Railways, was examined.

FRIDAY, 6 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The President laid before the Commission a document supplied by Mr. W. B. Wade, showing section of top and bottom booms at centre of girders over the Peel and M'Donald Rivers.

Mr. J. W. Drewett, Assistant Engineer, Department of Engineer-in-Chief for Railways, and Mr. Thos. Parkinson, Inspector of Railway Bridges, were examined.

The Secretary was instructed to summon Mr. J. G. Griffin, contractor, for examination at a meeting of the Commission on Wednesday, 11th instant.

WEDNESDAY, 11 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren reported to the Commission that he had, at the request of the President, visited the Menangle Bridge, and that he had found that some of the timber bed-plates under the river piers were very much decayed.

Samples of the decayed timber were laid before the Commission, and after discussion it was resolved, on the motion of Mr. Blacket, seconded by Mr. Courtney,—“That in consequence of the statements made by Professor Warren, and the samples of decayed timber shown by him, the Commission proceed to Menangle and inspect the timber of the bed-plates under the main girders.”

It was arranged that the Commission should proceed to Menangle by the 9.6 a.m. train on Saturday, 14th instant, and the Secretary was instructed to write to Mr. Cowdery and request him to have a platform erected on the top of the two river piers of the bridges, so that the Commission might be enabled to examine the wooden bearers, and to have a carpenter present with an auger for drilling holes through the timber.

A letter was read from Mr. Goodchap, forwarding photographs of engines used by the Commission testing bridges, and also diagrams giving the dimensions, weights, &c., of the engines.

Mr. John George Griffin, contractor, and formerly District Engineer in charge of a section of the Great Northern Railway, was examined.

SATURDAY, 14 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The Commission met at the Redfern Railway Station, and proceeded by the 9.6 a.m. train to Menangle, where they carefully examined the timber of the bed-plates under the main girders of the Menangle Bridge.

At the conclusion of the inspection a discussion took place; and the Commission being informed that similar decayed timber was to be found in the Penrith Bridge, it was resolved that Mr. Courtney and Professor Warren should proceed to Penrith that night to examine the timber bearings of main girders in the Penrith Bridge and to report upon them, and also to make preliminary arrangements for the testing of the bridge by the Commission.

WEDNESDAY, 18 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren reported to the Commission the circumstances of the visit made by him and Mr. Courtney to the Penrith Bridge, and it was resolved that a written report of the visit should be prepared.

A letter was read from Mr. Thomas Boag, Locomotive Foreman, Great Northern Railway, giving the weight, &c., of the engines used by the Commission when testing the bridges on the Great Northern Railway.

The Commission took into consideration the subject of forwarding a Progress Report to His Excellency the Governor for presentation to Parliament, and a Draft Report was submitted by the President, and, after discussion, approved of.

WEDNESDAY, 25 MARCH, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Progress Report of the Commission was submitted by the President in a completed form and signed, the President first explaining that the Report had been sent to Melbourne for the perusal of Professor Kernot, who had approved of it and signed it.

A letter was read from Mr. W. H. Quodling, returning a tracing of erecting marks on girders of the bridges over the Peel River (Tamworth) and the M'Donald River, with information required by the Commission noted upon it.

Professor Warren laid before the Commission the diagrams of deflections taken during the testing of the bridges, as far as they had been completed, and they were examined and considered.

The Commission decided that for the future the ordinary meetings of the Commission should be held on Monday and Thursday afternoons at a quarter past 2 o'clock, and that committee meetings be held from 8 to 10.30 on Wednesday and Friday nights.

FRIDAY,

FRIDAY, 27 MARCH, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., in the Chair.

W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Chairman reported that the Progress Report signed at the last meeting of the Commission had been forwarded to the Hon. the Minister for Works.

The Commission discussed the subject of the riveting of several of the railway bridges with a view of deciding in what instances the riveting showed careless or defective work, and in what instances it was an improvement to the strength of the bridges.

The Chairman informed the Commission that there were in use at the present time as a standard two kinds of hydraulic testing machines, one for testing rivets put in for boiler and steam tight purposes, and the other for girder work.

The results of the testing of the Wellington Bridge were read over and considered.

The Commission discussed the subject of further evidence that it was necessary to have, and it was decided to summon Mr. W. B. Wade, for examination on Monday, 30th instant.

WEDNESDAY, 1 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission discussed the general scheme of calculating the stresses in the bridges and agreed upon a classification of the bridges.

Professor Warren was appointed to complete calculations he had already begun, and to submit them when completed to the Commission for examination.

The Secretary was instructed to telegraph to Professor Kernot, asking him to forward as quickly as possible his calculations of the Menangle Bridge, and to return the Wagga Wagga deflection diagrams.

THURSDAY, 2 APRIL, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., (in the Chair.)

W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. W. B. Wade was further examined.

The Commission discussed the order of their future business, and it was decided that at the next meeting, to be held at 7.30 p.m. on Wednesday, 8th instant, the Commission should as far as possible prepare that portion of their Final Report which would relate to the bridges over the Wollondilly River.

WEDNESDAY, 8 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The reports and other records of the inspection and testing by the Commission of the Wollondilly Bridges were read and considered, and the substance of that portion of the Commission's Final Report which would relate to the Wollondilly Bridges was agreed upon.

It was resolved that at the next meeting of the Commission, to be held on Friday evening, 10th instant, the draft of the Final Report upon the Wollondilly Bridges should be further considered, and that the Commission should at the same meeting take into consideration the subject of preparing the Final Report upon the Bathurst and Wellington Bridges.

FRIDAY, 10 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The preparation of the Final Report of the Commission as far as it would relate to the bridges over the Wollondilly River was further considered and discussed.

The Commission then proceeded to discuss their Final Report upon the Bathurst and Wellington Bridges, principally with regard to the preparation of diagrams of stresses in web, with sectional areas required, and diagrams of stresses in booms with curves of areas required; and also with reference to commenting on the stresses and the material in the actual bridge.

A telegram was read from Professor Kernot, in Melbourne, intimating that he would comply with a request of the Commission, and that he would forward, as soon as possible, his Report upon the Menangle Bridge.

MONDAY.

MONDAY, 13 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren laid before the Commission a diagram showing effective and actual areas in booms, also curve of areas, calculated from maximum stresses, relative to the Bathurst and Wellington Bridges; and the diagram was examined and considered.

On the motion of Mr. Blacket, seconded by Mr. Courtney, it was resolved,—That tracings of the diagram submitted by Professor Warren be made, one to be forwarded to Professor Kernot, and the other to be for the use of the Commission."

The subject of the Peel River (Tamworth) and the M'Donald River Bridges was brought before the Commission by Professor Warren, and the Secretary was instructed to write to Mr. Whitton and request him to furnish the Commission with the sizes of the channel irons in the bridges referred to.

Mr. Courtney handed in, as part of the draft of the Commission's Final Report upon the bridges over the Wollondilly River, a description of the bridges.

The President drew the attention of the Commission to the fact that as the date on which the last extension of time granted to this Commission to conclude their inquiry and make their report would expire on the 24th inst., it was necessary to make application for a further extension.

On the motion of Mr. Courtney, seconded by Mr. Blacket, it was resolved,—“That application be made for a further extension of four months.”

FRIDAY, 17 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Blacket laid before the Commission for use in their Final Report, a description of the testing machinery used in the testing of the bridges.

The President submitted plans of deflection tests drawn by the draughtsman to the Commission, and after a lengthy discussion it was decided that certain particulars should be added to what was represented on the plans.

A general schedule of particulars for the Final Report on the Bathurst and Wellington Bridges was drawn up, and after consideration adopted.

FRIDAY, 24 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from the Commissioner for Railways, stating that he had been placed in possession of the Commission's Progress Report, and asking for an explanation of the concluding paragraph in the Report.

The letter was considered.

A letter was read from Mr. W. H. Quodling, returning a tracing of erecting marks of bridges over the Peel River at Tamworth, and M'Donald River, with what purported to be the sizes of the channel irons given.

Professor Warren laid before the Commission detailed calculations of the various lattice bridges.

The calculations were examined and discussed.

The President submitted, for the consideration of the Commission, plans showing the full speed test of the Bathurst and Wellington Bridges.

It was arranged that the plans should be completed and submitted again at the next meeting of the Commission.

WEDNESDAY, 29 APRIL, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

The Commission considered the diagrams of strains and of deflections, and the calculations referring to the sections, of the bridges over the Macquarie River at Bathurst and Wellington, and of the bridge at Aberdeen.

The calculation of the web of the Tamworth and M'Donald River Bridges was also considered.

A discussion then took place on the details of construction of, and on the defects pointed out in, the bridge at Penrith, and the Solitary Creek Bridges on the Great Western line, and it was resolved that Mr. Courtney should, on Tuesday, 5th May, proceed to those bridges and make the necessary arrangements for the inspection and testing of the bridges by the Commission on the following Thursday, Friday, and Saturday.

MONDAY,

29

MONDAY, 4 MAY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from the Principal Under Secretary, enclosing a document extending the time during which the Commission shall make their Final Report to the Government for a period of two months.

Professor Warren reported that he had been informed in the office of the Engineer-in-Chief for Railways that more information with regard to the sizes of the channel-irons in the bridges of the Peel River at Tamworth, and the M'Donald River, than that given in the returned tracings of those bridges, could not be furnished to the Commission, and that therefore it would be necessary for the Commission to have the necessary measurements of those bridges made by some one appointed by the Commission.

It was resolved that the necessary measurements of the bracing and channel bars should be made by some one appointed by the Commission.

The Commission discussed the subject of their intended visit to inspect and test the bridge at Penrith, and the bridges at Solitary Creek; and the Secretary was instructed to write to the Commissioner for Railways, requesting that three of the heaviest consolidation engines be on the Penrith Bridge at 9 o'clock on Friday morning, and that, after the testing of the Penrith Bridge, one of the engines, with a carriage, proceed with the Commission to the bridges over Solitary Creek, for the purpose of their inspecting and testing those bridges, and then bringing the Commission back to Sydney.

Professor Warren read to the Commission a letter he had received from Professor Kernot, containing a check made by Professor Kernot on Professor Warren's calculations with regard to Aberdeen, Bathurst, and Wellington bridges.

The Commission resolved to have diagrams prepared of the locomotives used in the testing of each bridge.

The diagrams of deflections relating to the Bathurst, Wellington, and Aberdeen bridges were considered, and also the drawing of one of the spans and one of the piers of the Wagga Wagga viaduct, as prepared for the Commission's Final Report.

The Commission also considered the diagram of moments produced by the position of the live-load on the continuous bridges at Bathurst, Wellington, and Aberdeen.

THURSDAY, 7 MAY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

Mr. Courtney having left Sydney on Tuesday night to make the necessary arrangements for the inspection and testing of the Penrith and Solitary Creek bridges, the Commission met at the Redfern Railway Station on Thursday morning and proceeded by the 9 o'clock train to Penrith, where they inspected the Penrith Bridge, and on Friday tested it. On Friday afternoon they left Penrith for Wallerawang, and on Saturday they carefully inspected and tested the six bridges over Solitary Creek.

On Saturday evening the Commission took into consideration two letters received from the Commissioner for Railways, asking for an explanation of the concluding portion of the Commission's Progress Report.

It was resolved that a reply be sent to the Commissioner, stating that while the Commission recommended that for the present "the maintenance of the bridges be carefully carried out," they did not exclude from maintenance anything urgent, such as may be rendered necessary by changes which may come under observation. But they recommended the discontinuance of replating, riveting, and other alterations in the bridges they had inspected and tested, until the result of their calculations, compared with the diagrams of strains and deflections, enabled them to determine if such work was absolutely necessary.

The Commission also resolved that, as a high wind, which was blowing at Penrith on Friday, prevented the testing of the bridge there from being as complete as desirable, a further test should be made on Saturday, 16th instant, and the Secretary was instructed to have the necessary arrangements made for the engines required for the purpose.

MONDAY, 11 MAY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the two previous meetings were read and confirmed.

Professor Warren submitted plans of the experiments carried out by the Commission at Clyde.

A letter was read from Professor Kernot, enclosing the report of a visit made by him to the Western bridges, and the report was considered.

A discussion took place upon the inspection which had been made by the Commission of the Penrith Bridge, and the testing of that bridge, and it was decided that a further examination should be made of the booms.

Mr. Courtney reported that he had examined a portion of the cells of the bottom booms, and had found that they had not been cleaned since the time when the bridge was erected, and that there was a great accumulation of rust and some loose rivets in them.

It was resolved that a letter be written to the Commissioner for Railways, requesting him to have the cells cleaned out by the Engineer for Existing Lines as soon as possible, so that access to them might be had by the Commission and a closer examination of them made than Mr. Courtney had been able to do; and also that some timber connected with the approaches to the bridge which blocked up the entrance to the cells, and which did not affect the strength of the bridge, be removed.

The Commission then proceeded to examine the drawings of the Penrith Bridge.

Diagrams of strains relating to other bridges were also considered, and it was decided that after they had been checked by the President they should be lithographed. Professor

Professor Warren submitted a sketch of the Wagga Wagga Bridge approaches, which, with the diagram of the experiments at Clyde, it was resolved should be photo-lithographed.

Diagrams of the engines used in testing the Bathurst, Wellington, and Aberdeen Bridges were also submitted and considered, and it was decided that they be sent to the photo-lithographer.

It was resolved that the Commission should meet at the Redfern Railway Station at 8 o'clock on Friday night, 15th instant, to proceed by train to Penrith, for the purpose of further testing the Penrith Bridge on the following day.

SATURDAY, 16 MAY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The Commission having met at the Redfern Railway Station on the previous night and proceeded by train to Penrith, assembled at the Penrith Bridge on Saturday morning and made further tests of the bridge.

The Commission took into consideration the letter to the Commissioner for Railways for the removal of the obstruction at the entrance to the cells of the bottom booms of the Penrith Bridge and the cleaning out of the cells, and the Secretary was instructed to write another letter to the Commissioner, requesting him to inform the Commission immediately the work was carried out, so that the Commission might proceed without delay to examine the cells.

Mr. W. J. Hilzinger, Inspector of Bridges, was then further examined.

WEDNESDAY, 20 MAY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous two meetings were read and confirmed.

Diagrams of deflections of the Penrith Bridge were submitted by the President and considered.

Mr. Courtney read to the Commission his notes of the inspection made by him of the Penrith Bridge, of his examination of the timber packing and girders, the plating, riveting, &c., and of the special inspection he made of the boom cells; and a discussion followed.

The necessity of obtaining further evidence with reference to some of the bridges was then considered, and it was resolved that the reports and other documents forwarded to the Commission should be read again at the next meeting and the names of additional witnesses noted.

FRIDAY, 22 MAY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Professor Warren submitted diagrams of the continuous bridges, and the diagrams were examined and discussed.

The various reports and other documents forwarded to the Commission relative to the Railway bridges were reperused and read, and additional notes were made by the members of the Commission as a guide for the questioning of witnesses yet to be examined by the Commission.

WEDNESDAY, 27 MAY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E. (in the chair.)
 W. H. Warren, Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered the reports and other documents relating to the bridges, and discussed the notes that had been made with reference to the examination of other witnesses.

The Chairman drew the attention of the Commission to an elaborate report on riveting, just issued from the Institute of Naval Architects.

FRIDAY, 29 MAY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E. (in the Chair.)
 W. H. Warren, Esq., Professor of Engineering, | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The subjects upon which it was considered advisable that further evidence should be taken were again considered, and a number of questions were prepared.

It was decided to summon Mr. T. R. Firth, District Engineer, for examination on Tuesday, at 2-30 p.m., and Mr. T. Smithyman, for examination on the following Friday.

The Secretary was instructed to write to Mr. Avern, and ask if his health was good enough to permit of his attending and giving evidence, and to Mr. Macnamara Russell, Melbourne, asking if he was likely to be in Sydney shortly, and if not whether he could arrange to visit Sydney to give evidence before the Commission, and at what cost to the Commission.

TUESDAY,

TUESDAY, 2 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from the Commissioner for Railways, informing the Commission that the work of removing the obstruction at the entrance of the cells of the bottom booms of the girders in the Penrith Bridge, and the cleaning out of the cells, had been completed.

Mr. T. R. Firth, District Engineer, Department of the Engineer-in-Chief for Railways, was sworn and examined.

The Commission decided to meet at 8 o'clock on Wednesday night to prepare, as far as practicable, the information in their possession with regard to the Wagga Wagga viaduct for their Final Report.

Photo-lithographs of diagrams of the deflections of the Penrith Bridge were submitted and examined.

It was decided that on Friday, the 5th instant, the Commission should meet for the purpose of taking further evidence, and that the following witnesses should be examined:—Mr. Alfred Williams, Harbours and Rivers Department; Mr. Richard Waring, Inspector of Railway Bridges, Department of Existing Lines; Mr. Thomas Smithyman, boilermaker; and Mr. G. C. Clark, District Engineer, Department of the Engineer-in-Chief.

It was further decided that on Friday the President (Mr. Morell) and Professor Warren should visit the Wollondilly Bridges, and that Mr. Courtney and Mr. Blacket should proceed to the Penrith Bridge for the purpose of examining the cells of the bottom booms of the girders.

The Secretary was instructed to write to the Commissioner for Railways, and ask that a second trolley be provided to enable members of the Commission to go through the cells of the bottom booms of the girders of the Penrith Bridge.

WEDNESDAY, 3 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

After discussion, it was resolved that the calculations for the timbers of 29 feet 6 inches should be made from the data obtained by the Commission on the experiments made at Clyde. Also, that a copy of the documents and tests should be supplied to each Commissioner as soon as possible, in order that he might make his remarks on the coefficient to be adopted.

A discussion followed on the advantages, or otherwise, to be derived from using wrought-iron girders instead of timber for superstructures. Also, as to cast-iron screw piles instead of timber for piers.

It was resolved that all the returns that could be printed should be put in hand without delay.

A further discussion took place in reference to the Wagga Wagga bridge approaches. It was resolved that Mr. Bennett, Engineer-in-Chief for Roads and Bridges, be written to, requesting him to give his opinion to the Commission as to his views regarding the life of timber bridges in the Colony.

The question of the examination of the following witnesses was then considered:—Mr. A. Williams, Mr. R. Waring, and Mr. Thos. Smithyman.

The President reported that he had been informed that Mr. Clark, District Engineer, had left the Department of Railways, and could not at present be found.

FRIDAY, JUNE 5, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Professor Kernot, containing his report upon the approaches to the Wagga Wagga Bridge.

The following witnesses were examined:—Mr. Alfred Williams, Mr. Richard Waring, and Mr. Thomas Smithyman.

MONDAY, JUNE 8, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mr. Avern, expressing his regret that he was unable, in consequence of ill-health, to attend and give evidence before the Commission.

Mr. Blacket reported to the Commission that he went on Saturday last to Penrith Bridge, and found that the T irons had been removed and some rivets cut out of the bottom of the booms, but the cells were in such a state of dirt that he could not go through them until they were swept and cleaned.

It was resolved that a letter be written to the Engineer for Existing Lines, requesting him to have the bottom booms of the Penrith Bridge cleaned out, but not painted, so that the Commission might inspect them.

The

The President stated that, on Saturday, he, in company with Professor Warren, had visited the Wollondilly bridges, had inspected all of them, and verified the facts of a report previously drawn up by Professor Warren and Mr. Courtney. The principal defects they found were in the general design, such as want of access to the ends of the girders over the piers, caused by the stone parapet, which made it almost impossible to clean the bearings and bed plates; also the narrow space between the top of the piers and ends of cross girders, where dirt falls in and accumulates, and if not frequently cleaned out must produce decay of the ironwork. This had caused the shifting of some of the girders, some of which were an inch, or an inch-and-a-half, out of the proper position.

A discussion took place with regard to the Wollondilly bridges, and in the absence of Professor Kernot, who had gone carefully into the subject, it was decided to adjourn the discussion until the next meeting.

The Secretary was instructed to telegraph to Professor Kernot, and request him to inform the Commission when he would be able to attend.

WEDNESDAY, 10 JUNE, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering,
W. M'D. Courtney, Esq., C.E.,

W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The diagrams of the testing experiments at Clyde were submitted, and after discussion it was resolved to send them to be photo-lithographed for the Final Report.

The diagrams of the Wagga Wagga approaches were carefully examined and revised, and the whole of the diagrams of deflections of the following bridges were submitted, viz.:—Penrith, Bathurst, Wellington, Aberdeen, Tamworth, and M'Donald River. It was resolved to have these diagrams photo-lithographed as soon as they had been finally checked by the President.

The printed draft of evidence was submitted with the corrections made by the Secretary. It was resolved to have the evidence corrected, and that a copy of his evidence should be sent to each witness who had not yet had an opportunity of correcting it.

It was resolved that the Secretary should be instructed to write to the Government Photographer, asking for photos of the experimental beams at the railway siding, Clyde; also for photos of the engine types used in the testing of bridges taken in a manner similar to the sample sent by the President; also that photos of the following bridges be at once prepared by the Woodbury process for publication with the Final Report, viz.:—Wagga Wagga Bridge, Wagga Wagga Bridge approaches, Mulwaree Creek Bridge, Goulburn, Wollondilly Bridge, Boxer's Creek Bridge, Menangle Bridge, Penrith Bridge, Tarana Bridge, Bathurst Bridge, Wellington Bridge, Dubbo Bridge, Aberdeen Bridge (to be obtained from the Under Secretary), Tamworth Bridge, Tamworth with approaches, M'Donald River Bridge.

It was resolved, in consequence of reasons stated as under, that the Government be requested to grant the Commission a further extension of time for two months from the expiration of the present term of extension :—

1. Because when the Commission in April last applied for an extension of four months, only two months were granted.
2. In consequence of the delay in obtaining the returns required by the Commission.
3. On account of having to obtain the evidence of additional witnesses.
4. On account of the necessity for the reinspection of the Penrith and Menangle bridges in consequence of certain serious matters having been brought under the notice of the Commission.
5. In consequence of the difficulty of obtaining from the Engineer-in-Chief for Railways the plans of certain of the bridges, which necessitated the sending of an officer to visit and make diagrams of certain bridges in the north and south.
6. On account of the Commission having had to await the arrival from Melbourne of Professor Kernot, who could not leave his duties at the Melbourne University until the second week in June to join the Commission in preparing their Final Report.
7. On account of the large amount of drawings now in the hands of the printer and in course of preparation for photo-lithography, and which will not be completed until after the expiration of the present term of extension.

FRIDAY, 12 JUNE, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering,
W. M'D. Courtney, Esq., C.E.,

W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The draft of a letter to the Colonial Secretary, requesting a further extension of time to the Commission for two months, was read and adopted.

A discussion took place on the subject of wind braces in lattice bridges.

The Secretary was instructed to write to the Department of Railways in Victoria, requesting that the Commission may be furnished with the results of timber testing by that Department.

Professor Kernot submitted designs of timber bridges as used in Victoria, and they were compared with the Wagga Wagga viaducts.

MONDAY,

MONDAY, 15 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering,
W. M'D. Courtney, Esq., C.E.,

W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from Mrs. M. Russell, of Melbourne, stating that Mr. Macnamara Russell was in Adelaide, but would shortly return, when he would reply to the Secretary's letter of 7th June.

A discussion took place with regard to the wind bracing of the M'Donald River and other bridges. It was resolved that the Secretary be instructed to write to Mr. R. D. Stephens, District Engineer, Goulburn, asking him for his calculations of the shorter spans which he proposes should be used instead of the larger spans for the Wagga Wagga timber viaduct.

A discussion took place in regard to the designs of the bridges on the Southern, Western, and Northern lines of railway, and on the evidence of witnesses in regard thereto.

It was resolved that Mr. Thomas Smithyman be summoned to attend on Thursday morning next, at 11 o'clock, to be further examined, and the Secretary was instructed to summon Mr. Smithyman accordingly.

WEDNESDAY, 17 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering,

W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

Committee Meeting.

A discussion took place upon the strongest, safest, and cheapest viaducts, not exceeding 30 feet span. A comparison of 15 feet, 20 feet, and 30 feet spans used on the Victorian Railways (5 feet 3-inch gauge), and the 26 feet span used on the Queensland Railways (3 feet 6-inch gauge), with the 26 feet and 29 feet 6-inch spans, used on the New South Wales Railways (4 feet 8½ inch-gauge), was brought forward by Professor Kernot, and during the discussion the quantity of timber used in the different designs was shown to be much greater in the New South Wales timber viaducts than in those of the adjoining Colonies. The weight of travelling and driving wheels, and wheel base of the heaviest locomotive engines used on the timber viaducts under consideration showed that the heaviest Government engines on the New South Wales Railways do not strain our bridges to a greater extent than the lighter engines used on the Victorian Railways.

The mode of construction of the different timber spans and of piers of different heights was also considered, and it was shown that stability may be obtained with much less timber than is put in the timber viaducts of the Colony, similar to those of Wagga Wagga.

The particulars and strength of Wollondilly, 130 feet span, were discussed, in reference to the web plates, at 42 feet from the centre of span.

FRIDAY, 18 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. H. Kernot, Esq., Professor of Engineering,
W. M'D. Courtney, Esq., C.E.,

W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Mr. Thomas Smithyman was recalled and further examined.

The Secretary was instructed to summon Mr. J. F. Mann to attend and give evidence on Monday next.

MONDAY, 22 JUNE, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.

W. C. Kernot, Esq., Professor of Engineering,

W. M'D. Courtney, Esq., C.E.,
W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

A letter was read from the Engineer for Existing Lines in reference to the cleaning of the bottom booms of the Penrith Bridge.

With reference to the Wagga viaduct, Professor Kernot laid before the Commission a letter he had received from Mr. Steele, Inspector-General of Public Works in Victoria, on the subject of screw piles, with a diagram.

The question of the best construction of timber viaducts was discussed fully. It was considered that less timber would have been required for the construction of such viaducts as those at Wagga had a design been selected similar to those used in the Victorian timber viaducts, or by substituting larger spans at the greatest depths, and making larger embankments in the more shallow water; also, that the larger spans might have been constructed of iron in the deeper portions where strong currents have been found in flood time. By such means great part of the expense of maintenance of these expensive timber structures might have been avoided. A saving of timber by using similar spans to those of the Victorian viaducts would have been made. The cost of using 60 feet iron spans with screw piles compared with the

cost

cost of the timber approaches would have been greater, but a saving in the cost of maintenance in the iron over the wooden structures would also have been made. With regard to construction it was considered that there were very few defects in the superstructure, which is ironbark, and the few girders which may have shown defects have been replaced. The transoms should have been of ironbark, and it would be advisable to replace them with that timber as they decay. With reference to the piles many of them are defective, having been put in with the sap in them. As ironbark piles could not have been obtained when the Wagga viaducts were constructed it would be advisable, the Commission considered, for the Government to keep a stock of piles, to be obtained by contract, and used for the construction of timber approaches and bridges.

WEDNESDAY, 24 JUNE, 1885.

MEMBERS PRESENT :—

| | |
|---|---|
| G. A. Morell, Esq., C.E., President. | |
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

Professor Warren handed in his calculations of all the bridges examined by the Commission, with the exception of Penrith, Menangle, and the Wagga iron bridge. The Secretary was instructed to have these calculations printed as an Appendix to the Report.

It was resolved that the diagrams of the testing of the various bridges should be printed to accompany the Report.

The Secretary was instructed to summon Mr. J. G. F. Mann and Mr. Hilzinger to attend before the Commission and give evidence on Saturday morning at half-past 10 o'clock.

It was resolved that a clerk should be engaged by the President to compile portions of the papers to be printed, and to perform other clerical work required by the Commission.

It was also resolved that the Messrs. Amos should be summoned at some future date to give evidence before the Commission.

THURSDAY, 25 JUNE, 1885.

MEMBERS PRESENT :—

| | |
|---|---|
| G. A. Morell, Esq., C.E., President. | |
| W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering, |
| W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq. |

The minutes of the previous meeting were read and confirmed.

The Secretary was instructed to write to Mr. John Rae, Under Secretary for Works, asking for photos of the bridges inspected by the Commission.

A letter was read from Mr. Robert Watson, Engineer-in-Chief, Railway Department, Victoria, enclosing results of experiments on different Colonial and other timbers in the year 1880; also copy of the report of the Carriage Timber Board, dated May, 1884. The Secretary was instructed to acknowledge with thanks the receipt of the above communications, and to request Mr. Watson to further oblige the Commission by supplying them with the results of experiments on large scantlings of red gum timber, made at Sandhurst in the year 1865.

The Secretary was also instructed, on the motion of Professor Warren, seconded by Professor Kernot, to write to the Engineers-in-Chief for Railways of the Colonies of Queensland, South Australia, Tasmania, and New Zealand, requesting to be furnished with the result of any experiments they may have made to ascertain the strength and elasticity of Colonial timbers.

A telegram was read from Mr. R. D. Stephens, dated from Albury, stating that he would forward the information requested by the Commission, immediately on his return to Goulburn.

The evidence in regard to the Wagga Wagga viaducts and the iron bridge, and the Wollondilly, Menangle, and Penrith bridges was discussed in detail, and questions were prepared for the further examination of witnesses thereon.

It was resolved to re-examine Mr. John Whitton, Engineer-in-Chief for Railways, at an early date.

SATURDAY, 27 JUNE, 1885.

MEMBERS PRESENT :—

| | |
|---|-------------------------------|
| G. A. Morell, Esq., C.E., President. | |
| W. C. Kernot, Esq., Professor of Engineering, | W. M'D. Courtney, Esq., C.E., |
| W. H. Warren, Esq., Professor of Engineering. | |

The minutes of the previous meeting were read and confirmed.

Mr. Gother F. Mann was examined.

Mr. William Hilzinger was recalled and further examined.

TUESDAY, 30 JUNE, 1885.

MEMBERS PRESENT :—

| | |
|--------------------------------------|---|
| G. A. Morell, Esq., C.E., President. | |
| W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering. |

The minutes of the previous meeting were read and confirmed.

The question of the evidence to be given by Mr. Macnamara Russell was considered, and it was decided, on the motion of Professor Warren, seconded by Mr. Courtney, that Mr. Russell be summoned to attend and give evidence on Thursday next, at 11 o'clock.

A letter was read from the Colonial Secretary, stating that the time of the Commission had been extended for two months from the 24th instant, but that no further extension of time would be granted.

Diagrams of the stresses of the different bridges, and of the experiments at Clyde, were submitted, examined, and revised.

A discussion took place upon the details of construction of the Penrith and Menangle bridges, compared with the calculations of the strains submitted by Professors Warren and Kernot, showing that on the Penrith Bridge the rivets fastening the web to the angle irons of top and bottom booms were strained to the extent of 8 tons per square inch, under the load of two locomotives and eleven ballast trucks covering the middle span and half the adjoining span. With regard to the cross girders it was shown that with a moving load they were strained to the extent of 7.5 tons compression and 9 tons tension. It was agreed that this matter should be made the subject of special mention in the Report.

The subject of the web and plate girders on the Wollondilly bridges was considered, and the strain of those plates when a full load passes over them.

THURSDAY, 2 JULY, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

Mr. Macnamara Russell was examined.

It was resolved that the consideration of the various matters before the Commission should be for some further time discussed in Committee.

FRIDAY, 3 JULY, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Committee Meeting.

The Committee was engaged during the whole of the evening in the examination and revision of the proofs from the Government Printer, of the calculations made in regard to the various bridges.

MONDAY, 6 JULY, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.
 Committee Meeting.

Professor Warren stated that he had received a letter from Professor Kernot, in which the writer spoke strongly about the weakness of the Penrith Bridge and the Solitary Creek Bridges, especially when considered in reference to the heavy engines which travel on the Western line.

A letter was read from Mr. R. Watson, Engineer-in-Chief in Melbourne, enclosing tables and diagram respecting testing of red-gum timber at Sandhurst. It was resolved that the diagram should be printed as an Appendix to the Report, and that the Secretary should acknowledge the receipt of the letter with thanks.

A discussion took place as to the general report on riveting; also as to the final report on the Penrith Bridge.

Professor Warren submitted the complete calculations of the Penrith Bridge ready for the printer.

THURSDAY, 9 JULY, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.
 Committee Meeting.

Mr. Courtney brought forward some valuable information he had just received from England in reference to riveting.

It was decided that Professor Warren should have reproductions made of some Victorian timber bridge designs supplied by Professor Kernot.

Professor Warren reported in what stage he had the calculations in regard to the Wagga Bridge and viaducts, and the various calculations were discussed.

It was decided that the Commission should visit Penrith on the following Saturday, and take further particulars in reference to the bridge there.

SATURDAY, 11 JULY, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The Commission proceeded to Penrith to test and examine the bottom booms of the Penrith Bridge, and to take further detailed particulars in regard to that structure.

WEDNESDAY,

WEDNESDAY, 15 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.
Committee Meeting.

Mr. Blacket read his report on the Wagga viaduct, which was discussed.
Professor Warren read his report on the Clyde experiments, which was discussed. Also his report on the Penrith Bridge, and a discussion ensued as to the suggestions contained therein.
Some correspondence was read from Professor Kernot in reference to deflections.
It was decided to send a telegram to Professor Kernot asking him to send complete calculations of the strength of strutted Victorian timber viaducts; also, that Mr. Whitton be requested to supply particulars of central cross-section of clear spans of main approach girder at Penrith.

FRIDAY, 17 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.
Committee Meeting.

A letter was read from Mr. R. D. Stephens, giving his estimate of differences if the 26 feet span had been adopted for the Wagga Wagga viaduct instead of the 29 feet 6 inches as now erected.
A proof copy of the experiments on the strength of red-gum timber was received from the Government Printer; also information that he had the photos. of bridges in hand.
Arrangements were made as to which members of the Commission should write reports on the various bridges, the work being distributed so that each member should bring in a report of the bridges allotted to him.

MONDAY, 20 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.
Committee Meeting.

Revised proofs of the experiments on the strength of timber at Sandhurst were received from the Government Printer.
A report by Professor Warren was read on the design and construction of the Aberdeen Bridge, and after discussion adopted.
A long discussion took place on the subject of riveting, and also as to how the General Report should be worded, and under what headings the various styles of rivets should be termed, and which should be replaced.

FRIDAY, 24 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.
Committee Meeting.

A letter was read from Professor Kernot on the Penrith Bridge. A long discussion ensued in regard to the best means to be adopted for strengthening that bridge.

TUESDAY, 28 JULY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
The minutes of previous meetings were read and confirmed.
Reports in connection with the Wagga Wagga viaducts were submitted and discussed; also various matters connected with the iron bridges.

WEDNESDAY, 29 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.
Committee Meeting.

The report on the Penrith Bridge was carefully gone over, and some necessary alterations were made in the same.

FRIDAY,

FRIDAY, 31 JULY, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Owen Blacket, Esq.

The minutes of the previous Committee and Commission meetings were read and confirmed.

A letter was read from Mr. W. H. Quodling, giving particulars of girder at the Penrith Bridge.

The President submitted a diagram of the deflections of the Wagga Wagga viaducts, and the diagram was considered.

The Commission discussed the deflections of the Menangle Bridge.

The printed matter connected with that portion of the Commission's Final Report which would relate to the Wollondilly bridges was examined and considered, and the Secretary was instructed to obtain for the use of the Commission additional proofs of everything that had been sent to the Government Printer.

A discussion took place with reference to that portion of the Commission's Report which would deal with the bridge at Wagga Wagga, and the Secretary was instructed to inquire of Professor Kernot by telegraph whether he had in his possession a book handed to the Commission by Mr. Nicholas, the engineer in charge of the construction of the Wagga Wagga viaduct, and relating to that viaduct.

Arrangements were made for the preparation of portions of the Commission's Final Report not already written, and the meeting then adjourned.

FRIDAY, 31 JULY, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Committee Meeting.

The Committee considered what recommendations should be made for the Aberdeen Bridge and also for the Penrith Bridge.

MONDAY, 3 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Owen Blacket, Esq.

The minutes of the previous meetings were read and confirmed.

The subject of the Commission's Final Report was further considered, and the printed matter relating to it was further examined and corrected.

The Secretary was instructed to write to the Engineer-in-Chief for Railways requesting him to furnish the Commission at his earliest convenience with a return showing the localities where timber bridges and approaches to iron bridges have been erected on the different lines of railway in the Colony, the length of each bridge or approach, the number of spans, the date on which each bridge or approach was erected, and, if possible, the cost; to the Engineer for Existing Lines, requesting him to furnish the Commission with a return showing the cost of maintenance of each of the timber bridges and approaches to bridges on the different lines of railway in the Colony; and to the Commissioner for Roads, requesting him to furnish the Commission with a statement of his opinion regarding the life of timber bridges in this Colony and the cost of maintenance, and to state what repairs have been necessary, if any, to the iron bridges erected in his department.

The Secretary was also instructed to telegraph to Mr. C. E. Nicholas, and ask him to supply the Commission, if possible, with a copy of the book classifying the different kinds of timber used in the Wagga Wagga viaduct.

MONDAY, 3 AUGUST, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Committee Meeting.

The Committee further considered the recommendations with reference to Penrith Bridge and the subject of renewal of rivets in that bridge, and a proposal by Professor Kernot to put a longitudinal girder in the bridge.

WEDNESDAY, 5 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meetings were read and confirmed.

The Commission's Final Report was further considered, and the printed matter relating to it further examined and corrected.

The Secretary was instructed to have the evidence taken before the Commission classified, and the Commission then adjourned.

FRIDAY, 7 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
 Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Final Report, and discussed the various matters to be referred to in the Report.

TUESDAY,

TUESDAY, 11 AUGUST, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

Proofs of diagrams to accompany the Commission's Final Report were examined and considered.

A letter was read from the Engineer-in-Chief for Railways, stating that he could not undertake to furnish the Commission with certain details required respecting timber bridges.

A letter was read from the Commissioner and Engineer for Roads, forwarding a statement with reference to the life of timber bridges and to repairs to iron bridges erected under the superintendence of officers in the Roads Department.

A paper on the waterway of bridges and culverts, forwarded from Melbourne by Professor Kernot, was read and considered.

The Commission then further considered the subject matter of their Final Report.

WEDNESDAY, 12 AUGUST, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
Committee Meeting.

The Committee discussed the details of the Penrith Bridge inspection.

TUESDAY, 13 AUGUST, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

A letter was read from the Chief Assistant Engineer of Existing Lines in Victoria, forwarding certain drawings for the information of the Commission.

A letter was read from Mr. Cowdery with reference to the request from the Commission for a return showing the cost of maintenance of each of the timber bridges and approaches to bridges on the different lines of railway.

A telegram was read from Mr. C. E. Nicholas, stating that he had no copy of the book classifying the different kinds of timber used in the Wagga Wagga viaduct.

A letter was read from Mr. W. H. Quodling, forwarding to the Commission vouchers sent in to the office of the Engineer-in-Chief for Railways for expenses incurred by witnesses when coming to Sydney to give evidence before the Commission.

The Secretary was instructed to telegraph to Professor Kernot, requesting him to be in Sydney on Saturday, 22nd instant, for the purpose of signing the Commission's Final Report.

The Commission further considered the subject matter of their Final Report.

A discussion then took place as to the advisableness of forwarding a copy of the evidence taken before the Commission to Mr. Whitton and Mr. Cowdery for their perusal previous to further examining them upon points brought out by the evidence; and it was resolved that, with the consent of the Hon. the Minister for Works, a copy of the evidence should be so forwarded, and an intimation sent to each officer that the Commission intended to summon them for further examination on an early day next week.

FRIDAY, 14 AUGUST, 1885.

MEMBERS PRESENT :—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering,
Committee Meeting.

The Committee discussed the details of the inspection made by the Commission of the Wagga Wagga viaduct.

MONDAY, 17 AUGUST, 1885.

MEMBERS PRESENT :—

G. A. Morell, Esq., C.E., President.

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meetings were read and confirmed.

The Secretary reported that a telegram had been sent to Professor Kernot requesting him to be in Sydney on Saturday for the purpose of signing the Commission's Final Report, and that a copy of the evidence taken before the Commission had been forwarded to Mr. Whitton and Mr. Cowdery.

The Commission further considered the subject matter of their Report, and then adjourned until the following morning, to examine Mr. Whitton and Mr. Cowdery.

TUESDAY,

TUESDAY, 18 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.

The minutes of the previous meeting were read and confirmed.

Mr. John Whitton, Engineer-in-Chief for Railways, and Mr. George Cowdery, Engineer for Existing Lines, were further examined.

WEDNESDAY, 19 AUGUST, 1885.

MEMBERS PRESENT:—

W. M'D. Courtney, Esq., C.E., | W. H. Warren, Esq., Professor of Engineering.
 Committee Meeting.

The Committee discussed the general question of loose rivets, and the various kinds of imperfect riveting, and their effect upon the strength of bridges.

FRIDAY, 21 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President. | W. H. Warren, Esq., Professor of Engineering.
 Committee Meeting.

The Committee discussed the calculations relating to all the bridges, and the recommendations with reference to strengthening Penrith Bridge.

SATURDAY, 22 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meetings were read and confirmed.

A letter was read from Mr. Cowdery with reference to the piers of Wellington Bridge.

The President submitted a complete draft of the Commission's Final Report, and it was read and considered.

MONDAY, 24 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Final Report, and adjourned until the evening.

MONDAY, 24 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Final Report.

TUESDAY, 25 AUGUST, 1885.

MEMBERS PRESENT:—

G. A. Morell, Esq., C.E., President.
 W. C. Kernot, Esq., Professor of Engineering, | W. H. Warren, Esq., Professor of Engineering,
 W. M'D. Courtney, Esq., C.E., | Owen Blacket, Esq.

The minutes of the previous meeting were read and confirmed.

The Commission further considered and signed their Final Report.

RAILWAY BRIDGES INQUIRY COMMISSION.

STATEMENT OF THE CIRCUMSTANCES WHICH LED TO THE APPOINTMENT OF THE COMMISSION.

MINUTE PAPER.

Construction of Iron Railway Bridges.

Department of Public Works, Sydney, 11 October, 1883.

For some time past the Engineer for Existing Lines, acting in what he considered to be the performance of his duties, has had a number of workmen employed in cutting out and renewing rivets and doing other works which he considered necessary on the iron railway bridges of the Colony.

Shortly after my acceptance of the office of Minister for Public Works reports were submitted to me by Mr. Cowdery which practically condemned the construction of most of the bridges in question; in fact in one or two instances Mr. Cowdery stated that he as Engineer for Existing Lines would not be answerable for the safety of these bridges unless he was allowed to repair them as he wished, as he had great doubts as to their stability.

The first of Mr. Cowdery's reports reached me on the 20th June last. On the following day I forwarded the papers for report to the Engineer-in-Chief, and at the same time expressed my intention of asking my colleagues to concur in the appointment of a Royal Commission to investigate the very serious charges and counter charges that have been made by two officers holding such high and responsible positions in the Public Service.

Mr. Whitton who, as Engineer-in-Chief, has the entire charge of the Railway Construction Branch, speaks in strong terms of Mr. Cowdery's want of professional ability to form any estimate as to the character of the iron bridges, and states in unmistakable terms that the action taken by Mr. Cowdery has tended very much to destroy the usefulness of the bridges and to impair their strength.

On the other hand Mr. Cowdery is equally pronounced in his condemnation of Mr. Whitton's abilities as an engineer, and in his opinions respecting the defective construction of the iron bridges.

This question is of so much importance to the entire community, and one so eminently of a professional nature, that it is quite impossible for any Minister to decide it. I therefore ask my colleagues to concur in the appointment of a Royal Commission to further and fully investigate the matter. I am strongly of opinion that nothing but the appointment of a Royal Commission (which would have the power to subpoena witnesses and examine them on oath) will meet the case.

I would suggest the following gentlemen to form the Commission :—

MR. G. A. MORELL, C.E.
MR. NORMAN SELFE, C.E.
MR. J. P. FRANKI (Manager, Mort's Dock).
MR. W. DAVIDSON (Manager, A.S.N. Company's Works).
MR. EDGINGTON (Atlas Company's Works).
MR. COURTNEY, C.E.

Cabinet approved.—A.S., 16/10/83.

F. A. W., 11/10/83.

The

The Commissioners named in the above Minute Paper were duly appointed, and their appointment was confirmed by the Executive Council, but circumstances arising in relation to the position of one or two of the Commissioners as persons connected with firms in the habit of contracting with the Government for the supply of ironwork for railway purposes, it became necessary to cancel the appointment, and to submit for the approval of the Executive Council a revised list of names. The cancellation of the appointment of the first Commission was effected by means of the following minute :—

MINUTE FOR THE EXECUTIVE COUNCIL.

Cancellation of Minute appointing Royal Commission to inquire into Railway Bridges.

Department of Public Works, Sydney, 13th March, 1884.

WITH reference to the Minute of the Executive Council, dated the 29th October last, appointing Messrs. Morell, Selfe, Courtney, Franki, and Edgington, members of a Royal Commission to inquire into and report upon the stability of certain iron bridges erected on the Existing Lines of Railway, I have the honor to request sanction to the cancellation of the said Minute, to enable me to submit for the approval of His Excellency the Governor and the Executive Council a revised list of names of members of the Commission in question.

F. A. WRIGHT.

The Executive Council advise that the proceedings on the 30th October last, appointing a Royal Commission for the purpose herein specified, be cancelled.—ALEX. C. BUDGE, Clerk of the Council.

Min. 84/10.—26/3/84. Confirmed, 1/4/84. Approved.—A.L., 25/3/84.

The revised list of names referred to in the foregoing Minute was only submitted and approved, and the Commission, the names of the members of which appear elsewhere, was appointed on the 23rd April, 1884.

Shortly after the appointment of the first Commission the following Minute Paper was written by the Honorable the Minister for Works, and a copy of it subsequently forwarded to the second Commission :—

MINUTE PAPER.

The Commission to inquire into Iron Railway Bridges.

Department of Public Works, Sydney, 5 November, 1883.

I SHALL be glad if the Under Secretary will prepare a *précis* of the whole case and forward it with the papers to the Chairman of the Royal Commission, Mr. G. A. Morell, C.E., pointing out the nature and the serious character of the dispute that has arisen between the Engineer-in-Chief for Railways and the Engineer for Existing Lines, with reference to the stability of certain iron bridges on the different railway lines ; stating at the same time my desire to have the matter thoroughly investigated for the satisfaction of the Government and to restore confidence in the minds of the travelling public.

As it will be necessary in conducting this investigation for the members of the Commission to personally inspect the bridges and subject them to such a strain as they may consider necessary to test the stability of the bridges, the Commissioners may be informed that all necessary appliances will be placed at their disposal by the Traffic Department, and every facility will be afforded them by the officers of the Engineering and Traffic Departments, who will be instructed to furnish plans and papers and to give all information that may be required. To enable them to report fully upon the design and workmanship of the bridges witnesses may be examined on oath.

It will be seen that among the papers there are some dealing with the subject of the approaches (timber) to the Wagga Wagga bridge. Though these do not strictly refer to the main question in dispute, I have carefully considered the matter in connection with the question at issue and wish the papers submitted to the Commission and dealt with by them.

Without wishing to interfere in any way with the deliberations of the Commission, or to precipitate their decision, they may be informed that I am desirous that no unnecessary delay should occur in conducting and concluding their investigations, so that the Government may take immediate action in the matter, and allay any feeling of alarm that may have arisen in the mind of the public as to the stability of the bridges over which so many thousands of persons are constantly travelling.

The Commission may be informed that I have appointed Mr. Charles Lyne to be shorthand-writer and secretary; and that a room in this Department is at their disposal for the purpose of holding their meetings therein.—F.A.W., 5/11/83.

Have copy of this minute sent to Mr. Whitton and Commissioner for Railways, and also to chairman of Royal Commission.—F.A.W.

PRECIS OF THE CASE FOR INQUIRY.

THE *précis* of the case submitted to the Commission for their consideration and inquiry was as follows :—

FOR some considerable time there has been a serious dispute between the Engineer-in-Chief for Railways and the Engineer for Existing Lines about the stability of some of the iron bridges on our railways. Reports from the Engineer for Existing Lines and his officers have from time to time been laid before the Minister by the Commissioner for Railways, and referred to the Engineer-in-Chief for his report. Being unable, from severe illness, to visit the bridges himself, he instructed some of his chief assistants to do so, and their united reports are directly at variance with those of the Engineer for Existing Lines and his assistants; but the allegations of the latter as to the unsafe condition of the bridges are so startling, and the opinions of the officers at the head of two branches of the same department so contradictory, that the Minister for Works (Mr. Wright) felt assured that no decision of his would lead to a satisfactory settlement of the dispute, and that the only means of solving the difficulty and satisfying the Government and the travelling public was the appointment of a Royal Commission of Experts. Mr. Wright's suggestion to this effect was at once adopted by his colleagues.

A Commission, consisting of Mr. Morell, C.E., Mr. Selfe, M.I.C.E., Mr. Courtney, M.I.C.E., Mr. Franki, Manager, Mort's Dock Company, and Mr. Edgington, Atlas Works, was appointed by the Governor and Executive Council. Mr. Morell was elected President, and Mr. Selfe, Vice-President.

The papers submitted to the Commission, with an index to facilitate reference, explained the serious character of the dispute that had arisen between Mr. Whitton and Mr. Cowdery as to the stability of the bridges.

On 7th December, 1883, Mr. Whitton in his report to the Minister drew attention to the cutting out of rivets in some of the iron girder bridges constructed under his superintendence, without any reference to him, and enclosed reports from Mr. Cowdery, received by him from Mr. Hilzinger, on the loose rivets of the Wellington bridge, and from Mr. Wade in reply.

A report from Mr. Cowdery on the 9th February combated Mr. Wade's remarks on the rivets in Wellington bridge, and referred to his inspection of Penrith, Solitary Creek, Wollondilly, and Menangle bridges, corroborating the opinion of his officers, Messrs. Avern and Hyndman, whose reports were appended with a memo. of Mr. Hilzinger's experience on bridge work, &c.

On 16th March, 1884, Mr. Whitton requested the Minister's attention to a paragraph in the *Evening News*, reflecting on his supervision of the construction of the bridges and asked for a copy of the reports on the subject before they were submitted to Parliament.

Mr. Hilzinger on 7th, 16th, and 23rd April, reported to Mr. Cowdery on his inspection of the Aberdeen bridge, and the bridges over the Peel River, Peel-street, Tamworth, and the McDonald River, on the Northern line, showing the nature of the defects and the number of loose rivets in each.

By the Commissioner's directions Mr. Cowdery, on 25th May, examined the whole of these bridges and generally corroborated the statements of his officer, and considered that though there is no immediate danger it would be advisable to have the riveting attended to without delay.

On 21st June Mr. Secretary Wright, on receiving this report, thought it of so much importance that he requested the Engineer-in-Chief to report on the subject as soon as possible. Mr. Whitton at this time was only recovering from a severe illness which had confined him to his house for several weeks, but on 25th June he informed the Minister that he had instructed some officers of his Department to inspect the bridges on the Northern Line.

On 29th June the Minister again referred to the seriousness of the statements in the reports of Mr. Cowdery and his officers as to the construction and stability of the bridges, and stated that he could not take action till he had received Mr. Whitton's explanation, after which he would suggest the appointment of a Royal Commission of experts to examine and report on the whole question.

Mr.

Mr. Whitton, on 6th July, reported to the Minister that, being unable from illness to examine the Northern bridges himself, he had instructed Mr. Wade, Mr. Drewett, and Mr. Russell, three of his assistants, accompanied by Mr. Ewing, an experienced mechanic, also in his Department, to inspect the bridges referred to. He forwarded copies of their reports, from which he stated that the Minister would see that there was not the slightest foundation for the allegation that the bridges were in any way defective. He had no hesitation in affirming that no better iron bridges with regard to material and workmanship were ever built, and he expressed the hope that the Minister would give instructions that no further attempt at either loosening or replacing rivets in these bridges be made without his approval.

On 30th July the Minister requested the Commissioner to send this report to Mr. Cowdery, for his perusal only, and to instruct him to at once stop all work in connection with the riveting of all the bridges pending the report of the Royal Commission. This was carried out on the following day.

On 3rd September Mr. Whitton reported to the Minister that as it had been decided to appoint a Commission he would merely refer in general terms to the reports of Mr. Cowdery and Mr. Avern on the bad condition of the Western bridges. He attributed the cause of the loose rivets mainly to Mr. Hilzinger who in his inspection was reported to have used a flogging hammer weighing about 6lb.

And on 10th September Mr. Cowdery expressed his regret that he was precluded from giving a specific reply to Mr. Whitton's continued attacks, but while passing them by he was fully sensible, he said, of the insults Mr. Whitton dealt out to his (Mr. Cowdery's) officers and to himself.

Along with the papers forwarded to the Commission were a number of reports connected with the timber approaches to the Wagga Wagga bridge, to which Mr. Wright requested the attention of the Commissioners.

LIST OF PAPERS.

THE following Papers on the subject of the instability of the Railway Bridges were forwarded for the information of the Commission :—

REPORT of the Engineer-in-Chief for Railways on the cutting out of rivets in the iron girder bridges, enclosing some papers on the subject from the Engineer for Existing Lines, forwarding Mr. Hilzinger's report on the loose rivets in the Wellington Bridge and Mr. Wade's report on the same. Mr. Whitton complains of the re-riveting having taken place without any reference to him, and states that his responsibility for the safety of these bridges must cease from the date of his report. 1882.
7 December.

Report from Mr. Cowdery in answer,—commencing with a reply to Mr. Wade's remarks about the loose rivets, as to the supervision of the Inspector's work on the Wellington bridge. He next refers to his inspection of the Penrith Bridge, and states that many parts of the girders in the main portion of the bridge have been disgracefully put together; that the small plate girders of Solitary Creek Bridge have sagged from bad workmanship; and with reference to the Southern Bridges over the Wollondilly that he could turn round hundreds of the rivets without the use of a hammer. He then explains the nature of the repairs he had effected in the Menangle Bridge, and forwards reports from District Engineers Avern and Hyndman, and a memo. of Mr. Hilzinger's experience on bridge work, &c. 1883.
9 February.
Wellington.
Penrith.
Solitary Creek.
Southern
Bridges.
Wollondilly.
Menangle.

Minute from Mr. Whitton, calling the Minister's attention to a paragraph in the *Evening News* of the 15th, reflecting on the engineering supervision of the construction of certain railway bridges, and stating that as he is responsible for their design and construction he should have been the first to be informed of any alleged defects in them. He asks for a copy of the reports before they are submitted to Parliament. 6 March.

Extract from the *Evening News*, under the head of "Railway Bridges and Blunders." 21 March.

Report of Mr. Hilzinger to the Engineer for Existing Lines, on his inspection of the iron railway-bridge at Aberdeen, on the Northern line, showing the number of loose rivets, &c. 7 April.

Memorandum from Mr. Avern to Mr. Cowdery,—that he was informed that Mr. Wade and Mr. Warren were examining the Wellington Bridge, and asking for instructions. Mr. Cowdery orders him to allow no examination of the bridge without his approval. 8 April.

Report from Mr. Hilzinger on the defective rivets, &c., in the bridges over the Peel River and Peel-street, Tamworth. 16 April.

Report of Mr. Hilzinger to Mr. Cowdery on the defective rivets in the iron bridge over the McDonald River, on the Northern line, with minute by the Commissioner instructing Mr. Cowdery to inspect the bridge, and if he finds the Inspector's report correct, Mr. Goodchap states that he will draw the attention of the Engineer-in-Chief to the matter. 23 April.
Minute

22 May. Minute of Mr. Stuart while acting as Secretary for Works, drawing attention to the wide breach between the Commissioner and the Engineer-in-Chief for Railways, and giving his views of the unwise procedure adopted where one engineer proceeds to alter the structural character of works done by the other.

25 May. Minute of Mr. Cowdery to the Commissioner for Railways reporting that he had personally examined the iron bridges on the Northern Railway, and confirming the Inspector's report on them. He considers that though there is no immediate danger of a collapse it would be advisable to have the riveting put right without delay to prevent sagging.

Mr. Secretary Wright thus minutes this paper :—

“The report submitted by Mr. Cowdery is of so much importance, and demands such immediate attention, that I should like the remarks of the Engineer-in-Chief for Railways to be made thereon as soon as possible.—21/6/83.”

25 June. Minute of Mr. Whitton regretting that his serious illness for the past few weeks still prevented him from waiting on the Minister to express his views on the grave matters referred to in Mr. Cowdery's report ; stating that he had instructed officers in his Department to inspect the bridges on the Northern line ; and requesting the Minister to obtain a report from Mr. Bewick, the Superintendent of the Permanent Way in the North.

27 June. Memorandum from Mr. Cowdery to Mr. Bewick for a report in detail, and to afford every facility to the officer of the Engineer-in-Chief to conduct an inspection.

Minute of Mr. Secretary Wright :—

29 June. “The question involved in these papers is so important to the Department, to the travelling public, and, in fact, to the entire community, that I forward them to the Engineer-in-Chief for Railways, and must ask him to lose no time in replying to the statements contained in the enclosed reports from the Engineer for Existing Lines and from officers engaged under him (Messrs. Avern, Hyndman, and Hilzinger), in which the construction and stability of the principal iron railway bridges in the Colony are questioned.

“As these bridges have been constructed under the immediate supervision of the Engineer-in-Chief for Railways, I cannot take action until I have his explanation. As soon, however, as I am in possession of his report I shall bring the matter before my colleagues, and suggest the appointment of a Royal Commission of Experts to examine and report upon the whole question, which is of such importance that I feel any delay that can be avoided on my part would be highly culpable.”

2 July. Memorandum from Mr. Bewick to Mr. Cowdery reporting on the bridges.

On Mr. Whitton's minute of 25th June, the Minister writes :—“The Commissioner will have the goodness to give effect to this through the usual channel.—26/6/83.”

And the Commissioner telegraphs in Mr. Cowdery's name to Mr. Bewick to carry out the Minister's instructions.—26/6/83.

6 July. Minute from Mr. Whitton to the Minister stating that not having sufficiently recovered from his late illness to go to the north to inspect the bridges so unfavorably reported on by Mr. Cowdery, he had requested Mr. Wade, Mr. Drewett, and Mr. Russell, three of his assistants, all fully competent, accompanied by Mr. Ewing, an experienced mechanic, also in his department, to inspect and fully examine the bridges referred to. He forwards copies of their reports from which he affirms the Minister will see that there is not the slightest foundation for the allegation that the bridges are in any way defective. He has no hesitation in stating that no better iron bridges, with regard to material or workmanship, were ever built, and requests that the Minister will give instructions that no further attempt at either loosening or replacing rivets in these bridges be made without his approval.

Minute of Mr. Secretary Wright :—

30 July. “Will the Commissioner for Railways send the attached report from Mr. Whitton to the Engineer for Existing Lines, for his perusal only. At the same time to instruct Mr. Cowdery to stop all work in connection with the riveting of the whole of the railway bridges north, south, and west, pending the report of a Royal Commission that it is my intention to move my colleagues to appoint for the purpose of investigating the serious and important charges made in Mr. Cowdery's reports about the workmanship and stability of these bridges.”

31 July. And the Commissioner forwards this minute to Mr. Cowdery to give it effect, which was done.

Minute

Minute of Mr. Whitton to the Minister, stating that as he had decided to appoint a Commission ^{8 September.} to investigate the matters in dispute, he would merely refer in general terms to the reports of Mr. Cowdery and Mr. Avern on the western bridges. He attributes the cause of the loose rivets mainly to Mr. Hilzinger in his inspection using a flogging hammer weighing about 6 lb.

Minute of Mr. Cowdery, regretting that from the Minister's remark he is not at liberty to make any ^{10 September.} specific reply to Mr. Whitton's continued attacks; but while passing them by he is fully sensible of the insults Mr. Whitton deals out to his officers and himself.

Sundry extracts from the Colonial Press.

Minute of Mr. Wright, recommending to the Cabinet the appointment of a Royal Commission, which ^{11 October.} was approved by the Cabinet on the 16th.

In addition to the above the following papers were received by the Commission on the subject of the Wagga Wagga Viaduct:—

- 1882
- 18 May Commissioner for Railways, *re* reports from Engineer for Existing Lines, *re* defective material used in the construction of the viaduct at Wagga Wagga.
- 3 October Engineer-in-Chief for Railways, forwarding copies of reports received from officers of his Department and Messrs. A. and R. Amos, *re* defective Pile, South Wagga viaduct.
- 1883
- 18 July Commissioner for Railways, forwarding report of District-Engineer Stephens on the subject of Wagga Wagga Bridge approaches.
- 11 August Engineer for Existing Lines, forwarding report of District-Engineer Stephens on the subject of defective works, South Wagga viaduct.
- 1 August Engineer for Existing Lines, forwarding statement of expenses in keeping the approaches to Wagga Wagga Bridge in order.
- 8 August Commissioner for Railways, enclosing report on defects in the Wagga Wagga viaduct.
- 10 September... Engineer for Existing Lines, *re* examination of South Wagga Iron Bridge.
- 14 September... Engineer-in-Chief for Railways, forwarding reports on timber viaducts over the Murrumbidgee Valley, at Wagga.
- 4 October Engineer for Existing Lines, forwarding papers in connection with timber viaducts over Murrumbidgee Valley, at Wagga.

DOCUMENTS REFERRED TO IN THE FOREGOING STATEMENT.

MINUTE PAPER.

Wellington Bridge.

Department of Public Works, Sydney, 22 May, 1883.

THE accompanying paper is one of several which have come before me during my short administration of this Department, which causes me extreme pain and regret.

This is caused by the evidence of a wide breach between two high officers of the Government—the Commissioner for Railways and the Chief Engineer for Railways.

It is my intention to state my views with some degree of fulness upon these differences as soon as I have time, not from any desire to favour one more than the other, or to depreciate either officer, but because I feel that such differences are in the highest degree detrimental to the Public Service, of which both are highly trusted and distinguished officers.

In this particular case it seems to me that if the Engineer of Existing Lines has any doubt as to the stability of the Bridge—nay more, if, in his opinion, there is any faulty construction in the Bridge, he should report or cause a report to be made thereon, with such recommendations as he may deem fit for rectifying the defects.

The Minister should then call upon the Chief Engineer for Railways for his remarks thereon, and then the Minister would have the opportunity and the responsibility of deciding between the two, to enable him to do which he would probably take the evidence of experts to cause a survey and report to be made to him.

I think that the procedure is not a wise one, where the one Engineer proceeds to alter the structural character of work done by the other, as it then leads to a state of things which cannot be examined or surveyed, but merely resolves itself into one asserting one thing and one another, to the embarrassment of the Minister and the detriment of the Public Service, as well as to the widening of the breach of these officers, on whose co-operation so much of the permanent good of the country—the common employer of both—depends.

A.S.,
22/5/83.

MINUTE from Engineer for Existing Railways to Commissioner.

Subject—Iron Bridges, Great Northern Railway.

Department of Public Works, Railway Branch, Existing Lines Engineer's Office,
Sydney, 25 May, 1883.

I BEG to report, for your information, that I have personally examined the Iron Bridges on the Northern Railway, and am sorry to say I can only confirm my inspector's report of them.

The Aberdeen Bridge, which is similar to the Bathurst and Wellington Bridges, has been very badly constructed. There are more bad booms than good ones, particularly in the centre top booms, where they should have been of the best. The number of loose rivets are quite as many as reported, viz., 2,359, and when they are replaced many of the others will become loosened. Nearly all the strain in the top booms of this bridge comes on the rivets that are tight, and as there are so many that are not tight it must consequently

consequently shorten the life of the bridge to a great extent. I do not anticipate any immediate danger, but the sooner the loose rivets are replaced by sound ones the better for the bridge.

The work is in bad line, and the plates in many places not close.

The bridge over the Peel River has been well constructed as regards the plates being well butted and close, but the riveting is very bad; in fact I do not think there are many sound rivets in it. Of course there are more loose ones found in the top booms in consequence of the butts being good, but there are 2,458 found in the bottom booms, and I have no doubt many others were loose before the strain came on them, that is, before the stage was taken from under; but whether that be so or not, with the number found loose the bridge cannot be nearly so strong as it should be, and although there may be no immediate danger of a collapse, I deem it advisable to have the riveting put right without delay to prevent the bridge sagging. The cause of so many of these rivets being loose is that they were never large enough for the holes, there being nearly $\frac{1}{8}$ inch difference.

The bridge over Peel-street, Tamworth, is fairly constructed, there not being so many loose rivets, but still too many.

The bridge over the M'Donald River is the same span, and similar to the one over the Peel River, and is in similar condition, except that there are only 3,813 defective rivets found against 4,585 in the Peel River bridge.

GEORGE COWDERY.

The report submitted by Mr. Cowdery is of so much importance and demands such immediate attention, that I should like the remarks of the Engineer-in-Chief for Railways to be made on it as soon as possible.—F.A.W., 21/6/83.

MEMORANDUM to G. Cowdery, Esq., Engineer for Existing Lines.

S. Wagga Viaduct—Defective work.

Railway Department, Office of Engineer for Existing Lines, Goulburn, 28 July, 1883.

YOUR M.P. 82-3,100, 83-7,844, &c., &c.

These viaducts are represented by the following openings:—

| | | | | | |
|---|-----|-----|-----|-----|----------------------------|
| Viaduct No. 1 | ... | ... | ... | 113 | bays of 29 ft. 6 in. each. |
| " 2 | ... | ... | ... | 66 | " " |
| " 3 | ... | ... | ... | 4 | " " |
| " 4 | ... | ... | ... | 73 | " " |
| Then the iron bridge over the Murrumbidgee. | | | | | |
| Then viaduct No. 5 | ... | ... | ... | 57 | " " |
| Total | | | | ... | ... |
| | | | | 313 | " " = S. 9,233 ft. 6 in. |

The iron bridge does not enter into the present question; this iron bridge is substantially built and bears very fair comparison with bridges of this class.

The superstructure of the timber viaducts consists of double 12 in. x 12 in. ironbark road girders, outside girders, and transoms with 10 ft. corbels resting on two bearing and two batter piles; the latter, *i.e.* the piles, being in some, in fact in many instances, of very doubtful quality, both as regards size and description of timber. In fact I simply state that they are bad, in fact very bad. The whole of the piles, with the exception of some 120 adjoining the river, rest on sills, and the working sideway is most apparent.

I attach detailed list of imperfections as ascertained up to the present time; this on careful examination will, I believe, more than anything else, clearly prove that my remarks contained in my reports, dated January 16, 1882, and May 12, 1882, are more than fully borne out.

Mr. Drewett's report is straightforward and to the purpose; his examination was honest, and though he and I happen to slightly differ as to amount of deflection, that is a matter of comparatively small moment.

I may, however, state that at the time he examined these bridges I myself was not fully aware of some most important defects that we subsequently discovered.

Curtly my objection to these viaducts are as under:—

1st. I consider that a very serious and fruitlessly expensive mistake has been made in extending the spans from 26 ft. centres to 29 ft. 6 in. centres.

I cannot but think that the Engineer-in-Chief never intended it himself; that it was some clerical error; in fact this is evinced by their very careful avoidance of 29 ft. 6 in. spans on the Jerilderie and Albury Extension Lines.

We have 30 ft. spans, but the girders are 14 in. x 14 in. which as against 12 in. x 12 in. makes a very considerable difference. Independently of this the racking of the timber is still further increased by the injuriously long corbels—10 ft. The cost of these useless or rather detrimental lengths of corbels, squared timber, with their accompanying bolts, &c., would have gone a very long way to putting in the requisite spans—26 ft. centres, as against the 29 ft. 6 in. spans, which border on the point of danger.

R. D. STEPHENS.

Let this paper be sent at once to the Engineer-in-Chief for Railways for a report, and I wish a report sent me at once stating what, if any, action has been taken in the matter, and what, if any, portion of the viaduct has been renewed, the parts taken out, &c. Reply to this so that they may be at any time examined. I also wish no work to be done in renewing any portion of this work until the Engineer-in-Chief has sent an officer of his own to examine and report.—F.A.W., 7/8/83.

I have personally examined these viaducts, and am sorry to say they are quite as bad as reported by Mr. Stephens, and at the present rate of decay, if it is decay since erection, it is my opinion that all the uprights and many of the girders will have to be renewed within ten years.—G.C., 1/8/83.

MINUTE

MINUTE from Engineer for Existing Railways to Commissioner.

Subject: Timber Viaducts over the Murrumbidgee Valley at Wagga.

Department of Public Works, Railway Branch, Existing Lines, Sydney, 4 October, 1883.

IN returning these papers to the Commissioner after perusal, waiving the continued and persistent insults of Mr. Whitton to my officers and myself, which I suppose must be endured for the present, as a specific reply would, I take it, be inconsistent with the Minister's intimation that these papers are sent for "perusal only," I must urge the Commissioner, however, in the strongest possible terms not to allow the props to be removed that were placed under the above viaduct, by my instructions, after a personal and careful examination of them; they were put there for the safety of the public and not "to alarm the public," as insinuated by Mr. Whitton.

As an illustration of the worth of Mr. Whitton's officers' reports, I would ask the Commissioner to notice Mr. Drewett's representation that "50 in all" comprise the hollow uprights or piles, and that the pipes in these are from "1 in. to 2 in. or 3 in." With the papers supplied is a detailed list, the correctness of which I personally tested, and this shows a total of 104 bad and questionable, with pipes from 1 in. to 9 in. There are actually 63 from 4 in. to 9 in. For the present I content myself with drawing attention to this misstatement of simple facts, and leave it to others to decide whether it springs from "ignorance or malice."

I may state that most of these faulty girders would have been taken out and replaced with sound ones by this but for the Minister's minute; 7/8/83, on Mr. Stephens' report, requesting that no work should be done until examined by the Engineer-in-chief.

Will Commissioner please say if these viaducts are now to be repaired, as a flood may come at any time and carry out the props.

GEORGE COWDERY.

As the props are to be left for the present it does not seem necessary to precipitate the question in dispute or prejudice it by repairing the structure in the way suggested. The Royal Commission is to be appointed, I understand, without delay, and they will probably give this matter, as it is the most urgent, their first attention. If the props are carried away by the flood they can be replaced by others. And in the meantime (should such an exigency arise) a light engine will be used to run the trains over the viaduct, and so reduce to a minimum all risk of accident.—CH. A.G., 5/10/83.

Wagga Wagga Viaduct.

Engineer for Existing Lines to The Chairman of Railway Bridges Inquiry Commission.

Sir, Railway Department, Office of Engineer for Existing Lines, Sydney, 11 June, 1884.

In connection with the investigation into the condition of the approaches to the Wagga Viaduct upon which the Commission has now entered, I have the honor to call your attention to the fact that the papers before the Commission conclude with reports by Messrs. Whitton, Wade, and Drewett.

The reason for my not replying to these reports lies in the order implied by the Minister, in his minute, forwarding these reports for my perusal only.

I now beg to submit to the Commission these remarks which I should otherwise have made at the time.

The result of Messrs. Wade and Drewett's inspection is reported by them to be,—First. That they found the dry rot had attacked the viaducts more or less throughout their length, and that they found some 50 piles having in them pipes from 1 in. to 3 in. in diameter. Under these circumstances they consider it a fortunate circumstance that a large margin of strength was allowed in the piers. To this I have to reply that Messrs. Wade and Drewett's report must have been a very superficial one, and I maintain that there are awaiting the inspection of the Commission not 50 but 130 piles, having in them pipes varying from 2 in. to 9 in. in diameter, the positions of which are shown in the diagram now before the Commission.

Further I have to state that I differ entirely from Mr. Wade in seeing any cause for congratulation in the manner of construction of the piers. I can only find great cause for regret that such extensive viaducts should have been constructed with inferior timber, leading as it surely will to the early necessity for the complete renewal of the piles at a very heavy cost to maintenance.

In regard to the superstructure, Messrs. Wade & Drewett speak of there being a few unsound girders. I prefer to be definite, and maintain that there are no less than thirty-six beams cracked or otherwise defective; of these four were so bad that they have been renewed, the others are more or less defective, and as a matter of precaution all of them should, I consider, be replaced by sound beams.

On the occasion of my second inspection of this viaduct I found that my District Engineer had placed props under certain of these cracked girders; I approved this action, and ordered certain other girders to be similarly treated. Mr. Wade has formed the opinion, which he was entitled to express, that this propping of the girders was unnecessary. I maintain, however, that he had no justification for describing my action as "an ostentatious display, intended to impair the confidence of the public in this structure"; and I also submit that Mr. Whitton's request that the Minister would order the removal of the props was a most unjustifiable attempt to override me in the execution of my duties.

Mr. Wade permits himself to characterize the District Engineer's opinion that the span of these viaducts, 29 ft. 6 in., is too great for the design as "silly criticism."

Even had Mr. Wade expressed his dissent in more courteous terms I could not agree with him. The extreme and unusual length of the corbels in this viaduct, namely 10 feet, would seem to evidence that the span had been stretched beyond the usual limits. The extra length of corbels is however a mistake, as beyond a limit of 6 feet they cease to be rigid, and spring with the girders, causing the unloaded end to kick up and raise the girders of the adjacent span, thereby setting up a jumping action in trains running over the bridge.

This

This jumping action I actually observed, and after experiment with an engine running at different rates of speed I considered it advisable to limit the speed of trains crossing the viaducts to 16 miles an hour.

This precaution having been dictated by actual observation of a dangerous rocking of trains, no calculations of breaking weight by Mr. Wade would induce me to relax it. Indeed the question is one of deflection, and I do not think it could be decided merely by a calculation of the breaking weight. Further, I believe the Commission will find that Mr. Wade's statement of the breaking weight being 1,000 tons for each span is erroneous, and far in excess of what actually exists, even viewing the action of the different members of the design under the most favourable circumstances.

With the above remarks I leave the case of these viaducts in the hands of the Commission, merely asking them to keep in mind that in my position as Engineer in charge of maintenance all my actions must necessarily and primarily be on the side of public safety.

I have, &c.,
GEORGE COWDERY.

1885-6.

RAILWAY BRIDGES INQUIRY COMMISSION.

PROGRESS REPORT.

TO HIS EXCELLENCY THE RIGHT HONORABLE LORD AUGUSTUS WILLIAM FREDERICK SPENCER LOFTUS, Knight Grand Cross of the Most Honorable Order of the Bath, a Member of Her Majesty's Most Honorable Privy Council, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

May it please your Excellency,—

WE, the undersigned Members of the Royal Commission, appointed on the 23rd day of April, 1884, to make a diligent and full inquiry into the stability of certain iron Bridges constructed on the Existing Lines of Railway, and also of the timber approaches to the Bridge over the Murrumbidgee River, at Wagga Wagga, in the Colony of New South Wales, beg to submit the following PROGRESS REPORT:—

The important nature of the inquiry entrusted to us has led us to consider with carefulness every step we have taken so that our investigation might be conducted in the fairest and best manner possible, and the conclusions to be drawn from it definite and beyond dispute.

The circumstances which led to the appointment of the Commission, and which have been an important feature in the various matters that in the course of our inquiry have come before us, viz., the differences of opinion, or the want of harmony, existing between the two great branches of the Railway Department with regard to the construction and maintenance of the railway bridges, we shall do no more in this Progress Report than allude to. In our Final Report it will be necessary to introduce a statement of the correspondence which has passed between the two officers of the department more immediately concerned in this inquiry, in order that the course of our investigations may be the more clearly apparent, but for the present it is sufficient for us to say that there was supplied to us at the time of our appointment, and it has received our earnest attention at every stage of our labours, all the correspondence which had passed between the Engineer-in-Chief for Railways and certain of his officers, and between the Engineer for Existing Lines and certain of his officers, together with minutes of the Honorable the Minister for Works, and other documents, relating to the stability or otherwise of certain of the bridges on the railways of the Colony.

In commencing our inquiry we first made ourselves thoroughly conversant with the correspondence and documents submitted to us, and then we decided upon a plan of operations, dividing our inquiry into two parts:—

- (1.) The taking of evidence with respect to the matters referred to in the papers before us, and to other matters which in the course of our investigation might come under our notice; and
- (2.) A personal inspection and testing of the various bridges.

The first matter inquired into was the wooden viaduct at Wagga Wagga, or the timber approaches to the Wagga Wagga bridge. This we regarded as the most urgent of the subjects requiring investigation, as it had been the most prominent before the public in the statements which had been published with reference to the condition of some of the bridges on the lines of railway. Plans and specifications of the viaduct, and the weight and length of the heaviest trains passing over it, specifying the weight, length and wheel base of each locomotive, and load on each axle, and weight, length, and wheel base of each carriage and truck when loaded, were obtained, and together with the papers already before the Commission were carefully considered. Later on the viaduct was twice visited by the Commission and minutely inspected and tested. The details of the formulæ adopted by the Commission for making an analysis of strains and safe working load on the viaduct, and the appliances used for ascertaining the deflection with a moving and with a dead load, will be best described in our Final Report; but it may be stated here that the viaduct was tested with two of the heaviest engines, and that twenty-four experiments were recorded.

Plans and specifications relating to the iron bridge at Menangle and to the bridges over the Wollondilly River (five in number) were then taken into consideration, and on the 27th June we inspected the Menangle bridge, particularly with regard to the riveting and the statements which had been made and laid before us of the finding of loose rivets in the bridge. On the 5th September we again visited this bridge, and further examined it and tested it. Information was also obtained from the Engineer-in-Chief for Railways relative to the design of the bridge, and to the testing of the bridge at the time of opening it for traffic, including the camber and deflection in the centre of girders and at points of contrary flexure, and from the Locomotive Engineer relative to the weight of the engines used in the testing of the bridge.

On the 23rd, 25th, and 26th August we visited and carefully inspected and tested the Wollondilly bridges—at Barber's Creek, Carrick, Wollondilly River, Boxer's Creek, and Mulwarree Creek.

We next gave our attention to the bridges on the Great Western Railway, dealing first with those at Bathurst and Wellington; and the detail of construction having been carefully considered from the plans in our possession, these two bridges were, on January 7th, 8th, and 9th, after a preliminary visit by Mr. Courtney and Professor Warren to make the necessary arrangements, minutely inspected and tested, and the bridge over the Macquarie River at Dubbo was examined.

On the 12th February Professor Kernot and Professor Warren left Sydney for Newcastle to make the necessary arrangements for the inspection and testing by the whole of the Commission of the bridges on the Great Northern Railway; and on the 19th, 20th, 21st, 23rd, and 24th February, a thorough inspection and testing of the bridges at Aberdeen, Peel River, and Peel-street (Tamworth), and Macdonald River, were made by the Commission.

More recently still, viz., on the 14th instant, the Commission again visited the bridge at Menangle, for the purpose of examining the condition of the wood bearers or plates laid on the top of the stone piers to support the iron girders; and two members of the Commission proceeded the same day to Penrith to make preliminary arrangements for the inspection and testing by the Commission of the bridge over the Nepean River at Penrith, on the Great Western Railway.

The

The inspection and testing of the Penrith bridge will be carried out by the Commission at an early date, and there will then remain to be inspected and tested the bridges over Solitary Creek, which are also on the Great Western Railway. It may, however, be necessary for another short visit to be made by one or more members of the Commission to Wagga Wagga, in order that some portions of the wooden viaduct there may be further examined. When the inspection and testing of the Penrith and Solitary Creek bridges, and the possible further examination of the Wagga Wagga viaduct, have been carried out, the visits of the Commission to the railway bridges will have ended, and we shall then be in a position to prepare our Final Report.

During the course of our inquiry we have deemed it essential to the due performance of the work entrusted to us to obtain from the proper officers of the Government various returns and diagrams affording information not included in the documents originally submitted to us for our consideration. In order to ascertain the changes that have taken place in the iron railway bridges since their construction, information was obtained from the Engineer-in-Chief for Railways respecting the whole of the bridges on the railways on the following points:—(1) The date of completion; (2) the date of opening for traffic; (3) a description of main girders; (4) the number of spans and dimensions; (5) the camber, if any, given to the main girders; (6) the name of the superintending officer in charge during erection; (7) the names of the contractors; (8) the test each bridge was subjected to, and how the test was applied; and (9) the deflection noted at the time of testing. Also (*a*) any reports or statements the Engineer-in-Chief might have received at different times relative to the various iron railway bridges, and which though not included among the papers before the Commission were documents he might desire to have submitted for their perusal; (*b*) a return showing the cost of the erection of each of the bridges; and (*c*) a return from the Engineer for Existing Lines, showing the cost of the repairs and maintenance generally of the bridges.

The subject of making certain experiments in the way of testing the strength of wooden girders similar to those used in the Wagga Wagga viaduct, came under the consideration of the Commission during their deliberations upon the condition of that structure, and we decided to make a series of experiments at the Government Yard, Clyde, near Granville, where everything necessary for them was at hand. Arrangements for these experiments were made by a committee appointed for the purpose from the members of the Commission, and on the 4th February, these arrangements having been completed, the Commission met at Clyde, and the experiments were commenced. They were continued for a week, and numbered 102, and they were carried out so as to establish a fair comparison between the experimental compound beam and the Wagga Wagga viaduct, and a large number of similar timber bridges on our railways.

The experiments related to the deflection under the same load as in the case of the Wagga Wagga viaduct which consists of compound beams, 29 feet 6 inches long, and to similar compound beams with 26 feet span as are used in the approaches to many other iron bridges on our railways; to a comparison between 9 inches and 12 inches and 6 inches transoms, and beams bolted together without transoms between them; to the increased deflection produced by slackening bolts; to the effect of corbels; to the increased deflection caused by various loads until reaching the limit of elasticity; and to the breaking of a 29 feet 6-inch beam, 12 inches wide
by

by 12 inches deep, to determine accurately the coefficient of safety of the best Colonial timber.

Twenty-two witnesses have been examined, and several of them re-examined, by the Commission, and a large amount of evidence has been taken.

The time allowed the Commission for making their inquiry and submitting their Report has been twice extended, and it may be necessary to ask for another short extension. If a further extension of time should be asked it will be in consequence of the elaborate and intricate calculations which have to be completed and the diagrams that remain to be prepared. The work of the Commission was very much hampered in its early stages by great delay which occurred in connection with the reply to a representation from the Commission to the Hon. the Minister for Works with regard to special travelling allowances—this delay, however, being unavoidable in consequence of the Minister's illness; and to some extent the speedy progress of the inquiry was interfered with by the serious illness, for some months, of the President of the Commission. It should also be mentioned that one of the members of the Commission (Professor Kernot), being a resident of Melbourne, has been able to visit Sydney and attend the meetings of the Commission, or accompany the Commission to inspect and test bridges, only at certain times, and as his duties in connection with the Melbourne University would permit. Each of these circumstances, but more especially the first, has caused the inquiry to be extended over a period much longer than under ordinary circumstances would be requisite.

We have, throughout, endeavoured to conduct the inquiry expeditiously, but at the same time we have not lost sight of the fact that, in an important investigation of this kind, expedition is not the only point to be observed, and that thoroughness and accuracy must not be sacrificed to a desire to close the inquiry quickly. A consideration of the design of each bridge and a calculation of strains have been necessary to bring out the diagrams for comparison with the actual sections from which the bridges have been constructed; the inspection of the bridges, to ascertain to what extent the original design has been carried out or deviated from; and the testing of the bridges, to verify our previous calculations. The amount of labour involved in the calculations and other work connected with our inspection and testing of the bridges has been very great. Our object, however, has been to so carry out the duty entrusted to us that the result shall be not only an accurate test of the present condition of the bridges on the railways of the Colony, but also a useful guide to bridge construction in the Colony in the future.

Our observations upon the condition of the bridges will be given in our Final Report. We recommend, however, that for the present the maintenance of the bridges be carefully carried out, but that no further alterations in the bridges be made until our Final Report has been submitted.

Certified under our hands and seals, this twenty-fifth day of
March, 1885.

1885-6.

RAILWAY BRIDGES INQUIRY COMMISSION.

FINAL REPORT.

TO HIS EXCELLENCY THE RIGHT HONORABLE LORD AUGUSTUS WILLIAM FREDERICK SPENCER LOFTUS, Knight Grand Cross of the Most Honorable Order of the Bath, a Member of Her Majesty's Most Honorable Privy Council, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

May it please your Excellency,—

WE, the undersigned Members of the Royal Commission, appointed on the 23rd day of April, 1884, to make a diligent and full inquiry into the stability of certain iron bridges constructed on the Existing Lines of Railway, and also of the timber approaches to the Bridge over the Murrumbidgee River, at Wagga Wagga, in the Colony of New South Wales, beg to submit our FINAL REPORT, as follows:—

As was stated in our Progress Report, which was forwarded to your Excellency on 25th March, 1885, the circumstances which led to the appointment of the Commission, and which have been an important feature in the various matters that in the course of our inquiry have come before us, namely, the differences of opinion or the want of harmony existing between the two great branches of the Railway Department with regard to the construction and maintenance of the Railway bridges, render it necessary, for the information of those more particularly interested in the work and the conclusions of the Commission, as well as for the information of the general public, that some statement of the correspondence which has passed between the officers of the Department more immediately concerned in this inquiry, should be given. That statement will be found in a separate paper accompanying this Report. In brief it is as follows:—Mr. Cowdery, in the performance of his duty as Engineer for Existing Lines, thought it necessary to renew what he considered to be loose rivets and defective work in certain iron bridges. Being, by the nature of his appointment, responsible for the safety of the bridges, he appears to have thought it unnecessary to refer to the Engineer-in-Chief for Railways, Mr. Whitton, for his advice in the matter, and to have considered himself competent to deal

deal with the subject without such reference. He, however, applied to the Engineer-in-Chief for Railways for the drawings or plans of these bridges, but these drawings or plans the Engineer-in-Chief declined to supply. Mr. Whitton, finding that some extensive riveting had been done in some of the bridges, and his attention having been drawn to some comments in the Press upon the insecurity of these structures, wrote a minute to the Minister for Works, recommending that this riveting, which he considered to be injurious to the stability of the bridges, should be discontinued. Mr. Cowdery, supported by the reports of his officers, assured the Commissioner for Railways that the bridges were very defective, and he was thereupon instructed by the Commissioner to report upon their condition. This report was forwarded to the Engineer-in-Chief for Railways who, also supported by his officers, reported to the Minister that the bridges were in good condition, and that "no better bridges, with regard to material and workmanship, were ever built."

This difference of opinion led to a personal attack on the one side, and to recrimination on the other; Mr. Cowdery regarding the statements of Mr. Whitton as an insult to him and to his officers. At this point, in order to arrive at a sound decision in the dispute, the Minister being unable to deal with the technical matters involved, and being desirous of having the question thoroughly investigated for the satisfaction of the Government, and to allay any feeling of alarm that might have arisen in the minds of the public as to the stability of the bridges over which so many thousands of persons are constantly travelling, determined to refer the subject for inquiry to a Commission of Experts, and this decision being approved by the Cabinet, and afterwards confirmed by the Executive Council, a Commission was appointed in the first place in October, 1883, of certain gentlemen whose appointments were subsequently cancelled, and afterwards, on 23rd April, 1884, of those whose names are appended to this Report.

The two parts into which we divided our inquiry, as mentioned in our Progress Report, necessitated the taking of evidence in respect to the matters referred to, and also an inspection of the bridges, as it was necessary to see that the bridges had been well designed and were well constructed.

In the taking of the evidence we were careful to examine as far as could possibly be done every person who had been connected with the design, construction, erection, or maintenance of the bridges, so that each side in the dispute might be fairly represented, and in order that we should have every information before us to enable us to form a correct opinion upon the matters referred to us for inquiry.

A personal inspection and testing of every bridge were made with the greatest possible care and accuracy, and this, with the evidence taken, led us to undertake an investigation of the design of each bridge, so as to ascertain by calculation whether the stresses in the different parts of the girders corresponded with the sectional area of the metal provided to resist them.

Diagrams referring to the stresses and sections have been prepared, and will be found in detail as Appendices, as also diagrams representing the method of testing the bridges and showing the loads to which they were subjected, and the deflections thereby produced.

We have taken in our calculation of the stresses applied to the bridges the unit stress generally recognized by engineers, and set down in the British Board of Trade Regulations for Railway bridges, namely, 4 tons per square inch of sectional area in compression, and 5 tons in tension.

The

The live load has been taken as follows:—

| | | | | |
|-------------|----------------------------|---------------------------------|---|---|
| In | 60 feet span, single line, | 1·5 ton per foot run on bridge. | | |
| „ 130 & 150 | „ „ | 1·4 | „ | „ |
| „ 162 | „ double line, | 2·8 | „ | „ |
| „ 198 | „ „ | 2·5 | „ | „ |

The dead load per foot run on bridge, and the effective span and depth of the girders, have also been taken in each case.

The calculations computed from all these data give the sectional areas required, and by comparison with the actual sections adopted in the design and carried out in construction the excess or deficiency of metal in the girders, and the load each bridge will carry with safety, are shown.

After careful consideration of the details of construction, the defects—regarding the importance of which the evidence is very conflicting—were minutely inspected by us and the loose rivets tested, in order to ascertain if the extensive riveting which has taken place in some of the bridges under the direction of the Engineer for Existing Lines has been useless expenditure and injurious to the bridges as stated by the Engineer-in-Chief. This careful inspection was made both before and after the testing of each bridge.

Before testing the bridges, returns were obtained from the Locomotive Engineer of the weight, length, and wheel base of locomotives and tenders of each class in use on the different lines of railways, to determine the load with which the deflections should be ascertained.

The live load taken in the calculations was not exceeded, as only a proportion of this load can be applied to the bridges by the heaviest traffic likely to pass over them.

The deflections were recorded in each case under the following circumstances:—

1. The locomotives standing on the bridge in various positions.
2. Running full speed across the bridge.
3. Running full speed, and applying the brakes when coming on the bridge.

The recording instruments (which were very sensitive, and increased the deflection eight times) were placed principally in the centre of the girders, and at points of contrary flexure. The pencils were fixed at the datum line before the testing began, and it was ascertained that no permanent set occurred in any of the bridges with the loads applied.

The result of this interesting portion of the work of the Commission forms the subject of some of the recommendations made in this Report.

We submit in this Report, in a condensed form, a description of each bridge; but our remarks upon the inspection, construction, and testing are more elaborately given in detail in the accompanying Special Reports.

The order in which the bridges examined are dealt with is as follows:—

SOUTHERN LINE.

Menangle Bridge, over the Nepean River; completed in 1863.

Wollondilly Bridges—Barber's Creek, Carrick, Wollondilly River, Boxer's Creek, and Mulwarree Creek; completed in 1869.

Wagga Wagga Bridge, over the Murrumbidgee River; completed in 1880.

WESTERN

WESTERN LINE.

Penrith Bridge, over the Nepean River; completed in 1867.

Solitary Creek Bridges—Tarana, 4th crossing, 3rd crossing, 2nd crossing, and 1st crossing; completed in 1872.

Bathurst Bridge, over the Macquarie River, completed in 1876.

Wellington Bridge, over the Macquarie River; completed in 1881.

NORTHERN LINE.

Aberdeen Bridge, over the Hunter River; completed in 1871.

Tamworth Bridge, over the Peel River; completed in 1882.

Peel-street Bridge (Tamworth), over Peel-street; completed in 1882.

Macdonald River Bridge; completed in 1882.

Wagga Wagga Timber Viaduct, completed in 1880.

The Menangle and Penrith bridges are designed to carry a double line, and all the other bridges a single line, of rails.

The permanent-way in every bridge is supported upon a timber platform fixed to iron cross-girders, spaced 3 feet from centre to centre.

SOUTHERN BRIDGES.

Menangle Bridge.

This bridge consists of three spans, each 150 feet in the clear, and is constructed with two main girders 486 feet long over all, and 25 feet 6 inches apart. The girders are 12 feet 6 inches in height, and are constructed with top and bottom boxes and central cells formed of two webs. The piers are of stone 162 feet between centres, and the main girders are continuous over two piers. The cross girders are 25 feet 6 inches long, and formed of flange-plates and double angle-irons at top and bottom, riveted to a web-plate.

The main girders are supported upon beds of timber laid on top of the stone piers. Expansion rollers between cast-iron plates are provided over three piers.

At present a single line of rails only is laid on this bridge.

The defects of design or construction are as follows, viz.:—

- (1) Decay of portion of timber supporting main girders over piers.
- (2) Want of access and drainage to bottom cells of girders.
- (3) Imperfect contact in riveted plates and angle or tee irons, and looseness of rivets.

Some loose rivets have already been replaced, but no weakness appears in the portion of the work to which nothing has yet been done. The greatest deflection in 1863, with 5 locomotives weighing 290 tons, was .60 inches, and in 1885, with 3 locomotives (equal to a live load of .92 per foot run on the loaded girder), as taken by us, .50 inches. The passing of an ordinary goods train across the bridge showed a maximum deflection of .44.

The safe load the bridge will carry is 1.15 tons per foot run on each line of rails, equal to 2.3 tons per foot run on the whole bridge, with an intensity of stress of 4 tons per square inch in compression, and 5 tons in tension.

Wollondilly Bridges.

These bridges are five in number and comprise two spans of 130 feet and thirty-two spans of 60 feet. The 130 foot spans are formed of plate girders 140 feet long over all, 10 feet 3 inches in height, with double web and plate booms, and are spaced

spaced 14 feet apart. The 60 feet spans are formed of plate girders 65 feet 6 inches long overall, 4 feet 9 inches in height, with single web and plate booms, and are spaced 12 feet 10 inches apart. The 130 feet spans are at the first and second crossings of the Wollondilly River, all the other bridges being of 60 feet spans. All the cross-girders are 14 feet long, formed of double angle-iron flanges top and bottom, riveted to a plate web. All the piers are of brick in cement, with stone caps. The main girders rest and slide upon metal plates bedded upon the piers. The girders of the 60 feet spans, many of which are built on the skew, are bedded on sheet lead at each end.

In our inspection of these bridges we noticed the following defects, viz. :—

130 feet spans.—The calculations show that the top boom will only carry 1.1 tons per foot run of bridge with a unit stress of 4 tons per square inch of section. The other parts of the girders are, however, strong enough to carry the calculated live load of 1.4 tons per foot run on span. The flange joints in main girders and angle-iron wrappers are barely sufficient in plate and rivet area. The expansion arrangement is not sufficiently protected to prevent cinder ballast from accumulating round the bearings of the girders.

There is no record of the first testing of these spans, but the greatest deflection we obtained in testing was .59 in the centre of the girders, with a load equal to .9 tons per foot run.

60 feet spans.—The flange plates joints are weaker than the rest of the girders, and a greater strain is brought upon the rivets.

The expansion arrangement is defective; the lead on which the girders rest becomes gradually destroyed, and the cinder ballast falling between the ends of the girders and the parapets of piers is injurious and prevents the examination and cleaning of the bearings.

The camber is irregular, varying from 0 to $1\frac{1}{8}$ inches in some of the girders. A sag occurs in each of the five spans of the Barber's Creek viaduct, but we could not obtain positive information to show with what camber they had been built.

The original deflection is recorded as .25 inch, and the greatest deflection we obtained was .625 in the centre of girder, with a live load equal to 1.50 tons per foot run on the bridge. The ordinary traffic (goods train) causes a deflection of .562 inch in centre of girder.

The safe load these bridges will carry is 1.1 tons per foot run on bridge, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension.

Wagga Wagga Bridge.

This bridge consists of four openings, each 150 feet in the clear, and is constructed of two main lattice girders 639 feet long over all, and 14 feet apart in the clear. The girders are 12 feet 3 inches in height, and are constructed with trough-shaped plate booms and double lattice web. The cross girders are 14 feet 8 inches long, formed of double angle-iron flanges at top and bottom, riveted to a plate web. The piers are 159 feet from centre to centre and are of cast iron cylinders, filled with concrete, and connected with wrought iron diagonal bracing. The main girders are continuous over three piers, and are supported upon cast iron bed-plates, fixed on the top of the piers. Expansion rollers are placed over four piers.

With the exception of some loose rivets we did not remark any defects in this bridge.

The

The record of the testing of this bridge in 1880, with three locomotive engines, weighing 185 tons, was $\cdot63$ inches on the centre span, and $\cdot74$ on the end spans.

The safe load this bridge will carry is 1.52 tons per foot run, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension.

WESTERN BRIDGES.

Penrith Bridge.

This bridge consists of three openings of 186 feet and one approach span of 127 feet in the clear.

The main girders of the 186 feet openings are 594 feet long and 28 feet 6 inches apart. The girders are 13 feet in height, and are constructed with top and bottom boxes, and central cells formed of two webs. The piers are of stone, 198 feet between centres, and the main girders are continuous over two piers. The cross girders are 26 feet 3 inches long, and formed of flange plates, and double angle-irons at top and bottom, riveted to a web plate. The main girders are supported upon a bed of timber, and the expansion rollers are similarly arranged to those in Menangle Bridge.

The approach span is formed of two separate plate girders, double web, and cellular top and plate bottom booms, the cross girders being similar to those of the larger spans.

There is at present only a single line of rails laid on the bridge, the remaining portion of the width being used for road traffic.

The bridge is of the same type as that at Menangle, and has similar defects. The small size of the top and bottom cells renders inspection and repairs very difficult.

The timber platforms supporting the main girders show signs of decay.

We find by calculation that in the booms the unit stress produced by the live load of 1.25 tons per foot run on each line of way, or 2.50 tons on whole span, is equal to 4.64 tons per square inch in compression, and 5.82 tons in tension, but the shearing stress in the web over piers is equal to 9.3 tons. This shearing stress is equal to 7.9 tons on one line of way, including ordinary road traffic on the other part of the bridge. This is in excess of the intensity of stress allowed by the Board of Trade. Mr. Whitton, however, in his evidence, states that the rivet iron in the Penrith bridge is particularly good, and that he would not consider a stress of $7\frac{1}{2}$ tons per square inch upon such rivets dangerous.

The rivet area in covering plates of booms over $\frac{1}{2}$ -inch thick, and in angle-iron wrappers, is barely sufficient.

The stresses in the cross girders would exceed a safe limit with a double line of way.

The testing of the bridge with a load of 1 ton per foot run on the main girder next to rails gave a deflection of $\cdot93$ inch.

There is no record of the original testing. The deflection with an ordinary goods train was $\cdot75$ inch.

Some recommendations will be made regarding the alterations necessary to increase the rivet area over piers where the shearing stress occurs, and for duplicating the line on this bridge in the future.

Approach

Approach Span—Main Girders.—The only defect in these girders is that the top cell is inaccessible for inspection and repairs.

The greatest deflection with the same load as on the larger spans was .70 inch.

Solitary Creek Bridges.

These bridges are five in number, comprising six spans of 60 feet each in the clear, and are constructed with separate plate girders, 4 feet 9 inches in height, having single web and plate booms 65 feet 6 inches long and 13 feet apart in the clear.

The cross girders are 14 feet 3 inches long, and are similar in construction to those of the Wollondilly Bridges.

The ends of the main girders are bedded upon sheet lead, resting on the stone caps of the piers, which are built of brickwork in cement.

We observed in the inspection of these bridges that the expansion arrangement is defective, and presents the same obstructions to examination and cleaning as the 60-foot spans of the Wollondilly Bridges.

The bed stones had become unset and broken by the expansion of the girders, but they have now been made good with brickwork in cement.

The girders were built with a camber of $\frac{3}{4}$ of an inch, but this has decreased in some of them.

The testing of these bridges, with a consolidation goods engine weighing with tender 75 tons, showed a deflection of .54 inch as against .35 inch after the first testing with a 42-tons engine.

The safe load these bridges will carry is 1.06 tons per foot run, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension; but with a live load, equal to 1.5 tons per foot run on bridge, the unit stresses will be increased to 4.3 tons in compression and 6.1 tons in tension.

Bathurst Bridge.

This bridge is of the same type as the Wagga Wagga Bridge, but consists only of three openings of 150 feet each, in the clear, constructed with two main lattice girders, each 480 feet long over all, and 14 feet apart in the clear. The cross girders are 14 feet 8 inches long, and are similar to those of the Wagga Wagga Bridge. The piers are spaced 159 feet, centre to centre, and are formed of cast-iron cylinders filled with concrete, connected with wrought-iron diagonal bracing. The main girders are continuous over two piers, and supported upon cast-iron bed-plates fixed on the top of the cylinders. Expansion rollers are placed over three piers.

The only defects in this bridge are in a portion of the span which has not been riveted. The angle-irons are not in close contact with the horizontal and vertical plates of booms; some of the angle-iron wrappers are not in close contact; and some of the rivets are loose.

The testing of this bridge, with a load of 1.4 tons per foot run, gave a deflection of .84 inch, and with an ordinary goods train .46 inch.

The record of the first testing in 1876, with three engines weighing 178 tons, gives a maximum deflection of .78 inch on the centre span and .77 on end span.

The safe load the bridge will carry is 1.6 tons per foot run, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension.

Wellington

Wellington Bridge.

This bridge consists of five openings. The three openings over the main stream are each 150 feet in the clear, and the main girders, cross-girders, and piers are similar to those of the Bathurst Bridge. The end spans are each 61 feet in the clear, constructed with two separate plate girders 12 feet 3 inches in height, single web and plate booms, 65 feet 8 inches over all and 14 feet 8 inches apart in the clear; the cross-girders are similar to those of the 150-foot spans, and the piers are also formed of cast iron cylinders, &c. The expansion arrangement consists of sliding plates.

During our inspection of this bridge our attention was directed to a difference of level of more than 3 inches in one of the land piers. This is attributed by the Engineer for Existing Lines to a settlement of the pier, which he believes will increase after heavy floods. The Engineer-in-Chief asserts that the difference of level is due to an error in the erection of the pier, and that the foundation is good.

The piers have been tested with a load of 150 tons without showing any sign of settlement. The evidence is contradictory; but we do not think that any sudden sinking will take place, although the difference of level should be watched and recorded, particularly before and after every flood.

The other defects in the construction of this bridge are the unsymmetrical positions of the main girders upon the cast iron bed plates, to the extent of from 4 to 9 inches, the want of close contact between the plates and angle irons and channel irons with web, and some loose rivets.

The testing of the bridge with a load of 1.4 tons per foot run showed a deflection of .84 inch, and with an ordinary goods train .461 inch. The record of the first testing in 1881, with three engines weighing 174 tons, gives a deflection of .64 inch on the centre span and .72 inch on the end spans.

The safe load the bridge will carry is the same as that of the Bathurst Bridge, viz., 1.6 tons per foot run.

The testing of the approach span with a load of 1.05 tons per foot run showed a deflection of .36 inch in centre of span.

The record of the first testing in 1881 with a 63-ton engine is .33 inch.

NORTHERN BRIDGES.

Aberdeen Bridge.

This bridge is similar to the Bathurst Bridge, consisting of three openings of 150 feet each in the clear, and constructed with two main lattice girders 480 feet long over all, and 14 feet apart.

The main girders, expansion arrangement, cross girders, and the piers are similar to those at Bathurst and Wellington Bridges.

In our inspection of this bridge we found the defects to be want of closeness in the joints of plates and bars, imperfect butting of plates in compression, space between plates of booms and cross-girders, loose rivets, and want of proper access to the expansion arrangement.

The

The testing of the bridge with a load of 1·37 tons per foot run showed a deflection of ·83 inch. The record of the first testing in 1871, with three engines weighing 170 tons, shows a deflection of ·68 inch on the centre span and ·79 on the end spans.

The safe load the bridge will carry is the same as that of the Bathurst and Wellington Bridges, viz., 1·6 tons per foot run.

Peel-street (Tamworth) Bridge.

This bridge consists of one span 61 feet in the clear, and is constructed with two separate plate girders 6 feet 3 inches in height, having single web and plate booms 65 feet 8 inches long over all, and 14 feet 8 inches apart. The span is similar to the approach spans of the Wellington Bridge. The cross girders are 14 feet 3 inches long and similar to those of the Aberdeen Bridge.

The piers are of brick in cement, with stone caps.

The expansion arrangement consists of sliding plates.

There are no defects in this bridge except a few loose rivets.

The original deflection is recorded as ·30 inch, and the greatest deflection we obtained with a 66 tons locomotive was ·29 inch.

The safe load this bridge will carry is 1·78 tons per foot run, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension.

Tamworth Bridge.

This bridge consists of one span 150 feet in the clear, and is constructed with two main lattice girders, double web and plate booms 161 feet 9 inches long over all, 12 feet 3 inches in height, and 14 feet apart. The cross girders are 14 feet 8 inches, and similar in construction to those of Aberdeen Bridge. The piers are formed of cast iron cylinders filled with concrete, and connected by wrought iron diagonal bracing.

The main girders are supported upon cast iron bed plates, fixed on top of cylinders, and expansion rollers are placed at one end of the girder.

The principal defects we found in this bridge were some loose rivets, and difficulty of access to the expansion arrangement.

The testing of the bridge with a load of 1·4 tons per foot run showed a maximum deflection of ·90 inch. The record of the first testing in 1882, with three engines weighing 174 tons, shows ·78 inch in the centre of the girders. The deflection caused by the ordinary mail train, with only one locomotive, was ·566 inch.

The safe load the bridge will carry is 1·6 tons per foot run, with an intensity of stress equal to 4 tons per square inch in compression and 5 tons in tension.

MacDonald River Bridge.

This bridge is similar in design to the Tamworth Bridge, except that the piers are of brick in cement.

It has similar defects.

The

The testing, with a load of 1·4 tons per foot run, gave a maximum deflection of 1·03 inches. The record of the first testing of the bridge in 1882, with three engines weighing 174 tons, shows a deflection of ·72 inch in the centre. The deflection caused by the ordinary mail train, with only one locomotive, was ·578 inch.

The safe load the bridge will carry is 1·6 tons per foot run, with an intensity of stress of 4 tons per square inch in compression and 5 tons in tension.

SUMMARY OF RESULTS.

The result of our consideration of the designs and our calculations upon the working live load that each bridge will carry with safety, together with the test load applied to each bridge, and the deflection produced by it, is summarized in the following table :—

| Name of Bridge. | Effective span. | Live load in tons per foot run taken in calculation. | Unit stresses produced by total load in tons per square inch. | | Live load which the bridge will safely carry according to rules of the British Board of Trade. Unit stresses, 4 tons per sq. inch in compression, and 5 tons in tension. | Test load reduced to tons per foot run of span tested. | Greatest deflection recorded by the Commission in testing the bridges in 1885. | |
|------------------------------|-----------------|--|---|---|--|--|--|------------------------|
| | | | Compression. | Tension. | | | With test load. | With ordinary traffic. |
| Wollondilly Bridges— | | | | | | | | |
| Small spans | 60 | 1·5 | 4·5 | 4·9 | 1·1 | 1·5 | ·625 | ·56 (goods train). |
| Large spans | 130 | 1·4 | 4·6 | 5·4 | 1·2 | ·90 | ·59 | |
| Solitary Creek Bridges | 60 | 1·5 | 4·3 | 6·75 | ·91 | 1·56 | ·542 | ·50 (goods train). |
| Bathurst Bridge | 159 | 1·4 | 3·68 | 4·33 | 1·6 | 1·4 | ·703 | ·461 ,, |
| Wellington Bridge | | | | | | 1·4 | ·84 | |
| Aberdeen Bridge | | | | | | 1·37 | ·83 | |
| Tamworth Bridge..... | 156 | 1·4 | 3·72 | 4·37 | 1·6 | 1·4 | ·90 | ·566 (mail train). |
| MacDonald River Bridge | | | | | | 1·4 | 1·03 | ·578 ,, |

| Penrith Bridge | 198 | { 1·25 on each line of way. | 4·64 in booms only ; 9·3 in web over piers. | 5·82 in booms only ; 9·3 in web over piers. | ·9 on each line of way for booms only. | { 1·5 on the line loaded or 1·00 on main girder tested. | ·93 | ·75 ,, |

Our inspection of the bridges and investigation of the defects and loose rivets, pointed out by the officers of the Department of Existing Lines, did not disclose such weakness in the bridges as the information supplied would have led us to believe. On the one side, Mr. Whitton's officers admitted that some defects and a few loose rivets existed, but gave a decided opinion that the strength of the structures was not affected by the imperfect work ; and on the other side, Mr. Cowdery and his officers insisted upon the necessity of making good the visible and apparent defects to prevent the deterioration of the material, and that no time should be lost in doing what they regarded as a very important and urgent work indispensable to the stability of the bridges.

RECOMMENDATIONS

RECOMMENDATIONS WITH REFERENCE TO THE IRON BRIDGES.

In making recommendations, we are aware of the great responsibility resting upon the Engineer-in charge of maintenance, and his officers, whose duty it is to renew any defective materials. Every detail of the design and construction should be known to the Engineer for Existing Lines, who should have for reference copies of the plans from which the bridges have been built.

In order to decide whether a certain group of rivets are to be cut out and replaced the stresses which the rivets in question have to transmit should be ascertained, and also the amount of effective rivet area which is necessary to transmit these stresses with safety after making due allowance for looseness and other defects, or the percentage of rivets in excess of the effective rivet area required. It is not necessary to cut out and replace rivets simply because they seem slightly loose, unless the looseness is such as to make them vibrate with passing loads.

After hearing all the evidence and carefully examining the bridges, we are unable to find any grounds for the allegation that rivets have been loosened by violent and improper testing.

By comparing the girders of the bridges in which thousands of rivets have been renewed with the girders in which no riveting has been done the difference in stiffness or deflection cannot be perceived, and although tight riveting is desirable a few loose rivets in the whole structure will not affect its safety.

At the time our Progress Report was forwarded to your Excellency, our consideration of the design of the bridges and our inspection of some of them had shown us that no apprehension need be felt by the Government for the safety of the travelling public, and we recommended that "no further alterations be made in the bridges until our final report has been submitted."

The recommendations we now make may be classified as follows:—

1. Regarding defects of workmanship.
2. Regarding defects preventing proper maintenance.
3. Making alterations in some of the bridges to comply with the rules of the British Board of Trade, and to provide for heavier traffic in the future.

Other recommendations for proper maintenance will be found in the Special Reports on each bridge.

Menangle Bridge.

1. Replacing decayed timber platform supporting main girders over piers. Re-riveting tee irons and web plates and angle iron wrappers in which loose rivets occur.
2. Facilitating the inspection of the cells of booms by proper ventilation and drainage holes in such places not affecting the stresses on the parts where they are made.

*Wollondilly Bridges.**130 feet spans.*

We have no recommendation to make with reference to these spans.

60 feet spans.

1. Removing the lead on which the girders rest, and placing a simple cast iron bed-plate under the ends of the girders; two adjoining girders being fixed on a bed-plate and sliding at the opposite ends on other plates with longitudinal strips to prevent lateral displacement.
2. Cutting away a portion of pilaster over piers to give access to expansion arrangement referred to above.

Wagga

Wagga Wagga Iron Bridge.

We do not recommend anything to be done to this bridge except the usual cleaning, repainting, &c., when necessary, and replacing a few rivets where showing signs of looseness.

Penrith Bridge.

1. We recommend the renewal of rivets in diaphragm plates of centre cells of girders, in covering plates of web, and in vertical tee iron attachment of cross girders where the rivets are loose and the parts in bad contact; also that where the rivets are loose in some of the angle iron wrappers, or where blank holes occur, the joint be entirely riveted.
2. Cutting convex surface on top of stone piers to permit the renewal of any portion of the decayed timber in the platform supporting the main girders.
(The obstructions to the entrance of the cells of bottom booms have been removed at our request, and the booms cleaned, but additional ventilation and drainage are necessary.)
3. The $\frac{3}{4}$ -inch rivets uniting the webs to booms in the main girder next to rails to be replaced by rivets 1 inch in diameter for a distance of 40 feet on either side of the two middle piers and for 10 feet from end piers; not more than six rivets to be taken out and replaced at one time.

Before the line is duplicated on this bridge we recommend that the $\frac{3}{4}$ -inch rivets uniting the webs to booms be replaced by 1 inch rivets on the other main girder for a distance of 40 feet on either side of the two middle piers and for 10 feet from end piers; also that a longitudinal girder be riveted to the cross girders the whole length of the bridge to distribute more effectually over several cross girders the weight brought upon them by the driving wheels of the engines when passing over.

Solitary Creek Bridges.

The recommendations made for the 60 feet spans of the Wollondilly Bridges also apply to these bridges.

Bathurst and Wellington Bridges.

We do not recommend anything to be done to these bridges beyond replacing a few rivets where positively loose.

Nothing should be done to the land pier at Wellington Bridge, reported to have sunk, until future observations prove that an actual sinking takes place.

Aberdeen Bridge.

We recommend the renewal of the angle wrappers where double holes or loose rivets occur, and the cutting out and removal of loose rivets where necessary.

Peel-street Bridge, Tamworth.

We have no recommendations to make with reference to this bridge.

Tamworth and MacDonald River Bridges.

We recommend a judicious removal of loose rivets in attachments of lattice bars in angle iron wrappers and in some of the joints of the booms.

Having

Having now dealt with the iron bridges, we proceed to refer to the Wagga Wagga timber viaduct.

WAGGA WAGGA TIMBER VIADUCT.

(*From Bomen to Wagga.*)

According to the documents submitted to us with reference to this viaduct, Mr. R. D. Stephens, District Engineer in the Existing Lines Department, having tested the viaduct on the 6th December, 1881, drew the attention of the Engineer for Existing Lines, in a report dated 16th January, 1882, to the great deflection of the timber girders, and commenting on what he considered to be an excessive length of span and corbels adopted in the design of the viaduct, advised that on account of the wavy motion of the engines when passing over the structure the speed should be limited to 18 miles an hour.

After subsequent reports from Mr. Stephens regarding defective girders and decayed piles, the matter in the meantime having been brought before the Commissioner for Railways, Mr. Goodchap, considering that it was a question affecting the stability of the viaduct, requested the Engineer for Existing Lines to personally examine the structure and report upon it.

Upon the receipt of this report, he directed that the speed of the trains should be reduced to 18 miles an hour.

Mr. Cowdery's report upon the examination of the viaduct was sent to the Commissioner on 13th June, 1882, and forwarded by him to the Engineer-in-Chief.

On 3rd October, Mr. Whitton forwarded for the information of the Minister, copies of reports received from officers in his Department upon a defective pile, and Mr. Cowdery having minuted upon these reports that it was desirable for engines not to run over the viaduct at a greater speed than 16 miles an hour, Mr. Goodchap before finally deciding to limit the speed to that extent, and before bringing the matter under the attention of the Minister, requested Messrs. Cowdery and Stephens to adopt such measures as were necessary to establish their statements.

Mr. Cowdery having again personally examined the viaduct, forwarded to the Commissioner a detailed list of imperfections in the structure, stating at the same time that the viaduct was quite as bad as reported by Mr. Stephens, and that he was of opinion that all the uprights and many of the girders would have to be removed within a few years.

This paper having been laid before the Minister by the Commissioner, the Minister directed that it be sent to the Engineer-in-Chief for Railways in order that he might have the work reported upon by his officers.

Mr. Whitton thereupon had the viaduct inspected by Messrs. Wade and Drewett, Officers in his Department, and sent the report of those gentlemen to the Minister for Works. This report stated that "the timber was to all appearances sound when put in, and that every care was taken to have the work properly carried out," but "that the dry rot which had made its appearance some time after the completion of the work was accelerated to a great extent by the timber having been cut when the sap was up instead of during the winter months," and that "the timber supports having a large margin of strength, no danger need be apprehended if the progress of the dry rot be carefully watched."

In the meantime Mr. Whitton asked the Minister to order that the props which Mr. Cowdery had directed to be put under the girders of the superstructure be removed as he considered they produced an impression that the viaduct was unsafe.

This paper having been forwarded by the Minister for Mr. Cowdery's perusal only, Mr. Cowdery in returning it to the Commissioner for Railways urged upon him in the strongest possible terms not to allow the props which had been put there by his instructions for the safety of the public, after a personal and careful examination, to be removed.

Description and Inspection of Viaduct.

The viaduct forms the approach to the Wagga Wagga iron bridge, over the portion of the Murrumbidgee River exposed to heavy floods. It consists of a series of timber spans, 29 feet 6 inches long, supported upon timber piers or trestles abutting upon embankments, except the span adjoining the iron bridge.

The piers are constructed of timber piles, headstocks, walings, and bracing, and consist of 1,288 piles in 322 rows, of which 58 rows are driven into the ground to a depth varying from 14 to 57 feet, and 264 rows are tenoned into sills bedded in concrete at depths of from 6 to 8 feet below the surface. The height of the piers varies from 5 feet to 16 feet.

The spans forming the viaduct are arranged as follows, viz.:—

| | | | | | | |
|-------|-----|-----|-----|-----|-----|------------|
| No. 1 | ... | ... | ... | ... | ... | 113 spans. |
| „ 2 | ... | ... | ... | ... | ... | 66 „ |
| „ 3 | ... | ... | ... | ... | ... | 4 „ |
| „ 4 | ... | ... | ... | ... | ... | 72 „ |
| „ 5 | ... | ... | ... | ... | ... | 56 „ |
| „ 6 | ... | ... | ... | ... | ... | 5 „ |
| Total | | | | | | 316 spans, |

Equal in length to more than $1\frac{3}{4}$ miles.

The number of beams forming this large structure is 2,528, each 29 feet 6 inches long, 12 inches wide, and 12 inches deep, equal in length to more than 14 miles of hewn timber. They are all of ironbark.

Each span consists of four compound beams, two of which are under the rails and the other two on the outside, at a distance of 2 feet from the former. Eight transoms unite the four compound beams, and keep the upper and lower girders of each 6 inches apart. Corbels 10 feet long, 12 inches deep, and 12 inches wide, projecting 5 feet on each side of pier, support the ends of each compound beam. The whole is bolted together with 1-inch screw-bolts through six of the transoms, and with $1\frac{1}{4}$ -inch screw-bolts through beams, corbels, and the two end transoms. The platform for the permanent way is formed of 3-inch plank-ing, with ballast boards on each side.

The difference of opinion between the Engineer-in-Chief for Railways and the Engineer for Existing Lines and their respective officers, regarding defective timber and the stability of the viaduct, and also the removal of props placed under some of the girders to support them, and the question of the rigidity of the structure and reducing the speed of trains passing over it to 16 miles per hour, could not be decided by us with an inspection and testing of the viaduct only, and without a serious consideration of the design and calculations upon the strength of Colonial timber. The opinion of officers belonging to the two great branches of the Railway Department was so much at variance upon the co-efficient of safety to be taken in calculating the strength of Colonial timber, that we resolved to make experiments on a large scale to test the strength and elasticity of compound timber beams, similar to those used

used in the Wagga Wagga and other viaducts on the Government Railways, and to determine a reliable co-efficient of safety. The particulars of these experiments will be referred to hereafter.

In our inspection of the viaduct, the detailed particulars of which are the subject of a Special Report, we found that properly seasoned timber for piles could not be obtained in the short period of time allowed for the erection of the viaduct and the opening of the line, and that the great distance from which the timbers had to be procured was taken into consideration in reference to the cost of the structure.

For this reason, in addition to ironbark the following timber was allowed to be used for piles, viz.:—Stringy-bark, ash, messmate, appletree, &c. The piles having been cut when the sap was up, instead of during the winter months, began to show signs of decay soon after the erection of the work, and in addition to the dry-rot, pipes and other defects were detected.

The number of piles in various stages of unsoundness were found to be eighty, equal to 1 in every 16 of the whole, and the number of unsound girders to be twenty, or 1 in 126; twenty-three piles are strutted and fifteen girders propped up.

The girders are of ironbark, and, except some occasional dry knot or bad heart, few defects were detected.

The question of the length of corbels (10ft.) being excessive is more particularly referred to in our experiments on the compound beam.

Great attention has been paid on the maintenance of the viaduct. Holes have been drilled to reach the pipes of the piles, and a composition injected to preserve the timber from insects and decay; bolts are kept well screwed up, and additional ones have been put in when necessary to stop the extending of the cracks in the hewn timber caused by atmospheric influences.

From returns furnished by the Engineer for Existing Lines, the cost of maintenance of the Wagga Viaduct from the time it was opened for traffic in September, 1880, to the 26th July, 1883, was £1,546 10s. 9d.

Taking the average life of a bridge constructed with good timber and properly maintained to be 25 years, the yearly renewal of the material will be about 4 per cent. of the whole. From the analysis of our timber inspection we find, however, that owing to the defects stated to exist in the piles of the Wagga Viaduct nearly the whole of the piers may have to be renewed within 20 years, whereas the superstructure being of ironbark may last over 25 years.

It is important to notice this as it may guide the Government Engineer in the future design of large timber structures, to calculate if the difference of cost of construction and maintenance of timber viaducts, compared with structures of iron and other materials, is the most economical system to be adopted.

In comparing the design of the Wagga Viaduct with the timber viaducts erected in Victoria, we find that some timber can be saved by a change of design which under similar circumstances presents the same objections regarding the duration of the material.

The testing of the Wagga Viaduct with two engines weighing each 63 tons 16 cwt. 3 qrs., running at more than 20 miles per hour, showed a deflection of less than half an inch except in three spans where it reached as much as .59 inch

Comparing

Comparing these deflections with those obtained in the experiments referred to, we found that the Wagga Viaduct gave satisfactory results, the maximum load produced by the engines under testing on one span of the viaduct being equivalent to a distributed load of 42 tons, or to 12·4 tons on each rail-bearing compound girder, and that the viaduct is more than sufficiently strong for the heaviest traffic which passes over it.

Having given careful attention to the oscillating and plunging motion of the engines as mentioned by the officers of the Existing Lines Department, we found nothing more abnormal in this motion than is usually accumulated in a large number of small uniform spans, when the elasticity of the timber has to be taken into account. We tested accurately the motion of the beams and trestles in every direction and found very little movement at any speed. Observations were also taken from an ordinary passenger carriage and from the overhanging platform of a bogie car. As a final test we rode on the engines when running at a speed exceeding 30 miles an hour, and found but little difference when running over the viaduct or on the embankments. The viaduct is therefore sufficiently stiff for the heaviest traffic that passes over it. We do not, therefore, see any reason why the ordinary speed of trains passing over the viaduct should be reduced, and we are of opinion that with proper maintenance no danger need be apprehended on account of the speed.

EXPERIMENTS FOR TESTING THE STRENGTH OF TIMBER GIRDERS.

These experiments were made at the Government Railway siding at Clyde, near Granville, and are more fully detailed in our Special Report upon the subject.

A compound beam, similar to those in the Wagga Viaduct, was erected upon two trestles representing piers, and gradually loaded in the centre until a weight of about 10 tons had been reached, the deflection being noted at each test. The deflections were also recorded with varying loads under the following circumstances, with all the bolts screwed tightly, viz:—

1. Compound beam, 29 feet 6 inches long, with 10-foot corbels, and 12-inch, 9-inch, and 6-inch transoms between the beams.
2. Compound beam with 6-inch transoms, and 10-foot, 8-foot, and 6-foot corbels respectively.

A compound beam 26 feet long, similar to those used on nearly all timber viaducts constructed before the Wagga Viaduct, was then erected upon the trestles and loaded in the centre until the weight reached $10\frac{1}{2}$ tons, and the deflection was recorded at each test under the following circumstances:—

1. With the length of corbels 8 feet and with 6-inch transoms between the girders and all bolts screwed tightly.
2. The same with slack bolts.
3. The same with the transoms removed and the beams tightly bolted together.

From the experiments with corbels we found that by shortening the corbels from 10 feet to 8 feet or 6 feet, the central deflection of the girder was increased while the deflection of the corbels was diminished; and from the experiments with slack bolts we found that the strength of the compound beam may be reduced according to the slacking of the bolts from 35 per cent. to 68 per cent.; also that girders bolted together without any blocks or transoms between them are much stiffer than with them.

CO-EFFICIENTS OF RUPTURE AND OF ELASTICITY.

The co-efficients or modulus of rupture and the modulus of elasticity of Colonial timber not having been definitely established for large-sized timbers, we resolved to complete our investigations upon the strength and elasticity of compound beams by testing to the breaking point an ironbark girder $12\frac{1}{4}$ inches deep by $12\frac{1}{4}$ inches wide, and 29 feet 6 inches long.

The beam was gradually loaded in the centre, and the deflection noted at each addition to the load until it began to crack with a load of 16.55 tons, showing a deflection of 7.62 inches.

The loading was continued until the beam broke with a load of 19.55 tons, showing a deflection of 12 inches.

Comparing our experiments with those made as far back as 1861 by Major-General Ward, R.E. (then Captain Ward), and Mr. Trickett at the Royal Mint, Sydney, on small scantling, and with those made more recently by the Victorian Railway Department, in October, 1880, on larger timbers, the particulars of which were sent to us by Mr. R. Watson, the Engineer-in-Chief for Victorian Railways, and with the experiments made by Mr. Whitton on scantlings used in our timber viaducts, we obtained the following results:—

| | Major-General Ward, R.E., and Mr. Trickett, at Royal Mint, Sydney. Scantling $2'' \times 2'' \times 4'$ long. (1) | Mr. John Whitton, Engineer-in-Chief for Railways, N.S.W. Scantling $12'' \times 12'' \times 26'$ long. (2) | Victorian Railway Department. Scantling $11'' \times 7\frac{1}{2}'' \times 14' 8''$ long. (3) | Railway Bridges Inquiry Commission. Experiments made at Clyde. Scantling $12'' \times 12'' \times 29' 6''$ long. (4) | Mean of experiments on large-sized timbers. |
|--|---|--|---|--|---|
| Modulus of Rupture " <i>f</i> " in lbs. avoirdupois per square inch | 13,734 Ironbark from Albury. | 13,953 Ironbark | 8,430 Red gum | 12,222 Ironbark | (2) and (4) 13,038 |
| Modulus of elasticity " <i>E</i> " in lbs. avoirdupois per square inch | 2,069,280 | | 1,948,128 | 2,715,813 | { (1) (3) and (4) 2,244,407 |

It will be observed that our co-efficient "*f*" with large-sized timbers is smaller than that obtained in the Mint experiment with small scantling, but the modulus of elasticity "*E*" is larger.

THE EARLIER AND THE LATER RAILWAY BRIDGES.

The two largest bridges in the Colony (those at Menangle and Penrith) were erected at a time when the designing and construction of such works had not arrived at the point of perfection apparent at the present day. The Engineer-in-Chief has followed the improvements made in the science of bridge designing, and every type of bridge erected since the date of the erection of the Menangle and Penrith Bridges has been an improvement upon previous designs. This we have ascertained by our inspection of the iron bridges at Dubbo and Albury, and more recently, of the George's River Bridge, in which the improvements are evident.

The same remarks apply to the construction of the bridges, the workmanship in the more recently erected bridges being more accurate and altogether a great improvement upon what is to be seen in the first iron bridges built in the Colony.

While in the first bridges erected on the railways of the Colony the makers and erectors did not arrive at the accuracy of construction which is now attained, each new bridge has been an improvement on that which has preceded it, and as is the case with the Albury Bridge, the Dubbo Bridge, and the bridge over the George's River, the bridges now erected on our railways are of a superior description both in design and construction.

Thus

Thus the greater facilities at hand in connection with the later structures make it unfair to expect that the earliest bridges should have reached the standard of the bridges more recently erected, and we cannot, therefore, in justice, compare the first of the bridges with those of later and more perfect design. We can only express our opinion that the earlier bridges were good specimens of bridge building at the time they were designed, and that notwithstanding the number of years which have passed since their erection they have not deteriorated to such an extent as to affect their safety.

THE MAINTENANCE OF THE BRIDGES.

The maintenance of the bridges having long since passed away from the Department of the Engineer-in-Chief, he can scarcely be held responsible for any want of attention to those parts of the structures to which the present Engineer for Existing Lines has considered it his duty to attend since he assumed the responsibilities of his office. Mr. Cowdery, in our opinion, has in all he has done acted conscientiously, and at the time this inquiry was instituted was endeavouring to remedy defects which he believed would lead to some disaster if the work of alteration, which he authorized, were not done. Much of that work, principally reriveting, has, it is true, been unnecessary, and many rivets which his officers have condemned as being so loose as to require replacing did not require to be replaced and should not have been renewed without greater consideration of the stresses and evidence of weakness. On the other hand, however, no harm has been done, and in the case of some of the smaller bridges the structures have been improved by the reriveting.

But we differ entirely from Mr. Cowdery's opinion that all plates and angle iron not butting properly or in perfect contact should be now removed and made good. We are of opinion that these defects are not of such importance in the parts of the bridges where they occur as to justify any feeling of alarm, and that they should not be interfered with until a positive looseness of rivets or an increased deflection renders such repairs necessary.

All work of this description must be watched carefully, and in no way interfered with by any one not possessed of a thorough knowledge of bridge work. Perfect contact is certainly desirable, but is not as necessary in bridge as in boiler work, where the joints are to be made steam tight. The cost of such perfection in the former would preclude ironwork from being used in the construction of bridges except in a very few cases.

It is to be observed that mathematical accuracy is not attainable, and should not be expected, in ordinary bridge work. Imperfect butting of plates constantly occurs, and to provide for it compression joints are usually designed on lines similar to those adopted for tension joints, that is to say, cover plates including several rows of rivets are used, so that sufficient shearing area is provided to carry the stress even though the butts should not be in contact. This practice has been followed at most of the bridges, and consequently the complaints of bad butting are of no force whatever, the strength of the parts being independent of the butting. At the Tamworth and Macdonald River bridges, however, this precaution has not been fully carried out, and hence the strength of the top booms is dependent upon the butting. Most fortunately all parties agree, and the members of the Commission are satisfied from personal inspection, that in these latter cases the butting is remarkably perfect.

In

In many places the contact between the channel iron struts and the side plates of the booms is not very perfect. This defect is due frequently to the circumstance that the back of the strut has become slightly rounded in the process of rolling. Such a strut may be in most perfect contact at the middle of its width where the rivets pass and yet may gape $\frac{1}{16}$ or even $\frac{1}{8}$ of an inch at the sides. Another cause of gaping is to be found in the "burr" or ridge left round the hole after punching, and which occasionally appears even in drilled holes. This "burr," if not removed, will keep the parts slightly apart and give an appearance of bad work.

Unless accompanied by an unmistakable looseness of the rivets, this apparently imperfect contact does not affect the strength of the bridge.

The British Board of Trade rules for proportioning iron girders make large allowances for imperfections in construction. Could absolutely uniform material and perfect workmanship be obtained, the amount of metal used might be reduced to the extent of 30 or 40 per cent. Hence a few defects, provided they are not of excessive magnitude, need not cause alarm. Their probable existence was foreseen and provided for when the rules generally recognized by engineers were first established.

PERIODICAL TESTING OF BRIDGES.

We recommend that every bridge be tested periodically, under the direction of the Engineer-in-Chief for Railways; that the test loads should not largely exceed the heaviest traffic passing over the bridges; and that a tabulated statement recording the loads with which the tests have been made, reduced to tons per foot run of spans tested, and the deflections produced by these loads, be published from time to time and filed for comparison with future testings; and also that the camber of each bridge be accurately ascertained as soon as possible, and that it be examined at each time of testing, in order to detect any alteration that may have taken place.

RESPECTIVE DUTIES AND RESPONSIBILITIES OF THE ENGINEER-IN-CHIEF FOR RAILWAYS AND THE ENGINEER FOR EXISTING LINES.

The great extent of the Government Railways has no doubt necessitated a subdivision of the labour and great responsibility involved in their construction and maintenance, but we are not called upon by the nature of our inquiry to make any recommendation upon this arrangement.

The duties of Mr. Whitton as Engineer-in-Chief are understood to be to design the lines of railway, including all bridges and other works, and to superintend their construction. As soon as new lines or extensions are opened for traffic his connection with them appears to cease, and it then becomes the duty of Mr. Cowdery, as Engineer for Existing Lines, to keep in good order and to maintain the works handed over to him. In addition to this, Mr. Cowdery has to take charge of the permanent way and to design alterations to existing lines of railways, as well as to design and superintend the erection of the extensive and costly buildings necessary for the protection of the rolling stock and the accommodation of the travelling public.

The engineers at the head of these two great branches of the Railway Department are assisted by a large staff of competent engineers and other officers.

Any official misunderstanding between the officers of the two branches must be injurious to the public interests.

The

The responsibility of the Engineer-in-Chief should not cease as soon as the railway lines are open for traffic, nor should the Engineer for Existing Lines be solely responsible from that time for works over the design and construction of which he has had no control. This applies particularly to railway bridges; and we are of opinion that in future no structural repairs should be made in any railway bridge without the knowledge and approval of the Engineer-in-Chief.

We are strengthened in this opinion by Mr. Cowdery's own evidence, that when authorizing the renewal of rivets he had not ascertained the stresses which the rivets in question had to transmit, nor the amount of rivet area which is necessary to transmit those stresses without exceeding the safe unit stresses on the rivets.

We recommend that the duties and responsibilities of these two high officers should be more clearly defined in accordance with the opinion we have expressed, and we suggest that the advice of the Engineer-in-Chief should be obtained in all such matters where his well-recognized ability in railway engineering and long Colonial experience render his opinion of especial value to the success of the Railway system of the country.

RECAPITULATION.

To recapitulate, our recommendations are briefly as follows :—

Menangle Bridge.—Decayed timber, supporting the main girder, to be renewed; tee iron and angle iron wrappers, in which loose rivets occur, to be riveted; holes to be made in cells of booms to provide for proper ventilation and drainage.

Wollondilly Bridges.

130 feet spans.

No recommendation.

60 feet spans.

The lead under girders to be removed, and replaced by bed plates to support the ends of the girders, and to provide proper expansion; portions of pilasters of the piers to be removed to give access to expansion arrangement.

Wagga Wagga Iron Bridge.—The usual maintenance to be carried out, and loose rivets to be replaced where they appear.

Penrith Bridge.—The loose rivets at present in diaphragm plates of centre cells of girders, covering plates of web, vertical tee iron attachment of cross girders, angle iron wrappers, and joints with blank holes, to be renewed; the top of stone piers to be cut down to permit a renewal of decayed timber under main girders; the $\frac{3}{4}$ -inch rivets uniting the webs to the booms in main girders to be replaced by 1-inch rivets for a distance of 40 feet on each side of the two middle piers, and for 10 feet from end piers. This last recommendation is intended to apply to only the main girder next to rails with a single line of way, but it will apply to the two main girders when the line is duplicated on this bridge, when also a longitudinal girder should be riveted to the cross girders the whole length of the bridge.

Solitary Creek Bridges.—To be dealt with as recommended in the case of the 60 feet spans of the Wollondilly bridges.

Bathurst Bridge.—The usual maintenance to be carried out, and loose rivets to be replaced where they appear.

Wellington

Wellington Bridge.—To be dealt with as recommended for the Bathurst Bridge, and careful observation to be made of land pier to ascertain if any sinking takes place.

Aberdeen Bridge.—Angle iron wrappers to be renewed where double holes occur and loose rivets to be replaced where they appear.

Peel-street (Tamworth) Bridge.—No recommendation.

Tamworth and MacDonald River Bridges.—Loose rivets in attachments of lattice bars, in angle iron wrappers, and in some of the joints of the booms, to be renewed judiciously.

Wagga Wagga Timber Viaduct.—To be kept in a perfect state of repair, in which case the speed of engines need not be reduced.

The Maintenance of the Bridges.—The maintenance of the bridges, which should not include structural repairs, to be strictly carried out.

Periodical Testing of Bridges.—Every bridge to be tested periodically under the direction of the Engineer-in-Chief for Railways, with a load not largely exceeding the heaviest traffic passing over the bridges; the results of the testings to be recorded and published for comparison with future testings, and the camber to be accurately ascertained and periodically examined.

Respective duties and responsibilities of Engineer-in-Chief for Railways and Engineer for Existing Lines.—The responsibility of the Engineer-in-Chief not to cease as soon as a railway line is opened for traffic, and the Engineer for Existing Lines not to be solely responsible from that time for works over the design and construction of which he has had no control; no structural repairs to bridges to be carried out without the knowledge and approval of the Engineer-in-Chief; the duties and responsibilities of the Engineer-in-Chief and the Engineer for Existing Lines to be clearly defined; and the advice of the Engineer-in-Chief to be obtained in all matters in which his opinion would be of special value.

Certified under our hands and seals, this twenty-second day of August, 1885.

RAILWAY BRIDGES INQUIRY COMMISSION.

MINUTES OF EVIDENCE.

FRIDAY, 6 JUNE, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,
OWEN BLACKET, Esq.W. H. WARREN, Esq., PROFESSOR OF ENGI-
NEERING,

John Whitton, Esq., Engineer-in-Chief for Railways, sworn and examined:—

1. *President.*] Dealing first with the subject of the approaches to the Wagga Wagga bridge, we want to J. Whitton, ask you some questions with reference to certain particulars that have come before us, and any informa- Esq. tion that you may feel disposed to give afterwards in the form of a statement, instead of answering a question now, we shall be very glad to have. We will take the information in the way in which you 6 June, 1884. wish to give it? Thank you.
2. These are the plans which have been forwarded to us, of the approaches to the Wagga Wagga bridge. (*Plans produced.*) Was the design of the South Wagga Wagga timber viaduct prepared under your direction? Yes.
3. Did you determine the length of the spans? Yes.
4. And the width of the platform? Yes.
5. And the arrangement of the girders? Yes; in fact the whole. I take the whole responsibility upon myself.
6. Was the length of the corbels calculated to reduce the spans of the girders? Well, it was to some extent no doubt; but it is not considered in any way whatever in the calculation. In making the calculations for this bridge I have taken no notice whatever of the corbels. I have taken the entire span as 28 feet 6 inches, irrespective of any assistance that might be obtained by the use of the corbels of the bridge.
7. Were the transoms calculated to assist the strain on the rail-bearing girders? No doubt they are, and they do very materially assist. They throw a very considerable pressure upon the outside girders. As a matter of fact I may say that the difference in the deflection of the rail-bearing girders and the outside girders is only one-tenth of an inch, showing that they do assist most materially.
8. Were any calculations made of the dead load of each span and also of the safe working load? Yes.
9. Did you make those calculations personally or did some of your officers make them and you checked them? I made them personally.
10. Do you remember what strain came upon each span? Yes.
11. I may rather call it the maximum working load? The maximum working load is about 70 tons, calculating the weight of the bridge, which it is hardly fair to take into consideration with a small span like this; but I have taken the rolling load at $1\frac{1}{2}$ ton per foot, and the weight of the bridge—the dead load—at a ton to the foot, and with that you get about 70 tons weight altogether.
12. That is distributed? Yes, the distributed weight. The breaking strain on the girders in the centre is about 400 tons, which will give a distributed load of 800 tons, and as the total load cannot be more than 70 tons it is clear that the bridge would carry at least ten times more than you would ever put upon it. It would, in fact, carry more than ten times, but I had better say ten.
13. Did you get the concentrated weight on the driving-wheels of a locomotive coming on the centre of this span? You cannot get more than 15 tons on the centre. There is no engine, I believe, in the Colony more than 15 tons.
14. What is the weight of the heaviest goods-engine passing over the viaduct? I think about 42 tons.
15. *Mr. Courtney.*] That does not include the tender? The tender cannot go on at the same time.
16. *President.*] At what speed would such an engine pass over the viaduct? I have tested scores of bridges, and I never could make the eighth of an inch difference in the deflection of the girders between running over the bridge at full speed and being stationary on it, more particularly in the case of long spans. It might be the case with smaller spans, but I have never yet been able to detect it.
17. At what speed would you consider it safe for the heaviest train likely to pass over this viaduct to travel? At any speed they can run.
18. What speed generally would that be? I believe 30 miles an hour, but I would not object to go 60 miles an hour.
19. You tested the viaduct before it was opened for traffic? Yes.
20. Personally, or by one of your officers? Personally. Of course the deflection in these bridges will very materially depend upon whether the bolts are screwed up tightly or not. If they are tight the greatest deflection I have found has been half an inch. If they are loose of course it is different.
21. How was the test made and the deflection noted? The deflection was noted by having two rods, one placed under the girder and the other placed from the ground, a pencil being put under the upper rod, and as the engine went over it depressed the rod. Of course you can test with levels.
22. Was this done with one of the girders, or with all the girders? All the girders as a rule.

- J. Whitton,
Esq.
6 June, 1884.
23. At the same time? Yes. These bridges are so strong that I should hardly have tested them at all except in the case of the first bridge that was put up. I never found more than three-eighths of an inch deflection in the 26 feet openings. These larger ones are 28 feet 6 inches. There is one of these bridges at Werris Creek, another at Breeza, and another at Tamworth with the same spans precisely.
24. Do you remember what the deflection was when the test was made on the Wagga Wagga viaduct? Half an inch, and a little less on the outside girders—a very little less.
25. Do you think that this would cause the wavy or jumping motion which is attributed to the deflection on this bridge? It does cause a wavy motion on all timber bridges, and you cannot avoid it.
26. But it is not dangerous? Not the slightest. I would run over that bridge at any speed an engine can travel. Of course no danger could be apprehended, except from the jumping of the engine; but as far as this bridge is concerned you could put upon it ten times the weight you do in practice.
27. Then you consider this viaduct to be perfectly safe for trains to be run at the usual speed? Perfectly safe.
28. Was the work of the contractor carried out to your satisfaction? Yes. Of course it must be assumed in a large bridge of this kind that there may be after the use of four or five years cracks in the timber. That naturally will take place in all timber. You can get no seasoned timber in this country, and therefore it is certain to shrink.
29. Who was the superintending officer in charge of this work? Mr. Nicholas.
30. Mr. Wade is one of your district engineers, is he not? He is Inspecting Engineer.
31. He reported on this bridge last August, I believe, and stated in one of his reports that he calculated the breaking strain at 1,000 tons? A thousand tons distributed load.
32. I will refer to the report to be certain of what he stated? I think the distributed load would be 1,000 tons.
33. "Respecting the silly criticisms on the design of this viaduct, it will be sufficient to point out that the design gives a calculated breaking weight of over 1,000 tons in each span"? Well he takes the formula for ironbark; I have taken the average of ironbark and the other timbers of the Colony.
34. What co-efficient of safety do you consider applicable to ironbark? 5; and I would not hesitate to put up a bridge to-morrow with two main girders alone, and 3-inch planking between them, and run the trains over that; if I were perfectly satisfied with the quality of the timber I would not object to use two beams instead of four. In fact I have used them—not the same spans as in this case, but 23 or 25 feet. I am not quite sure which, but at any rate over 20 feet, I know.
35. If you take 5 as the co-efficient of safety it would give a working strain of 200 tons? I say the breaking strain is 400 tons, and the distributed strain 800 tons.
36. I have not yet asked you about Mr. Wade's calculation; but if the breaking weight were 1,000 tons, and the co-efficient of safety 5, it would give you a working strain of 200 tons? Yes, but I say that I believe that bridge will carry ten times the weight it does carry before breaking down.
37. After the viaduct was opened for traffic it became the duty of the Engineer for Existing Lines to take charge of it and to see to its proper maintenance, screwing up, &c.? That is his duty undoubtedly.
38. And then your duty in connection with the bridge ceased? Yes, it was a most unfortunate arrangement, and the most singular fact is that the same bridges have been put up in the north as in the south and the west, and there never has been a complaint in reference to the north; all the complaints are from the south and the west; the reason is obvious, of course.
39. Do you remember when the Engineer for Existing Lines took charge of this viaduct? It was some time in 1880; I think September, 1880.
40. What time should elapse after the completion of such an extensive timber structure before it would require any screwing up? Well, the screwing up is a matter that should be going on for 6 or 8 months, and then if the timber shrinks it could be easily seen.
41. It should go on from the time the viaduct is finished? From the time it is finished it is a constant screwing up; these girders have shrunk so much that cast-iron washers have been put in and screwed up tightly.
42. The Commission propose to proceed to Wagga Wagga next week to examine the viaduct, and note accurately the deflection;—do you wish to meet us there, or will you send a competent and responsible officer to represent you? If you have anyone there to represent the Existing Lines Branch I should like to be represented; my view of the matter was that you would take an independent course; but if you have anyone there from the Existing Lines Branch I should like some one to be there from my department.
43. If you do not desire to meet us on the same day as the representative of the other branch, you could arrange to meet us on a different day? If you can let me know I shall be glad to make arrangements for sending some one; Mr. Wade cannot go, as he is going away with me to the north to-night.
44. We intend to test the bridge, and I dare say we shall have to hear what Mr. Cowdery's officers have to say in pointing out any defects, and then we may have to examine your officers. Probably we shall have an examination on the ground, and then test the bridge on our own account, and form our own judgment? If you will kindly let me know I will instruct an officer to attend.

W. B. Wade, Esq., Inspecting Engineer, sworn and examined:—

- W. B. Wade,
Esq.
6 June, 1884.
45. *President.*] We wish to ask you a few questions with reference to the Wagga Wagga viaduct. You know this viaduct? Yes.
46. You have inspected it, and reported to the Engineer-in-Chief upon it? Yes; I inspected it, and tested every span shortly after the opening; I tested a good many of the spans, and examined it all last year; it was completed in September, 1880.
47. You stated in your last report that some wood transoms necessitated the use of cast-iron washers? Yes.
48. Can you explain why they were put in? On account of the shrinking; those transoms were not iron-bark; the girders only were iron-bark; the transoms were ordinary hardwood of various sorts—stringy-bark, black butt, and that class of timbers; they shrink considerably, and it was necessary to put in an extra thickness of washers to screw the bridge up tightly.
49. Where were those washers put? Underneath the nut. The first time this bridge was tested, very shortly after it was opened for traffic, it was very loose; it was in rather a peculiar condition compared with what we usually have in connection with these bridges. There had been no running over it at all. The work had been going on at the other end, and the last work the contractors had to do was closing the
Wagga

- Wagga Wagga viaduct and the engine had not run over it. Usually we have everything running over a viaduct, but in this case the contract was for the bridge and the viaduct, and there had been no running over it. The consequence was that when it was opened for traffic nothing would come to its bearings, and it took weeks and months before the timbers would come to their bearings, and were tightly screwed up.
50. Which were the four spans you tested? I cannot tell you; I took them haphazard. We did not have a special engine that day; and we took passing trains. I think we took one span very near the iron bridge.
51. They were not four consecutive spans? No, they were not; I took them haphazard.
52. What arrangement did you make for the testing? On that occasion I think it was only a measurement on a batten—a batten nailed up against the bridge and another on the ground; the first time I tested it I did so with a set of dials which I had; that measured on an exaggerated scale of ten to one; in the other case I used sliding battens.
53. On what girders? The centre girder.
54. But it was on the rail-bearing girders you made the test? Yes, I mean the rail girder.
55. They gave respectively a deflection of 0.30, 0.28, 0.33, and 0.27 of an inch, and these were on the two centre girders? On one only.
56. You did not test the deflection on the side girders? Not on that occasion; I have often tested them and compared them with the others.
57. What difference did you make? A little over a tenth of an inch—the difference between 0.30 and 0.40.
58. You stated in this report of yours that this result was a marked improvement upon the test you made at the time of the completion of the viaduct? Yes.
59. Do you remember what difference there was? The deflection on the first occasion was as high as 0.40, and in some cases as high as 0.60.
60. Was the bridge screwed up then? No; quite loose.
61. *Professor Warren.*] That was immediately after the commencement of traffic? Immediately after opening—after about a fortnight had gone without any screwing up.
62. *Mr. Blacket.*] Then it had been standing some month or so? Some of it had been standing a year or more. It took a long time to complete.
63. *President.*] When was the work completed and opened for traffic? In September, 1880.
64. Did you at or about the time it was opened for traffic notice any wavy motion or any jumping of the train? No; the permanent way people said there was such a thing; but I looked very closely and could not detect the smallest sign.
65. What was the speed of the train that went over for the trial? We ran a good many over as fast as we could get speed on. I suppose 30 miles an hour. Then we found that we could not get any more deflection at that speed, and we adopted a more moderate pace.
66. Did you ever notice any difference in the deflection according to the speed? No.
67. If you have a higher rate of speed have you a greater deflection? No; I have tried it repeatedly and find it does not affect it.
68. Do you consider that the corbels being 10 feet long assist the strain coming on the spans? I should never take it into a calculation for strength. I only look upon the corbel as making a joint good—as making good the butt joints. I do not consider we are entitled to calculate its resisting strength. We take the strength independently of the corbel.
69. Do you think that these corbels bring any continuity on the girders? No, I do not think so; in fact they are not for any practical strength because they are divided in the centre by a pier. I only consider the corbel as a means of making a joint.
70. You made some calculations in connection with this bridge or viaduct? Yes.
71. And you stated that the design gave a calculated breaking weight of a thousand tons on each span? Yes, I made the breaking weight in the centre, I think, 1,000 tons—perhaps at the outside. It is barely as much as that. The exact breaking weight in the centre is for a single compound beam 130 tons. Then it is a question whether you are justified in taking 4 or only a portion of 4—say $3\frac{1}{2}$ or somewhere about $3\frac{1}{2}$. Of course the centre girder must have gone down something measurable before the side ones began to take their work—about one-tenth of an inch.
72. *Mr. Blacket.*] It is one girder that you call the single? A single compound bridge, that is one girder above another. Of course in an accurate calculation of a thing of that sort you are met with a very wide and doubtful quantity of the constant for timber.
73. *President.*] I was just going to ask you, from your experience of Colonial timber, particularly of ironbark, what co-efficient of safety would you use in a calculation of this kind? I would take 3,000 for ironbark.
74. What co-efficient of safety? I think 10 would be a fair thing. In this we have quite 20.
75. *Mr. Courtney.*] Does that refer to the dead load or to the live load? The live load; I do not consider the dead load in small bridges.
76. *President.*] What would be the dead load on that bridge then? Something under a ton to the foot—not taking the girders themselves.
77. No; the load only? Taking the transoms, sleepers, planking, ballast-boards, ballast, and rails, it would come to about 30 or 90 tons to the foot.
78. When you were speaking just now of 3,000, what did you allude to? The constant for ironbark timber in a calculation for cross-strains on timber.
79. What would you take for the modulus of rupture? I have not taken it out in that way. I have taken it the more simple way—the Barlow formula. All Colonel Ward's experiments, which are no doubt the most reliable we have, are taken out that way, from the actual cross-strain.
80. *Professor Warren.*] You refer to the experiments made at the Mint? Yes. We had some of them tried in this Department on a larger scale—thick beams, 12 x 12 and 26 feet long, and they have come out remarkably similar to Colonel Ward's.
81. *President.*] Do you consider that the transoms transmit the strain from the rail-bearing girders to the side girders? That is shown by testing the side girders under a load; and that I found, as I said before, about one-tenth of an inch less deflection than rail girders.
82. How long after the completion of such an extensive timber structure as the Wagga Wagga bridge do you consider that any repairs, screwing up, or maintenance, would be necessary? It would always want screwing up.
83. From the beginning? From the beginning; from the first hot day.

J. W. Drewett, Esq., Assistant Engineer, sworn and examined:—

J. W.
Drewett, Esq.
6 June, 1884.

84. *President.*] You reported to the Engineer-in-Chief regarding the defects in the Wagga Wagga viaduct? Yes.
85. This is the plan of the viaduct. (*Plan produced*)? Yes, that is the plan showing portions of it.
86. You tested the viaduct, did you not? Yes.
87. In what manner did you ascertain the deflection on the rail-bearing girders? By placing sliding rods underneath while a train was passing over the viaduct. I got down early one morning, and there was a train going over the viaduct with two engines attached. I had no means of knowing what those engines weighed, but I took advantage of the circumstance and took the deflection there and then. I do not recollect now what it was, but I think it is stated in my papers. It was some time ago.
88. You do not know the weight of the engine nor the speed? No; I should say the speed was about 25 miles an hour, because the train had had a good run to the station by the time it got to the viaduct.
89. Which were the spans of the viaduct which you tested? I cannot point out which ones; they are alike in construction.
90. It was not one with the gangways? It was one near the bank, but I could not tell you exactly. The engine was going at a good speed.
91. You did not make the test at one with the gangways? Those are merely places built out for taking a lorry. There is no difference in the construction.
92. *Mr. Courtney.*] They are what is called a "refuge"? Yes, "sanctuaries" we call them.
93. *President.*] Have you made any calculation to ascertain the safe moving load one of the spans will carry? Yes, I have. I have a memorandum which, if you have no objection, I will read to you.
94. We shall be glad to have it read, and also to have it produced in your evidence, if you like? I can give you a copy of it. It is as follows:—

Sydney, 6th June, 1884.

According to my calculations the severest strain to which the 29 feet timber spans is likely to be subjected by a dead load, is when a tank engine and tender, or so much thereof as can be brought upon the span, is on same; the maximum weight then brought upon it is = 30 tons (for two pairs of driving wheels) on a wheel base of 7 feet 4 inches, or $4\frac{1}{10}$ tons per foot; or an average of 40 tons on a wheel base of 18 feet 8 inches, or $2\frac{1}{10}$ tons per foot; this is, in fact, a distributed weight of 40 tons as a maximum strain from a dead load, such as that of the heaviest locomotives. The same load, if travelling at 50 miles an hour, would probably intensify this strain to an extent perhaps of 50 per cent., which would mean that each span of 29 feet, consisting of eight trussed timbers of 12in. x 12in., and ignoring the assistance afforded by the corbels, has to bear a working strain of not exceeding 60 tons.

Now, the strength of any one of these single girders is equal to a breaking weight in the centre of not less than 23 tons (*vide* experiment on box girders), and as given by following equation, wherein co-efficient of K equals 7 (similar to Teak)

$$W = \frac{b d^2}{s} \times K$$

Taking them as simple girders, then the four rail-bearing girders are equal to a breaking weight (applied in the centre) of 92 tons; but as shown by Weisbach's formulæ—

$$P = 14 \frac{b h^2}{l} \times \frac{K}{6}$$

they being really built girders are strengthened in the proportion of 4 to 14.

Thus the four ironbark girders only are equal to a breaking weight in the centre to 322 tons, whilst they are assisted (as regards the distribution of the load) by the side girders by half this extent to 483 tons, which is equivalent to a factor of safety of 7, and as a matter of fact these spans are really considerably stronger than indicated by the above analysis:

For instance, the girders are fixed at the ends (in lieu of being merely supported) and this increases their strength to double that above stated; again, no account has herein been taken of the lateral stiffening and distributing afforded by the 3 inch decking, or of the ballast boards, &c.

Against these advantages there may be placed as a practical set-off, the dead weight of the superstructure, loose road and permanent way materials, but which only amount to about 30 tons.

J. W. DREWETT.

95. You do not consider that the corbels are reducing the span? No, not at all. I never take the corbels into consideration in the span. But they really, in my opinion, make a continuous girder of it, because they are very firmly and strongly bolted together. I may say that I have designed a great many of these bridges, not only in this Colony but also in England. I have now been at this work for nearly 50 years. I was 20 years with Brunel, and I have been 28 years this month here at this work, and I have never had a failure in any design that I have ever put up.

96. You stated that you have not the slightest doubt whatever as to the stability of the viaduct? I have not the slightest doubt.

97. Can you account for the wavy motion that took place? I can account for the wavy motion on the occasion when I saw it. The bridge was not properly screwed up. The bolts were loose to the extent of an inch in some places. I could knock the washers round with my stick where I could reach them. That was the cause of the working at that time, and I think I reported so. But the last time I examined this viaduct with Mr. Wade we did not notice any movement.

98. You said you examined the viaduct in July, 1882, and again in August, 1883; I find this from your report; and you alluded on each occasion of your reports to the Engineer-in-Chief to insufficient maintenance as the cause of the working of the timbers and the deflection of the girders? I do not think the deflection then amounted to more than between $\frac{3}{8}$ and $\frac{1}{2}$ inch; but whatever it was I believe it is in my report. I have no notes of it with me now. The last time we tried it the deflection varied, I think, from '27 to '33 of an inch.

99. *Professor Warren.*] That was when the bolts were not screwed up? That was when the bolts were screwed up.

100. *President.*] Was the deflection upon the side-girders the same as upon the rail-bearing girders? The difference was very little. The deflection, if I recollect aright, was close upon $\frac{1}{4}$ of an inch, shewing that the side-girders were doing their work as well as the rail-bearing girders.

101. How long do you consider should elapse after the completion of a timber structure of such an extent as the Wagga Wagga viaduct before any proper maintenance is necessary? Well I think it wants constant looking after for some time after its completion, because this timber shrinks so tremendously that it requires a great deal of looking after. I should say that at the least it should be screwed up once in every six weeks.

MONDAY,

MONDAY, 9 JUNE, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq., PROFESSOR OF ENGINEERING,
W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF ENGINEERING,
OWEN BLACKET, Esq.

George Cowdery, Esq., Engineer for Existing Lines, sworn and examined:—

102. *President.*] Do you know the Wagga Wagga bridge and viaduct? Yes, but I have never seen the drawings before. G. Cowdery,
Esq.
9 June, 1884.
103. You have seen the bridge? Yes, I have seen the bridge.
104. These are the plans (*showing plans to witness*)? Yes, they appear to me to be correct.
105. What position does Mr. Stephens hold in your department? He is a district engineer.
106. Mr. Stephens is in charge of this portion of the district? He is.
107. He has written to you respecting this viaduct? He has.
108. And in that report he alludes to structural defects, and also to defects arising from workmanship and material? I am not sure whether he mentions anything about workmanship.
109. But he mentions material? The material certainly.
110. You have examined this viaduct personally? I have.
111. And did you remark any defects? I did.
112. You agreed with Mr. Stephens' report in that respect? Perfectly.
113. Do you consider the design of the viaduct defective? I do not say it is not strong enough as regards the girders, but they are not sufficiently strong to prevent the engine jumping when going at a high speed. They are not sufficiently rigid.
114. In what way? The spring from one to the other is complained of by the drivers—many of them.
115. Is this jumping caused by the continuity over the piers? I suppose it is from their being at equal distances apart. They get a regular spring from one to the other from the deflection of the girders.
116. Have you any details of the design of this viaduct? I have not.
117. Mr. Stephens has gone through these details? He has gone into them. I do not think he has said anything but what I could agree to.
118. Did you find any defects in the superstructure? Not further, I think, than that the spans are too great for that description of framing. The corbels are long to assist the span, but I do not think it has the desired effect, because they roll on the headstock as the train passes over.
119. What length of corbel should have been used? I do not think more than 6 feet is any use there.
120. What use is it at all? Only for making the joints.
121. Then in your opinion the corbel would not reduce the span? Only to a very small extent. Not anything like the extent of the corbel.
122. It would produce a kind of continuity between one span and the other? Yes, it does.
123. Do you know of any other defects in the superstructure except those you have mentioned? Some of the girders are defective; they are not sound. If they were all sound it is well put together, as far as I know.
124. Is that due to want of proper supervision at the time of erection? I should imagine so. It is not a very old bridge now. Some, I think, may have split since they have been in the bridge. That is quite possible.
125. Did you take possession of the viaduct as soon as it was constructed? As soon as the line was open, but a good deal of this timber framing was built a long time before; probably 12 or 18 months before the opening.
126. But when the Engineer-in-Chief for Railways completed this structure you took charge of it? No I did not. At that time Mr. Mason was in charge.
127. Do you remember at what time this bridge was completed? I do not exactly.
128. At what time was it put in your charge? I do not remember the date, but I will furnish it to you.
129. You do not remember what time it was between its being opened for traffic and your taking charge of it? Not many months, but I cannot tell you exactly from memory; I can ascertain for you.
130. How long do you consider a bridge of this description would require after it is completed, before it should be screwed up? It generally happens that as soon as it is completed it requires more screwing up than at any other time, for the simple reason that the timbers shrink.
131. During the time that you have had charge of this viaduct has the screwing up been attended to regularly? Yes, there has been a gang of men engaged in screwing up ever since.
132. Why did you recommend that the speed on this viaduct should be reduced to 16 miles an hour? Simply because of the jumping of the engines; I have been on the engines myself, and found that there was considerable motion, and uncomfortable to travel at a high speed, and I considered it necessary to reduce the speed; the engine-drivers complained of it.
133. At that time was the bridge screwed up? Certainly.
134. In one of your reports you say that, when this viaduct begins to decay, it will give an immense amount of trouble;—how is that? Because nearly all the supports are of a bad class of timber.
135. That does not apply to the superstructure? No; of course, when it begins to decay there will be a considerable amount of trouble to keep it in order; then there is such an immense length of it; but the uprights are the defective part of it, and they are all on sills; they are not on piles, except a few near the river; I have never been supplied with any of these drawings, and I cannot tell what it is composed of; I have asked for them repeatedly, and never could get them.
136. You tested the bridge? Only the viaduct.
137. What means did you use for testing it? I have not tested the deflection.
138. You only went by Mr. Stephens' report? Yes, Mr. Stephens' and Mr. Whitton's reports. Mr. Whitton reported $\frac{5}{8}$ deflection, or $\frac{3}{4}$, I think. I am not sure, but one of them deflected $\frac{7}{8}$.
139. Then you did not go into any calculation at all of the safe load the viaduct could carry? No, I have not, but I am quite satisfied about the strength of it, and that it is able to carry any train that we have. I am satisfied of that as long as the timber is good; the danger is in having bad girders. We have taken out a few girders already, and there are some more that I wish to take out. 140.

- G. Cowdery,
Esq.
9 June, 1884.
140. What is about the weight of the heaviest locomotive on that line? About 76 tons I should think.
141. What is the length between the leading and the trailing wheels? I am not certain whether any of the consolidation engines have been running on that line.
142. Were they intended to run on that line? They were intended to run anywhere.
143. What is the weight of the engines that go with the mail trains? I cannot tell you exactly from memory.
144. Do you know the weight upon the driving wheels of any of those engines? I have got a list of them in my office from the Locomotive department. I have never weighed them myself.
145. Before you recommended the speed to be reduced to 16 miles, what was the speed at which they passed over the viaduct? The usual speed. Any speed they liked to have.
146. What was the usual speed? With some trains it would be about 30 or 35 miles an hour, but they vary very considerably.
147. Do you know of your own knowledge whether that speed will affect the deflection? I think it will make a very considerable difference whether you run fast or slow. It affects the engine more than the bridge, by making it jump.
148. It is the deflection not the speed that affects the engine? A high speed does not give much more deflection than a low speed in the girders, only it makes the engine jump when she is running fast. When she is going slowly she goes over it without jumping.
149. You have had some experience in the quality of timber? I have; about 27 years.
150. What co-efficient of safety would you think necessary in a bridge of that description to use with good sound ironbark? I should think about one-fourth, or barely so much. It is so difficult to know when a stick of ironbark is really sound. It may appear sound outside, and you find it is not so inside.
151. What was the cause of your having props put in the centre of the spans? Simply because I found defective girders.
152. Are they merely piles? Yes; put in the middle of the girder as a temporary support, until the girder can be taken out.
153. To how many spans was this done? I do not remember exactly. I think it is all stated in the report.
154. Was it near the bridge? No; near the Sydney end.
155. About what portion of it? In various places; there are not many. There are some supports where the piles are defective.
156. What was the object of those props? To prevent the chance of accident; one girder would not be safe.
157. Were the props under one or two of the rail-bearing girders? Under whichever girder was defective. It was in the case of the lower girder being defective; propping the bottom one was propping the other also.
158. Did you prop both? Only the one.
159. Would there be more deflection in the one than in the other? No; it was only to prevent accident in the case of a defective girder.
160. Have those props been removed? No, they are there now; there are very few of the girders propped—perhaps four or five—I do not know exactly how many from memory; we always adopt that system wherever there are defective girders; the first thing is to prop it; we have men continually watching them.
161. It has been said that some of the piles were rotten, and that you were of opinion that they were rotten when put in? That was one particular pile, and such remarks were made with regard to it, but since then I find there are a great many rotten, and one must have been known to be rotten, because it was filled up with concrete or cement; Mr. Drewett went up to ascertain the facts of the case, and he agreed with me that it was so; there are any number of them rotten now.
162. You would hardly expect in such a large structure but that some of the timbers would be defective? No.
163. What proportion of this work is defective? I consider that very little of that timber will last many years.
164. Why? Because it is a bad description of timber.
165. What kind is it? A great deal of it is ribbon gum, or as some people call it, mountain ash; there is some apple-tree amongst it, and some stringy-bark; it is a mixed lot.
166. What speed would you recommend to be used for this viaduct? I would not approve of the speed being increased.
167. Only 16 miles an hour? That is quite fast enough; you will find if you travel over it on an engine at a high speed that it is very uncomfortable.
168. To what is the motion of the train due? It is the deflection from one to the other; I do not know perhaps but that a higher speed might reduce it again; the engines jump from one to the other, and the drivers were afraid that the engines would jump off the rails.
169. The motion is not sideways? No; there is very little side motion.
170. We intend to proceed to Wagga Wagga shortly; do you wish to be with us, or to be represented? Yes, I would rather be with you myself.
171. *Professor Kernot.*] Did you ever notice the span in front of the engine rise up before the engine came to it? Yes.
172. Visibly? Yes, visibly rising.
173. So that the train seemed to plough up a wave? Yes.
174. There is a certain speed at which this is troublesome? Yes.
175. At a lower speed it is not so troublesome? No.
176. At a higher speed? That has not been tested.

WEDNESDAY, 25 JUNE, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq., PROFESSOR OF ENGI-
NEERING,

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF ENGI-
NEERING,

OWEN BLACKET, Esq.

R. D. Stephens, Esq., District Engineer, Goulburn, sworn and examined:—

177. *President.*] You are the District Engineer in charge of the Southern Railway? The Southern Railway, yes—and South-western as well. R. D.
Stephens, Esq.
178. You are in charge of the Wagga Wagga bridge and timber viaduct? Yes.
179. Do you know this drawing (*plan of viaduct produced*);—have you seen it before? No, I have not seen it before. 25 June, 1884.
180. But you identify it as the design of the viaduct at Wagga Wagga? Yes, it is.
181. It is part of your duty to look to the maintenance of this viaduct? Yes.
182. That is to say, the screwing up, repairing any defective timbers, and so on? Yes.
183. Did you take charge of this viaduct as soon as it was finished? No.
184. Who was in charge? Well, I suppose Mr. Mason was; I do not know, but Mr. Mason, I suppose, was. I really do not know.
185. But who was the District Engineer who took charge of it as soon as it was finished? No one; I was the first engineer there.
186. That is you were the first engineer appointed in the Department of Existing Lines to take charge of that district? Yes.
187. How long was it after the completion of the bridge until your duties began? November 1, 1881; that was the date when I was appointed.
188. Then who had charge of this viaduct previous to that—from its completion to the time when you took charge? Well, I suppose, Mr. Mason, and then Mr. Cowdery; there was no one else.
189. There was no officer but Mr. Mason to look after it? No; except, of course, the inspectors.
190. The usual inspector, but no engineer? No.
191. I find that the viaduct was completed in September, 1880. Between that time and the time of your appointment Mr. Mason was in charge? Mr. Mason and Mr. Cowdery.
192. Do you know if anything was done to the viaduct during that time in the shape of maintenance? Oh yes. It had been screwed up. There was an inspector, you know, just the same.
193. Just the same? Yes.
194. You examined the bridge very carefully, and reported to Mr. Cowdery upon its defects? Yes.
195. You stated in that report that you did not like the structure—that you did not like the viaduct? No; I do not.
196. That it is decidedly weak in design? Yes.
197. Have you made any calculations? Yes; I have.
198. What working load would the viaduct carry? 30 tons is what a single girder will carry, and of course 120 to each double one. For a dead load, of course, it is perfectly safe; it would carry any amount of weight for a dead load. There is no doubt about that. But the usual span is about 26 feet.
199. You had better confine yourself to answering the questions, or otherwise it will be confusing to the Secretary to note down what you say. If you have made any calculation in connection with this bridge how did you calculate the strains, and on what length of span? 20 feet; that is allowing a full distance for the corbels.
200. Do you think the corbels add any strength to the span? That length of corbel weakens it.
201. What length of corbel is generally used with a 26-foot span? About 6 feet.
202. And for a 30-foot span, what length should be used? I consider that anything beyond 6 feet does more harm than good.
203. Why? I look at it in this way: Supposing this corbel instead of being 10 feet is 20 feet, or the whole distance apart 15 feet on this side and 15 feet on that; when the weight comes on to them, unless it bends it is bound to tilt this up. A corbel beyond a certain length does more harm than good. Suppose you make it still longer than 10 feet; make it 20 feet; this is bound to go down when the weight of the train goes on it; and if it is at all lengthy it will tilt this one up.
204. You state that the lengthening of the corbel to 10 feet would produce other than the effect intended; but what was the effect intended? It was of course to shorten the span; they wanted to shorten the spans as much as possible there.
205. But in your calculations you state you have taken the corbel? That is to give it every chance. If I were doing it for my own calculation I would not take more than 6 feet—in fact, not 6 feet. We find that the more you build one on top of the other with corbels like this—that in fact for moving loads it is a mistake to put too great top-heavy timbers.
206. Does this refer to strains or to deflection? Well of course the intention in putting corbels is to shorten the working span—that is the intention of course; in fact to shorten the distance where the real weight comes in on the centre of the span.
207. Then if you follow out that argument the bridge would be stronger without corbels than with them? Up to a certain point, yes.
208. Then how would you make the joints of the girders? Well, of course you would have a certain amount of corbels—about 5 or 6 feet of corbels is ample.
209. Would you make the corbels longer for the longer span than for the short one? No, I would not.
210. Then you consider that the viaduct would have been stronger if the corbels had been less than 10 feet? Certainly, and strictly speaking it would mean less expense, because there are 20 cubic feet of square timber wasted in each span.
211. You stated in one of your reports, which I have here before me, that the deflection on the timber girders varied from $\frac{1}{2}$ to $\frac{3}{4}$ of an inch, but was mostly $\frac{3}{8}$ with a 63-ton engine passing over the viaduct;—was the bridge properly screwed up at that time? No, it was not.
212. Would the deflection have been greater or less if the corbels had been shorter—do you consider that with this test, when you noted the deflection, the corbels would have made any difference? I do not think they would have made much difference either one way or the other.

- R. D. Stephens, Esq.
25 June, 1884.
213. How did you find the deflection? Well, with a rod, with a sliding rod; one rod above, and sliding down.
214. On which girders—on the rail-bearing girders? On the rail-bearing girders.
215. On both, or only one? We had three or four of them in each span.
216. Could you point out what spans you tested? No, I could not.
217. Was it in the centre of the viaduct or towards the end? We tried several; but I could not state which they were. They are all so much alike that it is really difficult to distinguish them. I tested them several times. The deflection now is not so great as it was.
218. What in your opinion is the cause of the wavy motion of the engine when passing over the viaduct? Sideways or vertically?
219. Vertically? Well, if each span were 26 feet it would not wave, to a certain extent.
220. But what is the reason of the wave being formed over a larger span than 26 feet? Well, it gives to a certain extent; the girder gives to a certain extent.
221. You mean to say that the girders are rocking over the piers? Oh, no. Well, the piers go a little laterally—they do not go longitudinally.
222. They do not go longitudinally? No, but they go sideways.
223. *Mr. Courtney.*] At right-angles to the road? Yes, slightly.
224. *President.*] Do you consider that these corbels form continuous girders of each span? I look upon the corbel more as a joint for the two girders, and also as a support for the main girders, the same as the wall-plate.
225. But not to establish continuity between the girders of different spans over the piers? You cannot look upon it as a continuous girder.
226. That is what I wanted to know. You stated in one of your reports that you found some difficulty in keeping the rails in line? Yes.
227. How can you explain that? It has simply what we term a loose hold on the top, and of course the ballast is simply on the planking.
228. I quite understand what you mean. You did not mean to say that the rails were getting further apart in the gauge, but that the whole line itself was sliding? It is liable to slacken on a slippery bottom. I do not ascribe any fault to the viaduct as far as that is concerned.
229. You just now alluded to the piers rocking sideways. To what extent do they rock sideways? Oh, very slightly; half an inch, or not even that. I have never actually measured it. But you will see that the ground around the piles there is all open; it is broken where the piles enter the ground.
230. But most of these piers are on sills? They are not strutted underneath. (*Plan produced.*)
231. This (*referring to plan*) is where these piers are strutted? Yes; I do not see it in all cases, but in some you will find that where any pile strikes the ground it is crumbled around the pile. I do not say it is anything serious at all.
232. *Mr. Courtney.*] It may be caused by a difference in the expansion of the timber in the ground.
233. *President.*] Is it the vibration; you have not remarked any longitudinal motion of the piers? No.
234. Only sideways? Only slightly; it is of no great importance. It is appreciable, but nothing of any moment.
235. When you tested the viaduct what load was passing over it, and at what speed? I think 60 odd tons.
236. A 63-ton engine you mentioned? Yes, that is about the weight.
237. A 63-ton engine you mentioned, but you did not state the speed? Well, about 15 miles an hour. As far as the deflection is concerned we found that it made no difference whether the engine went at full or half speed. The deflection in both cases was the same.
238. Could you give us a copy of your calculations in reference to the way in which you computed the strains? No; I simply did it roughly. I took the four girders—eight girders, rather—and computed the strength of those. It comes to about 120 tons for each double girder; that is for a 20-foot span.
239. *Professor Warren.*] Is that for a distributed load? No.
240. For a central load? Yes.
241. I thought you stated that a single girder would carry 30 tons? Yes; but that is for a double girder.
242. A double girder then carries four times as much as a single girder? Yes; supposing all the timber to be of the very best quality.
243. *Mr. Blacket.*] Is that the breaking weight or the safe load? The breaking weight.
244. *President.*] You stated that there is a general impression that the speed on this bridge should be limited to 25 miles an hour: To whom did you refer as having that impression? To the engine-drivers.
245. That is on account of the wavy motion and vibration on the bridge? Yes. Would you allow me to state one thing: We have had a rail break away at the joint on the viaduct.
246. At about what part of the span? That I could not tell you; I did not notice that.
247. Was it on the piers or in the centre of the span? I did not notice, but we have had one rail break away.
248. *Mr. Blacket.*] At the fish-plate? Yes.
249. That would be due to bad bolts? No, I do not think so. I do not attach so much importance to that; but what I do attach importance to is this: That with this wavy motion an engine would be far more likely to jump the rail if it came across a broken joint.
250. *President.*] If you could remember whether it was on the pier or on a part of the span where the joint broke we could form some idea of the cause? I could tell you the mileage.
251. *Mr. Blacket.*] Could you point it out if we were there on the bridge? Yes, I think I could. I can state one thing.
252. *President.*] Yes? In making the calculation for this breaking weight the weight is put on very, very gently. It is not an engine going over; it is simply a dead weight put on very gradually.
253. It is not a moving load? No; simply a very gentle weight, put on pound after pound.
254. But that would not be the calculations made for a railway bridge? No, but that is what it was.
255. *Professor Warren.*] Your breaking weight? Yes; in fact the same as testing for timber.
256. *President.*] You state there is very little advantage gained in the matter of cost by making the spans 26 instead of 29 feet? Yes.
- 257.

R. D.
Stephens, Esq.
25 June, 1884.

257. Have you taken the quantities of the viaduct as erected, and calculated the difference between that and a 26 feet span? Yes, I have; it would make a difference of 42 piers. There are 313 spans now. If 26-foot spans were introduced there would be 42 additional piers.
258. I think as you have gone into the matter it would be better for you to give us that statement in writing? Well, that is all it really comes to.
259. Because if you have a smaller span you require a great number of piers, and the quantities ought to be gone into accurately to know what quantity of timber is required for the piers in addition to the superstructure. The superstructure will be the same except that you will have more corbels and more piers? You will have 42 more; against that you have 20 times 42 cubic feet of squared timber saved.
260. This statement is not satisfactory; you cannot check a statement like this unless it is given in writing. It is only because you stated this in your report that I ask you the question. It would be better for you to give us a written statement in order that it may be checked properly? Yes. I would have to go into it very minutely then.
261. In a question of cost—when you mention anything in reference to cost—it should be gone into minutely, because 42 piers would involve a considerable amount of timber. You also stated that the 26-foot spans are constructed with 14 x 14 girders, instead of with 12 x 12. Is it your opinion that if these had been 14 x 14 that the viaduct would have been stronger—or sufficiently strong? Yes; but I do not know that there would have been much difference.
262. Why? Because I believe in shorter spans. It is far more easy to get short sticks than it is to get long sticks, and there is greater safety in short sticks. There is far more likely to be a flaw in long sticks than in short ones.
263. You have not made any calculation in reference to the working load that would give us a shorter span than this? No, I have not.
264. You have removed some girders and some piles from this viaduct—defective timber that has to be replaced? Yes.
265. Have you preserved it for examination? Yes.
266. So that we can see it when we go to Wagga Wagga? Yes.
267. Can you explain to us what you meant when you said that the piles of the bridge were very bad, and that the working sideways was most apparent? Well, I sent in a return of the pipes in each pile. You have that, I believe.
268. But how could you find them? We bored for them. We bored into the pile, and the moment we got into the pipe the auger went right into it. And some of the piles are only 11 inches at the top—that is, including sap-wood; so that actually the good timber would not be more than 9 inches or something like that.
269. Was it at your instance that the props were put under some of the spans? Yes.
270. What was the object of having these props under the spans? To reduce the strain.
271. And you recommended that all these spans should have a prop put under them? Well, we have done so. Mr. Mason did so at Fish River. But I would hardly recommend that now.
272. You recommended it at one time? Yes, I did.
273. What danger would you apprehend now if the props were removed? The possibility of the girder breaking. I do not say they would; but in cases of this kind you have to guard against any possibility of accident.
274. But you stated a little while ago that the girder was strong enough? Yes; but this happened to be a bad girder.
275. Then you would not remove the props if the girders were bad? No.
276. Since you have been in charge of this bridge you have constantly employed gangs of men in screwing up and painting? Not painting.
277. But screwing up? Yes, screwing up.
278. Do you consider that this screwing-up is more than would be considered necessary with any other timber structure of that extent? Yes, certainly more than double. We find that the whole of the bolts get loose—especially at the corbels. We now have washers on, a good 4 inches in depth.
279. Is that due to the shrinking of the timber only? And to the general working of the bridge.
280. Do you mean the workmanship? No, the working movement of the bridge. The bridge moves more than ordinary bridges would do.
281. Is that to be attributed to bad workmanship? No; I attribute it to the extra span—to the 4 feet 6 inches extra length of span.
282. Do you think that this viaduct is unsafe in any way at present? I consider that there is no fear of a train or engine falling through the bridge except where the girders are defective. There is no fear of that. It is strong enough in that respect. But the danger that I apprehend is that the engine or train is far more likely to leave the rails in jumping. You see when the engine goes on to the viaduct, if there is any obstacle on the line the engine is more apt to jump off the rail, and that is my reason for pointing out the way in which the joint in the rail was broken.
283. That is also the reason why you recommended the speed to be reduced? Yes; but I may mention that the deflection at the time I did so was considerably more than it is now.
284. How do you account for that? Well, in the first instance, the timber was greener. I find that green timber is more elastic than dry timber. That has a great deal to do with it. A rotten stick will not bend before it breaks altogether. Then, at the same time, the bridge was not so well screwed up as it is now.
285. *Mr. Blacket.*] Do the cross sleepers rest secured to the bridge? They rest simply on the ballast; they are not secured to the bridge at all; between the ballast boards it is filled in with ballast and then treated as an ordinary road.
286. And does the water go through the boards? That is one objection; they have put the boards too close to each other and the water is retained; it trickles through to the main girders and it is apt to rot the girders. There are two things I would like to state—especially with regard to the corbels: Suppose you put one corbel on the top of another—about 5 or 6 feet of corbel—so that you would have no span to signify in the middle, all this top-heavy timber is a real detriment instead of being an advantage. You see the higher it is the more it goes wabbling sideways.
287. *President.*] It would form an arch of timber? For a dead load it might be an advantage, but for a moving load it is the very reverse. With regard to those calculations which I made they were for the very best timber, and it was done on the supposition that there was not a single flaw in the timber.

- R. D. Stephens, Esq.
25 June, 1884.
288. *Professor Warren.*] What is the constant you use? Seven. I consider what I have allowed to be almost excessive; but it is on the supposition that the timber is very good and has not a single flaw in it; the objection to long sticks is that there is far greater liability to a flaw in a long stick, and if there is one flaw in a long stick it is just the same as a flaw in a chain; one bad link in a chain destroys the lot; and it is far easier to get good short sticks than it is to get good long ones.
289. *President.*] The timber in the piers is not ironbark? No; the only ironbark in this bridge is in the girders, corbels, and head-stocks; all the other—transoms as well—is local timber.

FRIDAY, 27 JUNE, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq., PROFESSOR OF ENGINEERING.,
W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF ENGINEERING.,
OWEN BLACKET, Esq.

The Commission met on the Railway Bridge at Menangle.

George Cowdery, Esq., Engineer for Existing Lines, examined:—

- G. Cowdery, Esq.
27 June, 1884.
290. *President.*] When was your attention first drawn to anything loose on this bridge? When fixing the cross girders; we had occasion to renew the decking in a large degree; it was thoroughly overhauled; and finding that the cross girders were nearly all loose they were re-riveted; it threw us into a great deal more riveting than probably we should otherwise have had; it was in consequence of the open work, the work not being well closed; as we tightened up we did not know where to stop.
291. How are the cross girders fastened? They are hanging on the rivets.
292. Who first reported on the condition of the rivets in the bridge? Inspector Rose, who is present here; he reported on the bridge before Inspector Hilzinger was employed. I have a copy of Inspector Rose's report which I can give you. (*Copy of the report handed to President.*)
293. When was this report supplied? Immediately after I took charge of the Department, when I went through everything with him.
294. Inspector Rose was the first to find loose rivets? Yes, and he commenced to repair the bridge.
295. Where did he first find them? In the girder on the west side and at the extreme north end of the bridge.
296. Have you the original report sent in by Inspector Rose? Yes, I have no doubt I have; I will get it and send it to you.

W. B. Wade, Esq., Inspecting Engineer, examined:—

- W. B. Wade, Esq.
27 June, 1884.
297. *President.*] What is the distance between the piers of this bridge? The distance between the piers is 150 feet, and 156 feet between bearings; it is 162 over all, and 150 in the clear—three continuous girders.

Mr. John Rose, Inspector of Iron Bridges, stationed at Goulburn, examined:—

- Mr. J. Rose.
27 June, 1884.
298. *President.*] Where did you principally find the loose rivets? Along the angle iron connecting the top boom with the web; and there were loose rivets in the cross girders. In many cases they were not up to $\frac{1}{8}$ of an inch. We found them loose in the angle iron and stiffeners principally; they were not close there by $\frac{1}{8}$ of an inch.
299. You reported this to Mr. Cowdery? Yes.
300. Then you were instructed to remove the loose rivets and replace them? Yes.
301. On which part of the bridge did you begin to remove them? I commenced from this end (the north end, and the west side of the bridge) on the web.
302. You brought the T iron in contact with the web plates? Yes, we closed everything.
303. Have all those rivets that now appear painted been replaced? Yes, those have been replaced.
304. Other rivets became loose as you re-riveted the work, did they not; you had to clamp or bolt the T iron to the web plate to bring the plates together, and put in new rivets, and then in doing so you naturally loosened other rivets? The other rivets were loose.
305. How many rivets did you take out of one T iron at a time? Not more than about half-a-dozen at a time.
306. You did not take all the rivets that are painted out at one time? No.
307. You only took out a certain number of rivets to bring the plates together and rivet again before you took more? That was all. If we took out any quantity of rivets we filled up every other hole with a bolt before we took out another.
308. How did you test the looseness of the rivets? With a small hammer.
309. Have you a hammer to show us how you did it? Yes; I tried it on the inside or head of rivet, not on the side on which it snapped.
310. What kind of blow did you make in testing? Just a small sharp blow on either side of the head of the rivet, putting a finger on one side while I made a blow on the other.
311. When you felt any vibration under the stroke of the hammer with the finger did you mark the rivet to be cut out? Oh, no; there was a distinct movement of the rivet in each case.
312. You did not when there was only a small vibration consider it necessary to cut the rivet? I passed those by.
313. You first went through this girder on the west side and at the north end of the bridge, and then I suppose you extended your investigation a little farther to the other girders, and found other rivets? The principal part I went through was the box between the top and bottom booms. With regard to the other side of the bridge I knew that one part I looked at was very similar to the other and I did not go through that; I only reported on the one side.
314. The rivets have been renewed on the other side? Yes, but that side was reported on by another inspector—Mr. Hilzinger.

Mr.

Mr. William Hilzinger, Inspector of Iron Bridges, stationed at Sydney, examined :—

315. *President.*] When you inspected this bridge you tested the rivets on the other side—the east side? No, the men continued until they finished the span on the west side, and then they came back on the other side. We kept on just the same. Mr. W. Hilzinger.
316. Where did you principally find the loose rivets on the east side? On the rims and on the cross girders. Most of those were loose. We cut all those out, and as we cut them out we had to follow up the straps until we got to solid ones. Those cross girders are hanging on the rivets, and they were loose, and where they were loose we cut them out and replaced them. We had to cut them out until we came to where they were solid. 27 June, 1884.
317. Did you find any space between the T iron of the web and the web plate? Yes.
318. In many of them? Yes, a great number of them. I could get a piece of hoopiron between the rivets, and shove it through; and all along the top boom, along the angle iron, and the cover straps you could get a piece of hoopiron between the rivets in the same way.
319. Did you find all the rivets to be loose when the plates or angle iron did not fit closely? No, not all loose; perhaps you would find one or two loose, and then when you replaced those and drew the angle iron close together it would make them all loose. I looked more for the work to be close together than for the rivets to be loose on this job.
320. Did you find any of the plates in the top or bottom boom not close together? No; they are pretty close together.
321. Not "pretty close";—were they close? Yes, they were close together.
322. With regard to the angle irons fastened to the booms, were the new rivets put in the angle irons or only in the wrappers? Occasionally there were places where a few were loose.
323. It appears more in the web than in the booms? Yes. Where the rivets have been only a little loose I have only tightened them up a bit, as you see on the bridge on both sides. But they are mostly on the angle iron and the wrappers, and when you find that you have to run them along until you get them solid again.
324. I notice that on almost every rivet there is a mark;—is that from a blow of the hammer? They have been sounding them as they went along. As they had a stage up they tried the rivets as they went along.
325. It seems to me that if you made a mark like this (showing a mark on a rivet) you must have given them a good blow with the hammer? It is only the paint knocked off.
326. What kind of a hammer did you use? A light hammer—4 or 5 ounces, perhaps.

MONDAY, 21 JULY, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M^d. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING.

OWEN BLACKET, Esq.

Benjamin Barnes, Esq., Railway Bridge Contractor, sworn and examined :—

327. *President.*] What position with regard to the Department of the Engineer-in-Chief for Railways did you hold at Dubbo;—were you the contractor for the railway bridge? I was the contractor—myself and another. My partner did not come on to the works at all. I carried out the work. B. Barnes, Esq.
328. Were you at Dubbo from the time when the erection of the bridge commenced until it was completed? Yes. 21 July, 1884.
329. Can you give us a few brief particulars of the Dubbo bridge? Yes. It consists of three 150 feet openings in the clear, that is 159 feet from centre to centre of columns, the columns being 9 feet in diameter, and there are two additional spans, one at each end, of 60 feet opening. There are in addition to that, long wood approaches at each end, the dimensions and particulars of which I cannot mention at this moment.
330. Are those approaches of iron or timber? Timber viaducts.
331. What description of girder—an open lattice girder? An open lattice girder.
332. Similar to the Wellington bridge? Similar, but by no means like the Wellington.
333. Were any deviations made from the drawings and specifications in the erection of the bridge? I do not remember any.
334. Do you consider that the work has been done satisfactorily according to the drawings and specification? In the Dubbo bridge?
335. Yes? I do.
336. Could any contractor take advantage of any omission in the drawings and specification in the erection of this bridge? Well, I do not see how he could, because, as you may know, the bridge is erected under the supervision of a district engineer with a resident inspector always on the works. The district engineer visits the works nearly every day. At some stages of the work he visits it every day, but when the work is such that it is not absolutely necessary for him to personally inspect it he does not come every day; he has other business to attend to. But the inspector was there every day, and all day; and they had the drawings and specification, and we had to work under their direction and to the drawings and specification.
337. So you could not take advantage of any particular wording of the specification to put inferior material in the bridge, or give inferior workmanship? I do not see how in any way we could.
338. Who was the Government superintendent or Government engineer in charge? Mr. Alfred Raudall.
339. Were all the joints of plates of angle-irons brought into close contact by the rivets? They were.
340. Do you think a few loose rivets may have escaped the notice of the inspector? Yes, I think it is possible.
341. Do you think that in a year or two some of the rivets may become loose by the expansion and contraction of the ironwork, or by the vibration caused by the traffic over the bridge? I think it is just possible some of them may become loose on the top member. Not exactly loose. No doubt there are some few of what you would call perfectly tight rivets that would possibly be loose on the top member—not on the bottom member. That would be where the iron is strained in tension.* 342.

* NOTE (on revision) :—There is no doubt that the strains referred to would have a tendency to loosen rivets, but it would not have that effect on the bottom member where the iron is strained in tension.

- B. Barnes, Esq.
21 July, 1884.
342. What number of rivets would be likely to become loose in a couple of years? I could not tell.
343. What percentage, roughly speaking? I cannot say.
344. In work of that description properly carried out, just roughly speaking? I could not give an opinion on that. I think where the work is in compression and the rivets do not fill the holes thoroughly, and when the bridge has been working for some time, that it is possible, in consequence of the vibration and the expansion and contraction of the iron, that the rivets may become not to say loose but not perfectly tight. There is almost a distinction between a loose rivet and a something not perfectly tight, if you understand.*
345. Would a smart blow with a 4-lb. hammer, struck on each side of such a rivet as you allude to, cause it to become loose? Well, I do not think it is fair to treat rivets like that; and when I say that I speak as one who has had some practice in the thing.
346. You would not allow your rivets to be tested with a 4-lb. hammer? I would not. When I say that, you could not prevent the Department from doing what they like.
347. But it would not be fair? I was myself a Government officer for four years, and had a large number of bridges erected under my supervision, and I never thought of testing rivets by using a 4-lb. hammer.
348. You would rather use a 4-oz. hammer? I would not use a heavy hammer in any case.
349. Such a blow as that from a heavy hammer would be likely to loosen the rivets if they did not fill the holes accurately? Yes, and in hand riveting it is almost impossible to get all the rivets to fill the holes. You may know that the practice in riveting is to heat the rivets at the forge, and the point of the rivet is almost always made much hotter than the head. The rivet is then put into the hole of say two or three thicknesses of half-inch plate, and we will suppose the rivet to thoroughly fill the hole. The riveters then come on it with their hammers and knock down the hot end of the rivet. In the meantime the cooler part of the rivet, under the head and near the other side of the plate, is not affected by the hammers, and as it cools it becomes smaller—only a fraction, but still it becomes smaller; and when the rivet is quite cold if you put your finger on one side of the head where it touches the plate and hit the opposite side of the head of the rivet with a hammer the chances are the slightest possible movement will be detected.
350. One part of the rivet will be loose? We distinguish between heads and bats. The bat is the end produced by the riveter. It is the head of the rivet I speak of; the other portion you will find tight. I may say that in machine riveting a totally different state of affairs exists. The rivets when they are put in by a machine are usually heated in a furnace all over alike, and when they are put into the holes they are rammed in by the machine, and so completely fill the holes.
351. But in the erection of a bridge you cannot have that—you must have hand riveting? Yes.
352. Would you allow rivets to be put in when they are nearly cold; do you consider that such rivets put in would make good work? No. The rivet requires to be heated, and well heated, or the men cannot well rivet it.
353. *Professor Warren.*] What do you mean by well heated? White—white hot.
354. *President.*] In your opinion, what time would elapse after the completion of an iron bridge before any rivets became so loose as to require renewing. I mean, of course, a few of the rivets, not the whole? Well, I really could not answer that question. I have had a lot of work done under my supervision, and I never yet saw any rivets I would renew in a bridge after the bridge has been completed.
355. Not unless the moisture has got to them, or something of that kind? That does not affect the bridge itself. I may say that in plate-work where the holes are punched the tendency to the head of a rivet being loose is much greater than in plate-work where the holes are drilled, because in one instance the hole is parallel and in the other slightly conical, and the conical part of the hole is or should be always next the head.
356. The Dubbo bridge is entirely completed, is it not? Yes.
357. Has it been tested? It was tested severely by the Engineer-in-Chief and the Inspecting Engineer.
358. Do you remember what the test consisted of? Yes, for I made a test myself. I took a diagram independently of the Government test, and I know that the greatest deflection did not reach two-thirds of an inch for the 150 feet span; it was a little under two-thirds of an inch.
359. *Professor Warren.*] How was the bridge loaded? With heavy goods engines. I am sorry I have not the diagram here. I may tell you that when the bridge was about to be tested I saw a lot of indicators that had been sent from Sydney, and I spoke to Mr. Randall, and said I knew a much simpler method of testing the bridge. He said if I would make an instrument he would have an independent test made.
360. *President.*] That was before the staging was removed? Yes, but I did not use the staging for my test; I took it from the earth in one of the land spans.
361. What height was it? About 15 feet.
362. What apparatus did you use? A simple lever with a pencil. I first prepared a board, which I fixed on a piece of iron driven into the earth. I then made a lever 12 inches long, working upon a pivot, and at the movable end of the lever I fixed a pencil at a point 3 inches distant from the pivot upon which the lever worked. I attached a copper wire and connected it with the underside of the girder, and weighted it so that when the girder deflected the lever would move up or down. I put a sheet of paper under the pencil and fixed it to a point, and when the weight came on the girder deflected and the pencil went down and described part of a circle; and when the weight was removed to the next span the pencil went up beyond the mark, because the portion between the two spans acted as a beam. One-fourth of what the pencil indicated was the actual deflection. It was intensified to get a more correct reading. The severest test was when three heavy goods engines were going over the bridge at about 40 miles per hour, and it was the same both ways.
363. Do you remember what type of engines they were? I do not remember; but they were heavy engines.
364. *Professor Warren.*] Did they cover the bridge? They covered rather more than one span.
365. Did you place the engines on the outside girders and leave the centre one light, and then place them on the centre one and leave the outside light? Yes; four engines were placed at rest on the first span, and then removed to the next span, and so on.
366. That was the first test? No; the first test was one engine on the bridge. That produced very little effect. Then four engines were put on at rest. They more than covered the span, and they remained

* NOTE (on revision) :—There should be a distinction between a loose rivet and a rivet the movement of which could only be detected by a blow on the side of the head of it with a hammer.

B. Barnes,
Esq.
21 July, 1884.

remained there some little time. After that test the four engines were run off the bridge, and three engines were coupled and taken back to the Dubbo station yard, and the drivers told to come at full speed to the bridge, and that produced the severest test. They went at a speed of about 40 miles an hour. 367. And was the deflection greater? It was a little greater than with the fixed load, but not more than $\frac{1}{10}$ th of an inch. The first test was one engine; the second was the four engines, and that produced what we call a permanent set, which I presume you know. When the one engine came on to the bridge it was taken off and we saw no difference. When the four came on they produced the effect I have just mentioned, and when taken off the bridge did not go back to what it was before. That test brought the bridge to its bearings—to the permanent set—and it remained at that.

368. *President.*] You considered that test was very satisfactory? Yes; the permanent set did not extend $\frac{1}{10}$ th of an inch; it was less than in any bridge I have ever before seen tested.

369. In alluding to the permanent set, you do not mean the permanent set beyond the elasticity, but the permanent set by which the bridge took its bearings? Yes; at all bridges I have tested the first great load brings down the bridge to something at which it remains; it brings everything down to its solid bearing, and it is what is carefully registered.

370. You do not know the weight of the locomotives put on? I did hear at the time, but I do not remember now. You will get that accurately from the Locomotive Department.

371. Have you examined any of the railway bridges in the Colony? No, none of the bridges except that at Dubbo.

372. Did you ever pass over them and look at them—I mean over the iron bridges? No, I have not. I was down at Wellington, but I scarcely had time to look at the bridge, and never went to look at anything about it.

373. Do you consider that the Dubbo bridge is a fine specimen of an iron work of that description? I do—I do indeed. I was one of the contractors for the bridge, and the engineer as far as the contractors were concerned, and I think it is a good job, whoever goes to look at it.

374. *Mr. Blacket.*] Who was your inspector? A Mr. Hodson.

375. *President.*] Was the Engineer-in-Chief satisfied with the way in which the work was carried out? The Engineer-in-Chief appointed a day for testing the bridge, and he came up and remained there two days. He and the Inspecting Engineer spent the whole of one day looking into the bridge and closely examining it. Some week or four days before the bridge was tested another inspector came up from Sydney with a letter which I received from the District Engineer, telling me that this new inspector from Sydney was sent by the Engineer-in-Chief to go over all the rivets in the bridge. I was to render him every assistance I could, and I did so; and he spent three days knocking about the rivets and examining them as closely as he could. The Engineer-in-Chief came up after that, and spent all one day examining the bridge, and then it was tested, and both he and the inspecting engineer expressed themselves well satisfied, and told me that when I had finished painting they would take the bridge off our hands.

376. We are very much obliged to you Mr. Barnes for what you have told us? Having gone so far, I should like to say something more.

377. Yes? I was very much surprised, after the bridge had been opened for traffic and everything was working satisfactorily, to find two more men come up there and hammer the rivets on the bridge for four days continuously. Continuously they hammered the heads of the rivets on that bridge. I thought that was an undue amount of interference—I thought it was going too far; in fact I felt so annoyed about it that I sat down at once and wrote a protest to Mr. Randall. I wrote the same morning they commenced.

378. From what Department did they come? I understood from the Maintenance Department, the Existing Lines.

379. They were not sent by Mr. Whitton's officers? No, they were not. The people of Dubbo came to me to know what was the matter. The editor of the *Dubbo Dispatch* came to me to know if anything had gone wrong with the bridge; and we have some feeling in a matter of that kind, although we are contractors.

380. Do you know the names of the men who did this? I do not know the name of one of them, but I heard the name of the other; I think it was Hilzinger. For three weeks they were there, hanging lines and examining everything most accurately; and it occurred to me that either the men who were there before were competent to inspect the work and pass it or they were not. Of course we had our reputation to look after, and if it gets abroad that we have been doing bad work we do not stand as well for other work. After the bridge was finished we had to take up the temporary line, and do other work which the Engineer-in-Chief requested us to do, and it was during the time I was taking up this temporary line and doing other work that these proceedings went on.

381. *Mr. Blacket.*] What sort of testing was it—testing with a chipping hammer? I do not think it was; but I did not go on the bridge while they were doing it. I could hear them from my office hammering all day, testing the rivets.

382. A small hammer you would not have been able to see; could you see the hammer that was used? Oh yes; I could see the men putting their fingers on one side of the head of a rivet and striking the other side with the hammer violently; and then treating the other side of the head the same way.

383. It could not have been a flogging hammer? Oh no, it was a hand hammer.

384. *Mr. Courtney.*] You say that an inspector came up before the bridge was taken off your hands, and that he spent three days going over the rivets with a hand-hammer;—what was the result of that? It would be better for the information to come from him, but he told me he found about $1\frac{1}{2}$ or 2 per cent. in which he could detect a movement. I do not give you that officially, but he told me that.

385. *Mr. Blacket.*] Two rivets out of every hundred loose? Yes; some he condemned, and some he cut out, and some we cut out and replaced. I had heard a great deal about the riveting in other bridges in the Colony, and I took every pains to do a good job at Dubbo. I gave big wages and would allow no piece-work, and I never hurried the men in the riveting. I tried my best to please, but I could not stand by and see every rivet put in, and I did not. There is one other thing I would like to mention. Going back to the testing, I told you that we got permission from the Chief to apply my own test. After it was over the Engineer-in-Chief and the Inspecting Engineer came up to the office and we compared the diagrams they had taken with the one I had taken, and they were exactly alike in every particular.

FRIDAY, 25 JULY, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING.

OWEN BLACKET, Esq.

Mr. Samuel Maddock, Railway Inspector, sworn and examined:—

Mr. S.
Maddock.
25 July, 1884.

386. *President.*] Your name is Samuel Maddock? Yes.
387. Are you at present connected with the Railway Department? Yes.
388. In what capacity? As inspector.
389. You wrote a letter to the Engineer-in-Chief on the 27th March, 1883, in reference to the rivets in the Wellington bridge? Yes. (*Letter read.*)
390. That is the letter, is it not? Yes.
391. You have been connected with the works on the Wellington bridge? Yes, I was inspector. When I wrote the letter just read I was not in the Railway Department; I was manager of the Eskbank Iron Works.
392. When you visited the Wellington bridge on the occasion stated in this letter you did not find any loose rivets? I did not.
393. What kind of examination did you make? I tested them with a hand hammer.
394. And you could not find one loose rivet? I did not find any loose rivets that were chalked or marked to be cut out.
395. There is another letter I have here from you to the Engineer-in-Chief, dated 9th May, 1884. You were in the Department before you went to Eskbank, were you not? Oh, yes.
396. And you are now in the Department again? Yes.
397. You left the Department for a time to go to Eskbank? Yes.
398. This letter, which is dated in May, 1884, was written when you were again in the Department? This was when I was in the Department again, and it is just as the men stated to me.
399. These are only statements made to you? Made to me and Mr. Smithyman; we were both standing together at the time.
400. But you do not know of your own knowledge whether the statements were correct or not? No.
401. You just reported what was stated? Yes.
402. Where is Sheardon who is mentioned in this letter? I have been trying to find him but cannot. He was working on the Cook's River Bridge when he made that statement to me.
403. Who is David Christie? He is a boiler-maker; I do not know the man myself. (*Letter dated May 9th, 1884, read.*)
404. That is the letter referred to, and it is signed by your name? Yes, that is the one.
405. In July and August, 1883, you witnessed some statements made by a man named Joseph Dunn and by another man named George Mills? Yes.
406. What are those men? One is a holder-up for a boiler-maker, and the other is a boiler-maker. Dunn is a holder-up.
407. Dunn refers to the riveting of the Penrith bridge? Yes.
408. Have you any knowledge of the work in that bridge? Not at all.
409. Mills refers to certain matters connected with some bridges in another department? Yes, in another department.
410. You know nothing of that of your own knowledge? No, not of my own knowledge.
411. At whose request did they come to make this statement? Mills came to my house at his own instance. Dunn went to Smithyman's house, and I happened to be there at the time.
412. As an inspector of iron bridges you have had some experience in riveting? Yes.
413. Do you think that rivets could be replaced in the boxes of such bridges as that at Penrith? I do not think so.
414. So as to be able to make a good job? I do not think a man would live to get up the box. How is he going to get up the box—it is only 18 inches.
415. 16 inches, I think? Yes, and he could not possibly hold a rivet up.
416. The rivets would probably get cold before they were used, I suppose? Before they got there at all.
417. And that, in your opinion, would not make good work? It would make bad work.
418. If there were a loose rivet in those boxes it would be better to leave it than to replace it by another? I think so.
419. Do you consider that in riveting plates or angle irons to plates they should be brought into perfect contact? Yes, close together; quite close; screwed up quite tight.
420. To make good work it is necessary to do that? It must be done.
421. From your own experience do you know if rivets will get loose after a bridge has been finished and the traffic is passing over it? The only rivets that can get loose in a bridge, from all my experience, are those in the cross girders which are attached to the bottom booms.
422. You mean to say the rivets of the cross girders, or those fastening the cross girders to the boom? Yes, fastening the cross girders to the bottom boom.
423. You do not think that rivets can get loose in consequence of a heavy load passing over a bridge? Only on the cross girders.
424. Not on the main girders? No, not if the layers of plates were close at first.
425. You would make no allowance for the expansion or contraction of the iron: Do you think that the expansion or contraction of the iron by change of temperature would loosen any rivet? I do not think so. There might be a great tension or strain on some portion of the bridge, and more compression on the other.
426. Would the loosening of the rivets be owing to the vibration of a load passing over the bridge? I do not think so.
427. Have you employed men under you to rivet a portion of a bridge? Yes.
428. If you employed any boilermaker or riveter to take out rivets from a bridge and replace them, how many rivets do you think would be a fair day's work? To cut them out?

429. And replace them—supposing there were any loose—to cut them out and replace them in the ordinary way? From 70 to 100 a day.

430. That would be a fair number? For eight hours per day, 70 to 100. I am presuming that there would be a rivet here and another there, that the man would be shifting about. If it was straightforward work they would do from 150 to 200 rivets per day. I mean one set of riveters, viz., 2 boilermakers, 1 holder-up, and 1 boy.

431. When you wrote this first letter in March, 1883, whilst you were at Eskbank, you did it voluntarily—you were not requested by anyone to write it? Not at all; I saw the statement about the rivets in the bridge in the paper, and I went there. Having been inspector there I took an interest in it.

Mr. S.
Maddock.

25 July, 1884.

Mr. Edward Massey, boilermaker, sworn and examined:—

432. *President.*] Your name is Edward Massey? Yes.

433. You are a boilermaker? Yes.

434. You have been employed on some of the railway bridges? Yes.

435. As boilermaker? Yes, on the Penrith bridge only.

436. You made a statement in reference to the riveting on the Penrith bridge, on the 28th March, 1883? Yes.

437. To whom was that statement made? I made the statement to Mr. Whitton.

438. At whose request was it made? Well, not exactly at his request. I was asked some questions concerning the work on the Penrith bridge—did I find this, that, and the other; and the statement I made to the individual asking me was brought by him before Mr. Whitton. It had reference to what actually went through my hands.

439. Who was it who brought you to Mr. Whitton to make that statement? Smithyman. (*Witness's statement read.*)

440. That statement which has just been read was the statement you made? Yes.

441. And this is your signature attached to it? That is my signature.

442. How many rivets did you cut out and replace—approximately? We commenced with about fifteen in a group; there were about fifteen to start with moderately loose. You could not exactly tell the sound of a rivet, the plates not being exactly close; but in a space of 80 feet you could find one or two that you could turn round with your finger. When they started jarring and cutting out I have known as many as thirty blows on a rivet. When the holders-up have come out of the box I have asked them if they have been able to get the rivets up, and they have said "we cannot get them up." As the rivets came out they were blood red. The boy had to drag himself in to get the rivets out; it was utterly impossible for a man to get into a 12-inch space to do his duty. As we were cutting out the rivets a great number were loosened by the jar of the hammer, and when the men, the holders-up, came out from the box I asked them how they were getting on inside, and they told me there was not room to work, and that they could not make a first-class job of it. Then taking one rivet out they loosened twenty, and by taking twenty out they loosened 100, right away along. It is difficult to sound a rivet with that jar, unless you get a very small hammer, and then you have to listen very acutely. I know the rivets swaged down because I swaged them myself.

443. How many rivets did you generally cut out in one day? Something like twenty.

444. That was in the box? Yes, we used to take out about twenty and put twenty others in.

445. Could you not do more than that in a day? They used to take them out and put them in.

446. How long did it occupy you to take one out? I have known it to take a quarter of an hour.

447. Why did it take so long? Well, through the iron being good, and the rivet perhaps not being properly solid, and the plate opening out, it is a drag; it drags the plate along with it.

448. Were the holes properly drilled? Yes, they were all straight holes—very good holes.

449. How many rivets did you cut out at one time before you replaced them; and did you put in any service bolt as you cut the rivets? We put fresh rivets in as we cut the others.

450. How many at a time? Twenty.

451. You cut out twenty at a time? Yes.

452. Were they consecutive rivets? Yes, they would cut out twenty in one space, and then put the others in—twenty a day.

453. You did not put in any bolts to hold a portion of the plates whilst you were cutting others? No.

454. After a few rivets had been cut out as you have described, did you see any movement in the plates—any bulging or difference that would show that the hole of the different plates had changed its position or was not so true as at first? Not at all. The plates—some of them—were not exactly close, but the hole was fair down, the rivet was fairly in. The holes were very good. Of course the hole being 5 inches pitch the plates were not exactly close.

455. What I mean is—there was no strain on the plates, so that the holes would change between the time when you cut a rivet and when you replaced it? Not at all; as the rivets were cut out the plates remained just as they were when the rivets were taken out; there was no strain, no move, or anything of that kind. She neither went up nor down; she remained in her place.

456. When you cut the head of a rivet, which you did first to remove the rivet, had you to punch the remainder of the rivet out to drive it out? We had to drive it out; and some came without driving out.

457. How many? I could not say. Some took a good bit of punching out, and some actually came out themselves.

458. How many of them? I cannot say.

459. Not many I suppose? Well, for the time I was there I have seen two or three which one blow would fetch out after being cut, and I have seen four or five blows on one. Of course that was reasonable.

460. Did you remark to Mr. Hilzinger that the work you were doing was useless? I made this remark: I said to him, "Well, where are you going to start first?" He said, "Start at the end." When I cut one or two rivets out I called his attention to the fact that as soon as we cut those out every one would be loose. He told me to "cut them all out, no matter." I had made a carriage to pull a man into the box, but I said "no man has the power to do the work properly," and I said "The more we cut the more will be loose."

461. You must have had a small man to put into the box? Yes.

Mr.
E. Massey

25 July, 1884.

- Mr. E. Massey. 462. And the rivets must have been nearly cold by the time they reached the men? Most decidedly, and that stands to reason, for the fire is outside the bridge and the rivets have to be handed in through a little hole to a boy, while the man has to lie on his back, and the space he is in is such that no man doing the work can do it properly. Went we first went up there—the day before we started—we looked around. He asked me what I thought about the bridge. He said, “She’s dropping.” I said, “It is impossible to drop; see those web plates.” We went where the ornamental angle irons are, and I said, “If she has dropped these angle irons will show it.” I said it was “a matter of impossibility; see those web plates”—11 feet web plates. The bridge would carry a million times more than it does.
463. You were there about two months? I was twelve months with Hilzinger altogether. I was working at the Ashfield bridge as well as at the Penrith bridge.
464. But with regard to the Penrith bridge? About two months.
465. During that time who was looking after the work besides Hilzinger;—did anyone else come to the work? Not that I saw.
466. It was left entirely to Hilzinger? I believe I saw Mr. Cowdery one day.
467. You do not think that taking the rivets out of the boxes at the Penrith bridge caused as good a job to be made of the bridge as was the case before with the old rivets? I cannot see it; I cannot see it at all. I have been doing many a bit of work, and it is a matter of impossibility, because the men cannot do their duty on a $\frac{3}{4}$ -rivet in a 12-inch hole. It is a matter of impossibility. I thought at the time that if the rivets were taken out it would be far better to fill up the holes with a bolt than with a bad rivet. That was my idea, though I did not say anything. As the men came out, I used to say, “Well, Jack, how did you get on?” “Oh,” he said, “it was a deuce of a job.” I said, “Mind you cut them all.” He said, “You cannot cut them all.”
468. Are you employed in the Railway Department now? Oh, no; I left the Penrith bridge to go down to Newcastle.
469. Mr. Blacket.] How did you come to give Mr. Smithyman the first information about this—who asked you for it? Well, I met Smithyman in the town one day, and he says to me, “You were working up at Penrith, wasn’t you, Massey?” I said, “Yes.” He said, “Did you find any loose rivets?” I said, “Yes, a few loose rivets.” He said, “How did they get them in after they cut them out?” I said, “Well, they got them in, but I don’t suppose they made a first-class job.” He then says to me, “Well, will you come and make a statement to Mr. Whitton?” I said, “I’ll make a statement before anybody”; and, doing nothing at the time, I came down and told Mr. Whitton just what I have told you.
470. President.] Did you see Hilzinger use one of those flogging hammers, trying the rivets? Yes, at times I have seen him give two blows, one on each side the rivet, on the head.
471. What size of hammer did you see him use? I saw him use a hammer of 4 lbs. or 5 lbs—a flogging hammer.
472. Mr. Blacket.] Was that to test the rivets? Yes, that was his style of testing.
473. But if you wanted to loosen a rivet you would not hit it on the head? No, I should hit it on the top. But it is a matter of impossibility to loosen a good rivet. You may hit it fifty blows. I have seen a boiler rivet, and three-blows would fetch the head off, but you may hit a good rivet in a boiler fifty times and not loosen it. The head may fly off, but the rivet will be in the hole. In this case it was not cutting but sheer dragging them out.
474. Professor Warren.] So many plates? There were so many thicknesses.

Mr. George Mills, boilermaker, sworn and examined:—

- Mr. G. Mills. 475. President.] Your name is George Mills? Yes.
476. You are a boilermaker? Yes.
- 25 July, 1884. 477. You have been engaged on some of the railway bridges, have you not? Yes, I was working on the Parramatta overbridge.
478. That is in the Department of Existing Lines? Yes.
479. You made a statement on the 4th August in reference to the class of work that was being done on that bridge at Parramatta? Yes. (Statement read.)
480. That is the statement you made? Yes.
481. And that is your signature attached to it? Yes.
482. Were you requested by anyone to make that statement, or did you make it voluntarily? Partly voluntarily. I had a hearing with Mr. Cowdery, and he promised to meet me at Parramatta to look at this defective work, but he did not come. I ran about for a week, and he did not come near, and of course I left the Government employ altogether.
483. Then why did you make this statement—what induced you to make it? I thought—at least I was told—if I said what I knew concerning the Parramatta bridge that I should have a fair hearing, and be brought face to face with Mr. Hilzinger.
484. To whom was this statement addressed—to whom did you send it? Well, it was a gentleman of the name of Maddock. Of course he heard at the time that I had a hearing with Mr. Cowdery. He came and saw me about the bridge, and told me about Hilzinger; and he asked me if I knew anything about the Parramatta bridge. I said I did, and I told him all I knew about the defective work in the bridge; and likewise Mr. Cowdery.

WEDNESDAY, 30 JULY, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING.

OWEN BLACKET, Esq.

Mr. Thomas Smithyman, boilermaker, sworn and examined:—

- Mr. T. Smithyman. 485. President.] You made a statement on the 20th March, 1883, in reference to the iron railway bridges? Yes, I did.
- 30 July, 1884. 486. To whom was that statement addressed? To Mr. Quodling, I think.
487. Were you requested by anyone to make that statement? No. 488.

488. You made it of your own free will? I used my own judgment. (*Statement read. Vide Appendix.*)
 489. That is the statement you wrote? Yes.
 490. And that is your signature attached to it? It is.
 491. Then you have been connected with the erection of the Menangle bridge? Yes.
 492. And of the Penrith bridge? Yes.
 493. And of the bridges over the Wollondilly? Yes.
 494. The whole of them? Right away from Towrang to Goulburn.
 495. And you were engaged in the erection of the Aberdeen bridge? Yes.
 496. Of the Bathurst bridge? Yes.
 497. And the Wellington bridge? Yes.
 498. Did you in every case give satisfaction to the Engineer-in-chief? Satisfaction in all cases; never had any complaints at all—not one to my knowledge.
 499. I think that will do for to-day. We shall want to examine you again some other day.

-Mr. T.
 Smiithyman.
 30 July, 1884.

Mr. Joseph Dunn, boiler-maker's holder-up, sworn and examined:—

500. *President.*] You made a statement on July 21st, 1883, respecting the Penrith bridge? Yes. *Mr. J. Dunn.*
 (*Statement read.*)
 501. The signature to that statement is yours? Yes. Before you got the trolley into the boom you had to crawl in on your hands and knees; you had to get in on your face and hands, and then you had to lie on your back. Before the rivet came it was passed to the boy and before it was used it was nearly black-hot. It ought to have gone in nice and hot. When they were not hot underneath the head it was impossible to hold them up. I have worked at riveting from a lad, and been a holder-up all my lifetime, and in the work I have done I have always done good work.
 502. How far had the boy to crawl on his hands and knees to hand his rivets to you? He had to go as far as from here to the corner of that wall.
 503. 20 feet? Yes; that was before he could put it up for me to get hold of it with the long-shafted hammer called a dolly.
 504. Who were the boiler-makers who used to knock the rivets on each side? James Foley and Thomas Crealey.
 505. Can you say if any rivets that were cut out were not loose? I can certainly say that rivets came out that were not loose at all.
 506. How could you find that out? By being inside and having an opportunity of seeing.
 507. Did you feel them with your finger? If a rivet is loose you can shake it with your finger.
 508. Did you feel that shaking with the blow of the hammer? Yes.
 509. You say that when the paint was blistered around a rivet you had to cut that rivet out? Yes, as long as the edge of the rivet was seen.
 510. Was this blister caused by the hammer used in testing the rivet? No, the blister was the paint at the edge of the rivet, the same as if you had the cup too long.
 511. *Mr. Blacket.*] It was a crack in the paint? Where the paint came off you could get many a snap to go on the rivet, and you do not put the edge in; still the rivet is sound.
 512. *President.*] The rivets that you put in and that were nearly cold could never be up under the head? No; some of them were up under the head, but others were not. If you cannot get a rivet up until it is cold you cannot get it up at all. If the head is cold you cannot get it up; it is a matter of impossibility.
 513. You got into the bottom box too? You mean by the bottom box the boom?
 514. Yes? No, I never went in there.
 515. Where then did you put the two rivets you allude to? That was underneath the bridge.
 516. When twenty rivets were taken out were they all cut at once? Yes, you had to cut twenty a day and put in twenty a day.
 517. But did you cut the twenty? No, you put in twenty and cut out twenty.
 518. What I mean is, did you first cut out twenty and then fill the twenty holes? No.
 519. How many did you cut at one time? You would cut some in one place and fill up, and then go about 3 feet further.
 520. How many rivets did you cut out, and then fill up the holes, at one time? Ten or fourteen.
 521. Were those rivets cut from the bridge generally or only within a small distance? In a small distance. You would cut them out in one place and then go along.
 522. Were those rivets cut out of the top plates or the side plates? On the top.
 523. Was it in the centre, or in the angle-irons, or the corner of the box? In the centre; and some were cut out of the angle-iron.
 524. Were you employed for three months in doing nothing else but holding-up inside the box? I would not say altogether three months; about that.
 525. Nearly three months, you say? Yes, I was holding-up all the time I was there.
 526. How many rivets did you cut out during the time you were in the box? I could not say; I never took account; I know we have taken out as many as fifteen at a time. The orders were to take out twenty and put in twenty, and sometimes they would average over that. The other two men were working on the other side, and sometimes they would run the others.
 527. Who marked the rivets to be cut out—who was to say what rivets were to be cut out? The riveters themselves. Hilzinger told them that twenty were to go out and twenty to go in. The riveters took out what were marked; the riveters would sound the rivets and take them out.
 528. How often was Mr. Hilzinger there at that time? He used to come perhaps once in a week. He generally used to be there on a Wednesday. I saw him once on the pay. Then he never stopped above a couple of hours when he did come; he would go away to Sydney again. There was a man named David Christie who used to sleep in his tent.
 529. How long did you stay in the box at one time? Well, I went in at a quarter to 9, and I have come out at 11. Of course I am an exception as I am a small man.
 530. You must have found it pretty hot? I did; I have come out ringing wet. In fact I have not had a shirt to my back, many a time. When a train has been going by we have had to knock off work because the vibration was so great.

- Mr. J. Dunn. 531. Do you think that some of the rivets which were cut out ought not to have been cut out? I am positive of it.
- 30 July, 1884. 532. Were the rivets that were put in as good as those that were taken out? Plenty of them were not.
533. *Professor Warren.*] Those rivets that you referred to as having been put up cold were afterwards caulked, were they not? Yes; they tried to pass them in with a long wire, but that would not suit.
534. *Mr. Courtney.*] Are there rivets in the box that are tightened up with a round nose to make them appear sound? Yes. That is the cup of the rivet; you take a round nose, and just touch it round; it is on the cup outside that you put the round nose.
535. *Mr. Blacket.*] They did not caulk the rivets inside the box? No; and nobody can see where the round nose has been put, where it is nicked in. Then you can sound the rivet and you will find it tight.

SATURDAY, 15 NOVEMBER, 1884.

Meeting held at Commercial Hotel, Wagga Wagga.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq., PROFESSOR OF
ENGINEERING.
W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR
OF ENGINEERING.
OWEN BLACKET, Esq.

Mr. George F. Chapman, Inspector of Bridges, sworn and examined:—

- Mr. G. F. Chapman. 536. *President.*] What is your position in the Railway Department? Inspector of Bridges.
537. In what district? From Picton to Albury, from Picton to Hay, from Picton to Jerilderie, and from Picton to Tarago.
- 15 Nov., 1884. 538. Have you been inspector of iron bridges as well as timber bridges? No; merely timber bridges.
539. Have you had some experience of timber in this country? Yes.
540. What experience have you had? I have had experience both as a worker and as a getter.
541. Can you tell one kind of timber from another kind? Yes, as a general rule.
542. You would know the difference between stringy-bark and gum? Yes; but the timber of the piles in these bridges was not determined by me.
543. You did not send in any of the reports which are before me as to what the timber was particularly, or if you did you assumed that it was correct as stated by some other person? You mean the superstructure. I know what it is. The timber of the piles was determined by an expert sent by Mr. Cowdery, called Rowlands, assisted by sub-inspector Giddy.
544. You examined the whole of the timber viaducts on the Wagga line? Yes.
545. These reports that you submitted to Mr. Stephens are yours (*showing documents to witness*)? Yes.
546. When did you begin to examine these viaducts? Shortly after they were handed over to our Department for traffic on. It is my usual course, as soon as the traffic commences, to go there and examine the bridges. It is part of my duty.
547. Had you anything to do with these bridges before the Existing Lines took charge of them? Nothing at all. I saw them while they were under construction, but I never interfered.
548. What state was the viaduct in when you first took charge? It wanted screwing up very badly.
549. That was before the traffic began to pass over it? No, after.
550. How long? Hardly a month, I should say, speaking from recollection.
551. The first thing you did was to screw up the bridge? Yes; the bolts in many instances came through a great way—from three quarters of an inch to an inch and a half.
552. Was that from shrinkage? I do not know that. All the bolts are let down into the top girder the depth of the head, flush with the top of the girder—various depths, from half an inch. We had to get cast-iron washers for them; they would not screw up sufficiently without.
553. You have had some of the girders strutted;—by whose orders was that? Mr. Cowdery's, through Mr. Stephens.
554. Did you first report that those girders were defective? Yes.
555. Can you remember how many of those girders were strutted? I cannot give it from memory to be correct. I should say about ten or twelve.
556. In which viaduct was that? In various viaducts—numbers 1, 3, 4, and 5. The pieces cut out were sent down to the office of the Engineer-in-Chief.
557. At what part of the girder was this cut out; at what distance from the pier? I cannot be exact upon that. I could not tell you within a foot. It was not on the centre; it was more on one side.
558. About a quarter of the span? I cannot say exactly.
559. Did you notice what was the effect of a train passing over those defective girders before they were propped up? Some of them came down more than others. Having a doubt I climbed up on the head stock, and I fancied that these girders came down, and I took steps to prevent anything from happening.
560. You have inspected these viaducts very carefully? I made it my particular duty to do so.
561. Are there any other girders beyond those propped up which are defective? Not that I know of, and I have been through them very carefully.
562. When these girders were propped up did you understand that it was with the object of having the defective girders replaced by sound ones? It was originally the object to replace all the defective girders.
563. In your experience of timber have you found that sometimes a piece of timber, say 12 by 12, will seem to be perfectly sound when put upon the ground, and yet, after a year or so, it will crack in several long cracks? Sound girders will do so, although the heart is in a sound state.
564. With regard to the piles in the piers, you found a great many of them had pipes in them? Yes.
565. And how many piles did you remove? I think there were two piers or rows of piles in No. 4 viaduct that were renewed by me.
566. Was that near the bridge? Yes.
567. *Mr. Courtney.*] You do not refer to those tressels which have an extraordinarily short pile? No, I do not.

not. There are only four piles in it. The reason they were done was this: I pointed out to Mr. Stephens that there were some defective piles that should be removed at once, and he gave me orders to do it.

568. *President.*] Have you seen timber which would have a pipe at some 10 feet from the butt end, and which would not show at the butt end? Pipes are very eccentric. Such a thing might happen.

569. Would that be frequent? No, not frequent.

570. If a pile has a pipe in it, it would generally begin at the butt end? Yes, generally.

571. And how far would a pipe of say 3 inches extend in a 16-inch pile? Sometimes it would run up to 8 or 10 inches, and sometimes it would run up quite hollow.

572. In your experience as a practical man in timber, have you noticed that the pipes in a pile increase in the course of time? That all depends upon the nature of the timber.

573. A great many pipes are caused by the shrinking of the timber leaving a pipe. That would be effected by the atmosphere? Yes, that would cause it.

574. If a pile was thoroughly closed up at the end, do you think the decay would still take place? Yes, I believe it would go on.

575. That would be the case with different classes of timber? Yes. I have bored holes into the timber until I have met a pipe at the bottom, while there has been none at the top.

576. Would not the white ant be likely to cause it? No, they do not occur very often. If a report came in that No. 4 or 5 viaduct was affected with white ant it would not surprise me.

577. Then you have to look very carefully for white ant in those bridges? Yes.

578. Have you found many? No, I have not; though I have looked very closely I did not find many.

579. If white ants came and settled on any of the piles, do you think it likely that some of them could get to the pipe? No, because we have put a composition in a great number.

580. In your experience of timber, how long should a 16-inch pile, that has sap an inch and a half round it, and a pipe 3 inches inside, be likely to last—such kinds of timber as have been used in the viaduct? If the pile was ironbark I would not be afraid of it, but with the majority of timbers I would not say how long they would last. There are internal effects at work.

581. In your opinion, were these piles sound at the time the bridge was erected? I could not say at all.

582. Would they be likely to have a pipe 10 feet from the butt-end? Probably there might be. Of course I would not attempt to say that any of these piles were all right when put in.

583. Is it customary in such timber as this to find pipes in the middle of the tree? It is not customary.

584. Have you found arsenic and kerosene a good composition to destroy the white ant? Yes, I have used it.

585. What time do you think the different kinds of timber used in these piles would be seasoning, say stringy-bark or messmate? They would be seasoned properly and fit for use in about twelve months.

586. And how long for ironbark? That would take longer, say eighteen months. It depends very much upon when the timber was cut, whether the sap was up or down.

587. In one of your reports you speak of a pile which had been stopped with putty;—was it in a 9-foot pile? Yes.

588. What was the cause of the putty being used? That pile was thoroughly rotten. You could poke an auger from one side to the other.

589. Has that pile been removed? No, it is still there.

590. Does coating the pile over with tar protect it from dry rot? I do not think it would protect it from dry rot; it merely keeps insects off. I do not think a coating of tar would protect the inside of the pile.

591. Did you open the ground to the concrete to examine the state of the piles below the surface? No.

592. That has been done by somebody? Yes, one row.

593. Did you do it yourself? Yes, with Mr. Stephens, and by his orders.

594. Did you expose the concrete? The concrete is below the surface. The timber there is not very good. Some of them are cemented up to the surface. When the sap rots the water gets down and runs along them from end to end.

595. What did you do in those piers where you took piles out? We took out the whole thing, and put in another.

596. What kind of timber did you take out? Either mountain ash or messmate.

597. *Mr. Courtney.*] Were you present at the driving of these piles? No, I was not present. It was Mr. Brayne.

598. *President.*] What was the depth of the concrete originally? As near as I could say, about 4 feet.

599. When you charred the piles below the surface did you take off any portion of the sap? Yes, except those filled up with cement; those we did not touch.

600. How many of those were there? I think Mr. Cook can give you a better idea of them than I can.

601. *Professor Warren.*] The timber in the piles of these viaducts is of various kinds, and you say in some the pipes increased in size. In what kinds did you observe that? In the softer kinds. They are more liable to decay at the heart.

602. You have not observed that in the ironbark? No, they do not increase in the ironbark.

603. *Mr. Blacket.*] Have you noticed that the bridge is decaying since you first took it in hand yourself? I have noticed that the piles seem to shake more sideways than before.

604. When you first went there did you notice any cement in the timber? Yes, in No. 4. I took the cement out, and it was sent to Mr. Cowdery. I went and made a preliminary inspection.

605. Did you consider the timber was defective when put in? It was not so good as it ought to have been.

606. *President.*] What is the pile that has been made so much of, that was replaced—the butt pile? I cannot make out where the butt pile would be.

607. *Mr. Blacket.*] There is another thing—there is the broken rail;—was there any reason for that rail breaking—was it bad? No. One of my men was working, and he discovered this broken piece of iron. I told him to deal with it at once, as the mail train was coming.

608. Was it the defect of the rail or the defect of the bridge? I could not say. I do not think the rail broke.

609. *President.*] There was a defective pile in No. 4 viaduct. Do you remember in what span it was? In 18 span. The pile was perfectly rotten, and must have been so, I think, when put into the work.

610. Did you remove that pile? No; we put in another at its side.

611. Was the head-stock of that pile quite sound and good? Yes.

612. *Mr. Courtney.*] Have you made any careful measurements to see if the pipes are increasing in size in the Wagga viaducts? No, I have not tried them since we bored into them.

Mr. G. F.
Chapman.
15 Nov., 1884.

- Mr. G. F. Chapman. 613. *President.*] You spoke of other works under your charge;—are they of similar extent? No, the Wagga is the longest I have got.
- 15 Nov., 1884. 614. Do they differ in any way? No, they are much the same. 26-feet centre is the largest we have got. I have been over all the viaducts on the line to Narrandera, and they are all ironbark, and of a quality that will always stand. There are different kinds of timber, and they all shrink differently.
615. You think the other viaducts are superior to the Wagga viaduct through having ironbark transoms? Yes.
616. Have you noticed how those other viaducts compare with Wagga in reference to springing? I have not examined that, but I feel sure they will compare favourably.
617. Is the plan of having sills instead of concrete generally used, or is it peculiar to the Wagga bridge? I believe it is peculiar to this bridge. They found through boring that they would have a job to get the piles into the rock, and they thought of the sills.
618. *Mr. Courtney.*] Have you found any of the heads of the bolts pulled down so that they were deeper in the timber than provided for in the first instance? If there is a washer put on they do not come down into the timber.
619. *President.*] Do you consider that the superstructure is now as it was put up at the time? If all the butts and all the girders were hollowed out like that I would not call it good work.*
620. The spaces at the joints are only due to shrinkage? Yes, that is all.
621. If a cabinetmaker had done it, he could not help shrinkage? No.
622. How long had the bridge been erected when you first took charge? More than a month. I had particular orders from Mr. Mason to have a special care.

Mr. Charles Cook, ganger, sworn and examined:—

- Mr. C. Cook. 623. *President.*] What position do you hold in the Existing Lines Department? I am a ganger.
- 15 Nov., 1884. 624. To whom do you report upon any work with which you are connected? To Mr. Inspector Chapman.
625. What are your duties? To keep the bridge screwed up, and if I see anything wrong to report it, and if possible to fix it up, such as in the way of strutting.
626. You refer to the Wagga bridge approaches? Yes.
627. How long have you been employed upon those bridges? Four years next January; but I have not been ganger all the time; I took that position on the 25th March, 1882.
628. You have made notes of the different kinds of timber used in the bridge? Yes, they are all in this book (*produces book*). Sub-inspectors Giddy and Rowlands classified the timber.
629. How often were they at the bridge to inspect the timber? The inspector generally comes up twice a month; sometimes three times.
630. Were you with them when they first came to classify the timber? Yes.
631. Was the timber tarred at the time? Yes.
632. They went through it pier by pier and you noted all the kinds of timber used in each bay? Yes.
633. Does this book record the classification? Yes.
634. Have they an inspector's book of this kind? Yes, I believe they have.
635. Did they allow you to get the whole of this information for yourself? It was not exactly for myself; I suppose they thought that if any one came up that I should have this to show; that is the only idea I can form upon it. There is no one else sees that book but myself and the inspectors.
636. And you have this book to refer to about any particular pier or girder or pile? Yes.
637. And you have them written down by numbers or letters so as to simplify classification? Yes.
638. Who do you say has the original of this book? Inspector Chapman.
639. And Sub-inspector Giddy and Sub-inspector Rowlands have a copy? Yes.
640. In classifying this timber they stated what each pile and piece of timber was, and in doing so they noted it down in this book? Not in this book, they had a small book with them, and this was taken down from that book afterwards. Sub-inspector Rowlands classified the timber and Sub-inspector Giddy took it down, and this was copied from the original book.
641. Who ordered you to drill holes in the piles? I got my orders from Inspector Chapman.
642. How did you find that certain piles were hollow? I tried them with the hammer outside, and if they sounded hollow I bored.
643. Did you find you had made a mistake in sounding the piles? No, I did not make many mistakes, except that I sometimes found a bigger pipe than I thought.
644. Have you had any experience of timber? No, I am a seaman, I have had no experience in timber except in American pine.
645. You have never been engaged in bridge work as carpenter or otherwise? No not before I came under the Government. I have been ganger for eighteen months or two years screwing up bridges, and then I got the gangership here.
646. Have you seen timber that showed no appearance of a pipe when you sounded it, but had a pipe higher up? No.
647. Then when there is a pipe in the pile you would be sure to detect it at the big end of the pile? Yes.
648. What size are the pipes in some of these piles in this viaduct? Some as much as 8 inches. I used to put my auger in until it broke into the pipe, and then I marked 9 inches with a rule, and then measured back in many, and found that there have been two pipes. I have found a pipe on the other side. I believe there is one pipe that I drilled quite through.
649. What kind of pipe was that? Only a very small pipe, about 2 inches.
650. Do you remember what height from the ground the pipe extended in some of the worst piles? In some I bored there were 18 inches or 2 feet. I bored farther on and found no difference in the pipe.
651. What was the highest bore? About 4 feet from the ground.
652. And you found a pipe then? Yes.
653. Do you think that if a hole is drilled through a pipe it is detected at once? Yes, I have found it in every pile.
654. Can you drill a $\frac{3}{4}$ -inch hole in these piles without finding out that there is a pipe there? I should think you could not.
- 655.

* NOTE (on revision):—Does this question imply that our Department made any alterations since viaducts were constructed—if so, no. I remember replying as per my answer to a question of good workmanship *re* hollowing butts, that I would not call that good workmanship.

655. You know at once that you have nothing to drill into? Yes, and I have brokn augers in the holes. *Mr. C. Cook.*
656. How was that? Because while boring I fell short apparently. In another instance while boring the auger slid round and I got into a kind of crack. *15 Nov., 1884.*
657. Was any auger hole put in without the pipe being detected? No; the bottoms of the holes I bored were immediately over the waling bolts.
658. You are satisfied that all these holes are the size mentioned in this book? Yes.
659. In screwing up the bridge have you found that the timber had shrunk much in the superstructure? I could not make out whether it was shrinking or whether I was drawing the bolts through. In some instances I have got $2\frac{1}{2}$ inches on some of the bolts; I have broken bolts in the girders, and I have never found a plate washer on any bolt that I have taken out; the heads of the bolts in every instance let into the girder.
660. When you find any cracks in any pile do you fill them up? No.
661. Do you draw the attention of the inspector to them? Yes. The only thing I have done I have stopped cracks in piles with tallow and arsenic, for the white ant.
662. Do you also fill the holes you drill with tallow and arsenic? Yes.
663. Have you found white ants? Yes, and I have dressed them with kerosene and arsenic, and stopped the cracks also. The hole bored I plugged up.
664. But there is very little white ant in the bridge? Very little.
665. What is the state of the sap that you found in these piles, and in what kind of timber? The sap was rotten; they were all pretty well the same; I have got 2 inches of sap on some.
666. You scraped that depth, and then charred the piles? Yes.
667. Were any of them strutted below the ground? No.
668. What state did you find the piles in before you charred them;—what state of decay or preservation compared with the timber above the ground? I charred them before we thought of boring for the pipes. The only one bad I found before charring them was in No. 4 viaduct, No. 18 row. That was over three years ago. It was cemented and tarred over. I knocked the cement out, and found a great many white ants behind it. After the charring, was finished I got orders to sound the piles. I found some of them hollow, and sent in my report, and the inspector came out, and we went into the matter.
669. Did you find that some of the piles had been concreted up to the surface? Yes, in the low bays in No. 4 viaduct, where there are no braces or walings up to No. 18 row of piles.
670. In what state was the timber? The sap was rotten on the surface.
671. So that the moisture could get in? Yes, it could get in.
672. *Mr. Blacket.*] Were you there when they built that viaduct? There was a great part of it built when I came. I was here five years ago. We had nothing to do with the viaducts then. We only had the temporary bridge to look after.
673. *President.*] Do you think there are many white ants in the bridge now? Not to my knowledge.
674. *Mr. Blacket.*] You go through the bridge to see? I go through the bridge three times a week.
675. *President.*] Have you noticed in any of these places where you state the piles are hollow that any of the head stocks were bad? No.
676. All generally sound? Yes.
677. Of what timber are they constructed? Ironbark all through.
678. But the transoms are not of ironbark? No.
679. *Mr. Courtney.*] From your observation, what timbers are the transoms mostly made of? There are some gum and a few ironbark, and I think a few ash.
680. There are very few rotten? Very few; only those with butt pieces that are in any way gone.
681. The butt pieces are not ironbark? No.
682. Did you find any caulking in the girders besides cement? Only putty; I found putty.
683. *President.*] When you have been screwing up the braces and walings have you found any of the bolts to be as tight as they would be in sound timber? Yes, very tight, so that when I have had to take a bolt out I have had hard work to drive it out.
684. Have you replaced any of these bolts? Yes, every bolt that has been taken out has been replaced.
685. Have there been many of them taken out? Not many of them.
686. How many of these bolts have you taken out of the walings and piers? I have taken I believe three or four out of the walings and one out of the bracing, and in every instance had a job to get them out.
687. When you put the new bolts in do you try if there is a pipe in the pile? No.
688. Was it before you bored the holes to find out the pipes? Yes.
689. If it was pretty tight you would soon find when you came to a pipe? Yes, and if so, I made the hole bigger.*
690. *Professor Kernot.*] Were those bolts that were removed in sound piles? I cannot say. It was before I started to bore for pipes.
691. You did not know whether there were pipes or not in these particular piles? I cannot say that for certain.
692. You have the means of measuring the diameter of the pipes in the piles? Yes.
693. Have you been led to the conclusion that the pipes are increasing in size? No, I have not noticed any increase.
694. How long have you had them under inspection? The first time was just after I bored the holes. I used wires within the last twelve months.
695. So you have not had a very long experience with these pipes? No.
696. *President.*] You did not remark that some of the timber was decayed when you excavated in order to remove the sap and char some of the piles? Yes, I spoke to our inspector, and I think that was what led to this being done; I told him I had removed the sap, and under the sap the timber was found to be rotten, but I had never bored holes to find pipes at that time.
697. *Mr. Blacket.*] Have you noticed that any particular kind of timber seems to be fretting away more quickly than any other kind? No, I have not noticed that.
698. Which seems to be worse? What they call messmate. Ironbark is the best; I have never found any pipe in that.
- 699.

* NOTE (on revision) :—I do not remember being asked this question, unless it is in reference to putty holes in girders or dry knot holes in piles.

- Mr. C. Cook. 700. *Mr. Courtney.*] Can you give any opinion about the tressels with these piles? No, I did not see that going on.
- 15 Nov., 1884. 701. The outside pile is not plumb? No.
702. Do you know how many are on tressels? From No. 6 row to No. 35 row, I think.
703. There is one pile at the south end driven 75 feet? Not to my knowledge.
704. What length is the longest you know of? 45 feet. There is a trial pile near No. 1, cut off close to the surface; that was driven down 75 feet.

MONDAY, 15 DECEMBER, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq.,

PROFESSOR OF ENGINEERING.

OWEN BLACKET, Esq.,

C. E. Nicholas, Esq., C.E., District Engineer, sworn and examined:—

- C. E. Nicholas, Esq. 705. *President.*] You were the district engineer in charge of the erection of the Wagga Wagga approaches? Yes.
- C.E. 706. Did you reside near the works? Yes, at Wagga.
- 15 Dec., 1884. 707. How often did you visit the works? It all depended upon what there was to do. If you had a copy of my journals that would tell you. I would be away sometimes as much as a week. I had charge down to Albury, which was 80 miles, but I resided at the Wagga Wagga end. It would take me a week to measure up to Albury and back; that would be the time I would be away. That was up to the time when, in consequence of the iron bridge being commenced, I was relieved of a considerable portion of the work, and I only went out some 20 miles from Wagga.
708. Then you had some overseer? Yes, Mr. Brayne—Inspector Brayne.
709. This is a plan of the Wagga Wagga viaduct (*showing plan*)? That is it.
710. You are well acquainted with the design? Oh, yes.
711. Did you make any calculation of the strength of one span, or of the girders? No, I did not.
712. You have had some experience of timber bridges? I had not then had much experience of timber bridges. Most of the bridges I have put up have been in masonry or brickwork.
713. It was at first specified that these piles should be driven, and it was found advisable to put the piers on sills, on account of the great depth of driving? The first idea was that they should be planted, and then it was thought better to put them on sills.
714. Did you keep a record of the depths at which in every case the sills were sunk? Yes. I have not them now, but the inspector has them. He has them outside now, and I can get them in a moment.
715. If you will not mind getting them for us? (*Witness obtained the record.*) This book will give you the measurements of every bit of the viaduct, including the measurement of every pile in the viaduct. For instance, here (*indicating in the book*) is the concrete in the piers. The five to one came up to the sills. Here is the eight to one which came above the sills, and at every fifth pier you will see there is an extra quantity of concrete. Five to one is the composition of the concrete, and eight to one above the sills, and every fifth pier, to start with, and afterwards every fourth pier, the concrete came up to the ground, which accounts for the increase in quantity. Here are the abutments; then the length of all the piles, and the number of the piers. Luckily Mr. Brayne has kept this book. (*Book handed to President.*)
716. We can keep this book for the present for our own information? Yes; it gives the total number of spans and total amount of everything in them; you can find everything in there; all the piers are numbered. This tracing is for the spans adjoining the iron bridge. (*Tracing produced.*) Five piers on each side adjoining the iron bridge. Those are all ironbark.
717. There is another small tracing showing the sills? I have one with me. (*Tracing produced.*) That is what you require.
718. Yes. How was the timber protected below the ground? You see it was buried in the concrete.
719. Was it tarred as well? Let me see. Yes, it was; it was tarred before it was concreted.
720. Was the other portion of the pile also tarred, or protected against the white ant, or decay? Yes, all tarred.
721. What kind of timber was it? If you will let me look at that book for a moment it will show the measurement of the tarring. But I know it was tarred. No, you will not find it in this book, because they averaged the length of the piles for the measurement of tarring.
722. What kind of timber was used in the sills? Various timbers. It was not ironbark. Most of the timber came from Sutton Forest. We were at first using a timber called messmate, but we stopped using it.
723. Was the timber that was put in the sills well seasoned? I cannot say it was well seasoned; I suppose it was all got after the contract commenced. But a lot of the piles lay up there for a long time before they were used. At the commencement of the work the timber was necessarily greener than it was afterwards.
724. I see from this tracing that the tenons of the piles let into the sills are 14 x 9. Was the work carried out according to this? That 14 x 9 refers to the size of the sill.
725. What was the size of the tenon? 6 x 4 x 4 or 6 x 3 x 3. I think 6 x 3 x 3 was about the average size.
726. Of what timber generally were the piles? They were of box, stringy-bark, and messmate; very few red-gum were driven. You could not get the gum small enough, and on either side of the bridge for five spans the piles were ironbark.
727. They were, I suppose, more or less seasoned according to what you could get? Yes; more or less seasoned.
728. Did you find any pipes in any of the piles? We did not allow any pipes to get in. There were a few piles in which we found pipes, and they were thrown out. I do not believe there were any visible pipes in the piles when they were put in the work.
729. You rejected all the piles you thought were defective? Certainly. I rejected several in consequence of some openings or cracks which the inspector thought it unnecessary to condemn. They were principally stringy-bark which opened very much to the sun.

C. E.
Nicholas, Esq.,
C.E.
15 Dec., 1884.

730. What end of the pile did you put in? The butt end down; for driving the butt end up.
731. And if there were pipes in the piles you would in cutting the piles discover what otherwise would remain hidden? In the timber bridge we were putting up 40-foot girders, and among them was an ironbark girder that looked a most perfect piece of timber. We had to cut it 6 inches at the end, and it disclosed in this ironbark girder a "dosy" place which we should never have suspected if we had not cut into it. Otherwise the girder looked as sound as a bell.
732. In what per-centage of piles would that be likely to occur;—what would be the age of a pile in which such a thing could occur? I should say a very small per-centage; but it is hard to say, because if you have not seen it in the butt end you do not know whether it is there or not. There would be very few piles where you would be lucky enough to cut into it.
733. If a pipe existed in a pile you would when drilling the holes for waling and bracing pass through it? You would probably find it out.
734. That is to say if a pipe really existed through a pile you would find it out by a drilling a hole? Yes. It does not follow though that a carpenter drilling a hole would call the inspector's attention to the pipe. If the inspector found it out he would have the pile taken out.
735. In any case in which the inspector's attention is drawn to the matter? Yes.
736. But he should look for a pipe in a pile? Certainly.
737. It is his duty to do so? Certainly.
738. If any piles had pipes in them, and they could be detected through the bolt-holes, and the attention of the inspector was not drawn to them, the contractor must evidently have given you timber which he knew would not have been passed if the pipes had been pointed out? Quite so.
739. That is to say, if the inspector's attention had been drawn to a pipe of 3 inches or more existing in any pile, he would have had that pile drawn out? Of course—less than that. I do not think I ever saw many piles come in with pipes; but if there were a pipe in a pile they would cut it off until the pipe was out. Then, if the pile were sound and long enough it would go in.
740. What difference in effect is there between a pile with a pipe in it and a sound pile? I do not think a small pipe hurts at all, except that it allows white ants to get along. I do not think a small pipe hurts in a pile unless there is "dosy" timber all round. If the timber is clean and sound all round it does not matter.
741. Is a pipe likely to increase in size—is the decay shown in the pile likely to increase, and therefore decrease the soundness of the pile? I cannot say from experience. I do not, you know, refer to large pipes. Of course if the pipe is a large one it would materially decrease the strength of the pile; but a small pipe is different. As a matter of habit we cut them out, but I do not think it matters much except that the pipe helps white ants.
742. If one of the piles of the Wagga Wagga approaches—not under the rail-bearing girders—were removed altogether do you think that the headstock would be strong enough to carry the girder without too much deflection? It depends upon what you call too much deflection. It would, no doubt, cause deflection; but I have no doubt that with three piles instead of four, with one in the centre, it would be strong enough.
743. The reduction of the section of a pile by a pipe would not affect the safety of the pier? No.
744. How long do you think would be the difference between the life of timber with a pipe and that of timber without a pipe? I cannot say. One would have to live a long time in the bush and have a long experience to be able to say.
745. A pile with a small pipe might last as long as the other? Yes, unless the white ant got in, and the pipe helped it along. In the case of the piles at Wagga Wagga the white ant could not get into them; the ends are covered. They might get in through one of the bolt holes when the timber shrinks. But anyhow it is against all rule in the Department to allow pipes. Pipes are condemned whenever they are found out.
746. Was the timber comprising the piles for the Wagga Wagga viaduct generally of the quality specified? The specification merely said "in approved hardwood," and they were all approved hardwood because they were all submitted to the examination of the inspector and myself. Not that I claim to have been a judge of the timber then. I was fresh out from home, and had no experience of Colonial timber. I was a far better judge when the timber was cut. So I left it to the inspector as much as possible. Still I was able to throw out a good many suggestions. I do not like those sun-cracks, and they would open in the sun sometimes. This messmate that I was talking about just now is, I believe, exactly the same timber as the black-butt on the coast. Messmate grows inland, and they tell me it is not so good as it is on the coast. I am just now driving black-butt piles, and they stand a lot of hammering and seem very good timber.
747. You have put up some other bridges of the same description as that at Wagga, but not in the same district? Oh yes.
748. Did you put up the Albury bridge? No; I put up some of the timber bridges between Albury and Wagga. I think they are all 26 feet openings.
749. Do you think a 26-foot opening is much stronger than 29 feet 6 inches? No doubt.
750. Do the corbels add any strength to the girders? No doubt they help.
751. They bring also more continuity from one span to another? Yes. I think the corbels in the Wagga Wagga approaches are longer than those we put in the 26 feet span. But anyhow the 29 feet 6-inch span is not so strong as the 26 feet.
752. You think there is likely to be more vibration and deflection upon the 29 feet 6-inch span than upon a 26 feet span? Oh yes.
753. Particularly on very long timber approaches? The part of the Wagga Wagga approaches which is not quite the thing is, I think, as we find from experience, the continuity of it. It is so long that it is like driving a buggy over a field that is ridge and furrow; every pier you feel regularly, and get into a regular spring, and you fancy there is far more deflection in the girders than there really is.* There is a lot of it in the springs. The piers occur so regularly, and are so rigid, that you get into a regular dip between them.
754. The girders are ironbark? Yes, all ironbark.
755. And I suppose some defects may occasionally escape notice? The ironbark girders—I am not speaking for myself, but all people who are well acquainted with the timbers of the Colony who saw them

said

* NOTE (on revision):—I do not think you can feel the piers in a carriage; it was when on the engine I have felt them.

C. E. Nicholas, Esq. said they never in their lives saw such a fine collection of ironbark—certainly I never saw anything like it. They were magnificent girders. You could see more about the ironbark—it was square timber. The piles were another matter.

C. E. 756. Defects such as cracks might be seen sometimes after the timber has been put in its place, through shrinking? Quite so, but if there were any serious defects seen after the timber was put in the piles would have to come out. There were very few defects to be seen before the timber was put in.

15 Dec., 1884. 757. It has been reported that some of the girders crack through the load upon them. Is that a fact? I should doubt that. There have been some brought up, but they have not split longitudinally but from the heart being too much on one side.

758. *Professor Warren.*] Have you tested the vibration? You could feel every pier as you went over it on an engine, and there was so much deflection. When I say that there was a certain amount of deflection on each of those spans I should say that the deflection on each of the spans was I think '60. With such a short length as that when you come on the solid pier you are bound to notice it. When you come to something alternately rigid and elastic you get into a regular up and down spring.

759. *Mr. Courtney.*] That is more in the rolling stock than in the bridge itself? Yes.

760. You mentioned that besides the concrete put in the sills, to cure an oscillation in the trestles, every fifth one was filled to the surface? Every fifth one was concreted up to the surface. The original object of that was to stiffen the viaduct, on account of the oscillation of the timber coming down the stream.

761. I thought it might be on account of the oscillation. For instance, with the line running a certain way, were there any experiments ever taken to ascertain its oscillation sideways? I do not think so.

762. The whole viaduct did not become sinuous? Oh, no.

763. The sills were an after consideration? Yes.

764. But if the sills were put down on account of the foundation being bad, did such large sills as those run up, because those sills carried up from the ground must be very heavy? Yes; there is 2 feet 6 inches base of concrete, and when carried to the surface it is only carrying them up 6 or 7 feet.

765. But the foundation cannot be very bad? Oh, no; the foundation is not bad where we put the concrete. I think it was sent to us to put in simply because it was a better job than the planting. Directly you drive a pile with a flat head to it it bursts up the ground, and the more you drive the more it will burst up the ground about it.

766. That does not speak well for the foundation of the viaduct? But any ground will do that.

767. *Professor Warren.*] What weight had you for driving? A ton monkey and an 8 feet fall. The foundations, as a rule, were very good—very good hard bottom. They would have all been good culvert foundations.

768. *President.*] Did you try the strength of your concrete? I had one or two samples in the office, and one day a man told me that he did not believe they were putting any cement in, so I took some home to my office to try it, and in three months it was as hard as any stone. It looked very hungry, but it set tremendously hard. We had a very fine matrix for the concrete in the river-bed gravel with a very nice proportion of sand.

769. *Professor Warren.*] The deviation from driving the piles to putting them on sills was not due to bad foundations? Oh dear, no.

770. *Mr. Blacket.*] You did drive one pile 40 or 50 feet on the Albury side? We drove two or three test piles, but they went down so far that the Chief concluded they would take too much timber altogether, and that was the reason we put them on sills. The piles that went deepest were the ironbark piles on either side of the iron bridge, and we bored holes to start them. We planted them 28 feet down before driving them. We would have put them down further by boring, but we came to running sand there. It was a very good thing and the piles drove beautifully afterwards. They went very easily and steadily and had not half the tendency to burst. They had a good grip all the way down. Here it is (*referring to record*): Ram 27 cwt., fall 8 feet, a mountain ash pile; the hole was bored to 28 feet. It took 13 blows to get it down to 29 feet, 16 to 30, 22 to 31, 27 to 32, 29 to 33, 30 to 34, 33 to 35, 33 to 36, 40 to 37, 48 to 38, 48 to 39, 50 to 40, 50 to 41, 52 to 42, 62 to 43, 81 to 44, 80 to 45, 80 to 46, 80 to 47, 80 to 48, and 160 to 49—160 blows to get it down to the 49th foot.

771. *President.*] You refer, in a report of your own upon a defective pile filled in with concrete, to Brayne and Murray;—what position was Murray holding? Murray was a chainman. I took him off from being my chainman and left him with Brayne to look after the concrete and piles. Brayne could not attend to everything. Murray had to see that the concrete was properly mixed, and do other jobs of that sort.

772. Then if bad timber has been put into these piers you think it is not the fault of the inspectors but more the fault of the contractors? I do not know that it was the fault of the contractors. I do not think the contractors wilfully put in bad timber. I think they gave us the best timber they could get in Sutton Forest—the same timber that has been used in other bridges.

773. Is it a fact that the Wagga Wagga bridge is worse than the other bridges? The timber came from Sutton Forest, and my inspector who has put up other bridges says it is the same timber as in other bridges; and if it has gone in this bridge other bridges have probably gone too.

774. I am alluding particularly to the piles? Yes, I think Wagga Wagga is a very bad place for timber; it is so very hot. I know that in the case of good looking timber sent up there for scantling we condemned, I think, over 50 per cent. going into the works, after it had been lying there for some months. The thermometer is frequently over 100° in the shade there, and that is rather rough on timber.

R. D. Stephens, Esq., District Engineer, re-examined:—

R. D. Stephens, Esq. 775. *President.*] We inspected the approaches to the Wagga Wagga bridge, and we want to ask you a few more questions, particularly in reference to the timber of the piers. Mr. Chapman is the inspector under you in the district? Yes.

15 Dec., 1884. 776. And Charles Cook is what? He is the foreman.

777. The ganger? The ganger in charge of the screwing-up gang, who has been there ever since I have had charge. There has been more than the one gang at one time, but there is always one gang there. As soon as they have finished one end they have to go to the other end.

778. These piles or ends of piles (*referring to some decayed ends of piles produced by the witness*) are, I suppose, pieces cut from the piles originally put in? No; these do not refer to the South Wagga viaduct at all. I simply brought them to show you that we have not been meddling with the bridges unnecessarily.

unnecessarily. These piles came out of a bridge about 12 miles outside of Goulburn, and I simply want to bring them before you to show that the Wagga piles will go precisely the same way as these, as they are precisely the same kind of timber. These were in the ground only eight years, and the Wagga ones will go just the same way.

R. D.
Stephens, Esq.
15 Dec., 1884.

779. Tell us where these came from? 145 miles 47 chains from Sydney, and these are no worse than what we have to deal with. I have renewed eighteen bridges since I have had charge—that is two and-a-half years ago, and these piles are no worse than what we have had to deal with. Two bridges I would like you to see are one at Yass and one at Gunning, which are worse than this.

780. Was this timber sound when it was put in? That I could not tell you.

781. How long has it been in? Eight years. I can send you another sample, if you like, of a pile that has been in only five years, I think, and the pipe inside of it is so big that I could put the whole of my leg down it. I could send you that down.

782. Do you think that some of the piles of the Wagga Wagga approaches are likely to become as bad as these? I do, decidedly.

783. But these have not been tarred and protected outside? I do not think that makes much difference. Tarring is very good when the timber is seasoned, but I do not place much faith in tar.

784. It does not prevent dry rot? Until the timber is seasoned I do not place much faith in tar.

785. In what part of the piers were these piles? I have here a full account of them, in a report to me from Inspector Chapman. The report is as follows:—

Inspector Chapman.

Goulburn, 7 July, 1884.

Sir,

Bad piles in bridge 145 miles 47 chains south.

No. 0.—Row of piles from Sydney end—

Being found bad, were cut down, and new trestles built on top [*sample of C and D bad piles herewith.*]

No. 2.—Row of piles from Sydney end—A. Sound swamp gum:

B. Do do
C. Do do
D. Bad pile renewed.

No. 4.—Row of piles from Sydney end—A. Sound swamp gum.

B. Do do
C. Do do
D. Bad pile renewed.

No. 8.—Row of piles from Sydney end—A. Sound swamp gum.

B. Do do
C. Bad pile renewed.
D. Sound swamp gum.

Yours, &c.,
JOHN GIDDY.

R. D. Stephens, Esq., District Engineer.

Sir,

These are the piles, samples of which you examined this morning, which I have had renewed at 145 miles 47 chains bridge south. I beg to state that they are in the store next my office, at any time you should require them.

July 7, 1884.

Yours, &c.,
GEO. CHAPMAN.

I HAVE carefully examined the samples, some 18 inches cut off from top of piles referred to. They are really fearfully bad, but they are most instructive, and will go far to explain the defects in the South Wagga piles. I shall retain them here till you and the Commissioner come up.

R.D.S.,
July 8, 1884.

To Mr. Cowdery.

Boring is not always an invariable guide, for you may in boring miss the pipe.

786. Were these piles exposed at all to the water? No.

787. Were they above ground? Yes; this (*referring to one*) was one immediately above one of the head-stocks.

788. They are the same piles as those used for the Wagga piers? Yes; and during the last three years I have renewed eighteen bridges of a similar character, some as bad, and some worse. These are not a bad sample by far. I will send you down the other one.

789. I do not think we want any more. If the other pile is of the same character these are quite sufficient.

790. *Professor Warren.*] These have been in use about eight years? About eight years.

791. *President.*] Could the decay in these piles have been prevented by any process or means? No; if it is bad timber and put in too green. There is one thing I wish to specially remark, and it is that in regard to all the timber for the South Wagga Viaduct it was felled one day and put into the bridge the next day, or two or three days afterwards.*

792. It was not seasoned? No, none of it was seasoned. Since I saw you I have obtained a drawing, which I would like to show you.

793. We shall be glad to see it? It is a sketch of the Wagga viaduct spans, as originally built by the Department. (*Sketch produced.*) What I wish specially to draw attention to is that there are no straps at the bottom of the pile. I wish to qualify this by stating that in the two cases where we opened out and actually had occasion to take away the trestles and renew them, there were no straps. In other cases there possibly may have been straps. As the sap-wood of the underground portion of the piles decays, and as the tenons decay there is nothing at all to hold the pile in position; it will be like so many stilts on the sills, because there is nothing to hold it.

794. You think they ought to have had straps to the sill? That is the way we are doing it now. The two we have renewed in this Wagga Wagga viaduct we have done it with a strap going right round underneath—round the pile, underneath the bottom sill. All this timber is ironbark and seasoned timber. (*Plans showing the original form of the bridge and the alterations made were handed to the President.*) What I wish to draw your attention to specially is that sap-wood is detrimental; it does more harm than good.

795. It gets decayed near the ground line, and then there is a place for the water to come in? Exactly. In Queensland, where I was for several years, all timber was measured exclusively of sap-wood; sap-wood counted as nothing. In the case of the Wagga viaduct the piles are barely 12 inches at the top, and out of that 12 or 11-inch pile there are 3 inches of sap-wood; and when you place those iron straps on

* NOTE (on revision):—This, perhaps, is rather too sweeping an assertion, but still it is remarkably like the truth.

R. D. Stephens, Esq. on the sap-wood, and this sapwood decays, there is no hold for the straps at all. All bearings ought to be on real wood. I really think it is a matter of importance to point out to you that these tenons will decay very shortly.

15 Dec., 1884.

796. The strap will not prevent them from decaying? No, but there are two bolts which hold the sill to the pile. It won't prevent the tenon from decaying, but at the same time it is held by bolts.

797. Do you think where a pipe has been found, as at Wagga, 4 or 6 feet above the ground line that it was visible at the bottom of the pile—at the butt end? That does not follow. In Queensland, for instance, there was a beautiful bit of ironbark which was condemned by the inspector, and the contractor complained to me. But though the wood was perfectly sound at each end, the inspector brought his hammer and showed that it was hollow in the middle, and there was a pipe I could put my arm in.

798. There were a great many piles pointed out at Wagga Wagga with pipes, and those pipes generally were above the ground line;—do you think the pipes extend to the butt end—to the tenon of the sill? I really could not tell you; I think it is very likely they extend a considerable distance, but I could not say exactly.

799. A tenon could not be cut where there was a pipe? Oh, no.

800. *Professor Warren.*] You attribute the state of the bridges you have mentioned to bad unseasoned timber? I attribute what I said with reference to all the bridges I mentioned, to bad timber—not seasoned—cut down one day and put in the next.

801. *President.*] Tarring such piles would not prevent the decay? No; I think it would rather accelerate it? I am a great believer in charring 2 feet above and 2 feet below.

802. In the case of those piers you opened in order to replace them with others, as shown in these diagrams, what was the state of the sill that you removed? I did not see it myself. There is a man here who could tell you.

803. Who is that? Giddy.

804. Did you see some of the timber in the piers at Wagga which had pipes in it and which we saw;—do you think the pipes were in the timber when it was put in the piers; the pipes could not have been formed afterwards? Some must have been put in with the pipes. For instance, there is that one with the cement in it.

805. That is to say, whoever put that pile in must have known it was a bad pile? Must have known. I do not see how you can get out of that.

806. *Professor Warren.*] That is only a solitary case, what about the others? I really could not say; it would be wrong for me to say. The same inspector is looking after the bridges on the Jerilderie line at the present time as looked after the Wagga bridge, and he is making a very good job of the Jerilderie bridges. There is no reason at all to complain. They are really very good and well put together. There is one thing which perhaps the Commission ought to know, and that is that Mr. Brayne, who was the inspector at the time, had other work to do as well. He had to go down to the Rock and several places. And you will find that as you approach the iron girder bridge the work improves in quality; he could exercise more supervision there; he could attend more to it.

807. You mentioned two other bridges just now—one at Yass, and one at—I did not catch the other name? Gunning.

808. Are those among the bridges you renewed? No; they require renewing. You can take an auger and not merely screw it in but shove it in.

809. *President.*] Have you remarked the effect of the traffic passing over piers with such damaged piles as those? My experience is that it will stand without any apparent sign of going until it goes altogether, just like a rotten stick—it won't bend, it will suddenly snap. That is one reason why I do not pay much attention to deflection. You can put a heavy weight on a rotten stick and it won't bend at all—it will break. Whereas you can take a sapling and it won't break until it is actually nearly bent in two. The rotten stick will keep its own form until it snaps and goes altogether.

TUESDAY, 16 DECEMBER, 1884.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,
OWEN BLACKET, Esq.,

W. H. WARREN, Esq.,
PROFESSOR OF ENGINEERING.

Mr. Alfred Cecil Brayne, Inspector of Bridges, sworn and examined:—

Mr. A. C. Brayne. 810. *President.*] You were the inspector of the Wagga Bridge approaches under Mr. Nicholas, District Engineer? Yes.

16 Dec., 1884. 811. Do you know these plans (*plans of the Wagga Wagga Viaduct*)? Yes, but slightly altered in some of the bays. In No. 1 part there are 113 bays.

812. And in the next? Well, we did away with the bank shown in this No. 2. No. 2 has 66 bays; No. 3, 4 bays; No. 4 has 72, adjoining 4 spans of 159 feet iron; No. 5, 56 spans on the Wagga side of the bridge; No. 6, 5 spans. The original arrangements were 9 viaducts, which were altered to 6, thereby doing away with some of the embankments.

813. There is a book here which Mr. Nicholas left with us; he said it was a book which you kept during the erection of the viaducts? I have kept a lot of memo. books; I do not know whether they will be of use to you or not. That one is a record of the measurements.

814. That shows the depths of the piers? Yes. There are two kinds of concrete—5 to 1 underneath and 8 to 1 on the top of the sills.

815. Have you seen some of the concrete since then? I saw them pick some out about eighteen months ago.

816. What was it like;—good, hard, and well set? Yes. 8 to 1 is of course poor; 5 to 1 would be of course rich.

817. You saw them take some from around the piers when they were moving some of the piles? Yes; the 5 to 1 was rich, the 8 to 1 was poor.

818. This book shows in these tables the width and depth of the concrete? Yes.

819.

819. And the length of every pile? Yes, and the different braces too. I think it is summarised at the end, and shows the whole quantity.
820. Will you show me that, please? (*Witness indicated the part of the book containing the information.*) Of course, all this was done in the open air. One column represents bolts put in by contractors, which they had the option as to whether they would take the big transoms out or bolt them.
821. In which pier were the longest piles? Very close here (*indicating position by book*); piles driven in your No. 4.
822. Those were the longest piles? Yes. 35 to 57 and 58 feet—to 61 feet in fact; the longest is 61.
823. They averaged from over 30 feet to 61 feet? Yes.
824. And the piles on sills;—have you the lengths of those? Oh, yes; the whole of them are here in this book; you will find the information on page 79.
825. These dimensions are all actual measurements, and include the tenon? Yes.
826. Did you find that in some of these piles pipes existed? No; we rejected the pipey ones.
827. If a pile had a pipe in it at the butt you could not cut a tenon? No.
828. The tenon would be all broken to pieces? Yes; the tenon is the worst part of the pile at any time.
829. And it should be the most sound part of the pile? Yes.
830. Have you had any experience of timber work? I have had thirty years' experience in this Colony of timber work.
831. Are you acquainted with all kinds of timber work? All kinds; I have been right through.
832. What timbers generally have more pipes than others? Box is the most liable to pipes, and then the mountain ash. It is nearly all pipey, more or less. Gums are generally very solid.
833. What timbers have been used in these viaducts? Box, red-gum, stringy-bark, yellow-gum, or ribbon-gum, mountain ash, and messmate. There is one timber we do not use at all now—white gum.
834. *Mr. Blacket.*] Is there any white gum in the Wagga Wagga bridge? No.
835. *President.*] The mountain ash and the box;—are those timbers in which the pipes generally occur? Yes.
836. What proportion of this mountain ash and box was used amongst these piles? I could not say.
837. You did not enter in this book the timber that each pile consisted of? No, I did not notice what the timber was, except to see that it was sound. The timber was all imported there from Sydney way. I used to see it as it came off the trucks, and either condemn it then or after it was cut.
838. Do you sometimes find that a pipe will be in a pile or piece of timber apparently sound at the butt;—do you think you are likely to frequently find pipes in timbers which are sound at the butt? They are not exactly pipes that we find, but sometimes we find bits of rot inside. There was one instance of a pile which was sound at both ends and which, when being driven, burst in the ground; there was a bed of rot in it, and only an inch and a half of sound timber. That would have gone into the bridge had we not seen it.
839. Could you not have sounded the pile with a hammer, and found the defect? No, it was sufficiently sound for the hammer.
840. That was an exception? We often find it, but it generally gives us notice, because the wood is swelled. We then generally bore it with an auger. If the timber is perfectly straight the sound is not ascertainable. We pulled out three or four ironbark girders that opened out after they were in about a week or two.
841. Did you find any of those piles in the Wagga Wagga viaduct piers? No; we found the one I mentioned, and I think two or three more, but they were short trestle piles.
842. At what distance from the butt is the defect likely to occur? At various parts; but it may sometimes be from a limb having broken off and died away in the inside, and then another part growing over it.
843. Sounding the pipe outside with a hammer would not enable you to detect it? If there is sufficient wood around it you cannot. We sound them all, and if we have any doubt we bore them.
844. If there were a hole of that kind in a pile and you had to drill for a bolt through the centre —? We should find it immediately, and if I were there I should have the pile out, but if I were not there the men would put the bolts through and let the pile be taken up.
845. Would that occur at Wagga? Not likely.
846. If it did occur it would not be your fault, but because of your not being there it escaped your notice? Yes.
847. Was there anybody there looking at the state of every pile? I had a man there looking after the concrete. His name was Murray. Looking after the concrete was what he more particularly did.
848. Do you think the contractor would take advantage of you if you found a piece of timber apparently sound and yet having such a defect as you have mentioned? It is not exactly the contractor, it is the men who are careless. The contractor sends up the timber and employs men. But he has an inspector in Sydney.
849. How was the timber protected under ground to the concrete—the sill was laid on the concrete. (*Drawing of pier shown to witness*)? When I excavated the hole I drove in three wood pegs 18 inches from the ground, and the concrete was filled in to the pegs; the sill was placed on the concrete and the pile was then put in. I think we started at every fifth bay to fill the hole right up, but the other holes were only covered over the sill.
850. But you finished one before you commenced another? Oh, yes.
851. Was the timber protected by tarring under ground? Yes, it was all tarred, the sills were tarred before going down to the bottom.
852. What kind of tar? Coal tar—a mixture of coal tar and kerosene. The tar is greatly inferior to what it used to be through the Gas Company's using kerosene to make the gas. In fact tar to be the same as it originally was requires 2 lbs. or 3 lbs. of pitch to every gallon of tar.
853. Do you find much sap in these piles? They were full of sap, both outside and in the wood too—all of them.
854. How long had this timber been seasoned before being put in? I could not say; not very long.
855. How long had it been cut before it was used—judging it from these piles? Not more than two or three months; some of it might be six months.
856. Timber in such quantities put under ground would be likely to decay very much at the junction?
The

Mr.
A. C. Brayne.
16 Dec., 1884.

Mr.
A. C. Brayne.
16 Dec., 1884.

The horizontal pieces would decay quicker than the vertical pieces. There is no outlet for the sap, and of course it is the sap that takes the dry rot.

857. Would it have been possible to get such a large quantity of timber thoroughly seasoned as was required for this viaduct in the time? Oh, no; if you wanted to season your timber you would want to let it lie over two or three years before it went in.

858. Would 6 to 12 months have been sufficient time? I do not think so; I do not think you would get it seasoned in six months; the sap would lie in the timber. We season the piles in rivers by putting them in rivers to wash the sap out of them, but we have no appliances in this country for doing that. If we could get rid of the sap we could get rid of the dry rot, which and the white ants are our two greatest enemies.

859. Did you see any white ants in any of this timber? Yes, lots of them. And there is another little insect which bores a hole as small as that which would be made by a needle; they come on the wing; they swarm and perforate the wood in millions. They perforate the sap and when you afterwards knock a part of the timber where they have been it becomes like snuff.

860. What do you call these insects? I do not know.

861. *Mr. Courtney.*] A kind of flying ant? They have very small bodies.

862. *President.*] These insects cause a good deal of damage? Yes.

863. They do not go into the sound part of the timber? No, they do not go further than the sap.

864. Does it occur more in some timber than in others? I do not think they make much distinction, except where the sap is thicker on the wood. There is the box which we call the yellow jacket; it has a sap of an inch and a half; the other box has only a sap of half an inch.

865. The dry rot does not come from these insects? Oh, no.

866. What was the kind of timber used in the sills of the trestles? We started with the messmate, but I got them condemned and they were thrown out; then we got the turpentine.

867. Was it seasoned? No, it might have been cut a few months.

868. Would turpentine resist the white ant? It did not resist the white ant, but we find it stands better on the ground than other timber, except the Murray gum.

869. Will white ants attack timber that is seasoned sooner than timber that is not seasoned? No, they attack green timber the most.

870. So that it is necessary to put well seasoned timber in anything likely to be exposed to the white ant? Yes.

871. The piles were tenoned to the sills? Yes.

872. Were the holes filled with any tar previous to the piles being put in? They were painted; the mortices were painted, and the tenons likewise, and the ends of the piles.

873. What size were the tenons made? 3 inches wide, and according to the size of the pile to the heart. We were supposed to cut them 9 x 3 x 3, but some of them would be 11 inches.

874. Were the piles fastened in any way to the sill? No, I do not think they were at Wagga. There was one place, but I do not remember whether it was at Dubbo or Wagga. You can see by the ironwork in this book. (*Memorandum book referred to.*) Yes, they were all strapped.

875. *Mr. Blacket.*] Was not that for the top pile? Ah, perhaps it might be. (*Memorandum book referred to again.*) No, there is nothing at all of it in this book. (*Witness referred to another memorandum book.*) No, there were no sills strapped.

876. Are there any sills strapped in any other bridges that you have been connected with? Yes, I have put straps on those I am at now at Narandera.

877. Are the piers constructed under the same conditions as these? The same, except that I have got the red gum instead of the mountain timber at Sutton Forest. I believe the red gum will last fifty years. It is our mountain timber that goes the quickest.

878. *Mr. Courtney.*] Mountain timber is not so good? Oh, no; I think you should get the local timber. By getting timber at 1,000 feet high and taking it to Wagga, which is about 500 feet above the level of the sea, it must make a wonderful difference in the timber. The timber becomes dry and perishes. Local timber seems to stand well.

879. *President.*] If you had detected a pipe in any pile you would not have allowed that pile to go in? Decidedly not.

880. And all the tenons made at the butt ends of the piles that rest on the sills were sound? All sound.

881. Could bad piles or bad tenons have been put in without your knowledge? Not many; I have been all over the work. Not many—very few, if at all.

882. In that case you would have been greatly deceived? I should. You see there is a long stretch; 1,700 or 1,800 piles were put in there.

883. How many piles were put in, on an average, per day? We would get a lot framed—perhaps twenty piers framed—before putting them in.

884. Did you frame the whole of the pier together and put it in its place sills and all? We framed it on the ground first, and took it to pieces again. There were 317 piers altogether.

885. If a pile had a pipe in it—say 4 or 5 inches—and another pile was perfectly sound, what would be the difference in the time that each would last? None at all, I think. If you could cover both ends so that no insect could get at it the timber is better when it is hollow; the harder it is round the more likely it is to be seasoned; but still we are not allowed to use such timber, and I have never allowed it to go in.

886. What about the cracks? It is not so liable to crack with a pipe as it is when it is solid. It is the soundness of the heart that causes the burst on the outside.

887. Then there would be no difference in time between the life of a pile that is hollow and one that is sound? No.

888. Then why do you not allow the pipes to go in? I have to go by instructions.

889. Would the decay go on in the hollow pile? There would be no decay if it were a clean pipe. When we get a pipe in timber it is always clean.

890. Not always? You will find it all clean.

891. But there must be a certain amount of decayed matter falling to the bottom of it? I should consider it a rotten pile if there were anything in it.

892. Then you speak of a clean pipe only? Yes. In mountain ash you will find it like a hard surface inside. The sapling has evidently perished and fallen down to the bottom of the tree, and the tree has grown.
893.

893. *Mr. Blacket.*] What do you call it then when a pile is rotten in the middle? That is a rotten heart.
894. That would keep increasing? Yes.
895. *President.*] You would not call that a pipe? No; that is a rotten heart. There must be no dirt in a pipe; it must be clean.
896. *Mr. Blacket.*] You never put in a pile with a pipe? No we are never allowed to do that unless it is for temporary work.
897. Then all these things that are in now must be bad hearts and not pipes according to what you say? They must be bad hearts, not pipes.
898. You would not call those pipes (*referring to samples of piles*)? No they are all bad hearts.
899. *Mr. Courtney.*] They might have been sound four or five years ago? Oh yes—two years ago. All that Sutton Forest timber is exactly the same timber as I have seen from Mount Macedon, in Victoria.
900. *Mr. Blacket.*] Do you consider that the Wagga Wagga viaduct will go like that (*referring to samples of piles*) in a couple of years? Some of them, no doubt, may go, and some may not.
901. Had you any idea when you were working on the bridge that that class of timber would decay in two years? No; I did not expect it then.
902. It is from information you have gained since? Yes we have seen a lot of it since. I was quite surprised to see a lot of it again; but I saw them taking it out where the white ants had got right into the middle. It was all perfectly sound when it went in—every bit of it.
903. How do you account for the piles in No. 5 viaduct, near the bridge, which are ironbark driven piles, being split from the top right down from the tenon? You see they are cut small for the shape of the headstock, and then it is sure to burst there because the rings will tear it apart. Where strapped bolts go up it will go right through the rings; you cut off the rings and it must burst. If you square a log on two sides instead of four it will burst.
904. *President.*] A pipe generally begins at the butt end? Yes.
905. And continues to a certain distance up the pile? Yes.
906. If it is only a rotten pile very likely the butt end will be very sound, and in driving a hole through the pile at a certain height—say 8 or 10 feet from the butt—you might find the rotten part, if you found that the auger jumped—that would not be a pipe? No, it would be some rot in the tree. If a branch had died in the tree it would decay.
907. Do you remember one of the piles that were stopped with putty? No.
908. There has been something said about such a pile—that it was stopped with putty? Not that I knew of.
909. That must have been done behind your back? I don't think it could have been stopped with putty, because they were all tarred there.
910. There was something also said about a pile being stopped with cement? That would have been done behind my back.
911. You would not have done it any more than allow a defective pile to be put in? No.

Mr.
A. C. Brayne.
16 Dec., 1884.

Mr. John Thomas Rowlands, Sub-Inspector of Timber for Railway Timber Bridges, sworn and examined:—

912. *President.*] You are a sub-inspector of timber for timber bridges? Yes.
913. Do you know the Wagga viaduct? Yes.
914. You went over the whole of the timber of that viaduct? Yes, every pile.
915. And the superstructure? Well, no; I looked at some of the girders and corbels that were shown to me by Inspector Chapman, but all I had to investigate were the piles.
916. And you classified these piles, and determined the kind of timber? Yes.
917. You had a book or record of the specification? Yes. (*Book produced.*) I sent a copy of this in to Mr. Cowdery.
918. Yes; we have it. (*Book referred to.*) You have had great experience of the different kinds of timber in the Colony? Yes, I have been at it all my lifetime; I am a native of the Colony.
919. And you can distinguish a good piece of timber from a bad piece? Oh, yes. There are 113 bays in that book.
920. I see the different kinds of timber here—apple-tree, mountain-ash, stringybark, messmate —? Ironbark and spotted gum.
921. *Mr. Courtney.*] Is apple-tree in it? Yes. It is a very soft timber. They generally used it in olden time because it used to make good naves. It is tough. It will wear when it is kept out of any heavy weights. Spotted gum came from this district, I think.
922. *President.*] Did you find any pipes in some of these timbers? Oh, yes. I marked every pipe in them. I did not go to extremes, bear in mind. Some of these pipes are much larger than I have it here. There is a 2-inch pipe there, for instance (*referring to book*), and it is all dozy—only the outside sap over it; 2 inches to 5 inches I found. Very likely the 2-inch pipes, if you opened them out, would go to 3 or 4 inches; but I did not do that, or go to extremes.
923. What are these pipes? Dry rot—dirty dry rot.
924. Do you think this pipe, or dry rot, extends from the place where it is found by the auger to the butt end? As a rule. The greatest class of timbers there—messmate and mountain-ash—is very old before it is cut; it is almost decayed before it is put into the work.
925. *Mr. Blacket.*] It is decaying inside while it is growing on the outside? Yes; but it is no good at all, the mountain-ash.
926. *President.*] Which are the most pipey of these timbers? The mountain-ash. Stringybark has generally a little dry pipe; it does not rot nearly so quickly as the mountain-ash.
927. And the box? Box is very good timber, and generally sound.
928. *Mr. Blacket.*] Apple-tree has a good pipe? Yes; sometimes a very large pipe. Box, as a rule, is very good timber.
929. *Mr. Courtney.*] How about the ash? Mountain-ash and messmate.
930. There is another called plain ash? That is just the way; some bushmen will vary in the names given to timber. The white gum some will call cabbage gum, and some cheesy gum. They go in at it with a sharp axe, and they say, "This goes like a bit of cabbage," or "like a bit of cheese," and then it is called a cabbage or cheesy gum. The ribbon gum derives its name from the fact that it splits down like a ribbon.

Mr. J. T.
Rowlands.
16 Dec., 1884.

- Mr. J. T. Rowlands.
16 Dec., 1884.
931. But in this book there is mountain-ash and ash;—you do not think there is any distinction between them? No, they are all one tribe. The real mountain-ash grows very free. It is very nice working timber, and looks well; it planes up beautifully.
932. *President.*] If there were a pipe in a pile you would generally detect it at the butt end? Yes, as a rule; but in some cases it commences at the top. A limb may decay at the top, and then the water gets in and causes decay from the top instead of the bottom. You will find some trees quite decayed at the top and sound at the butt.
933. Could you find some of these pipes in a pile with both ends sound? Yes, you could find them by tapping them.
934. But does that occur: that the two ends of a pile may be sound, and a portion of it may be pipey? Yes, that occurs.
935. Often? Yes. I have noticed where the white ant has started where a bit of bark has been knocked off and the timber has cracked. The white ant travelling about has gone in, and then the water has got in and decay commences. There was a splendid ironbark girder on the Parramatta Bridge which I condemned. When I condemned it the contractor asked why it was condemned, and I told him it was pipey. To look at the girder no one would have thought of condemning it, but on looking over it I saw this little track of the white ant. He said he would write about it, because I had not done him justice. It appears he cut the pile, which he had given 6s. a foot for, and he then found a 3-inch pipe going up 9 or 10 feet.
936. Was it a clean pipe? Well, yes, it was a clean pipe; clean in places, and “dozy” at the ends—at the extreme ends.
937. *Mr. Courtney.*] That was a 14-inch girder? Yes.
938. And you found in it a 3-inch pipe? Yes. There was another instance at Darling Harbour where we had a “dozy” knot, and we cut eleven pieces off it before we found it sound, and it was sound at each end. When you split a tree open you know what the cause of the decay is. Sometimes a grub will work its way in and cause decay.
939. *President.*] In what state do you consider this timber appears (*referring to samples of piles*) for the time the piles have been put in? A very bad state.
940. What do you call a very bad state? I say the timber ought not to have gone in at first.
941. Do you think that some of that timber was put in by the people when they knew it was pipey? I do not say they knew it. The inspectors sometimes get deceived when they do not keep their eyes about. The timber is sometimes plugged, and I have seen plugs put in which are very hard to see unless a man knows it.
942. If you have a pile close at both ends, as in the Wagga viaduct piers, there would be no decay in that pile? Sound at both ends?
943. Yes? Oh, there may be decay for all that.
944. Then the decay may go on, too, in spite of there being no influence upon it? Yes, it would.
945. That timber (*alluding to the samples of piles*) has not been very long decaying? Not from the dry rot. Of course it was bad when it was put in, but you could see it was decaying.
946. Would the tarring of the piles prevent decaying? Not that kind of timber.
947. But in the case of timber like the Wagga piers: would tarring prevent the rapid decay? Not now; it is too late now.
948. What is the cause of it? Well, it was very inferior timber when it was put in.
949. How do you mean? Very old and short heart.
950. You mean it was not seasoned? No; it was too much seasoned.
951. *Mr. Blacket.*] You mean cut too long? No; it is the same with an old tree as with an old man. If you put a young man out in the weather he will stand it much better than an old one, and it is just the same with a piece of timber. And some timber grows on land that is no good at all; it grows too quickly, and grows soft, and bad in the heart. I went to look at the place where the timber for the Wagga approaches came from, and no good timber would grow there; it is too swampy and wet.
952. Where is that—Sutton Forest? It is the other side of Goulburn, between Moss Vale and Marulan.
953. To what do you attribute the dry rot? It is the nature of the timber. It would take a piece of ironbark fully thirty years to go as far as the pieces of timber you have here.
954. What is there to prevent dry rot? Well, there is nothing to prevent dry rot.
955. *Mr. Courtney.*] What would you class that timber as (*referring to samples of piles*)? It is called ribbon gum; the proper name is white gum.
956. Is that the famous spotted gum? No. The only fault with spotted gum is the sap. There is a little insect that eats just through the sap, but will not go any further. With regard to the mountain ash posts, when we have been fencing we have found that the rails have stood better than the posts. You could break the posts right off where the dry rot has occurred just above the ground.
957. *Mr. Blacket.*] Wind and water? Yes.
958. *President.*] You did not ascertain the length of the pipes in all the cases referred to in your book? No. For instance a pipe may go right up to the top or to the first limb.
959. You are certain that these pipes existed as you have stated in this book? Yes; and I have not gone to extremes.
960. You tried them with a piece of wire? No, I tried them with augers, and I chopped a piece out, and put my arm up some of them.
961. Was the pipe generally clean? No, dry rot; you could pull the stuff down and crumble it up.
962. What length would these pipes be? Running up to the top of the bridge.
963. No insects would be likely to get in now that you have stopped the holes? They could get in. Of course the little holes we made would not make much difference. Mr. Chapman was stopping them up and tarring them.
964. The tarring would not prevent the dry rot or decrease the decay in the holes? No.
965. Who assisted you in this examination? Mr. Chapman and his sub-inspector, Mr. Giddy.

Mr. John Giddy, Sub-Inspector of Wooden Bridges, sworn and examined:—

- Mr. J. Giddy.
16 Dec., 1884.
966. *President.*] You are a sub-inspector of wooden bridges? Yes.
967. And you have had, in connection with Mr. Rowlands, to report upon the kind of timber put in the piers of the Wagga Bridge approaches? Yes. 968.

Mr.
J. Giddy.
16 Dec., 1884.

968. You have had experience of the different kinds of timber? Yes; I have had great experience during the last twenty years.
969. Did you agree with Mr. Rowlands with regard to the kind of timber that he has mentioned in his book? We do agree with regard to it.
970. What is your opinion of that timber? Very bad timber. Once it is cut that timber lasts a very short time. No matter to what use it is put it decays—a kind of dry rot.
971. Where is that dry rot? It is in the heart; just the same as this [*alluding to samples of piles.*]
972. Is it a pipe? Some of it is a pipe, and some of it crumbles and moulders away.
973. Does it extend a long way through the timber—this dry rot? In different kinds of timber.
974. What is the length of a pipe? In course of time it goes right through the pile or log.
975. Would you have it at the butt end? That is where it mostly starts first.
976. But could the butt end be sound and the upper portion bad? Sometimes. But it may be from the ground upwards; it generally starts from the top of the pile.
977. Do you think that at Wagga they could have got a tenon at the butt end of a pile without finding a pipe if there were one? It is hardly possible to do that.
978. You were there with Mr. Rowlands when the holes were made to find out the pipes? Yes.
979. Did you see that some of the pipes extend right up the piles? Yes.
980. Are these pipes rotten holes or clean pipes? In some cases they are clean, but in others dry rot 5 or 6 inches.
981. Which are the worst? The dry rot, because they gradually go more and more. When once you get a clean pipe in it does not decay any more.
982. Then you make a distinction between a clean pipe and the dry rot? Yes.
983. And what are principally pointed to as pipes in the piers of this viaduct are more dry rot holes, you may say, than really clean pipes? In the report it is mostly "hollow and dry rot." Some of the piles had 2 or 3 inches of a pipe in them and 4 or 5 inches of dry rot—not a clean hollow. Inside of this it is a clean pipe, and you come on 3 or 4 inches of sap; and then you come into another which is pipey all through. That is in the Wagga bridge approaches.
984. *Mr. Blacket.*] Do you consider that if when the piles were put in you were able to make a tenon on one, and it looked all sound, there has since been time for it to decay? Oh, yes, plenty of time, from the kind of timber that is put in. Messmate, mountain ash, and such timber is cut green, and as soon as it starts to dry it begins to decay.
985. *President.*] How long do you think that such piles are likely to last—these bad piles that have been found with dry rot in them? Well, some of them may last two or three years longer; others won't last that long to be safe. In three or four years more there will be some hundreds of piles in that bridge that I do not consider to be safe.
986. What timber do you consider the worst put in these Wagga approaches? Messmate and apple-tree; that is the worst kind of timber. Most of the stringybark timber that is in is sound. There are very few of the stringybark piles that are not as sound as when they were put in.
987. But the messmate is not? Messmate is a wood that will not last many years if it is cut.
988. Are pipes in the messmate? In the messmate and in the apple-tree.
989. Do you think they could have drilled the holes necessary in the piles for the bracings and the walings without finding the pipes if they were there? No, they could not, because the bolts of bracings and walings go through the centre of piles, and if there was a pipe in a pile it must have been known.
990. In your opinion if there were a pipe in a pile when the holes were drilled for the bolts it must have been known? Yes.
991. Could the inspector have known in any case that he was being imposed upon? It is very hard for the inspector to know. There are a great many men working in different parts at the one time, and it would be impossible for the inspector to know everything that takes place.
992. *Mr. Blacket.*] Did you notice that different piles at the Wagga end of the viaduct were split at the top? Yes.
993. Those are ironbark piles? Yes.
994. Why are they split? I cannot say, unless because they are exposed to the weather; the jar of the driving since the weather got to them might open them, and the vibration of the train on the top might open them.
995. Do you consider that tarring those piles keeps the moisture in so as to make the centre rot more quickly? I think the tar is a protection.
996. It keeps the wet out? It keeps the wet from getting into the piles.
997. *President.*] How long would timber of the description required take to season properly? Without being cut?
998. After being cut? Well, some timber takes longer than others. Six to twelve months before being properly seasoned; but timber after it has been cut ten or twelve years will shrink, though not so much as when green.
999. *Mr. Blacket.*] Every time you cut a fresh surface the stuff shrinks? Yes.
1000. *President.*] You did not find any white ants in this bridge at Wagga? There are some odd ones; the men screwing up use kerosene, arsenic, and tallow and other stuff to get them out; they use scalding hot water too. Most of it is between the waling and the piles. There are two or three of the piles that have the white ant right through them.
1001. You think that some of this timber that has been found defective or pipey, and so on, should have been found out before it was put in? Well, I believe some of it has been put in that has not been good,—that it has had a kind of dry brittle substance in it when being put in.
1002. Could you by striking it on the outside with a hammer detect whether it was hollow or not? Oh, yes; you could tell very easily by the sound. When you strike a hollow part there is a difference between the sound of it and the sound of any other part; you could tell the difference at once.

WEDNESDAY,

WEDNESDAY, 7 JANUARY, 1885.

The Commission met on the Railway Bridge at Bathurst.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING.

Mr. William Hilzinger, Inspector of Railway Bridges, examined:—

Mr. W.
Hilzinger.
7 Jan., 1885.

1003. *President.*] We wish to know what has been done in the way of alterations to the Bathurst bridge. Whatever you say now in the form of a statement will be regarded as a continuation of your evidence before the Commission, and you have already been sworn? All girders have been repaired, except No. 1 down-stream girder, which has only been repaired a distance of 15 feet from the west end. The work is not all close. (*Witness showed how the space between the angle-iron and the top boom had been filled with rust cement; and also pointed out loose rivets.*) The bottom boom is not so bad as the top. A number of rivets show loose in the top boom of No. 1 up-stream girder, which have not been altered. Rivets that have been replaced show new painting. In No. 2 span both girders have been repaired, except the bottom boom which is not quite finished. A few rivets are loose in the cross girders.

MONDAY, 23 FEBRUARY, 1885.

The Commission met at the M'Donald River Bridge.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq.,
PROFESSOR OF ENGINEERING,
W. M'D. COURTNEY, Esq., C.E.,W. H. WARREN, Esq.,
PROFESSOR OF ENGINEERING,
OWEN BLACKET, Esq.

George Bewick, Esq., Superintendent of Way and Works, sworn and examined:—

G. Bewick,
Esq.
23 Feb., 1885.

1004. *President.*] What position do you occupy in the department? I am Superintendent of Way and Works.

1005. You were requested some time in July, 1883, to examine this bridge and to report with reference to a number of rivets alleged to be loose? Yes.

1006. And you made your report to the Engineer for Existing Lines? Yes, the report was addressed to him.

1007. Would you like to have your report read again in order to refresh your memory? No, I can remember distinctly the purport of everything I said.

1008. Have you had a large experience of riveted iron-work? No; I think I say in my report that I have not; I have had very little experience.

1009. But you know whether a rivet is well or badly put in? I do not know that I do. I do not profess to know. All I profess is that if anything is seriously wrong with a bridge I know it; but as for any question about riveting I would rather not express an opinion on what is a professional subject. I say in my report that I have had less experience of iron bridges than of any other kind of work, although I have had forty-eight years experience in connection with railway works generally. Wooden bridges I profess to be a little of an authority on, but as to iron bridges I do not.

1010. Do you know when a rivet is loose? Yes, by feeling with the fingers or tapping with a hammer.

1011. But you cannot tell us when a rivet is well put in? No, I won't say that altogether. I can tell whether it is loose or fast.

1012. You can form an opinion as to whether work is well or badly done? No, I should not like to offer an opinion with regard to an iron bridge, unless, of course, the work is very bad, so that anybody can see it. I would prefer not to offer an opinion on a matter with which I am not thoroughly conversant. I think I stated in my report that my opinion must be taken for what it is worth.

1013. You state in your report that after carefully examining and tapping some of the rivets you found that a large proportion were perfectly tight, but that in the case of a few—about 10 per cent. of those marked—you discovered symptoms of looseness? Yes; such was the impression on my mind after examining them. I have no objection to answer any question, but I will not profess to be what I am not.

1014. Were you present at any testings of these bridges? I have tested them myself with a single engine on several occasions, but I do not know that I was ever present at any other test. I test them myself once a year.

1015. What load do you use? An ordinary engine of 62 tons.

1016. At any speed? I run the engine over both slowly and fast and then I test the deflection. Half-an-inch is the greatest deflection ever I got. I am speaking from memory, but I am pretty certain I am right. I run over all the important bridges every year and test the deflection.

1017. Have you noticed much vibration in those tests? No, very little indeed.

1018. In this bridge particularly did you notice any vibration? None whatever, nothing more than you might expect.

1019. *Professor Warren.*] How did you make the test? In rather a rough and ready way; simply by having three boards, one at each end and one in the middle, and then marking the deflection.

1020. It was really a case of boning? Yes.

1021. *President.*] Did you test the bridges at all with a running load? Not this one—I daresay I did; I ran the engine over.

1022. And did you observe the vibration caused by the passage of the engine at speed? No. 1023.

1023. Did you look for it? Yes, of course I did.

1024. *Mr. Courtney.*] On other occasions have you tested otherwise than with boards? When we have dry land below I test with solid rods.

1025. Were you here when the bridge was being erected? No; I don't think I saw it until it was completed.

1026. Here is a piece of information we were going to apply to Mr. Whitton's office for, but perhaps you may be able to give it to us: Do you know how these booms came out, as to whether they were in sections with the angle irons riveted to them? I think so; in fact I am pretty certain.

1027. *President.*] Mr. Wade in one of his reports states that "at M'Donald River bridge I find there is a place where the head of a rivet had been cut off, and the rivet being too tight to get out by either hammering or driving remains there still";—were you here on that occasion? I was present when the head of the rivet was cut off, and the rivet is there still I believe. I saw the attempt.

1028. Do you think that every rivet in the bridge is in the same condition? No, I do not say that. There are a few loose rivets in all of them.

1029. If the original head of a rivet is loose does it follow that the other head or the snap-head would also be loose? I think not. They must both go together to some extent. A rivet cannot be loose at one end and not at the other, that is absolutely loose. There might be an apparent looseness in the hole or at one head while the other is perfectly tight.

1030. Do you think the quantity of metal in the snap-head of a rivet should be as large or nearly as large as the quantity of metal in the original head? That is a question I would prefer not to answer. I do not profess to be an authority on such matters. I do not understand the technical matters in connection with the work and I do not wish to place myself in a false position by answering a question I am not able to answer. (*Witness, at the request of the President, tested a number of rivets in the lattice and upper boom at the north end of down-stream girder.*)

1031. *Mr. Courtney.*] You were asked whether the angle irons came out attached to the plates of the boom? I think they did but I cannot speak positively.

1032. You were asked the question with reference to this bridge;—did you see any of the materials of the others? I have, and my impression is that they all came out in that way—in sections.

1033. *Professor Kernot.*] Can you help us to identify the portion of the riveting done here and that done in England? No; I was not here when it was fixed.

1034. *President.*] What is your opinion with regard to the stability of the bridges? I think they are perfectly safe in every respect. I have had charge of them since their erection and I am responsible for their safety, and they are exactly the same now as when they were erected. There is no permanent deflection whatever, and no variation in the deflection caused by loads passing over; if there were, I should feel it my duty to examine them more closely. If, for instance, I found a deflection of $\frac{1}{2}$ an inch on one occasion and of $\frac{3}{4}$ of an inch on another occasion, I should think there was something wrong; but as long as there is no permanent deflection and no difference of deflection when loads are passing over, I assume that everything is perfectly safe.

1035. Does your remark apply to all the bridges as well as to the bridge at M'Donald River? Yes; of the three bridges I consider that at Aberdeen the best, it having the least vibration.

Mr. Robert Ewing, Inspector of ironwork, sworn and examined:—

1036. *President.*] What position do you occupy in the department? I believe I am called Inspector of Ironwork. Mr. R. Ewing.

1037. In what department? The Engineer-in-Chief's department. 23 Feb., 1885.

1038. Have you been connected with the putting up of any bridges? I have not.

1039. You were requested by Mr. Whitton to come and inspect these bridges? Yes, I suppose I may say so; I came up with Mr. Wade. Perhaps it would be well for me to tell my story in my own way, and then you could ask me questions afterwards. In the month of June, 1883, I came up along with Mr. Wade, Mr. Drewett, Mr. Russell, and Mr. Bewick to examine the bridges. Mr. Wade, Mr. Drewett, and Mr. Russell were engaged some considerable time in taking levels and testing the bridges with locomotives; I was assisting them, and I was directed to go into the lattice-work and test some of the rivets. I did so, and to the best of my recollection the proportion I made—I did not test many, but the proportion that I think I made was one in eight or ten of what one would call loose rivets.

1040. *Professor Warren.*] In this bridge? The remark applies to all.

1041. *Professor Kernot.*] Was that one in eight of the whole number or of the marked rivets? I am under the impression that it was of the marked rivets—those that were marked as loose.

1042. *President.*] How long have you had experience of bridge-work? I have had very little experience of bridge-work, but I have had experience of ironwork as a mechanical engineer for the last thirty years.

1043. Have you had experience of boiler work and riveted work? Yes, although not a boiler-maker.

1044. You would know when a rivet is well put in and when badly put in? I should think so.

1045. Do you think that a rivet well put in should be loose at the head and tight at the other end? It would altogether depend on the size of the rivet. If the rivet were small, it would be possible to jump up the point, and yet it might be slack at the head.

1046. I mean a rivet that would be calculated to fill the hole? Well, if the rivet were the proper size it ought to be a reasonably tight fit. I do not know that it would absolutely fill the hole on account of the contraction of the hot rivet. The rivet must necessarily be smaller than the hole.

1047. If you put in a rivet through several plates or thicknesses of iron, would you have the rivet hot right through, or only at the point? Well, the rivet ought to be heated through to get the hole to fill. As I said before the rivet must be smaller than the hole before it can go in, and of course as it gets hotter it gets larger.

1048. If the head of the rivet was cold, and only the point hot, the head end of the rivet could not be made to fill the hole exactly? Certainly not.

1049. Then you would consider that a bad rivet? I do not know that I would.

1050. Not if you found a rivet loose at one end and tight at the other? There are rivets, even in the best made boilers, that do not fill the hole, and yet they are steam tight.

- Mr. R. Ewing. 1051. But they would not be loose at the head for all that? No, but they might be made loose at the head; a very sharp blow on the head would make them sufficiently loose to be leaky rivets.
- 23 Feb., 1885. 1052. Would not a blow with one of these small hammers (*showing a hammer of 3 or 4 ozs. weight*) produce that? No, I do not think it would.
1053. It would require a heavier hammer? I should think it would.
1054. What difference of metal do you think there should be in the snap-head of a rivet as compared with the head? I think the heads are usually made pretty nearly equal. A diameter and a quarter to a diameter and a half is what is allowed generally for making a snap-head. I think that is about the proportion.
1055. If you cut out a rivet which is apparently loose to the touch with a hammer, can you put a tighter one in if the plates are close to each other without loosening the adjoining rivets? I doubt whether you could; not if you had very much cutting to get it out.
1056. Suppose that one of the rivets marked in this bridge is loose where the plates are well in contact; in cutting that rivet out and putting a new one in, would you loosen any of the adjoining rivets? I think it very probable that you would.
1057. Then if you had a number of loose rivets adjoining each other, you think it would be better to leave them loose than to take them out and replace them? Well, no, that is a different question, where there is a number of them loose, you might replace that number with advantage perhaps; that is, providing they were very seriously loose; but where they are so very slight as some of these are—infinitesimally almost—I do not think it is wise to take them out; it is a mistake. (*At the request of the President the witness tested a number of rivets in the upper boom of the bridge, one triangulation from abutment north end of up-stream girder, and out of 45 marked he indicated 11 as loose, the looseness being just perceptible.*)
1058. But suppose that the angle-irons are not very close to the plate, is it better to leave a loose rivet in than to cut it out and put a tight one in; that is to say, if you put a tight one in would there be a danger of loosening the adjoining ones? Yes, bound to.
1059. Then it would be better to leave it than by taking it out to loosen more? Yes, the looseness is so slight.
1060. If you tap them nearer the plate, and they do not fill the hole, you can shift them slightly without affecting the top of the head? Yes, but the extent to which you shift them is the extent to which they are slack in the hole, and they would not go in unless they were smaller than the hole. (*The Commissioners here went inside the girders and tested a large number of rivets, and also directed the witness to indicate those which he considered loose.*)
1061. Professor Warren.] With reference to the rivets you have just marked how many would you cut out? I would not cut out one.
1062. Does that remark apply generally to the whole bridge? Well, I have not been over the whole bridge.
1063. President.] Does your remark apply to the three bays you have just gone over? It would apply to all I have done with you; I would not cut one out.
1064. Why? Because I do not think it would add to the strength of the bridge to put in new ones.
1065. Professor Warren.] You mean that you could not put in rivets that would add to the strength of the bridge? I doubt very much whether you could do it now. The looseness is very slight. The rivets must be slack at the head. You might keep on hammering at them with a small hammer until you got a feelable looseness.
1066. Professor Kernot.] I should like to know whether you consider the following statement to be a correct representation of the state of things on the bridge, namely, that there is one rivet visibly loose, and six others just perceptible to the touch? In the number I tried I believe such was the case, but this continual hammering will loosen the rivets.
1067. But I should like to have a direct answer to my question, because the statement is made in a certain document without any qualifying words that I am able to discover, and it conveyed a certain impression to my mind when I read it. I should be glad to know whether you really consider that that statement was calculated to lead a person reading the report, and who had not seen the bridge, to a correct conclusion? The number of rivets I tried was a very limited number, not anything like the number I have tried now, and I believe that it is substantially correct. It is my belief that in the number of rivets I tried there was one in eight or thereabouts loose—perceptibly loose, visibly loose.
1068. I am not referring to the statement that one in eight was loose; but I am asking whether the statement that one is perceptibly loose, and six others just perceptibly loose to the touch, was intended to describe the state of things on the bridge generally? I could not describe the state of things on the bridge generally when I had not gone over it. I only tried a limited number, and consequently I could not be expected to say that that represented the whole. You might find places where there are half-a-dozen loose all in a row. That was the proportion I made in the number I tried.
1069. Can you tell us what number you tried? I could not.
1070. Could you give any estimate of the number? I only tried in this corner (*in the box, north end of up-stream girder*) and along a portion of the way here.
1071. Professor Warren.] Did you try more than sixty rivets? I think I tried more than sixty or seventy rivets in each bridge.

Mr. W. J. Hilzinger, Inspector of Railway Bridges, sworn and examined:—

- Mr. W. J. Hilzinger. 1072. President.] You are an Inspector of Bridges in the Department of Existing Lines? Yes.
- 23 Feb., 1885. 1073. Did you visit the McDonald River bridge in April, 1883? Yes.
1074. And you reported as to a certain number of loose rivets? Yes.
1075. You said that there were 3,813 loose rivets? Yes, something like that; I do not remember the number exactly.
1076. Your report was sent to the Engineer for Existing Lines? Yes.
1077. What hammer did you use in testing the rivets? One like this (*exhibiting a hammer weighing 3 or 4 ozs*)
1078. Did you never use a heavier hammer than that? I never carried a heavier one about with me.
1079. Did you mark all the loose rivets with a cross in chalk? No, I did not mark them myself; I had two riveters marking them.
- 1080.

Mr. W. J.
Hilzinger.
23 Feb., 1885.

1080. But since then you have gone over the rivets yourself? I have gone over them myself since then.
1081. And did you find that everyone of the marked rivets was loose? Yes, everyone.
1082. What do you mean by a rivet being loose? When I can hear it rattle in the hole, or when I can knock it about from one side to the other in the hole.
1083. With a slight tap? With one of these hammers (*a 3 or 4 oz. hammer*). I consider it loose if I can move it with one of these.
1084. How many of the rivets that have been marked as loose seemed to be loose on the head and tighter on the snap;—what proportion, do you think? Most of them are tight on the snap; it is the heads that are loose, not on the top of the hole. They are tight on the snap because the iron is caulked in with the rivet. At the point it fills up at the edge of the plate where it is knocked down and is not plugged up in the hole behind it.
1085. You have had great experience of riveted joints? Yes.
1086. What length of rod should be allowed in the rivet for making the snap-head? That all depends on the thickness of the plate it is to go through. For instance: there are four or five thicknesses there (*indicating the place on the bridge*), and a rivet $\frac{3}{4}$ of an inch or an inch longer would be required than in a place where there are only two thicknesses, in consequence of more of it having to stave up in the hole. If there are only a couple of thicknesses, $1\frac{1}{4}$ inch or $1\frac{3}{8}$ inch is plenty; whereas if there are four or five thicknesses you want a couple of inches. But those rivets that are loose on the head have simply been heated at the point, and they are just brought up through the first plate or half-plate, and that keeps the snap from shaking about. The more thicknesses the longer rivet you want to knock down.
1087. *Mr. Courtney.*] It is your opinion that very few rivets are so bad as not to be tight in the snap? They are very bad when they are not tight in the snap.
1088. But you mean that very bad rivets are tight at the snap? Yes, unless the work is not close, in which case they will go backwards and forwards.
1089. It would be well if you would state to the Commission your opinion as regards cold-headed and hot-headed rivets;—is there any advantage in a cold-headed rivet? A rivet should be hotter at the head than at the point to stave it up in the hole.
1090. Which end would you have in the fire last? The head; and the boy, just before bringing the rivet out, should catch hold of the point of it with his tongs so that the part of the rivet towards the head may be hotter than the point which gives something cooler to hammer on, so that it will stave back in the hole towards the head. If the rivet is hot on the point it splashes over the plate on the top while being rivetted and does not fill the hole but knocks down like a piece of lead over the top plate.
1091. Do you approve of a cup-headed or a flat-headed dolly? I do not believe in cup-heads at all. You cannot hold them solid with the cup.
1092. The best method of heating rivets is, in your opinion, to heat them horizontally on a smith's hearth and not to put them vertically or to use a plate? I do not believe in plates at all.
1093. You consider that a long rivet especially should be heated on the horizontal? Yes, across the fire.
1094. But not standing through it? Not to heat it; it is too long for the fire to heat it vertically; you must heat it horizontally.
1095. The usual practice is to heat with a plate? Nowhere, except in England. In Scotland and America they do not use plates.
1096. You think that as regards time there is no temptation to a contractor working properly to put rivets in with a riveting plate? He can put them in cheaper and better without a plate. Nobody that I know of will use a plate. I am talking about bridge rivets, not counter-sunk heated rivets or small rivets, but bridge work.
1097. Is it your opinion that the rivets should not be laid over with light hammers but struck in the middle with three or four blows, after which they should be struck about six with the snap? Yes.
1098. Then again, you think that a snap that is too hollow is a dangerous thing inasmuch as it cuts the plate when the rivet comes short in length? Yes, a shallow snap is the best.
1099. And that the fin is no objection? No; as soon as the rivet forms a lip on the plate of course you can drive no more into the hole. It wants to be left like a ball to put the snap on so that when it gets a smart blow with the flogging hammer it will upset the iron into the hole.
1100. Do you consider a snap injurious which is too deep for the amount of over-length of the rivet? Yes, if it is too deep.
1101. Is it your opinion that on this bridge the rivets have been snapped with deep snaps? Yes; or the snap has been worked round the rivet too much.
1102. Do you consider the snap heads of the rivets in the flanges abnormally small? Yes; in fact all over they are small for seven-eighths rivets, but especially on the top boom.
1103. *Professor Kernot.*] I should like to know the history of this hole (*pointing to a hole from which a rivet had been removed in the top boom of down-stream girder, near centre arch*)? I came up here with Mr. Cowdery and Mr. Avern about a month after I had had the bridge inspected and they wanted me to knock out a rivet. I had no tools with me for knocking out rivets but I got an old hand-hammer with nothing but a splinter of the handle remaining, and I just chipped the bat off on the top, and tried to knock it out with a piece of half-inch or five-eighths round iron. In consequence of its being a rivet that had not been heated at the head, but only heated at the point, and therefore only staved up just at the bat half-way through the first plate, it was bigger at the top of the hole than at the bottom, and the hole was not fair. I could not knock the rivet out with the piece of iron because the piece of iron bent; but next time I came up I had a punch and a hand-hammer with me, and the rivet was knocked out. It came out very easily. (*Rivet produced and its appearance explained by the witness who also used it to illustrate what he meant by defective riveting.*)
1104. *Mr. Courtney.*] In what condition did you find the rivet? Burnt halfway along it.
1105. *Professor Kernot.*] On what bridges were you engaged in Victoria and in what capacity? I was working as a riveter for Cornish and Bruce at the Castlemaine Foundry; and also at the Tarradale bridge, at Sunbury bridge, and at Bucki bridge.
1106. Were there any others? Yes, but I do not remember them. Tarradale was the largest.
1107. Was there not a bridge near Hawthorn? Yes, the Hawthorn Road and Railway bridge, and also the Cremorne Railway bridge. I worked piece-work as a riveter on those bridges.
1108. As a riveter not as an inspector? Yes.

- Mr. W. J. Hilzinger.
23 Feb., 1885.
1109. *President.*] When I was inside the girder with you just now, and you pointed out so many loose rivets, did I understand you to say that they should all be replaced with new ones? I do not know about that; I do not say all.
1110. Which would you replace? I would replace those in the joints. I do not know about the ones between unless they are very bad. Wherever the work is not close I would replace the rivets. It is not so much a question as to whether the rivets are tight as to whether the work is close.
1111. There are some places in the booms where a large number of consecutive rivets are marked as being loose? Where I find a lot like that I would take them out.
1112. And where you find only two or three? I would not touch them unless the work was not close.
1113. Would there be any danger in taking out rivets like these in this boom (*indicating the place*), of loosening the rivets around them? If the work is close they will not be loosened.
1114. Do you consider the joints of the angle-irons and plates in this bridge close? Fairly close. In a few places they are little wide, but generally they are fairly close.
1115. *Professor Warren.*] Generally, if you were to take out a rivet where they occur singly or two together do you think you would loosen others near them? I would not bother with odd ones like that. If these two (*pointing to two rivets*) were very loose I would take them out, and not loosen the other ones. We cut them out very carefully. We do not cut them off with a side-set, but with a chisel. We just cut them across with the chisel, and the least thing cuts them off.
1116. And generally on this bridge you consider that you could cut out rivets where necessary without loosening other rivets? You might run along a few where the work is not close without going further.
1117. But this is a bridge where the work is close? Yes, it is fairly close.
1118. *Mr. Courtney.*] Did you see any of these bridges when they came out? No, never before I came to inspect them.
1119. Do you know whether they came out with the angle-irons riveted on the plates? Yes, I can point out the home work. (*The witness pointed out several parts as English work in which long rows of rivets were marked as loose.*)
1120. With regard to those rivets in the English work, did you find that they have been put in with a cold head and burnt in the point? I never took any out.
1121. But in any of the bridges taking the whole three? Yes.
1122. You find that they have been put in with a cold neck and burnt at the point? Yes they are. That is the result of heating them on a plate; that is why I condemn rivet plates.
1123. And from your experience you would say that in the three bridges on this line the rivets have been put in cold in the neck? Yes, which they ought not to be.
1124. *President.*] I suppose you have had to do with putting new rivets in bridges? Yes.
1125. Can you say whether you have had more rivets to put in in the English work than in the work done by the contractors in the erection? In some of the bridges it has been about the same in both, but in others it has been all in the Colonial work.
1126. But I mean in bridges similar to those at Wellington and Bathurst for instance? About the same with both.
1127. The Colonial riveting and the English riveting are about the same? Yes, I do not know any difference.

[*The Commission then proceeded to the bridge over the Peel River, at Tamworth.*]

Mr. Robert Ewing was here further examined:—

(*At the request of the President, the witness tested a number of marked rivets in the bridge.*)

- Mr. R. Ewing.
23 Feb., 1885.
1128. *President.*] In the bay you have just examined, you find that out of thirty-six rivets marked as loose, seven are tight; that is to say the remainder are slightly loose? Very slightly indeed.
1129. I think you told us that the testing of the rivets was likely to loosen them? I think too much of it will.
1130. To what extent? Simply to the slight extent that there will be a play of the rivet in the hole.
1131. *Mr. Blacket.*] Do you mean that by testing with these small hammers the rivets will be loosened? I think too much testing will do it as the dropping of water will wear away stone.
1132. Do you say that that will be done by such a test as we have been making; that is by slightly tapping the rivets on one side with a small hammer? I think it will in the course of time.
1133. *Professor Warren.*] How many blows would it require? I have no idea.
1134. *President.*] But it is your opinion that it will loosen the rivets? I think too much hammering will.
1135. That is to say that if a tight rivet is hammered by testing as we have been doing, in the course of time the rivet will become loose? I believe so. (*The witness here, by the direction of the Commission, tested a rivet in the top boom of the up-stream girder, and stated that it was slightly loose.*)
1136. *President.*] Now we have all tested that one rivet which has not been marked as loose, and we find after striking it at least 150 times, and with harder blows than usual, that it is not loose, and you consider that it is a loose rivet? No, you are not putting my words fairly. I say that I would not call it a loose rivet, but it is to my feeling as loose as some that have been marked as loose. I would call it a tight rivet, and so I call those others that have to my feel as much play as this one has.
1137. But it has no play? I feel it to have a little play.

Mr. W. J. Hilzinger further examined:—

- Mr. W. J. Hilzinger.
Feb., 1885.
1138. *President.*] Did you mark the rivets in this bridge yourself? No, my men marked them.
1139. What instructions did you give them? To sound all the rivets and to mark those which were loose, and to be particular not to mark them unless they were positively loose—unless they could hear them rattle in the holes or see them move about.
1140. *Mr. Blacket.*] Were the men accustomed to the work? One of them I have had working for me twelve or fourteen years in different shops. I have had them between two and three years sounding rivets.
1141. One of them had been employed in Africa, had he not? Yes, he has been over the rivets recently

to

to see if all those that were marked were loose, and if not to rub out the marks, and he found a lot with no marks which he marked. I suppose the marks had been washed out.

1142. *President.*] Do you know how many blows were given to the rivets to see whether they were loose or tight? Just one tap, and when the men found one that appeared to be loose they tapped it on both sides.

1143. Half-a-dozen taps I suppose would be sufficient? No, not half-a-dozen; it would take six months to sound all the rivets on the bridge at that rate.

1144. And have all the rivets in the bridge been tested? Every one, except the ends.

1145. But in the booms top and bottom? Yes.

1146. And those rivets that are marked are those that are considered to be loose? Yes.

1147. And you have been over them yourself since? Yes, pretty well all of them. I was here the first time they were marked. If the men found one they were doubtful about I examined it myself.

1148. Do you consider that those which are marked now should be replaced? Not all; in the case of some of them it would not be necessary.

1149. Which do you think require to be replaced? I think all those in the joints, and where there are three or four loose ones together, but where there is only an odd one or two I would not.

1150. *Professor Warren.*] Where there are half-a-dozen rivets like these (*pointing to the top boom*), would you replace them if they were loose? Yes, where there is a batch together like that. It all depends on how loose they are. Some are more loose than others; some have only a slight jar; when they have only a slight jar I would not replace them.

1151. In a case where one in every six is loose, you would not consider it necessary to replace them? No.

1152. *President.*] In a case where you have a number together (say eight or ten) loose, would you replace them one at a time, or would you take the whole lot out and put in service-bolts? At a place like that (*the joint of an angle-iron*) we would take the whole lot out and take the angle-cover off, and heat it so as to close it in its place hot.

1153. Have you found that the first few rivets you had put in in such a case became loose when you put in others afterwards? Say that you took the whole of them out; have you found that you loosened the first few that you put in by putting in others afterwards? No, not when we put the covering plates on hot and closed it. We put the bolts in and closed it well before we put in any rivets at all.

1154. If rivets are put in in the way you described at M'Donald River, do you think that some of the rivets first put in could be loosened by others being put in afterwards? If the work is close and the rivets were tight before, they will not become loose, but if the work is not close, then, of course, the rivets will shake loose.

1155. *Professor Warren.*] The work being such as is in this bridge—ordinary riveting—in which no particular trouble has been taken to make the head as hot as the rest of the rivet, do you think there is any danger of loosening a rivet by putting in an adjacent rivet? Not if the work is close and the rivets were tight previously.

1156. *Mr. Blacket.*] In the event of the Government Inspector condemning a rivet as loose, while the bridge was in course of erection, could the contractor tighten that rivet without taking it out? No; all the time he is trying to cobble it up he is loosening it. It would be just the same as hammering it.

1157. If the work was not properly done at the beginning it could not be rectified; the rivet would have to come out? Yes, in the case of these big rivets; with little ones of course it is different.

1158. *President.*] This bar is marked as not being in contact with the plate, and yet four of the rivets are not loose? That is because they are little short rivets, and the heads as well as the points have been made hot. They could not make the point hot without making the head hot also.

1159. If one of those rivets in the booms is tight, how many blows—ordinary blows—would be required to make it loose? I do not think you could make it loose. You might hammer it for a week, if it was solid, with a 4-oz. hammer, like that you have in your hand, without shaking it.

1160. You have told us before that the rivets have not been tested with heavier hammers than this? Yes; I have never carried about a heavier hammer.

1161. In testing the rivets you have never intentionally loosened any of them? I always had strict orders and always gave strict orders to my men never to use heavier hammers than that to test the rivets. When one of these hammers has not been at hand I have taken an ordinary hand-hammer to test them with.

1162. *Professor Kernot.*] Then you say that the rumours which have reached us as to rivets having been intentionally loosened by heavy hammers and by violent treatment are absolutely without foundation? Yes. We of course hit them a little smarter than you do, but never harder than this (*showing by a blow*).

TUESDAY, 24 FEBRUARY, 1885.

The Commission met at the Aberdeen Bridge.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. C. KERNOT, Esq., PROFESSOR

OF ENGINEERING,

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR

OF ENGINEERING,

OWEN BLACKET, Esq.

Mr. Robert Ewing further examined:—

(At the request of the President, the witness examined a number of marked rivets in No. 1 up-stream girder, near south end of bridge.)

1163. *President.*] You have just tested a number of rivets in two bays of this girder, what do you consider to be the result of your test? It harmonizes with the marking, though there is only one rivet that is really loose to the sound; the others are so slightly loose that they require feeling. All those that are marked are certainly feelable, but there is one that is hearable.

Mr. R. Ewing.

24 Feb., 1885.

1164.

- Mr. R. Ewing, 1164. Out of 298 rivets in these bays you find that there are nineteen more or less loose? Yes, if you can call them loose.
- 24 Feb., 1885. 1165. If you do not consider them loose you are not obliged to say they are? Perhaps imperfect would be a better word. One is decidedly loose.
1166. *Professor Warren.*] You say slightly loose? Well, there are loose rivets and rivets that are loose, just as there are drunkards and men who drink.
1167. *Professor Kernot.*] You would say loose to the touch? Feelable, I would say, and one that is hearable; one loose to the ear and the others to the touch.
1168. In your evidence yesterday you stated that a tight rivet might become loose in testing by constant hammering? I think so; as a matter of fact I have done it, but with heavier hammers than these.
1169. But did you find out that it was a perfectly tight rivet and in a place where the plates were in perfect contact? Yes.
1170. How many blows did you give? I cannot tell you the number of blows.
1171. Do you think that heavier hammers than we have been using have been used on these bridges? I believe that heavier hammers than these have been used but I am not prepared to say what was the weight of them.
1172. Do you know of your own knowledge that such hammers have been used? I do not.
1173. It is only your impression? It is only my impression.
1174. And that impression is obtained by having seen one or two rivets which seem to have had stronger blows than the others? Yes; from the appearance of the rivets.
1175. But if only one rivet out of 150 seems to have had a stronger blow than usual and it shows the blow on the sides, how is it that the others do not show signs of similar blows? Well it may have been that what looked like a defective rivet did not show it at the first blow and it was given an extra blow. Some of them do appear to have had an extra blow.
1176. *Professor Warren.*] And you consider such an extra blow sufficient to loosen a rivet? To mark it, decidedly. It would of course make a greater impression on the head and it would also tend, I think, to make the looseness more marked.
1177. You see that many of the plates are not in perfect contact with the angle-irons and also that some of the butts are wide apart. Do you think that the work would be improved if the joints were closer and the angle-irons were in better contact with the plates? I do not know that that is a question I am competent to answer; it is more a theoretical question I think. I would say this: These parts of the bridge are in compression, and if there had been any movement, any sagging, or undue deflection, I think—
1178. That is not the question. The question is, would it make better work to have the plates in contact? Most decidedly it would be better work. That is certainly defective work.
1179. With regard to those rivets that are slightly loose, do you think they are likely to become looser in consequence of the vibration caused by the traffic passing over the bridge? I think not.
1180. *Professor Kernot.*] Suppose that the plates of the bridge were in perfect contact and that one rivet was loose, do you think the renewing of that rivet would have any effect in loosening the adjoining rivets? I think so.
1181. That is if the plates were in perfect contact? Yes.
1182. Would there be any difference if the plates were not in perfect contact? The looseness would perhaps be more perceptible in the adjacent rivets.
1183. *President.*] But if you had to replace a number of rivets side by side and the plates were in perfect contact, every rivet you put in would loosen the one previously put in according to that? No, I think not, not when putting in a row. I think Mr. Blacket will know that, as a rule, when boiler-makers are doing boiler work and there is a difficulty in getting the plate down in some parts, as at the landings for instance, the men go back on the work one or two rivets.
1184. *Mr. Blacket.*] Is it not a common thing in practice to find, even when a job is finished, that a rivet is loose and a new rivet has to be put in its place, and that this is done without loosening the rivets on either side? Yes, sometimes, but it is not often the case. Sometimes you have to take out more than one.

Mr. Peter Morrison, general foreman, sworn, and examined:—

- Mr. P. Morrison, 1185. *President.*] What position do you at present hold in the service? I am general foreman in the Permanent Way Department.
- 24 Feb., 1885. 1186. You were present at this bridge while it was being erected were you not? Yes.
1187. What was your position at that time? I was inspector of buildings and bridges.
1188. Under Mr. Wade? Yes.
1189. Do you remember the bridge coming here in sections as it arrived from England? Yes.
1190. Was the whole of the trough of the booms riveted in one piece? Yes.
1191. *Professor Warren.*] Just the length from angle-iron to angle-iron? From plate to plate.
1192. *President.*] Who was the contractor for the erection of the bridge? Mr. Smithyman.
1193. What were your duties in connection with the erection of the bridge? To look after the sinking of the cylinders and to get everything ready for the superstructure; also, to see as well as possible how the work came together. I believe that the holes for the rivets were all very fair holes.
1194. Had you to test the rivets for the Government? No.
1195. Not to see that they were tight? Well, yes, I was supposed to do that.
1196. And you did it? I believe so.
1197. Do you remember if there were any loose rivets in the parts that came from England? I could not say; I had nothing to do with that at all.
1198. Had you a copy of the specification? Yes, I had a copy.
1199. Did you remark that in one of the clauses it is stated that the plates are to be in perfect contact? It is too long ago for me to remember.
1200. To make good work the plates and angle-irons should be in perfect contact? Yes.
1201. You see a number of joints in the bridge with spaces between them;—can you remember whether that portion of the work was done in England or here? That work was done here—that scarf.
1202. Do you remember these false-punched holes in this joint (*in centre span of up-stream girder*)? No, I do not.
1203. Then you cannot tell us how they occurred? No, I cannot now.
- 1204.

1204. Do you remember anything being said about these open joints—this bad butting of the plates? No, nothing was ever said about that.
1205. Not by Mr. Wade at the time? No, he was satisfied with the work.
1206. If you had seen these bad joints and these false-punched holes at the time, would you have drawn Mr. Wade's attention to them? Yes, certainly, to those holes in particular.
1207. Do you think the work would have been better if the butts had been close and the holes truly punched? Well, the holes are the worst. I must say that the work would have been better if the holes had been fair holes, but I do not think so much of the plates as the one is scarfed over the other. The plates pass one another and form a scarf.
1208. You have had, I suppose, a large experience of riveting? Not very much experience of riveting.
1209. But you can say whether rivets are well put in or badly put in? I think I can.
1210. Can you remember the way in which the rivets were put in by the men employed by Mr. Smithyman;—were they heated rivets? They were.
1211. Can you describe to us the plan they adopted in riveting? The rivets were made quite hot, then put in and snapped over with a snap-punch.
1212. Were they heated through? Yes.
1213. Including the head? Not so much the head, but about three parts of the rivet and sometimes the head too.
1214. Did they use a riveting plate, or did they only put the rivets into the fire? Only just put them into the fire.
1215. They had no plate into which they put the rivets vertically? No, they did not put them in that way.
1216. You see here an opening or bad joint between the angle-iron and the diaphragm of the cross-girders? Yes.
1217. Was that done in England? Yes, except the one that comes opposite to the scarf; the remainder were all fixed to the boom.
1218. *Professor Kernot.*] Do not the rivets that hold on the cross-girders also hold on the diaphragms? Yes.
1219. Well, were the cross-girders riveted on in England? The cross plates in the box-girders were riveted in England; also the bottom girder at one end, and the top girder at both ends, excepting the scarfs.
1220. *President.*] The contractor for the erection of the bridge had everything sent out for him from England? Yes.
1221. And he put it up just as it came—he did not make the pieces? No.
1222. He fitted the work just as it came out? Yes.
1223. *Professor Kernot.*] Can you give any account of these holes (*pointing to a number of holes near the northern end of the up-stream girder*). You will find them in similar positions on each span of the bridge? I cannot; I am sure they were there once.
1224. What, that rivets were there? I cannot give any explanation at all of those holes. I was under the impression when I said the rivets were there once that there had been someone here who had cut the rivets out; but it appears that they are blind holes.
1225. There is another peculiarity that occurs here—what is the meaning of this (*pointing to a number of dummy rivets in one of the boxes*)? They are only just filling up holes in angle-irons. They are neither one thing nor the other. They have simply to be filled up. They do neither good nor harm to the work.
1226. Are you aware whether in other bridges of similar design there is any work attached to that part? I do not think there is.
1227. Will you look along the top boom of the girder, and see if you notice any peculiarity? It is slightly out of line near the north end—about an inch I should think.
1228. *Professor Warren.*] You would not pass that? I do not think I would.
1229. You consider it a defect? It is a slight defect.
1230. Do you think it sufficient to justify the condemning of the work? No, I do not think so.
1231. Would you pass that work—(*pointing to a joint of channel iron strut with stringer plate near pier, where five rivets out of seven were loose*)? I find that they are slightly loose, but what has been on them. There has been a little sledge-hammer work about that. I would pass that.
1232. Would you pass such work as this (*pointing to a compression diagonal near centre of middle span up-stream girder where there was a "dummy" rivet*)? No, but I am not sure that it was always so. I should think that was the only putty rivet in the bridge.
1233. *Mr. Blacket.*] Will you go into these two bays (*those in which the rivets had been tested by the last witness*) and test the rivets, telling us how many you consider loose? There are about two slightly loose.
1234. Did you hit the rivets on both sides? Yes.
1235. And you consider that there are only two loose? That is all.
1236. *President.*] I will ask you to go over the bays again with Professor Warren and myself. (*Witness made a second examination as requested.*) What is the result of your further examination;—do you not find that there are five loose, four slightly loose, and four not loose? Yes.
1237. You stated that there had been some sledge-hammer work about the rivets in a portion of the bridge you examined;—what did you mean by that? Well, it is only hearsay; I do not say that it has happened.
1238. You do not know it of your own knowledge? No, certainly not.

Mr. W. J. Hilzinger further examined:—

1239. *President.*] You have had something to do with the testing of the rivets in this bridge? Yes.
1240. Did you test them personally? I was here all the time. I had two men tapping them and I was following them about and looking after the butts and the wide places.
1241. Did you see how the men were tapping the rivets? Yes.
1242. What kind of a hammer did they use? A hammer similar to those we always use—one like this (*showing a hammer weighing 3 or 4 ozs.*).
1243. Did you ever see them use a heavier hammer? They had no heavier hammers.
1244. They did not use a heavier hammer by accident? No, only these little testing hammers.
1245. They never used a sledge hammer? No, we never had one with us.

Mr. W. J.
Hilzinger.

24 Feb., 1885.

- Mr. W. J. Hilzinger. 1246. *Professor Warren.*] But there are marks on some of the rivets that have not been made by these hammers? Just show me one and I will explain how that was done.
- 24 Feb., 1885. 1247. Here is one? That was struck when it was hot. Where there are any marks on the rivets, they were made when the rivets were hot, and the testing hammers have happened to strike the same place.
1248. *President.*] You have reported upon a good many defects in this bridge, particularly as to bad rivets, and the cutting of the plates? Yes.
1249. I see many places marked on the booms and angle-iron covers: Are those the places to which you refer? Yes, pieces of straw are sticking in most of them, so that you can see them easily.
1250. Which do you consider the worst places? Here is an angle-iron cover which is nearly a quarter of an inch from the angle-iron.
1251. That is not what I mean; I want you to point out the worst of the bad buttings? I think this is (*pointing to a bad butt about 12 feet from the centre pier in up-stream girder*). It is open about five-sixteenths of an inch. (*The witness then walked along the top of one of the girders, directing the attention of the Commission to the joints in the top booms of both sides of the bridge, and pointing out those that were open to a greater or less extent.*)
1252. You consider as the result of your examination that most of the joints made in England are close? Yes, all through.
1253. And that those made in erecting the bridge are mostly loose? Yes, mostly loose.
1254. Have you examined the bottom boom? Yes, from the inside.
1255. And what do you find with regard to the butting of the joints? In the bottom booms they are fairly good, excepting the ends of the cross-girder plates. Some of them are open a good deal—about three dozen I think. There are some very wide on the up-stream side.
1256. Will you point out a few? Yes. (*Witness pointed out a few as requested.*)
1257. The diaphragms of the plates you have just looked at are not in contact with the web plate of the boom? No.
1258. Could they have been put in contact without straining the plates? If they could not have been brought into contact a liner should have been put in between.
1259. Have you observed that where they are not in contact is principally at the covering plate of the vertical plate of the boom? At the butts of the bottom boom web plate and the end of the cross girders.
1260. *Mr. Courtney.*] Have you ever tried how much these bridges are out of line? No.
1261. *President.*] What other defects do you point out in this bridge? A lot of double holes and the plate torn away through the holes having been punched from the top side where they should have been cut up from the bottom, so saving the tearing away of the plate. (*Witness pointed out several such holes in the top boom of centre span down-stream, near No. 3 pier.*)
1262. That was done in the erection of the bridge, not in the work as it came from England? Yes, in the erection.
1263. Can you point out any other place where the same thing occurs? (*Witness pointed out a number of double holes in various parts of the bridge.*)
1264. All those double holes seem to be in the joints that were made during the erection of the bridge? Yes.
1265. Do you know of any in the joints of the work as imported? No, all the double holes are in the work done here.
1266. The work did not fit properly and additional holes were made to make it fit? If the butts had been brought up close and fitted fairly the holes would have been fair. It is in consequence of the butts not having been drawn up.
1267. With regard to the contact of the angle-irons and plates we find that several are not close. Does your idea of riveting apply to this bridge as well as to the others you have examined in cases where the plates are not in close contact? Yes, the plates and angle-irons should have been bolted up and closed properly before the rivets were put into the holes.
1268. *Mr. Courtney.*] Have you ever thought that this shear in the holes in the flange plates was owing to bad scaffolding? I do not know anything about the scaffolding.
1269. But the reason is this: The work that has been jointed at home is close, and what has been put together here ought to be close also unless it were on account of bad scaffolding. Has it never struck you that that was so? Of course it was all on account of not having proper staging and not properly drawing the work together that the butts are bad.

WEDNESDAY, 4 MARCH, 1885.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING.

OWEN BLACKET, Esq.

W. B. Wade, Esq., Inspecting Engineer, further examined:—

- W. B. Wade, Esq. 1270. *President.*] You were requested by the Engineer-in-Chief in June, 1883, to inspect the iron bridges at Aberdeen, Peel River, and Peel-street, Tamworth, and M'Donald River, on the Great Northern Railway? Yes.
- 4 Mar., 1885. 1271. To ascertain the correctness of certain statements made as to defective construction; and you reported to the Engineer-in-Chief on the subject? Yes.
1272. The Aberdeen bridge was erected under your special supervision? Yes.
1273. Who was the inspector under you? A man named Morrison.
1274. Could you trust him as a competent man to see that the work was well put together? Yes.
1275. Had he any other duties to perform in addition to looking after the works? He was over the bridges, but I think at the time the Aberdeen bridge was built there was nothing to take him any distance away—only the neighbouring viaduct; I fancy so; I would not be certain about that.

1276.

W. B. Wade,
Esq.
4 Mar., 1885.

1276. Did you yourself frequently visit the bridge? Constantly.
1277. Do you consider that the Aberdeen bridge has been erected in a satisfactory manner? Yes, I consider it a very good bridge indeed. It was the first drilled bridge we had, I think, in the Colony. A number of people visited it in the course of erection, and they all used to remark about the extraordinary accuracy of the work and the excellent way in which it fitted.
1278. Are all the plates and angle-irons in close contact? There are some small faults to be found in the butt joints; otherwise I am sure they were all in close contact. I may say that was observable at the time in 1871, and it is in precisely the same position now.
1279. Do you think the bridge would have been benefited by having close butting joints? I do not think it would have been benefited in the least. I do not think it would have been a bit the better for it, except in appearance.
1280. You saw a space between some of the cross girders and stay-plates? Yes, I think there were some of them that did not fit—that were not in very close contact.
1281. Do you think that if they had been in close contact the vibration would have been less? I do not see how it could be so at all; I do not see how it could affect it. Of course they are strictly bound down by the width of the longest cross girders. If you have certain cross girders longer than the others all the others are bound to be somewhat loose.
1282. Would it not have been better to have put liners to make the joints close? There was not space enough for liners; it would have been too small for a practicable size; I doubt if they were measurable.
1283. The girders—the iron-work generally—was imported from England in sections? Yes.
1284. The boom plates and the lattice-bars separately? Yes; the lattice-bars were not riveted one to the other.
1285. But the sections of the booms were riveted in England? Yes.
1286. Did you remark in those sections that came from England riveted together, where the joints were secured, that the butting joints were not close? Yes.
1287. Was that the fact in the portion that came from England? Yes. I am not at all sure whether in those days they planed the butt joints.
1288. Are you sure that some of those badly butting joints were riveted in England? I think so. You see the smallest irregularity in the butt joint would make it appear open from the edge. It does not follow that some part of that butt is not in contact.
1289. But some of the worst of the butting joints were made in the Colony during the erection? Well, I could scarcely say. Of course there is no choice in the matter; your holes are drilled through, and you must fit the holes, and if the joint does not butt you must take it at that, because you are bound down by the position of the hole. Perhaps I may remark that I do not consider the butt joints as of the least consequence except for appearance, for they are either methodically true or they are just as bad as if they were put apart.
1290. Was the bridge put together in England before it was sent out here? We always presume so.
1291. Do you not know for certain? I may say for certain, for nearly every bridge we have had was.
1292. Well if it were put together in England with service bolts, the butting joints must have been close? I do not see how the joints could ever have been different from what they are now. It is the same camber.
1293. If it were put in the yard would it have been passed by the engineer there unless the joints were fairly butting? We must only presume that it was passed.
1294. Did you remark that in several of those joints which were put together in the Colony during the erection—in three or four to my knowledge—there were double holes for the purpose of making the holes in the plates coincide? Yes, I remember that; I remember a few of them.
1295. That was not done in England? I presume so. We certainly did not drill any holes here.
1296. But these double holes which form a kind of oval hole were not made in England, surely, unless they had some special rivets to fit them? I presume that the original riveting when they came to put it together in England would not fit with the other holes—the holes would not come opposite one another; so they had to lengthen one of the holes to bring it in. We never drilled any holes here.
1297. Do you think the inspector should have passed the work without some better provision for the joints? The only thing he could have done would be to have had the plate cut out, and that is rather a serious matter when a lot of rivets have been made. If there had been a hundred rivets in one of the plates made he would have had to loosen all those for the sake of one or two others.
1298. These double holes occur in the angle iron, as well as in the plates themselves? The angle iron wrappers are very small—that could easily have been replaced; but in regard to a plate it is a very serious matter to condemn a long plate with a lot of rivets in it for the sake of one hole.
1299. *Professor Warren.*] You say for the sake of one hole? Yes.
1300. There are a lot of holes? There were a lot in one bridge!
1301. *Mr. Blacket.*] Six or seven in one place? Whereabouts in the bridge?
1302. *Professor Warren.*] In about six places? A main plate with the boom or a web plate!
1303. Main boom plates principally.
1304. *President.*] You can put a wire by the head of the rivet into the hole where the rivet is put in, showing that it is an elongated or double hole? Where is that?
1305. In the boom plates, towards the end? In the compression part of the boom!
1306. *Professor Warren.*] In the tension part and in the compression also; it occurs in six places altogether? You can put a wire in and through the hole! How many plates does that go through—one or more?
1307. You can only see it in one plate.
1308. *President.*] Did you find any loose rivets in the Aberdeen bridge? On my last visit?
1309. At the time of your visit to report upon it? Scarcely loose rivets—rivets that would vibrate, but not loose in a boiler-maker's sense. But I noticed that all rivets or nearly all that had been marked with a pencil had had a tremendous hammering; they were all of them quite flat in the head.
1310. You state in your report that the course adopted in the maintenance department seemed to be to despatch the man Hilzinger armed with a heavy hammer to knock the rivets about until he could report a number of them loose, and then cut out and replace as many as he thought proper? Yes, I believe that is their custom.

- W. B. Wade, 1311. Is it only your impression, or did you get a report from anybody that this was the case? A man came to the office—I forget whether I was present or not, but I know Mr. Whitton has his evidence—and stated that was the case, and that he left the work because of the way in which the rivets were treated. And I know that wherever Hilzinger has been the rivets have been knocked about.
- Esq.
4 Mar., 1885.
1312. Do you think that man could swear that Hilzinger used a heavy hammer, as reported? He did swear.
1313. Who was the man? I could not say, but Mr. Quodling has the evidence reported. I dare say you remember the day we were at Menangle, when Hilzinger came up with a heavy hammer prepared to show you how to loosen rivets, and Mr. Cowdery said, "No, I don't want you to show that."
1314. But you never saw him use a heavy hammer in the way you mention? No, I never saw the man in my life, except on that occasion at Menangle.
1315. At the time of your inspection you tested the iron bridges on the Northern Railway, and you stated, with regard to the Aberdeen bridge, that the deflection of span No. 1 was $\frac{1}{8}$ of an inch, of span No. 2 $\frac{1}{8}$, and of span No. 3 $\frac{1}{8}$; this was with an engine weighing about 70 tons? Yes.
1316. How did you register your deflection—at what points of the span? The centre.
1317. But how did you register the deflection? With a level on that occasion.
1318. You stated that before the bridge would fall an enormous deflection would take place? Yes.
1319. Your extension you put here—extension of the iron—would be enormous? Yes.
1320. Can you explain the meaning of this? Yes; I dare say you remember some twenty years ago or upwards there was a great cry out about an enormous weight of iron being swept out of Britannia bridge in rust; people got alarmed about it, and there was a great deal of writing in the newspapers about it. But the newspapers came to the conclusion that before there was any danger the deflection would become so enormous that everybody would notice it; and in taking a span of this sort I consider that before any danger could take place, all the plates would extend (say) 5 per cent., and if you extend them to 5 per cent.—say 5 per cent.—and then take the proportion of the new line or curve showing the extension to the original horizontal line, and compare that with the vertical line, you will find you have gone down 20 feet.
1321. *Professor Warren.*] That is assuming the elongation to be 5 per cent.? Yes; the elongation of one or both the beams before it reached its rupture point would have caused a descent of some 20 feet. That is to say, if you take the half bridge the length of the new line and the length of the old line, then the perpendicular between the two will represent some 20 feet. (*Sketch submitted by witness.*) That shows what the result of straining to a large per centage would be in practice.
1322. Do you consider that a riveted structure such as a bridge would elongate—that is to say, that the tension-boom would lengthen as much as 5 per cent.? I do; and I am not quite sure but I fancy I could bring you results to prove it by some of the riveted beams broken by Baker. I forget to what they extended, but it was a very large amount. One of the conclusions he came to with regard to the breaking of those beams was that the rivets acted as clamps only and not as pins.
1323. Referring to the question which the President asked with regard to deflection;—did you consider the result obtained with the 70 tons engine satisfactory, seeing that with 170 tons you got very little more deflection? One was practically a central load and the other was a distributed load.
1324. But you would have expected the deflection to be in proportion to the load? No, not strictly proportionate to the load. It would be rather a complicated result to work out with the different points of loading.
1325. But taking the weight of 170 tons distributed over the whole bridge;—suppose you had half that weight distributed in a similar manner, would the deflection be one-half or more than one-half? More than one-half.
1326. The result of your test would be more than that of 70 tons distributed? It would be equivalent to more than 100—decidedly.
1327. There is another question, on the violent treatment that the bridges are said to have received, and which is said to have caused loose rivets: You stated, I think, that you noticed the rivets had been hammered? Yes.
1328. In how many cases? A great number.
1329. At all in proportion to the number of rivets loose—there are a lot of rivets marked in Aberdeen bridge, and on a few rivets there are marks of a larger hammer than an ordinary testing hammer; but those are a very small proportion to the total number of loose rivets? I never saw any loose rivets—not worthy of the name. There may have been a few odd ones, but nothing to compare or to be named in the same day with the number marked.
1330. *Mr. Blacket.*] If the rivet had a flat head and the paint had not been removed would you say that had been done with a heavy hammer? It would be difficult to say; the bridge may have been painted recently.
1331. The bridge has not been painted recently. Did you ever notice a holder-up with his dolly on one side of the rivet, and the rivet-head hot, and he put a flat appearance on the rivet? Oh, yes.
1332. Could that not have been done? Possibly, but I believe the marks were from the hammer; they were too small to be from the effect of a dolly.
1333. *Professor Warren.*] And too large to be the effect of a small riveting-hammer? Well, they are too large for a small riveting-hammer. The rivets were all tested during the construction; I suppose I tested many thousands of them myself during construction. And there is another thing. Mr. Bewick has had charge of the Aberdeen bridge for twelve years, and has had it looked to every year, and never found fault with it until this man Hilzinger worked at it as he liked. I believe it was Mr. Bewick's custom to have men every year or every two years to test and examine the bridges.
1334. Did you notice that the third span nearest Tamworth was out of line? Very, very slightly. It is not an absolute straight line.
1335. It occurs at the last angle iron cover? It is very, very slight.
1336. You do not consider that of any consequence? Not the slightest.
1337. And you do not consider that there are really loose rivets in the angle iron covers? Not a quantity; there may be an odd one or two.
1338. Nor in some of the more important lattice-bars? I think I was pointed out some of the lattice-bars, but I do not consider them as of the smallest importance.
1339. I do not mean the sections, but the rivets uniting the lattice-bars with the struts? With the web: no, I was not shown any.
- 1340.

1340. But you would not pass loose rivets in that position? I would not pass loose rivets anywhere; but where there is a rivet loose it is very rare indeed that it is advisable to put a new one. That has been my experience. W. B. Wade,
Esq.

1341. How was it that the struts were not brought in contact with the stringer plate? The web plate? 4 Mar., 1885.

1342. Yes? I was not aware they were open. There are some cases where a washer has to go in.

1343. I do not mean that? They are in contact in some portion I suppose. They ought to be in contact to make neat work, but I do not see how that can affect the strength unless the channel iron has been damaged, but it is not at all likely.

1344. With reference to the tension bars, towards the end of the first span and towards the third span several cases occur in which the rivets have not been put in; we have a blind hole instead of a rivet? I suppose it was not considered advisable to make a new hole without having proper appliances, but I am not aware of it.

1345. With reference to the rivets at the intersections, you do not consider that it matters at all whether they are loose or not? No.

1346. *Mr. Courtney.*] Did you notice in the specification it was specified that no machine riveting was to be done in that bridge? No.

1347. It is so specified? Is it?

1348. Yes. I was going to ask you whether, at the time it was brought forward, any remark was made upon it? I do not remember it. (*Specification shown to witness.*) I never noticed that before. But it is negatived. It says it must be executed by hand, but it does not say it must not be executed by machinery; and the question is what at that time—about '67—was the position of machine-riveting at home.

1349. *Mr. Blacket.*] We had steam riveters out here? They were in use, but were they considered a good thing?

1350. *Mr. Courtney.*] Yes? I never noticed this in the report, but I dare say Mr. Baker will be able to explain.

1351. *President.*] You also tested the Peel River bridge at Tamworth and the bridge over the M'Donald River? Yes.

1352. And the result is stated in your report? Yes.

1353. Do you consider the work in those bridges satisfactory? Yes, very good indeed.

1354. Do you consider rivets likely to be loosened by the traffic, or expansion, or contraction of the iron? There is no question whatever that the expansion and contraction of the iron affect the rivets. Every writer on rivets says so.

1355. In the course of time there would be a slight looseness in several of the rivets? No doubt of it.

1356. And that would account for some of the rivets being slightly loose? No doubt of it; and moreover in every work it is universally admitted that there are a number of rivets which the least tap or pitch will make loose.

1357. The heavier the traffic the greater would be the looseness of the rivets? I do not think so much of the traffic, for it is limited to a few hundred tons; but the expansive forces amount to many thousands of tons.

1358. But heavy traffic would bring more deflection on the girders and more strain on the rivets? Yes, it would have that tendency; but the expansion and contraction of rivets between plates must lengthen rivets.

1359. Not sensibly? I think so.

1360. Do you think this apparent looseness of rivets is caused by the way in which the rivet has been put in? No, I do not think so.

1361. By the coldness of the head of the rivet when put in, so that it would not expand? The head of the rivet should always be kept hot. I will tell you one thing I have noticed lately on these new bridges of ours that came out in a different form: Our more modern bridges came out in plates and also without any web, consequently all the boom comes out as pure plate to which you can apply the hydraulic riveter with very great ease, and constantly we are using the hydraulic riveter.

1362. But the plates could not have been put in perfect contact? That is the fact, however, and by the best makers.

1363. Did that occur in the Dubbo bridge? Yes, I believe it did—I know it did; I saw some.

1364. Did you cause some of the rivets or hydraulic rivets to be cut? No, I did not.

1365. To see how they behaved in the riveting? No, it would be such a deuce of a job that I did not try to cut them.

1366. But if you passed them through four or five plates you could have seen whether it was good all through the hole? I did not do so.

1367. Here is a rivet that came from the Peel-street (Tamworth) bridge (*rivet produced*). The portion near the head has not been much upset in the riveting, whereas a portion of the bat has filled the hole completely. In the riveting you might have seen whether such an effect took place? The rivets should be tight, but it is a very difficult matter to get them so.

1368. Do you consider this rivet has a good head? No; not a good one; only so-so.

1369. It would make better work if it had more metal in it? Yes.

1370. Here is another, for instance (*rivet cut in two produced*);—is that an old or a new head? An old head; it is about the right proportion. But this has been so much on one side that the whole lot has been cut under the snap, I expect.

1371. *Mr. Blacket.*] They are all the same. This one with the head was cut off; you could almost take it out with your finger? There is one in the Aberdeen bridge that could be cut off, and was condemned as a loose rivet.

1372. We have that: that came from the M'Donald River.

1373. *President.*] You refer to a rivet at the M'Donald River that could not be knocked out;—do you know the circumstances connected with that rivet. "At M'Donald River bridge I find there is a place where the head of a rivet had been cut off, and the rivet being too tight to get out either by hammering or driving, remains there still." (*Rivet produced.*) Do you remember which way it was cut off—whether the head or the bat was cut off to drive it out? Indeed I cannot tell you, but probably the head was cut off. I could not tell you. It had been cut out before I got there.

- W. B. Wade, Esq., 1374. Who was the contractor for the erection of the Aberdeen bridge? A man named Smithyman, who has erected a good many bridges for us.
- 4 Mar., 1885. 1375. He had the specification as his guide? Yes.
1376. Did he work closely to that specification? Yes.
1377. Do you consider him a good contractor for that kind of work? Very good, indeed—one of the best in the Colony. He certainly has had more experience than any other man in the Colony on the question.
1378. Do you think that if those defects that have been mentioned in the Aberdeen bridge had not existed the bridge would have been better? No, not a bit; not for any practical purpose. I consider there could not be a better bridge for its purpose of carrying a railway train than the Aberdeen bridge. There might possibly be a neater one, but I do not think there could be a better one—I am sure there could not.
1379. If the maintenance of these bridges were in your hands would you have the rivets in the bridges tested periodically? Certainly—oh, yes.
1380. If you found a number of loose rivets would you replace them? What I considered were loose—If there were any, that is to say. I should consider it my duty to replace a really loose rivet.
1381. Then in those iron bridges on the Northern Railway you would not think it necessary to replace any of the rivets? No.
1382. You do not think those bridges would be benefited by doing so? No, I do not.
1383. *Mr. Blacket.*] Was there no size given with regard to the rivets—that the rivet head should have a certain amount of metal in it? Oh, yes; it is in the specification. But then I would not condemn a lot of English rivets if they were a little too small—if they would not quite make the head specified for. We had a case where a lot of English rivets were a little too short to make the head specified for, and the question was whether we should condemn a lot of rivets and get inferior ones in the Colony. I say no, make the best of it. I think our size is a little too large. I notice that the English rivets latterly are not so large as we have specified for, in the heads.
1384. But what is the use of a specification if it is not worked to? Well, if you cannot work to it you must come to an explanation and see the reason, and if it is a fair reason why the rivets are not keeping this head then we must keep to the letter of the specification.
1385. *Professor Warren.*] You quoted Baker as to rivets acting as clamps, and no doubt they do act as clamps. What would be the action of rivets that are really loose, that you can knock from side to side? I say that rivet only fills a hole.
1386. But a rivet that you can fairly shake cannot act as a clamp? No.
1387. *Mr. Blacket.*] Did you have any rivets cut out? Oh, yes; scarcely a day passed during the erection but some were cut out.
1388. Do you know whether many of them showed signs of burning or heating? Many of them. That was a very common cause for cutting them out, because the head was burnt.
1389. The middle I mean (*rivet handed to witness*)? I am sure that the principal thing loose rivets teach you is that there is no shear going on.
1390. *President.*] That is to say there is an excess of rivets over those required? A very large excess.
1391. And a few that would be loose would not affect the strength of the bridge? The least possible shear would make those rivets tight. I say there is no shear going on where you find loose rivets.
1392. The effect of a section of the rivets always exceeding is to affect a section of the plates? Yes. But that is the principal lesson you learn from loose rivets—that there is no shear going on.
1393. *Mr. Courtney.*] At the time of the erection of the bridge did they heat the rivets with a rivet plate? No.
1394. *Professor Warren.*] They did not use a rivet plate? No.
1395. *Mr. Courtney.*] They were put in on the flat in the fire? On the flat in the fire. Riveting in the Colony is rather a loose way of going on. They have only one, two, or three rivets at the time, so that they can manage them with the tongs. I never yet found men who would do the work systematically.

FRIDAY, 6 MARCH, 1885.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. M'D. COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR OF
ENGINEERING,

OWEN BLACKET, Esq.

J. W. Drewett, Esq., Assistant Engineer, further examined:—

- J. W. Drewett, Esq., 1396. *President.*] You inspected the iron bridges on the Great Northern Railway with Mr. Wade and Mr. Russell? Yes.
- 6 Mar., 1885. 1397. In June, 1883? I think that was the date.
1398. And reported to the Engineer-in-Chief in July? Yes.
1399. You tested some of the rivets? Yes, a good many of them.
1400. And you found about one in twelve of those that were marked slightly loose; that is what you state in your report? Yes; but I must tell you that I consider these rivets, or most of them, had been loosened by the hammering they had received before they were marked as loose, because there were the marks of blows on the heads of most of those that were marked as being loose.
1401. You know that the paint is easily knocked off, and that this looks like a heavy blow? Oh, yes, the paint is easily knocked off, no doubt, but unless it were a heavy blow it would not make the indentation I saw on the rivets.
1402. On what proportion of rivets did you see those blows? There was a large number; I did not count them; there were said to be some 2,000 or 3,000 rivets.
1403. Not loose? Loose.
1404. You did not see anyone give those heavy blows to the rivets? No.
1405. It is only your impression? Only my impression from what I saw.

1406. You saw the badly butting joints in some of the plates in the top booms? Yes, I saw a few of J.W. Drewet them; there are a few that did not butt closely.

1407. To what do you attribute that? Well, I know it is a very difficult thing in punched plates to get them well one over the other, and the slightest discrepancy in the rivet holes would prevent them butting. The system of shearing or cutting those plates, which is done by a chalk line, generally speaking, is not exactly what you might term joiners' work.

1408. You do not consider that the strength of the bridge is affected at all by the butts being bad? No, certainly not. Of course it is better that the butts should close as nearly as possible, and they are always made to do so, but there may be a failure in a joint by the riveting together of a number of plates. Where five or six plates go together it is a very difficult thing to get the rivet holes exactly in the same position; I should think it was almost an impossibility.

1409. Do you remember seeing some double holes in some of the plates—two holes drilled side by side? No, I did not see anything of the kind.

1410. The rivet-head hid the second hole partly? You mean the rivet-hole is wrongly punched, or drilled in the wrong place?

1411. Yes? That happens sometimes, now and then.

1412. These were near those bad butts? Yes.

1413. Did you remark some of the joints of the cross-girders with the cross-plates in the bottom boom? Where they joined on to the main girder—yes.

1414. Some of them were loose or open? They were not loose; they were open here and there.

1415. Do you think that would affect the bridge in any way? I do not think it does. It is almost impossible to get those plates so as to have the side-plate almost perfectly straight. It is not like timber that you can work up to anything. You cannot get those plates in a dead line, and if one cross-girder happens to be a trifle longer than the rest there will be a slight gap. If one plate is cut too long and another too short, of course where the short one comes in, there will be a slight gap.

1416. But you think if all these joints had been close, and the butts closer than they are, that it would have been a better piece of work? Of course it would have been a better piece of work, no doubt; but that sort of thing is to be seen in every kind of bridge work. It is perfectly impossible to cut those long plates the exact lengths required, and it might not even depend on the length of those plates, but upon the side-plates being a little out of line.

1417. Your remarks with regard to the loose rivets equally apply to the bridges at Tamworth and the M'Donald River? Yes, I think so.

1418. About the same quantity of loose rivets as you mention? Yes, I think so. I think I noted that—about one in twelve.

1419. You seem to assert in your report that Mr. Cowdery gave directions for the rivets to be tested with a heavy hammer? Yes.*

1420. But have you any knowledge of that? I have nothing more than we have heard that it has been so reported, and I fancy you have the papers in which the manner of testing these rivets has been reported.

1421. But you do not know of your own knowledge how the testing of the rivets was carried out? No.

1422. You do not know the name of the person who has seen it? I only know from having heard.

1423. Have you had anything to do with the design of the bridges in the north? No, I have not had anything to do with the designing of those bridges. There have been a great many of those bridges made, and orders have been sent for similar bridges. They are all 150-feet span. I have merely made a small drawing of the required number of openings to be sent away; I have had nothing to do with them otherwise.

1424. *Professor Warren.*] How long were you on the bridge at Aberdeen? A couple of hours or more.

1425. And you examined both sides? Yes, there were three of us examining; I took the rivets, principally, while Messrs. Russell and Wade were taking levels. More than two hours—four hours I should say.

1426. You confined your attention principally to marked rivets? Yes, we only did that one bridge in the day; it must have taken us half a day.

1427. Did you notice on the marked rivets you found any signs of violence? I did on most of them.

1428. There appeared to be the marks of a heavy hammer? Yes, and some of them sideway blows.

1429. Not marks made with the dolly? Certainly not.

1430. And do you consider that only about one in twelve were loose? I do not consider there were any loose rivets; I consider they are a very good specimen of riveting in ironwork.

1431. But in the rivets that you say were not loose could you detect any vibration? There were a great many that were marked as loose that were not loose.

1432. Are those included in your one in twelve? Yes; we were very careful in testing them. If I had any doubt about a rivet being loose, I got one of my companions to test it. We tested four times over, each of us, and when Mr. Wade tested a rivet in another part of the bridge that appeared loose, he generally called us also. Of course there were some rivets, but very few, that were loose.

1433. Did you notice any blind holes in the lattice-bars—just over the lattice-bars in No. 1 and No. 3 spans—No. 1 span near Aberdeen? Yes, I think we noticed one or two blind holes.

1434. Did you say you did not notice any double holes? No; I did not examine the top booms.

1435. What do you think would be the effect of double holes in tension? I do not think in a large bridge like that with two or three double holes it would have any effect whatever.

1436. But suppose you have half a dozen or a dozen holes in one joint, what effect would it have in tension? It would weaken the tension.

1437. Do you consider that the Aberdeen bridge is a well fitted bridge—that the contact is good? I consider it a very fair specimen indeed.

1438. But you do not consider it as good as M'Donald River and Tamworth bridges, do you, as far as fitting is concerned? I rather think I give my preference to the Peel River bridge, from what I recollect of it.

1439. *Mr. Blacket.*] Just look at that rivet. (*Rivet handed to witness.*) Do you consider the head large or small for that sized rivet—I mean the amount of metal in the head? I think it is a tolerably fair size if the head were in the centre of the rivet.

1440.

* NOTE (on revision) :—With regard to my reply to question No. 1419 I can only account for the answer given by my not having properly heard the question, and in consequence of my being somewhat deaf. I have carefully gone over my report, and I find no such assertion made by me therein; and I feel satisfied I must have misapprehended the question put by the President. My answer to this question should have been: "I do not assert that Mr. Cowdery gave such instructions, but I understood they were tested in the manner described."

J.W. Drewett,
Esq.
6 Mar., 1885.

1440. Compare it with the other end—with the amount of metal in that? That is a little better. You are speaking of the iron here. (*Another rivet handed to witness.*) I do not call that a very good rivet.
1441. Do you consider those rivet heads are small? I consider that rivet (*a section of a rivet produced*) small.
1442. That is a sample of the rest of the riveting? It is small in comparison with the other.
1443. *President.*] Did you remark whether any of those badly-butting joints occurred in the portion that was sent riveted from England? I could scarcely tell that; the bridge had all been painted over, and I could not tell whether the joints were riveted together here in the colony. I did not look over it either, and I do not know how any person could very well.
1444. *Professor Warren.*] What about the angle iron covers? I mean where the two pieces are riveted together.
1445. *President.*] You can see by the different rivets? I did not remark it.
1446. The riveting is different at the joints made in the Colony? Yes.
1447. You were present at the testing of the bridge with Mr. Wade? Yes.
1448. Do you consider that the deflection you obtained there was satisfactory? Yes, highly satisfactory. I do not recollect what it was now, but I think it was about six-tenths of an inch thereabout.
1449. *Professor Warren.*] Suppose that in the joints—say an angle-iron cover, and of course where you have an angle-iron cover you have also boom-covers in these bridges—suppose that in an angle-iron cover you had several loose rivets—rivets that you could just feel move—would it make the joint much weaker? I do not think it would. I do not think it would affect the joint at all. I think it most unusual to rivet up bridge-work as you would a steam boiler.
1450. But would you not be more careful at the joints? If I were inspecting a work of that kind I would not admit loose rivets anywhere.
1451. You did not design the bridge? No.
1452. *President.*] Do you think it would be better to put the joints of a number of plates further apart than to have them as close as they are in the Aberdeen bridge? You mean lengthen the spaces between the joints?
1453. Yes? Well, I think they are pretty long now. I do not know what they are, but I think they must be from 12 to 13 or 14 feet in length.
1454. Do you think it would be better, for instance, to extend eight joints in plates of angle iron in the boom over 4 feet or 5 feet, if possible, than over 2 feet 6 inches? I cannot see what advantage there would be. Of course there is such a thing as having them too close together, but as long as you can get a couple of rivets in between, clear of the joints, it would appear to me to be space enough. I think the space now made is generally about a foot. I do not know what it is in the Aberdeen bridge. No, it cannot be a foot, because three plates would make 3 feet.
1455. *Professor Warren.*] What relationship should exist between the rivet area and the area of the plate (*sketch shown to witness*)? I cannot say.
1456. Should it be equal to it, do you think? Yes, I think so.

Mr. Thomas Parkinson, Railway Bridge Inspector, sworn and examined:—

Mr. T.
Parkinson.
6 Mar., 1885.

1457. *President.*] We want to ask you a few questions about the bridges at Tamworth and M'Donald River. Your name is Thomas Parkinson? Yes.
1458. You were Inspector of Bridges at Peel River and M'Donald River? Yes.
1459. Mr. Griffin was the engineer in charge? Yes.
1460. What was the nature of your duties? I had to see that the ironwork was properly fitted and that all the rivets filled the holes, and see the construction carried out according to the building. All the iron was fitted in England. Both those bridges were well fitted together; there were no alterations required in anything.
1461. What portion came out riveted from England? In the ironwork?
1462. What portion of the ironwork—the booms? Yes.
1463. In sections? Yes.
1464. In about what lengths? 20 feet to 26 feet.
1465. Did you remark any loose rivet in the portion that came out from England? No; there were none cut out, not in the construction in England; not that I remember; and I was there all the while.
1466. Who was the contractor for the erection of these bridges? Amos Brothers—A. and R. Amos; but the manager they had over the constructing of the ironwork was named Bennett, and he is dead.
1467. Do you remember the way in which the rivets were heated and put in; can you describe to us the method adopted in putting them in? They had a portable forge, and one man to hold the rivets, and one man carried them to them when they were hot enough, and put in the rivet on one side and held it up with the dolly.
1468. What do you mean by “when they were hot enough?” They were blown up with a coal fire.
1469. To what degree of heat;—was the rivet heated right through or only at the point? It was heated right through, and especially at the point.
1470. Were the rivets laid horizontally on the fire? Yes.
1471. Not put on a plate? Oh, dear no; fairly in the fire.
1472. Do you consider that on the whole the riveting was well done? I do. I do not consider there were half a dozen rivets but what I tried in both the bridges. I could not see every rivet put in, and for this reason: there were four or five sets of riveters at work. But I was always on the work.
1473. You tested them afterwards? I did.
1474. You have of course had some experience of riveting? I have seen a great deal of it. The first time I saw anything was in the south, upon Mr. Favil's contract at the Wollondilly, and I was afterwards foreman for Blunt and Williams at Sodwalls. My instructions verbally from Mr. Wade, when he was generally around the work, were that I was to see that the rivets were all full.
1475. Do you think if a loose rivet existed and you had to cut it to replace it, that you would loosen the adjoining rivets? That has been tried in several places, and I never found any loose but the one that has been cut out.
1476. You have not seen those bridges over the Peel River and M'Donald River since you were there as Inspector? No; I have been in Mudgee these three years. The last I saw of the bridges was when they were tested.

WEDNESDAY,

WEDNESDAY, 11 MARCH, 1885.

Present:—

G. A. MORELL, Esq., C.E., PRESIDENT.

W. D. M'COURTNEY, Esq., C.E.,

W. H. WARREN, Esq., PROFESSOR
OF ENGINEERING,

OWEN BLACKET, Esq.

John George Griffin, Esq., Ass. M.I.C.E., formerly District Engineer on the Great Northern Railway,
sworn and examined:—

1477. *President.*] I see by some returns sent to us by the Engineer-in-chief for Railways that you were in charge of the bridges over the Peel River and Peel-street (Tamworth), and the bridge over the M'Donald River? Yes.

1478. That was in —? It commenced in '79, and went on to '82, I think.

1479. The manufacturers of those bridges were Brettell and Co., and the contractors for the erection, A. & R. Amos? Yes.

1480. And J. S. Bennett was a kind of partner? No, he was not a partner; he worked under Messrs. Amos. He had not a sub-contract, but was merely their foreman. He is dead since.

1481. Who was your Inspector? Parkinson. He had the brickwork and the bridges at the same time—most of the bridges he inspected were built of timber. He is a timber man.

1482. Had you any other duties to perform in the Department of Railways, at that time, besides the superintendence of these bridges? I had the whole line to supervise—*i.e.*, the whole construction of the line—about 64 miles in length. I saw the bridges every week.

1483. Do you consider that Mr. Parkinson was a competent man to look after the riveting and other matters connected with the erection of these bridges? I have a little hesitation in answering that question. If I were to say he was an incompetent man I should do him an injustice because he was always a careful man, and I rarely ever found him away from the work, but whether he knew anything about riveting or about putting any large iron bridges together before he saw these particular bridges I do not know, and if he did not he was hardly the man to have charge of them. But at the same time I was instructed to employ him as such, and I had no power, nor did I see anything to induce me to act to the contrary.

1484. How often were you on the works in connection with your duties at these bridges? I think I saw the bridges every week. I was rarely away longer. I may sometimes have been a fortnight, but I am almost sure I saw them every week, and when anything important was being done I saw them more frequently.

1485. Were you satisfied with the quality of the work done by the contractors? So far as the contractors (A. & R. Amos) did their work for the erection of the bridges, I think they did their work well. Of course we had disputes now and then.

1486. Then you consider that these three bridges over Peel-street (Tamworth), Peel River, and M'Donald River have been erected in a satisfactory manner? Yes, three bridges. They were tested afterwards, and the result of the tests gave but a very slight deflection.

1487. But the workmanship or erection? Yes, I think so. I may tell you there were several little things we had to alter in the bridges when they came out. There were some small alterations necessary, and repairs needed; not only repairs but changes, especially in the wind bracing. I think A. & R. Amos did these repairs as well as the erection of the bridges.

1488. In a satisfactory manner? Yes. The concrete was all put in the cylinders where cylinders were used, and everything required by the specification carried out.

1489. The portion sent from England, which was manufactured in England, consisted of sections of booms—that is to say, the vertical plates attached to angle irons and other plates were in certain lengths, and the bracing separately? Yes, all iron girders were separate; I think the booms were separate. I cannot remember whether they were all the same lengths, but they were in parts capable of being shipped. A plan was sent with the bridges showing the position of each part as it had been fitted in the English contractor's workshop.

1490. Did you remark in the portion sent from home whether there were any loose rivets? Yes, there certainly were; we cut out a good many rivets.

1491. When you cut out any of those rivets did you remark if any of the joints were in close contact where you cut the rivets out? I think taking them as a whole they were fairly close. Had they not been we should have had to alter the plates. I think it might be said that the plates were fairly close. The joints were slightly joggled in one place.

1492. When you took out any rivet from any of the riveted portions that came from England did you remark whether it loosened other rivets adjoining? I think in the M'Donald River bridge, which was the worst of them all, it did. But as this occurred some time ago, I would not like to be too positive.

1493. What I want to get at is this: whether, when replacing any rivet, you loosened adjoining rivets? I do not think we did. In the M'Donald River bridge we found one or two passably loose, and when we cut them out we found one or two others which required to be cut out; but I do not know that this was owing to anything we did.

1494. Do you think the expansion and contraction caused by the traffic passing over the bridge is likely, in the course of time, to loosen the rivets? I do not think it ought; the bridge ought to be sufficiently strong to stand that. I may remark for your information that in the M'Donald River bridge in the wind bracing, which consists of diagonal ties under the bridge, the threads of the screws were very bad in some places, and would not bear turning. We had to take them out and replace them. There were some other defects besides. That bridge was undoubtedly the worst of the three, but I do not remember what those other defects were. I think, however, I wrote a report on the whole subject, and if I did that report must be in the office. I think there was something else defective besides the wind bracing and the riveting in that bridge.

1495. You had a specification to work from? No, we had not; we had only the general specification for the construction of the works. (*Specification handed to witness*)? I never saw this.

1496. You had only the drawings or tracings sent from home for the erection? Exactly; marked.

1497.

J. G.
Griffin,
Esq.

11 Mar., 1885.

- J. G. Griffin, Esq.
11 Mar., 1885.
1497. Then there must have been no conditions? The general specifications that the contractors were to put the bridge together in accordance with the drawings. The drawings showed exactly the position of every part, and they had not to do more than follow them. They would not be responsible if the bridge were defective through any cause before they reached them. The bridges were properly tested. We had very heavy testing—at first engines at speed, and then at slow time.
1498. You mean to say that the contractor was not responsible for defective workmanship in the work supplied to him from England? No, he was not.
1499. With regard to the test, it is stated in a return the Commission has had supplied to them that the total load on one span was equal to 174 tons brought on by three engines, the deflection being $\cdot 78 \cdot 72$ hundredths of a foot? Is that the permanent deflection?
1500. No, it is the test under this 174 tons? I forget. I know it was about three quarters of an inch, and it came back, I think, again to about a quarter of an inch.
1501. Did you consider that was satisfactory? Yes.
1502. Was there much vibration in the M'Donald River bridge at that time? I do not think so. I was not on the bridge. I did not stand on the M'Donald River bridge. On the Peel River bridge I did; and the engines were going over it at speed. I stayed on it as they passed over the bridge, and while they remained standing upon it. At the M'Donald River bridge I think I was at the testing apparatus below—a small clockwork arrangement, a hand and needle.
1503. What kind of apparatus is that? A wire is attached to the girder and above to a post driven into the bed of the river; on the post is fixed a small index, or dial with an index on it; and the movement of the girder as the weight goes over moves the wire which in turn moves the index on the dial, and gives the amount of deflection.
1504. How many testing apparatuses had you on each girder? I think we had only two on Peel River, and one at the M'Donald River bridge.
1505. In the centre? In the centre. On Peel River bridge we had two.
1506. *Professor Warren.*] One on each girder? One on each girder. I am not quite sure about M'Donald River.
1507. You had every rivet tested before the bridge was handed over? Every rivet was struck or ought to have been struck. I cannot say that I saw every one.
1508. What kind of hammer was used? The ordinary hammer used by fitters.
1509. And the rivets were found to be pretty generally tight? Yes, we had cut out those that were loose. Had we noticed anything different more would have been cut out.
1510. You have left the Department? Yes.
1511. *Mr. Courtney.*] In your visits there, can you call to mind how they heated the rivets—did they heat them with a rivet-plate or put them in altogether; it makes this difference—that in one case every rivet is white in the head, and if put on a rivet-plate so as not to burn them they are hot in the point but black in the neck? I think the rivets were heated throughout, but there was no particular plate used; it was done with the tongs and forge; the rivets were put in the forge, and heated on the bridge, as close as possible to the plates where they were required. Those were my instructions, and the rivets were heated throughout, so that the cooling should be uniform.
1512. *President.*] You have only been connected with these three bridges on the railways? I was connected with the line further on, but those were the only iron bridges I was concerned in.

THURSDAY, 2 APRIL, 1885.

Present:—

W. M'D. COURTNEY, Esq., C.E., IN THE CHAIR.

W. H. WARREN, Esq., PROFESSOR
OF ENGINEERING,

OWEN BLACKET, Esq.

W. B. Wade, Esq., Inspecting Engineer, further examined:—

- W. B. Wade, Esq.
2 April, 1885.
1513. *Mr. Courtney.*] We want to ask you some questions relative to the bridges on the Great Western Railway. You were on that line at the time the Wellington bridge was put up? Only when it was started; I handed over the works to Mr. Clark.
1514. Can you tell us if you were there when the foundations were put down? Yes.
1515. How did they turn out? Oh, just as they were expected.
1516. You had no difficulty in getting them to start sinking? No; they went pretty easy at first; when they got to the bottom they were all right.
1517. They bottomed on—what? Two bottomed on clay, and the remainder on shale.
1518. They got a little out of range in going down? A little.
1519. That was not owing to any accident? No.
1520. I mean there were no broken slings? No.
1521. You are aware that they were doctored as regards plumb afterwards—that they came up crooked a bit—and were afterwards altered to bring them in as near as they could? I do not remember.
1522. *Professor Warren.*] The spans are different in the Wellington bridge; they are not all exactly alike? Well, I suppose that a Whitworth measuring apparatus would probably show that they were.
1523. Would you consider 2 feet a difference? I am sure they are not that; I think they are some number of inches—4 or 5.
1524. Did you know when the girders were cut that they were delivered on the site in order to go into the piers? No.
1525. They were not cut at all? They were not cut for that purpose. One of the girders was cut but not for that purpose. The bottom boom was not affected in the smallest degree, and if they were cut on account of the discrepancy of the length of the piers the bottom boom would be cut, and it was not.
