THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the present Session of Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, and the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, to whom was referred the duty of considering and reporting upon "the expediency of carrying out drainage works for the Western Suburbs, including the Boroughs of Alexandria, Ashfield, Balmain, Burwood, Camperdown, Darlington, Glebe, Macdonaldtown, Marrickville, Newtown, Petersham, Redfern, and Waterloo, with the Municipal Districts of Canterbury, Concord, Five Dock, Leichhardt, St. Peters, and Strathfield," have, after due inquiry, resolved that it is expedient the works should be carried out; and, in accordance with the provision of sub-section IV, of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

General description of proposed scheme.

1. The proposed scheme, so far as it has been referred by the Legislative Assembly to the Committee, provides for the main sewerage with outfall works of nineteen suburbs at a cost of £830,304. It forms a portion of a proposed complete scheme, and does not include the construction of subsidiary sewers; but the position of the main and branch sewers has been devised to facilitate the construction of the subsidiary sewers in such a manner as to avoid all unnecessary depths and expense. The principal object sought in the scheme is the removal of as much of the sewage as is practicable by gravitation, and to attain this end the situations and points of termination of the various sewers and sub-mains have been determined with a view to serve as large a gravitating area as possible. Some parts of the districts included in the scheme—nearly 29 per cent. of the area—are, however, too low to admit of their being drained by a gravitating system, and the requirements of those parts will be met by means of low-level sewers and branches, which will be emptied by means of pumping machinery or other mechanical power, the sewage being discharged into and carried off by the gravitating sewers. The localities included in the scheme which it is proposed to drain by gravitation are the high-level portions of the nineteen suburbs already mentioned. The low-level area, for which drainage is provided in the present scheme, is a portion of Marrickville and St. Peters. Darlington and part of Redfern possess recently-constructed sewers, which are now in operation, these sewers being branches of the Prince Alfred Hospital sewer; but, in other respects, these two boroughs come into the general scheme for the Western Suburbs.

Low-level areas.

2. In addition to the low-level area in the Borough of Marrickville, there are twenty-two other low-level areas in the Western Suburbs—two at the Glebe, three at Leichhardt, ten at Balmain, one at Ashfield, one at Five Dock, two at Burwood, one at Concord, and two at Strathfield. Provision has been made in the capacity of the main sewers and sub-mains for the removal of the sewage from the whole of the low-level areas; but, in the case of most of these localities, the existing conditions

do

do not demand the immediate construction of sewers, and where this is so, no provision for their drainage has been made in the estimate of the present scheme. The low-level system at Marrickville will necessitate the erection of a pumping station in Marrickville Valley, in the vicinity of Meek's Road; and central compressing stations under the Shone system will be required in connection with some of the low-level areas in other suburbs.

The proposed plan, and the area to be drained.

3. The drainage area of the scheme is 22 square miles, and the plan proposed for dealing with the sewage of this area comprises three systems of sewers, which, respectively, are designated the Northern, Southern, and Western systems. The Northern and Southern will serve an area of nearly 5 square miles, dealing with the Glebe, Leichhardt, and Balmain; Newtown, Camperdown, and Petersham; Darlington and Redfern; part of the city, Redfern, and Waterloo; Alexandria, Macdonaldtown, and Newtown; and these localities will be drained into the existing sewerage systems which discharge at Bondi and at the Sewage Farm, Webb's Grant, Botany. The Western area, embracing nearly 17 square miles, and dealing with Marrickville, Petersham, Newtown, and Leichhardt; Marrickville, St. Peters, Macdonaldtown, and Alexandria; Marrickville, Ashfield, Petersham, and Leichhardt; Ashfield, Burwood, Strathfield, Concord, and Five Dock; Canterbury, and Southern Slopes, it is proposed to drain by an entirely new system discharging at the Sewage Farm, Webb's Grant, Botany.

The new sewers.

4. The proposed new works comprise,—

(1.) A main intercepting sewer and branches from Newtown Road and George-street West through The Glebe, Leichhardt, and Balmain, for the area which will be found coloured purple on plan No. III accompanying this Report.

(2.) An extension of the Prince Alfred Hospital sewer through Camperdown to Liberty-street, Petersham.

(3.) A main intercepting sewer and branches from the southern outfall sewer at Alexandria through Macdonaldtown to Wilson-street, Newtown, for the area coloured green on the plan.

(4.) An outfall sewer for the Western Branch sewers from the outfall at Webb's Grant to Marrickville, a distance of 2 miles 380 yards.

(5.) An eastern intercepting sewer and branches from Marrickville to Leichhardt, for the drainage of parts of Marrickville, St. Peters, Newtown, Macdonaldtown, Alexandria, Petersham, Leichhardt, and Camperdown, as coloured yellow on the plan. This includes a low-level system for Marrickville Valley and St. Peters.

(6.) A northern intercepting sewer and branches for the western parts of Marrickville, Petersham, and Leichhardt, as shown in red colour on the plan.

(7.) A western intercepting sewer and branches from Marrickville and Strathfield, for the drainage of Burwood and parts of Ashfield, Five Dock, Concord, and Strathfield, as shown by blue colour on the plan.

The additional area required at Webb's Grant.

5. It is proposed to resume about 250 acres of land near Webb's Grant, Botany, as edged green on plan No. III, for the future disposal and purification of the sewage by means of filtration and irrigation, and to construct the necessary outfall works and carriers thereon.

Description of the sewers.

6. The scheme generally has been designed, its author explains, with a view to the sewers being laid in straight lines as far as practicable, and at a sufficient depth to drain the lowest part of the adjacent premises. The main intercepting sewers are oviform, with the narrow part at the bottom, this form giving the greatest hydraulic mean depth, and consequently the greatest velocity or scouring power during the periods of minimum dry-weather flow. The areas and gradients, together with steps at the intersections, are so regulated as to ensure self-cleansing and to carry off effectively the maximum quantity of sewage and rainfall. Due provision is made by shafts for inspection and ventilation, also for storm-water overflows, for automatic flushing tanks or chambers, and for air-flaps.

7. The cost of the works, including land and compensation, is estimated as follows:— Cost of the works.

		£	£
Northern System—Main sewer		75,518	
Sub-mains		70,376	
Camperdown branch		12,454	
			158,348
Southern System—Main sewer		10,289	
Sub-mains		2,856	
			13,145
Western System—Outfall sewer		190,557	
Eastern high-level main sewer		56,690	
„ sub-mains		27,530	
„ low-level main sewers		62,076	
„ „ sub-mains		16,217	
Northern main sewer...		65,776	
„ sub-mains		20,434	
Western main sewer		133,001	
„ sub-mains		29,930	
			602,211
Marrickville pumping station (including duplicate engines, boilers, penstocks, buildings, &c., complete)			11,000
Outfall works (including additional land and laying out first section of Sewage Farm)			45,600
	Total		£830,304

8. This amount of £830,304, as already intimated, is only a portion of the cost of the entire scheme. There are works, consisting of the northern and southern outfall sewers, already executed or nearing completion, a proportionate part of the cost of which must be charged to the Western Suburbs, and that proportion of the cost is set down at £274,000. Then there is what is described as the first section of additional works which it is proposed shall follow the works comprised in the amount of £830,304, and these additional works will cost £340,741. Further additional or subsequent works will cost £372,851, and thus an estimate of the cost of a complete scheme, providing for every contingency, is made, amounting to £1,817,896. With the complete scheme, however, the Committee have nothing to do, except incidentally. It has been necessary for them to take evidence to a large extent on the entire scheme, because ultimately the entire scheme will have to be carried out, and on the scheme as a whole must be calculated the sewerage rate which the residents of the Western Suburbs will eventually have to pay. With the scheme as referred to them by the Legislative Assembly the Committee have, however, more immediately to do. Cost of the entire scheme.

9. In the consideration which they have given to the proposed works referred to them, the Committee have had before them very complete information. The author of the scheme is Mr. G. H. Stayton, M. Inst. C.E., an engineer of considerable English experience, who for some years, and until recently, was connected with the Sewerage Branch of the Department of Roads and Bridges in this Colony, and who devised the works which are to be carried out for the drainage of North Shore and Manly. After a close personal investigation of the suburbs, covering a period of nearly two years, Mr. Stayton produced an elaborate and comprehensive report, with accompanying plans, in which the scheme for the effectual drainage of the Western Suburbs, as it has been before the Committee, was carefully explained; and this report with its plans has formed one of the principal features of the Committee's inquiry. The report has been laid before Parliament, and has been distributed amongst the Borough Councils of the suburbs affected by the proposed drainage scheme, and it has been issued to the Press. Those chiefly concerned with its recommendations are, consequently, not unfamiliar with them; and as the document was made public in the early part of last year there has been ample time for all interested to examine the details of the scheme, and to be satisfied as to its value or otherwise. The information before the Committee.

10. In addition to having this report before them, the Committee have had Mr. Stayton and Mr. W. C. Bennett, late Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers (who concurs in Mr. Stayton's recommendations), under examination as witnesses; and were accompanied by them and other officers connected with sewerage works on visits of inspection to Webb's Grant, Botany, the locality Witnesses examined by the Committee.

 where

where it is proposed to deposit a large part of the sewage from the suburbs which would be drained by the new system. The Committee have also examined, as witnesses, the Hon. H. N. MacLaurin, M.D., M.L.C., late Medical Adviser to the Government and President of the Board of Health, and Dr. J. Ashburton Thompson, Deputy Medical Adviser to the Government, as to the present unhealthy condition of the Western Suburbs, and the urgent necessity for a proper system of drainage as a preventive against the spread of disease and the existence of an abnormal rate of mortality. Mr. T. A. Coghlan, Government Statistician, has been examined with reference to the health statistics of the suburbs, and Mr. J. N. Oxley, superintendent of the Sewage Farm at Webb's Grant, in relation to the operations at present carried on there in the reception and disposal of sewage, and the probable effects from the increased quantity of sewage that would have to be dealt with under the proposed system. Furthermore, there have been before the Committee as witnesses representatives from every Borough or Municipal Council interested in the scheme, and the opinions of those in any way opposed to it have been ascertained, as well as the views of those in favour of it. It should also be mentioned that, in order to obtain any evidence of importance which might be available, apart from that given by persons summoned as witnesses by the Committee, an invitation to all who might be desirous of being examined with reference to the scheme to forward their names to the Secretary, was made by advertisement in the daily newspapers of Sydney.

Objections to the proposed scheme.

11. By the appendices to the evidence attached to this Report it will be noticed that some objections have been raised to the scheme by three gentlemen, one of whom favours a rival system for one of the boroughs included in the present proposals. Only one of these gentlemen was called as a witness. The ideas advanced by the two others have been very completely answered by Mr. Stayton, and, in the case of one, by the Borough Council immediately concerned.

Why all the low-level areas are not immediately dealt with.

12. It has already been stated that in devising the main sewers and sub-mains provision has been made in their capacity for the removal of the sewage from the whole of the low-level areas. The first areas to be dealt with, apart from Marrickville and St. Peters, are, in the engineer's opinion, at the Glebe, Leichhardt, and Balmain; the other low-lying localities can be provided for, from time to time, as may become necessary. It is considered prudent to postpone the full consideration of any such works until the gravitating sewers are complete and in operation, as under those conditions, it is pointed out, the actual requirements of each area can be better ascertained.

The provisions for storm-water.

13. Storm-water may cause considerable difficulty in any system of sewerage, and the subject has not been overlooked in the present proposals. Overflow weirs will carry off any excess of storm-water, or, if necessary, at some future time relief sewers can be provided, and the small quantity of sewage contained in storm-water so discharged into natural watercourses would be so greatly diluted, it is considered, as to render it perfectly unobjectionable. These provisions for storm-water would not be sufficient to prevent flooding in a portion of the Marrickville Valley, and for the effectual draining of that locality from any excess of storm-water, certain special works would have to be carried out. The same thing would probably be necessary in some other localities.

Points upon which the Committee elicited information.

14. In their examination of the report and plans and other documents before them, and of the various witnesses summoned to give evidence, the Committee have endeavoured to elicit information, and to come to a sound conclusion upon the following points :—

I. What the proposed scheme is in all its details.

II. What necessity there is for a drainage scheme for the Western Suburbs.

III. Whether the scheme is likely to meet the requirements of the suburbs proposed to be drained, and to prove generally satisfactory.

IV. Whether the cost of the proposed works has been accurately estimated, and is such as the population of the suburbs concerned can defray.

V. Whether there are any sound objections to the carrying out of the scheme.

15. These main points of the Committee's inquiry embrace a number of relative matters which also have been kept in prominent view, viz. :— Relative matters inquired into.

I. The details of the scheme.

(*a*) Whether Mr. Stayton's proposals are concurred in by the head of the Government Department with which Mr. Stayton was connected when the scheme was designed.

(*b*) Whether the details include everything likely to be required.

II. The necessity for a West Suburban Drainage Scheme.

(*a*) What is the present condition of the Western Suburbs in regard to drainage.

(*b*) What is the method at present adopted for the disposal of nightsoil.

(*c*) What is the condition of the Western Suburbs in relation to disease and death.

III. Whether the scheme will meet requirements and prove satisfactory.

(*a*) As to the comprehensiveness of the scheme in regard to the area it is proposed to drain.

(*b*) As to the style and capacity of the sewers.

(*c*) To what extent storm-water, as well as sewage, will be dealt with.

(*d*) How the sewage is to be disposed of.

(*e*) Whether the scheme, as a whole, presents any feature indicating that, though the proposed works may be beneficial to the population of the Western Suburbs, they are such as it is not in the interests of the people of the Colony generally to approve.

IV. The cost of the works.

(*a*) An examination of Mr. Stayton's figures, and the extent to which they are supported by others.

(*b*) The method proposed for paying the interest on the sum expended, and repaying the principal.

(*c*) The opinions of the Borough Councils upon the question of payment on the cost of the works.

(*d*) The cost to the ratepayers in the Western Suburbs in connection with the present method for disposing of nightsoil, and the difference between it and the rate that would be charged under the proposed sewerage system.

V. Objections to the scheme.

(*a*) The nature of the objections raised.

(*b*) Whether the objections are such as to justify the Committee in reporting against the scheme, or in recommending any modification.

16. One other important point which has engaged the attention of the Committee is whether the experiments which have been made recently in England to ascertain the effect of employing electricity as an agent for the purification of sewage are of such a character as to justify a postponement of the whole or any portion of the proposed works until further information on the subject of electrolysis has been obtained. Electrolysis.

17. The evidence and appendices, including plans, which have been before the Committee will show that the details of the scheme as prepared by Mr. Stayton are very fully explained. Mr. Stayton's report describes the proposed works minutely; the accompanying plans illustrate in a clear and accurate manner the localities affected by the scheme, and the routes and areas to be drained by the proposed sewers; and the evidence obtained from Mr. Stayton, Mr. W. C. Bennett, and other witnesses who have been examined, supplements anything which the documents and plans before the Committee may in any respect have left incomplete. That the late head of the department in which Mr. Stayton was employed by the Government when he formulated his scheme entirely concurs in his proposals, will be seen from a memorandum written by Mr. W. C. Bennett at the date of forwarding Mr. Stayton's report to the Secretary for Public Works, and from his evidence before the The evidence, &c., with regard to the details of the scheme. Concurrence of the Engineer-in-Chief in Mr. Stayton's proposals.

the Committee. In the memorandum referred to Mr. Bennett writes: "He" (Mr. Stayton) "has conferred with me from time to time, and I have studied the case sufficiently to enable me to concur in all his recommendations." In his evidence he states that he has superintended the preparation of the plans, he has devoted considerable attention to the project, and the work has been done by Mr. Stayton under his (Mr. Bennett's) particular surveillance. The other point in relation to the details of the scheme—as to whether they include everything likely to be required for the effectual drainage of the Western Suburbs—will be found satisfactorily answered in both Mr. Stayton's report and the evidence generally, keeping in view, of course, the fact that the works proposed, and under immediate consideration, consist of main sewers only.

Whether the scheme includes everything likely to be required.

The evidence as to the necessity for a West Suburban Drainage Scheme.

18. As to the necessity for a drainage scheme for the Western Suburbs the evidence is overwhelming. Mr. Stayton, in his report, says the existing sanitary condition of these suburbs is most unsatisfactory, that glaring sanitary defects exist in nearly every municipality, and that great inconveniences and nuisances are occasioned. The method in which the land has been laid out for building purposes has been conducive to the soil becoming "charged with filth and fever-poison," and the evils arising from this state of things are becoming aggravated by additional surface drainage as a consequence of the increase in population. Dr. MacLaurin states that during the period of his duties as Medical Adviser to the Government and President of the Board of Health his attention was especially drawn to the necessity for sanitary improvements in the Western Suburbs; and the necessity for proper drainage in those and other suburbs, in the interests of the health of the community, was a subject that had frequently been brought under the notice of the Board of Health. It will be seen also from the evidence of the municipal representatives of the different suburbs, who were summoned before the Committee, that the necessity for a proper drainage scheme for these suburbs cannot be denied, and that it is a matter of great urgency. There is, in the case of most of the suburbs, absolutely no system of drainage, and sewage in the form of house slops remains upon the surface of the soil in the vicinity of many of the houses, or sinks into and saturates it. In other instances there are open drains in which the drainage of populous localities frequently stagnates and becomes ill-smelling and pestiferous. Nightsoil is disposed of in a very unsatisfactory manner, and in addition to being the cause of considerable trouble to the Borough Councils is a source of very great danger to the health of the public. The method adopted for getting rid of it is in most instances to send it anywhere outside of the municipality disposing of it. Each municipality is actuated by one idea, which is to get the nightsoil outside its own boundaries, regardless of where it may be taken to afterwards. In this way the suburban municipalities have been a source of constant danger to each other, the only remedy for which, and this an ineffectual one, has been the passing by some of the Borough Councils of a by-law prohibiting the passage of nightsoil from other municipalities through their boroughs. The enforcement of such a by-law in some cases, it can easily be understood, may place the residents of a suburb in a position of insurmountable difficulty, and greatly aggravate the danger to health to which, in common with the residents of other suburbs, they are now exposed. This danger to health is undeniably very great. Dr. MacLaurin states there is no doubt that there has been more sickness in the suburbs than in the city of Sydney, and that the diseases are largely traceable to the bad drainage, particularly in the case of diseases of childhood. The statistics of typhoid also show that this fatal disease has been much more excessive in some of the suburbs than in Sydney, and it is "in all likelihood to be attributed," he says, "to the want of proper means of disposing of nightsoil." His evidence upon these matters will be found of much interest. "It is absolutely necessary," he urges, "that there should be some means of getting rid of the nightsoil from the suburbs. As long as we go on as we are the death-rate will increase. At present it is higher than it ought to be, and steps should be taken to reduce it; and the first step to be taken is to adopt some method of getting rid of the nightsoil." Further, he gives it as his opinion with regard to the proposed scheme, that if it were brought into existence "there can be no doubt there would be a decided reduction in the mortality, especially in the infant mortality, which is very high in the suburbs; and" he proceeds, "I think it would be money well laid out." Mr. T. A. Coghlan, Government Statistician, in a statement furnished to the Secretary for Public Works respecting the occurrence of specific febrile or zymotic

Condition of the Western Suburbs in regard to drainage.

Present method of disposing of nightsoil.

The condition of the Western Suburbs in disease and

zymotic diseases in the Western Suburbs, and published as an appendix to the evidence given before the Committee by Mr. J. Barling, Under Secretary for Public Works, says, in allusion to deaths from these diseases, that "although it may not be possible, even with the most complete sanitation, to save all these lives, there is ample evidence that an efficient sewerage scheme would have prevented the sacrifice of many lives, have saved much sickness, and have ensured a greater length of life to those who survived."

Evidence from private residents as to necessity for proper system of sewerage.

19. Evidence pointing quite as strongly to the necessity for a proper sewerage system is given by residents of the suburbs who are not connected with either the Government or the Borough Councils, and one statement, made by Mr. Charles Edward Pilcher, Q.C., a resident of the borough of Burwood, is both important and serious:—"Recently," he says, in referring to the present method of disposing of nightsoil, "they have begun to remove the nightsoil on a system which is very pernicious. It is what they call the interchangeable pan system, and it is extremely dangerous, because, although it gets rid of the offensive matter very completely, a pan may be in a house where there is typhoid one day, and next day brought to your own house, and so the typhoid germs are spread throughout the district."

Whether the scheme will meet requirements and prove satisfactory.

20. The third of the principal points kept in view by the Committee during the course of their inquiry—whether the scheme will meet requirements and prove satisfactory—is, in the opinion of the Committee, very clearly established. The scheme as it was specially referred to them, estimated to cost £830,304, provides for the construction of the main sewers necessary for the drainage of the Western Suburbs, mostly by gravitation. Other works, however, will be necessary for the drainage of the low-level areas, and for completing the scheme as a whole, so that a proper system shall be in operation throughout the Western Suburbs; and for these there is a supplementary estimate and statement by Mr. Stayton which, to a certain extent, have been under the consideration of the Committee, and will be laid with this Report before Parliament. This supplementary estimate amounts to £713,592, and is made up of £340,741 for what Mr. Stayton describes as "the first section of additional works," and £372,851 for subsequent works. The first section of additional works consists of 300 miles of subsidiary sewers, costing £300,000; the first part of a main sewer for Canterbury and Enfield, to cost £20,741; and a provision for the storm-water drainage of Marrickville, estimated to cost £20,000. The subsequent works comprise another 100 miles of subsidiary sewers, costing £100,000; the completion of the Canterbury and Enfield main sewer, at an expense of £65,410; the establishment of low-level systems which are to cost £119,650; the completion of the western outfall sewer, at a cost of £48,374; the completion of the Marrickville pumping station, costing £6,817; and the completion of the sewage farm at Webb's Grant, at a cost of £32,600. These proposed additional works, considered in connection with those included in the estimate of £830,304, and with works described by Mr. Stayton as "already executed or nearing completion," and meaning the northern and southern outfall sewers, which will be used for the drainage of some portions of the Western Suburbs, are declared by him "to provide for every contingency," and to include "all works which can possibly be foreseen at the present time." The total suburban area included in the scheme is 14,077 acres, and the existing population on that area is about 170,000 persons; but the scheme has been designed for a prospective population of 482,608 persons, which, at the present rate of increase, may be looked for in the Western Suburbs in from eighteen to twenty years. The comprehensiveness of the proposal is, therefore, quite apparent.

The comprehensiveness of the scheme.

Style and capacity of the sewers.

21. The style and capacity of the sewers appear to have been well designed. It has already been stated that the scheme generally has been planned with the object of the sewers being laid as far as practicable in straight lines, and at a sufficient depth to drain the lowest part of the adjacent premises; that the areas and gradients have been regulated so as to ensure self-cleansing and the carrying off effectively of the maximum quantity of sewage and rainfall; and that due provision has been made for inspection and ventilation and other necessary matters inseparable from an effective drainage system. In addition to this it has to be mentioned that the sewers will carry off the combined sewage and rainfall when flowing about three-quarters full, ample provision being made for the accommodation of an excess of storm-water. The capacity of the sewers will be such, it should also be noted, that several years must pass before the catchment area will be so great as to cause overcharging or back-flooding.

flooding. The greater part of the intercepting sewers and submains is intended to be in tunnel, the cost of which through ordinary sandstone or shale formations is said to be not greater than for moderately-deep open cuttings, and the inconvenience from the closing of streets while the work of excavation is in progress much less. The details in relation to each sewer will be found in Mr. Stayton's report.

Extent to which storm-water as well as sewage will be dealt with.

22. The extent to which storm-water as well as sewage will be dealt with is a matter of considerable importance. The scheme before the Committee is what is called the "partially separate system," by which, as Mr. Stayton explains, all sewage, and a limited portion of surface water, are removed; and this he considers, after a careful study of the question, the best method to adopt. "I have," he says, "no hesitation in recommending as the most practical, efficient, and economical remedy, a comprehensive scheme upon the 'partially separate' system." His report deals very fully with this question. The sewers, he explains, are intended not only for the removal of fœcal matter from water-closets, but for all kinds of liquid refuse, such as domestic slops and urine, together with the waste water from baths, sculleries, wash-houses, stables, dairies, and other premises; and, in addition to this, the scheme provides for the carrying off of the rain water from back yards and from a certain portion of the roofed surface of the houses. An excessive combination of rain water with sewage dilutes the sewage to a degree that injures it as a fertiliser, and the admission to the sewers of more than a certain proportion of the rainfall would necessitate the construction of larger sewers than are considered desirable; and therefore Mr. Stayton recommends that a certain catchment area should be allowed for back yards and for roofed surfaces, and that the other part of the rainfall should be conducted to the street channels, whence it would flow into storm-water drains or culverts, and be discharged into natural watercourses. All surface water from roads and streets is also to be excluded from the sewers. As a reason for admitting the rainfall from back yards, Mr. Stayton points out that "rainfall from paved yards is invariably more or less foul, and should therefore be admitted to the sewers. In fact," he proceeds to say, "it would materially help to scour out the house drains."

How the sewage will be disposed of.

23. The outflow from the sewers will be disposed of partly at Bondi, but chiefly at Webb's Grant, Botany, where there is what is termed a sewage farm. This locality is at present receiving the drainage that runs through what is known as the southern outfall sewer, which commences at Redfern, and passes through Waterloo, Alexandria, and a part of Botany, and then crosses Cook's River to the land upon which the sewage is discharged.

Methods of sewage disposal or treatment.

There appear to be four methods of sewage disposal or treatment, generally stated as follows:—

1. By discharge into the sea or into a tidal estuary or river, without treatment.
2. On land, by irrigation.
3. On land, by intermittent downward filtration.
4. By chemical treatment.

24. Each of these methods is good, and has in one place or another proved its value. But everything, Mr. Stayton points out in his report, "depends upon local conditions, or, in other words, every place must be dependent upon its own physical circumstances and requirements." In the case of the Western Suburbs the method of disposing of the sewage believed to be the best is on land, by irrigation, or, otherwise stated, by discharging it on the sewage farm at present at Webb's Grant, and on land which will be added to the present area now operated upon there. "Irrigation," Mr. Stayton says, "is not the universal mode of sewage purification, but where favourable conditions exist it is the cheapest and most efficient process, especially where sewage can be delivered by gravitation." These conditions are present in the case before the Committee. A warm climate is suitable for irrigation; the area of land at present available for this system is twice as large as is required for the existing population, and can be increased as it may be wanted, from time to time, and what it may be necessary to do in addition to the mere discharge of the sewage upon the land, as the population increases, can be done. So far as relates to the method recommended for disposing of the sewage and the area of land upon which it will be discharged the advantages of the system appear to be unquestionable.

The sanitary conditions and results attendant upon the disposal of the sewage at the Sewage Farm.

Then arises the question as to the sanitary conditions and results attendant upon such a process. Will the discharge of such a large quantity of sewage upon an area of land, however extensive, be in any way detrimental to public health or comfort? Is it likely to disseminate disease, or prove offensive to the residents in the immediate neighbourhood?

neighbourhood? The evidence before the Committee goes to show that it will not. Mr. Stayton's report deals minutely with the various provisions which it will be wise to introduce in order that the operations at the sewage farm may be entirely unobjectionable, and it is necessary here only to refer to the matter in general terms. The area of what is called Webb's Grant is at the present time 300 acres, and it is proposed to add 254 acres to it, part of the additional area being Government land and part land that will have to be purchased. The method of sewage disposal now adopted there is a combination of ordinary sewage irrigation and deep filtration, the solids in the sewage being slightly separated from the liquids by passing through screens, and the system has been found most successful. The soil or sand is particularly suited to the purification of sewage, and there is practically nothing in connection with the process which can be called a nuisance. This is both the tenor of the evidence, and the conclusion at which the Committee have arrived after visiting the farm and carefully inspecting the operations carried on there. The most valuable testimony upon the question as to whether the discharge of the sewage upon the land in this locality is likely to prove detrimental to health, apart from the statements of the engineers, is to be found in the evidence of Dr. MacLaurin and Dr. Ashburton Thompson. The former states that he has visited Webb's Grant, and gone into every part of it, and the system seemed to him to answer remarkably well. "There is practically," he says, "no nuisance there at all. Of course you can tell on examining the effluent water that it is the result of sewage, but there is no apparent nuisance about it. * * * There is a certain amount of smell if you go alongside the large open carrier for the sewage, but not very much." "I am sure," he replies to another question, "there is no nuisance at present, and I do not see any reason to suppose that there will be at any future time, because the water, as far as I could see, is absolutely free from any smell, though when you come to analyse it you can see that it has been sewage water." Nor does he see any danger in using sewage in connection with the growth of cattle food or vegetables. "There is not the slightest possible objection to it," he states, "because when it is turned into vegetable matter any noxious quality it may have had before must be gone." This is important in relation to the sale of vegetables or other produce that may be grown upon the sewage farm. Dr. MacLaurin is of opinion that "if sewage is properly treated on a sewage farm at a suitable place, it can be done without any nuisance or injury to the public health," and he does not think that a continuous deposit of sewage on the same piece of land for a number of years would destroy the absorbent and purifying qualities of the soil, because every year the vegetation would consume the greater part of the sewage deposited. Dr. Ashburton Thompson has very frequently visited Webb's Grant, and considers the system carried out there eminently satisfactory. The place, he thinks, is most favourable for sewage farming, and the climate also; and, as to the danger to the public health, "there is actually," he says, "no evidence whatever that sewage farms are hurtful to the health of neighbouring populations, even in places very much less fitted for sewage farms than is Webb's Grant." The process at the sewage farm he describes in this way: The fresh sewage, "which comes down rapidly, really has not very much smell of its own; it is only with putrefaction that it begins to smell. If it is run on to the sand within twenty-four hours of its production it will go into the soil practically odourless; then it is attacked by chemical processes and begins to be oxydised. It has not time to putrefy, that is to give off offensive gases, before it is altered into odourless compounds." As for vegetables grown upon the farm, he is of opinion that the things which are grown upon a sewage farm and are intended for human use should be those which require cooking before they can be eaten. Fodder for cattle thus grown, he says, is excellent, and quite devoid of harmful properties; but the danger to man, he points out, is from the mechanical adherence to vegetables of particles of sewage—"just a mechanical danger." Much of the evidence given by both these medical gentlemen, and that by Mr. J. N. Oxley, who is the superintendent of the Sewage Farm at Webb's Grant, bears in an important manner upon these matters, and is very favourable to the proposed system.

25. With regard to the area which will be available at the Sewage Farm, Mr. Stayton is of opinion that there will be more than sufficient land for a population of half a million. "In the first instance," he says, "it would only be necessary to gradually clear and prepare a portion of the land, and month by month and year by year,

Area available at the Sewage Farm.

year, as additional sewage was brought in by the new sewers, the area would be increased; but as far as we can see there is not the slightest doubt that the area, including the additional part, will be more than ample for many years to come; and then, if it should so happen that there is any difficulty in the question of disposal, it will be a simple matter to resort to some other mode of treating the additional volume of sewage—either by electricity, by a chemical process, or by continuing the outfall across George's River to the Pacific Ocean."

Sewage farms in England.

26. It should also be stated that the evidence before the Committee respecting sewage farms in England is to the effect that they have, from a sanitary point of view, proved successful.

Whether the scheme is such as to be objectionable to the general public.

27. In considering any scheme such as that under review it is wise to inquire whether, while it may be beneficial to the people immediately interested, it is of a kind likely to be objectionable to the general public, and this has not been lost sight of by the Committee. The manner in which extensive works such as those proposed for the Western Suburbs may affect the general public is chiefly in relation to the questions of cost and repayment, and whether the general body of the people will be burdened with the indebtedness brought about by making provision for what is principally for the benefit of a certain number. This important matter, it will be seen further on, is disposed of satisfactorily. The money required for the proposed works will have to be obtained by loan, and to that extent the public indebtedness of the Colony will be increased. But the interest, and, within a fixed period, the principal, will be paid by the residents of the Western Suburbs—the general public will not be called upon to contribute in any degree.

Examination of Mr. Stayton's figures as to the cost of the works.

28. The cost of the work, as at present proposed, is, as already mentioned, estimated at £830,304, and the complete scheme at £1,817,896. Mr. Stayton appears to have made his calculations with carefulness, and he has sworn to the correctness of his figures. In addition to this, his figures are confirmed by officers of the Sewerage Branch of the Department of Public Works, who have shared in the work of making the calculations or have checked them. The Committee have not thought it necessary to have the whole of the figures checked by a competent person outside the Department. To have handed the whole of the calculations to someone unconnected with the Department, with the intention that he should thoroughly examine and inquire into them, would have entailed upon that person the necessity to investigate the data upon which the calculations were made, and that would mean, if properly done, a labour for as long a period as Mr. Stayton was occupied in getting together the information upon which he based his report and made his estimates. There is no reason to doubt the accuracy of Mr. Stayton's figures, and in the opinion of the Committee it is quite sufficient to have them confirmed by other competent officers of the Sewerage Department. This has been done, and it is shown that Mr. Stayton's calculations and figures are substantially correct.

Method proposed for paying the interest and repaying the principal.

29. The method proposed for paying the interest on the sum expended and repaying the principal is that of charging a certain sewerage rate, which will be paid by the residents of the Western Suburbs. The rate has been calculated for each of two periods—for twenty-eight years, as provided for in the Metropolitan Water and Sewerage Act, 43 Vic. No. 32, and for a suggested extended period of sixty years, so that posterity may share the expense as well as experience the advantages of the proposed works. Should the works be carried out under the provisions of the existing Act, the annual payment to repay principal and interest, at 4 per cent. per annum, would amount to 6 per cent. on the sum expended, for a period of twenty-eight years, and this would mean an annual sewerage rate of 10½d., calculated on the amount necessary to construct, not only the works included in the £830,304, but the works already executed or nearing completion, costing £274,000, and the first section of additional works, to cost £340,741. Under the suggested amendment of the Act, the rate would be 8d., and with interest at 3½ per cent., for which possibly the money may be borrowed, it would be 7¼d. The sewerage rate chargeable upon the cost of the entire scheme when completed would be, under the existing Act, 9¼d., under the suggested amendment of the Act, at 4 per cent. interest, 7d., and with the interest at 3½ per cent., 6½d. The sewerage rate upon the cost of the works immediately before the Committee, £830,304, would be, under the existing Act, 6·68d., and under the extended period for repayment of the loan 5·12d., but as this deals with only a portion of the entire scheme, and the entire scheme must eventually be carried out, it is advisable that the people of the Western

The sewerage rate which will have to be paid.

Suburbs

Suburbs should understand what they ultimately will be called upon to pay, and that, as already stated, will be 7d. or 6½d. This rate will provide interest, repayment, and working expenses. Information in detail upon this subject will be found in Mr. Stayton's evidence, Questions 111–113, on pages 21–22 of his report, published as appendix C, and in appendices C1, C2, and C3.

Opinions of the Borough Councils as to the willingness of the residents to incur the expense.

30. In eliciting evidence respecting the sewerage rate that will have to be charged to meet the cost of the proposed works the Committee have been careful to obtain the opinions of the Borough Councils upon the willingness or otherwise of the residents of the Western Suburbs to incur the expense attendant upon the carrying out of the proposed drainage scheme, and from the statements made it may be said that the Borough Councils are practically unanimous in favouring the proposals, and that the scheme has the approval of a large majority, if not of the whole, of the residents. There is apparent in the evidence of the representatives of municipalities, and in that of private residents of the Western Suburbs, not only a distinct approval of the proposed works, but an earnest wish that they should be commenced and carried to completion with the least possible delay. The readiness to incur the responsibility of repaying the interest and principal by a fixed sewerage rate of the amount indicated is, however, accompanied by a desire that the period of repayment should be extended to sixty years. At present the ratepayers are charged for the removal of nightsoil a sum which shows that the proposed sewerage rate will not be a seriously additional burden, and any excess of cost will be counterbalanced by the greater cleanliness, comfort, and freedom from the risk of disease, which will be the immediate results of the new system.

The present charge for the removal of nightsoil compared with the proposed sewerage rate.

Nature of the objections raised to the scheme.

31. Some objections have been raised to the proposed scheme, but they are of the nature of rival schemes. It is remarkable that no one has come forward and challenged the soundness of the scheme referred to the Committee, apart from suggesting a system which it is thought might be better. It is noticeable also that these objections have come from only three persons, one of whom is opposed to the scheme so far as it relates to the suburb of Burwood; the second recommends a system—the Liernur system—which the Committee do not consider themselves in a position to recommend; and the other advocates a system which it is clearly shown does not, except in theory, exist in any part of the world. Only one of these three objectors was examined by the Committee. He advocates what is known as the separate system of sewerage, by which is meant a system that deals with the sewage and the rain water separately. The scheme before the Committee is the partially separate system, by which a portion of the rain water is admitted to the sewers. This partial admission of rain water is to be found, the evidence shows, even in cases where the system in operation is called the separate system; and an absolute separation of the sewage from the rain water could, in the opinion of the Committee, only be effected at an increased cost and with doubtful advantage. The witness' ideas upon the advantage of the system he recommends are replied to in a special paper by Mr. Stayton, which is published as an appendix to Mr. Stayton's evidence, and similar papers are included in the Appendix dealing with the schemes or systems recommended by the two other gentlemen who think that the proposals before the Committee might be improved by substituting for them something else. In the case of one of these gentlemen his recommendations are effectually dealt with by the Borough Council of Burwood declining to support them, and accepting the scheme of Mr. Stayton. The objections that have been raised are, therefore, not such as to justify the Committee in reporting against the scheme or in recommending any modification of it.

Experiments in electrolysis and the effect of the evidence on this subject.

32. The other point of importance which has engaged the attention of the Committee—whether the experiments in electrolysis have been such as to justify the Committee in recommending a postponement of the whole or any portion of the proposed works—is disposed of by the tenor of the evidence relating to this subject, which is that the process has not yet emerged from the stage of experiment, and is very expensive. The possibility of purifying the sewage by means of electricity was brought prominently under the notice of the Committee by a report of a recent visit made, at the instance of the Secretary for Public Works, by Professor Threlfall, of the University of Sydney, to some experimental works which are being carried on by Mr. William Webster, F.G.S., at Crossness, England, but the matter was mentioned in an early stage of the Committee's inquiry by Mr. Stayton and Mr. W. C. Bennett.

It would appear that almost simultaneous experiments in electrolysis were made by Mr. Webster, in England, and Mr. Roberts, of the Sewerage Branch of the Department of Roads and Bridges in Sydney, and the possibility of applying the process with advantage to the scheme for the drainage of the Western Suburbs became at once apparent. But, as already stated, and as will be seen from the very full information on the subject which will be found in the evidence and the Appendix, the experiments have not reached a point which would justify the Committee in recommending that the process should be introduced in the scheme under consideration. Electrolysis, shortly described, means the purification of the sewage outflow by the precipitation of the solid portion of the sewage, produced by electrical agency, and the question to be determined in connection with it is, as a leading professional paper, the *Engineer*, puts it, "whether an effluent, inoffensive to sight and smell, free from all secondary fermentation, exercising no precipitating action on the water of a river, and having no matters in suspension, can be produced at a reasonable cost." This question has not yet been satisfactorily answered. It is clearly established that electrical action can be applied to sewage with a purifying result, but it is not as satisfactorily shown that the process is a profitable one to adopt. In a paper published in the Appendix, it will be seen that Mr. Robert Hickson, the present head of the Sewerage Department in this Colony, states, that according to a calculation made by an officer of his department it would cost something like £300,000 extra to apply the system to the scheme for the drainage of the Western Suburbs.

Extra cost of applying electrolysis to the scheme for the Western Suburbs.

33. But while the Committee do not consider themselves to be in a position to recommend in this Report the application of the electrical process to the Western Suburbs Sewerage Scheme, they desire to point out that it may be advisable at some future time, when the experiments shall have reached a more advanced stage, and before the final completion of the works comprised in the entire scheme for the Western Suburbs, to introduce electrolysis as a means of purifying the sewage outflow. Where it would be of special advantage, supposing the cost of applying it to be reasonable, is in connection with the sewage from the low-level areas. But the time may arrive when it will be an advantage to apply it to the sewage outflow generally. When the population shall have increased so largely that the area of the sewage farm at Webb's grant is insufficient to receive and absorb the whole of the sewage, it will be necessary to apply some special process, either electrical or chemical, for the treatment of the sewage before anything is permitted to flow from the sewers, and at that time electrolysis may be the best process to employ. At present, the Committee do not make any recommendation in regard to it.

The conditions under which electrolysis, in connection with the Western Suburbs scheme, may be an advantage.

34. One other matter it is necessary to mention before bringing this report to a close. On page 26, and in question 683, of the evidence, it will be noticed that Mr. Stayton recommends an alternative scheme for the drainage of the eastern part of Leichhardt, and for Balmain. The Committee are not disposed to recommend that this alternative scheme be adopted. The best course to follow is, in their opinion, to adopt the original scheme which proposes that the borough of Balmain shall be drained by gravitation sewers, supplemented by the "Shone" system. Any special process which in the future may be considered necessary for the more effectual drainage of the low-level areas can be attended to.

Proposed alternative scheme for Balmain.

35. The final conclusion at which the Committee have arrived upon the scheme, as submitted to them by the Legislative Assembly, is expressed in the following resolution, which on Wednesday, 21st August, was moved by Mr. O'Sullivan, seconded by Mr. Trickett, and agreed to :—

The final resolution of the Committee.

> "That the Committee consider it expedient that the proposed drainage works for the Western Suburbs, as submitted to them by the Legislative Assembly, be carried out to the extent of the amount before the Committee, viz., £830,304."

J. P. ABBOTT,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
27th August, 1889.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

DRAINAGE WORKS FOR THE WESTERN SUBURBS.

FRIDAY, 7 DECEMBER, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.	JACOB GARRARD, Esq.
The Hon. WILLIAM HENRY SUTTOR.	ALEXANDER KETHEL, Esq.
The Hon. JAMES WATSON.	SYDNEY SMITH, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	THOMAS MICHAEL SLATTERY, Esq.
JOSEPH PALMER ABBOTT, Esq.	JOHN RENDELL STREET, Esq.
HENRY COPELAND, Esq.	DANIEL O'CONNOR, Esq.

The Committee proceeded to consider the proposed Drainage Works for the Western Suburbs.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and examined :—

J. Barling, Esq. 7 Dec., 1888.

1. *Chairman.*] You have considerable knowledge of the action proposed to be taken with reference to the drainage works for the western suburbs? Yes.

2. The term western suburbs I suppose includes all the boroughs? It includes Alexandria, Ashfield, Balmain, Burwood, Camperdown, Darlington, Glebe, Macdonaldtown, Marrickville, Newtown, Petersham, Redfern, Waterloo, Canterbury, Concord, Five Dock, Leichhardt, St. Peters, and Strathfield. Three of these municipalities however, viz., Darlington, Redfern, and Waterloo are not immediately affected, as outfall sewers for those districts have already been provided by the Government.

3. What is the approximate cost of the works? I have a statement here containing the whole of the information, which I will read :—

"This question has frequently occupied the attention of the Government during the past four or five years, and voluminous correspondence has taken place between the Department and the various boroughs and municipal councils. Joint deputations from the municipal authorities waited on Mr. Secretary Wright, in September, 1885, on Mr. Secretary Lyne, in August, 1886, and on the present Minister for Works, Mr. Sutherland, in August, 1887, urging the preparation of a main sewerage scheme. In July, 1886, on the strong recommendation of Mr. Bennett, the Commissioner for Roads and Engineer-in-Chief for Sewerage, Mr. Lyne appointed Mr. G. H. Stayton, M. Inst., C.E., to specially deal with the question, and in January last a comprehensive scheme was prepared by him and submitted to and approved by Mr. Bennett, who forwarded the report to Mr. Sutherland, the Minister for Works. The approximate cost of the works is £830,304. Copies of the report and plan were subsequently forwarded to the nineteen municipal councils interested. Up to the present time the following municipalities have expressed approval, viz. :—Ashfield, Burwood, Camperdown, Macdonaldtown, Marrickville, Newtown, St. Peters, Strathfield, and Leichhardt. I may also mention that yesterday, on the invitation of Mr. Sutherland, a conference, convened by circular, of the mayors and aldermen of the different Municipalities interested was held. We had a very large meeting. I think there were between thirty and forty mayors or aldermen and Members of Parliament interested in the districts, present, and the outcome of the meeting was that the following resolution was passed unanimously: 'That this conference of mayors and aldermen of the western metropolitan districts, after considering and discussing the proposed sewerage scheme of Messrs. Bennett and Stayton, approve of the same, and respectfully urge upon the Minister for Works the necessity of obtaining legislative powers for the early and simultaneous commencement of the work at different points.'" [*Vide Appendix A.*]

This resolution was moved by Mr. Frederick Walsh, Alderman of Leichhardt, and seconded by Mr. E. Dean, Mayor of Ashfield.

4. *Mr. Garrard.*] Have you a list of the municipalities represented at the meeting? I have not, but I think I could obtain it.

5. *Chairman.*] Are you aware whether any of the mayors are opposed to the scheme? I do not think I can say that there are any absolutely opposed to it.

6. You do not recollect whether the whole of the mayors of the municipalities were present? I am sure the whole of them were not present.

7. If there were any dissentients among the representatives of the municipal bodies you would probably be aware of the fact? Yes.

J. Barling, Esq. 7 Dec., 1888.

8. Has there been any correspondence between the Department and any municipalities opposed to the scheme? No; the only thing is that there was a rival scheme proposed by Mr. Cowdery, an engineer at Burwood, and affecting Burwood only.
9. If any correspondence of the kind that I suggest had taken place you would be cognizant of it? Yes. I am aware of the correspondence referring to Mr. Cowdery's scheme, but no other. Burwood has approved of the Government scheme.
10. As far as you are aware, then, there is no dissentient feeling among the municipalities? I cannot say positively, although I am pretty sure there is not.
11. The scheme has been proposed by the Roads Department, under Mr. Bennett? Yes. The total area included in the scheme comprises 14,077 acres. The existing population on that area is about 170,000, but the scheme is designed for a prospective population of 482,608 persons, and at the present rate of increase this will be realized in eighteen to twenty years. Of the total drainage area of 22 square miles, 5 square miles will be drained to Bondi and Webb's grant, by means of the recently constructed northern and southern outfall sewers, and 17 miles will be drained to the enlarged sewage farm at Botany by means of the proposed western outfall sewer shown on the plan.
12. We can obtain all that information from the professional officers? Very well. I should like in conclusion to say that Mr. Sutherland has taken great interest in this matter, and some correspondence has passed between the Department and the Government Statistician with the view of obtaining some statistics relating to health, and I should like, with the permission of the Committee, to hand in Mr. Coghlan's reply to the letter which was sent to him by the Minister. [*Vide Appendix* A 2.] There is also a sanitary map showing the deaths which have occurred from measles, scarlet fever, diphtheria, typhoid fever, cholera, diarrhœa, and dysentery; they are illustrated on the map in different colours. [*Vide Plan* No. 1.] There is also a diagram showing the death rate of the city and suburbs from 1870 to 1888. This diagram shows the much healthier state of the city as compared with the suburbs. [*Vide Plan* No. 2.]
13. Are there any other items of information you desire to submit? I think not, except a minute on suburban sewerage by Mr. Sutherland, and some information in reply to that minute from the Medical Adviser to the Government, which I now hand in to the Committee. [*Vide Appendix* A 1.]
14. *Mr. Garrard.*] Is there any report from the Health Officer in regard to the health of the city and suburbs? Yes, and I now hand it in, but the Health Officer will appear himself. We propose to call Dr. MacLaurin and Dr. Thompson.
15. *Mr. Copeland.*] I understood you to say that the death rate was greater in the suburbs than in the city? Yes.
16. But the diagram you have produced shows the reverse? If so there must be some mistake. Mr. Coghlan will explain that matter himself. It is his diagram, not mine.
17. *Mr. Garrard.*] Have you received from any municipality—the Balmain Municipality for example—a report antagonistic to the scheme? I do not think so.
18. Is it a fact that to each of the suburbs interested the Department has sent out plans and also a letter inviting their opinion upon the scheme? Yes, in January last.
19. Can you say how may direct replies have been sent—you have mentioned those who have given favourable replies? I think I am right in saying that there has not been one unfavourable reply.
20. Will you let the Committee know whether you have received a report from the Balmain Municipality? Yes; I will inquire and make certain.

William Christopher Bennett, Esq., M.I.C.E., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers, sworn, and examined:—

W. C. Bennett, Esq. 7 Dec., 1888.

21. *Chairman.*] You have superintended the preparation of the plans of the proposed drainage works for the western suburbs of Sydney? Yes.
22. You have devoted considerable attention to the project? Yes.
23. Has it been done under your special surveillance by some officer of the Department? It has been done by Mr. Stayton under my particular surveillance.
24. The proposed scheme is intended to provide sewerage works for the municipalities enumerated in the estimate? Yes; that is, Alexandria, Ashfield, Balmain, Burwood, Camperdown, Darlington, Glebe, Macdonaldtown, Marrickville, Newtown, Petersham, Redfern, and Waterloo, with the municipal districts of Canterbury, Concord, Five Dock, Leichhardt, St. Peters, and Strathfield.
25. What is the difference in the provision made in the case of the last mentioned municipalities—Canterbury, &c.;—is there a different system for them? No; the difference is only in the mode of description.
26. Which of these drainage works is it proposed to connect with the general sewer emptying at Bondi? Balmain, and part of Leichhardt, and the Glebe. The drainage of Macdonaldtown, Glebe, and Balmain goes to Shea's Creek, and empties into Botany.
27. Where will the other municipalities drain into? They will all be drained into a point near the Warren. The three sewers will converge there, and will be carried by a main sewer under Unwin's Hill and the railway across to the other end of Webb's Grant.
28. That is where you are now utilising the sewage from Shea's Creek? Yes.
29. And you propose emptying the sewage of these suburbs on to the same land? Yes.
30. Will you have sufficient space for that purpose? It is proposed to add to the land there.
31. What area have you now? 300 acres.
32. That is what is called Webb's Grant? Yes.
33. What area do you propose adding to it? 254 acres.
34. How do you propose to acquire the land;—is it Government land, or will it have to be purchased? Part of it is Government land and part of it will have to be purchased.
35. And do you propose to use the sewage in the same way as you are now using the sewage from Shea's Creek? Exactly in the same way.
36. That is by working it into the soil and using it for purposes of cultivation? Yes; it is a combination of ordinary sewerage irrigation and deep filtration.
37. Do you separate the solids from the liquids? Yes; they are slightly separated by passing through screens.
38. As far as your experience goes with reference to the treatment of the sewage at Webb's Grant, do you find it successful? Most successful.

39.

39. The nuisance is reduced to a minimum? Yes, and the soil or sand is particularly suited to the purification of the sewage; it absorbs a greater quantity than ordinary land will absorb.
40. It is an important feature in the work that the soil should be of a sandy porous nature—the same successful result will not attend the working in a clay soil? The results as far as crops are concerned would be a little more successful, but not with respect to absorption of sewage. The ground is much better suited for the absorption of sewage, though perhaps so large a profit may not be obtained from it at first as might be obtained from the clay soil.
41. Have there been any complaints from the people in the neighbourhood since you have been working at Webb's Grant? None that I have heard.
42. There is not much population—the place is somewhat isolated? It is.
43. It is not an island? It is very nearly an island—it is a peninsula.
44. Will the additional land proposed to be acquired join on to the land you already have? Yes, at the other end.
45. What crops do you grow there? Sorghum, and all sorts of vegetables, such as turnips, cabbages, and cauliflowers; also lucerne.
46. *Mr. Watson.*] Do the Government sell the vegetables? We have not grown them commercially, but experimentally.
47. *Chairman.*] Though you have not grown a considerable quantity you find the experiment a success? Yes.
48. And you utilize what otherwise would be a source of great danger to the whole community? Yes.
49. Have you sold any of the vegetables? I think some of them were sold to the men on the farm. The sorghum has been bought with great avidity by the dairyme , and so has the lucerne.
50. You grow lucerne too? Very favourably.
51. Then you think the same success which has attended your operations so far can be continued upon the additional land? Yes.
52. It is recognized, I believe, that in large populations this is one of the principal means of disposing of sewage? Yes; it is the great means where the local body can afford to purchase the land. Sending it to sea, and getting rid of it, is the best.
53. But it is not permitted in any populous part of the world that the sewage should be discharged into rivers, or creeks, or estuaries—it must be carried out to sea, or utilized? Yes.
54. In fact modern science points to these as to two means of disposing of sewage? Yes—either putting it into the sea or into the land.
55. You have not used any manure except the sewage? None.
56. That is quite sufficient for all purposes? Yes.
57. Then you regard the operation as a success? Yes, a great success.
58. How far are the works from Sydney? Six or seven miles.
59. Are they easy of access—could the Committee get to them easily? Yes, very easily. You have nothing to do after getting out of the tram at Botany except to walk about a quarter of a mile; the other end, of course, would be easier of access from the other side.
60. What quantity of land have you cultivated? Only a very small quantity.
61. An acre? Five or six acres.
62. I suppose sorghum would be the largest crop? Sorghum and lucerne. There is one fact, however, which tells against us, and that is that the great sewage crop at home—the Italian rye grass—we have been unable to cultivate so well as other things.
63. Have you tried perennial rye grass? I do not know. Mr. Oxley, who is down there, is much better acquainted with these matters than I am. At any rate we do not find the rye grass a success, although it is the great crop on sewage farms at home.
64. A successful crop here is perennial rye grass, but that is not, as far as I am aware, Italian rye grass;—have you tried the red clover? Not to any extent.
65. *Mr. Suttor.*] Rye grass requires a cool climate? We have tried it at all times. I was persistent about it with Mr. Oxley, because it is the great crop at home.
66. I suppose the work is carried on under the supervision of a gentleman who has had some experience in agriculture? Yes, the best man I could get—Mr. John Oxley; he is a man of high character, and can be thoroughly relied upon. He has spent all his life in farming. He is one of the best practical farmers I know. He is a little fond of theory and experiment; but that is the sort of man we wanted.
67. Have you kept any record of the produce per acre of the different crops? Returns have been prepared, and I can supply them to the Committee. [*Vide Appendix* B.]
68. It would be interesting to know what the production per acre has been under the combined influence of irrigation and sewage, for that is really what the system amounts to? I will have the information supplied.
69. What is the system of drainage that you propose;—are the drains of brick, or of iron? All the main ducts will be bricked oviformed sewers.
70. What will be the diameter of the main ducts? They vary. In the lower part they will be 5 feet by 4 feet.
71. What do you call the lower part—near the mouth? Near the mouth.
72. The larger ducts are there, I suppose? Yes. The outfall sewer will be 6 feet in diameter—that is, below the junction of the three main branches.
73. What will be about the length of the large duct of 6 feet diameter? 11,700 feet.
74. What will be about the diameter of the branches before they join the main sewer? They vary from 6 feet 10 inches by 5 feet 10 inches to 4 feet by 2 feet 8 inches.
75. About what depth will they be in the ground? Varying depths, according to the configuration of the country.
76. There will be means of access to the drains by means of manholes at different points? Yes, at every suitable point.
77. About what depth will they be? About 30 feet, or thereabouts.
78. I suppose every provision is made for purposes of sanitation—I mean that the ventilation will be sufficient to prevent danger to health? The necessary provision has been made for ventilation and for checking

W. C. Bennett, Esq. 7 Dec., 1888.

the flow of sewer gas into the sewer. There will have to be additional legislation to provide for proper ventilation. The provision for ventilation in the present sewers is only through the manhole grating at the surface of the street. When the proposed enactment is passed we intend to have elevated pipes attached to houses and trees and every possible place, and if necessary to have shafts in prominent places. This plan has been a great success in Adelaide.

79. In the construction of works of this sort ventilators are regarded as essential? Yes; if the sewers are not ventilated into the streets they will ventilate themselves through the connections into the houses.

80. And, therefore, are a source of danger? Very great danger.

81. Of course an approximate estimate has been prepared in your Department of the probable cost of the work? An estimate has been prepared by Mr. Stayton, assisted by some of the trained hands in the Department. So that we had both Mr. Stayton's experience and such experience as has been gained on the works here as to cost, &c.

82. *Mr. Copeland.*] With reference to the green crops grown on the farm—has there been any attempt to trace the results from feeding on those green crops in the shape of typhoid fever? There has been no attempt of the kind here, but at Home there have never been any injurious effects traced to such a source; there have been assertions, but the majority of the evidence goes to prove that the plants are perfectly innoxious.

83. What have you done with the crops? Mr. Oxley has sold them to the dairy-people about.

84. You are not aware whether there have been any symptoms of typhoid at the dairy-farms, or amongst the people who have used the milk? I am certain there have been none, or I should have heard of them.

85. There has been no special effort made to ascertain whether the fact is as I have suggested? There has not.

86. You have not heard any complaint either that cattle, or that individuals who have used the milk, have suffered from typhoid? No.

87. Have you grown any lettuce? Water-cress has been grown, but I am not aware whether lettuce has been grown or not.

88. Has the water-cress been sold? I do not think so.

89. *Mr. Street.*] Have you any experience to show whether the continuous use of this sewage matter will not, after a term of years, destroy all that absorbent character of the native soil, supposing it to be sand, that is now so very necessary for the destruction of the noxious matters in it? It will not; the more sewage that is put on to the land the more crops are grown; and if you keep continually cropping it you remove, in an innoxious way, the elements of the sewage matter which are absorbed by the plants.

90. Then you may continue using the same soil for an indefinite number of years? Yes.

91. *Mr. Suttor.*] I suppose the sewage matter is not poured on the living plants? No; it is poured into little drains running near them, and is absorbed by the roots.

92. Of course there can be danger in that way? No; the lucerne is sometimes flooded, but that is when a large quantity of rain comes down, so that the sewage is very much diluted. We have the lucerne beds made flat so as to turn flood-water on to them, and so that it will not have to be turned into the river; it is a sort of safety-valve, as it were.

93. What is about the height of the lucerne crops? I think about a foot.

George Henry Stayton, Esq., M.I.C.E., Engineer, Sewerage Branch, Department of Roads and Bridges, sworn, and examined:—

G. H. Stayton, Esq. 7 Dec., 1888.

94. *Chairman.*] You have been charged with the preparation of the drainage scheme for the western suburbs? I have.

95. Will you formally produce the information which has been placed upon the table;—I think you are the authority of most of it? I am. I now lay before the Committee a copy of the report [*vide Appendix* C] with plans [*vide Plan* No. 3] and sections of the proposed works.

96. You have made a survey of the whole area? I have made a close inspection of the entire district.

97. Both superficial and underground;—I mean that you have taken the bearings of the different sewers and branches of sewers? Yes, so far as was necessary.

98. In fact there is a drawing on the table showing the depth of the sewers at different points? Yes; that has been prepared in connection with the report.

99. Under your superintendence? Yes.

100. You have been engaged on this work for some time? Yes; it has taken very nearly two years to complete.

101. I think you told us before that you had had considerable experience of sewerage works at Home before you came to this country? Yes; in London, Portsmouth, Coventry, Ryde, and other places.

102. And you consider the project submitted to us a very desirable one for the country to adopt? I do.

103. It will provide for the complete drainage of the districts enumerated? Yes; it provides for the main sewerage of the nineteen boroughs mentioned in the report.

104. During the time that you have been carrying out these works I suppose you had to make many personal visits to the different parts? Yes; I had to make myself intimately acquainted with the whole of the area, both as to its physical conditions and requirements. When we first commenced to investigate the question there was no plan showing how the greater part of the suburbs were laid out, and the whole information which appears on the map accompanying the report had to be specially obtained for the purpose.

105. Did you communicate with any municipal officials during the time you were carrying on your investigations? Yes. But the chief communications I had with them had reference to obtaining certain information as to what sewers and what length of streets they had, the number of houses, the ratable value, and population, &c., of each municipality.

106. From your observation, did you come to the conclusion that they were, as a rule, favourable to the carrying out of the project? They are so undoubtedly. On several occasions, by deputation to various Ministers, municipal representatives have asked that the work should be carried out; and since the scheme has been prepared and has been considered by them, a majority of the Councils interested have signified their approval of it. None have informed the Department that they are opposed to it.

107. The gross estimate for carrying out the works amounts to £830,304, does it not? That is the gross estimate so far as the present scheme is concerned; but I have prepared certain information for the use of the Committee which will be found to have an important bearing on the general question. I therefore lay before the Committee an approximate statement showing what the ultimate outlay and annual cost will be in connection with the sewerage of the whole area of the western suburbs. [*Vide Appendix* C 1.]

108. Does that include a larger area than is provided for in the present scheme? It is for the same area; but the present scheme, as explained in the report, is for main sewerage and outfall works only. The figures now submitted relate to the completion of the entire scheme; everything necessary to bring it into operation.

109. That is to say that as the other portions of the area get populated, provision will be made for connecting them with the main sewerage system? Yes, but it also provides for present conditions. Here is a paper which I think will be very serviceable to the Committee on account of the information it contains. I do not know whether it should be read now or be regarded as an appendix. There are several supplementary papers which it is desirable should be considered.

110. You propose to hand those papers in as appendices to your evidence? Yes.

111. You had better hand them in formally, and they will be available at any time to refer to for information? The first supplementary paper is with reference to the ultimate estimated cost of completing the system of sewerage throughout the western suburbs. [*Vide Appendix* C 1.] It shows that the works already completed, in addition to the proposed works, which are divided into three sections, would result in an ultimate outlay of £1,817,896. The next statement shows the annual ratable value of the boroughs and districts comprising the western suburbs. [*Vide Appendix* C 2.] This has a very important bearing on the question. It shows that the ratable value, which in 1884 was £1,116,000, is now £1,700,000; and that on the completion of the first three sections, according to the present rate of increase, it would be at least £2,200,000; in which case a penny rate would produce £8,900 net. At the final completion of the entire scheme in (say) from 15 to 20 years time, when the population will be double or nearly treble what it was in 1887, the ratable value may be fairly estimated at £3,300,000, in which case a penny rate would produce £13,400 net. Then a statement follows as to the rate of interest, and it shows that money may be now borrowed at 3½ per cent. instead of 4 per cent., and it also shows what amount of rate would be charged. [*Vide Appendix* C 3.] Although the total sum looks enormous on paper, yet owing to the increase in the ratable value, the actual rate to be charged to the ratepayers throughout the whole district in 1894, after the first three sections of the work, involving an outlay of £1,445,000, have been completed, would only be 10½d. in the £ under the existing Act, and 8d. in the £ under the proposed amending Act. The Minister for Works informed a conference yesterday that the Government had practically decided to extend the term for repayment from 28 years to 60 years, so that instead of a 10½d. rate an 8d. rate would be sufficient to pay for the whole. Then when the entire scheme is carried out in from fifteen to twenty years' time the rate under the existing Act would be 9¼d.; whereas under the proposed amending Act it would be only 7d. If the interest were taken at 3½ per cent., which seems now to be the current rate for loans, the 8d. rate would be reduced to 7¼d., and the 7d. rate to 6½d. That would provide interest, repayment, and working expenses upon an outlay of £1,817,000.

112. That would be the gross expenditure to make the whole system complete? Yes.

113. That would be about a million sterling in addition to what is proposed at present? Yes. I have not enumerated the works because the Committee apparently wish to save time, but the particulars are set forth in the schedule. They are the works necessary to make the scheme complete. Against the items I have read there is an important set-off, that is to say, the cost of the disposal of the night-soil throughout the western suburbs at the present time. [*Vide Appendix* C 4.] I may say that in 1887 the number of occupied houses was about 34,000; in 1894, at the present rate of increase, that number will have increased to 44,000; and taking the small sum of 15s. per annum as the expense for each house—and I may say that the cost now varies from 13s. to 26s. and upwards—but taking 15s. annually, that would represent the equivalent of a rate of 3·70d. in the £ throughout the suburbs, or, in other words, the proposed works would create an extra rate of about 4½d. in the £ only beyond the present expense. A house rated at £50, at 8d. in the £, would have to pay £1 13s. 4d., and if the present charge of 15s. is deducted, it would simply mean 18s. 4d. extra per annum. So that although the outlay seems very large, still, when the circumstances demand such a large expenditure, the ratable value will have so increased that the rate will, in consequence, be very much smaller. The next paper to hand in is a reply to Mr. Henson's criticism on the scheme. [*Vide Appendix* C 5.] Mr. Henson is connected with the Water and Sewerage Board. He read a paper before the Engineering Association in September last, which raised various points, and it was thought sufficiently important, that Mr. Bennett referred the matter to me to prepare an official reply, in order that the Committee might have every information on the question. It is a complete refutation of all that has been asserted in opposition to the scheme.

114. By Mr. Henson only, or generally? It deals with Mr. Henson's objections and with the discussion that took place thereon. The next paper has reference to the reports and correspondence in connection with a proposed system of sewerage for Burwood. A counter scheme was prepared by Mr. Charles Cowdery and handed in to the Council, who forwarded it to the Minister for his consideration. [*Vide Appendix* C 6.] A report upon the scheme was prepared and considered by the Burwood Council, who disagreed entirely with the counter scheme, and approved of the present scheme.

115. Is the Mr. Cowdery you speak of the Engineer-in-Chief for Existing Lines of Railway? No, he is his brother. I may add that in each of these cases the type has been kept standing in order that if the Committee deemed it desirable the matter could be presented as an appendix to their report. The information which is given in the reply to the criticisms of Mr. Henson has a strong bearing upon the general question, and the paper contains even later information than the report which was prepared nearly a year ago.

116. You hand that in also? Yes, and there are sufficient copies struck off to supply all the members of the Committee at the present time.

117. Are there any other papers you would like to hand in, or any figures that would furnish the Committee with information that might help them? This plan of the low-level areas has been prepared [*vide* Plan No. 4.]; it is in addition to the plan attached to the report. The latter shows the present scheme. This one deals entirely with the low-level areas which are described on page 17 in the report. Out of the 13,628 acres, which comprise the western suburbs, 29 per cent. of that area is below what is termed the gravitation area, and will have to be provided for by pumping or other power. The portion coloured yellow on the lithographed plan shows the low-level area at Marrickville, where it is proposed to have a pumping station, and to raise the sewage by pumps to a height of 34 feet. The frontages round the harbour and along Cook's River are the places where the levels are too low to admit of gravitation, and where it is proposed to raise the sewage by means of the "Shone" automatic system. That is a system extensively adopted in England and on the Continent, and is making considerable headway. Under such circumstances as these it is cheaper than direct pumping.

G. H. Stayton, Esq. 7 Dec., 1888.

118. What is the nature of it? It is called the "pneumatic-ejector" system, and is worked by means of compressed air. The particulars are given on page 20 of the report. The estimated cost of the low-level system, which is included in the total of £1,817,000, is £119,650. Some sections would be required immediately the present scheme could be brought into operation, but the other portions might not actually be required for fifteen or twenty years to come. The supplemental estimate is believed to be ample to provide for every contingency that may arise, as far as can be foreseen, to make the sewerage of the whole area complete and effective.

THURSDAY, 13 *DECEMBER*, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.	JACOB GARRARD, Esq.
The Hon. WILLIAM HENRY SUTTOR.	ALEXANDER KETHEL, Esq.
The Hon. JAMES WATSON.	SYDNEY SMITH, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	THOMAS MICHAEL SLATTERY, Esq.
JOSEPH PALMER ABBOTT, Esq.	JOHN RENDELL STREET, Esq.
HENRY COPELAND, Esq.	DANIEL O'CONNOR, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

The Hon. Henry Norman MacLaurin, M.D., M.L.C., Medical Adviser to the Government and President of the Board of Health, sworn, and examined :—

Hon. H. N. MacLaurin, M.D., M.L.C. 13 Dec., 1888.

119. *Chairman.*] You have held your present position for a considerable time? For a little over three years.

120. During that time you have had brought under your notice the necessity for sanitary improvements in the city and suburbs? Yes; especially in connection with the western suburbs.

121. Have you been much impressed with the necessity for sanitary improvements? Yes; we have had a good deal of trouble in connection with it, and it has shown me the absolute necessity for something of the kind.

122. Has your attention been called to one portion of the suburbs more than another? The western suburbs chiefly. A great deal of trouble and inconvenience has arisen in the western suburbs from the want of proper means of disposing of night-soil.

123. Is it the case that certain infectious and contagious diseases have been found more prevalent in those localities than others? It is not very easy to make an exact comparison, but there is no doubt, as far as we can judge from the statistics, that there has been more sickness in the suburbs than in the city. I have been preparing a list for several years of the deaths from various causes in the Colony of New South Wales. As yet only that for 1884 is ready, but it can be taken as a specimen. Taking the deaths from these causes, in the city we find they are 1,845 per 100,000, while in the suburbs they are 2,208 per 100,000.

124. Do you find that these diseases are traceable to drainage more than to other causes? We have every reason to believe that bad drainage has a great deal to do with it, because first of all we find it is so very much shown in the case of diseases of childhood—children under five years of age, who are particularly liable to diseases arising from filth and improper disposition of night-soil. Take atrophy and debility, a disease of childhood,—in Sydney the death rate for this year was 157 per 100,000, and in the suburbs 239. So also with diarrhœa and dysentery—in Sydney, 126, and in the suburbs, 213. So also with enteritis, distinctly a disease of early childhood,—almost all the deaths occur under five years of age; in Sydney the rate is 56 per 100,000, and in the suburbs, 134 per 100,000.

125. What is the nature of this disease? It is a disease of the bowels in childhood.

126. Approaching the character of typhoid? Something like diarrhœa or dysentery; it is inflammation of the bowels.

127. Then, as to typhoid? There is a difficulty about typhoid for this particular year, which is the only year I have yet received from the printer, owing to the fact that Prince Alfred Hospital was not open that year, and a great number of people came in from the suburbs to the Sydney Hospital and died there, and so the rate of Sydney was increased. Here is a return for the first six months of the present year of the patients brought into the metropolitan hospitals for treatment. It must be understood that we have no means of knowing how many people are actually suffering from typhoid fever at any time; the only things we can find out are how many people are taken into the hospital and where they come from, and secondly, how many people die of typhoid fever; but from this we may form an estimate of the relative prevalence of the fever in different portions of the town. Taking the persons admitted into the hospitals, we find that from the city the rate was 8·9 per 10,000, from the north-western suburbs—Balmain, Leichhardt, and the Glebe —11·44, and from the western suburbs—such as Newtown, St. Peters, Camperdown, and Macdonaldtown—the rate ran up to 23·64, while from Redfern, Darlington, Alexandria, Waterloo, and Botany, it was 14·22. That shows a very considerable excess of this disease in those suburbs over the rate in Sydney, and that is in all likelihood to be attributed to the want of proper means of disposing of night-soil.

128. Then, from your experience you have come to the conclusion that there should be proper drainage in the different suburbs in the interests of the health of the community? There can be no doubt of it. It is a matter that has been frequently brought under the notice of the Board of Health.

129. Have you made recommendations officially? Yes; I made a recommendation some time ago to the Colonial Secretary. During the latter part of 1886 public attention was drawn to this question by numerous complaints caused by the burying of night-soil. A number of companies at that time communicated with the Board, and I prepared a minute for the Colonial Secretary, in which I recommended that the Manchester plan should be adopted.

130. *Mr. Garrard.*] Is that Sir James Farmer's process? It is Mantone, Alyott, and Fryer's process. I recommended that at the time, because I thought it could be introduced with the greatest ease and most quickly; and the Colonial Secretary accordingly summoned a meeting of the mayors of the different municipalities, and put the matter before them. However they did not care for this plan, and it was given up.

131. *Chairman.*] Has that plan been adopted by any municipality? No.

Hon. H. N. MacLaurin, M.D., M.L.C.
13 Dec., 1888.

132. We had it reported that the Municipality of Parramatta had adopted it? I do not think so; I do not know.
133. Have you seen the machinery in the Colony at all? There was machinery of the same kind, but not fully worked out. It was not effectual; it was not complete.
134. Sir James Farmer himself has been in the Colony, has he not? I do not know. The man I dealt with was Mr. Petherick, the engineer. When Mr. Stayton introduced his plan I withdrew the other, because on the whole there is no doubt that a system of water sewerage has certain advantages, although it does not get rid as the other plan does of household refuse, street sweepings, and the like.
135. Some professional men recommended the adoption of the duplicate system—a system of drainage for the sewage, and separate drainage for the rainwater? It is a very important thing to keep the storm-water separate from the sewage if you can.
136. However, I suppose that belongs to a different profession? Yes; that has more to do with the Engineering Department.
137. As far as the interests of health are concerned you have no hesitation in recommending the immediate adoption of some system of sewage? It is absolutely necessary that there should be some means of getting rid of the night-soil from the suburbs. As long as we go on as we are the death rate will increase. At present it is higher than it ought to be, and steps should be taken to reduce it; and the first step to be taken is to adopt some method of getting rid of the night-soil.
138. Even the present system in Sydney is not fully carried out? Not yet.
139. So the results you have in your returns would be based on the old system? Yes. Still it has been very much better in Sydney for many years past than in any of these suburbs, because there are no cess-pits nor huge accumulations of buried night-soil.
140. Do you know how they have been getting rid of their night-soil in the suburbs? Some have buried it; some have taken it into Cattanach's steamer, or into punts lying behind Pyrmont.
141. What are the regulations of the municipalities now with reference to night-soil? They make such by-laws as they think proper under the Nuisances Prevention Act which gives them authority to make by-laws or to combine to make joint by-laws. They generally contract with certain persons to remove the night soil, and they have several ways of doing it. Many of them have it taken either to Cattanach's steamer or the punt that is there, which is towed out to sea; or they can get Executive authority to set apart a place which is Gazetted as a depôt for night-soil, and they can bury the night-soil in that place till it is filled up.
142. Then there are certain regulations as to depth, I suppose, and as to covering with dry earth? It ought to be covered with dry earth, but it is exceedingly difficult to see that it is done. These regulations are entirely under the control of the municipalities themselves. In the case of one municipality, for example, they had a depôt for night-soil which they were believed to conduct in such a way as to be a nuisance to the people in the neighbourhood. When they were prosecuted they pleaded that it had been Gazetted, but it was found that they had Gazetted it themselves without any Executive authority at all. That shows that the matter is not very well understood.
143. Have you given your attention to the dry earth system? I have seen it in some places.
144. Is it your opinion that it has been carried out successfully? It can be carried out successfully in small places with a great deal of care and trouble. Then you have the difficulty of getting rid of all the urine and water of that sort.
145. That is to deodorise the fluid you require a much larger quantity of dry earth? Yes.
146. And I take it that the objection to dry-earth systems generally is that they do not use sufficient for the purpose? Yes, and it requires great trouble and care on the part of the persons using it, and, generally speaking, unless it is very well managed it is apt to cause a nuisance, especially where the population is large.
147. Then you think on the whole there is no better system than a complete system of sewage? I think it is the best system where it can be carried out, and where there is an abundant supply of water.
148. Have you given any attention to the use of sewage for purposes of fertilising? I have to a certain extent; it is a matter on which I hardly like to speak with authority.
149. Do you think, from your professional knowledge, that it would be quite safe to use sewage for the purpose of growing vegetables? Perfectly safe. There is a good deal of it being done on the sewage farm on the other side of the river.
150. And it is being largely resorted to in different parts of the world? Yes. We find that there is a considerable improvement in the water. The effluent water is very considerably deprived of its organic constituents, showing that a great deal of it has been absorbed.
151. Do you think the soil about Sydney being sandy is particularly adapted for disposing of sewage of that description,—say Webb's Grant? It seems to do very well.
152. You have inspected it? Yes; I have gone over it, and gone into every part of it, and had the water collected and analysed, and it seemed to me to answer remarkably well.
153. Is there any great nuisance about? There is practically no nuisance there at all. Of course, you can tell on examining the effluent water that it is the result of sewage, but there is no apparent nuisance about it. It would never do to let it go into water that is to be drunk, but going into a tidal stream where it is carried out to sea there is no nuisance. There is a certain amount of smell if you go alongside the large open carrier for the sewage, but not very much.
154. Is the tide at all active where the water is emptied into the bay? It percolates through the sand. There is a pretty good tide.
155. Sufficient to remove any nuisance? Yes.
156. You do not think there would be any nuisance or danger? I am sure there is no nuisance at present, and I do not see any reason to suppose that there will be at any future time, because the water, as far as I could see, is absolutely free from any smell; though when you come to analyse it you can see that it has been sewage water.
157. You are aware that under the proposed plan for disposing of the sewage of the western suburbs it is intended to deposit the bulk of it in the neighbourhood of some land adjoining the land now being used? That is the plan.
158. You do not think there would be any danger from that? No.
159. Have you seen any large sewage farms in other parts of the world? I have seen them, but it is a long time ago. It is a long time since I was in the neighbourhood of London or Edinburgh. 160.

Hon. H. N. MacLaurin, M.D., M.L.C.

13 Dec., 1888.

160. Have you seen them on the Continent at all? Not for a very long time.
161. I believe sewage is now being very largely used in the reproduction of vegetable food? Yes; there is not the slightest possible objection to it, because when it is turned into vegetable matter any noxious quality it may have had before must be gone.
162. Would that apply to all descriptions of vegetation,—of course cabbages or turnips, or anything of that description, would be cooked and their objectionable character would be limited;—but would it apply equally to salads or cress? The only objection to salads and cress is that you might possibly by accident have a direct application of sewage water to those things. That is perfectly irrespective of the fact that they had obtained growth from sewage; it would be an accidental contamination.
163. *Mr. Garrard.*] It could be removed by washing? Yes; I suppose so. Still, I think people would rather not take salads of that kind; cooking is more efficacious.
164. *Chairman.*] So far as you have given your attention to the subject, which do you think is the more desirable plan—to convey sewage to sea, or to utilize it in farms such as this? I think it is better to utilise it; it is a pity to see it lost.
165. In all largely populated places it is utilised? Wherever land is valuable, if sewage is to be got, it will be turned to account in that way. But it comes to be a question of expense. If sewage is properly treated in a sewage farm at a suitable place, it can be done without any nuisance or injury to the public health; and then it resolves itself mainly into the question what is the most profitable and convenient way of dealing with it. It does seem a pity to see valuable fertilising material thrown into the sea.
166. Have you given any attention to the large outlay proposed for this system? I see the calculations of Mr. Stayton in his report. It seems a pretty large sum—£830,000; I should hardly like to say anything about that.
167. I would like to have your opinion as a medical man—the head of your profession and the medical adviser to the Government—as to whether you think it would be desirable to undertake an expenditure of this sort in view of the advantages which in point of health would be gained by it? There can be no doubt that there would be a decided reduction in the mortality, especially in the infant mortality, which is very high in the suburbs; and I think it would be money well laid out.
168. *Mr. Copeland.*] Do you not think that a good deal of the sickness that you have spoken of in the suburbs is owing to the inefficiency of the water supply, quite as much as to the bad drainage? A water supply may be inefficient in two ways; first of all it may be defective, and secondly it may have been contaminated by night-soil in the neighbourhood. The very first benefit of removing the night-soil in this way is that it diminishes the risk of the water being contaminated at all. I have no doubt whatever that a great deal of this sickness arises from contamination of the water owing to the night-soil not being removed.
169. Therefore, giving the suburbs a better supply of water would, in all probability, remove a great proportion of the sickness? When you make perfectly certain that the water is quite pure you diminish the sickness, but where you have large stores of night-soil in the immediate neighbourhood it is exceedingly difficult to say how it gets into the water.
170. Speaking of the effluent water at the sewage farm, would there not be danger of the sand where the water percolates through becoming charged with noxious matter? I do not think so; there is no evidence of it just now and I do not think there will be any particular danger, because the water that comes through just now seems to have been so very much acted upon by the vegetation, that really one can hardly fancy there will be very much harm at all. There is a large space of ground which is as yet untouched.
171. Have you any knowledge of the areas that are generally attached to these sewage farms in other countries; do you think the area proposed here would be sufficient to absorb the large amount of sewage that would be available in the course of a few years? That is a matter I have not gone into; it is one that would require calculation. Judging from my recollection and speaking at hazard I think it would be quite sufficient for a very long time.
172. *Mr. Street.*] Do you think that a continuous deposit of sewage on the same piece of land for a number of years would destroy the absorbent and purifying qualities of the soil? I do not think it would, because the object of depositing the sewage there is to get it turned to account by vegetation.
173. You think then that the growth of crops from it in time would, as it were, recoup the qualities that are taken out of the native soil? I believe so. I believe that every year the vegetation would consume the greater part of the manure deposited there. The more manure deposited the more vegetation you would get.
174. We have it in evidence that a sandy soil is particularly adapted for a sewage farm of this nature as its absorbent character is peculiarly calculated to absorb all the excrement placed on it? A light soil of that sort seems to be the best; it enables the sewage matter to be most thoroughly taken up by the vegetation.
175. Do you not think the soil itself would become so charged with this sewage matter that it would cease to purify the sewage put upon it? I do not think the sand purifies the sewage itself; it is the vegetation which assimilates the organic matter. The advantage of the sandy soil is that, being so very porous it allows the sewage to be so thoroughly distributed throughout the whole of the soil, and so every little radicle of the plants is able more readily to absorb it.
176. *Mr. Campbell.*] I think you said you did not think any mischief would accrue by the use of vegetables grown on sewage farms? I do not think so.
177. You are aware that there is a strong objection to vegetables grown by Chinese gardeners by reason of the fertilising agents they are said to employ? I do not think there is any reason for that objection.
178. We know these fertilising agents are composed very largely of sewage? Quite so. I fancy that if people have a reasonable objection to vegetables grown by Chinamen it is because of the hands through which the vegetables pass; the Chinamen may not be very clean.
179. You do not think the fertilising agents they employ would make the vegetables objectionable? Not in the slightest degree.
180. *Mr. Garrard.*] You exclude from that assertion food such as salad? Where sewage is frequently distributed you must always bear in mind the possibility of accidental contamination. The mere fact that the salad is grown from a basis manured with sewage will not make it objectionable.
181. *Mr. Kethel.*] But does not the fact that the Chinese are reputed to be in the habit of watering their plants with a substance called "soup," of a very objectionable character, affect the Chinese vegetables? I do not think there can be any objection to liquid manure.

182.

182. Not when poured on the growing plant? Not if you get it down to the soil and the roots take it up. Of course one would not like to take lettuce after it.
183. *Mr. Garrard.*] Would you eat lettuce grown under such conditions? No; I do not think so.
184. *Mr. Suttor.*] You made some reference to a duplicate system to carry off rain water and sewage separately;—what objection is there to having a uniform system for carrying away both? I suppose you would require to have your drains considerably larger.
185. But from a sanitary point of view? I do not think there is any very great objection from a sanitary point of view, except that it is not a good thing to have your pipes larger than you require; there is a liability to stagnation, the evolution of gas, the difficulty of ventilation, &c. I think the objection is chiefly an engineering one.
186. Would it not be desirable occasionally to let the sewers be flushed by the heavy rainfalls? I think the objection is chiefly from an engineering point of view; except that it is always recommended that you should not have your drains too large for the daily work they have to perform.
187. Is there any danger of gases forming in these drains if they are too large? They say you are apt to get stagnation of the flow, and there is more room for the gases to develop; but I think the difficulty is chiefly from the point of view of the engineers. It is their business to arrange a system of drains so that they should be perfectly tight against the gas. We could tell what would be the evil result of any foul air escaping into the house, and it is the business of the engineer to tell us exactly the best way to prevent it.
188. I suppose you have studied the plans and seen how the escape of gas is provided for by ventilating shafts? It seems to me, from what I can tell, though it is of course a question for the engineers, that I would rather support the plan of Mr. Stayton, as adopted here, providing for the sewage by his drains and by the stormwater in another way.
189. *Mr. Copeland.*] Is it not a fact that some of these cases of typhoid have been traced to milk There is no doubt whatever that there was a very considerable outbreak of typhoid at Leichhardt which was traced to a dairy. That was the first case inquired into carefully in this country, and there can be no doubt of it.
190. I suppose on these sewage farms there would be a considerable amount of lucerne and other green forage grown? Yes.
191. Do you think there is any danger of dairy cows becoming affected with typhoid through consuming green stuff grown with such a large proportion of sewage? I do not think so. In places where typhoid is propagated from milk it is not on account of the cow becoming affected with typhoid, but from the contamination of the milk after it is taken from the cow. It seems to be very liable to a great number of animal poisons of that kind, and the way it generally happens is this: that impure water is either used for washing the vessels, or is absolutely added to the milk by an unprincipled dairyman. That was actually the case at Leichhardt, as far as we could see; the well used by the dairyman was supplied with water which came from a cemetery; it appeared to drain from the cemetery in the direction of this well. In all probability it was the origin of the infection of the milk in that particular case. It is not like other diseases which seem to come from the cows themselves. In the case of typhoid, so far as we know at present, the infection is acquired by the milk after it has left the cow's body.
192. The cow itself does not become infected? The cow may be perfectly well, but after the milk is removed from the cow and placed in vessels it is liable to infection of this kind, which is generally got by the addition of impure water.
193. You would anticipate no bad results from the green stuff grown on sewage farms? None whatever.
194. *Chairman.*] Is not milk considered a very active agent in absorbing disease, flavours, or smells? Yes, an exceedingly active agent, and it absorbs even the poisonous matters of certain herbs.
195. *Mr. Copeland.*] You know that when cows have been fed with lucerne or Swedish turnips, the milk retains the flavour of the turnips or the lucerne? Yes, and the butter too. There can be no doubt that the milk gets flavoured to a certain extent by the food the cattle eat, but what I mean is that the kind of manure that is used for producing the food, so far as I know, does not produce any difference in the influence of the food upon the cow itself.
196. *Mr. Sydney Smith.*] How long is it since that case occurred at Leichhardt? I think it was in 1885; it was before the Dairies' Act was passed.
197. Are you aware that a good deal of the typhoid in many of the suburbs was owing to the water supply not being laid on to the suburbs? I believe that had a great deal to do with it. In administering the Dairies' Act, we have always, if possible, insisted on the water used by the dairymen being city water.
198. And that has, to a large extent, removed that cause of typhoid? I think the dairies are in a better state.
199. *Mr. Campbell.*] Would not the drinking of infected water by the cows affect the milk? I do not know; it would depend very much upon the nature of the infection. I do not suppose the cows would be allowed on the sewage farm, and so they would not have an opportunity of drinking the effluent water. The feed would be cut on the farm, and carried away.
200. The cows' milk is affected a good deal by what the cow eats or drinks? No doubt to a certain extent. Of course diarrhœa is a thing commonly caused by milk, and that milk has been affected by the kind of food the cow has been eating; that is perfectly well known, but I do not believe there is anything to show that a cow drinking water contaminated with typhoid fever germs, without suffering herself, would communicate the quality of typhoid fever to her own milk. I would not absolutely say that she would do nothing of the kind, but I do not think it has been proved that she would. Certainly by far the most common way in which milk gets contaminated is by the addition of water to it, either by washing the cans, &c., or by directly adding it to the milk.
201. *Mr. Street.*] It has been said that it may very likely be desirable at a future time to let out some portion of the sewage farm to fatten cattle for market;—do you think the consumption of the feed on the farm by the cattle would be injurious to the meat? I should not think so; as long as they did not get actual disease, I do not think the meat would be affected at all.
202. *Mr. Garrard.*] The only danger would be the possibility of their getting at the effluent water? Well, it would be very difficult to say; the water might upset them, but it would depend very much upon the condition in which it was. It would be very difficult for them to get the water because it really percolates through the sand.

Hon. H. N. MacLaurin, M.D., M.L.C. 13 Dec., 1888.

203. *Mr. Street.*] You do not see any danger in their consuming the feed on the ground? I do not think it would injure them at all providing they were healthy cattle not affected with disease, but it would not be wise, I think, to feed milking cows on the place.
204. *Mr. Sydney Smith.*] Have you inspected many dairies in the suburbs since the new Act came into force? I have inspected some myself, and the officers of the Board have inspected all the dairies in the neighbourhood over and over again.
205. Do you find any improvement in them now? Yes; there has been a very great improvement under better supervision, and the municipalities have taken immense pains in the matter. I do not think there are any cases now like the one I mentioned.

George Henry Stayton, Esq., M.I.C.E., Engineer, Sewerage Branch, Department of Roads and Bridges, sworn and further examined:—

G. H. Stayton, Esq. 13 Dec., 1888.

206. *Chairman.*] You wish to put in some documents? Yes. The Committee asked for any supplementary information which it might be useful for them to consider before the examination came on. I omitted then to put in a statement which was prepared in accordance with Mr. Sutherland's request, some three or four months since, with regard to the Liernur system of sewerage. There was an article in connection with Mr. Backhouse's letters, and as he will probably be examined, I think the information in this paper may be useful to the Committee.
207. What is the paper? It is a paper prepared by me dealing with the merits of the Liernur system. [*Vide Appendix* C 7.] The only other matter is a paper written some months since, criticising the Government scheme of sewerage. The Minister for Works sent it on, and Mr. Bennett sent it to me to prepare a memorandum. That memorandum was prepared, and submitted, and a minute was put on it, "The remarks herewith must be sent to the Public Works Committee for their information." That gives a great deal of information with respect to sewage farms and points likely to arise in connection with this inquiry. [*Vide Appendix* C 8.]
208. What was the original paper? It was an article in the *Herald.*
209. You put these in as additions to your evidence? Yes.

THURSDAY, 20 *DECEMBER,* 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL,	ALEXANDER KETHEL, Esq.
The Hon. WILLIAM HENRY SUTTOR.	SYDNEY SMITH, Esq.
The Hon. JAMES WATSON.	THOMAS MICHAEL SLATTERY, Esq.
HENRY COPELAND, Esq.	JOHN RENDELL STREET, Esq.
JACOB GARRARD, Esq.	DANIEL O'CONNOR, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

John Norton Oxley, Esq., Superintendent, Sewage Farm, Webb's Grant, sworn, and examined:—

J. N. Oxley, Esq. 20 Dec., 1888.

210. *Chairman.*] You are at present in charge of the sewage farm at Webb's Grant? Yes.
211. How long have you been in charge there? I was in charge four or five years ago; but latterly I have only been twelve months in charge—since the sewage works commenced.
212. How long is it since the sewage works were completed there? A little more than twelve months. I think it was in September, 1887.
213. The farming operations have been under your control since that period? Everything has been started since twelve months ago.
214. You are an old colonist, I think? Yes.
215. You have had a good deal to do with agricultural and pastoral pursuits in the Colony in your time? Pretty well.
216. Did you ever grow crops under a system of sewage before? Never with sewage.
217. You have with manure, of course? I have tried all kinds of manure.
218. You formerly lived at Kirkham, Camden;—your estate was there? Yes.
219. When you cultivated there, the principle of irrigation, I take it, was very little considered? I attempted a little irrigation scheme, but I found it was not wanted. It was all lucerne, and the lucerne roots went down to the very bottom and found their own nourishment.
220. To what depth do you suppose the lucerne roots would go down? Fourteen feet.
221. At Camden? Yes.
222. How far were you from the river? The Narellan Creek meandered through the alluvial land, so that no portion of the cultivated land was more than 20 or 30 chains from the water.
223. You think that the lucerne plants and others that were sown got nourishment from that source? Just so.
224. Did you ever grow other crops, such as those you are now growing at Webb's Grant? I used to grow cereals, maize, and sorghum.
225. With fairly good results? The result at Kirkham for sorghum was much better than I am getting now. I have grown as much as 80 tons to the acre.
226. That is without the sewage? Without sewage at all.
227. It was a rich river deposit? Rich black alluvial soil.
228. And with water percolating underneath? Yes.
229. You could not cultivate under those conditions where you are now, at Webb's Grant, without the advantage of sewage or manure? We could not cultivate at all. It is scarcely right to call it cultivation. It is pure sea-sand where we are now.
230. The soil in its natural state? It is pure sand, and these crops are merely growing upon 3 or 4 inches of soil deposited from the sewage.

231. Do you find that the sewage mixes well with the sand? No; it does not amalgamate with it at all. It is there; but a shower of rain will produce white sand again.
232. The nourishment will get into the soil? No doubt the nourishment is there; but the sand is pure silica, so sharp that the manure will not mix it.
233. But is not that the case also with the general run of the vegetable gardens about Botany? Yes; but they make an artificial top dressing with horse-manure and other things, which, in the course of a number of years, has decayed and become more or less alluvial. They would not venture to go where we are now. Where they are there is generally a flat bottom.
234. Peat, or something of that kind? Yes.
235. Do you not think that in course of time, with a continual accession of fluid and solid deposited by the sewage, this land will eventually become of the same character as the other? It will be a very long time first.
236. In the interim, you can produce fairly good crops? What you saw.
237. You do not require to do much better than that? I have cut those crops since you were there.
238. Which? The sorghum and the lucerne. The lucerne produced 55 cwt. for half an acre.
239. Since we were there? Since you were there—that crop that you saw growing.
240. And you got 55 cwt. from the last cutting? Yes; that was a month ago. We got 51 cwt. in November, and 55 cwt. in December.
241. That would be at the rate of 5 tons to the acre per month? Just so.
242. That would be about 60 tons per acre per annum? Yes; but you must not take it all the year round, because the winter crops are small.
243. Do you suffer from frosts there? No; but nevertheless the sand is so cold that vegetation does not go on during the winter.
244. That is the case everywhere; the cooler the season and the frosts, the less actual growth you get? Yes.
245. I should have thought that you would have very little frost there, and that you would get an even temperature? The atmosphere appears to be sufficiently warm; but the sand has not the ground-warmth that mould has.
246. But is not that warmth supplied in some degree by the sewage? I rather think it is just the opposite way. I think that possibly the application of so much sewage chills the ground.
247. What do you call those partitions you have in the building? Silt-pits.
248. Do you occasionally catch solid manure there? The only manure that we get out of them is manure that is too heavy, or supposed to be too heavy, to go through the syphon.
249. What would be the character of that manure? It consists principally of sand and rubbish; it would not be manure.
250. Night-soil? No. It is all kinds of heavy stuff—old rags, tin cans, and various things that come down the sewer that we would be afraid to let into the inlet well. It would go down and through the syphon, but it would not come up again by the outlet well, so it is better to intercept it and be on the safe side.
251. And how do you put that on to the ground? Cart it on like ordinary farmyard dung. It is simply taken there for convenience sake, and the farm cart distributes it and pitches it on as you would ordinary farmyard manure.
252. You were getting at the rate of 5 tons per acre per month in November and December? These last two months we have, of lucerne.
253. Can you form any approximate calculation of what you would get for the year? Well, we have only had two crops. I can scarcely tell.
254. You have not had experience enough to enable you to form an opinion? No; this is really the first crop that we have had.
255. What did you get from the sorghum? Twenty tons an acre.
256. But it was hardly ripe; the sorghum would have grown higher? It was as ripe as the cow-keepers will take it. It becomes too woody if it is any riper.
257. You were speaking of having cut very large crops at your place at Kirkham;—when you cut that crop of 80 tons to the acre I suppose it was much older? It was like sugar-cane—perfectly sweet, and past the flowering stage.
258. It had seeded? It was forming.
259. Was it sorghum saccharatum? No; the ordinary green sorghum.
260. It had not seeded? It was seeding. When I found that it had become sweet enough I put it in bundles, and stood them up on end in the stack yard for winter fodder.
261. Did you find that the animals ate it in that state? Yes. It was put through the machine and mixed with chaff.
262. Was it under cover? No.
263. Have you ever grown the English clovers—the large red or the white clover? I used to grow it many years ago, but it ran out.
264. Red clover is very profitable? Very profitable; but it seemed to exhaust the surface soil, and ran out. It simply disappeared.
265. Do you think that it is a plant that could be grown successfully under the influence of manure at Botany? I am sure clover could not.
266. It is too sandy? It is too sandy. I do not think the roots go deep enough.
267. Have you sufficient sewage to manure or fertilise a larger extent of land than you have under cultivation now? We are using the utmost quantity of land we can. We could not use another yard.
268. With your present supply of sewage? With the present supply.
269. Is it likely to increase? Of course. There are now nearly 1,600 houses. The district engineer estimates that I have the sewage of between 8,000 and 10,000 people running on to that farm, and the flow is between 250,000 and 300,000 gallons a day.
270. How many water-closets did you say? I do not know; there are more than 1,500 houses.
271. You have got the sewage of the water-closets attached to them? Whatever number of water-closets there may be; but we have gauged the flow in the city and upon my flumes, and I make it 250,000 gallons of liquid sewage a day running on to the farm at least.
272. That would consist in a large measure of ordinary water, the emptying of baths, and so forth? It is everything; every description of water. Sometimes it is full of vegetable matter and fat from the kitchens.

J. N. Oxley, Esq.
20 Dec., 1888.

273. You estimate that in the course of years you will have a much larger supply of sewage than you have now? It is increasing every week.
274. Do you know how far the water-sheds reach which drain into Shea's Creek? We start from the Victoria Barracks, and I suppose that there are 800 or 900 acres altogether to come in. Part of Marrickville will come in by and by.
275. That is very sparsely built upon at the present time? I don't know the locality.
276. When it is more thickly populated the sewage will become greater? Immensely so.
277. Do you think it desirable to augment your power of utilising that in growing crops? The men are now employed in adding from day to day to the cultivation area as required. We cannot do it all at once, because it blows away. The farm was finished four years ago, and whilst waiting for the sewage to come it all blew away, and had to be remade this year.
278. I suppose you have studied the system of sewage farming and irrigation and all that since you have had charge of the farm? I made it almost a profession when in Europe to thoroughly understand the system of irrigation.
279. You gave considerable attention to it in Europe? I went through every irrigation scheme I could find.
280. In what places did you find that irrigation was most successfully carried on? In Lombardy.
281. That is watered by the snow from the mountains? Yes, off the Alps. There are two or three systems; but this was the system that I thought the best.
282. That is the adaptation of the sewage of the nearest town? No; the laying out of the scheme—a perfectly level system. I believe that this is the system in use in India, though I have not seen it there. All the rice paddocks in Lombardy were like these, perfectly level.
283. How were they fertilised? With water.
284. Did they receive stimulants in the shape of manure of any sort? They may have manured them when they cultivated them.
285. I suppose that the irrigation system of eastern and western California had not grown up in your time? No; I do not know how they are managed. I saw only the European systems, and it struck me that all irrigation systems must be either contour-irrigation or perfectly level. In this case the flow is constant, and must be got rid of whether the crops require it or not, so every bed is impounded by a small bank, some 1 foot and some 2 feet high.
286. Did you visit any other places where irrigation was carried on? The south of France.
287. What was grown there—cereals? No, vegetables. That system was a perfectly level one, in rills. Everything was grown upon a little bank.
288. With small drains at the side? No; one drain running along the top of the paddock, and the water running from that between the rows of crop. The supply of water was not sufficient where I was to irrigate the whole paddock at once, and so they used to run one drain full and then stop it, and then run another full, instead of, as I do, covering the whole field with water.
289. Were they successful in growing crops? Immensely successful.
290. Were they grown for market purposes? Yes, and sent into the market every morning.
291. Did you study the nature of the manure? It was the ordinary town manure brought out and taken into the garden.
292. And watered by irrigation? Yes; the water was pumped into a large tank by a donkey.
293. Then you think you have all appliances to utilise the sewage as it increases? Quite so. I do not think it is possible that I will live to see that place swamped with sewage.
294. Have you heard of the intention of the Government to convey the sewage from the western suburbs to a point on the same neck of land further west? I have.
295. Do you think that the absorption there would be sufficient for the sewage that would be conveyed from the western suburbs? I should think quite. It is all the same kind of ground.
296. Do you think that in course of time it might be made profitable—made to give some return for the outlay? I can scarcely tell. If the quantity of sewage I receive were applied to good agricultural land it would fertilize 50 acres, and be profitable now, whereas I only use two.
297. The difficulty arises from the character of the soil? I am not prepared to say that it is any difficulty. It is a question for the city to say whether they are satisfied with a few acres of filtering beds *versus* a farm. It is simply a filter bed now, and it will be a filter bed to all time. It will never be a farm. The whole tongue of land will have to be reduced into proper level beds, and each one will be a filter bed. When it becomes foul it will be more profitable to put a crop on it and cut the crop off, and sell it, than to take the manure off and throw it away. It may pay its way so.
298. Have you tried any other crops there besides sorghum and lucerne? We have grown various kinds of vegetables.
299. Cabbages? Immense quantities of cabbages. They grow very well. Turnips, peas, and all the vegetable crops seem to grow very well.
300. Under the agency of liquid manure, could you not produce them at all times of the year? They are a winter crop. We cannot grow them in the summer; we have tried. The little miserable lot you saw was an experiment. They will not grow at all in the summer, but when the winter sets in they will grow almost without irrigation. The land being flooded all this time leaves a good deposit, and if you dig it up and put in cabbages they will grow on it.
301. *Mr. Copeland.*] Can you say what proportion of solid matter is contained in the sewage? I have not the least idea. It all comes down, with the exception of a very small quantity of solids, in solution. Crude sewage flows right on to the ground.
302. Do you know that the effluent water becomes clear, becomes filtered by passing through this coarse sand that you speak of? It becomes perfectly bright.
303. I suppose that is evidence that whatever solid matter is contained in the sewage must be absorbed and retained in the sandy soil? Not in it. It does not appear to go into it. It remains on top as a thin skin.
304. The sand forms a sieve, as it were? It is. If you let the thickest sewage matter we can get on to a sand-bed there, in twenty-four hours you could take it all up and leave the sand-bed clean.
305. Do you not think that in course of time the finer particles will sink in and become absorbed in the sub-soil?

sub-soil? I am not prepared to say. It has not been found so. The oldest sewage farm is at Edinburgh, and that is not more than 3 inches deep.
306. Is that sand also? It is the same as this, I am told. I have never seen it.
307. I suppose that when this land is surcharged with sewage it becomes the same as undrained land? We do not allow it to be surcharged. It must not be allowed. I can stop any one of the filtering beds by overdoing it.
308. I understood you to say that there was too much sewage and that it made the land cold? Yes; but the moment the sewage is off, it is dry land. It goes down to a certain stratum and passes away in the shape of effluent into the sea.
309. There is no sub-soil? Not that we know. If we do not keep the ground wet it will not grow anything; if we do, it is too cold to do more than keep the vegetation growing.
310. That is the reason why you think it will not be more than a filter bed? I do not think it ever will.
311. Therefore you do not anticipate making anything like a colossal fortune out of this land? No. In the first place all the effluent is lost. We have no means of saving it. It passes away at the rate of 300,000 gallons a day, simply wasted. It goes into the river.
312. The object is to get rid of the water, is it not? Of course, but it ought not to be. If that 300,000 gallons a day were applied to a farm it would make it a proper irrigation farm.
313. You do not think that this water, after it passes away from the filter-beds, contains any organic matter in the shape of manure? No; but good lands properly manured only require water. All I do is to take the manure out, and the water immediately goes away. In twenty-four hours I lose it.
314. According to your present anticipations, you do not expect to realize anything like an asset? I do not. I think that if it pays its expenses it will do exceedingly well.
315. Can you say what the current expenses of the farm are? 15s. a day. Two men will look after the sewage of 1,600 houses.
316. Does that include the expenses in connection with the sewers themselves? I know nothing about that. I have got a piece of ground where they have to dispose of all their night-soil and all their kitchen stuff and dirty water. Everything connected with the household arrangements is deposited on 2 acres of land, and two men look after it.
317. Then the expense of working this farm amounts to 15s. per house? Per day, not per house.
318. *Mr. Garrard.*] The wages of the two men? Yes.
319. *Mr. Copeland.*] What is the total expense? If the system were complete?
320. Yes; I mean including your salaries? It is not finished. You want to know what are the actual expenses now?
321. Yes? We are making now. We are expending capital. We are spending £11 a week; but that is not wholly for——
322. What I want to get at is the expenditure by way of salaries and wages? The wages are now about £11 or £12 a week.
323. All told? All told.
324. *Mr. Watson.*] How many acres have you under cultivation now? Two.
325. Do you purpose putting any more under cultivation? Every day, as the sewage comes down, we keep putting in a fresh bed.
326. Where do you sell your produce? By auction to the cow-keepers. That crop you saw was sold by auction.
327. What did it realise? The lucerne £1 a ton, and the sorghum 12s. a ton.
328. That is at the rate of £5 an acre per month? Yes, for lucerne.
329. What does the sorghum realise? Twelve shillings a ton.
330. And they take it away? From the office—from the weigh-bridge. We take it over, of course.
331. What is the weekly expense of carrying on that? The weekly wage sheet is at £11 odd; but that does not include the actual working of the farm. I can only arrive at that. I anticipated some inquiry would be made, and when I began to cultivate this year I put two men on to do it alone, and they have done it.
332. Do you keep any more than two men on the farm? I have four men at the farm; but they have made it as well as cultivated it. They have made the whole of that you saw. That has been all reduced from sandhills. It has all been cut down by the cubic yard.
333. *Mr. Garrard.*] What is the estimated amount of sewage that will come down when the western suburbs are connected? I have no idea.
334. You consequently do not know how much land you will then have under cultivation? I have not the slightest idea.
335. You know the area they propose to add to the farm? Two hundred and fifty or 300 acres, I think.
336. Is the quality of the soil similar to that where you are now operating? The whole of that tongue of land is simply drift sand from the bay.
337. The proposed addition is included in the tongue of land? I do not know what addition of area is proposed. I have nothing to do with anything but the piece of ground I am cultivating and levelling.
338. And you do not purpose levelling anything more than you need from time to time? That is all.
339. Your experience ——? Our experience is that 10 acres levelled before the sewage was applied put themselves into sand hills again in three years, so that it is much better to go on from day to day.
340. Have you charge of the whole of the works there? Everything.
341. The receiving house as well? Everything.
342. Is there no solid manure in the stuff kept back by the grating? Very little, unless mixed with sand. There is no solid manure really.
343. And the manure that lies on the top when the water has filtered away—do you collect that and use it in any way? Plough it straight in. We get it as thick as we can. When we have got three or four layers on it it will take no more sewage. We plough that in, and then there is another layer, and so on.
344. How long before you sow your crops? When we think it is rich enough. We have tried several times before, and lost many crops. This is the first crop we have been able to get.
345. Is there no complaint about the smell from the neighbours? There are no neighbours around to complain. You had the benefit of it when you were out, and are the best judges of the smell.

J. N. Oxley, Esq.

20 Dec., 1888.

346. Is it true that in the neighbourhood of Botany there are boiling-down establishments? Very many, and very disagreeable ones.

347. Have you smelt any noxious smells on the farm from them? Well, we are not supposed to smell anything.

348. If statements are made that unsavoury smells come from there it is quite possible that they come from the boiling-down establishments, and not from the farm? I do not think they are from the farm. We are visited at all times by all sorts of people, and have never had any complaint. I may say that there were no preparations for your coming. You found it exactly in its ordinary condition.

349. *Mr. Suttor.*] You said you could not grow crops in the winter. I suppose the temperature is much lower then? The only crops we are able to grow are cabbages and turnips.

350. Lucerne and sorghum require a higher temperature? The lucerne was cut, but it only produced about a ton during the winter.

351. As a matter of fact lucerne and sorghum do not grow as well then? There will be a second cutting of sorghum, and it grows all through the winter; but it does not grow high, and it will not cut.

352. Then there are times in the year when you cannot get crops? We can get vegetables.

353. But as far as sorghum is concerned? No; it does not grow well in the winter.

354. What is the return of sorghum? 20 tons an acre. The crop you saw was a good one, and weighed 20 tons to the acre.

355. At 12s. a ton? Yes.

356. That is a much more productive crop than the lucerne? Oh, dear no. The lucerne comes once a month; but this is a yearly crop; at any rate there are only two crops a year.

357. You say that all the solid particles of the sewage remain on the surface;—how do you treat that? Plough it in.

358. Do you find they become at all offensive? There is not the slightest odour after it once goes on to the soil. No matter how filthy the stuff is, the moment it goes on to the soil the smell goes away.

359. It is not likely to make a nuisance in the neighbourhood? It never can. It was tried by the Government chemist. 150,000 gallons of sewage were kept back until it became black filthy mud, that you could almost walk over, and it was put upon half an acre, a foot deep. The next morning I sent him the dry manure in a paper, and he put it into his pocket. The effluent was analysed, and was quite good drinking water.

360. Did he give any report as to the state of the solid matter? He simply analysed it as farm manure. He gives its constituent portions, but I forget what they are.

361. With reference to the expenditure, you spoke of it being about £11 a week;—is not some of that expenditure spread over some other part of the work? All the levelling and everything is paid for out of that. That is the capital. The actual running expenditure is only 15s. a day.

362. Is not some of that used for the carrying on of the machinery? The inlet-house you mean. I am not including that at all; I am only including the farm; the expenses of the inlet-house must be tacked on to the expenses of the syphon.

363. The making of that syphon has saddled the general system with a heavy expenditure? You cannot help that. There was a necessity to make it, and it has to be cleaned. The western suburbs scheme will come right on to the farm, so that there will be no expenditure beyond the receiving and ploughing in of the sewage.

364. Could not the sewage be carried on to the farm without the syphon? No; because they would not allow the river to be blocked. The syphon is under the river.

365. It had to be used to prevent the navigation being blocked? That was the reason.

366. Is there much navigation carried on there? No; but there may be. It is one of those navigable parts of the harbour that might be used at any time, and it would not be safe to put a pipe across it.

367. Do you know how much extra the effect of the syphon being there makes upon the cost of the whole scheme? I do not know anything about the original cost; the running expenses are about £10 per week.

368. *Chairman.*] Have you tried any description of trees or vines there? I have got a row of vines planted now; but they are not looking well.

369. How old are they? Only put in this year.

370. Are they cuttings or rooted plants? Cuttings.

371. Would it not have been better to try rooted plants? I find that the cuttings come very nearly as soon as the others.

372. What description of vine have you planted? Table grapes. I am afraid it is too windy for them. I have also got a lot of orange and lemon trees.

373. You have not tried any other description of fruit trees? Yes; we have a few stone fruits, but the wind blows them all away. As soon as the young leaves come a sand-drift sets in and cuts all the leaves off. I am afraid they will not be able to make headway against the sand-drifts.

374. You say that you have tried turnips;—were they Swedes or the common white turnip? Swedes.

375. Do you find them answer well? Splendidly.

376. Have you ever tried pumpkins? No; we do not plant them, but they come up everywhere from the sewage. The fruit is not any good.

377. Have you ever grown onions there? No; I have not tried any of those crops, because I know I cannot deal with them. I could grow them, but obviously I could not sell them at a profit; the manual labour necessary to put such crops in must result in a loss to the Government.

378. But it would be developing the uses to which the sewage farm could be put? There would be no difficulty, but it must be done by somebody who could do the work himself. We cannot afford to keep a market garden.

379. It would be a matter of great interest to show what crops could be produced under the system? They have been tried; everything has been tried except onions.

380. How do the tomatoes do;—I suppose they grow like weeds? They come up almost everywhere.

381. *Mr. Copeland.*] Would there be any chance of letting this land out, say to some other vegetable gardeners, letting them use the manure and the water to properly irrigate the land? I think it is very likely that when there is a sufficient area that will be the proper way to dispose of it. If we had 10

acres

acres any enterprising gardener ought to take it and work it himself, under the inspection of the Government, of course, because all of these beds require attention. They cannot be used continuously, any of them. They are intermittent; the whole system is intermittent. The filtering power of any one of those beds can be destroyed if it is not carefully irrigated.

382. I suppose you would hardly consider a piece of land of that character an advisable place to try an experimental farm to see what vegetables or fruits or other things would grow in the Colony? It is entirely experimental.

383. But as an experimental farm would you not prefer to have soil of a better character? You could not have an experimental farm there. What you grow is simply growing upon the few inches of manure put on to the sand; it is not growing in the sand.

384. Do you think the sale of the produce of the 2 acres has paid the expenses of the men employed in cultivating the land? Well, scarcely.

385. What wages do you pay those men? Seven shillings a day.

386. Two men at 7s. each? Yes.

387. Anyone else besides yourself? No.

388. What salary do you get? £300.

389. So that the total expenditure on that farm by way of wages is this; £300, and 7s. a day each for two men? It is hardly fair to put that down, because there are only 2 acres at present under cultivation. I could superintend 500 acres; but it is not finished. It is in process of being made. I am designing and carrying it out every day, and therefore I have got more men. As I thought the Committee might wish to know the difference of cost between the earth-closet system which they have inquired into and the system of simple filtration, I might say that the system of simple filtration costs about 15s. a day for 8,000 people.

390. As you increase the area under cultivation do you think it would pay the Government to employ a larger number of men to cultivate the land, or simply to leave it as a sewage filter? It must be cultivated. The whole of the system would break down if the ground were not cultivated. Every one of those filter-beds there would cease to be filter-beds in two months if they were not cultivated, and then the question is whether you will collect the manure and sell it in bags or whether you will grow something on it.

391. What is your opinion—do you think it would pay better to employ men to grow vegetables and fodder on it, or to sell the manure off the surface? At present you could not sell the manure at all. I do not think it is saleable. We do not get enough, neither do we cultivate enough, to make it pay. I should not say positively which was the best. I would like a little more experience. I have really produced only one crop, and we can hardly tell whether it will pay better sold as manure or cut as a crop. It will only go somewhat toward maintenance either way.

392. Then, as a farm at the present time it is a mere experiment? It is not an experimental farm at all, and never can be a farm.

393. It is termed a sewage farm? You can call it what you like; but it is not a farm. We have no soil there; we have nothing but sand. It is simply a filtering arrangement. The system of irrigation there may be adopted on any land.

394. You are perfectly satisfied with the results as a filter-bed? Yes; I believe everyone is.

395. It is perfectly satisfactory? It is perfectly satisfactory.

396. The effluent water passes away in a clear state, free from smell? Yes; the water is nearly as good as it might be. I would not like to drink it, and the chemist says that it ought not to be drunk, but the men have drunk it.

397. Does it pass out as a stream? At present it passes away a little above high-water mark in the form of a damp line. Eventually it is intended to have an intercepting pipe all round the farm to carry off this water.

398. Do you notice any effluvia from the saturated sand? None whatever. There is no smell. It is perfectly clear water. Cattle and everything drink it.

399. *Mr. Suttor.*] Are you employed by the Government? Yes.

400. These filter-beds are not under the control of the Water and Sewerage Board? Not at present; they are under the Works Department.

401. *Chairman.*] I think you said it cannot be regarded as a farm? I do not think so.

402. Do you not think the results you have given us—5 tons to the acre in a month—is a good result? Well, there may be different opinions about a farm; I do not call it a farm. Whatever is grown there is simply forced out of pure sand by means of excessive manuring and watering. You put 300,000 gallons of water a day on 2 acres of land; it is enormous. If we had it on a sheep run we could get the whole place under cultivation.

403. Have you ever followed the roots of the lucerne? Yes; they are about 3 feet down.

404. Do they reach moisture at that depth? They get the moisture passing from one paddock to the other. The lucerne is not generally sewaged at all, but there is a sewage paddock on each side, and the effluent passes under it to get away to the beach, and the lucerne seems to pick it up.

405. Is that the case with sorghum as well? No; it dies in two days if it is not watered; two hot days will kill it. It has to be watered every two or three days at the very least.

406. Then you think there is a great deal more experience required before you can ascertain the real producing property of the soil under the agency of sewage? I think so; it is entirely experimental.

407. Do you know the extent of the suburbs proposed to be drained? Not exactly; I believe 800 or 900 acres.

408. With a tolerably large population? I have never inquired into the matter. I only made the preliminary levelling there for 50,000 people.

409. You have no data to enable you to form an estimate of the probable capacity of the soil to receive sewage? Yes, as far as we can go we have.

410. With what result? We can filter 300,000 gallons a day on an acre intermittent; that would be 2 acres—1 acre in operation and 1 off.

411. Have you had any estimate made of the number of gallons that would probably be received from this large area? No. I commenced with the understanding that there would be at least 50,000 people on it shortly, and the filter-beds are designed to receive the sewage of 50,000 people in conjunction with whatever cultivation we may carry on besides.

J. N. Oxley, Esq. 20 Dec., 1888.

412. Has it ever occurred to you, supposing that a system of farming were carried on at the places where the sewage is to be deposited, that the working might be profitably added to by the addition of soil of any sort? No doubt, but we would destroy another thing. It requires clay to keep the particles of sand together, and if we put that on we cease to have a filter-bed that will satisfy the sanitary authorities.
413. Is clay the property most required to make the sand reproductive? I should think so.
414. No other description of soil? I do not think so. If we take a handful of that ground saturated with manure and dry, we can rub the whole of the manure out, and have the bright silica left. It never seems to mix. If there is a little clay in it it becomes soil at once; and if it were saturated to the extent we saturated it, it would very likely be disagreeable.

John Ashburton Thompson, Esq., M.D., Deputy Medical Adviser to the Government, sworn, and examined:—

J. Ashburton Thompson, Esq., M.D. 20 Dec., 1888.

415. *Chairman.*] You have held your present position for some time? Three or four years.
416. And of course in performing the duties of the office you have had a good deal to do with the health of the citizens? Yes. Perhaps I may mention for this purpose that I am specially qualified in sanitary science by the University of Cambridge. It is my business to know something about the matters you are inquiring into.
417. That is a branch of the profession to which you have given considerable attention? Quite so.
418. Have you had to do with town sewage and country sewage as well? I have not had practically to do with either the one or the other.
419. But in the course of your professional observations you have formed opinions as to the influence of the different descriptions of drainage upon the health of communities? Certainly.
420. You understand the nature of the proposed sewage works for the western suburbs? Yes; I have studied Mr. Stayton's proposals.
421. Of course you recognise that it consists of an elaborate and expensive plan? I do.
422. It is proposed to cost something over £800,000? Yes.
423. And when this shall have been done a greater outlay will take place before the scheme is a complete one? Yes; very considerable.
424. Have you ever visited the sewage farm at Botany? Very often.
425. Have you noticed the absorption of the solid and liquid manure from the drains, and the uses to which it is put? Yes, I have; and I think it is eminently satisfactory.
426. Have you given any attention to the way in which it is utilised in producing vegetables and green crops? Yes.
427. Have you ever had to do with analyses of soils at all? Yes.
428. Do you know anything of the ingredients which compose the soil of what is called Webb's Grant—that neck of land that the sewage is now deposited on? I believe it is pure sand; I think it contains really nothing but silica on the whole.
429. As far as you know, would solid or liquid manure be the best for the reproduction of crops on silica? Undoubtedly a liquid manure, I think.
430. In the market gardens about Botany and in those swamps in the neighbourhood, they have something other than pure sand? Yes; there is a large quantity of alluvial soil there.
431. And peaty soil? Yes.
432. Which works in well with ordinary manures? Yes.
433. And that is not the case with Webb's Grant? Not at all. On the other hand, of course, the areas you mention are for the most part water-logged, and not at all suitable for sewage farming in their present state.
434. You have seen the crops produced on Webb's Grant? Yes.
435. They are very satisfactory crops I think? Very satisfactory indeed.
436. Both in quantity and quality? Yes. I think the place is most favourable for sewage farming, and the climate also. There is great trouble very often in other climates caused by the excessive volume of sewage as compared with the area available for utilizing it; but here where there is so much evaporation, I think we shall not be troubled in that way at all events.
437. From a sanitary point of view you think it is a success—the deposit of the sewage at this point? Yes, I do, undoubtedly.
438. And there is no probability of danger to the health of the inhabitants round about? I think there would be no danger at all, even if the inhabitants were very much closer than they are. There is actually no evidence whatever that sewage farms are hurtful to the health of neighbouring populations even in places very much less fitted for sewage farms than is Webb's grant.
439. It is the case I think that whatever may be the experience as to farming there, as a filter it has been found very perfect? Yes; the effluent is a very good effluent. Of course, it must be remembered that at present only a very small area of the sand is being used. If necessary the sewage could be spread over a larger area, and then you would get probably a still better effluent; but it is good enough.
440. You have seen sewage farms in other parts of the world? Yes; in England only, but I have seen a great many there. Perhaps the farm at Croydon is the one with which I am most familiar, or rather the farms connected with the district of Croydon, because there are three of them.
441. What is the description of the soil there? On two it is gravel. One of the farms is entirely on clay, and it is therefore under-drained very carefully.
442. With subsoil drains? Yes.
443. And ultimately where is the water conveyed to? It runs into a stream. As it leaves the farm it is perfectly bright and clear and tasteless, and as a matter of fact, although it is not desirable, people occasionally drink that water. Also I know from my own observation that except from some occasional fault—as the temporary stoppage of a carrier—those farms are perfectly free from nuisance and offence. At Norwood there is a footpath crossing one of them, and that is a very favourite walk for people on Sunday afternoon. They do not know they are walking on a sewage farm—they think they are simply crossing a cultivation paddock.
444. Do you recollect the nature of the crops they mostly produce there? Roots, and some grass, market produce, and Italian rye-grass.

445. Do you recollect the proportion of solids as against liquids, or is it all in the shape of liquid? It is all liquid.
446. They have no means of intercepting the solids in any way, as far as you recollect? The sewage is mechanically strained through Latham's extractors, by which a small proportion of fœcal matter, garbage, and the larger solid objects are separated.
447. Then I suppose the solid portion of the manure would be ploughed into the surface? Yes.
448. It is spread just as they do here on a smaller scale at Botany? Quite so; but at Botany of course there is all the advantage of a loose soil, devoid almost of any organic matter. There they are turning crude sewage on in a vastly larger proportion than is possible on a clay soil; and the sand will be all the better for it, no doubt.
449. I think you told us in evidence some time ago, that the system of sewerage was preferable to the dry earth system? Yes, I daresay I did; I am quite of that opinion. The dry earth system is a delusion as applied to large populations. It is all very well for an individual who will look after it, or for an institution where some officer can be told off to inspect the arrangements daily; but applied to a large population it is entirely a delusion, the earth that is taken to the house not being supplied to the closet as it is required; people will not do that. Of course there is also the expense and labour of supplying the earth to the households. In point of fact, we are supposed to have earth closets here in many districts, but you do not find them—they do not exist—the earth is not supplied. And that is a very expensive way and a very imperfect way, because the slop-water has still to be disposed of, and, after all, the contents of closets are not a conspicuous constituent of the sewage of a town. The sewage of an entirely water-closeted town differs very little indeed from the sewage of a town which has earth closets or middens. There is very little difference between the sewage of those two towns. The main difference is a little one of some 56 grains per gallon of solid matter in suspension. In offensiveness and harmfulness the sewage of a middened town is as bad as that of a water-closeted town.
450. I suppose you keep records of the state of the health of the inhabitants of the city generally? No, we do not do that, because we have not the means of doing it. Of course I examine from time to time the monthly returns of the Registrar-General; but as for watching the public health week by week, I must say it is not done, because at present the means do not exist.
451. You have not the appliances? The organization and so forth is wanting.
452. Then the only record you have of health is from the Registrar-General's returns? From the returns which the Registrar-General makes in conjunction with the Government Statist. The Registrar-General's officers abstract the register of deaths and forward a return to the Statist, who then arranges it and remarks on it. All that is done quite apart from the Health Department, who in point of fact ought to have charge of it. It is impossible for a layman to deal fully with vital statistics. Mr. Coghlan is of course as competent as any man; but a layman does not know what are the points which should attract attention, and, I should suppose, would be glad to be relieved of the duty.
453. As a medical man, are you not of opinion that records should be carefully kept? I am of opinion that they should be kept with the greatest care, and that that is the most important thing for every nation to do, because that really is their book-keeping; it is the nation's account. You cannot stop waste if you do not know the health of your population—the death rate, and the causes of death in particular districts. But if I were to go into that I am afraid I should detain you a very long time, because there are so many things that, as far as I am able to learn, seem to want adjusting. I have already said—to give you one single example—that it is not possible to make comparisons between different districts. Comparisons are constantly proposed between the city and suburbs, and it is not possible to make those, for this reason alone if for no other: that no less than 15·7 per cent. of the deaths in 1887 took place in the public institutions; they are credited to the district in which those public institutions happen to stand; they are not referred back to the districts to which they really belong. Of course the Statist makes an attempt to minimise the error. In his summaries he puts in a separate line all the deaths in public institutions, and then strikes his rate upon the remainder; this causes a good deal of unprofitable trouble and labour. The 15 per cent. of deaths in the hospitals ought to be distributed, but the means of doing it do not exist. And then there are other reasons. However, of course I do study the tables, and I have brought with me, as I thought it might possibly be of some service to you, a copy of a table which I have constructed. [*Vide Appendix* D.] It does not exist in the statistical returns; I made it for my own information. It shows the deaths from various causes, and the birth rate, and the natural increase, and so forth, and other particulars; and especially the deaths from zymotic or preventable diseases, for the ten years 1875 to 1884; and then strikes an average upon those ten years, and gives the figures of 1885 for comparison. It is so far behind as 1885 only, because the returns for 1886 and 1887 are not yet published.
454. Can you let us have that paper? Yes.
455. *Mr. Garrard.*] Is that based on the figures supplied by the Registrar-General and the Statist, which you say are defective? Of course the figures are from the Registrar-General's returns; there is no other source; but this is an abstract for the whole metropolitan district, and is therefore not subject to any very great error on account of deaths in public institutions, because many of the institutions stand within the metropolitan district. The remark I made just now applied to a comparison between the several districts—as between the city and suburbs—and then again, between one district and another. For instance, Darlington has a population of 142 persons to the acre, and the city has a population of only forty-six persons to the acre. Now it would be very interesting and very important to ascertain what the effect of that difference of density is upon the health of the two populations. I should be very glad to do that, but I cannot. So with other districts.
456. *Chairman.*] There would be other elements to be taken into consideration besides the mere density of population in a return such as that; for instance, the nature of the drainage? There are other considerations of course; but nevertheless it has been ascertained by Dr. Farr, who may be said to have founded the science of vital statistics, that death-rates do bear a constant proportion to density; they increase as the twelfth root of the density; so that given these two districts, which in many respects are similar, one would expect to find that although Darlington has for about a year been sewered, and supplied with pure water, it would have a slightly higher death-rate than a similar district having in addition the advantage of low density. It is not very easy offhand to make clear the advantage of being able to make those comparisons; one wants a specific example and then it is clear enough; and that I am not prepared to give at this moment.

J. Ashburton Thompson, Esq., M.D.

20 Dec., 1888.

457. Has your Department at any time made application for means to have these compilations made? I am not aware.
458. You think it would be very valuable, of course, to have it? Just as valuable to a nation as a merchant's books are to the merchant. Without them he does not know what he is doing; nor do we.
459. Has anything occurred to lead you to form any fixed opinions as to the influences of the recent sewerage works on the citizens of Sydney? No, because although the outfall sewers have been constructed the connections are going on but slowly. There are only connected with the northern outfall about 150 houses, and with the southern outfall about 1,500 houses, and that within the last year.
460. Have you been led to form any opinions as to the influence of sewage in the various bays where it is deposited; as for instance Darling Harbour, Woolloomooloo Bay, and Elizabeth Bay? No, not specifically with regard to the populations in those neighbourhoods, for statistical reasons already mentioned.
461. Do you happen to know how far the sewage extends out into the water at those places? No; I do not know anything about that.
462. Have you formed any opinion about the death-rate from time to time, from defective sewerage in Sydney? It is so very difficult, for the reason I have just given, to estimate the death-rate in different districts of Sydney. Defective sewerage fosters typhoid fever. Now, many of the persons who are attacked with typhoid fever are the newcomers, at ages between 15 and 35, or thereabouts for the most part; they are immigrants of one sort or another who have not much money and who go to the hospitals. It is precisely those people whose deaths are not recorded in the districts to which they are due.
463. Then the town would be credited with the disease with which they were affected? Yes; if they happen to die in Sydney Hospital, then the city will be credited; if they happen to die at Prince Alfred or the Coast hospital, then Camperdown or Waterloo will be credited. Of course, I know that our death-rate from typhoid for the *whole* of the metropolitan district is very much too high; that is, it is 6·4 per 10,000 living, upon the average of those ten years 1875 to 1884, whereas in London, during the ten years 1877-86, it was never above 2·9, and in 1885 and 1886 was only 1·8.
464. *Mr. Copeland.*] Are you personally acquainted with Webb's Grant? Yes; I have often been there to watch the works.
465. Can you say what quantity of solids they conserve during the year? I do not think they conserve any; perhaps I do not understand the question.
466. Have they not settling pits—some method of retaining the solid sewage before it goes on the farm itself? No; that is not the object of those pits. The object of those pits is to separate extraneous matters—tins, for instance, and stones, and things of that sort which get into the sewers. They are not in order to allow the sewage to precipitate, but to strain it.
467. Can you form any idea as to the percentage of solid matter contained in the sewage that goes on the farm;—I want to get some idea as to how long it will take for this clean sand to become charged with sewage matter? It is a very variable quantity. I do not think it is possible to state any general figure for that. The sewage contains variable quantities of water from rain and so forth.
468. Do you know what population this system of sewerage serves at the present time? About 1,650 houses, and you can reckon roughly five persons to a house.
469. That would be roughly 8,000 persons;—what quantity of excrement could we reckon per head? Four ounces of solid; but you cannot get at it in that way, there are so many other solids. They are now turning on 2 acres, I understand, the sewage of 7,500 people. The general canon is laid down by Professor Robinson, who is one of the first authorities on such matters, that you may turn the sewage of 500 people on to an acre as long as you like, and it will be properly purified, and the soil will not get over-worked.
470. Is that where the land is under constant cultivation? The statement is general, and refers to filter-beds—to under-drained land, which may or may not be cultivated. But as soon as you approach 1,000 persons to the acre the cleansing becomes uncertain. Then you must first of all precipitate your sewage, or allow it to settle at least.
471. In this case we have approximately 8,000 persons to 2 acres—an average of 4,000 persons per acre? Quite so; but one must remember the circumstances under which Robinson writes. He is speaking of England, and that is a very different place from this—a very different climate. This is a place where there is an immense evaporation. We have soil which is very porous, and which contains scarcely any organic matter at all, and therefore it will for a considerable period no doubt destroy a much greater quantity of sewage than that estimate of Robinson's.
472. It appears already to be four times the average—4,000 persons per acre instead of 1,000? Four times the average of England, under the circumstances of England, which are not the same as these. Of course, you may ask why I should give that illustration which I imply is scarcely applicable here, but you know conditions never correspond exactly, and one has to try the practical experiment by testing the conditions on the spot.
473. At least you have no anticipation whatever that the whole of that land will become surcharged with organic matter? I have not the least expectation of it. The only thing is that when you have the total expected outfall, then I believe it is intended, and I am quite sure it will be necessary, to allow for some settling before turning it on the land. I do not think you will be then able to run it straight on out of the sewer as at present. You will have to allow it to deposit, and I believe use some chemical precipitant. When that is done there is no limit to the time during which that area will continue to cleanse; there is no chance of its getting overloaded and clogged. As for the sludge, that will simply raise the surface farther above the tide level. It will always be good; it will itself at last contribute to this filter-bed.
474. *Mr. Street.*] In speaking of the comparative advantages of liquid and solid manures, of course a good deal depends upon the character of the solid? Yes.
475. You said just now you were in favour of liquid in preference to solid manure on soils for a sewage farm? I am not an agriculturalist, and all that I am thinking of is the getting rid of the sewage from the city. Your question, from that point of view, seems to resolve itself into one whether I think the water carriage the best system. I do think so.
476. You have no particular preference for the deposit of liquid manure on a sewage farm over solid manure? In this climate, yes; I believe the liquid form is preferable.
477. I suppose the success of the cultivation would depend a great deal on the original soil in either system? Well, yes, I suppose it would, only you are putting an agricultural complexion on your question.
478. You only gave your opinion with reference to getting rid of the sewage matter? Quite so.
479. *Mr. Suttor.*] You are perfectly satisfied that a good sanitary condition is brought about by the use of

of this farm? Yes; perfectly satisfied. I have not the shadow of a doubt about that, judging by experience in other countries. J. Ashburton Thompson, Esq., M.D.

480. The use of the sewage farm is not at all likely to affect the health of the inhabitants of the neighbourhood? Not at all. I repeat that there is literally not a particle of evidence to show that any properly managed sewage farm ever did affect the health of the neighbouring residents. 20 Dec., 1888.

481. You think pouring out the sewage on the surface of the soil is a proper thing to do? Entirely proper. If there is anything settled as to the disposal of sewage at the present day it is just this, that filtration is the only practical way of dealing with it. You may precipitate, but you must conjoin with that filtration, and your filtration may be done on filter beds or it may be done by what is called irrigation, that is to say on a sewage farm. Perhaps when you were at the farm you observed that the sewage which is fresh, which comes down rapidly, really has not very much smell of its own; it is only with putrefaction that it begins to smell. If it is run on to the sand within 24 hours of its production, it will go into the soil practically odourless; then it is attacked by chemical processes and begins to be oxydised. It has not time to putrify, that is to give off offensive gases, before it is altered into odourless compounds. There is not the least chance of offence from that farm, I am quite satisfied.

482. *Mr. Campbell.*] With regard to vegetables or fodder grown on sewage farms,—is there any objection to the use of them by men or cattle on the score of health? I explained to the Committee once before that the things which are grown on a sewage farm and are intended for human use should be those which require cooking before they can be eaten; and as a matter of fact, I myself never do eat salad in Sydney, because it does not require cooking, and it may not be sufficiently cleaned. As for cattle, fodder thus grown is excellent, and quite devoid of harmful properties; and if I add that the managers of the Croydon farm have now 200 milch-cows, feeding and milking them, I give a very full answer to this part of your question, since the farm is familiar to every sanitarian in London, and is carried on under the immediate eye of that distinguished man, Dr. Alfred Carpenter.

483. Do you apply that to gardens generally? Yes. The danger to man is not from the constitution of the vegetable, but from the mechanical adherence to it of particles of sewage; just a mechanical danger.

484. *Mr. Garrard.*] By the actual contact of the sewage matter with the plant itself? Quite so.

485. *Mr. Suttor.*] With reference to earth-closets, I suppose that the earth-closet system is a good system where it can be carried out? That depends upon what you have in mind. If it were carried out it would be good as far as it went under all conditions; the objection to it is that when you try to get a large number of people to use the earth-closets, they neglect them, and then they become a very serious nuisance.

486. *Chairman.*] And probably a source of danger? Yes; undoubtedly.

487. *Mr. Suttor.*] But in country places where people can use earth-closets under their own inspection? There they are excellent; there is nothing better.

FRIDAY, 21 *DECEMBER*, 1888.

Present:—

The Honorable JOHN LACKEY (CHAIRMAN).

The Hon. GEORGE CAMPBELL.	HENRY COPELAND, Esq.
The Hon. WILLIAM HENRY SUTTOR.	JACOB GARRARD, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	ALEXANDER KETHEL, Esq.
JOSEPH PALMER ABBOTT, Esq.	THOMAS MICHAEL SLATTERY, Esq.

JOHN RENDELL STREET, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

T. A. Coghlan, Esq., Government Statistician, sworn, and examined:—

488. *Chairman.*] You are at present holding the position of Government Statistician for the Colony of New South Wales? Yes. T. A. Coghlan, Esq.

489. How long have you held that position? For nearly two years and a half. 21 Dec., 1888.

490. Had you been engaged in statistical work before you commenced the duties of your present office? I was an assistant engineer in the Harbours and Rivers Department before that.

491. Had you paid much attention to statistical matters before you came into your present position A good deal.

492. And since you have held the office of Government Statist you have constantly observed the statistics of births and deaths—all particulars relating to health? Yes; I have given them special attention.

493. Was a correct return of births and deaths kept before you assumed your present position? Yes; just as exact as at present.

494. For how many years have the statistics been kept accurately? Since about 1856, under the present system of registration.

495. From your knowledge of the method of collecting the statistics do you suppose they are collected accurately? I think so; the percentage would be so small as not to affect the details.

496. Do you keep account of the different diseases—zymotic and others? Yes, full particulars of all diseases.

497. And how do you estimate the deaths or the proportion of people dying in the different districts—in the suburbs and other places—the city as distinct from the suburbs, for instance? I report monthly on Sydney and the suburbs surrounding Sydney, giving the number of deaths from specific causes and the percentages.

498. How would these be collected—are there returns from medical men? Each death must be registered, and before that can be done a certificate has to be given, not necessarily by a medical man, but by a competent person. It depends on the Registrar-General.

499. Suppose a disease were to break out at Marrickville, and a great number of people were sent from there to the hospitals, would the death rate be credited to Marrickville or to Sydney? To the hospitals.

500. There would be nothing to show where the disease was contracted? Not unless I made special inquiries, as I did at the first half of this year. Usually, if a person contracts a disease at one place and dies at another the death is debited to the place where he dies.

501.

T. A. Coghlan, Esq.
21 Dec., 1888.

501. In your statistical returns have you any record of the number of deaths in the suburbs or towns? Yes; I group the suburbs for statistical purposes according to their geographical distribution, and according to the similarity of the circumstances obtaining in each suburb.
502. Then could you at any time show the death-rate of any suburb? Yes.
503. The death-rate of Petersham, for instance, or any other suburb? Yes.
504. And those that extend through the country? No, only for Sydney. The country is treated in districts. I make returns on districts separately; treating the country as a district separate from the metropolis.
505. Do you report upon the country as a whole? As a whole. The record of deaths would be kept for districts in the country, but the percentages would be given for the whole.
506. Well, during the course of the collection of these statistics, have you been impressed by the unhealthiness of one portion of the suburbs as compared with another? They are very much alike. I, at one time, thought certain districts showed unhealthy signs as compared with others, but there is very little difference, except that the North Shore is apparently very much healthier than any other part of Sydney.
507. The North Shore shows that in its results? Yes; invariably the North Shore comes out better than the other suburbs.
508. I suppose that would be from the better natural drainage? I can hardly say, but it is evident this is the case.
509. Have you given any attention to the subject of drainage? I was working with Mr. Bennett and Mr. Moriarty on the original scheme for Sydney.
510. But you have not been called upon to give particular attention to one scheme of drainage more than to another, or in connection with one suburb as compared with another? No.
511. You know that North Shore is much more healthy than other suburbs; that would be, perhaps, because the natural drainage is better—the deposit of matter would not be so stagnant as in other places? Probably so; and I think the population is very scattered.
512. Is it not the case that some of the Western Suburbs are very flat, and the drainage from them very sluggish? Yes.
513. Marrickville for instance? Yes.
514. The Western Suburbs? Yes, it is so.
515. Are your means for collecting the health statistics satisfactory? As regards births and deaths, and kindred statistics the means are perfectly satisfactory. But, of course, I have no means of telling the general health of the community, judged by the number of diseases; the Board of Health would tell that.
516. Does the Board of Health supply their report annually to the Government? I think so.
517. Is it not submitted to you? No.
518. Do you not think it desirable to have it submitted to you to enable you to record your statistics satisfactorily? I do not think it needful. I can at any time refer to the report after it has been laid before Parliament.
519. Have you made any recommendations for improvement in the system of keeping statistics? I have no need to make recommendations, for I carry out my own ideas.
520. Then you have the power to carry out such alterations and improvements as you think necessary? Such as will not be affected by Act of Parliament.
521. I do not quite see how you get your returns from the Medical Board? You are referring to the case of deaths.
522. And diseases? The deaths are registered with the Registrar-General, and each month I get them from him. I see the original returns, or my officers see them.
523. You have no reason to complain of the way in which they are furnished,—you think they are accurately kept? Yes.
524. Then you consider your work purely of a statistical character; you do not go outside to matters of drainage, or anything of that sort? No.
525. *Mr. Copeland.*] Did you furnish Mr. Barling with a diagram showing the death-rate in figurative form? Yes.
526. Have you a copy of the diagram with you? No.
527. I was under the impression at the time that the diagram was in error, but afterwards on looking at it I found that it was I who had made the mistake in reading it. I just wished to correct this, because questions put to Mr. Barling at the time indicated that the diagram was wrong, whereas the error was mine not yours? I think the diagram was all right.
528. *Mr. Garrard.*] Are you aware that the Western Suburbs are included in this proposed drainage scheme? Yes.
529. Have you anything to show the death-rate of those suburbs as compared, for instance, with the city? Yes. I have not particularly distinguished the Western Suburbs, because there is very little difference between the death-rate of the Western Suburbs and others.
530. Then your information would include the Western and Eastern Suburbs? Yes.
531. Can you not give us the death-rate of the Western Suburbs? Yes; for the eleven months that have elapsed this year.
532. Take Balmain, for instance;—what is the death-rate per thousand, according to your last returns? I include Leichhardt with Balmain.
533. You include Leichhardt, I suppose, because it is a Registrar-General's district, and the returns refer to it? No; but because I consider that geographically the two suburbs are one district.
534. Have you to go upon the mere geographical knowledge of the district? No; because I consider that the circumstances which obtain in Balmain obtain also in Leichhardt.
535. And also in Petersham? No; I include Petersham in another district.
536. Why? Because I think the circumstances of Petersham, Ashfield, and Burwood, and all the western suburbs are alike.
537. In what respect? In the sort of people who live there and the character of the houses.
538. In the natural facilities of getting rid of drainage, or anything of that kind? There is a common want of facilities.

539. But they are well off? Well, the water gets off the ground. It all goes in the same direction.
540. There are some eight or ten suburbs included in this Western Suburb scheme,—into how many districts would you group them. You said just now that you included Balmain and Leichhardt as one. Would you give us the death-rate of Balmain and Leichhardt up to the last completed record? Balmain, Leichhardt, and the Glebe ———
541. You said that the geographical features of those three districts are so similar that you can very well group them together so far as statistical purposes are concerned? That is my main reason; but I have another reason for grouping contiguous districts together, and that is because I want to eliminate the chance of error as much as possible. Persons living on the boundaries of districts are apt to register at the nearest place. A person living just near Balmain, on the borders of Leichhardt, may think that he is living in Balmain.
542. But when that person goes to the suburban registrar's office to register the death or birth, as the case may be, must he not state in what street he resides, and consequently is not the registrar in a position to say whether he is registering rightly? In most cases that will be so; but in other cases where the streets run right through two municipalities it happens that persons in one municipality will register in another, at the nearest registrar's office. It does happen; so, in order to avoid any chance of error, and because I can calculate the population better, I group these municipalities. It spreads the chance of error over a large number of persons.
543. As a matter of fact each of the three suburbs you have mentioned,—Balmain, Leichhardt, and the Glebe—has a separate district? Yes.
544. And you get three separate returns for those districts? Yes.
545. But for your purpose you group them together as one? Yes. In the average. I show the number of deaths in each place separately.
546. You say that you group these three districts together because of their geographical features; but do you not also group them together because your previous returns show that the death-rate is very near akin in these districts;—is not that another reason? I cannot say that I was influenced by the death-rates.
547. Do you not think that is rather a misleading way to deal with statistics of that sort? I candidly think it is not misleading.
548. Do you not think, supposing one of these districts had a perfect system of sewerage, and another had not, that you would be charging against the district which had the good system the effects of the bad system of the other district? If I knew of a district which had a good system I would endeavour to show it.
549. Are you not aware that the Glebe is the best drained of these districts, inasmuch as it has a great deal of underground drainage? I am not aware what system the Glebe has.
550. Can you give us the death-rate of these three districts which you have grouped together because you think their geographical features are similar? I can give you them for eleven months of this year.
551. Perhaps we had better keep to one complete year,—last year will do? I am excluding deaths in public institutions.
552. Deaths in public institutions you put altogether? Yes.
553. Because, I presume, they come from all quarters, and are not fairly chargeable against one particular district? Yes; Balmain, Leichhardt, and the Glebe have a low average, 14·44.
554. The city for the same year? 12·22.
555. In Waterloo and its contiguous suburbs, which I suppose are included? We include Redfern, Waterloo, Alexandria, and Darlington, in one district. The death-rate of that district was 16·63.
556. You group all these in the same district? Yes, and Botany.
557. Are you aware what proportion of Redfern, Waterloo, and Darlington is connected with the Sydney sewerage works? I know that part of Redfern is connected.
558. Which part of Redfern? I fancy there is not a very large part of Redfern reticulated.
559. What is your group immediately contiguous to Balmain, Leichhardt, and the Glebe? Westward?
560. Yes? The Canterbury electorate practically.
561. The whole of it? Yes; Ashfield, Burwood, Five Dock, Petersham, Marrickville, and West Botany.
562. What is the death-rate for that district? 14·34.
563. Is not that rather a large group? I cannot get the population unless I take a census year by year. It is all very well to ask for small districts, but I cannot get the population. I can tell the population of the electorate, but not of the individual districts unless a census is taken.
564. Do you take any cognizance of the age of persons dying? Yes.
565. What was the mortality amongst children under 6 years of age, or whatever age you take as a figure? Five years.
566. What were the deaths under 5 years of age in the two districts just referred to—viz., Balmain, Leichhardt, and Glebe, against Waterloo, Darlington, Alexandria, and Botany? I cannot give a percentage of ages without reference to my papers.
567. Do you recollect whether the mortality in the former districts was larger amongst the infantile community than that in Waterloo and Redfern? I do not think that Waterloo and Redfern stand high in comparison with other districts. I may say that all the suburbs are fairly on the one line, except North Shore; their death rate is much worse than that of the city.
568. I think you answered the Chairman that you were perfectly satisfied with the way in which the returns of vital statistics were brought in through the machinery of the Registrar-General and his officers? I am quite satisfied of the accuracy of the record.
569. You cannot suggest any improved way of collecting these records? No.
570. Who furnishes you with a record of the deaths at public institutions,—the Medical Board? No; they are all registered at the registrar's office in the district in which the public institution or hospital is situated.
571. Do you tabulate or make up the numbers of cases of various kinds of sicknesses as well as the deaths themselves? No; I have no means of knowing that.
572. So that altogether the Medical Board may have returns of a number of cases in public institutions of different kinds which would not go to you? Certainly.
573. You deal merely with life and death? Yes.
574. You are a civil engineer by profession? Yes.

T. A. Coghlan, Esq. 21 Dec., 1888.

575. As an engineer, and also having had considerable knowledge of these vital statistics, do you think that a system of sewerage has a very marked effect upon the death-rate of any locality? I think it has a very marked effect. A good system of sewerage undoubtedly improves the rates.
576. Do you attribute it simply to the system of sewerage that the city has a lower death-rate than Redfern, Leichhardt, and the Glebe? I do.
577. Do you think that is the sole cause? I think it is because Sydney is sewered that it has a better rate than the suburbs.
578. Do you not think that the water supply of the suburbs has a very large effect on the death-rate? It certainly has a large effect; but the suburbs you mention are supplied with water.
579. So that that consideration would not affect them? No. Of course there is a point to be considered with respect to a water supply which is this,—the more water you supply to a district which is not sewered the more would infection be liable to spread. When you give a copious supply of water to such a district that water after having been used for household purposes would have to be taken away in the open drains or the streets, and might give rise to conditions that would tend to propagate disease. Matter that would be perfectly innocuous in a dry state, when it is in a moist state becomes full of life.
580. Can you give us the death-rate of last year for the North Shore suburbs? The North Shore death-rate was 10·16.
581. That is near the death-rate of the city? Below that of the city.
582. That embraces the whole of North Shore? Yes, including Manly. It includes a very large district containing very few people, and stretching away towards Pitt Water. Although it is a large district there are not very many people in it.
583. Have you the returns for any of those separate suburbs contained in North Shore? No; I group them, for the reason that I have explained before.
584. I suppose the return of the Registrar-General is given in for each of those boroughs? No; there are two districts, North Shore and Manly.
585. On the Registrar-General's books? Yes.
586. What is the highest death-rate in any of these suburbs? For last year I think that of Redfern, Waterloo, and Darlington was the highest.
587. *Mr. Suttor.*] In collecting your statistics do you consider the density of population in the different districts? Yes; by the density I get the number per thousand.
588. I mean as to how many people there are per acre. We were told yesterday that in Sydney it is about forty-two, and in the suburbs about one hundred and forty, per acre? I think you have been misinformed. I could get it, of course, but from memory I could not tell you the density of population in any particular district.
589. Of course the density would have some effect upon the death-rate? It would have.
590. I suppose you are not much up in these matters? I do not profess to be an expert.
591. Could you furnish the Committee with a statement of the density of the population in the suburbs and the city? Yes, I will do so.
592. *Chairman.*] Is there any information you would like to volunteer? I have got some information which would perhaps interest the Committee about the increase in the mortality of the suburbs compared with that of the city. I have got some figures here to show that the city has improved very greatly, while the suburbs have deteriorated. As I have explained to you I have taken the suburbs as one district, because I can see very little difference in the mortality of one suburb as compared with that of another. This year one suburb may appear bad, but next year it may right itself, and taking the death-rate over a series of years there is not much difference, excepting in the case of North Shore. North Shore invariably stands out well in the returns.
593. *Mr. Garrard.*] You make North Shore bear the sins of Waterloo? No; that is a mistake.
594. *Mr. Humphery.*] You group them? The figures correct themselves in this way: Waterloo has an apparently high death-rate, because a number of children are born there, and I distinguish the deaths of persons under 5 years from those of persons over 5, and that enables the relative death-rates to be seen. I find that, taking the children under 5 years, from 1872 to 1879, 64 children, speaking in round numbers, out of every 1,000 died within the year in the suburbs, and that in Sydney the average death-rate for those nine years was 77 to every 1,000. During the last nine years 75 children in every 1,000 died per annum in the suburbs, whereas in Sydney only 68 died in that number, and that increase has been pretty general during the last eighteen years, showing that Sydney has become fairly healthy. Although 68 is still actually a high rate, being more than it ought to be, it is much better than that of the suburbs. Taking children under 1 year of age of course Sydney shows out very badly, because the Benevolent Asylum is in Sydney, and it is a lying-in hospital.
595. *Mr. Garrard.*] I thought you excluded the public institutions from these calculations and took them altogether? I do in the districts, but in taking the suburbs as a whole the hospitals must be included. Taking persons over 5 years of age I find that the suburbs have advanced from 9 per thousand to 14 per thousand, and that the city has sunk from 16¾ to 14 per thousand, showing an improvement in the death-rate of persons over 5 years of age. There has been an improvement in Sydney, but a deterioration in the suburbs.
596. *Chairman.*] Have you in your own mind found any reason why the death-rate of Sydney should be less than that of the suburbs? I think it is entirely a question of sewerage.
597. That is they have fairly got sewerage in Sydney, but none in the suburbs? The circumstances of Sydney are not different from the circumstances of some suburbs. Redfern is just as thickly populated as some portions of the city are. There is very little spare ground about those places.
598. Is there a sewerage system at Redfern? No. I am mentioning this to show that there are just as many people in some of the suburbs as in Sydney.
599. But you have a fairly perfect system of drainage in Sydney that they have not in the suburbs? Yes.
600. Should you attribute to that the higher death-rate? Yes; in one place they have sewers, and in the other they have not.
601. How does the death-rate of Sydney compare with the death-rate of other large towns? Very favourably indeed. When I speak of Sydney being bad, I mean bad compared with what it might be; but compared with the cities of the old world it is very good. Sydney has an average death-rate of 20·5; whereas London, which is reckoned to be an extremely healthy city, has a death-rate of 22·8; Manchester, 29·9; Dublin, 29·6; Liverpool, 29·1; Birmingham, 24·4. Among the continental cities St. Petersburg has a death-rate of 35·2, Berlin 26·4, and Paris 26·3.

602.

602. Under those circumstances Sydney comes out very well as compared with other large cities? Very well indeed. There are very few cities with the population of Sydney with so low a death-rate. T. A. Coghlan, Esq. 21 Dec., 1888.
603. Have you any record of the death-rate of the other large Australian towns? Adelaide has a death-rate of 19·2; that is somewhat better than Sydney; Melbourne 20·6, which is practically the same as that of Sydney; Brisbane has a rate of only 19·8; Wellington 15·8. New Zealand is one of the healthiest countries in the world.
604. *Mr. Suttor.*] The density of the population in the suburbs has very much increased? In the last eighteen years I speak of?
605. Yes? It has increased very much.
606. Of course the population in Sydney would not increase so much? Nothing like so rapidly.
607. The buildings put up in the city are very much improved as well? Yes; the buildings are better.
608. Both of these considerations would tend to establish the fact of a high death-rate in the suburbs and a low one in the city? There may be a dense population and fairly good health. The suburbs are not overcrowded. When they become overcrowded then another element of death comes in; but you cannot speak of any of the suburbs as being overcrowded.
609. *Mr. Garrard.*] How do you arrive at the population of the city. Do you put down everyone. For instance, a large warehouse employs 100 men;—do you class all those men as belonging to the city, or only the caretaker who lives on the premises? No; only the caretaker.
610. Only the person who actually lives there, sleeping there,—is that the definition? Yes.
611. *Mr. Copeland.*] I think you said that in estimating the deaths in the city and suburbs you keep the deaths occurring in hospitals separate? Yes.
612. You do not debit Sydney, for instance, with any deaths occurring in hospitals? I keep them separate, and show them both ways. I give all the deaths in the city, and I then show the number, deducting the public institutions.
613. In these general estimates, making a comparison between the death-rate of Sydney and that of Melbourne, do you include the deaths in the hospitals? Yes; they would be included in both estimates.
614. Are they included in Melbourne? Yes; the year I gave you was a healthy year.
615. In that case a great deal will depend upon the locality of the hospitals in different places? When I use the term "Melbourne" I mean Melbourne and its suburbs, so that you see the objection would not count.
616. It would be Sydney and its suburbs as against Melbourne and its suburbs? Yes.
617. *Mr. Garrard.*] Can you give us the death-rate for Melbourne proper as against Sydney proper? I have the record, but I could not give it you at this minute.
618. *Chairman.*] But that would not include the death-rate of the hospitals in the suburbs? It would not.
619. Do you include the deaths of persons who go to the hospitals? Yes.
620. *Mr. Garrard.*] And you base your calculations practically on the same grounds as those of other cities? Practically on the same ground.

George Henry Stayton, Esq., M.I.C.E., Engineer, Sewerage Branch, Department of Roads and Bridges, sworn, and further examined:—

621. *Chairman.*] You are still connected with the Roads and Bridges Department? Yes; in the Sewerage Branch. G. H. Stayton, Esq. 21 Dec., 1888.
622. You have been actively occupied in connection with the survey and the designing of the sewerage system of the Western Suburbs? I have.
623. And you know the point where it is intended to drain those suburbs? Yes.
624. What point did you describe the other day as that at which these main sewers are to discharge? The main outfall sewer will cross Cook's River, and pass through a part of Arncliffe, on the south side of Cook's River. The total distance is 11,700 feet from Marrickville to Webb's Grant, the point of discharge.
625. And that forms a portion of the neck of land which we inspected the other day at Botany? That forms the western portion.
626. It is a sort of promontory coming down from Cook's River? Yes.
627. You have given some attention to the purification of sewage in the old country? Yes; I had some years of experience there.
628. Have you always regarded the absorption of sewage on farms for the growth of vegetation an effectual means of disposing of it? Yes, but it depends entirely upon the conditions. There are certain localities where irrigation is the best system to adopt, and there are others where it would not be desirable. Everything depends on the local conditions. The conditions at Webb's Grant are most favourable to filtration.
629. And thus absorbing the sewage generally? Yes.
630. From your experience at home have you formed any opinion as to the character of the soils on which the sewage has been deposited? Yes, and it has generally been considered that a light porous soil is the most suitable for irrigation.
631. Have you had any experience of soil similar to that at Webb's Grant, where it was almost pure silica? No; except at Edinburgh. That is the only case with which I am familiar.
632. Is the ground very sandy there? It is somewhat similar to the soil at Webb's Grant.
633. Do you recollect the result of the use of the sewage; I mean in producing crops? I know generally that it has been successful.
634. I mean especially with regard to Edinburgh, where the character of the soil is similar to that at Botany? I have no special knowledge of what has been done at Edinburgh; but I have some information with regard to other sewage farms. The Croydon sewage farm is one of the largest sewage farms in England; I lived in the locality and used to see it daily.
635. That is clay soil? It is partly clay and partly gravel.
636. The water goes through a system of underground drainage? Yes.
637. That is tile drainage? No; it passes through pipes.
638. Have you had any opportunity of knowing what depth the drains have been made? No; but they were not laid at any very great depth—3 or 4 feet probably.
639. They empty into main drains? Yes.

G. H. Stayton, Esq. 21 Dec., 1888.

640. Into open drains or larger pipe-drains? Into larger covered drains, and the effluent is carried to the nearest river and discharged there.
641. Is that a tidal river? No.
642. Is it the Thames? No, the Wandle.
643. Did you say the Wandle? Yes; it flows into the Thames at Wandsworth. I noticed in a report of the sewage farm committee of Croydon some short time since the following particulars:—
"1. That the monthly analyses of the several effluents from the sewage farm were of excellent quality.
"2. That the mortality tables for the parishes in which the sewage farm is situated were equal to an annual death-rate of 6·78 per 1,000 of the population.
"3. That the bullocks and other grazing cattle were all healthy and well.
"4. That the milk from the cows was satisfactorily sold, and that additional cows were to be purchased
"5. That the Chairman stated that the farm was in a satisfactory condition all round. The manager had grown and sold nearly £2,000 worth of grass; had made a quantity of hay, and had grown some exceptionally fine specimens of mangold-wurzels, some weighing from 13 lb. to 16 lb. each. The financial return for the year would altogether be about £3,000 better than that of last year."
This shows that it is a very large undertaking, and that after many years of labour the Committee have seen their way to make it a remunerative business.
644. And they have a mixed system of farming, grazing, and agriculture together? Yes; that is being done generally in England now. Apart from the question of sewerage irrigation, farmers have found it necessary to turn their attention to it. I am also acquainted with the sewage farms at Coventry, Rugby, Warwick, Leamington, Wimbledon, Epsom, and Bedford. The Croydon farm is the most efficient of all.
645. Is that all covered drains? Yes; the Croydon farm is entirely sub-drained, I believe.
646. Do you recollect the diameter of the drain pipes? Some are 3 inches, some 4, and others are larger.
647. The intercepting drains would be greater than the branches? Yes. They vary from 9 inches to 12 inches and upwards.
648. I suppose the water clarifies as it percolates through the ground into the drains? Yes, it is so purified.
649. Have you noticed any smell from it? I have not; it was generally very satisfactory. No exception whatever is now taken to the farm by the residents in the neighbourhood. Some years ago there were very loud complaints, but the Corporation at that time had not sufficient land. They have since bought an additional 500 acres, and the system is carried out satisfactorily.
650. In viewing the irrigation systems which you saw at the places you have mentioned, were you impressed by the superiority of one system over another, or were they all carried on under similar conditions? They were all carried on in a similar way, but some were better managed than others.
651. Could you discover any difference in the character of the soil, whether it was clay, marl, loam, sand, or gravel? The soil varied between clay, marl, gravel, and chalk.
652. And you think the drainage was equally perfect under the different conditions? I am not prepared to say precisely what the results were.
653. You heard no complaints? No; but in some instances the authorities produced much heavier crops than in others.
654. Have you any record of any of the returns of the crops at those sewage farms? Nothing very recent.
655. You saw the crops at Webb's Grant the other day? Yes.
656. Did you see anything more luxuriant than that in the Old Country? No; I cannot recall anything better. I have seen very large root crops in England, mangolds and turnips.
657. They are used largely for feeding stock, I believe? Yes.
658. What is your impression of the ultimate result of the adoption of sewage for the cultivation of the soil at Webb's Grant;—do you think it will come ultimately to be made the means of using up the sewage? My impression is that such ought to be the case. Under good management and careful supervision I believe that in the course of time there will be a revenue from the operations there, and that the sewage will be perfectly purified and rendered innocuous.
659. When visiting the farm have you noticed any offensive effluvia from the water on its escape after percolating through the sands? No, none whatever.
660. Have you observed any where it emptied itself? No. I scarcely think it possible to notice where it escapes, except perhaps at low water.
661. I thought we had evidence of its having been seen percolating into the bay? I am not aware of it.
662. Before the drainage works now before us have been completed, considerable work will have to be done; that is before the system is perfect? Yes.
663. Could you explain the nature of the work which will have to be done if the present design is carried out? The Committee will probably recollect that a supplementary statement [*Vide Appendix* C 1.] was submitted to them at the previous meeting, and that it showed that in addition to the scheme now under consideration, which is estimated to cost £830,304 other works would be necessary. There would be what is termed the subsidiary sewers to be laid in 400 miles of streets. In the first instance it might only be necessary to lay 300 miles.
664. Is that comprised in the present project? It is not. The present project comprises the trunk sewers as marked by the red and blue lines on the map. [*Vide Plan No.* 3.] The next thing to be taken into consideration is the first part of the Canterbury and Enfield main sewer, which is indicated on the map by a red dotted line, and referred to at length on page 16-17 of the report.
665. *Mr. Garrard.*] What is the estimated cost of those subsidiary sewers? £1,000 a mile is the average. I have taken it at that rate, which makes a total of £300,000 for the first section.
666. The sewer will have to be duplicated on this extension? Yes; that work is described in the report as being very necessary, and on page 21 it is shown that it is estimated to cost £20,741. Then there is the question of the Marrickville storm-water drainage, described on pages 22 and 23 of the report, the cost of which is estimated at £20,000. That work is not only for the removal of storm-waters but also includes the raising of the low parts which are now flooded.
667. For actually raising the surface of the land where it is below high-water mark? Yes. That brings up the cost of the first section of the additional work to £340,741. It will subsequently be necessary to consider the works included in the fourth section, and to complete the subsidiary sewers, viz., the remaining 100 miles, at a cost of £100,000.

668.

668. You have said that 400 miles of street sewers will be required, 300 of which you estimate going on with at once;—how much of those subsidiary sewers have to go into the dotted line? Probably from 20 to 25 miles out of the 100. The completion of the Canterbury and Enfield main sewer is estimated to cost £65,410. It is shown by the red dotted line. The low-level systems were foreshadowed and described in the report (*vide* p. 17), but were not included in the present scheme, because it was scarcely possible to tell which portion would be first required. In four or five years time the main-sewer works will have been so far constructed as to be ready for the low-level systems. I might, perhaps, describe the low-level systems. The supplementary map [*vide* Plan No. 4] showing the present low-level area west of the Glebe, and the suggested mode of dealing with the sewage thereof, was recently laid before the Committee. The area is divided into three parts. The northern part includes Leichhardt, Balmain, and a portion of the Glebe, and is estimated to cost £52,925. The western part, including the low-lying portion only, of Burwood, Five Dock, Ashfield, Concord, and Strathfield, is estimated to cost £48,625. The southern portion, comprising Canterbury and Enfield, is estimated to cost £18,100; making altogether £119,650 as the total cost of the low-level system. This is the cost of the complete system, but the whole of that may not be required for very many years. The annual cost for wages, fuel, repairs, &c., is estimated at £5,627. Practically this provides for the whole area of the western suburbs, and it may not be wholly required; but in order to make the estimate complete, the scheme is inclusive of everything as far as can be seen. G. H. Stayton, Esq. 21 Dec., 1888.

669. The total cost would be £119,650? Yes.

670. *Chairman.*] That is of the low-level system? Certainly. It is all mentioned in the report on page 17.

671. What was the extreme limit of this system;—does it go beyond Cook's River? No.

672. Except where the main sewer conveys the sewage to Webb's Grant? That is so; the area is between Parramatta and Cook's Rivers, and does not go further westward than Homebush Station. I have also to explain the item for the completion of the western outfall sewer. The report distinctly foreshadowed that owing to the adoption of a 6 feet sewer in triplicate, a considerable sum would be saved by providing two sewers only until there was a necessity for the third sewer. It is included in the supplementary estimate; and to make the triplicate sewer complete would cost £48,374 more. The next item is the completion of the Marrickville pumping station, which was also foreshadowed in the report, which stated in the first instance that only a 40 horse-power engine would be required, which would be supplemented from time to time until the 120 horse-power became necessary, increasing the cost by £6,817. There is also the completion of the sewage farm and the laying out of an additional 250 acres. The land proposed to be resumed is coloured green on the plan, and the cost is estimated at £32,600. These works bring up the total for the fourth section of the work to £372,851, making a grand total, including the works already executed, of £1,817,896. That is, as far as can be seen, the ultimate cost of the entire scheme.

673. What mode of treatment would be adopted for dealing with the whole volume of sewage in ten or fifteen years' time? I should like to call the attention of the Committee to the remarks on pages 19–20 of the report. It is there shown what the effect of the whole volume of sewage would be on this area of land, and what the limit would be; but I think that the figures, from what Mr. Oxley has told the Committee, are very much understated, and that the sand would absorb a great deal more liquid sewage than we have any idea of; but as far as I can tell there is more than sufficient land than would be necessary for a population of half a million persons. The prospective population is 351,545, so that we have a large margin. In the first instance it would only be necessary to gradually clear and prepare a portion of the land, and month by month and year by year, as additional sewage was brought in by the new sewers, the area would be increased; but as far as we can see there is not the slightest doubt that the area, including the additional part, will be more than ample for many years to come; and then, if it should so happen that there is any difficulty in the question of disposal, it will be a simple matter to resort to some other mode of treating the additional volume of sewage—either by electricity, by a chemical process, or by continuing the outfall across George's River to the Pacific Ocean.

674. Then have you given any consideration to the new system of purification by electricity? Yes, and I have certain information thereon. In fact, I might read to the Committee a few notes I made on the question some two or three months ago. The system of sewage purification by electrolysis is now being carried out at Crossness main sewerage outfall in London, where it is intended to treat 1,000,000 gallons of sewage per day, or $\frac{1}{12\frac{1}{2}}$ part only of the entire daily flow. The Metropolitan Board of Works have allowed Mr. Webster to construct tanks and provide engines, dynamos, electric light, and all plant at his own cost, estimated at £5,000 to £6,000. The time required to treat 100 gallons takes ten minutes at the outside, and the engine-power provided consists of two 25 nominal h.p. engines, which indicate to 43 h.p. each. Mr. Webster says that electrolysis is nothing more than a chemical action produced by an electric current. The *Engineer*, a leading professional paper, states that the question to be determined is, whether an effluent, inoffensive to sight and smell, free from all secondary fermentation, exercising no precipitating action on the water of a river, and having no matters in suspension, can be produced at a reasonable cost. Very little data is given or known as to the cost of treatment; but I have endeavoured to arrive at an idea from the figures supplied by Mr. Webster. The estimated cost can only be considered as very approximate. It will probably be several years before any definite results can be safely established; and it may be, as in nearly all other cases of the application of electricity, that practical experience will greatly cheapen, if not transpose, the present ideas. I estimate the approximate cost of the process, according to Mr. Webster's figures and at Sydney current rates, at £7 13s. 9d. for 1,000,000 gallons treated per day, or if 20,000,000 were treated per day, at £4 7s. 5d. per 1,000,000 gallons. These calculations include interest and repayment of outlay, and depreciation, fuel, labour, iron, &c. Compared with the cost of irrigation or filtration at Webb's grant, as proposed by the western suburbs sewerage scheme, it is much greater, the latter being under £1 per 1,000,000 gallons disposed of. I have great hopes that the system will prove both a scientific and successful commercial undertaking; but I think that this will not be realised for several years to come. At the meeting of the British Association at Bath in September, 1888, the president of the mechanical section—Mr. W. H. Preece, M. Inst., C.E., F.R.S.—said of electricity: "Our sewers are likely to find in its active chemical agency a power to purify poisonous and dangerous fluids." It is a remarkable coincidence that Mr. Webster, of London, and Mr. Roberts, of the Sewerage Department, Sydney, should have been so close together in their investigations. Mr. Roberts submitted his idea to the Government of New South Wales in November, 1887, and patented his process in Sydney on the 19th November, 1887. Mr. Webster made experiments in July, 1887, and had provisional protection in England on November 17th, 1887, and in New South Wales a patent was granted

G. H. Stayton, Esq. 21 Dec., 1888.

to him on 10th February, 1888. I distinctly recollect, however, reading an account of somewhat similar experiments at some place on the continent of Europe about two years ago, and that the process was found too costly. The system may hereafter be found of much service in this colony; but its present aspect would not justify any application of it to the system of sewerage under consideration. I believe that Mr. Roberts is still experimenting at the southern outfall works at Botany.

675. Is it not found that electricity is expensive at first? Yes; but the cost of its application has generally been considerably reduced afterwards.

676. *Mr. Street.*] What is the effect of the system of electrolysis—does it purify the liquid? Yes.

677. And then leaves the solids to be dealt with? Yes, but the quantity is very small. It purifies the liquid, and the effluent is clear, and the amount of sewage sludge is smaller than under the chemical process.

678. *Chairman.*] Are the ingredients used in any way afterwards? No. As a matter of fact the question has not yet taken any definite position so far as I know. It is only in London and Sydney that experiments are being tried.

679. It would be a small arrangement I suppose? At present, of course. It may prove a most valuable invention and be of great use in this country, especially in up-country towns; but so far as one can see there is no likelihood of its being required at Webb's Grant for many years to come.

680. How do you propose dealing with the low-level areas shown on the plan? The plan and report show that 29 per cent. of the whole area is too low to be drained by gravitation. A pumping station would have to be erected at Marrickville, and central compressing stations under the "Shone" system would be required at Leichhardt, Burwood, and Canterbury.

681. How will you deal with it at Marrickville? By the direct pumping system. The sewage would flow to the station through the brick and pipe sewers, and would be pumped into a high-level sewer gravitating to Webb's Grant.

682. *Mr. Street.*] Sewage is raised by the pneumatic system instead of pumping in some cases? Yes, under the "Shone" system; and it is more economical.

683. *Chairman.*] Is it working satisfactorily? Yes; it has been in use in various towns in England for a number of years, and has been the means of rendering a part of Eastbourne habitable where formerly land was flooded. There is another matter which, perhaps, should be mentioned, and it is this: I have examined the various points of the scheme now under consideration to ascertain whether any modification could be made by which any portion could be made more effective or convenient. I venture to think that the Committee might very properly consider a modification of the arrangements shown on the plan for the sewerage of the eastern part of Leichhardt and for Balmain. Such proposal consists in the substitution of an aqueduct for the 42-in. syphon at Johnstone's Creek, as shown on the supplemental plan which I now lay on the table [*vide* Plan No. 5]; and in lieu of the 40-in. syphon at White's Creek, and the gravitation and low-level sewers for the remainder of the district, as coloured red on such plan, to provide an entirely low-level system of main sewers and submains for an area of 1,200 acres, with a pumping station in the vicinity of White's Creek. The extra outlay on the present scheme which this modification would involve would amount to £44,667, making a total of £874,971; but in consequence of the saving on subsequent works which such alteration would effect, the estimated ultimate outlay [*vide Appendix* C1] would only be increased by £8,742, making £1,826,638 in all. The effect of such modification upon the annual drainage rate would be to temporarily increase the 8d. rate mentioned in the appendix to 8·36d. in the first instance, but such rate would gradually be reduced to 7·07d. instead of 7d., as shown in the general statement dated December 3rd, 1888. [*Vide Appendix* C3.] On the whole I am of opinion that the greater efficiency which would thus be ensured, together with the fact that some 600 or 700 acres comprised in the thirteen low-level areas in question (some of which are becoming thickly populated) would thus be provided with main sewers, without having to wait for the supplemental "Shone" system, is a sufficient justification for the slightly increased annual charge. Under the present scheme the borough of Balmain is proposed to be drained by gravitation sewers, supplemented by the "Shone" system. Balmain, however, is more complicated than any other part of the suburbs, and I think if the Committee consider the figures they will probably deem it desirable to approve of this alternative scheme. In short, if the low-level system only is to be adopted for Balmain, instead of the two, the extra cost would only amount to £8,000, and would practically make no difference to the rating.

684. Would that be the pneumatic system? No; that would involve direct pumping.

685. *Mr. Street.*] Where would be your nearest gravitation main? Close to; within a few hundred feet at the most.

686. You are in favour of a low-level system for Balmain? Yes, the extra cost would be small; it would not average one-fifth of a penny in the £ on the rate. Instead of being 7d. the rate would be 7·07d.—a very small addition.

687. Is it not a large area to pump? Yes. It is 1,200 acres, and the population thereon will eventually be 50,000; but the extra cost of pumping as compared with the "Shone" system would not be more than about £1,760 per annum.

THURSDAY,

THURSDAY, 20 *JUNE*, 1889.

Present:—

JOSEPH PALMER ABBOTT, Esq. (CHAIRMAN).

The Hon. JOHN LACKEY.	JACOB GARRARD, Esq.
The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	JOHN SUTHERLAND, Esq.
The Hon. JAMES WATSON.	EDWARD WILLIAM O'SULLIVAN, Esq.

JOHN HURLEY, Esq.

The Committee further considered the proposed Drainage works for the Western Suburbs.

Joseph Barling, Esq., Under Secretary for Public Works, sworn, and further examined:—

688. *Chairman.*] You are the Under Secretary for Public Works? Yes.

689. And you were formerly, I think, examined in connection with the proposed drainage works for the Western Suburbs, before the Public Works Committee? Yes. J. Barling Esq. 20 June, 1889.

690. It has been stated that since your examination on that occasion experiments have been made upon sewage matter by electricity, and that by the use of that system a great deal of the proposed expenditure in connection with these drainage works may be saved? That is the case.

691. Will you tell us what this system is? I may mention that since the Committee last met experiments have been made both here and on a very large scale in England, in connection with the purification of sewage matter by electricity. The matter has assumed such importance that Mr. Bennett has thought it desirable to write a minute to the Minister upon the subject, a copy of which I hold in my hand. It is as follows:—

Roads, Sewerage Branch, Sydney, 17 June, 1889.

MINUTE PAPER.

Subject:—Drainage of Western Suburbs.

IN further reference to the proposed purification of sewage by electrolysis, now that it begins to assume a practical form, and from experiments at home and in the Colony promises to be successful, it is my duty to bring under the notice of the Minister for Works the propriety of delaying action with regard to a great part of the scheme for the sewerage of the Western Suburbs.

Before that project is again brought under the notice of the Public Works Committee inquiry might be made to determine if by the aid of electrolysis a more economical system could not be adopted.

I do not concur with the view put forward by extreme advocates of the system of electrolysis, that each premises could be dealt with separately by a wire, but I think the most we can expect is that each catchment could be dealt with separately at its outlet as proposed by Mr. Cowdery, by chemical means, thereby avoiding the expensive long conduit and large sewers.

The electrolysis system seems to effect such a complete purification that the objections made to the imperfect chemical processes might not hold good. However, I think this matter should be inquired into in the light of the further information being obtained previous to going again before the Committee.

This will not apply to some portions. The Balmain drainage, which it was proposed to provide for by gravitation to Bondi, requires objectionable syphons and other adjuncts. It might, I think, be drained towards Long Nose Point, and the effluent there run into Port Jackson when the electrolytic purification is quite proved.

The remainder of the Western Suburbs scheme gravitating to the city sewers, that is, the Glebe, Camperdown, southern branch from Macdonaldtown and Newtown, might be dealt with by the Committee and carried out if approved of by them, also the Marrickville and Newtown low-level system. The estimated cost as per report will be shown on attached paper, £260,786. I send on this hurried memo. just to raise the question in the light of the latest information before the Minister pays his promised visit to some of these localities.

WILLIAM C. BENNETT.

Under Secretary for Public Works.

ORIGINAL scheme of Balmain, up to Johnstone's Creek:—

Balmain and Leichhardt.—Inclusive of 46 shafts—9 man-holes and ventilators—17 automatic flushing chambers.

	£
Main sewer, 2 miles 1,670 yards	48,401
Sub-mains, 3 ,, 136⅔ ,,	43,195
6 miles 46⅓ yards.	91,596

NOTE.—This scheme to be altered so as to come under the electrical treatment.

THE GLEBE from Johnstone's Creek to Newtown Road:—

The Glebe.—Inclusive of 20 shafts—4 man-holes and ventilators—5 automatic flushing chambers.

	£
Main sewer, 1 mile 610 yards	27,117
Sub-mains, 2 ,, 376⅔ ,,	27,181
3 miles 986⅔ yards.	54,298

Camperdown Branch.—Inclusive of 5 shafts—6 man-holes and ventilators—1 automatic flushing chamber.

Main sewer, 1 mile 140 yards £12,454

Southern Branch.—to Main Botany Sewer.

Inclusive of 16 ventilating shafts and man-holes—2 automatic flushing chambers.

	£
Main sewer, 1 mile 780 yards	10,289
Sub-mains, 1,230 ,,	2,856
2 miles 250 yards.	13,145

MARRICKVILLE AND ST. PETERS' low-level system.

Marrickville and St. Peters.—Inclusive of 71 shafts and man-holes—6 automatic flushing chambers.

	£
Main sewers, 3 miles 450 yards	62,076
Sub-mains, 1 ,, 1,074 ,,	16,217
Pumping station, including boilers, engines, &c.	11,000
	89,293

J. Barling, Esq. 20 June, 1889.

Six months ago, when Professor Threlfall was about to visit Europe, he was asked to inquire into this matter, and to make a report thereon to the Government on his return. Experiments on a very large scale have been carried on there in connection with a system patented by Mr. Webster, I think. Professor Threlfall has been to England, and is now engaged in preparing his report, which, I think will be ready in a few days. I would therefore suggest that Mr. Bennett be examined again first, and that Professor Threlfall be also called before the Committee. I have had a conversation with the Minister on the subject, but it has not been finally dealt with by him.

692. *Mr. Lackey.*] But I take it that it is the wish of the Department that this evidence should be given to the Committee? Quite so.

693. *Chairman.*] And you think that until Professor Threlfall has reported, it is no use obtaining further evidence? I think that Professor Threlfall will be able to give his evidence at once.

694. As to the dredge for Sydney Harbour;—are you ready to go on with that matter? No, we are not. I am not sure whether we shall not be able to do without it.

695. You have bought one? No. We are getting out some sand-pump dredges, and it is just possible—I am speaking now subject to correction on further inquiry—that they may be used in places where bucket-ladder dredges are now being employed, and thus release these dredges from work on which the proposed new dredge would have been employed. Three of these sand-pump dredges have been ordered.

696. The Richmond and Clarence River matters;—are they ready? Yes; they can be gone on with as soon as the Committee wish.

William Christopher Bennett, Esq., M.I.C.E., Commissioner, and Engineer-in-Chief for Roads and Bridges and Sewers, sworn, and further examined:—

W. C. Bennett, Esq. 20 June, 1889.

697. *Chairman.*] You are the Chief Commissioner for Roads? Yes, and Engineer in charge of the sewerage works.

698. Mr. Barling, the Secretary for Public Works, has produced a minute written by you to the Minister on the treatment of sewage matter with electricity. Can you give us any information upon that subject? When I was last before the Committee, I referred to this process of electrolysis for clarifying sewage matter, and I mentioned that it was being investigated by the Department, having been discovered by one of the draftsmen. I directed this gentleman, Mr. Roberts, as the discovery was a valuable one, to secure his interest by patenting it; and this he did. I then represented the matter to the Minister, and had his authority to incur some small expense to make experiments on a larger scale at Botany than could be done by Mr. Roberts. During this time we received in the professional papers from England information that a similar discovery had been made in London, and although the discovery here was made simultaneously with that made at home, I have no doubt that Mr. Roberts' discovery was certainly his own, and that he had not had information of the other discovery. At my instance that matter was then referred by the Minister, Mr. Sutherland, to Mr. Threlfall; but he, because of the incomplete state of his laboratory, was unable to make any experiments until he went to England. There he visited Crossness, where experiments were being made on a large scale for the London Commission, and reported most favourably on the system. I therefore represented to the Minister that before the very large expense necessary to carry out the drainage proposals for the railway suburbs was incurred, this matter ought to be investigated. Balmain was connected with the Bondi sewer by a system of syphons; but I pointed out that if the results obtained by electrolysis on a small scale could be obtained on a large one, a large proportion of the expense of these works could be saved, and that the effluent water from the sewage of that borough, purified by electricity, could be drained into Port Jackson without creating an offence. I thought that the portion of the scheme which has reference to the suburbs gravitating to Botany, such as Macdonaldtown and parts of Newtown, the low-lying portions which it was proposed by Mr. Stayton should be pumped, and which must be pumped, might be considered by the Committee, and if they were prepared to recommend the execution of those works, the scheme would be so much in advance. In the meantime a further investigation could be made into the application of this system to the more expensive parts of the project, so as to ascertain whether the sewers proposed by myself and Mr. Stayton should be carried out, or whether a number of smaller works, draining into Port Jackson and the Parramatta River, as proposed by Mr. Charles Cowdery, should be constructed, with a system of electrical purification at their mouths. I simply drew the Minister's attention to the propriety of considering the matter in that respect; the time was too short to give any detailed estimates or comparisons.

699. You have not Professor Threlfall's report upon what he witnessed at home? We have not. What he will have to say will be very interesting.

700. *Mr. Watson.*] Is it your opinion that the Committee should proceed any further with the consideration of this general sewerage scheme until we get Professor Threlfall's report? I think it would be very important to get Professor Threlfall's report at once, before going any further.

701. *Mr. Lackey.*] You have not made tests of this system yourself at all? Yes, at Botany. When we found that Professor Threlfall was not able to make any tests, and that the matter was so important, with the approval of the Minister I borrowed dynamos and steam-engines, and went to an expense of between £50 and £60 in making experiments. We found that the results on a larger scale corroborated Mr. Roberts' results on a smaller.

702. The experiments were successful? Yes.

703. Does this process separate the liquid from the solid, or does it only purify the liquid? It purified it so much that I had no hesitation in tasting the water.

704. Under those circumstances there could be no objection to its being drained into a harbour, creek, or river? No objection, provided that decomposition did not occur afterwards. Frequently, after effluent waters which have been chemically treated have been flowing down a river for two or three days, they become bad again, though I do not think they will do so when treated under this process. But it is a very important point, and Professor Threlfall's evidence upon it—secondary decomposition I think they call it—will be very desirable.

705. Does this electric system lessen the quantity of solid as well? It precipitates it. It is simply oxidising the matter more rapidly than it would be oxidised by nature if deposited in a flowing stream. No matter how bad sewage is, if you put it into a flowing stream, after 10 or 12 miles it becomes purified. As far as I can see, electrolysis simply compresses the process into a shorter time.

706.

W. C.
20 June, 1889.

706. *Chairman.*] The water could be allowed to flow away, but the solid matter would still have to be removed? Yes, but it would be small in quantity and comparatively easily dealt with. That is a point which needs further elucidation.
707. Are the reports from the Board of Works in London, which is using this system, favourable;—do you regard them as favourable? So far as we have seen they are favourable. There was an article in the *Engineer* the other day about the matter; but Professor Threlfall, who has just visited the works, can give you more information than I can about them.
708. *Dr. Garran.*] You deal with this matter at the outflow? Yes.
709. If this system is carried out you will have certain collecting stations at which you will deal with the sewage? Yes.
710. On the road? Yes; instead of bringing it all down to Webb's Grant we would have collecting stations at more frequent intervals.
711. You will deal with it in sections? Yes, if practicable. I am not proposing this scheme; I only offer it for consideration.
712. Then the less diluted the sewage is the better the system of electrolysis will deal with it? I should think so. There would be less difficulty in dealing with a small quantity of fluid than with a large. I fancy that you would have to expose the larger quantity longer to the process.
713. If that were the case it would be important to keep storm-water out of the sewers? Yes; but we do that as much as possible now.
714. But you admit a large proportion of it? We admit some; I think it is impossible to keep it all out.
715. If you are lessening the size of the pipes it is strictly important to keep the storm waters out? Yes.
716. You consider it necessary to take in water from back yards? Yes. There is a paper by Mr. Stayton on that subject before the Committee, which I think is very valuable. It combats the complete separation of each.
717. Do you think that the dirtiness of the washings from back yards is worse than that from the washings of horse-droppings on the roads? I rather think it is.
718. Still it would be important to keep the quantity of water down as much as possible? Yes; but there is always a minimum size for the pipes beyond which it is not well to reduce them, so as to prevent stoppages. As a rule we never put down less than a 9-inch pipe.
719. I understand you to say that you think the Committee may go on at once considering the Camperdown, Glebe, and Marrickville portions of the sewerage scheme without waiting for further evidence on the subject of electrolysis? Yes.
720. But if that system is going to be a success would you not be able to use smaller pipes, or earthenware pipes, in those districts? Yes; we could substitute earthenware pipes for the sewers. The possibility of reducing the size of the sewers was the point to which I wished to draw the attention of the Minister.
721. Would it not be possible under this new system to drain the Camperdown area, which goes into the Prince Alfred Hospital Branch and the Glebe, with earthenware pipes? It might be possible, but then you would have to have a place where this system of electrolysis could be carried on, and if you waited for that system you might have to adopt an entirely different scheme. I suggested that as we have the gravitation sewer to Bondi, the system of gravitation should be adopted.
722. Your object is to throw into Bondi all that can be thrown into it by gravitation? Yes, and into Botany.
723. With the exception of the sewerage of Balmain, which matter you now propose to reconsider? Yes.
724. With regard to Camperdown and the Glebe, if you carried out the scheme which is proposed by Mr. Stayton there, and afterwards found that electrolysis was a very great success, you would have gone into a larger expense than was necessary? The sewers there are not large.
725. They are brick sewers? Yes.
726. And they are at some considerable depth? You will have to go to that depth whether you have pipes or sewers, and if there was any tunnelling you would have to have the sewer the minimum size in which a man could work.
727. If the other portions of the scheme are to be reconsidered, ought we not also to leave Camperdown until we find out more about this matter? If you will allow me I shall answer that question when I am able to answer it categorically. I shall have the matter investigated.
728. With electrolysis could we not introduce the earthenware pipe system very much more than Mr. Stayton has introduced it, and with more economy? It was with that view that I recommended that those portions of the scheme where there was a large population should be reconsidered. The portions where there was a smaller population did not seem to me so well worthy of consideration; but I shall have the matter further investigated.
729. With a view to that? Yes.
730. Suppose the Glebe is treated by electrolysis, do you think it probable that the collecting place will be near the syphon in George-street, or near the head of the bay? A great deal depends upon the character of the effluent water. It might be desirable having it going into the syphon.
731. For the sake of the scour? Not so much for that as to prevent injury to Blackwattle Bay.
732. I am not proposing to turn anything into Blackwattle Bay; but if you had electrolysis the quantity of sewage to go through the syphon would be less than that under the existing system? A good deal less.

WEDNESDAY,

WEDNESDAY, 3 *JULY*, 1889.

Present:—

JOSEPH PALMER ABBOTT, Esq. (CHAIRMAN).

The Hon. JOHN LACKEY.	HENRY COPELAND, Esq.
The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	JOHN HURLEY, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

Richard Threlfall, Esq., Professor of Physics, University of Sydney, sworn, and examined :—

R. Threlfall, Esq. 3 July, 1889.

733. *Mr Lackey.*] You have been some time in England, I think ? Yes.
734. And have given some attention to this new system of treating sewage by electrolysis? Yes. I spent some days over it.
735. Electricity is a science in which you have taken considerable interest, and a subject to which you give your attention at the University? Yes. Of course this system of treating sewage is partially a chemical problem ; but I am as much a chemist as an electrician.
736. The Committee are engaged in the consideration of a scheme to treat the whole of the sewage of the western suburbs, and we think it desirable to have your evidence as to the effect of electricity upon the solids and fluids contained in the sewage. You have no doubt given considerable attention to this matter? I have.
737. From what you saw in England while you were there, were you led to believe that the system of electrolysis could be applied to ordinary sewage generally? I have no doubt that all sewage could be purified by this means—it is merely a question of cost. The process is a purely chemical one, and the chemicals employed are produced by electric agency in the sewage, and have not therefore to be added to it.
738. Then it is quite practicable if sufficient money is available? Perfectly. I think there is no question as to the perfect success of the process, setting financial considerations on one side. We have only Mr. Webster's figures as to the cost to go upon.
739. Have you made any experiment yourself? I made some small experiments of electrolysis on dilute solutions of salt, but, with that exception, I have made no experiments.
740. I take it that it would be very difficult to carry out experiments of this kind in consequence of the expense which would have to be incurred ? I have given an estimate as near as I could of the cost of a plant which would purify 1,000,000 gallons of sewage. I think that estimate is an outside one, because I have put the money on whenever I could ; but of course it is not necessary to make experiments on such a large scale.
741. What is your estimate? £5,214 for one year. At the end of that time you would have as an asset about £300 worth of iron, together with the engine and dynamo, which would come altogether to about £1,800.
742. I see from a statement of Mr. Webster that the precipitate is not likely to be used as a fertilizing substance? No ; he does not say that it will.
743. Would that be generally the case or would it be so only in exceptional cases ; in other words, would all the objectionable and fertilizing properties be extracted from the precipitate during the operation of electricity? The mineral principles are chiefly carried down with the sludge, but they are contaminated with iron, and although it is possible that the sludge might have some manurial value, still Mr. Webster does not claim that it would have a marketable value. There are many hundreds, if not thousands, of patents for treating sewage by chemical processes, and it has been usual for the inventor to claim that, not only could he get rid of the sewage, but that the sale of the manure manufactured would pay a large dividend upon the expense of the work. Now, the experience in all countries on this matter has led to the conclusion that if you make a precipitate which is marketable as a manure, you spend more on it on the whole than you get for it, while if, on the other hand, you make a cheap precipitate, you cannot sell it. Mr. Webster, bearing this in mind, does not claim any marketable value for his sludge. That being the case, of course we want the sludge to be as small in quantity as possible, so that it may be more easily removed, and I think I may safely say that the sludge produced by this process is the smallest possible. It is mixed with oxide of iron.
744. Is it the case then that the effluent, in proportion to the purity of the sludge, contains a greater quantity of objectionable matter—oxide of iron, or whatever it may be. Does it vary according to the manurial value of the sludge? The effluent has always to be brought up to a certain standard by getting rid of the sludge.
745. We are regarding the matter from a practical point of view. Our object is to see how far we can separate the objectionable properties of the sewage from the effluent we take away from it? The effluent is the sewage from which all objectionable matter has been removed.
746. According to the manurial value of the sludge, is the effluent more or less pure. For instance, I see by the report that Mr. Webster drank half a glass of the effluent. I take it that that was an evidence of the pureness of the water and of its freeness from any property that would communicate disease? Yes.
747. In that case would it be safe to convey the effluent to the nearest stream, river or harbour? Certainly ; that is the object of the process.
748. Then you think, if the process succeeded, the fluid may be taken into any stream, estuary, or creek, near to which the operation was carried out? Most decidedly.
749. What is proposed to be done with the sludge at home? The amount of sludge which has been produced from the sewage treated by Mr. Webster is not a very serious matter. He happens to have large contracting works going on in the neighbourhood, and my impression is that it was just dug into the ground. That is what would have to be done with the sludge obtained from the process here. It is a nuisance and has to be got rid of.
750. In that case it would not always be a fertilizer? I think that we may take it for granted that it will have a certain manurial value, but whether it will have such a value as would make it worth while to sell

sell I cannot say. Mr. Webster thinks it will not. If you are willing to pay for the removal of the sludge you would probably find that its fertilizing power is a small asset, but it is not to be calculated upon.
751. Supposing the sewage of a large town were treated in that way, has any calculation been made to show that the system would warrant the expense which would be incurred by digging the sludge into the ground? It is a thing which we must look at from a different point of view. The assumption is that you would have to get rid of it. If you are bound to get rid of it, if the protection of health requires that you should do so, I think the experience of all countries shows that you must be prepared to pay for getting rid of it, and not expect to get a profit. Out of no chemical process for treating sewage can you, as far as I know, expect to make a profit.
752. Do you know the method by which sewage is treated in England at the present time? I know that a good many ways have been tried.
753. By depositing it upon sewage farms? That has been, I think, a failure. Experience has shown that when sewage is successfully treated by that system, the farm, as a farm, is not a success, because the land has to take the sewage at times when it does not want it. On the other hand where the sewage is dealt out to the land according to agricultural requirements, its purification is not a success. Sewage is a nuisance, and you have to pay to get rid of it. In this as in other things you cannot have your cake and eat it.
754. Have you given sufficient attention to this subject to know which treatment, from a practical point of view, would be the least expensive for a town? That of course is a question for a sewage engineer, but as far as I have been able to inform myself by reading and conversation—never having had to treat the sewage of a town—the cost of a chemical process will depend almost entirely upon local conditions. It is almost impossible to say which method would be the cheapest for a specific place without having the local conditions given. In one place for example alum may be cheap. There are many chemical processess founded on the use of alum, which, as chemical processes, appear to be very efficient. Where alum or aluminous earth is very dear, however, these processes cannot compete in cost with certain other chemical processes. The process of treating sewage with alum is, I think, one worthy of attention; because I am told that there are large deposits of that substance within a comparatively short distance of Sydney. Dr. Tidy, whom I quote in the first part of my report, thinks that one of the alum processes, generally known as the A. B. C. process, gives as good an effluent as any which he has come across, and it also gives a sludge which has a manurial value. The manurial value of the sludge, however, in England does not pay a dividend because their alum costs so much that it swallows up all the profits; but in Sydney if we could get alum cheap that would not be the case. I think if the alum deposits exist they will have to be examined and experiments made in order to test their precipitating power. After such experiments have been made an idea may be formed as to the comparative cost of the alum and the electrical process. I think it would give a good year's work to a very competent man.
755. Have you given any attention at all to the matter which has been submitted to the Committee for its consideration—the drainage of the Western Suburbs? I have not been informed on the matter at all.
756. The expense of the scheme immediately under consideration approaches £2,000,000, so we are anxious to have your evidence on the subject of electrolysis. What do you think would be the smallest expense which would have to be incurred in erecting a plant which would enable us to come to a decision as to whether the process could be made available for treating the sewage of the Western Suburbs? That is a question which I am hardly in a position to answer. In my report I have given an estimate of the cost of a plant which would treat 1,000,000 gallons a day.
757. I take it that, for experimental purposes, it would not be necessary to go to nearly that expense? That, I was going to say, is a question for a sewage engineer to decide. I should be satisfied with a smaller experiment; but I am not a sewage engineer, and I should not like to express an opinion as to the smallest possible experiment which it would be necessary to make. There may be conditions of which a sewage engineer is aware, but of which I know nothing, which would render a large experiment very necessary. We all know that it is very desirable to have an experiment upon a large scale, but it may be essential, and the fact that Mr. Webster has gone to the expense to which he has gone leads me to think that it may be important to make a large experiment.
758. Do you think, in view of the work which the Government propose to carry out, that it would be desirable to make the experiment? I think it is well worthy of attention, in so far as the expenditure of a sufficient sum would enable a reliable experiment to be made.
759. *Mr. Copeland.*] You are not aware of any corporation having adopted Mr. Webster's process? No, when I was in London it had not been adopted by any corporation, though I have an impression that several were in treaty with Mr. Webster.
760. At the present time the matter simply assumes the experimental form? It simply assumes the experimental form, but the experiment is so large that it would represent the treating of the whole of the sewage of a small town.
761. The Metropolitan Board of Works is the body which has the drainage of London under its control? Yes. Mr. Webster has contracted with them for other works, and they allow him to use a portion of their ground at Crossness.
762. I suppose the Metropolitan Board of Works are not sufficiently assured of the success of the scheme to feel that they are warranted in incurring an expenditure on their own account? Certainly not.
763. The sewage is being treated merely as an experiment? Yes.
764. Do you not think that it would be more judicious for a small community like this to wait until richer communities like London and other places had paid for experiments before we experimented ourselves? Certainly. If you can get other people to pay, it is always better to do so. I think that an experiment treating 1,000,000 gallons a day is so large that the process may be considered to be shown to be practicable and deserving of being tried by somebody. There is no reason why this town should try it, provided that some other town will step in and do so.
765. Have you taken any interest in the treatment of sewage at the sewage farm at Cook's River? I have been told about it but I have never been asked to examine it.
766. You are not aware that the people in charge of the sewage farm there emulate Mr. Webster by drinking some of the effluent water. I merely mention this to show that the effluent there is for all practical purposes rendered pure and clear, merely by passing through filter beds of sea sand? Of course you can purify sewage in a thousand ways; it is merely a question of cost.
767. The cost of an experimental plant you estimate in your report as £5,214? Yes, that is my estimate.

R. Threlfall, Esq. 3 July, 1889.

768. Then there is the cost of management as well? The cost of management has to be added to that, of course. This estimate is only the cost of the plant and maintenance for one year, but a considerable portion of the plant will remain at the end of the year as an asset. You will have a large quantity of iron, the engine, and the dynamo still remaining at the end of that period.
769. So I suppose the experiment would involve a risk of £4,000, or a little more? Yes; if you decide to make the experiment on as large a scale as the one proposed by me, I do not think you could safely put the risk under £4,000. I should not be inclined, taking the cost of management into account, to go below £5,000.
770. With this system do you not require to use alum? No, that is an alternative process. I mentioned it because I thought it was one which might be looked into.
771. How long is it since you saw the process of electrolysis at work? Just after I received the first letter from Mr. Webster, dated the 14th February, this year. During the beginning of February I was engaged in examining the process.
772. Is Mr. Webster, or any other person, making similar experiments in any other place except on the Thames? I do not know, at first hand, of any other experiments being made. I am told that some experiments are being made out here by Mr. Roberts.
773. Did you inquire into any other process in England? No, I did not. I simply undertook to look into this particular matter.
774. Is it not a fact that large centres of population in England and Europe have their own special systems of treating sewage? Yes, and hardly two of them are alike.
775. And I suppose each has something to recommend it? Yes. As I said before, the particular process which can be most successfully employed depends upon the local conditions of the place. For instance, if there are manufactories sending down a very alkaline sewage you have to adopt a different process in dealing with it from that which you would adopt if you were dealing with an acid sewage.
776. Has this system more to recommend it than numbers of other systems that have been adopted and are being worked in different places at the present time? I think it has this to recommend it. First, that the amount of sludge produced is a minimum; and secondly, that it may be considered a purely chemical process in which the coal, which is used to supply the engine, is the only chemical employed. Coal is cheap here compared with the lime, alum, or animal charcoal which are used in other processes. These latter substances are most of them dear. They are dear in England, and would be still dearer here, whereas coal is a cheaper thing to get.
777. In the system adopted at present, we are using no chemicals? Yes.
778. Merely filtering the sewage? Yes, merely filtering. I think there can be no doubt that if that can be done efficiently it is the cheapest process.
779. *Mr. Garrard.*] I should like to ask you whether you were requested to report upon Mr. Roberts' discovery before going Home? To the best of my recollection I was, some eighteen months or two years ago, asked not to report upon it, but to examine it. When I came to inquire about it I found there was nothing to examine or report upon. Mr. Roberts had made a few experiments on a few gallons of sewage, but really from a commercial point of view there was nothing to be said at all.
780. Is it a fact that you were requested to make experiments at the University, but not having the necessary appliances you were forced to refuse? I am not sure whether I was requested or whether I volunteered to do so, as soon as the laboratory was in a fit condition. At the time it was not in a fit condition, and, before I left England, it was never in such a condition that I could commence experiments of the magnitude required.
781. You are not aware that since you were asked to report upon Mr. Roberts' scheme further experiments have been made by the Department at Cook's River? No.
782. Can you inform me when Mr. Webster's process was first made known in England. I presume he has patented it? Of course it is a patented process, but I do not know when his patent was filed.
783. You do not know when the process first became known to the English public? The first I heard of it was just about the time I came out here, three years ago, so that I may safely say that it has not been before the public for much more than three years.
784. And it is about two years since you were asked to report upon Mr. Roberts' process? It is two years since Mr. Roberts' experiments were mentioned to me.
785. The experimental plant you suggest would be capable of doing only the same amount of work as that done by Mr. Webster's plant, viz., 1,000,000 gallons a day? Yes; my estimate is for the treatment of 1,000,000 gallons.
786. If a plant similar to Mr. Webster's were erected here you would make several alterations in fitting up the different parts? Yes.
787. For instance, as he suggests himself, you would place the dynamo nearer the shoots containing the electrodes, so as to diminish the length of leads, and so on? Yes.
788. Do you know if Mr. Webster has patented his process in these Colonies? I am not quite sure, but I think Mr. Webster told me that he had patented his invention both in America and in the Colonies.
789. Could the Department in this Colony make experiments without his consent? Of course if he has not secured himself by patenting his discovery they can do as they please; but if he has done so I suppose he would object to their making experiments without his consent. I am not acquainted, however, with the legal aspect of the case.
790. *Chairman.*] The Crown can use any patent right? In that case I suppose the Department could make experiments.
791. *Mr. Garrard.*] You prefer this system of dealing with sewage to other chemical processes, and next to it you think the process in which alum is used is the best? As I said, the most advantageous processes depend upon the place, and there are some things about electrolysis which I think make it suitable for Sydney. The cost of chemicals to be used as precipitates would be heavy here, while I think coal and iron are nearly as cheap as they are anywhere, and they are the only materials used. I thought also, as the streets are watered with salt water, that the sewage would contain more salt, and that would be very favourable to the success of the process; but I find from Mr. Hamlet, the Government Analyst, that the sewage only contains the normal quantity of salt owing to the fact that the water with which the town is supplied has less than is usual.
792. I suppose no better site for the erection of a plant could be obtained than the outfall at Cook's River;—you have been there? No, I have not. I think the conditions to be observed in erecting a plant would be, first of all, facility for running the sewage into shoots, and secondly, easy means for conveying the sludge to a place where it would not be a nuisance.

793. If the sludge has already been used on an experimental farm, would it not be better to use that place as a site? If the other conditions are favourable, you must remember that a certain amount of coal will have to be carted to feed the furnace, so that the site must be on a road if possible.
794. I think I understood you to say that your estimate was based on very full prices. I see that you have estimated the consumption of coal per horse-power per hour at 5 lb.? Yes; that is estimated for a high-pressure steam-engine, and I do not think it is too high under the circumstances.
795. Do you know what it cost Mr. Webster to erect his experimental plant? No; I may have heard, but I do not recollect. I do not think it is likely that I should have asked him what it cost him.
796. Much of his expenditure he has found useless. As he has gone on he has found ways in which he could economise, and has discarded portions of his plant? A great deal of his older plant has been discarded.
797. So that if we had the amount which it had cost him to erect his plant at Crossness it would not be fair to take it as an estimate of the cost of erecting such a plant here? No, I think not, since he has discarded many things; and we have the advantage of his experience. Not only that, but even as things are, his electrical apparatus is not well arranged. He is not an electrical expert himself, and he did not call in Dr. Hopkinson, the electrician, until afterwards. There are many things which he might have foreseen which would have made the plant more efficient.
798. I understood you to say that several local Government bodies were negotiating with Mr. Webster for the use of this process? Mr Webster gave me to understand that he was in treaty with several corporations who wished to adopt his system.
799. The London Metropolitan Board of Works have not done so? No, not to my knowledge.
800. But I presume they have been watching his experiments? The experiments have been going on close to their pumping, station, so that I fancy they could not have failed to have noticed them. Mr. Webster told me that the Metropolitan Board of Works were going to take the matter up, but it seemed to me to be a private matter, and I was careful to confine myself strictly to the scientific aspect of the question and its commercial applicability in general.
801. What is the height up which he has to pump the sewage into the shoots? It can only be a few feet, because the ground is very low. I should think only 7 or 8 feet.
802. Of course if the sewage could be run direct into the shoots, and so save the pumping, the cost of the process would be so much less? Of course.
803. I understood you to say that the sewage you saw being treated did not go through the last process, where coke is mixed into the iron electrodes, but that it simply came into contact with the iron electrodes? Yes.
804. Are the electrodes parallel with the shoot or at right angles to it? They may be placed either way. In Mr. Webster's experiments the plates were parallel, but I think in rearranging the plant I should place them alternately, parallel and at right angles, so that the sewage would have to run in and out.
805. Was there much deposit in the shoots themselves? No; it is part of the process to so regulate the speed of the sewage through the shoots as to allow no deposit.
806. The speed at which the sewage would pass through the shoots would depend upon its density. It would have to travel quickly if it was thick. and less rapidly if it was diluted? Yes. I draw attention to that in the report in reference to the sewage coming down after a heavy rain.
807. How would the sludge be got out of the pits would it be dug out? I imagine that sludge is generally dug out Sometimes an arrangement can be made, if a pumping station is available, to have the tanks at such a height that they can be tapped at the bottom, and the sludge run off. That has, I think, been done at or near Manchester.
808. Would the small amount of iron in it very much depreciate the sludge as a manurial agency? The value of the sludge as a manure depends really upon the state in which nitrogen exists in it. If I am rightly informed, when nitrogen is almost wholly converted into ammonia the sludge has not the manurial value that it has before such conversion. I think it is part of the result of electrolysis with this process that the organic compounds become converted into ammonia. The nitrogen passes out of its organic combinations into the form of ammonia, and thereby the manurial value of the sludge is diminished. This is a thing I know that happens in many chemical processes, and since Mr. Webster did not claim for his sludge any manurial value I believe it would happen in this process.
809. In many chemical processes the bulk of the sludge is increased by the chemicals used? Certainly, by the precipitating agents, as they are called.
810. By this process the sludge is reduced to a minimum? I think an absolute minimum. The iron itself is precipitated with the rest of the sewage, and it carries down the flocculent matter in the same way as alumina will carry down the matter from logwood and make the paints known as crimson lakes. But in this case the precipitate is produced through the agency of electricity, and forms a kind of mesh-work, and by its density sinks more rapidly than the flocculent matter would by itself. It entangles the flocculent matter and carries it down.
811. The Metropolitan Board of Works have, I believe, a test which they apply to any sewage matter or effluent before it is allowed to go into the Thames? They have.
812. For the purpose of preventing the contamination of the stream, and thereby diminishing the supply of fish, I presume? In the Thames the backwater, when the tide comes in, makes a great nuisance.
813. There is a great rise and fall of the tide there? Yes. The condition of the Thames is so shocking under any circumstances that it is the very last river to consider as an example. The sewage which is now turned into it is, in all probability, cleaner than the water of the Thames itself, because of the large amount of drainage which goes into the river over which the Board has no control.
814. One of their reasons for making this test is to prevent the noxious effluvium being increased? Certainly.
815. You are clearly of opinion that it would be advisable, in view of the proposed large expenditure, to undertake these experiments? Of course it is merely a matter of opinion. I went to Mr. Webster's place with the impression that the process was rather a humbug, and I came away very strongly impressed in the opposite sense. The more I think of it the more impressed I am.
816. The system is based on sound principles? Yes; and certain people with whom I have had occasion to converse—engineers and others in London—have expressed themselves in much the same way as I do.
817. Do I understand you to say that the Metropolitan Board of Works had works at Barking? They have had some at Barking.

R. Threlfall, Esq.
3 July, 1889.

818. I understood you to say that they had not been a success? No, I am informed not.
819. Do you mean a commercial success or successful from a sanitary point of view? I meant that if they were a success from a sanitary point of view they were not a commercial success, and if they were a commercial success they were not a success from a sanitary point of view. My authority for that is Dr. Meymott Tidy.
820. You are aware, of course, of the existence of a sewage farm at Cook's River, where we are now dealing with some of our sewage? I have not visited it.
821. Do you think it desirable where sewage farms are necessary to have a number of small farms rather than one large one? I do not think I am sufficiently acquainted with the practical difficulties to answer that question. I should not like to answer it without having devoted myself exclusively to the treatment of sewage.
822. *Dr. Garran.*] I understand that this process is partly chemical and partly an electrical process? It belongs to a large class of processes known as chemical processes. The peculiarity of it is that the chemicals used are produced on the spot through the electrical agency.
823. The electrical part consists in detaching minute portions of iron from the plates? In dissolving it The iron passes into solution, and, as a second operation, is reprecipitated as oxide of iron in the body of the sewage and carries down with it the fine matter, which gives such trouble in dealing with sewage, such as minute particles of paper, which will not settle unless some means are adopted to force them down, such as the use of extraneous precipitates.
824. The electrical part of the process simply consists in dissolving the iron from the plates? No; along with that go other chemical changes.
825. The chemical changes take place when the iron is separated from the plates and mixed with the sewage? No; when the current passes through the sewage a number of chemical changes take place—one of the most important of which is the solution of the iron, and another almost if not quite as important is the separation of a large quantity of oxygen and hydrogen from the water. The water, together with common salt, is decomposed by the action of the electricity, consequently we have free chlorine which partially oxydises the organic matter which causes the nuisance, then we have oxygen given off which oxydises the matter in the same way as the atmospheric oxygen does in the filter.
826. Then the electrical action is two-fold—first in dissolving the iron and putting it into the sewage, and secondly in acting upon the sewage itself? It may be put in that way, but it is not philosophical.
827. And there is a chemical as well as an electrical action? The primary substances produced by electrolysis are chiefly hydrogen, oxygen, chlorine, and sodium. The first result of this is the formation of oxide of iron precipitate, and a second is the oxidation of the sewage.
828. To deal with the sewage thoroughly by this process, the electrical force must be in proportion to the quantity of liquid passing down? If the quality of the sewage is constant the amount of electricity to be forced through each gallon is also constant.
829. And by a series of experiments upon the sewage we can form an opinion as to how far the sewage is constant? Yes. We know that with heavy rain it varies.
830. Supposing the rain goes into the sewage itself? Yes.
831. If we kept the rain out we should have more definite material to deal with? Undoubtedly.
832. I asked that question because in the report before us the separate system of sewage is disparaged. What I want to get at is, if we take this system of electrolysis, it does not altogether compel a reconsideration of the drainage system? I do not think so. Take the worst case—suppose heavy rain comes suddenly, then the quantity of sewage is increased by a large amount and its quality becomes worse—it is more charged with fœtid matter; but all you have to do is to have a margin of engine and dynamo power, and turn on a stronger current, or else have a weir by means of which you can shunt part of the extra sewage into a reservoir. I do not, however, recommend that. I have estimated for sufficient plant to allow a considerable strain to be put on the apparatus for 10 or 12 hours, and perhaps enable it to treat 20 or 30 per cent. more.
833. You do not think it would be at all requisite to keep out the flood waters? No.
834. In this country especially heavy rains would only be occasional? It would be far less expensive to deal with the sewage containing the flood water than to duplicate the sewers.
835. A large portion of the storm waters would run off on the surface, or be drawn off by a separate set of pipes? I do not know what system is being adopted now.
836. It is proposed by the system we are considering not to carry off the flood waters, but only the washings from back yards? You must remember that after a heavy rain the sewage is not only increased in quantity, but it is worse in quality.
837. But after the streets had been washed the water would be purer? Yes.
838. Then we should want some shunting apparatus to get rid of it? That is a great consideration.
839. This process of electrolysis requires the water to be a little in motion, does it not? Yes. At first Mr. Webster had his plates in motion, but subsequently he discovered that if the flow were properly managed the motion of the liquid was sufficient.
840. If he put his plates into the sewer the effect would be to precipitate the solids in the sewer itself? If the flow was small, but it would not work, because the hydrogen gas has to be separated from the precipitate.
841. Then it is necessary to take the whole of the sewage through the shoots and settling tanks? I think so.
842. The shoots through which the fluid passes have a slight incline? Yes, to give the requisite motion.
843. And the whole of the chemical process goes on in the shoots? It does.
844. The settling tank is to allow the water to remain quiet so that the sludge may settle? Exactly.
845. Is the process thorough—are all the solids taken out of the sewage? That is shown by the analyses. All the solid matter in suspension could be absolutely removed. Supposing it was not entirely removed at a cost of 14s. per 1,000,000 gallons, it could very likely be so removed for 15s. or 16s. It is merely a question of cost.
846. If the sludge were not quite removed from the effluent after it passed from the settling tanks, a second process would completely purify it? Yes.
847. You could try the process twice over? Yes. I do not think myself that the second process is necessary, unless the effluent is required to be fit for drinking.
848. But if we were putting it into a river from which water was taken for drinking, to supply a town a little

little further down, we should have to be more careful. If the process were repeated twice it would be quite safe to do this? The two processes are not identical. In the second process carbon-plates are substituted for iron-plates.

849. But if you were to treat the effluent with carbon-plates after it had been treated with iron-plates it would be perfectly harmless, and you would have a safe result? As far as chemistry goes you would. Whether the process would destroy germs of typhoid fever and other diseases, is a matter upon which in the absence of information one would not wish to decide.

850. For the success of the process I understand it is necessary or desirable that almost every portion of the sewage should touch the iron-plates? Practically.

851. Do you think the plates are sufficiently close for all the sewage to come into contact with them? You must either have them near together or you must have more of them. Mr. Webster says that there should be about a square foot of iron per gallon, but the ratio of the surface to the volume of sewage is not, I think, a matter of very great importance.

852. Would it be any advantage to pass the sewage through fine iron net-work? No; I do not think it would—the net-work would soon disappear.

853. It would be eaten away? Yes.

854. Are the tables shaken or are they fixed? The plates?

855. Yes? The plates are fixed.

856. Would it be any advantage to shake them? No. In Mr. Webster's original scheme they were shaken.

857. *Mr. Copeland.*] If the shoots were shaken the water would come more into contact with the iron? Yes. But by the time the sewage has gone through the troughs, 100 yards in length, it is found that that is sufficient.

858. *Dr. Garran.*] I understood you to say that a little salt facilitates the process? Yes.

859. If we had a little dribble of salt water going through the sewage it would be an advantage. Yes.

860. We have an advantage in being able to supply salt water from the harbour? Undoubtedly.

861. You are unable to say upon what scale the experiments can be carried out to the greatest advantage? I can safely say that this, as well as any other, process can be carried out on a large scale at a comparatively lower cost than if it were carried out on a small scale.

862. If you look at the map before the Committee, you will see that it is proposed to shoot most of the sewage into the main sewer which goes out to Bondi. Would there be any advantage in cutting that off before it goes into the main sewer, and treating it by electrolysis—or would it be better to treat it at the outfall? I think that the larger the works are the more effectual the process. Other considerations might, of course, render it advisable to treat it before it reached the outfall.

863. There is no reason, as far as the action of the electricity goes, why the sewage should be treated at large works, or at small works? None whatever.

864. It would be quite practicable for us to make a fair experiment at the Cook's River outlet? I should like to visit the place before I answered that question.

865. You could not say, unless you visited the place, whether an experiment there would be effective? No, I should require to visit it first.

866. If we were to treat the Bondi sewage, and pumped it from any part, say from Rushcutters' Bay, would that afford a fair test? I should think so, but I have no special knowledge.

867. Although the sludge is not saleable as manure it would not be bad material to distribute over low lands for the purpose of filling in? For filling in it would be very foul.

868. Does it remain foul long? When I saw it it was not foul at all, but Mr. Webster told me that during the summer it was foul, and that the foulness lasted of course until the sludge was oxidised.

869. By exposure to the air? Yes, and the rapidity of the process would of course depend upon how much the sludge was broken up. If it was placed in heaps it would not oxidise rapidly.

870. If it were spread out into thin layers it would very quickly oxidise? I think so.

871. Is there any cheaper way of making it innocuous? No, unless it is dug into the ground and treated agriculturally.

872. You think there would be an objection to banking it up in open places to reclaim ground? I should not recommend its use in that way.

873 Then that is a reason why we should have these works away from human habitations? Yes. I think you may regard the sludge as a nuisance whatever the process adopted.

874. Then the tendency of your evidence is to show that we must not break up the sewage, and treat it at intervals? Certainly.

875. We must treat it at the outfall? Certainly.

876. So that the system of drainage required would remain the same as it is proposed to construct? Exactly, unless you took the effluent into the harbour.

877. Take the case of Balmain; there the sewage could all go into the harbour, so that the engineering part of the scheme would remain unchanged whether or not we used electrolysis? I think the process of electrolysis would purify the sewage so that you could take it into the harbour.

878. A large amount of sewage collects in one pipe before going to Bondi. I want to know whether it would be an advantage to treat it before it entered the pipe? There would be a gain by saving the sewer.

879. You can see by reference to the plan that the sewage of the Glebe, Balmain, part of Darlington, and Camperdown is to go into the Bondi sewer? Yes.

880. If there is to be no alteration in the size of the sewers that part of the scheme might be carried out at once without further delay, might it not? If there is to be no alteration.

881. If the electrolysis does not cause any change in the size of the sewers that part of the plan might be carried out at once? Certainly, provided that the electrolysis takes place at Bondi or on the main Bondi sewer.

882. I ask this because Mr. Bennett was rather of opinion that your scheme might enable him to substitute smaller pipes or earthenware pipes for those he proposes to use, thus diminishing the cost. It could only be done, I suppose, by having apparatus for electrolysis at intervals along the pipes? That, of course, would diminish the size of the pipes, but if you decided to take the sewage into the Bondi sewer the pipes would have to be the same as they are now.

R. Threlfall, Esq.
3 July, 1889.

883. The question is rather an engineering than a scientific one? Yes; it would depend upon the amount Mr. Bennett could save on the cost of the pipes by going to the harbour at several convenient points.
884. It is simply a question of relative cost? Yes.
885. If the process were successful we could subject the whole of the Balmain and Glebe sewage to it, close to the University, and discharge the effluent into Blackwattle Bay? I think so.
886. The only trouble would be that the sludge would be a nuisance? Unless promptly removed.
887. And that will always be a draw-back to carrying out the process in neighbourhoods in which people are living, unless you can deodorize the sludge? Yes.
888. It will be better than to carry the sewage to Bondi? The quantity of sludge is not very much, and it might be quite a simple matter to remove it. It would depend very much upon the sewage.
889. A good deal depends upon the possibility of making a saving in the cost of the pipes? Certainly, it is merely a question of money.
890. We have to make a particular recommendation, and the question is whether it is absolutely necessary to go into the intended expense or whether the adoption of electrolysis will effect a saving. On that point you do not speak positively? If Mr. Bennett will let me know how much he could save by going into the harbour at two or three points, and would give me an estimate of the quantity of sewage expected to be discharged at each of the proposed outlets, I think I could fairly estimate the cost of an installation at each of these points. It would be a mere matter of relative cost. One thing could be balanced against the other.
891. So far as you have looked into this system do you think the Committee would be justified in calling a halt before we incurred the large expenditure of £2,000,000? I think it would be worth while to estimate the saving which would be effected. It need not take more than a few days.
892. How long would it take to fairly test 1,000,000 gallons? That is a very difficult question. First of all one wants the length of time during which the experiment is being made to be sufficiently extended to allow of all the varying conditions likely to occur actually to do so.
893. You want dry weather, a heavy rainstorm, and every possible condition? Exactly. On the other hand it might happen that whoever was conducting such experiments was continually making great progress. He might from day to day effect improvements which would lower the cost and increase the efficiency of the process.
894. You think the promise of the scheme is enough to almost compel the Government to give it a fair trial before we finally decide upon the system of sewerage which we should adopt? Yes. There are also other chemical processes, and I think the alum process is almost equally worthy of consideration.
895. If you could guarantee that the effluent would not be injurious, we could have installations at the head of bays on the Parramatta River? That can be guaranteed, but the same result could be obtained from any other chemical process. It is all a matter of expense.
896. This system has been presented to us on the assumption that all the other chemical processes are failures, and that there is nothing to do but to connect the sewage and to force it down to Cook's River. We are proposing to go to great expense to take the sewers away from the natural fall of the ground, but if the electrolysis is a success, we need not go to that expense? If electrolysis can be a success at a cost less than the proposed expenditure.
897. If electrolysis were adopted we could let the sewage take the natural fall of the land and let the effluent flow into the harbour, so that it is a matter of extreme importance before deciding upon its adoption to know whether or not it is trustworthy? When you say that the other chemical processes have been failures, I imagine that they have been failures taking their cost and setting it against the extra expenditure.
898. All things considered? I think this process is at all events worthy of being considered.
899. Then your strong recommendation to the Committee is to try and make a fair experiment? I think so certainly.
900. *Mr. O'Sullivan.*] As the sewage would be discharged by the main conduit into the ocean, I presume there would be no necessity to apply the process to it at all? Unless you do not want to dirty the ocean.
901. You think it would be necessary to have an apparatus out there? If you do not mind having the ocean and beach of Bondi in a filthy state, it is not necessary, but if it is necessary that the effluent should be clean you would require to use some process.
902. You have stated that you have no doubt from what you have seen and heard in London of the success of this invention? From an electrical and chemical point of view certainly. As to the financial aspect of affairs we have only Webster's estimate to go upon. His estimate I think is a low one as compared with other chemical processes, but still it is merely his own—but at present there is no evidence before the public as to the expense of these works.
903. I find that since 1762 there have been no less than sixty processes in use in the City of London? I should have thought there would have been more.
904. I presume that is a reason why the Metropolitan Board of Works are not in a hurry to adopt this process? The Metropolitan Board of Works is of course defunct, but their successors are at present using a lime precipitate, but which process it is out of the sixty I do not know—they change nearly every month.
905. It is estimated that the cost of treating the sewage of London by this process would amount to £37,000 per annum? At the rate of 14s. per 1,000,000 gallons, I suppose. I have not estimated that cost.
906. I suppose, allowing for the extra cost of labour and materials, we could fairly assume that the cost would not exceed £8,000 or £10,000 here? You must find out first what the amount of sewage is; I have had very varying estimates. I have had one estimate of the quantity of the sewage of the western suburbs which came to considerably more than the whole sewage of London. I said, I thought that estimate was hardly correct. I daresay the Secretary has the details I received on the subject; but the position was defended. Heavy rain, I think, was given as the chief reason for this large amount of sewage.
907. I suppose by the time we have the sewage works constructed the matter will be decided one way or the other, and it will be pretty safe for us then to adopt the process? Of course the longer we wait the more information we get, and it is quite possible that some of the Municipalities which Mr. Webster mentioned to me may take the matter up and apply the process. In that way we should get a cheap experiment, but it must never be forgotten that the efficacy of any process depends largely upon the conditions

conditions of the place, so that the result of an experiment here would not necessarily be applicable in Melbourne, and *vice versa*. There are some conditions prevaling at every place which distinguish it from any other place. I thought that salt water was a peculiar condition in Sydney, but it seems that it is not.

908. *Mr. Humphery.*] In the event of the process of electrolysis being employed to deal with the sewage, would you recommend that the works should be constructed at the outfall of the sewer; and, if constructed, would you treat the whole of the sewage at the outfall? I think so; but I should like to examine the run of the sewer very carfully before I answered.

909. Could any quantity of sewage be treated at the outfall? I think so; the more the better.

910. What is the difference in cost. Assuming that the treatment of 1,000,000 gallons would cost so much, what would be the cost of treating 100,000,000 gallons? That is a matter which will need a great deal of calculation, but I think that you might safely say that there would be a saving of 25 per cent. I can see a saving of 10 per cent. in the electrical conditions.

911. Therefore it would be more economical to have large works at the outflow of the sewer instead of a series of works at different points of the system? As far as the economy of the process goes, yes; but as far as the economy of pipes goes, I cannot say.

912. I asked the question because in the appendix to your report it is stated that the cost of treating 3,000,000 gallons at Newcastle would be £10,800 per annum, while to treat 15,000,000 at North Shore, it will cost £5,400 per annum; is there not an error there? Yes; a printer's error—"3,000,000 gallons" should read 30,000,000 gallons. It is right in the manuscript.

913. In carrying out these proposed sewage works, the question is whether a saving of 25 per cent. upon the erection of the apparatus at the outfall of the sewer would amount to more than the difference between the cost of the pipes proposed and pipes of less dimensions? That is the whole question. In order to obtain the data for its solution, I think it would be necessary to make an experiment here. That is the gist of what I have been saying, that although I can form an estimate to some extent of the expenditure necessary to carry out the work in London, I cannot make a reliable estimate here without special experiment.

914. Do you think that that special experiment should be attempted before the proposed works are commenced, and how long do you think it would take to conduct it? I do not think you could get a satisfactory experiment made under a year.

915. That would mean a postponement of the commencement of our drainage system for a year? Assuming that the question is between the adoption of this system and the adoption of another, certainly.

916. Would it really be necessary to postpone the commencement of this system for a year, because I understood you to say in answer to Dr. Garran, that you would have the works at the end of a series of sewers? Yes.

917. So that portions at any rate could be constructed? If it is decided to operate on the whole of the sewage at Bondi, I take it that the scheme will stand as it is. If on the other hand it is decided to operate upon it at a number of small stations, so as to allow the effluent to pass into the harbour, the pipes could be made smaller, and the connection with the main sewer would not need to exist at all, and the other sewage works would be less expensive.

918. Would it not only lessen the size of the main sewer which collects the sewage of the other sewers? I understood the question was whether the whole of the sewage should go into the main sewer or be treated at a nearer or more convenient point.

919. Therefore would it not be more a question as to the dimensions of the main sewer? Yes, and the junctions with the main sewer.

920. So that the other pipes would remain the same? The branch pipes would possibly remain the same.

921. So that part of the scheme which includes the branch pipes could be proceeded with without interfering at all with the adoption of the system? Clearly on the assumptions.

922. So that in any event—? In any case the capillary pipes could be gone on with. The adoption of the process would only affect the main sewer.

923. So that it would not be necessary to suspend operations for a year? Not if you began with the small pipes.

924. *Mr. Hurley.*] Having in view the works being carried out in England now for the electrical purification of sewers, and from your own knowledge of the action of electricity upon iron, what kind of pipes should be used if the process were adopted here? For a general sewage scheme?

925. Yes. In the event of the process of electrolysis being adopted would it be better to use pipes other than iron? I think the same pipes might be used whatever the process was. I do not think the effluent would have any effect upon the pipes. It is not a question for me to decide whether an iron pipe is better than an earthenware pipe, as it is a matter about which I know nothing. Whatever pipes are most suitable for any process or system I think would be most suitable for this.

926. In your description of the Crossness apparatus you say: "The sludge was black and very nasty-looking, but it had not much smell at the time I visited the works. This was possibly due to the weather being very cold, for there is no reason why the sludge should not be foul under ordinary circumstances"? Quite so. The sludge is the offensive portion of the sewage concentrated and collected together, and there is no reason why it should be more offensive when it is separated than when it is collected.

927. At the time you visited Mr. Webster's works you had not discovered anything which would do away with it? He was carting it away. He was engaged in large contracting works near by; but whether the sludge was dug into the ground I cannot say. There was a heap on the ground which I went to and examined, and it was not foul at all, but still I think it would have been foul had the weather been warm.

928. From your reading and general knowledge you are somewhat averse to this being utilized for manure? No; but I am averse to anybody adopting the process with a view to making a profit by selling the sludge. I think if it were supplied for nothing a good many people would probably be very glad to have it.

929. *Mr. Tonkin.*] If we are given to understand that the expense of disposing of the sewage at the outlet of the sewer, wherever it may be, will be repaid by the manure produced by an ordinary process, do you not think it would be cheaper to treat it in that way than by electrolysis? If you can get hold of such a process adopt it by all means.

930. If we can do that—and it has been represented to us by men who knew what they were talking about that that is the case—it would be much the cheaper process? If there is a process which will treat the sewage for nothing it is clearly cheaper than the electrolysis process.

931.

R. Threlfall, Esq.
3 July, 1889.

931. We have been informed that the sewage farm at Cook's River pays for itself? [*It was explained to Mr. Tonkin that he was under a misapprehension with regard to this matter.*]

932. Have you any idea what the treatment of 1,000,000 gallons would cost besides the cost of machinery and so on—I mean the total cost? Mr. Webster's estimate was 14s., but his latest estimate is about 13s. —that is in England.

933. The wages are higher here, and that would increase the cost? That is where a saving would come in if we had a big plant. The machinery is practically automatic, and you would not require more men, except for the removal of the sludge. The engine tending would be the same, though of course more boiler men would be required. I think the difference between the English price of coal and iron and the price here, together with the difference in wages, would not be very great if the process were carried out on a large scale—that is assuming that Mr. Webster's estimate is correct, though, as I pointed out, it is absolutely unchecked. I should think that the addition of a couple of shillings for this Colony would make it right, and that would bring the expense of treating 1,000,000 gallons up to 16s. or 17s.

934. As it is absolutely necessary to cart away the sludge, would it not be better to have the works at Webb's Grant? If it is far enough away for the sludge not to be a nuisance. Private owners generally find that they have building sites near the place where it is proposed to deposit the sludge. I imagine from the way the sewage has been treated there that the Government have a considerable quantity of land. If they had not they would not be able to carry out the work, because everyone would say that it was a nuisance.

935. If we should dispose of the sewage without any special treatment it would be much cheaper than to treat it by electricity? Certainly. I think myself that if the sand filtration were enough to purify the sewage before it passes into the ocean, and if the farm itself and the filter beds do not become a public nuisance and a source of danger, it would be a folly to adopt either this or any chemical process. I do not think any chemical process could compete with the process in which the sewage is left on the sand to take its own way.

936. *Mr. Dowel.*] Do you know of any other place, except Crossness, where operations or experiments of the electrical purification of the sewages are being carried on? I am informed that some are being undertaken by the Works Department here; but otherwise I know of none, and I feel pretty sure that there are none.

937. What are the special advantages that you claim will result in the adoption of Mr. Webster's process? I do not know that I claim any particular advantages. I do hold no brief for Mr. Webster's process; but, looking at it from a purely chemical point of view, I should say that the cost of the chemicals is less than in any other chemical process which you could adopt. The process is just as efficient and requires the employment of less labour.

938. In what way would the electrical purification of sewage reduce the cost of the construction of the sewers? That depends entirely upon what part of the drainage you are referring to. It might increase it very much in one place and not alter it in another. If you were close to the harbour the process would enable you to save five or six miles of sewer. If, on the other hand, you were not situated conveniently it might not save you anything.

939. Have you any knowledge of the various modes of treatment adopted in different parts of the world? I have a large amount of information in note-books, but I have hardly any in my head. I know that there are hardly two towns trying the same system, and I believe hardly two towns are using the same systems now that they adopted five years ago.

940. Do you know anything about the systems in use at Chelsea and Tottenham? I have not the slightest knowledge of them.

941. Have you given any attention to the proposal to purify sewage by the action of fire? I happen to know that it was tried largely in Manchester, and I examined the process on the occasion, I think, of the last Inventions Exhibition in London. There it was reported to be very successful, but since then I have heard that the Manchester Corporation have discontinued the process, and given up the works.

942. *Mr Garrard.*] Was that Farmer's patent? I am not sure. On the other hand, more recently still, I believe the process of destroying sewage by fire has been successfully in operation at the town of Newcastle under Lyne, under the management of a certain Mr. Jones. Whether or not he has patented the process I cannot say. With reference to Mr. Roberts' process—at the time it came before me it was at that stage in which I have three or four things every week in my laboratory—there was nothing at all to report on. However, when I visited Mr. Webster, I intended to say something to him about Mr. Roberts' discovery, but when I got there and found he was treating 1,000,000 gallons a day, it struck me it would be ridiculous to mention experiments which had been made perhaps on 10 or 20 gallons. In the course of conversation I learnt from Mr. Webster that he had tried electrolysis with lead-plates, which is one of the peculiarities of Mr. Roberts' process. According to Mr. Webster, the lead-plates failed, as no oxide of lead could be obtained as oxide of iron could. On the other hand, a great deal of lead was rendered soluble, and passed into the sewage. Thirdly, the lead was about ten times as dear as the iron. All those remarks seemed to me very just, but on the other hand Mr. Roberts may have found some advantages in the uses of lead-plates, of which I know nothing. Mr. Hamlet told me that some of Mr. Roberts' effluent was contaminated with lead to a poisonous extent, and I am inclined to think on general grounds that the lead-plates cannot compete with iron-plates. As to who has got the patent rights to the process I neither know nor care; it is a matter for the parties to fight out themselves.

WEDNESDAY,

WEDNESDAY, 24 *JULY*, 1889.

Present:—

JOSEPH PALMER ABBOTT, Esq. (CHAIRMAN).

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	WILLIAM SPRINGTHORPE DOWEL, Esq.
JACOB GARRARD, Esq.	EDWARD WILLIAM O'SULLIVAN, Esq.

CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed drainage works for the Western Suburbs.

George Henry Stayton, Esq., M.I.C.E., sworn, and further examined:—

G. H. Stayton, Esq. M.I.C.E. 24 July, 1889

943. *Dr. Garran.*] The particular point upon which I wish to ask you some questions is the relative economy of the drainage scheme as designed by you, and the possible amendment of it under the electrolysis system submitted by Professor Threlfall. We understand that that system requires a certain amount of apparatus, which, of course, will cost a certain amount of money; so that in that way the system would be dearer than if the sewage matter were simply deposited on the ground, unless there were an economy effected by having smaller sized pipes and sewers? That system would certainly be dearer, because there are several natural valleys to be taken into consideration and provided for; in other words, the machinery and appliances necessary for treating the sewage in that way would be multiplied.

944. If the electrolysis system were effective, we could treat the sewage of every valley that runs into the Parramatta River by an apparatus at its outlet? You could have it treated at the natural outlets; but the system would not be effective without the aid of pumping? The levels are such that considerable areas would have to be excluded from a system of drainage by gravitation.

945. What areas do you refer to? The low-level areas.

946. Each of the valleys that debouch into the Parramatta River discharges its drainage into the river at least by one creek? Yes.

947. And if you put a purifying apparatus at the mouth of each creek, you could deal with all the sewage of the area which it drained, supposing that the pipes were laid according to the conformation of the country? But at the same time it is perfectly true that the whole area could not be dealt with except by means of pumping. The levels would not admit of it. All these operations would have to be carried on at a considerable height above high-water mark, and considerable areas are too low to allow that to be done by a system of gravitation.

948. You mean to say that we have already alienated the land on the beds of creeks, and that people have already begun to build there? The beds and the adjacent areas.

949. And in order to deal with the sewage by a system of electrolysis, we must have the outlets a certain number of feet above high-water mark? Yes.

950. Then, however effective the system would be, there are a certain number of houses built upon low-lying ground which could not be included? A considerable number.

951. And that considerable number is dealt with under your scheme? They are all provided for.

952. Supposing we could deal with the greater part of the sewage at the mouth of each creek, we should still have all the peninsulars upon the Parramatta River to deal with? That is so.

953. All the shore line? Yes, all the margin.

954. All the water-frontage houses? Yes.

955. You do not think, then, that there would be any economy in having a number of separate systems to deal with the drainage of each bay? I think quite on the contrary, notwithstanding any additional expense that might have to be incurred by making one main sewer, as proposed, to Webb's Grant, that it would unquestionably be cheaper to treat the whole of the sewage at one spot—that is, if the necessity arose for such treatment. I go further, and say that I do not think it is at all likely that such a necessity will arise for some years to come. The area of Webb's Grant, and the natural facilities are so great that they will meet all requirements for not only the present population, but for a considerably increased population.

956. Then, after having considered both systems, you think it is a preferable plan to concentrate the whole of the sewerage at one outlet? I do, and I had stuck to that opinion all through, notwithstanding the last evidence that was given on the subject. I think that it is unquestionably better to treat the whole of the sewage at one spot, instead of dividing the operations as under the other system. There are at any rate four or five valleys on the northern boundaries that would have to be treated. A sewage farm at Webb's grant is already established, and, comparing the additional expense of taking the sewage from the northern watershed to that place, with the extra cost of having five or six installations, I think the Webb's grant system would be the more advantageous.

957. If we have one outlet, as you propose, at the sewage farm at Webb's Grant, and the process of treating the discharge there is perfectly innocuous, there would be no necessity for the adoption of the electrolysis process? I think it is a matter that really need not be taken seriously into consideration at the present time. I think I fully stated my opinions about the matter in answer to question 674, on page 25 of the evidence.

958. But if the electrolysis system is effective, and if the operations at the sewage farm hereafter prove the nuisance, we can still apply the system to disinfect the sewage at the outfall? Yes; and apply it more advantageously than you could at the natural valleys that have been referred to.

959. You think one installation would be better than a great many? I am sure of it.

960. So that, even looking to the future, there is nothing to be gained by a subdivision? I fail to see that there is at the present time.

961. Do you deliver the sewage at a sufficient height at the sewage farm to admit of the process being applied? Yes. I forget for the moment the number of feet above high-water mark; but at some thing like 10 or 12 feet, I believe, and that is ample for the whole operation.

962. When we first began to inquire into the electrolysis system it was because of an impression that Mr. Bennett seemed to have that if it could be applied we might make a saving in the size of the pipes and sewers;—do you think any such saving could be effected? It would necessitate a remodelling of the whole

G. H. Stayton, Esq., M.I.C.E.
24 July, 1889.

whole system. You could not reduce the capacity of the main sewers marked red on the map without very much increasing the inclination; because it naturally follows that if a large and tolerably flat sewer were reduced in size, the velocity would be very much diminished; and therefore, if you had smaller sewers, you could not have nearly so large a gravitation area, and you would have an increased pumping area, which would mean an additional annual cost.

963. You mean that to take in the whole of the area you propose to take in we must have the inclination of the sewers as low as you have put it? I think so.

964. And therefore we cannot afford to have the sewers and pipes of smaller dimensions than those proposed by you? You could not do so to get the accommodation that that system as proposed will provide.

965. Your answers then amount to this: That it is better to have one outlet than several outlets? Certainly. It has been the experience of sanitary engineers in the old country that it is more economical in administration to have only one outlet, and that the operations can be carried on much better by that plan, especially at such a place as Webb's Grant.

966. Looking at your proposal in the light of all that has been stated about the matter since you submitted it, you do not see any way in which to reduce the expenditure and make the scheme equally efficient? I have been unable to find anything, or to suggest any improvement up to the present time. I have looked into the matter time after time.

967. Taking the expense of the scheme as estimated by you, together with the margin which we always feel it necessary to allow to provide for unforeseen circumstances in works of this kind, it seems to me that a rate will have to be charged equal to nearly 1s. in the £—that the suburban residents must be prepared to pay a rate of 1s. in the £. You think there is no way of reducing the cost so as to make that rate less? I do not think that I can admit that the rate is likely to be so large, because a large expenditure has to be incurred now by each householder in connection with the removal of night-soil, which would be done away with if the scheme were carried out.

968. You make a reduction on that account? Yes; it would be a very large reduction. In one of the appendices to my evidence the whole question is treated at great length; and, taking into consideration the large expenditure at present incurred for the removal of night-soil, I think, especially if the period for repayment is extended, that the rate would be very small.

969. There is no rate levied at the present time? No; but a charge is made on each householder.

970. Equivalent to a rate? Equivalent to a rate.

971. *Mr. Garrard.*] I suppose you have read the evidence given by Professor Threlfall on the electrolysis system as he saw it in operation in London? I have read his paper; but I have not been able to digest it thoroughly, as I am leaving for London to-morrow, and during the past week it has been high pressure work with me night and day. I have simply gone through it and made certain notes.

972. Last time you were before us, you mentioned the fact of electrolysis having been tried by Mr. Webster and Mr. Roberts, and anticipated possibly good results from it so far as the purification of sewage was concerned; but you did not commit yourself as to the commercial aspect of the question? No. What I stated with regard to the cost of the system was very approximate indeed, and was only from the information which I then had.

973. Under your system many of the northern portions included in the scheme will have to be pumped in order to allow the sewage to flow into Webb's Grant? The northern parts, such as Balmain and Leichhardt, will drain into the Bondi sewer; the sewage from those localities will not go to Webb's Grant at all.

974. If it were possible to take the whole sewage of a borough like Balmain to one place, and deal with it locally by electrolysis, or by any other system which might be found to be efficient, would it not be a great deal cheaper for the inhabitants than the continual pumping of the sewage to a higher level? But it is not possible to drain Balmain, even locally, without a low-level pumping system. It is absolutely impossible to drain the whole of Balmain and treat it by the electro-chemical process, without resorting to pumping.

975. The sewage must be delivered to the electrodes at a certain height above high-water mark? Yes.

976. A considerable quantity of sewage would still have to be pumped, even if electrolysis were brought into operation? Yes. I think that the system of drainage shown on the map by red lines would be the most effectual for carrying away the sewage at Balmain. If you attempted to design a local scheme the same amount of tunnelling would have to be resorted to, owing to the natural configuration of the district; and if you wished to obviate that by treating the sewage locally in each valley, you would multiply the expense enormously.

977. But if you cut off a large borough like Balmain from the main Bondi sewer, does not that at once do away with the necessity of having the Bondi main as large as would be needed if the sewage had to go through it, and thus reduce the expense? But the Bondi sewer is already constructed to the point where the red line commences, and the syphon in Parramatta-street has been devised to take the whole of the sewage. This was determined upon ten years ago, and the scheme has never been altered.

978. I suppose large expenditure would be incurred in continuing the Bondi main to Leichhardt, where it branches away to Balmain; but with a local treatment of the sewage there would be no necessity for that work? No; but then I take it that Balmain will, without doubt, simply be merged, so far as the expense is concerned, into the whole district. That is, if the part coloured yellow should cost relatively more per head to drain than some of the other parts the residents of Balmain would not be called on to pay an additional rate on that account. The whole thing is treated financially as one work, and as if there were only one municipality. That is so all over the world, wherever there are different boroughs constituting a metropolis, or the suburbs of a metropolis, and I do not see how it could be obviated.

979. When you were examined before, you gave same evidence with reference to a rival scheme proposed by Mr. Cowdery for dealing with the lower levels of Burwood; and, if I remember rightly, you were under the impression that the nuisance created by pouring the sewage into the Parramatta River would be very great, and you therefore would not adopt the scheme? That is scarcely the ground I took. My chief objection was that Mr. Cowdery delivered the sewage at such a low level, at so few feet, or rather inches, above high-water mark, that he could not possibly purify his sewage without creating a nuisance.

980. And if a system of purifying the sewage locally were adopted there, a large area would remain that could not be treated, as in the case of Balmain? That is so.

981.

G. H. Stayton, Esq., M.I.C.E.
24 July, 1889.

981. A very large quantity of the sewage at Burwood would of necessity have to be pumped. Would the sewage from that place run to Bondi or to Webb's Grant? To Webb's Grant.
982. How long do you expect to be absent from the Colony? I think I shall be back in December.
983. Is it likely that your attention will be directed whilst at home to the process of dealing with sewage by electrolysis? Yes. I have instructions from the Secretary for Public Works to inquire into the electrolysis system of purification, and into one or two of the other systems which appear to be most successful.
984. But even supposing that electrolysis is all that its inventors claim for it, you think it would be desirable to have one place in which to deal with the whole of the sewage instead of dealing with it in several localities? I have no hesitation in saying I do.
985. Independently of that, you think you have sufficient ground at Webb's Grant to deal with all the sewage for a long time to come, without requiring any artificial process? Yes.
986. *Mr. Tonkin.*] In the event of electrolysis being the system adopted, would the main sewers be very much smaller than they will have to be under your scheme? As I explained just now it would necessitate the remodelling of the whole scheme. There is a certain amount of sewage and rainfall which has to be carried off, and my object in devising that scheme was to carry off as much of it as possible by gravitation. If you reduce the gravitating area, as I explained in answer to Dr. Garran, it is possible of course to have small pipes laid at a greater inclination.
987. What I want to get at is this—would it make a material difference in the cost. Supposing a sewer could be 4 feet instead of 5 in diameter, would that make a material difference? Oh dear, no; nothing like relatively the difference between 4 and 5 feet.
988. Then, if we determined to treat the sewage by electrolysis, that would not make a great difference in the absolute cost of the scheme, as far as the making of sewers was concerned? I fail to see that it would.
989. The cost of construction would not be so much reduced? What I state in answer to that is only an expression of opinion. To give a definite answer I should have to go into the matter carefully, and make a thorough examination of it. Broadly, I do not think any economy would be effected.
990. Do you not think that the electrolysis process would actually cost more than your system, considering the facilities which you have at Webb's Grant for disposing of the sewage? That is unquestionably the fact. The purification of sewage by filtration as now carried on at Webb's Grant, and as proposed for this scheme, will undoubtedly be cheaper than by an electro-chemical process. I worked the figures out some time since.
991. *Mr. Humphery.*] Mr. Garrard referred to Mr. Cowdery's paper upon the drainage of Burwood, and I think you said that you had given it some consideration;—have you given any further consideration to Mr. Henson's proposed scheme since you were last examined? No special consideration; because I submit that the replies which I have given to the Committee, and those contained in an appendix to the report, are unanswerable.
992. You have no reason to modify the views to which you give effect in that appendix? Not the slightest.
993. With regard to the cost of completing the scheme shown on the plan, I think you expressed an opinion that there should be a uniform rate to cover the interest upon the outlay? The interest and the working expenses—a uniform rate throughout the suburbs.
994. *Mr. O'Sullivan.*] Do you regard this system of electrolysis as being in its experimental stage? I do.
995. I see that there is a great discrepancy between your estimate and that of Professor Threlfall. He estimates that at the most it will not cost more than 15s. or 16s. to treat 1,000,000 gallons; but you say that it will cost £7 13s. 9d;—can you explain that difference? Yes. I would ask the Committee to notice the guarded reply which I made when submitting those figures. I said, "Very little data is given or known as to the cost of treatment; but I have endeavoured to arrive at an idea from the figures supplied by Mr. Webster. The estimated cost can only be considered as very approximate. It will probably be several years before any definite results can be safely established; and it may be, as in nearly all other cases of the application of electricity, that practical experience will greatly cheapen, if not transpose, the present ideas." I think that it is apparent from Professor Threlfall's evidence that the system has already been modified considerably—that it has been improved from time to time. With regard to the cost, my estimate included one or two items which I see Professor Threlfall has not included. For instance, I allowed £1 5s. per 1,000,000 gallons for pressing and dealing with the sludge, while he has made no provision whatever for that. Possibly my labour item is more than his is; but I do not think, from the figures which he has submitted, that he has allowed enough for the cost of machinery. He said 13s. would be the cost of treating 1,000,000 gallons in London, while Mr. Webster appears to have said 14s. Then Professor Threlfall says that, allowing for the higher rates paid for wages and materials, he would put it at £1. I went very fully into the question of treating sewage by means of the filtration effected at Webb's Grant, and, allowing for what the scheme will cost when in full operation, I make it considerably under £1 per 1,000,000 gallons. I must ask the Committee to understand that the estimate of £7 13s. 9d. was submitted at the time as very approximate, and only based upon the figures we then had. Another point to be noticed is this, that Professor Threlfall's estimate of £1 per 1,000,000 gallons is based upon the idea that 20,000,000 gallons a day will be treated. All these matters, as far as I can get the information, will be thoroughly inquired into by me whilst at home; but as far as I can see at the present moment, considering the enormous interests at stake through the want of proper sanitation in the suburbs, I do not think there is likely to be any alteration of the scheme.
996. I find, by reference to a work on sewage, that in London during the last century they have tried no less than sixty systems of dealing with sewage. Have we any guarantee that we have anything like the best system now? They are improving the systems from year to year, and I have no doubt that what is being done now will be further improved during the next five or ten years. At the same time, we must remember that they have not anywhere in England such natural facilities for the purification of sewage that we have at Webb's Grant; at any rate, I know of no place.
997. I suppose the sunshine and the fresh air play very important parts with regard to the purification of our sewage? Yes.

Robert William Hardie, Esq., sworn and examined:—

R. W. Hardie, Esq. 24 July, 1889.

998. *Chairman.*] I understand that you are Mayor of Burwood? I was the year before last.
999. You are an alderman of that borough now? I am.
1000. Have you been connected with the municipality for any length of time? For about six years.
1001. During that time have you given any consideration to the necessity for drainage in the suburbs? Yes; it is one of those questions which is always cropping up, and which can never be properly dealt with.
1002. I suppose you are satisfied, like most people there, that there is a necessity for the adoption of some system of drainage without very much delay? I think that is generally admitted.
1003. Have you given any consideration to the scheme proposed by Mr. Stayton, and shown on the plan? Yes. I may say that a number of meetings were held by the Burwood Council to deal with Mr. Cowdery's system first, and subsequently with the more comprehensive scheme proposed by Mr. Stayton; and, after many nights consideration of both, they unanimously decided to recommend Mr. Stayton's scheme.
1004. Then, as a municipality, you may safely say that they intend to adopt the proposal before the Committee? Yes. I may say that the Municipal Council consists of nine members, eight of whom voted for the scheme, whilst the remaining member did not record his vote at all.
1005. Has the matter been discussed by the public at all? Yes; we have had several public meetings. In the year when I was Mayor we had a crowded meeting in the local Town Hall to consider the matter. Medical men and others were present, and I think the general consensus of opinion was in favour of Mr. Stayton's scheme. Practically, the chief reason of that is, that we are very desirous to keep the Parramatta River pure.
1006. I suppose you have given some consideration to the question of cost, as it is a matter that affects the boroughs? That of course is the ticklish question. We have been agitating for years for three things. First of all, the water; second, the City Railway; and third, a sewage scheme. We have the water; but when we were about to get it, the ratepayers in the Western Suburbs certainly grumbled at the prospect of having a large rate to pay; though I do not think that they would now give up the water for the sake of the rate.
1007. Under the law, as it stands, you know that the municipalities are liable to pay back to the central Government the cost of a system of sewerage within a certain number of years—twenty-eight years;—do you think that is too short a time, or is it too long? That question has been gone into, and we think that the time should be extended to the greatest possible limit. I believe that in England it is extended to fifty or sixty years. Our principal argument is that we are a young community, and that we are doing a large work by which posterity will benefit more than we shall ourselves.
1008. *Mr. Copeland.*] I suppose in Burwood, and in the boroughs there with which you are acquainted, the majority of the people could be connected with a system of drainage? I think so. There is a small portion of Burwood that does not come within the gravitation area—a low-lying part that is undoubtedly unhealthy; but the greater part of the borough comes within it, as I think the whole of Strathfield does.
1009. Has the Council at any of its meetings committed itself to the payment of rates if this system is carried out? No; the only meetings that we have had have been to give, for what it is worth, the adherence of the Council to the comprehensive scheme of taking the sewage to Webb's Grant at Botany in preference to sending it into the Parramatta River or dealing with it locally.
1010. You have never had the question submitted to the ratepayers as to whether they would bind themselves to repay the cost of carrying out this work? I think it is a work that ninety-nine out of one hundred of the ratepayers would be glad to see carried out.
1011. They are doubtless all anxious to see it carried out; but would they agree to repay the cost? I do not think they have objected.
1012. Has the question been discussed by the Council? It has been thoroughly discussed by the Council at meetings extending over a period of some months. It has also been dealt with at public meetings when prominent persons in the municipality have argued about the matter from different standpoints; and the outcome is, I think, speaking for Burwood and Strathfield, that they heartily agree to the scheme for taking the sewage to Webb's Grant, and they are anxious not to have the purity of the Parramatta River endangered. Parramatta itself at the present time is suffering from the pollution of the river. Some years ago there was a suggestion to put the abbatoirs on the Homebush estate; but there was a strong protest against it, and the scheme was abandoned, though I do not say that it was abandoned simply because of that protest.
1013. I suppose they have considered the question as to the rate which it would be necessary to charge? I do not think they have; but it is a question of rate against human life. There are many hundreds of persons dying every year in these suburbs who ought not to die, and the question is whether this is to continue.
1014. You know that the estimated cost of the scheme is £830,000? Yes.
1015. Four per cent. on that would come to £33,200, and a heavier rate than that would have to be levied so as to repay the principal along with the interest. I think it is a question for the municipalities themselves to consider, through their aldermen, what rate they are prepared to pay? The question of rate has been considered as an important one, and a deputation waited upon the late Secretary for Works, Mr. Sutherland, requesting an extension of the period in which it was necessary to repay the money, from twenty-eight years to the longest term possible.
1016. *Chairman.*] It was pointed out to that deputation that if the period were extended in that way, a rate of 8d. in the £ would do instead of 10d? I do not think the suburban residents would object to pay a rate of 8d. in the £, if it were necessary, in order to have a proper system of sewerage; because, naturally, every year, as population increased, the rate would decrease.
1017. *Mr. Copeland.*] That is your opinion as an alderman of the municipality of Burwood? Yes; and as one who has taken a great deal of interest in the question during the last six years.
1018. Do you know that similar views are entertained by the majority of the aldermen? Not only by the majority of the aldermen; but I believe that the whole of the Councils of the Western Suburbs have intimated their unanimous approval of the project.
1019. *Mr. O'Sullivan.*] You say that the period for repaying this money is too short—it is now twenty-eight years;—what do you think would be a fair extension? I think the longer the time the better it would be. I think it should be at least sixty years.

1020. *Mr. Humphery.*] In what way do you dispose of the night-soil of the borough at the present time? The night-soil is taken away in carts. We have just inaugurated a new system—the interchangeable pan system—which is a great improvement upon the old one. The full pans are covered with a lid, surrounded by an india-rubber band, and are removed without creating a nuisance.
1021. And an empty pan is substituted? An empty pan, cleaned with steam, is substituted.
1022. Where is the night-soil deposited? I cannot tell you, but outside the borough.
1023. What does this cost each heuseholder? 5d. or 6d. for each pan—5d. I think.
1024. Do you know how frequently they are emptied? They are bound to have them emptied once a week; but I am perfectly certain, for healths sake, the pans should be emptied more frequently.
1025. Is it not a fact that very few householders are visited more frequently than once a week? Very likely.
1026. So that there is the accumulation of a week's night-soil at each house? Not at each house; but at a great many.
1027. Are there many low-rented houses in Burwood? Not so many as in more thickly populated suburbs.
1028. Are there many paying a lower rent than £1 per week? A great many.
1029. A lower rent than 15s. a week? Yes; and some are paying only 10s. a week; but the majority of the houses, I think, are more than £60 a-year.
1030. In many cases the payment of 6d. a week would actually amount to a rate of more than 8d. or 1s. in the £? Very likely.
1031. £26 a year at 6d. would be 13s., so that the cost of removing the night-soil to a great many of the householders is, at the present time, greater than the rate of 8d. in the £? Yes; and the system is very imperfect in regard to the smaller houses.
1032. It is your opinion that in every way, both with regard to the cost and for sanitary reasons, it would be advantageous if the proposed system of drainage were carried out? Undoubtedly.
1033. *Dr. Garran.*] I gather from your recent replies that you have not worked out minutely what the present rate really is? The rate I think is 5d. I am not on the Committee now; but I believe it is 5d.
1034. Do you think you could get from the authorities a statement showing the actual cost of removing the sewage at the present time? Undoubtedly.
1035. Will you supply the Committee with that information? Certainly. [*Vide Appendix I.*]
1036. We desire to compare the present cost with the cost of the more efficient system. In Mr. Stayton's report the greatest cost of the whole scheme is put down at £1,817,896. Have you had any experience of the cost of public works? No; I have not.
1037. You do not know whether they are generally carried out in accordance with the engineer's estimate or not? I believe that sometimes they are under that estimate; but that generally they exceed it.
1038. Do you know whether the cost of carrying out the Sydney water supply works was under the estimate? It exceeded the estimate.
1039. Was the cost of the Bondi sewer under the estimate? It exceeded it.
1040. Do you think it possible that this work will exceed the estimate? That I cannot say; I cannot express an opinion.
1041. As an alderman you think it would be wise to allow a margin? I think so.
1042. And if we can get the work for £2,000,000 we may consider ourselves pretty fortunate? I think so.
1043. Do you think there is a general feeling in favour of paying a rate to defray the cost and the interest? There is a feeling in favour of getting a sewerage system; and if that work were carried out, the ratepayers would be willing to pay the rate.
1044. Then it is only an opinion of your own that they are willing to pay a rate? I am perfectly certain that they would be willing to pay a rate if they had a sewerage system there.
1045. Has the Corporation given any assent officially to the adoption of this scheme, or will they simply allow the Government to carry it out as they think fit? I imagine it will be done exactly the same as the water.
1046. The Government carry out the work, and take steps to enforce payment of the rate? Exactly.
1047. And you do nothing to express concurrence with their action? Only by meetings of the ratepayers.
1048. What do you do officially? We have officially, by resolution, informed the Minister of our concurrence with the scheme proposed by Mr. Stayton.
1049. Supposing it cost 50 per cent. more than it is estimated to cost, would you still consider yourself bound to pay the rate? I suppose that whatever the rate was it would have to be paid.
1050. Do you think you would have any good ground for resisting? We should have no ground.
1051. If you bound yourself to the scheme you must submit to an extension of the cost? I think so.
1052. Do you think that is the general feeling? Yes; but the cost will not be 50 per cent. more than is estimated.
1053. Do you think the opinion of the ratepayers is that they are in honor bound to pay the rates? More than that, they consider that they are legally bound.
1054. You think that they could have no objection to paying the rate? I think so.
1055. It is estimated that the rate will be 10½d. for a short term, and 6½d. for a long term, whilst the longer the term the greater will be the charge for repairs? Yes.
1056. If you do not pay off the cost in less than sixty years you will towards the end of that time have a larger amount to pay for repairs? Yes.
1057. You think that will be fairly met by the larger income from an increased population? Undoubtedly. If I remember rightly, the population is 250 to each mile of sewage, whereas in London it is as high as 2,000, and in Paris, 4,000, so that in the course of fifteen or twenty years we may expect the population to quadruple itself, since in ten years it has increased 170 per cent.
1058. So far as you can express the public opinion in your district, it is strongly in favour of the scheme being carried out, notwithstanding the expense? Yes.
1059. You would rather pay 8d. or 1s. in the £ than allow the present state of things to continue? Yes.
1060. I suppose there is much that is offensive in the present way of dealing with the sewage? Yes. The nuisance is reduced to a minimum, but it is not a very civilized way of treating it.
1061. You can distinctly trace illness and death to result from it? Yes.
1062. That is the opinion of all the medical men in the district? I think so. Might I be allowed to say, with reference to Mr. Cowdery's scheme, that if such a scheme were carried out in Burwood and the neighbouring suburbs, during the summer time, the prevailing north-easters which blow over the suburbs might create a nuisance and be dangerous to health.

John Hinchcliff, Esq., sworn, and examined:—

J. Hinchcliff, Esq. 24 July, 1889.

1063. *Chairman.*] What are you? A merchant.
1064. Residing at Homebush? Yes.
1065. That is the borough known as Strathfield, is it not? Yes.
1066. Are you connected with the Municipal Council? Yes; I am an alderman.
1067. The municipality has only recently been created? It has been in existence three or four years.
1068. I suppose you know all the Western Suburbs very well? Yes; very well, I have a large property at Newtown.
1069. Have you given careful consideration to the scheme for the drainage of the Western Suburbs, known as Stayton's scheme? No; I have not had much opportunity of doing so. I only got notice to attend last Monday. I had a glance at the plan this morning.
1070. Has the scheme been considered by your municipality at all? Not during my time; but they are more or less in favour of it.
1071. Public feeling generally is in favour of it?, There is no doubt about it, as far as I can see.
1072. What is your opinion, as one of the community? I think it is a very good scheme indeed.
1073. As a sewerage scheme, do you think it will serve the requirements of the Western Suburbs? I think so; I do not think the sewage should go into the Parramatta River. I quite agree with what Mr. Hardy said with reference to the north-easterly winds.
1074. You heard what Mr. Hardy said about the people in the borough being quite willing to bear the cost of the construction of the work? I have no doubt about it. We are a very small municipality, and we are better situated than Burwood is.

THURSDAY, 25 JULY, 1889.

Present:—

JOSEPH PALMER ABBOTT, Esq. (Chairman).

The Hon. Andrew Garran.	Henry Copeland, Esq.
The Hon. Frederick Thomas Humphery.	James Ebenezer Tonkin, Esq.
The Hon. William Joseph Trickett.	William Springthorpe Dowel, Esq.
Jacob Garrard, Esq.	Edward William O'Sullivan, Esq.

Charles Alfred Lee, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

Henry David Bray, Esq., Mayor of Concord, sworn, and examined:—

H. D. Bray, Esq. 25 July, 1889.

1075. *Chairman.*] You are Mayor of Concord? Yes.
1076. How long have you held that position? Since February last.
1077. Have you been an alderman or a resident of the municipality for any length of time? I have been a resident all my life, and an alderman for the three previous years.
1078. Have you given any consideration to the sewerage scheme proposed by Mr. Stayton, and indicated on the map before the Committee? I cannot say that I have. We received a diagram in the Council Chambers some months since, but very little attention was paid to it, seeing that we at present are not troubled to any extent by our drainage. The suburb is thinly populated, and the idea has not occurred to us to provide for the drainage in any way.
1079. But if the sewerage is provided you will have to pay for it, and probably you will not be asked to assent to it. Do you not think it is a matter worthy of your consideration? That is the question. I thought it was almost implied that we should contribute, but the matter has not been brought before our Council.
1080. Your Council has expressed no opinion one way or another since you have been an alderman, with reference to it? No.
1081. At present where is the sewage or drainage of your municipality discharged? On the western side into Powell's Creek.
1082. Does that creek flow into the Parramatta River? Yes. On the eastern side the drainage runs into Hen and Chicken Bay, on the Parramatta River, bounded by the municipality of Five Dock.
1083. What method do you adopt at present for getting rid of the night-soil of your municipality? We have adopted the earth system.
1084. Pans? Yes.
1085. Do you know what that costs each householder per week, or per annum? Sixpence per week.
1086. Each householder? Yes.
1087. Is that 6d. a pan or 6d. for each house? I think it is 6d. a pan.
1088. How many householders are there in the municipality? I can scarcely answer that question.
1089. You have not given the matter any consideration, then? No, we have not entertained it,
1090. Have you formed any opinion about the matter yourself—have you looked into it? I have never seen it described on paper. [*Mr. Garrard here described the scheme as set forth on the map before the Committee.*]
1091. What do you think of it now, having had it explained to you? I think it would be desirable, if we are bound to connect, as you state we are. I think it would be the best way of getting rid of the sewage.
1092. *Mr. Trickett.*] Concord is a municipal district, not a borough? Yes.
1093. You have explained how you dispose of your night-soil; what becomes of your house-slops, and surface sewage of that character;—how does the municipality deal with that? There is no provision made for it at present; but we have not felt any inconvenience from it in any way. I suppose it is absorbed by the ground. The buildings are very far apart there.
1094. Are there any terraces of houses? No.
1095. Any shops? There are three at Mortlake, and three on the Parramatta River.
1096. Not in successive rows? No.

H. D. Bray, Esq.
25 July, 1889.

1097. Have you any means of dealing with your surface drainage, or do you let the people do just as they like? We have no means of dealing with it; but in going through the district, I have not remarked anything approaching a nuisance.
1098. You have no kerbing and guttering as a general thing? Not as a general thing. One or two of the localities have a little kerbing, but nothing of any consequence.
1099. Is the borough a progressive one;—do you think the population is likely to increase? It is rather slow; but no doubt the population will increase. It is a matter of time, I imagine.
1100. What is your way into Sydney by train; do you not come through the borough of Burwood? Yes.
1101. In approaching Burwood from Concord, I suppose you see some of the ill effects of surface drainage in the streets? No, I have not, between the railway station and the Parramatta Road; but I have on the other side of the railway.
1102. You know that there slops, and so forth, run along the streets, in fact, just gravitate to their natural level? Yes.
1103. Do you think that a desirable state of things? No; I do not. I think it is very undesirable; but I suppose they have no other means of disposing of their drainage.
1104. With regard to a locality of that kind, do you think it would be an advantage or otherwise to have a sewerage system by which such a state of things could be got rid of, and the drainage taken to a distant part where it could be treated without being a nuisance? Yes.
1105. *Mr. Garrard.*] What do you do with your night-soil now? It is deposited somewhere towards the back of Enfield.
1106. The night-soil is not buried anywhere within the borders of your district? No; nor within the district of Burwood.
1107. Does the Council or a contractor take it away? It is contracted for.
1108. So far as your knowledge goes, it has to go through two or three other municipalities before it reaches the place of deposit? I think two.
1109. Have you experienced any inconvenience because of other municipalities stopping the conveyance of night-soil within their borders? We have not had any complaints.
1110. Are you aware, as a municipal representative, whether objections have been lodged and proceedings taken by some boroughs, to prevent the conveyance of the refuse of other boroughs within their borders? I am not aware.
1111. You have never had any complaint from the municipalities of Burwood or Strathfield about your night-soil being taken through their territory? No.
1112. *Mr. O'Sullivan.*] In view of the probable increase of population at Concord, do you think the present means of disposing of the surface drainage and night-soil satisfactory, and do you think they are likely to be so for some time to come? They are, and they will be for the next ten years.
1113. Supposing the borough of Enfield objected to your depositing night-soil in it? Then I suppose we should have to go further afield. The contractor lives somewhere on the Liverpool Road, and I suppose he would have to take it further.
1114. Then you would have to adopt some other means? Yes.
1115. *Mr. Tonkin.*] Do you not think that if this sewerage scheme were carried out it would be beneficial to your municipality, supposing it gave you a proper means of getting rid of your sewage? Possibly it would; but, as I remarked before, our population is so slight that the drainage causes no nuisance; and for that reason our people might object to the taxation.
1116. That is your objection to the scheme—that there may be a little extra taxation? Yes.
1117. But the scheme itself would be beneficial to your district if it were carried out? Possibly. I should not like to say that it would be. I think it would be of very little use at the present time.
1118. What is the average weekly or yearly rental of the houses in your municipality? I think you might average them (say) at £60 per annum.
1119. Do you know whether houses rented at that amount would only have one or two pans to be emptied at 6d. per week? That I am not prepared to say; but I am under the impression that one pan is the rule. There may be exceptions.
1120. What do you think the average number of pans per house would be? One.
1121. It would have to be more than one, because every house must have one, while some may have two or three? From that point of view it would be more than one; but I may state that in many cases the pit system is adopted, and consequently that brings down the average. The average may be a shade over one.
1122. If it were shown to you clearly that there would be no extra taxation at all for this sewerage scheme, do you not think that you would then prefer it to the system which at present exists in your municipality? I do not see that we require it. If we required it we only should be too happy to fall in with the scheme as suggested; but at the present time we do not appear to be in want of it.
1123. Do you then think that a system of cess-pits is preferable to a proper sewerage system, whereby you get rid of the whole of the refuse and drainage? I should, of course, prefer the water-closet system myself; but when I speak of cess-pits, it is in connection with properties as large as 8, 10, 20, and 50, and more acres in extent, and on such areas of land as those, cess-pits cannot be objectionable.
1124. *Mr. Humphery.*] I think you said that the average rental in your municipality is about £60 per annum? About £60 per annum.
1125. Is it not a fact that subdivisions have been made, and that a number of small houses have been built there within the last few years? There has only been one subdivision, that is of the Powell Estate; but not one-tenth, or one-twentieth part of that has been built upon.
1126. You said, I think, that one pan a week was about the extent of the use made of the earth system? Yes.
1127. With a family of six, would not the pans become very offensive at the end of the week? I am not prepared to say. I have never used them myself; so I have no personal experience.
1128. Does it not occur to you that that would be so? I should say so; but the pans may be emptied more than once a week.
1129. For sanitary reasons, do you not think it would be very advantageous to be connected with the proposed

H. D. Bray, Esq. 25 July, 1889.

proposed sewerage scheme so as to provide for the natural increase of population in your locality? I should say most decidedly; "abandon the earth system and adopt the water system," and, if that were done, a system of drainage would be of very great service.

1130. Would you offer any objection to the proposed system of sewerage if it could be shown that the uniform rate which it is proposed to charge would not be greater than the amount which the people are in the habit at present of paying for the removal of their night-soil? It is not a matter of cost at all with us, so far as I am able to learn the feeling of the aldermen and the people of the district; it is simply that we could not utilize such a system; the people are too scattered. From where the termination of the sewer is shown upon the map, to the boundary of the municipality is 2½ miles.

1131. At present your contractor, I suppose, undertakes to remove night-soil at a fixed rate? Yes.

1132. And you do not inquire where he deposits it? We know tolerably well where it is deposited—off the Punch Bowl Road.

1133. If the adjoining municipalities objected to the night-soil of your municipality passing beyond your boundaries, how would you then dispose of it? We should have to make some other provision then, I suppose.

1134. In view of such a difficulty as that arising, do you not think that it would be advantageous that you should be placed upon the same footing as other municipalities, and would there then be any objection to all being charged a uniform rate, thinly populated districts having to pay no more than those which were densely populated? As far as my own personal opinion goes I should prefer a system of sewerage before the present system immensely.

1135. On the whole, after giving it consideration, you think you would? That is so.

1136. *Dr. Garran.*] Do you know how much the corporation receives as income from these pans? No.

1137. You cannot tell whether your present charge amounts to a rate of 2d. or 3d.? No, I cannot.

1138. Could the council clerk work it out? He could of course give you the information.

1139. *Mr. Copeland.*] Where do you get your water supply from? The water is laid on for about a mile, and there is a stand-pipe that is possibly of service to half a dozen persons—not more. The water used is principally tank water.

1140. Off the roofs? Yes.

1141. And I suppose you also get water from wells? I do not think there are many wells in the municipality; tanks principally are used.

1142. Do you think that tank water is sufficiently pure for drinking and domestic purposes generally? Yes. We have used it for the last thirty years, I suppose.

1143. Are there many sparrows and pigeons in the district? No, very few. I do not think we are likely to suffer in that way to any extent.

1144. Do you know what the death-rate of your borough is? I think it compares very favourably with that of any other borough in the Colony.

1145. Have you had any cases of typhoid there? I think I have only heard of one case of typhoid during the last six years.

1146. What do you reckon is the population of the borough? I am not prepared to say.

1147. Have you had any cases of diarrhœa or dysentery there? Not that I heard of; on the whole it is a very healthy place.

1148. Do you say that there are a very few people in the municipality who are supplied with water from wells? I do not know of any. I know of one or two wells in the district; but the persons who own them have provided themselves with tanks.

1149. I suppose the night-slops, as a matter of fact, are simply thrown out on to the surface of the ground? Yes.

1150. Thrown out into the back yards? Yes; there is not much nuisance created by it. I have been through the district frequently, and have never detected anything.

1151. I suppose the houses are sufficiently far apart to allow each household to consume its own smells? At any rate there is nothing evident in the way of a nuisance.

1152. Do you think that the people of your borough would be willing to pay such a thing as 10d. in the £ rate, for the benefit of having this system of sewerage extended to them? I scarcely think they would, because they could not apply it. The majority of the people in the district could not apply it.

1153. The question has not been discussed in your council? No.

1153½. Therefore you are not in a position to say either what are the views of your fellow councillors, or of the ratepayers generally upon the subject? No.

Henry Chrichard Fraser, Esq., Alderman of Strathfield, sworn, and examined:—

H. C. Fraser, Esq. 25 July, 1889.

1154. *Chairman.*] You are an alderman of the borough of Strathfield? Yes.

1155. Have you resided there for any length of time? For the last nine years.

1156. Has your council taken into consideration this proposed scheme for dealing with the sewerage of the western suburbs? Yes. We have gone as carefully as we could into the matter, and we believe that the scheme will benefit the borough; inasmuch as the highest point in it is in the borough. There is a very nasty drain, especially after a heavy rain, flowing from Burwood to Strathfield. The nuisance is so great that after a heavy fall of rain the road is completely covered, and I have had to walk round a block to get to the Railway Station.

1157. What are your present means of disposing of your night-soil? We use the pan system.

1158. Can you give us any idea as to what that costs each householder upon the assessed value of his property? If I had the figures with me I could give them to you.

1159. Could you give us a guess, an approximation? We charge 2s. 6d. a pan per month, and certain arrangements are made with the contractors. For instance those who have a larger number of pans than others have get the work done at a lower rate. Of course the more pans the man with whom we have contracted has to empty the better it pays him. There is no doubt that the earth-pan system is far preferable to cess-pits or dome-pits. I was mayor of St. Kilda at one time. In Victoria the municipalities have greater powers than those in this Colony have, because our Act is about twenty years old. At St. Kilda

H. C. Fraser, Esq. 25 July, 1889.

Kilda the council determined to close up all the cess-pits and all the dome-pits within the municipality, dome-pits are very expensive. There is a dome at the top of them, which is so arranged that the vitiated air goes up through it. We had a great deal of trouble there in getting rid of these pits, because the people preferred them to the pan system; but before I left Melbourne there was not a cess-pit or dome-pit within the municipality. Prahran has done the same thing. Of course some persons had an arrangement of a double set of pans, and the pans used one week were not used the next, so that they became perfectly dry.

1160. I suppose you look upon the proposed scheme as even superior to that? There is no doubt about it.

1161. And you think your borough would be content to pay an additional rate for the benefit which they would receive from this system of sewerage? I think so. We have not sounded our ratepayers.

1162. *Dr. Garran.*] Could you get your council clerk to send us a statement of what the present system would cost the ratepayers in the form of a rate. How much would the amount which they have to pay now be, if charged as a rate? You mean what rate would be struck?

1163. Yes. You do not levy a rate, at present you levy a charge? For the pan system?

1164. Yes? We appoint a contractor to carry out the work. He signs an agreement and has to carry into effect certain resolutions passed by the council. Of course, he can make any arrangements he likes privately with the ratepayers so as to suit their own convenience. Some will only have a pan emptied once in two months, while others use two, three, and four pans. A larger number of the ratepayers who own a good quantity of land bury the night-soil in their own gardens, and that I think is a good plan where there is a large piece of ground. It is the system which I adopt.

1165. *Chairman.*] And so consume it in the shape of vegetables? Yes.

1166. *Dr. Garran.*] I understand that the ratepayers pay the contractor, not the council? Yes.

1167. Then you have no means of knowing what they pay? No.

1168. Could you make an approximate estimate of what the gross amount would be as a rate, supposing they had to pay as a rate the amount contracted for with the contractor? You want the payments in the shape of a rate.

1169. Yes? I will let you have it.

1170. *Mr. Trickett.*] You say that the pan system is chiefly used now? Yes.

1171. That does not dispose of your slops and waste water? No.

1172. What becomes of that? Unfortunately some of it is allowed to run into the street, though we are trying to stop that. We have, however, very little power under the Act, which was the most miserable Act that was ever passed by any legislature in the world. We say to these people, "You shall not do this," and they ask us to quote the clause of the Act which prevents them; but we cannot, and therefore cannot enforce our resolutions.

1173. And thus the refuse water finds its way into the street? Not all; some of it. We have a very good plan for disposing of the water from washing tubs. A Scotch drain is made, but with larger stones than usual, and if a house has an acre of land adjoining it there is never any offensive smell.

1174. But that is only applicable when there is a considerable area of land attached to each house? Yes. Several of the ratepayers have adopted the plan, and no disagreeable odour has been experienced.

1175. But, when the place becomes more built upon, that system would be impracticable? Yes; it can only be carried out where you have a large area of land. I have 3 acres of land. All along the Boulevard the houses have large areas of land attached to them, and they could easily carry out that plan.

1176. Is the city water laid on in the municipality? Yes; the water from the Nepean, and I am thankful, to say that it is.

1177. Do you find that any nuisance arises from the surface water forming pools? No; except in some places where the water-tables had not been formed. We are only a municipal district, not a borough yet.

1178. Any surface water that escapes runs into the street, and you pass it on to the next street, or borough, as the case may be? Yes.

1179. Do you not think it would be desirable to alter that by having a system of sewerage? Most certainly; and, as a council, we are in favour of the scheme—that is as laymen. We know nothing about the engineering part of the work.

Josiah Mullens, Esq., sworn, and examined:—

J. Mullens Esq. 25 July, 1889.

1180. *Chairman.*] You reside at Burwood? Yes.

1181. You have lived there for some time? For many years.

1182. I suppose you knew the locality almost before it was populated at all? Yes.

1183. Have you taken into consideration this question of sewerage for the western suburbs? I have taken considerable interest in the question, but only as an amateur. I have read Mr. Stayton's report.

1184. You have followed out his scheme as shown on the plan? Yes.

1185. It is of course as a layman that we ask you to give evidence. Do you think the scheme would satisfy the requirements of the residents of the locality in which you reside, as well as of those of the other western suburbs? I do. I think such a scheme is urgently required.

1186. You have nothing better to suggest? No. The reserves in the neighbourhood of Burwood upon the other side of the Parramatta Road are too small to allow of the treatment of sewage that is likely to come from Burwood and Ashfield, and the population is increasing so rapidly that it would not be safe to do anything but to take it right away.

1187. Having regard to the present system of dealing with sewage and night-soil, and the possible doctors' accounts which it occasions, do you think a rate of 1s. in the £ upon the assessed value of property would be a saving to the residents of Burwood;—do you not think the benefits conferred by the system would be so great that it would pay the inhabitants to pay such a rate? I think they would cheerfully pay more than that if necessary

1188. Mr. *Copeland.*] Has the question been considered by the council? Yes, although I am not a member of the council.

1189. You are only speaking as a resident? Yes. I have spoken at public meetings on the subject and have advocated the scheme.

1190. Do you know what the death-rate is? I could not tell you. I have made a memorandum of one or two facts that have come under my own notice which I think may be useful to the Committee. During the first six months of last year four cases of illness, at almost the same spot, came under my notice, resulting from

J. Mullens, Esq.

25 July, 1889.

from the open drain that passes the Burwood Station on its way to Five Dock. In one case a young lady died of malignant typhoid fever; in another case a young man of 20 died of diphtheria; my own daughter-in-law had an attack of typhoid; and a young man in the neighbourhood was attacked by typhoid and recovered. The houses in which these people were living were all good houses, and their illnesses no doubt were caused by the smell from the frightful open drain through which all the refuse of Burwood flows down to the bay at Five Dock.

1191. What generally becomes of the night-slops there; are they merely thrown upon the ground? The council is trying to initiate a system of earth closets, and to make it compulsory. Most people use earth closets at the present time.

1192. Do they empty the slops into the earth closets? No; the drainage runs into the creeks and makes the smell.

1193. Or into the back yards? Yes. In my own case the drainage is all absorbed by the garden; but then I have 13 acres of ground. There are, however, many houses that have only a small area of land attached to them, and in those cases the slops are turned into the streets.

1194. In the case of smaller houses the slops are very often thrown into the back yards, and allowed to fester in the sun, in the summer time? Yes, and the smells are very bad at night sometimes.

1195. You think that the people as a whole would gladly pay a contribution towards defraying the cost of the scheme? I have no doubt of it.

1196. Has the question been discussed at any public meeting? Yes.

1197. And has met with general approval? We have had enthusiastic meetings in Burwood on the subject.

1198. *Dr. Garran.*] Has there ever been anything like an opposition to the payment of a sewerage rate in your district? Not that I know of.

1199. At present you are contributing to foul the Parramatta River? Yes.

1200. And if you became a nuisance to people lower down you would be open to a law action? I do not know anything about that.

1201. So far as you know the opinion of your neighbours, they cheerfully acquiesce in this system? Yes.

1202. They would be thankful to see it carried out? Yes.

1203. *Mr. Lee.*] Is there any system of sewerage in the borough? None at all.

1204. Is the pan system in existence there? Yes.

1205. Is the population about Burwood increasing rapidly? Very rapidly.

1206. And there is plenty of room for a further increase? Yes; there is plenty of vacant ground.

1207. The borough in the near future is likely to be densely populated? As densely as Ashfield is.

1208. The people have taken this scheme into consideration? Yes.

1209. And I presume they have had all the data before them? All they could get.

1210. They have probably a fair idea of the extra rate they will have to pay in order to meet the interest? I have not heard that gone into; but I do not think it is a matter of any consequence as compared with the public health.

1211. Do I understand that a system of sewerage is absolutely necessary to the borough? I think so.

1212. And, in your opinion, a general scheme would be better for Burwood and the neighbouring boroughs than separate systems? We are advised that a separate system would be much more expensive; in fact we are told that a small system would be expensive and inefficient. Such a scheme was once propounded by a mayor of Burwood; but was rejected by the community as insufficient.

1213. If it is a matter of grave consideration now, it will be still more so in the course of a few years? Yes.

1214. Inasmuch as the population is annually increasing? Yes.

1215. And the residents have fairly considered this, and therefore agitate for the scheme? I think so.

1216. They are almost unanimously of opinion that it would be desirable to have the scheme carried out? Yes.

1217. *Mr. O'Sullivan.*] At the public meetings to which you referred, was there any opposition to the project? None at all.

1218. *Mr. Trickett.*] Where were these meetings held? At the School of Arts.

1219. In the centre of the borough? Yes; and advertisements and placards were stuck up all over the place. We had full and enthusiastic meetings.

1220. You have experienced the greatest nuisance in the neighbourhood of the Railway Station where it is thickly populated? Yes.

1221. Is there not a very extensive open drain upon the western side of the railway line? It has recently been covered, and I think the nuisance has been modified, and the drain confined in a narrow channel; but an officer of the borough could tell you more about that than I can.

1222. But even with that improvement, the drainage is simply being passed on to the lower lands beyond without any system? Yes. Might I suggest that I hope the scheme will extend over fifty years, instead of twenty. I thought that probably I was called to give evidence on that particular point.

1223. *Chairman.*] The Committee have already represented to the Government that they think the period should be extended; but I dare say they would be glad to hear the views of one who is so good an authority on the subject. At present the whole debt is to be wiped off in twenty-eight years. In England the term is generally about sixty years, and in one case eighty years. This is what Mr. Stayton said upon the subject; "It shows that the works already completed, in addition to the proposed works, which are divided into three sections, would result in an ultimate outlay of £1,817,896. The next statement shows the annual ratable value of the boroughs and districts comprising the Western Suburbs. This has a very important bearing on the question. It shows that the ratable value, which in 1884 was £1,116,000, is now £1,700,000; and that on the completion of the first three sections, according to the present rate of increase, it would be at least £2,200,000; in which case a penny rate would produce £8,900 net. At the final completion of the entire scheme in (say) from fifteen to twenty years time, when the population will be double, or nearly treble, what it was in 1887, the ratable value may be fairly estimated at £3,300,000, in which case a penny rate would produce £13,400 net. Then a statement follows as to the rate of interest, and it shows that money may now be borrowed at 3½ per cent., instead of 4 per cent., and it also shows what amount of rate would be charged. Although the total sum looks enormous on paper, yet owing to the increase in the ratable value, the actual rate to be charged to the ratepayers throughout the whole district in 1894, after the first three sections of the work, involving an outlay of £1,445,000, have been completed,

would

would only be 10½d. in the £ under the existing Act and 8d. in the £ under the proposed amending Act. The Minister for Works informed a conference yesterday that the Government had practically decided to extend the term for repayment from twenty-eight years to sixty years, so that instead of a 10½d. rate an 8d. rate would be sufficient to pay for the whole. Then when the entire scheme is carried out, in from fifteen to twenty years time, the rate under the existing Act would be 9¼d., whereas under the proposed amending Act, it would be only 7d. If the interest were taken at 3½ per cent, which seems now to be the current rate for loans, the 8d. rate would be reduced to 7¼d., and the 7d. rate to 6½d. That would provide interest repayment, and working expenses, upon an outlay of £1,817,000." "That would be the gross expenditure to make the whole system complete? Yes."

1224. What have you got to say about the sinking fund? I was only going to suggest that a sinking fund of 2 per cent. be provided to continue until the whole is paid for.

1225. That is provided for now? It is obvious that 2 per cent. in fifty years will pay off the money. I do not propose the sinking fund to be cumulative; but that the Colonial Treasurer should buy debentures each year with the proceeds of the sinking fund and absolutely extinguish them.

1226. *Mr. Humphery.*] A 7d. rate provides for a sinking fund so that at the end of sixty years the entire loan will be wiped out? That is a most beneficial provision. I think fifty years would be a fair term.

1227. *Dr. Garran.*] You do not mean to buy any particular debentures; but any debentures? Yes. They should be bought in London, or elsewhere, and cancelled by him as a diminution of the debt every year.

1228. I should like to ask you another question. Mr. Stayton estimates that he can borrow money at 3½ per cent. With your financial experience can you say that with all the charges such as interest, the transmission of money for repayment, &c., it could be borrowed at that rate? I have not gone into the question so minutely as that; but practically when a loan is made, extending over thirty or forty years, you leave posterity to pay that.

1229. Posterity means the suburban residents in this case? Yes; but you might borrow the money at 2½ per cent. before the loan became due.

1230. And if we borrow the money for fifty years, 2 per cent. would enable us to repay it? Yes. You could buy something else, though you would have to buy at a very dear rate of course, and I should say that the sinking fund should be applied at the market price of the day to purchase debentures until every bit of the debt was extinguished.

1231. Do you take 3½ per cent. as the fair percentage, and assume that we really could borrow at 3½? Yes.

1232. Because there are a large number of charges to be considered? They are not always disclosed; but I think some of the recent loans have shown a profit of a few shillings.

1233. Does that include the remission of interest to England? That is an annual charge; you cannot go into that. If you borrow money from the other side of the world, the charge of repaying it half-yearly has nothing to do with the cost of the loan.

1234. The Government has to send the money to England? It generally borrows money in England, and pays the loan with that money.

1235. As long as we are borrowing money in England, we have not to send any home; but when we are not borrowing we have to send it home. The Colonial Treasurer stated the other day that he had sent home £500,000, and I remember that that has been done on other occasions. That is paid out of the annual revenue, which would therefore be paying a charge created by the suburbs, and which should be paid by them? Yes.

1236. Have you any idea whether these charges have been met in this way? I do not think they have. We have very few scientific accountants called in to help the Government.

1237. As far as I know the money has been remitted—it has been put down to the annual cost, and no one has asked what loan has caused it? Yes.

1238. Suppose we stop borrowing for thirty years, the cost of remission to England would be charged to the annual revenue, and the suburbs would never pay for it? I should charge it to them every year.

1239. Then you would inaugurate a new system? I should.

1240. As far as you know that has never been done yet? No.

1241. We have treated the debt in the lump? Yes.

1242. And have never asked who were the contributors? Yes.

1243. Then you think that if we have to pay this money upon the debt incurred in carrying out the water supply works, it should be charged to those works? Against the rate.

1244. We should send in the bill to the Commissioners for Water and Sewerage? Yes, each half-year.

1245. You still think 3½ is a fair basis to calculate upon? Yes.

1246. *Mr. Humphery.*] And, on the other hand, you think the principal cost should be charged against the rate? It should be charged against the rate until every charge was paid. The scheme should be self supporting; it would be easy enough to make it so.

1247. At the present time the rate of exchange is ⅞ths? Yes.

1248. So that money in England would be worth ⅞ths more than in Sydney? Yes.

1249. So that should be included in the cost? Yes; that should be charged against the rates.

1250. *Mr. Copeland.*] Do you think we are justified in undertaking responsibilities for our unborn grandchildren? I think we are justified in taking measures to protect the lives of our grandchildren.

1251. But supposing that during the next thirty or forty years an improved system is discovered, and these works are found to be virtually useless, do you think that the people then will be inclined to thank their grandfathers for having saddled them with this expense? They will have to take the world as they find it. The English people are paying now for the powder and shot fired off at the beginning of the century. They have to pay.

1252. You think we are justified in placing this responsibility upon the shoulders of people still unborn? I think we have to act with regard to existing circumstances, and not with regard to what may be. We are now attacking a positive evil, and I think it is the duty of every sensible man to attack an evil when he finds it.

1253. But would it not be as well to pay the bill in this generation, say within twenty-eight years? It is a very heavy bill, and we are conferring a benefit possibly upon many generations, just as a similar system in England has conferred benefit upon generation after generation.

1254. You are strongly of opinion that the term should be extended over sixty years? Sixty years is a fair compromise.

J. Mullens, Esq. 25 July, 1889.

1255. It would be perpetrating no injustice on the people to come? Well; I shall not be here then, so I cannot say.
1256. Supposing they were to rebel? That would not trouble me.
1257. *Dr. Garran.*] I understand that you prefer to have a sinking fund of 2 per cent. instead of extending the period to sixty years? That is for the Committee to decide, 2 per cent. would pay the debt off in fifty years. If you made the sinking fund $1\frac{1}{2}$ per cent. that would lighten the annual burden.
1258. Would you prefer doing that to keeping up the fixed sum? You relieve the annual burden by the interest paid off each year, so that in fifty years by my system you would have to pay interest on £6,000 instead of on £300,000.
1259. Then you would have a diminishing payment? There would be a diminished charge for interest, on my system, every year.
1260. *Mr. Humphery.*] You would be quite confirmed in your view if you were informed that the works are likely to cost £1,000,000? Yes.
1261. *Mr. Trickett.*] Supposing the Government determined to effect a loan for the purpose of carrying out works of this kind, would it not be an advantage if they made it a separate loan? Yes; and a distinct account should be kept from the beginning.
1262. That is the course that has been adopted in the case of London, Liverpool, and other places? I think so.
1263. Are you acquainted with the value of stock of that character in England. Is the London Metropolitan Board of works stock, and the Liverpool stock good? It is sure to be. It is a quasi-Government stock, and of the highest character.
1264. Do you think it would be clearly of an advantage to borrow for a specific purpose in a work of this kind, instead of taking the cost out of the general loan fund? I think so, and to keep a separate account from the very beginning in the Treasury.

Charles Edward Pilcher, Esq., Q.C., called in, sworn, and examined :—

C. E. Pilcher, Esq., Q.C. 25 July, 1889.

1265. *Chairman.*] Where do you reside? In the borough of Burwood, on the borders of Strathfield.
1266. Have you been living there for any length of time? There, and in the neighbourhood, for 15 years.
1267. Of course you have seen a great deal of the growth of population in the railway suburbs during that time? An enormous growth.
1268. Can you say whether these suburbs are suffering at the present time for want of a sewerage system? Most undoubtedly, to a very large extent.
1269. I suppose the inconvenience increases as the population does, and that every year it becomes proportionately greater? Decidedly.
1270. Have you given any consideration to Mr. Stayton's scheme? I had it explained to me once, I think in this room, by Mr. Lackey, by means of diagrams, and so far as I could form an opinion, as an outsider, it seemed to me to be exactly the thing we want.
1271. There has been a good deal of discussion in the suburbs up the line in reference to the disposal of sewage, has there not? I believe so.
1272. Have you heard any objection against this proposal? None whatever, except quite recently, by certain gentlemen, who do not object to the scheme, but who thought that the particular portion of the western suburbs in which they resided did not want such a scheme.
1273. They want to escape the taxation? That I do not know.
1274. Otherwise the scheme is generally approved of? Undoubtedly.
1275. *Mr. Copeland.*] As a ratepayer, you think that the Government would be quite justified in incurring this large expenditure, and in imposing the necessary rates upon the people to repay it? I have not a shadow of doubt about it, because in my opinion a sewerage system is an absolute necessity to health, and is a necessary means of preserving and continuing life.
1276. I suppose you are aware that the first cost of the scheme is set down at £830,000, and that that will probably be considerably exceeded. Do you think, notwithstanding that, that Parliament would be justified in incurring the expenditure? My own idea is that whatever the expenditure, Parliament will be fully justified in incurring it, and that the annual expense would be willingly borne by the people who derived the advantage of it. Of course, I do not mean to say that people would be pleased if money were thrown away, or lavishly expended; but I believe that if the money were spent in securing an efficient system of sewerage the people would willingly pay for a justifiable outlay.
1277. Would they pay a rate of 7d. or 8d. in the £? That is not for me to say. I could not commit other people to that opinion.
1278. That is your opinion from what you have heard? I should think so, but that, of course, would depend a great deal upon the number of years over which the expenditure extended. The annual outlay would increase or decrease according to the number of years over which the expenditure was extended.
1279. That is your opinion with reference to this matter? It is a matter of which I have had no experience, and my opinion would be so crude as to be valueless at best.
1280. At any rate, you believe that if a sewerage system like that proposed were carried out it would decrease the mortality and improve the health of the people in the suburbs? I am sure of it. The supply of water to the suburbs has caused a marked improvement, and the council have done away with all cesspits within the district; that has effected a very marked improvement. Recently they have begun to remove the night-soil on a system which is very pernicious—it is what they call the interchangeable pan system, and it is extremely dangerous, because, although it gets rid of the offensive matter very completely, a pan may be in a house where there is typhoid one day, and next day brought to your own house, and so the typhoid germs are spread throughout the district. The corporation are alive to this, but their difficulty is great in guarding against it. I may mention that several medical men hold the views which I now express.*
1281. In the meantime how are the night-slops got rid of? Kitchen slops?
1282. Yes? They are being absorbed day by day and week by week, and that is sowing the seed of untold disease in the future. 1283.

---

* NOTE (*on revision*): And, I may add, I know, from gentlemen residing in Melbourne, that the spread of typhoid there has, in cases, undoubtedly been traced to the change of pans.

C. E. Pilcher, Esq., Q.C. 25 July, 1889.

1283. I suppose very few people are dependent on wells for their water supply? I do not think anyone is.
1284. Even for bathing purposes? I do not think so. Nearly all the people out there still have their underground and above ground tanks; but they are useless, because the water supply is very good and very liberal.
1285. I suppose your opinion is that they would be quite as willing to contribute towards the expense of providing drainage as they are now to pay for a supply of clean water? I have not a shadow of doubt about it.
1286. *Mr. Dowel.*] Can you say what is the population of Burwood? I cannot give you that exactly. It goes into thousands, but I cannot give it to you exactly.
1287. You have no idea of the number of ratepayers? I could not give you that.
1288. Have you known many cases of typhoid? Yes; I remember an epidemic of typhoid about two and a half years ago; but I believe that was attributable to the milk supply. There were twenty odd cases at once, and there is no doubt that there were many others which I did not hear of. Out of that number I know for certain that eight very valuable young lives were sacrificed—some vigorous young men, tradesmen of twenty-four or twenty-five years of age, and as fine young fellows as you could wish to see.
1289. Are you aware that public meetings have been held in Burwood in reference to this matter? Yes.
1290. What has been the result of those meetings? My impression is that public opinion as evidenced by those meetings is in favour of the system.
1291. It has been publicly expressed by resolution? I think so.
1292. *Mr. Humphery.*] You have a very large property at Burwood? A good sized one.
1293. At the present time you suffer no inconvenience from the night-soil and slops from your own dwelling? I do and I do not. My kitchen slops run out into the paddock, and they grow grass, at least, the water helps to grow very rank grass; but at the same time, in hot summer weather, you can perceive a smell, and that is objectionable.
1294. How many acres have you? 33 or 34 acres; I am not quite sure of the exact area.
1295. If a rate were struck for the purpose of paying the cost of constructing these works, you would be subject to a very heavy annual charge? No doubt; but so I am now for other purposes.
1296. Notwithstanding that, it is your opinion that the advantages to be derived from this sewerage system will be equal to the increased cost? I am perfectly satisfied of that, and for this reason alone. The average temperature in the suburb in which I live is considerably lower than the average temperature in Sydney, and it is therefore much more healthy, and the only thing you want is to get rid of this necessary evil from your kitchen. When you multiply that it pollutes the atmosphere. If I wanted to sell my property, and people knew that they could get their sewage and night-soil taken away, they would be ready to pay more for the land, so in that way I should get back the amount I paid in rates in another form.
1297. You are of opinion that the owners of land would derive advantages from a system of sewerage which would make it quite worth their while to pay the additional rate? I have not the shadow of a doubt of it.
1298. Therefore it is your opinion that these works should be carried out? Yes; that is my opinion.
1299. *Dr. Garran.*] Supposing a considerable minority were opposed to the construction of these works; do you think the Government would be justified in proceeding with them? I do. Supposing that there were now in the city such spots as existed many years ago, where the worst class of criminals and wretched low people concentrated, I assume that some people would object to an interference with those places; but I think it will be admitted that a small majority would have a right to sweep them away.
1300. You think that even if the reformers were in a minority the Government would be justified in carrying out the work? Yes; but I think the reformers would be a very large majority. Of course you only ask me what in my opinion is right or wrong.
1301. You do not think it is necessary for the Government to get the formal consent of the people of these suburbs to the carrying out of this work if in their opinion it is a wise one? I do not think so.
1302. You do not think there is any necessity to take a public vote? I do not think so.
1303. *Mr. Trickett.*] You are aware, I suppose, that all the sewage is to be taken to Webb's Grant? So I believe.
1304. Have you heard any other system spoken of in the locality, which the people favour in any way? No. The only other system mentioned at all is the electric system. Of course that is only a new idea, and an experiment, and may or may not be effectual. What strikes me is this, that all we can do is to deal with these matters according to what science knows at present. We cannot keep a bad tooth in our heads now because twenty years hence dentists may have a very much better way of dealing with it.
1305. I was not speaking of the treatment; but of the destination? I never heard any other destination spoken of.

Michael Stephen Foley, Esq., Mayor of Five Dock, sworn, and examined.

M. S. Foley, Esq. 25 July, 1889.

1306. *Chairman.*] You are Mayor of Five Dock? Yes.
1307. How long have you occupied that position? During the present year.
1308. Have you been an alderman for any length of time? For the last three or four years.
1309. Have you given any consideration to the proposed scheme for dealing with the sewage of the western suburbs? Personally I have not. It has been discussed in our council, and a majority of the aldermen have come to the conclusion that it would be little or no use, because where the sewer terminates, which is at the highest point, there is little or no population. The great bulk of the population is on the water-frontage, and the council as a whole felt very much disappointed that there was not more provision made in the scheme for Five Dock. I think there has been a good deal of correspondence relating to it. I believe the scheme would be acceptable to the larger portion of the inhabitants if it were general; but if it terminates where it is shown to do on the map, it will be of little or no use.
1310. You complain that the scheme will not benefit Five Dock in proportion to the population—that, as proposed, it will not be of much benefit to the bulk of the population? No; because they could not connect with it unless there was some lifting apparatus, it would be too high.
1311. *Mr. Trickett.*] What is your system of drainage at the present time? Pans.

M. S. Foley, Esq.
25 July, 1889.

1312. I mean drainage such as house-slops? There is none whatever, and this causes a great nuisance. It is a big trouble to the council now.
1313. Does the drainage find its way into the streets and public thoroughfares? Yes.
1314. And accumulates there, and festers on the surface, and becomes a nuisance generally? Yes.
1315. Has the council had under its consideration any mode of dealing with the nuisance of house-slops and surface drains? No. They have not had any other sewerage scheme submitted to them. I think that they have stated that the proposed scheme would not materially benefit them.
1316. Have you had many complaints from the ratepayers of the nuisances which arise? We have had a great many.
1317. Do you not attempt to treat it in any way? We can effect very little improvement. We have by-laws framed so as to prevent these nuisances as much as possible, and where possible, we do prevent it. In the larger portion of Five Dock the areas of the land attached to the houses are very large, in some cases amounting to 60 and 90 acres; that is where the proposed system will terminate. The northern portion of the borough, however, is more thickly populated.
1318. Do you not kerb and gutter there? Yes.
1319. Where does the drainage go? Into the street.
1320. And into the river? Yes; the river runs right round.
1321. *Chairman.*] Does the borough go right down to the Parramatta River? Yes; the portion I allude to is between the two bridges.
1322. *Mr. Garrard.*] The municipality comprises the whole area bounded by Hen and Chicken Bay, the Parramatta River, and Long Cove? Yes.
1323. *Mr. Trickett.*] What is the character of the country between that part of Five Dock coloured lavender, and the water frontage? It is high, undulating country.
1324. Is the part which the sewerage system will touch higher or lower than that? It is higher.
1325. No part of it is very hilly? It is not hilly.
1326. Would there be any difficulty in dealing with the other parts of the municipality so as to connect it with the small portion at some future time? I think that difficulty was explained when it was considered in the Council, that it would be impossible to connect the more northern end of the municipality with it.
1327. Your chief objection to the scheme is that it would benefit so small a portion of the municipality, and that it would not find favour with the aldermen? Yes.
1328. Have the people expressed any opinion; have any meetings been convened? Nothing further than that the matter has been brought before the council. They decided that it would not be a very great benefit.
1329. *Mr Garrard*] How do you dispose of your night-soil? By a contractor.
1330. Where is it buried—within your own borders? No; I think it goes through Balmain.
1331. Has there been any objection raised by any of the boroughs through which your contractors pass? Yes; objections have been made. In fact it is a difficulty which we shall very shortly have to face.
1332. Can you tell us where the contractor bears it, or where he disposes of it? I think it is shipped at Balmain, where the Balmain people ship theirs.
1333. You are not burying it anywhere? I think not.
1334. Did you not at one time use some land at Enfield for the purpose of burying it? It must be a very long time ago.
1335. Is the pan system in operation at Five Dock? Yes.
1336. What do you charge the ratepayers each? About 6d. for each pan.
1337. For one attendance a week? Once only.
1338. Do you know the number of houses that have adopted the pan system? I could not tell the exact number. I think £80 or £100 a-year is about the cost of the removal of night-soil.
1339. I suppose where the thick red line terminates is about where your Council Chambers are? They are somewhere about there.
1340. The ground there begins to fall toward the Parramatta River? Yes; on each side.
1341. Are you aware that it is intended to deal with your municipality on what is called the low-level system? I am not aware of it.
1342. You do not know that it is the intention of the framers of the scheme to embrace that portion of the municipality? This is the only scheme that came under my notice.
1343. So far as the scheme extends it would be a benefit—it would benefit that part of the municipality tapped by it? Yes.
1344. Do you think the people there would be prepared to pay an equitable tax? For the reason that they have so much land about their premises there, I do not think that they would be very partial to it.
1345. Is there any by-law in your municipality to prevent people from burying night-soil on their estates? Yes; there is; but when a man has an estate of sixty acres it is very difficult to prevent him from doing it.
1346. The authorities wink at it? They cannot help it.
1347. If you had a system of sewerage which would get rid of the house-slops, it would be a very great benefit? The system would be a benefit if it served the whole of the municipality; but it would not be a great benefit if it only served the parts shown on the plan.
1348. It would be a benefit to the portion of the municipality which it went through? Yes.
1349. But it would be a greater benefit if it went through the whole district? Yes.
1350. The principal portion of the district is near Birkenhead? Drummoyne; yes.
1351. And drains into the river? That is the natural fall of the water. The drainage is as imperfect there as in other places.
1352. *Mr. O'Sullivan.*] Are the waters round Five Dock polluted by the drainage of Burwood and Strathfield? No; though they are at Iron Cove. I do not think the main Parramatta River has been materially affected yet.
1353. Then you cannot say that the drainage in the eastern municipalities is a nuisance to the people at Five Dock? So far it has not been so to any extent.
1354. Can you suggest any way in which the scheme could be made better than it is at present? No; I do not say that I can, unless it could be put at a lower level, as far as regards Five Dock.
1355. Do you think it would be advisable for you, as mayor, to call a meeting to test the feeling of the people of Five Dock? I should have very little doubt about their decision, if we were to submit that plan and

and ask if they would be taxed to pay for that length of sewerage, they would say, almost to a man, "No," if they were to get no further benefit. M. S. Foley, Esq.

1356. *Mr. Dowel.*] Can you say what is the population of Five Dock? I cannot say exactly—it is somewhere about 3,000 people. 25 July, 1889.

1357. Are you aware of the number of ratepayers? I think the number on the roll is about 900.

1358. Is the population increasing? Oh, yes.

1359. You say that you have given some attention to this scheme. As far as you are personally concerned, do you approve of it? I should approve of it if it took in all the drainage from the river. Eventually we may expect the municipalities to be built upon very thickly, and the water of the river must of necessity be defiled if the sewage is allowed to run into it. Unless the scheme could be made to drain the whole of the districts along the Parramatta River, I do not think it would do any good by only draining a very small portion of the area.

1360. You know of your own knowledge, that many very offensive smells exist in certain portions of your municipality? Yes.

1361. Do you not think that there would be a very considerable improvement in the health of the community if the smells were removed? Undoubtedly, if some scheme were submitted which would remove them; but, as I pointed out, this scheme would not have that effect, because the sewer would not go within 3 or 4 miles of the end of the municipality.

1362. I think you were given to understand recently that it was determined to connect with this system of sewerage a pumping system, of which you would receive the benefit? A pumping system was suggested; but I cannot say that the municipal council fell in with the idea. They looked upon it, firstly, as too e pensive; and secondly, that it might be many years before it was carried out.

1363. You are aware that the present system is an expensive one? Yes.

1364. Do you think a rate of 10d. or 1s. in the £ would not be very considerably cheaper than the present system? It would not be cheaper at the present time; but it must be in the near future—within the next ten years.

1365. Have you known of many cases of typhoid fever or sickness in the district? No, we are very free from that. I have not known more than one or two cases during the last four years.

1366. *Mr. Tonkin.*] Have you any idea what depth from the surface the sewer will be at its termination at Five Dock? If my memory serve me right, when the plan was submitted there were some further instructions; but I remember that it was decided at the time that the greater portion of the municipality could not be drained by this sewer.

1367. That you know from the figures? Yes, that was our conclusion.

1368. You see the junction of that sewer with the sewer at Burwood;—have you any idea whether the land is lower there than it is at Five Dock? From my knowledge of the country, I fancy it is.

1369. You are quite satisfied that the sewer would not serve any portion of Five Dock beyond that coloured on the map? I am quite satisfied that it would be of no benefit to the surroundings. The land on the water frontages is much lower than the land where the sewer terminates.

1370. But if this plan of sewerage were carried out and extended over the whole of the municipality you would have no hesitation in saying that it would be a great benefit to the residents? I think so undoubtedly.

1371. And you think that the ratepayers then would welcome it gladly, and be prepared to pay a proper and a fair rate? I believe they would.

1372. *Mr. Humphery.*] Are you aware that the intention is to specially provide for the drainage at Five Dock together with that of the other low-lying districts? I cannot say that I am aware of it. I heard it explained to some degree that it was the intention after the scheme had been constructed to have something of the kind if it were found necessary.

1373. If such a scheme wers submitted to the Five Dock Municipal Council for their consideration you think it would meet with their approval? I fancy it would not. They think that nothing would satisfy them except a gravitation scheme.

1374. The only objection to the scheme is that it does not take in the whole municipality? Yes.

1375. *Dr. Garran.*] There is a main ridge going through Five Dock which is high land? Yes.

1376. Could not the main sewerage be extended along that? It could be extended along the ridge; but the difficulty would be to get the shores to drain up to the ridge.

1377. But Mr. Stayton has provided a plan which he calls the "Shone" system, by which the sewage would be collected and pumped up into the pipe on the ridge? I understand that it is proposed to do so, but I myself could not fall in with the idea of a pumping system.

1378. If you do not have a pumping system you must drain the sewage into the bay, and filter it before it enters the water? Either that or a lower level.

1379. That might be more expensive than pumping it up? Yes, it might be.

1380. If the pipe were to branch into two directions it would catch a good deal from the houses in low land? Yes.

1381. What I mean is that we could carry the gravitating system out further than the line shown on the plan? I think so.

1382. And take in a good many of the houses on the ridges? It would not take one-fifth.

1383. The remainder would have to be dealt with either by a pumping system or by some system of filtration at the outlet? I think so.

1384. Has your corporation considered which would be the better system? I cannot say that they have. They are of opinion that some system of gravitation would be much the better.

1385. But supposing it is impossible to put all the sewage into the pipe by gravitation and you must have some other system—you have to choose between two. At present I suppose you are fouling the river? To a certain extent.

1386. Supposing the Government came down and said, "You shall not foul the river," you would then have to choose some other system? I suppose they look upon it as the natural flow of the water.

1387. *Chairman.*] But not of foul water. If somebody obtained an injunction from the Supreme Court to prevent you from allowing this sewage to drain into the river, what would you do? We should have to adopt some means to have it removed, as with the night-soil.

M. S. Foley, Esq. 25 July, 1889.

1388. *Dr. Garran.*] Have you any idea of what that costs in the gross, at present? I think about £100 a year.
1389. That is the whole sum the contractors receive? About that.
1390. Not more than that? Not more than that.

Joseph H. Wright, Esq., Mayor of Burwood, sworn, and examined:—

J. H. Wright, Esq. 25 July, 1889.

1391. Where do you reside? At Burwood.
1392. You are the Mayor of Burwood? Yes.
1393. How long have you been in that position? Six months.
1394. Have you been an alderman for any length of time? I was an alderman for three years before that.
1395. How long have you resided in the locality? About ten years.
1396. Have you given any consideration to this proposed system of sewerage for the western suburbs? Yes; in fact the whole council went down to Mr. Stayton's office to have it explained. We also considered a scheme drawn up by Mr. Cowdery specially for the municipality of Burwood, but we decided in favour of the scheme under the consideration of the Committee. We understood, however, since, that you have got something superior.
1397. There was some question as to disinfecting the sewage by electricity, but it has not been shown that a system of sewers could be done away with. It is only a question of purifying the sewage before you discharge it. Have many meetings been held in your borough to deal with this subject? No special meetings; only council meetings.
1398-9. Can you say that the scheme is generally approved of in the borough? Yes; so far as it went the borough was satisfied with it at the time; but we understood that there was some alteration and improvement.
1400. You think this scheme would be effective, that the whole borough would be drained by it? Yes, so far as we can judge.
1401. *Mr. Copeland.*] You heard the evidence given by Mr. Mullens, did you not? Yes.
1402. I suppose you endorse his evidence? Yes.
1403. You believe the people generally would be quite willing to pay a reasonable rate to defray the cost of constructing these works? Yes; we are suffering now from the want of drainage.
1404. In health? Yes; and the present drains cause a great deal of inconvenience.
1405. There is a large quantity of very valuable property in Burwood, is there not? Yes.
1406. I suppose you have no idea of what the total value of the property is? I cannot say just from memory. There is no doubt that we want a system of sewerage there.
1407. The borough council will approve of this expenditure? Yes; we did approve of it once, when it was first started.
1408. *Mr. Trickett.*] As Mayor of the borough, have you heard any objection to the scheme? I have not.
1409. Or any better suggestion? No better suggestion.
1410. You think that it would be a great advantage to have the work carried out? Yes. We are certainly in need of a scheme of some sort.

Robert Dougan, Esq., Mayor of Ashfield, called in, sworn, and examined:—

R. Dougan Esq. 25 July, 1889.

1411. *Chairman.*] Where do you reside? At Ashfield.
1412. You are Mayor of Ashfield I understand? Yes.
1413. How long have you held that position? During the present year.
1414. You have been an alderman for some time? For about four or five years.
1415. How long have you resided in the Borough? Going on for thirty years—twenty-nine years.
1416. Do you know whether this sewerage scheme has been under the consideration of your council? Yes, it has.
1417. What is the opinion of the council in reference to it;—is it acceptable or otherwise? It was ultimately acceptable to them. Some few of our aldermen thought that they should give it further consideration; but I, for one, have always strongly urged that the matter be carried forward as much as possible. Some of our aldermen thought the scheme required further consideration; but I told them that there were very few at the table fit to criticise the report, as the survey had been made, and the engineering done by experts.
1418. The area of Ashfield is rather large? About 1,800 acres.
1419. It is not so densely populated as the adjacent boroughs? It is pretty thickly populated.
1420. I see by a return here that in Ashfield the number of persons to the acre is 4·48, while in Newtown it is 36·03. You think the proposed scheme would meet the requirements of the whole of the borough so far as you are capable of forming an opinion? I do.
1421. You have not heard any strong objections urged against it? I may say I have heard none at all.
1422. *Dr. Garran.*] Do you think your ratepayers would kick at a 6d. rate? I think that would be cheaper than the present system.
1423. Do you think they would stand a 9d. rate? They would like it as cheap as possible.
1424. You do not think there would be any serious grumbling, even if a shilling rate were charged, provided that the scheme were successful? I think there would only be grumbling from those who did not require it. In some parts of the borough, where the population is thick, there is a great difficulty in getting rid of the drainage
1425. Supposing a 6d. rate were charged, you do not think that would be unfair—it would be better than the present state of things? Yes.
1426. *Mr. Humphery.*] The residents who have large properties, and who may not require a system of sewerage, would derive a great advantage from the improved sanitary condition of the borough, if the scheme were carried out? Certainly they would.
1427. And they could afford to pay for it? Undoubtedly.
1428 *Mr. Tonkin.*] Did you say that some of the aldermen want to reconsider this plan? When the report was first submitted, one or two of the aldermen were anxious that the matter should be forwarded back to the Minister, urging the speedy commencement of the work, because they saw the urgent necessity for it.

R. Dougan, Esq.
25 July, 1889.

1429. Would all the aldermen be satisfied if the work were carried on now, as it is proposed? They have unanimously decided in favour of it.
1430. *Mr. Dowel.*] What is the system at present in use? The pan system.
1431. To deal with sewage? We have no system whatever. We have a by-law compelling people to use up all sewage matter in their own yards, but if a yard is not more than 20 or 30 feet square we find it a cruelty to enforce the by-law, and so it is not enforced, and the sewage runs into the street.
1432. You consider the present system very objectionable? Certainly.
1433. And you think the proposed scheme would be a considerable advantage? I do.
1434. Have you any idea what would be the cost of the pan system? I cannot say exactly; but it is about £1,000 annually.
1435. *Chairman.*] You could let us have a return? Yes.
1436. *Mr. Dowel.*] The proposed system of sewage, with a rate of 6d. or 1s., in the £, would be much cheaper in the interests of the ratepayers than the present method of getting rid of the night-soil? I believe it would.
1437. I presume that you are of opinion that the public health should be considered before everything else, and that that is one reason why you are in favour of the scheme? Yes.
1438. *Mr. Lee.*] You have seen the proposed plan? I see it now for the first time.
1439. Do you think the system will sufficiently serve the borough of Ashfield, or will it not need to be extended? If it were extended somewhat it would be a great advantage.
1440. Your present system is to be looked upon as a bad one? Yes.
1441. And in a rapidly increasing community like that, things must go from bad to worse? The nuisance is getting worse every day.
1442. And consequently must be highly dangerous to human life? Yes.
1443. Under these circumstances it becomes not an actual question of cost, but almost compulsory, that they should have some proper system of sewerage? Yes.
1444. Bad as the present system is you can see that in the future things will be very much worse, and that a proper system of sewerage will become compulsory? That is my opinion.
1445. Are those opinions held in the densely populated suburbs? Yes, and aldermen are urged to try and hasten matters on.
1446. No public meeting has been called to enable the people to express their feelings on the subject? No public meetings. The people of Ashfield generally leave such things in the hands of their municipal representatives.
1447. *Mr. Garrard.*] Is there a by-law in force in your municipality which prohibits the ratepayers from burying their own night-soil? Yes, we have such by-law.
1448. Have you many cess-pits in your borough? None.
1449. All use the pan system? Yes.
1450. How often is the service? Weekly.
1451. Where do you deposit your night-soil? At Punch Bowl.
1452. You pass through Canterbury then? We pass through Canterbury and the new borough of Enfield.
1453. You have heard no objections raised by these municipalities to your night-soil passing through them? Not yet.
1454. You anticipate some? We have not heard.
1455. Has your borough objected to any other municipality carrying its night-soil through it? No.
1456. Ashfield, I think, drains both into Cook's River and into the Parramatta River? Principally into the Parramatta River, at Long Cove and Iron Cove Creeks.
1457. All your house-slops go down by gutters, and eventually find their way into these coves? Yes.
1458. Is it a fact that a great nuisance arises from this? Yes.
1459. Is it a fact that there have been frequent complaints from the adjoining borough of Leichhardt? They have no reason to complain, because they are in the same condition.
1460. That is not the question. Have there been frequent complaints? I have heard of complaints, and have been surprised. What we require in the meantime is a kerbing and guttering Act.

John Wheeler, Esq., M.P., Mayor of Petersham, sworn, and examined:—

J. Wheeler, Esq., M.P.
25 July, 1889.

1461. *Chairman.*] You are Mayor of Petersham? Yes.
1462. And also a member of the Legislative Assembly, as one of the representatives of Canterbury? Yes.
1463. How long have you been Mayor of Petersham? Three and a half years.
1464. Previously to that were you an alderman? I had been an alderman for about six years.
1465. Have you lived long in that municipality? Between twenty-three and twenty-four years.
1466. Then you know all the western suburbs very well;—have you given any consideration to this proposed scheme of Mr. Stayton's? As a council we have considered it two or three times.
1467. What determination did you come to about it? To allow the Government to proceed with the work.
1468. You approved of the scheme? Yes.
1469. You think it would meet the requirements of your municipality? Yes; because we are placed in a peculiar position. Naturally we are receiving no drainage from anybody else; all our drainage runs away from us and passes through Leichhardt into Long Cove Creek, Johnston's Creek, White's Creek, and a creek at the foot of what is known as Taverner's Hill.
1470. *Mr. Garrard.*] How about the drainage on the other side? The quantity of drainage that goes to Marrickville is very small.
1471. They kick up a row about it, though? Not with us. We can deal with the drainage that runs from Petersham into Marrickville. There is only an area of ten or thirteen acres that drains into Marrickville.
1472. *Chairman.*] Do you know as a resident of one of the western suburbs that the scheme is generally accepted there? Yes.
1473. You had many opportunities of hearing it discussed? Yes. Petersham has an area of 880 acres and about 10,000 inhabitants.

J. Wheeler, Esq., M.P. 25 July, 1889.

1474. *Mr. Dowel.*] Is the population increasing in Petersham? Yes, and will increase more when the large areas such as the South Annandale Estate are subdivided. If that and other estates are subdivided the population will increase by 3,000 or 4,000.
1475. Has any other scheme of drainage been considered by your council? None whatever other than our own subsidiary scheme. We have a sufficient number of sewers of our own to drain into the creeks and to connect with the general scheme.
1476. *Mr. Lee.*] You noticed by the map that the sewer will run in three directions through your borough? Yes.
1477. That will serve it tolerably well? Yes; with the exception of one low lying spot, which is known as the Park Area. Although Petersham is densely populated the tenements are not small.
1478. Are the inhabitants generally satisfied with this proposal? Yes.
1479. As being so much superior to the system in use at present? With our present system the drainage runs away from us.
1480. You have the pan system I presume? Yes.
1481. The contents of the pans have been removed and deposited in some other locality? Yes.
1482. Would the inhabitants consider this scheme as one of the most suitable that could be designed? Yes; they are thoroughly in accord with it.
1483. You think it would carry off the sewage matter both solid and fluid? Yes.
1484. And reduce the death-rate? The death-rate is not a large one.
1485. Has any objection been raised to the scheme? None whatever.
1486. Is it generally approved of? Yes, it is.
1487. The scheme is pretty well understood? Yes.
1488. It is pretty generally understood that it means taxation? It does undoubtedly, and the people are willing to pay for it.
1489. But, notwithstanding that it will cause taxation, they are anxious to have that work constructed? Decidedly.
1490. *Mr. Garrard.*] Do you allow cess-pits in your borough? There are very few.
1491. How do you get rid of the night-soil at present? By contractors.
1492. How much do the ratepayers pay a week? 5d. a pan.
1493. For one attendance? For one attendance, or more if required.
1494. Where do the contractors take the soil? To Belmore, the other side of Canterbury.
1495. Then they have to pass through several municipalities? Only through one—Canterbury.
1496. Has any objection been made to their passing through that borough? They have objected to the contractors passing through once or twice.
1497. Did they summon them? No—they did not persist in it.
1498. You spoke just now of a system of drainage you had in operation, that is of the ordinary surface channels, is it not? Some of the drains are underground.
1499. *Mr. Trickett.*] Do you think that your ratepayers will object to pay a tax of 10d. in the pound upon the assessed yearly value of their properties? They are prepared to pay more if you give them a proper system of sewerage.

WEDNESDAY, 31 *JULY*, 1889.

Present:—

The Hon. ANDREW GARRAN (TEMPORARY CHAIRMAN.)

The Hon. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
HENRY COPELAND, Esq.	CHARLES ALFRED LEE, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

Joseph Jolly, Esq., Mayor of Newtown, sworn, and examined:—

J. Jolly, Esq. 31 July, 1889.

1500. *Temporary Chairman.*] Are you officially connected with any of the western suburbs? I am the mayor of Newtown.
1501. How long have you been mayor? About six months.
1502. How long previously have you been alderman? About four years.
1503. You are thoroughly familiar with the want of drainage in that locality? Yes.
1504. It has occupied your attention? Yes.
1505. Has the matter come officially before your council? Yes.
1506. What system are you now adopting? We have the dry-earth system, and we have the old system—the pit system.
1507. You have not found it necessary as yet to abolish the pits? No; because we have found that system the best, and we thought a system of sewerage would be shortly introduced.
1508. Is it a little expensive for the householders to shift from the pit to the pan system? Yes. In the first place they would have to fill up the pits, and then make preparations for the pan system, and that would cause expense.
1509. It is the general opinion with sanitary engineers that the pit system is bad, because it fouls the soil;—is that your view? Yes.
1510. Your observations as mayor have satisfied you that the pit system ought not to be extended? That the pit system ought not to be extended.
1511. Have you any power under the present law to prevent the extension of the pit system? We have no power. We are trying to get the public to adopt the pan system, but we have no power to compel them to do so.
1512. Do you think it would be an improvement in a new Municipalities Act if you had that power? I believe it would.

1513. What is the amount of expense involved in changing from the pit to the pan system? You have, in the first place, to have the pits emptied, although they may only be a quarter or half full. They have then to be filled up, and preparations have to be made for adopting the dry-earth system. The matter of expense would not be very much; but a great many of the residents of Newtown are people owning small properties, and to them the expense would be a consideration.
1514. Does the objection come from the freeholders, however small their properties, or from the owners of small tenements, who let them? It comes from the owners of small tenements; because tenants will not look after the dry-earth system as well as the owners of the property would if they were living upon it.
1515. Then, practically, the objection comes from the capitalists who own small houses, and not from the people living in those houses? From those who own small houses.
1516. How much a week do you charge for emptying one pan? At the present time we are charging 5d. per week per pan if it is emptied once a week. If it is emptied twice a week double that amount is charged. Most of the people, however, and especially the poorer class of people, only have their pans emptied once a week.
1517. Do you think that in an ordinary working man's family, consisting (say) of a husband, wife, and four children, one removal of the pan a week is really sufficient for the preservation of health? I think one removal a week is sufficient, but where there are larger families I think the pans should be emptied twice a week.
1518. 5d. a week would be about 250d. per annum;—how much do you make it? 21s. 8d.
1519. Then what they pay is equal to a rate of 21s. 8d.? Yes.
1520. Do you think that with the proposed system of drainage the rates will exceed 21s. 8d. for the smallest houses? No.
1521. If there were a rate under the proposed system the smallest houses would not be taxed more than they are now? Not more than they are now.
1522. While the larger houses would be taxed more heavily in proportion? Yes.
1523. A gentleman who had servants and a large family would want more than one pan a week, and would pay twice as much, or three times as much, as a poor man? Yes.
1524. Therefore, under the present system, a rich man may pay twice as much, or three times as much, as a poor man does? Yes.
1525. Would the rate on his improved or more valuable property be greater than the present charge? Yes.
1526. It is your opinion that under the proposed system the effect of rates would be rather to let the poor man off a little, and to put the burden on the shoulders of the rich man? Of course the property would be more valuable, and he would gain a benefit from that.
1527. Apart from the question of the increased value of his property, a rate would press more heavily upon the rich man than upon the poor man? I think it would.
1528. Then you think if any objection could be made, from the position of the taxpayer, to this outlay, it would come rather from the rich than from the poor man? By keeping so many servants and men about the place the expense would be increased.
1529. Then, comparing the two classes, the present system is more in the interests of the poor than in the interests of the rich? Yes.
1530. Have you considered the scheme before the Committee? Yes.
1531. Do you personally approve of it? The council approve of it.
1532. Do you personally approve of it? Yes.
1533. The council approved of it by a majority? Entirely.
1534. They have no objection whatever to the expenditure? Not the slightest—they agreed to the scheme upon an unanimous vote.
1535. So far as you know the opinion of the ratepayers do you think they would willingly pay a rate for this system? They are paying it now.
1536. But sometimes people forget that when a rate is imposed? I have not the slightest doubt they will pay it when the system comes into operation.
1537. Have your people to pay for deodorizers? Yes.
1538. That is extra? No, the man includes deodorizing in the 5d. charge. The contractor finds the deodorizer.
1539. Does he clean the pans in any way? No, he merely empties and replaces them.
1540. They are returned smelling and dirty? Smelling and dirty.
1541. During the whole time the pans are on the premises they are more or less foul in their smell? Yes.
1542. Then the present system simply stores a foul smell upon every man's property? It is a very bad system, and leaves a smell upon every man's property.
1543. If the proposed system were introduced and were effective you would get rid of the whole of the filth before it had time to ferment? Yes; and that would be a boon to the public and to the ratepayers generally.
1544. The people would be willing to pay a rate to make the system self-supporting? Yes.
1545. They could pay a rate and not be out of pocket by so doing? Yes.
1546. Do you think you could commit your municipality to an adhesion to the scheme? Yes.
1567. There would be no attempt afterwards on their part to break away—to say that they had not been parties to it and did not approve of it? No.
1548. *Mr. Trickett.*] You have explained to the Chairman the mode of the disposal of fœtid matter from closets; but how do you get rid of the house-slops? The contractor for the night-soil has the contract for the pits and the dry earth-pans, and the contents of these are taken out to works between Newtown and Botany, and destroyed there. The works are called the poudrette-ammonia works. The slops from the houses go down into a sewer between Newtown and Camperdown, and thence through Leichhardt into Johnston's Creek.
1549. Is that sewer underground, or is it a surface-drain? Underground as far as possible. Newtown stands on the rise of a hill, and a portion of her drainage goes down to Macdonaldtown, on the left-hand side, as you go to Newtown into Alexandria, and on the right-hand side into Camperdown, and thence into Johnston's Creek.
1550. Through what borough? Through Leichhardt.
1551. Does that municipality object? They have never objected to Newtown though they have objected to Camperdown; and the Camperdown people have sent us a writ requiring us to prevent our drainage from entering their sewer.

J. Jolly, Esq. 31 July, 1889.

1552. They are now seeking to prevent you from allowing your drainage to enter their sewer? Yes.
1553. If they succeed you will be in a very great difficulty? We shall be in a very great difficulty.?
1554. Where does the sewage eventually go to—does it find its way into the Parramatta River? Yes. If we only got the sewer from Prince Alfred Hospital to Liberty-street it would get rid of all the nuisance, and it would be no hindrance to our neighbours.
1555. Looking at the scheme as affecting Newtown, do you know any other scheme which is as good or better? I think this is the best scheme that could be adopted.
1556. You see Newtown marked on the plan marked light green? Yes.
1557. You see the red lines running through it, indicating the positions of the proposed sewers;—have you examined the scheme sufficiently to know whether those sewers would serve the borough of Newtown? I have examined the plan at the Council Chambers, and I find that it could not be better.
1558. The sewers would be in the best place in the interests of Newtown for getting rid of the sewage? Yes.
1559. With regard to paying a sewerage rate, do you think the people would pay as much as 10d. or 1s. in the £ on the yearly value of their property? I do not think 10d. or 1s.; I think that is rather high.
1560. With regard to the small tenements that you have spoken of, it comes to as much as that at present, if they have to pay 5d. a week? It does not come to quite as much as 10d.
1561. Fivepence a week on houses worth 10s. a week would equal a rate of 10d. in the £. That would amount to 26s. a year, while at present they have to pay fifty-two five pences, or 21s. 8d.? My opinion about the ratepayers is that if they got the sewerage they would not mind a reasonable charge even though it were a little more than they pay now, because it would get rid of the existing nuisance. The pans are not cleansed but are returned in a filthy state.
1562. Independently of that, does it cost your borough very much for scavenging and cleaning gutters? Yes; we pay a lot for that. We have four contractors, and they get £18 or £20 a month each.
1563. That is for keeping the gutters clean? Yes; and for taking the garbage away from the back yards.
1564. That would be in a measure saved by the proposed system? I do not think so; you could not get rid of it in that way.
1565. But the house-slops, instead of going into the gutters would go right into the sewers? You could not go without the scavenger, because the rubbish would need to be swept up.
1566. Do you not disinfect your gutters? No; we are fortunate as far as the gutters are concerned, because we are on the rise of a hill. The gutters are swept out once or twice a week.
1567. You have heard no objection to the scheme? Not the slightest. I have brought a map of the borough with me. [*Produced.*]
1568. *Mr. O'Sullivan.*] Have you held any public meetings in Newtown with regard to this proposal? No.
1569. Do you know whether any opposition is likely to be offered to it? I do not think any opposition will be offered to it at all.
1570. I suppose the borough council have seen the necessity for a scheme of this character being carried out? We have for a long time.
1571. Can you trace any illness to the present system of disposing of sewage matter? Yes; we have had a lot, not lately, but six months ago, and it was caused by the bad drainage.
1572. I suppose that if the scheme were carried out there is a reasonable prospect that the amount of sickness would be minimized? It would be done away with nearly altogether.
1573. *Mr. Humphery.*] At present is the sewage of Newtown carried out to the adjoining borough of Macdonaldtown? The sewage on the left-hand side, after you pass the Deaf and Dumb Institution, goes down to Macdonaldtown.
1574. That is a separate municipality? Yes. On the right-hand side from Prince Alfred Hospital to Liberty-street, in Stanmore, it goes to Camperdown.
1575. That is another municipality? Yes.
1576. Have you had complaints from the adjoining boroughs? There is an action pending now between Camperdown and ourselves because of our drainage running into theirs.
1577. That is unavoidable? Yes; we cannot help it. If we stand on a hill the drainage must take its course.
1578. The only way you see of getting rid of the present objectionable system is by adopting the system proposed? Just so.
1579. *Mr. Copeland.*] Have you not had difficulties with Macdonaldtown and Alexandria? No we have not, They had an action against Macdonaldtown, and if it had not gone against them we should have heard from them.
1580. *Temporary Chairman.*] How many houses are there in your municipality? About 4,000.
1581. What is the annual value of them? £7,850.
1582. That is the return that you get from them in the shape of rates? Yes.
1583. The rate is 1s. in the £? Yes.
1584. With a rate of 3d. in the £ how much would you get? £1,962.
1585. With a rate of 4d.? £2,617.
1586. With a rate of 6d.? £3,925. At the present we alse receive for the cesspits £1,100, and for the pans £1,600, making together £2,700 per annum.
1587. *Mr. Humphery.*] You pay that for the night-soil? Yes.
1588. *Temporary Chairman.*] I understand that the taxation at present for the disposal of night-soil is £2,700 per annum? Yes.
1589. And a 4d. rate would give slightly less than that per annum? Yes.
1590. That is, at present they are paying rather more than a 4d. rate? Yes.
1591. If they were not taxed more than 4d. in the £ they would be as well off as they are now, and they would have the additional advantage of having their sewage properly disposed of, and the general health would therefore be better? Yes.
1592. In consideration of that advantage they would pay a higher rate? Yes.
1593. *Mr. Copeland.*] The houses in Newtown are increasing rapidly? Yes.
1594. I suppose you anticipate that they will continue to increase, and that that would reduce the rate if the drainage works were carried out? Yes.
1595. *Mr. Humphery.*] A 4d. rate would give about the cost of the present sewerage system, and a 10d. rate upon houses rented at not more than £26 a year would only be equivalent to what the tenants are at present paying? Yes; that is the case.
1596. 4d. is the average rate? Yes.

Joseph

Joseph Graham, Esq., Mayor of Marrickville, sworn, and examined :—

J. Graham, Esq.
31 July, 1889.

1597. *Chairman.*] Do you hold office in any municipality ? I am Mayor of Marrickville.
1598. How long have you occupied that office? I became an alderman in 1869. I was mayor in 1870, and I have held that office off and on ever since.
1599. You have never ceased to be an alderman all that time? No.
1600. You are thoroughly acquainted with the district? Yes; perfectly.
1601. And with the existing system of dealing with refuse? I am.
1602. Is yours a thickly populated locality ? No. We estimate our population at 10,000 people.
1603. Have you not several market-gardens in your municipality? We have.
1604. Then some parts of it are thinly populated and some more thickly? Yes.
1605. And it is only in the thickly populated parts that the drainage difficulty exists? No; I think not. The red lines on the map show where the sewers pass through the district, and the blue lines show the sewers going through the low-level country. There is also a pumping station marked, which will be at Meek's Road. It is contemplated to run that up to what they call the Illawarra Road.
1606. Is the present drainage in your municipality satisfactory? No ; it is very unsatisfactory, when we have the drainage of Newtown, St. Peters, Petersham, and I do not know what coming into it.
1607. You have a great deal of low-lying land in the municipality? It is not so much low-lying land; but it is lower than the surrounding country.
1608. And your neighbours discharge some of their surplus filth into the borough ? They do to a certain extent.
1609. You have no remedy? There was some talk of getting an injunction, but that would not do it.
1610. You wish that they would adopt a better system of sewerage? Certainly.
1611. If they did that they would greatly relieve you? Yes.
1612. Is that your principal difficulty—the trouble with your neighbours ? We have all our own sewage besides.
1613. Leaving out of the question the trouble caused by your neighbours sewage, is the sewerage system in your municipality a bad one? Certainly.
1614. And greatly needs altering? Undoubtedly.
1615. Has the matter received the attention of your council? It has.
1616. Has the scheme before the Committee been considered? It has.
1617. Is the council in favour of it or against it? Our council was the first to adopt unanimously the scheme shown on the map, which is known as Stayton's scheme for dealing with the sewage of the western suburbs. As perhaps you know the late Hon. John Sutherland sent a copy of the proposal to each of the boroughs, and we were the first municipality to unanimously resolve that the system appeared to us perfectly satisfactory.
1618. Since that date has there been any reversion of opinion upon the matter? None at all.
1619. You know the views of your neighbours pretty well in the matter? Yes.
1620. Do you think they would cheerfully pay the necessary rates ? Undoubtedly.
1621. What do they at present pay a pan? Five shillings a quarter. We do our own night-soil work. We pay 5s. for every load that is taken to the Poudrette Ammonia Company, and we empty the pans at 5s. a quarter with our own carts.
1622. Do you sell the material to the company ? We pay 5s. a load to them for taking it.
1623. By that means you are able to dispose of it without creating a nuisance? Yes, as long as they let it stop there.
1624. Where are the works of the company ? At the end of Rickety-street, towards Botany Road.
1625. They are not in your municipality ? They are in the Municipality of West Botany.
1626. You are dependent upon another municipality for a place to which to send your refuse ? Yes.
1627. If you could not do that it would be difficult to dispose of it? Yes.
1628. Could you find any place within your own boundaries on which to deposit it? Certainly not.
1629. You must get rid of the stuff, and you do not know where to put it? Yes; all the municipalities are in the same position.
1630. They all want to deposit the stuff away from their own boundaries ? They do not like to deposit it within their own boundaries.
1631. The pressure which is put upon them in that way makes them willing to fall in with a general good scheme? I do not know that the pressure does so. I believe they would be glad to have a good scheme for sanitary and financial reasons. No money would be badly spent in constructing works that would conserve the health of the people. I have not heard so much about the expenditure as about the great benefit that would result from the carrying out of the works.
1632. You think the people value health and comfort sufficiently to be willing to pay more than they are paying now for a better scheme? Undoubtedly.
1633. Do you think if this system were adopted and proved a success there would be no reversion of public feeling against paying the rate ? I do not believe there would be.
1634. Have you cesspits in your municipality? Yes.
1635. How much is paid to the council for emptying cesspits? £488 9s. 2d. was paid during last year.
1636. How much do you collect for emptying earth-pans? £1,406 15s. 8d.
1637. That is to say, your ratepayers at present pay you altogether £1,895 4s. 10d. for the disposal of their night-soil ? I beg to add that a large number of people who have gardens of considerable area are allowed to empty their pans themselves. The amount which they would pay if the council disposed of their night-soil would be about £250, making a total of £2,145 4s. 10d.
1638. That is what your people pay at present, exclusive of getting rid of the slops? Yes.
1639. If they were provided with a system of sewerage which would get rid of the slops they would have to pay more than that? We have struck a sewerage rate, but they are kicking at it.
1640. What rate have you struck? Three-pence in the £.
1641. You levy a rate of 3d. in the £ in addition to the charge of £2,145 per year? Yes.
1642. Could you tell me what that would amount to? I could not.
1643. How much will the 3d. rate bring in? I think about £1,600, as well as my memory serves me. A rate of 6d. in the pound would be cheap for this system, because we could then get rid of everything.

J. Graham, Esq. 31 July, 1889.

1644. The amount paid for your pan and cesspit system is about equal to a rate of 4d. in the £, and as you are levying a sewerage rate of 3d. in the £, your people are paying 7d. in the £ for a very unsatisfactory system? Yes.
1645. Do you think they would pay 8d. or 10d. in the £ for a good system? Undoubtedly.
1646. How many houses are there in your borough? 2,700.
1647. And what is the population? It is roughly computed at 10,000.
1648. What do your rates for this year amount to? £5,700. The rate is 1s. in the £.
1649. Supposing the sewerage rate were equal to the general rate you would have to pay £5,700 per annum? Yes.
1650. A sixpenny rate would bring in half that amount? Yes.
1651. Could your borough be quickly served if the works were put into hand at once? We are the first after the sewer crosses the river, taking all the arms which they branch off.
1652. If the outlet works were completed you could very quickly be joined on to them? Yes. Three main sewers pass through the municipality.
1653. Part of your district is low-lying land which is apt to be flooded in wet weather? An area of about 250 acres; but it is a very small part of the borough because the whole municipality contains upwards of 2,000 acres.
1654. For that area it will be absolutely necessary to have a pumping system? Yes, that is shown on the map.
1655. Is that low-lying land still being built upon? The last floods have stopped it to a certain degree, and we are trying to get the Government to pass a trust Bill so that we can resume the whole of the land.
1656. Have you any power to prevent people from building on land which is too low for drainage? We have not unfortunately.
1657. People can build where they like and then ask you to drain their properties? We cannot drain this land. There is not more than 6 feet fall in 2 miles.
1658. If a pumping system were adopted would the low-lying land be good for the purpose of residence? Not unless it was raised. It must be raised at least 4 feet.
1659. Nothing can make the swampy land healthy unless it is raised? No.
1660. No amount of pumping can do it? It was part of the river once, and was filled in, and sold to unfortunate people. I knew the place twenty-five years ago, and I know almost every house that has been built upon it.
1661. Your people are quite wide awake to the evils of the present system? Yes.
1662. Those evils make them approve of the proposed system? Without any dissent at all.
1663. So far as your council are concerned they give their warmest assent to the Government going on with the work? We do.
1664. *Mr. Trickett.*] At present you have no system of drainage at all? We have no system.
1665. The sewage merely gravitates to the lowest spot? Those who have money get the street in front of their property kerbed and guttered, and they shoot their sewage out into the gutters, and the nuisance is thereby increased.
1666. And when the sewage reaches a place where there is no kerbing and guttering, does it not, if there is not much rain, lie and fester, and become offensive? Is it not notorious that this is the case in Marrickville? For that reason we have tried to get a system of sewerage in order to get rid of these spots, We argue that there cannot be a fever spot without its affecting the whole neighbourhood, but we have no power to compel the people to assist us in kerbing and guttering.
1667. I suppose a heavy rain is a God-send to you, because it clears out the drains? Yes; but the water lies on the flat places, and when dry weather comes the effect will undoubtedly not be beneficial. It is very strange that the lower parts of Marrickville are the healthiest; but that I account for by the presence there of brick-kilns. I believe they keep down the fever germs.
1668. They are destroyed by the smoke and heat? Yes.
1669. Is there much sickness in your district? Very little, and we have to thank the brick-kilns for that.
1670. I suppose you think that this scheme is the best that could be adopted? Yes. It has been before us since it was promulgated, and I have been over it with Mr. Stayton and Mr. Bennett. I also take an interest in the matter because I am on the Water and Sewerage Board; and it further interests me, because I have represented Marrickville so long.
1671. A portion of your borough is really below high-water mark? Virtually it is, because the water used to come up for nearly 2 miles on the low land before the dam was built. This land was virtually a part of Cook's River.
1672. Without speaking from a professional point of view, do you think the position of this land will interfere with the success of the scheme? We have an idea of getting it filled up, or of utilising it in various ways, either for lakes or canals. By the excavation of the sewers we should get an immense quantity of stuff, and that might enable us to fill the swamp up. The main sewer is a large tunnel, and would give a great deal of earth.
1673. You have lived a great many years in Marrickville? Over twenty years. I bought land there over twenty-five years ago.
1674. I suppose you have come into contact with a great many of the ratepayers? I have. I know almost every house.
1675. Do you think they would be willing to pay as high as 10d. in the £ for a sewerage scheme? I think that would be a saving on the present rate.
1676. 10d. in the £ upon the annual value of property would be a saving on what is at present paid? Undoubtedly. The pans are only emptied once a-week, and in many cases they are a great nuisance.
1677. Speaking as a representative man, you think they would pay as high a rate as 10d. in the £? Undoubtedly. A shilling in the £ would be an advantage over the present system.
1678. *Mr. O'Sullivan.*] Is it not likely that the sewers would be flooded if, as you say, the tide goes over the land? The floods would be at that part where the blue lines are; that is all low-lying land. The sewage would have to be brought to a point and pumped up. There are very few houses on that land of any value. It is the only part that would be affected, as the rest of the borough is high land.
1679. What portion of Marrickville was recently flooded? Where the pumping station is marked, as far as the crooked line goes.
1680. Are not the floods likely to occur again? Certainly. 1681.

J. Graham, Esq. 31 July, 1889.

1681. Do you think then that the works should be carried out? They could be kept above flood-level. The place will never be fit for building upon until it is raised. We have taken the levels of all the flat land, with the idea of asking the Government to form a trust to take charge of it—to expend money upon it, and to make charges to repay that money.
1682. Have you held any public meetings with regard to this scheme? Not as regards the general scheme. We have had some with regard to the low part.
1683. Speaking just now with regard to the feeling of the people upon the subject, you were only giving the feeling of the borough council? The council had the scheme before them for perhaps a month.
1684. You have no reason to believe that any opposition will be offered to a scheme like this? Certainly none whatever.
1685. And people will be willing to pay a rate of 8d. or 10d. in the £? Undoubtedly; because that would be cheaper than the present charge, and we do not know for a day where we are going to deposit the night-soil. Every municipality has a by-law prohibiting people from carrying the night-soil of other municipalities within their boundaries. We cannot drive a cart through Newtown, and the mayor of Sydney has prevented us from taking the stuff through the city. It used to be taken round to the iron works at Pyrmont, but that has been stopped.
1686. *Mr. Copeland.*] How do you get rid of it? At the present time it is taken by a company called the Poudrette-Ammonia Company, which does splendid work. I think the Committee should inspect the works. The stuff passes through revolvers and through a vacuum pump, and when dry it is sold at £5 a ton.
1687. Where is this? At the end of Rickety-street, near Botany Road. They are doing a great work. I advised them to try and have it gazetted, because they make a very valuable manure. The night-soil is dried so that any one can handle it, and it is not touched by fire. The objection to the process at first was that the fire destroyed the ammonia.
1688. You said just now that you have to thank the brickmakers for the good health of the borough—in what way? Because of the large fires and the smoke.
1689. You think that causes a current of air? It draws the germs from a long distance. There are very few houses in this locality, and instead of the trade being a nuisance we look upon it as a benefit, both as an industry and as a sanitary agent. Upon this flat of 150 acres is deposited the drainage of 1,500 people. It comes from St. Peters, Petersham, and Marrickville, and during the summer there is no current to take it away. Without some sanitary agent it would certainly produce fever.
1690. *Mr. Humphery.*] Where is the sewage carried at the present time—where is it deposited? When floods come it is taken into Cook's River.
1691. But before the floods? It goes as far as Providence will allow it, and there stagnates.
1692. You keep it in the borough? Yes.
1693. It does not go beyond the borough? When it is flooded out it goes into another borough, West Botany; but all the summer it lies upon the flats. We have spent some money in making a drain there, by which we are able to do a great deal of good, intercepting the Newtown and other sewers with old temporary iron pipes. We broom it, and intercept the solids, and thus keep it as healthy as we can. Before the whole place was a quagmire from one end to the other.
1694. Close to the railway station a large area of land is frequently under water? Yes.
1695. When there is a heavy flood? Yes. The railway station is about 10 feet above flood-level.
1696. The land in the immediate vicinity is usually under water in flood time? Yes.
1697. Are there many houses there? A number of people have put up houses, worse luck, but they have had to abandon them.
1698. The scheme you speak of for creating a trust to take over this low-lying land is the scheme known as Carruther's scheme? It was he who laid down the lines that we have followed.
1699. The object of the scheme is to raise all the low-lying land some 4 feet? 3 or 4 feet.
1700. And to deal with the land so that it will pay interest on the sum which it is proposed to borrow? The interest is to be paid by the people draining upon the land, and the capital would be paid back by its resale after it had been properly improved.

Andrew Murray, Esq., Mayor of Macdonaldtown, sworn, and examined:—

A. Murray, Esq. 31 July, 1889.

1701. *Temporary Chairman.*] To what municipality do you belong? Macdonaldtown.
1702. What office do you hold there? I am mayor.
1703. How long have you been mayor? About six months.
1704. How long have you been an alderman? Two and a-half years.
1705. How long have you been a resident of the municipality? For nearly ten years.
1706. You have seen the municipality grow gradually to its present dimensions? Yes.
1707. You are pretty well acquainted with all the streets and lanes? Yes.
1708. Where does the surface water naturally drain? On to the low-lying grounds; it goes through part of the borough of Alexandria.
1709. Into Shea's Creek? Into Shea's Creek.
1710. You helped to foul Shea's Creek? That is where our drainage goes.
1711. Is the present state of things satisfactory? No.
1712. Do you use the system of pans, or cesspits, or both? Both.
1713. Are most of the houses served by pans or by cesspits? By cesspits.
1714. How much a pan do you charge? 4d. a pan for once a week, and 6d. for twice a week.
1715. How much a year does the removal of your night-soil cost the municipality? £700 per annum.
1716. How much a year would a sixpenny sewerage rate yield there? £850.
1717. Then you are paying very nearly a sixpenny rate now? Yes.
1718. You make no provision for your kitchen slops? Only in the gutters.
1719. Have you considered the scheme before the Committee? It has been before the council.
1720. Does your council generally approve of it? Yes.
1721. If that scheme were carried out you would have some provision for slops as well as for night-soil? Yes.
1722. You would be very much better off than you are now? Yes.
1723. The present system costs you nearly 6d. in the £? Nearly 6d. in the £. 1724.

A. Murray, Esq.
31 July, 1889.

1724. Do you think your people would be willing to pay 9d. for an improved system? I think so—this would be much better than the present system.
1725. You think that in your district there would be an intelligent appreciation of the advantage of the scheme? I do.
1726. The people are crying out for some improvement? Yes.
1727. They know the value of health and sweet air? Yes.
1728. They would be glad to have their back yards and houses sweet? Yes.
1729. Has there been any public meeting in your district to discuss this matter? No.
1730. You only gather the public opinion from what you know of the people? Yes.
1731. You think you may speak confidently on their behalf? Yes.
1732. *Mr. Trickett.*] I suppose your drainage goes chiefly into the adjoining borough? A small part of it into Alexandria.
1733. The flow is very sluggish, as it is mostly low level land? Low lying land.
1734. Between your municipality and Alexandria there are some very offensive open drains, are there not? Yes.
1735. I suppose in all places where kerbing and guttering has not been been carried out the effect of the present system is very bad? Very bad.
1736. Very injurious to health? Yes.
1737. And causes a very offensive smell? Yes.
1738. I suppose you know of no better scheme for getting rid of the sewage which you can suggest to the Committee? I know of no other scheme. There are two streets in the municipality,—Pleasant and Prospect Streets, which it will be very hard to deal with. I do not know how you are going to connect them, unless through private property.
1739. You see the two sewers marked on the plan as going through Macdonaldtown? Yes.
1740. Do you think those are well situated for the purpose of the scheme? I do.
1741. The greater part of your borough could be conveniently connected with them? Yes.
1742. It would be a great advantage to the borough generally, to have the scheme? It would.
1743. Is there much sickness there? Not at present. Sometimes we have a little.
1744. I suppose in hot dry weather, when the water lies about, it becomes worse? Yes, but we generally keep the gutters scavenged.
1745. Well flushed? Yes.
1746. *Mr. Copeland.*] You have had considerable difficulty with Newtown, in connection with drainage, have you not? Yes. We had an action lately with regard to the drainage from Newtown.
1747. The whole of the drainage from one side of Newtown runs under the railway and into your borough, does it not? Yes.
1748. You have had difficulties with your other neighbours—with Alexandria? No, we have had no difficulty with them. Of course we put it on to them, but we have had no difficulty.
1749. Do they take it kindly? We have had no difficulty so far.
1750. I suppose Macdonaldtown would be a difficult borough to drain in any case, would it not? Yes, unless it went through that way.
1751. I suppose you have a considerable amount of vacant land there yet? There is some vacant land in low-lying places.
1752. Have you any idea of the number of houses in the municipality? I am not prepared to say what the number is.*
1753. At any rate you spoke of the number of houses as increasing very much? Yes.
1754. You expect that the municipality will be a pretty densely populated suburb? Yes, and is at present in some parts.
1755. I suppose mostly by the working classes? Yes.
1756. The houses are generally small? They are small.
1757. That I suppose you will consider a reason for carrying out drainage works—the houses being small and close together? Yes.
1758. You anticipate a pretty dense population there soon in connection with the railway works? Yes.
1759. The Macdonaldtown council are quite in favour of the works being carried out? Yes.
1760. You do not think the people will be likely to object to paying the necessary rates? I do not think there will be any difficulty at all with the people. They will only be too glad to have the scheme.
1761. *Mr. O'Sullivan.*] Have you any sewerage at all in your Municipality? Only the gutters.
1762. The ordinary street channels? The ordinary street channels.
1763. Do you notice that any deleterious effect arises from this—any sickness? It may be so. We have had some complaints; but we have always attended to them.
1764. What is the general state of health of the people in Macdonaldtown? It would compare favourably with that of most other municapilities.
1765. I suppose you have taken steps to consult the people as to whether they approve or disapprove of the scheme? The scheme has only been before the Council; but every person to whom I have spoken has been very much in favour of it.
1766. You have no reason to doubt that there will be no opposition to it? No.
1767. I suppose the peeple will be quite prepared to pay the rate in preference to the present system? I think so.
1768. A portion of the municipality would come under the low-lying system? Yes.
1769. That portion is subject to floods? We are flooded sometimes.
1770. How are you disposing of your night-soil at the present time? The contractor finds the depôt.
1771. I suppose you have to trust to chance whether he can find it? He contracts to take it away from us.
1772. What would happen if he were unable to find a depôt? He would have to try to find one.
1773. At the present time you really have to trust to chance to get rid of this dangerous matter? When we call for tenders it is to take the night-soil and find a depôt for same, and they contract according to that.
1774. In point of fact it is absolutely essential, as far as Macdonaldtown is concerned, that some system of sewerage should be carried out? Yes.
1775. *Mr. Humphery.*] I suppose you are not curious about where the night-soil is deposited? I do not know where it is deposited.

1776.

* NOTE (*on revision*) :—1,107.

A. Murray, Esq.
1 July, 1889.

1776. What is the population of Macdonaldtown? I am not prepared to answer that question.*
1777. How many houses are there in the municipality? I do not know. I did not post myself up in that.†
1778. I think you said that the cost of the residents at the present time is about 6d. per week That is for emptying the pans twice a week.
1779. That is about equal to a rate of 6d. in the £? About equal to that.
1780. That is for disposing of night-soil alone? That is for disposing of night-soil alone.
1781. Do you consider that the system of sewerage would be worth 3d. or 4d. in the £? I think it would be worth that.
1782. 8d. or 9d.? Well, of course, we are only a poor electorate.
1783. But still you would cheerfully pay 8d. or 9d. in the £ to get rid of the surface drainage as well as of the night-soil and nuisances generally? Yes.

John Rowland Dacey, Esq., Mayor of Alexandria, sworn, and examined:—

J. R. Dacey, Esq.
31 July, 1889.

1784. *Temporary Chairman.*] To what municipality do you belong? To Alexandria.
1785. What office do you hold there? I am mayor of that municipality.
1786. How long have you been mayor? For two years.
1787. How long have you been an alderman? About four years.
1788. How long have you been a resident of the municipality? About five years.
1789. Are you familiar with the drains and streets? I might preface my evidence by stating that this scheme will be of very little advantage to Alexandria, as it merely, so to speak, passes through it. Some parts will be as high as 12 feet above the surface of the ground, and we shall get very little good from it, so that it does not interest us much at all.
1790. Has it been officially considered by your council? Yes.
1791. They are not much in favour of it because they do not see the advantage to be derived from it? They are in favour of it so far as it goes, but they consider at the present time that they are simply made a convenience of.
1792. Do any of the other suburbs at present throw their drainage into your municipality? A large number of them do. Redfern, Waterloo, part of St. Peters, Macdonaldtown, and Newtown all do.
1793. Practically, Alexandria is a natural cesspool for the other suburbs? Yes.
1794. Would it not be a great thing to get rid of that? Yes.
1795. That alone would be worth something? We are most anxious to do it.
1796. You have no power at present to prevent the surface water of your neighbours running within your boundary? None whatever.
1797. Do any of them deposit their night-soil within your municipality? No.
1798. Where do you deposit your night-soil? Lately, we have been taking it to Moore Park; but it is a very difficult question to answer. I think the nightman goes wherever he gets a chance, when nobody is looking.
1799. You contract with the nightman and ask no questions? Yes.
1800. Do you think it better to have no eyes or ears? Yes.
1801. But you have noses? Yes.
1802. Are they occasionally offended? It depends where the smell comes from. If it comes from another borough they are very much offended.
1803. Do you use the pan system or the pit system? The pit system. We have a few pans, but not many.
1804. Are the pans emptied by the corporation? Yes; by contract.
1805. Do you know what you get? £450 per annum.
1806. How much would that be as a rate? We just charge them what it costs us.
1807. What do your rates bring you in? £3,000 per annum.
1808. What rate do you charge? A shilling in the pound.
1809. At present, the cost of emptying the cesspits is only small? Yes.
1810. Would the cost of dealing with the pan system be greater? That I could not say—we have no experience.
1811. If you were connected with the proposed scheme, a great deal of your sewage would have to be pumped up? The sewage of a large portion of the borough would have to be pumped up.
1812. Do you think your people would be willing to pay their fair share of the cost of the system?
1813. They would rather do that than remain as they are? Yes.
1814. The fact that you are on low ground makes it a matter of necessity to get rid of the slops in a satisfactory way? It does.
1815. If you were on the top of the hill you would not be so particular? Yes.
1816. Although your present cost is not so great, you would be willing to pay a rate, if the proposed scheme were satisfactory? Yes.
1817. What rate would you be willing to pay? The general impression is that we should have to pay a rate of 1s. in the £. The people are prepared to pay what is a fair thing.
1818. They are quite prepared to pay a rate of 6d.? Yes.
1819. If it were proved that 8d. or 9d. would be absolutely necessary, you do not think there would be much grumbling? I do not think so.
1820. Your people value health? Yes.
1821. They wish to live in pure houses and sweet yards? Yes.
1822. There is general feeling in favour of sanitary reform? Yes.
1823. You can confidently say that they will not stick at a few pence in the £? Yes.
1824. *Mr. O'Sullivan.*] Your present system appears to be as uncertain and insufficient as that of many other municipalities. I suppose you have no security whatever that some day you will not be stopped? None, whatever; we have been stopped lately by the Mayor of Sydney.
1825. In the event of your being stopped altogether, what would you do? We would have to put it in another borough by force.
1826. Notwithstanding the fact, as you say, that you will not be very well served by the proposed scheme, it is essential that some scheme shall be carried out? I am informed by the Government officials that they have some very good thing for Alexandria, but I have not seen it yet. 1827.

---

* Note (*on revision*):—5,535. † Note (*on revision*):—1,107.

J. R. Dacey, Esq. 31 July, 1889.

1827. Are you not served at the present time by the outfall sewer to Webb's Grant? Not at all. It is above the level of the ground where it passes through the municipality.
1828. I suppose a great deal of inconvenience is caused through there not being an efficient system of sewerage in the borough? A great deal.
1829. Notwithstanding that this scheme does not appear to offer you much relief, you think some scheme should be carried out? Yes.
1830. And the people are quite prepared to pay a fair rate to maintain that scheme? Yes.
1831. Have you held any meetings to discuss this matter? No.
1832. It has merely come before the Borough Council? Just so.
1833. You think that you can say that the people see the necessity for some safe system. They have experienced so much inconvenience from the bad sewerage that they are quite prepared to endorse any proposal of that character? I believe they would do so.
1834. *Temporary Chairman.*] When you say that the scheme does not do you any service, you mean the existing out-fall sewer to Webb's Grant? I mean the proposed sewer. There is a V shape there, running up into two streets, which would be of use to us, but the rest of the scheme is for the adjoining municipalities.
1835. But when that is constructed it will take all your stuff by gravitation to the pumping station? There is only that V-shape portion of the scheme that will affect us at all, as far as I am aware, and it only affects a couple of streets. The aldermen felt aggrieved until they were informed that there was another scheme in store for us.
1836. If any extension of the scheme will make the system as available for you as for the other people included in it, you will be quite content to fall in with it? Yes. There is a feeling on the part of some of the aldermen that the crossing of the main southerly outfall sewer would interfere with the work at Shea's Creek, through not passing at a sufficient height above the waters of the canal.

Robert H. Judd, Esq., Mayor of St. Peters, sworn, and examined:—

R. H. Judd, Esq. 31 July, 1889.

1837. *Temporary Chairman.*] What municipality do you serve? St. Peters.
1838. What office do you hold? I am mayor.
1839. Ho long have you been mayor? During the current year only.
1840. How long have you been an alderman? For three years.
1841. You have been a resident for a long time, have you not? For five and a half years.
1842. Is your municipality thickly populated? It has a population of 5,000 inhabitants.
1843. Have you had much trouble with your drainage? Not as far as we are concerned, because there is a watershed running through the centre of it and so some portions of the borough drain one way and some another.
1844. Is the ground low lying or high? Practically it is high.
1845. Your houses are mostly on the ridge? Yes.
1846. With a fall both ways? With a fall both ways.
1847. Do you throw your sewage into any adjoining municipality? To a certain extent, but not to any great extent.
1848. You do not complain? No.
1849. Do your neighbours complain? Marrickville complained once. We receive the whole of the drainage ultimately, inasmuch as it all runs into Cook's River, and Cook's River is within our boundary.
1850. The drainage from the eastern side of the ridge goes into Shea's Creek? Yes, but there are few buildings on that portion, with the exception of the northern end. The land is pricipally occupied by brick-yards, and they hold the water.
1851. What falls on the western side of the ridge goes into Marrickville? Yes.
1852. Have your neighbours ever made any formal complaints? Marrickville called a meeting on one occasion, asking us to try and deal with the matter. We have met them amicably, inasmuch as we offered to put down filter beds. The proposal for the formation of a sanitary trust came before us, but it is meeting with some opposition in our borough, the ratepayers objecting to pay a rate towards improving another borough.
1853. Do you use the pan system or cess-pits? We have both. We charge 4d. a week for each pan emptied, and 4d. per cubic foot for each cess-pit.
1854. What is the total amount you receive from the cleaning out of pans and cess-pits? During the last municipal year we received from pits £182 6s. 6d., and from pans £280, making a total of £462 6s. 6d.
1855. How much would that be as a rate—what would you have to levy to get £462. What do you get by a shilling rate? £2,000 from the general rate.
1856. The £462 would be about a 3d. rate? Yes.
1857. You are really paying now a 3d. rate for an ineffective method? Yes.
1858. Do the people of your municipality ardently desire an improved system? When Mr. Stayton's sewerage scheme came before us I was the first to agitate for a public meeting. There was no public meeting called however, but a special meeting of the council was held, and the majority of the aldermen were in favour of the scheme;—they were not all in favour of it.
1859. There is a somewhat divided opinion? As far as the aldermen are concerned; but if you went to the ratepayers I believe they would be entirely in favour of a better system of sewerage.
1860. Is there much sickness in your district? Very little.
1861. You cannot say that the present system is distinctly unhealthy? Not by any means. We have very few complaints with regard to typhoid or other fevers. No doubt the danger is minimised greatly because of the brick kilns in one portion of the borough.
1862. Do you think they are healthy? Yes. The sulphurous fumes arising from the burning brick purify the air. We are troubled of course by Alexandria and other boroughs.
1863. You do not think your district would want to stand out of this system if it were carried out? Not by any means.
1864. They would be willing to come in and pay their share of the cost? If it were not exorbitant. The majority of the residents in the vicinity of the brick kilns are working men, and they could not afford to pay a heavy charge.

R. H. Judd, Esq. 31 July, 1889.

1865. Does not the present system press more heavily upon the poor than upon the rich? It does.
1866. But a rate would press more heavily upon the rich than upon the poor? Yes, it would. 17s. 4d. a year is the average.
1867. So that if a rate were charged on the value of property a gentleman living in a good house would pay relatively more than a person living in a cottage? Undoubtedly.
1868. So that there would be a distribution in favour of the poor man? Yes.
1869. The poor man has to pay 4d. a week for his pan—there is no charge below that? No.
1870. So that the rate would not be more than the present payment? I think it would not.
1871. *Mr. O'Sullivan.*] Are you in the same uncertain position with regard to the disposal of night-soil as the surrounding municipalities? We are. We called tenders at the beginning of the municipal year, and the contractor has to find a place in which to deposit the night-soil. I understand that his depôt is in Canterbury at present.
1872. I suppose it does not matter very much to you where it is as long as you get rid of the nuisance? It would if he deposited just outside the boundary of the municipality. There is a Poudrette Ammonia Company which has works on the border of the municipality, the operations of which seem to be very satisfactory, but I understand that the night-soil contractor is still depositing it in Canterbury.
1873. St. Peters is on low-lying ground, is it not? Not particularly. Some portion of it is, but none of it is flooded.
1874. Have you any power to restrain people from building on land which is liable to be flooded? The Municipalities Act does not give us any.
1875. I suppose in the absence of drainage a good deal of trouble might arise and possibly some danger of sickness through the ground being charged with filth? Not so much now, because we have recently borrowed £10,000 and expended it upon kerbing and guttering;—that prevents the earth from absorbing the drainage.
1876. Does that carry out most of your refuse? Yes; and scavengers clean them out.
1877. Where does the water go to? Into Shea's Creek and Cook's River.
1878. You said just now that although there was some opposition offered on the part of the borough councillors the people generally would approve of being connected with the scheme? I believe they would. A resolution in favour of it was passed by a large majority. My experience of the municipal councils is that one or two will always oppose anything in the shape of taxation, whether it be beneficial or otherwise.
1879. Where was this carried? In the municipal council. I convened a special meeting. I read the proposal through, and I thoroughly agreed with it, with one or two alterations.

J. C. Sharp, Esq., Mayor of Canterbury, sworn, and examined:—

J. C. Sharp, Esq. 31 July, 1889.

1880. *Temporary Chairman.*] To what municipality do you belong? To Canterbury.
1881. What office do you hold there? I am mayor.
1882. How long have you held that office? This is the fifth year; but I have not held it continuously.
1883. How long have you been an alderman? About six years I think.
1884. How long have you been a resident? Seven or eight years.
1885. You are thoroughly familiar with the streets of the municipality? Yes.
1886. And with the present system of drainage? We have none.
1887. Is the present disposal of your refuse satisfactory? It is just the opposite.
1888. Do you think at present it is injurious to health? Well, I can scarcely say that, seeing that we have a very large district, and that the people have, as a rule, large areas of ground attached to their dwellings.
1889. You have no very dense population in any part of the district? No.
1890. You think if the matter of sewage is not attended to soon there is a likelihood of bad sanitary conditions? Our council have always advocated a scheme such as is now proposed.
1891. Has this scheme been officially considered by the council? More than once or twice.
1892. And always favourably? We wish that it would serve a greater number of people than it appears it will do.
1893. You think it will not include the whole of your district? It will not.
1894. But as far as it will go it will be very favourable? Yes.
1895. Is the cess-pit system in vogue in your municipality? We have that system as well as the pan system.
1896. What charge do you make for removing the pans? 4d. per week.
1897. How much for cleaning the pits? 4d. per cubic foot.
1898. How much do you think that is in the shape of a rate? Perhaps £100 in each case. I am scarcely able to say, because men having large areas of land are allowed to dispose of their own night-soil on their own premises.
1899. You charge them nothing? We do not charge them.
1900. You cannot say exactly what the cost is? Not exactly.
1901. Do you think the people would be willing to pay a rate for this system? Yes.
1902. There is no popular feeling against the sewerage rate? I have not heard any one express an objection to it.
1903. Where do you dispose of the night-soil which you take away? Those matters are attended to by a contractor. We had considerable difficulty, because we had to receive it from other places though very much against our wish.
1904. Do you continue to receive it from other places? No. They go beyond the borough now.
1905. You do not prohibit their going beyond the borough? We object to their depositing night-soil in the borough, and we take every precaution to make them go beyond it.
1906. They sometimes will empty it in your borough? Yes.
1907. You have no objection to their going through the borough if they go beyond? Not if they go beyond, but that is the difficulty,
1908. All those contractors want watching? Yes; and they put us to considerable inconvenience and expense.

J. C. Sharp, Esq. 31 July, 1889.

1909. Then the present system is expensive, merely because you have to watch your neighbours? It is.
1910. Besides being very unpleasant and unneighbourly. You would be very glad to see this scheme carried out? Yes.
1911. It would improve the health of your district? Yes. It is necessary for something of the kind to be done, as the river is getting fast polluted and made foul.
1912. Taking the suburbs as a whole, you think the system would be a great advantage to all of them? I do.
1913. *Mr. O'Sullivan.*] While you are sending your night-soil to other people, are you aware that other people are sending theirs to you? We do not send ours to other people.
1914. I understood you to say that the contractor took it away? Right through the bush, but not into another borough.
1915. Why? Because the place to which they take it—Salt-pan Creek is outside the borough, and is not part of a municipality.
1916. Then the night-soil is deposited on Crown land? It may be so.
1917. While you are taking all that care to send it away, however, other people are depositing their night-soil upon your territory, so that you do not benefit very much from your system? I did not say that other people sent theirs to us, but the contractors for other boroughs bring it into our district whenever the opportunity arises. It they can steal in quietly and deposit it unseen they do so.
1918. Is there any law to prohibit that—have you any power to prevent it? We could prevent them from creating a nuisance, but we cannot always be on the watch.
1919. You could take action in the court to restrain them? That has been done several times, but still they do it.
1920. You are in a hazy and uncertain condition, similar to that in which other boroughs are—you cannot tell for a moment when you will be debarred from depositing your night-soil? No. You do not understand me to say that we have a depôt for night-soil within our own boundaries.
1921. I understood you to say that you had a depôt on some Crown lands near Canterbury; No; the contractor goes through our district and deposits the night-soil somewhere beyond it. I do not know where, but the place is outside our district.
1922. I suppose you do not care so much where as long as it is deposited outside your district? No, very little.
1923. If this depot is outside your district, and some one took action to restrain you from depositing your night-soil there, you would be powerless to get rid of it? I do not know what we should do at all. We should be in a mess.

William G. Coward, Esq., Alderman of Strathfield, sworn, and examined:—

W. G. Coward, Esq. 31 July, 1889.

1924. *Temporary Chairman.*] Do you hold office in any of the western municipalities? I am an alderman of the borough of Strathfield.
1925. Have you lived long in that borough? About three years.
1926. Is the pit system or the pan system in use there? The pan system.
1927. How much a pan is charged? 6d.
1928. Can you say what that would be as a rate? No. I cannot; because the fees for emptying the pans are not paid to the council, but to the night-soil contractor direct, and he does not at present empty the whole of the pans. Some of the residents bury the night-soil on their own ground, so we have no means of ascertaining the actual cost.
1929. Do you know how much the contractor gets? No.
1930. You cannot form a relative estimate of what the present cost is as compared what rate it would be? No.
1931. Do you think that the people generally are in favour of a good system of sewerage? I think they are, because at the present time they experience a great difficulty in disposing of the slops. The council will not permit the slops to run into the streets, and therefore the people have to get rid of them themselves.
1932. Every man is shut up to his own yard? Yes.
1933. And he must somehow or other purify his stuff or get rid of it? Yes.
1934. Did you allow people to make cesspits in the borough? Yes.
1935. You encourage it practically? Yes, because they have no other means of disposing of their slops.
1936. Where do your contractors take the closet refuse? I have not the remotest idea.
1937. You leave them to find out a place? We leave them to dispose of it. I do not think it is deposited anywhere in the borough.
1938. Do you prohibit that being done? That I cannot say. At the present time there is a lot of bush-land in the borough.
1939. Do any other corporations send their refuse into your borough? Not to my knowledge.
1940. Do they send it through to any place beyond? I am not certain whether the night-carts from Burwood pass through it.
1941. So far as you know the borough is favourable to the scheme and willing to pay the expense of it? Yes.
1942. *Mr. Copeland.*] It seems to me that each of these municipalities shoots its night-soil into some other municipality—you send yours away to some other place, but does another municipality deposit its night-soil within your boundaries? I do not think so—not to my knowledge.
1943. Are you aware of some general depôt for night-soil? I am not aware of any. There is a lot of bush-land beyond Strathfield, and possibly it is taken there.
1944. You are under the impression I suppose, that it is taken there? Yes. The person who contracts for Strathfield I believe contracts for Burwood and some other municipalities, so I suppose he deposits it all in the same place.
1945. Are there any residences near this bush-land? Some scattered houses.
1946. Do they complain? I never heard of any complaint.
1947. Have you any idea of the average value of the houses in your district? £24,000.
1948. That is the total value? The total rental value of the house property.
1949. Comprising how many houses? 250 houses.

W. G. Coward, Esq. 31 July, 1889.

1950. I suppose you anticipate a large increase in the number of houses? The district is rapidly growing.
1951. It is quite a favourite borough? I believe so.
1952. On account of the many through trains? Yes; and because of the way in which we have laid out some of our streets. We have planted trees along them.
1953. I suppose the houses there are of rather a superior character? Yes. There are a good many houses of the rather superior class.
1954. Not belonging to the working classes? No. It is by no means a working man's suburb.
1955. Therefore the people will be well capable of paying a reasonable rate for drainage? Certainly.
1956. You think they would be inclined to do so? I am sure they would.
1957. Has the matter been considered by your council? It was considered by the council and the then Mayor, Alderman Von der Heyde, myself, and the Council Clerk were deputed to wait upon Mr. Stayton to inquire into the scheme. We afterwards made the report to the council, and they unanimously approved of the scheme. Mr. Stayton's scheme does not provide for the drainage of the whole Borough—there are some high parts the scheme will not take in. I do not know whether they would be able to levy a sewerage rate on those portions.
1958. Could you not drain from the high parts to the lower parts? Mr. Stayton told us that these parts would have to come in later by some other scheme. If you notice on the map there is a sewer marked by a dotted line going through Enfield and Canterbury—that would take in the portion of Strathfield which the other sewer would not take in.
1959. Then I suppose you would be glad, speaking as the Mayor, to see the Government carry out these works? Yes; the council would be glad to see them carried out. I am not the Mayor—the Mayor was unable to attend, and asked me to come in his stead.
1960. *Mr. Humphery.*] You can give us a professional opinion as to the desirableness of the scheme? Yes.
1961. Do you speak in your capacity as an alderman or from your professional knowledge? In a dual sense.
1962. You have no doubt that the scheme is a good one,? It is. It is the best scheme that they have placed before us.
1963. You fully approved of it? Yes; we looked at Mr. Cowdery's scheme, but we did not consider it at all suitable for the purpose, because at Hen and Chicken Bay at high tide we thought that the filter beds would be flooded, and of course the drainage would be unable to get away, and a great nuisance might have resulted.
1964. I suppose at the present time you really do not know where the night-soil from the municipality is deposited? I do not.
1965. You make no inquiry when the contractor removes it for a certain sum? Yes.
1966. *Mr. O'Sullivan.*] Have you any subsidiary sewers or channels in your municipality—any drains? Yes. We have one or two creeks. We have one creek called Powell's Creek, which at the present time is a great nuisance.
1967. Does the foul water from houses drain into these creeks? It is not supposed to do; we do not allow it to be done. The creek comes from Burwood, and it brings with it a lot of dirty water.
1968. Where do the creeks flow to? The creek, I believe, eventually empties itself into the Parramatta River.
1969. All the way down I suppose the air is pervaded by a smell from the bad water? Yes. Of course, with a storm like that which we had recently, it gets well flushed out; but after a time, as the water begins to run off and to dry up, a number of little pools are formed, in which the water stagnates, and becomes very offensive.
1970. I suppose a great deal of inconvenience and damage is caused from the want of drainage in the district? There is not much damage done. Sometimes the creeks overflow after a heavy downfall, but the greatest objection is the nuisance from the smell.
1971. You appear to be pretty well in the same position as your neighbours in regard to the night-soil question—you have no certain depôt? We have no certain depôt.
1972. *Temporary Chairman.*] As an architect, you are familiar with the cost of the constructive works? Yes.
1973. Have you checked the calculations of Mr. Stayton at all? No.
1974. You could not give the Committee any evidence as to whether you consider the estimate a sound one? I have not gone into the question at all.

THURSDAY, 1 *AUGUST*, 1889.

Present:—

The Honorable JOHN LACKEY (VICE-CHAIRMAN.)

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	WILLIAM SPRINGTHORPE DOWEL, Esq.
JACOB GARRARD, Esq.	EDWARD WILLIAM O'SULLIVAN, Esq.

JOHN HURLEY, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

John Trevor Jones, Esq., Engineer, Water and Sewerage Board, sworn, and examined:—

J. T. Jones, Esq. 1 Aug., 1889.

1975. *Dr. Garran.*] What is your position in the Civil Service? I am engineer to the Board of Water and Sewerage.
1976. You know something about the scheme of Mr. Stayton's, into which the Committee are inquiring? Yes.
1977. If it is carried out, and water-closets supersede the present privies, there will be a large demand for water for the service? There will.

J. T. Jones, Esq. 1 Aug., 1889.

1978. Can you give the Committee any estimate as to the probable quantity per individual that would be consumed? I have been called unexpectedly to attend this meeting of the Committee, so I can only give you such an estimate as occurs to me from my long experience. I fancy it would be about five gallons per individual.
1979. Is that an estimate based upon present experience? It is not based on any calculation from present experience, but from a recent experience in Surry Hills, where the carrying out of sewerage works made that difference in the consumption of water.
1980. There was no other cause to stimulate the consumption? There may have been, but I do not know of any other. The increase was immediately noticed, and my attention was drawn to the fact that the pressure was less in certain portions of Surry Hills after the sewerage works were carried out there, I then took the matter into consideration, and the pipes being too small, I was obliged to lay down larger pipes to meet the new demand. I tkink I am correct in saying that 5 or 6 gallons per individual per diem would meet the extra consumption.
1981. I suppose there is always some risk of waste in connection with water-closets? There is some risk; but with the careful inspection such as we profess to apply just now, the risk is very much reduced. It is reduced in proportion to the inspection.
1982. You are looking forward to having to supply the whole of the district with water for sewerage purposes? The reticulation of water pipes was laid out with that view.
1983. By the time the scheme is ready you will have an abundant water supply for the purpose? Everywhere. Had I not been called unexpectedly I might have looked over the plans and obtained a little information, but I have a very good knowledge of the reticulation, and also of the proposed sewerage system. I do not remember at present that it goes into any place that we cannot supply with water.
1984. What population are you now supplying with water for closet purposes? Including Darlington, we are now supplying close upon 35,000 houses. I think we are supplying that number of houses.
1985. What do you estimate is the quantity consumed per house? I should estimate that each house consumed 25 gallons per day for water-closet purposes
1986. Have you any idea of the additional population that you will be called upon to serve? By the time the sewers are made, I expect that the population will be very largely increased. I take it that if the sewerage were ready to start to-morrow there would be in the western suburbs close upon 40,000 houses, and estimating five persons to a house, that is 1,000,000 gallons a day more than we have to supply at present.
1987. The population in a few years time in the western suburbs may be quite equal to the population which you are at present supplying? Yes; the population will then be considerably increased.
1988 And the demand upon you would be doubled? Yes; but the pipes are laid with a view to meeting it.
1989. Will you have the water to meet the demand? The water will be there. The Board has passed the duplication of some of the larger supply mains, and that will keep us ahead with all requirements in the way of water.
1990. You expect that the dam at Prospect will be thoroughly settled by that time? Yes; and even without that, I do not expect that there will be any want of water.
1991. Where is the storage besides that? The storage there is abundant for the present population. It was designed for a very largely increased population in fifteen or twenty years time.
1992. Is the Prospect reservoir half full now? I fancy it must be about half full.
1993. That would be about a six month's supply? Far more than a six month's supply. We do not depend upon that—the river is always flowing in and keeping it full.
1994. Not in dry weather? It has never stopped yet. If it were allowed to flow in the canal there would always be enough.
1995. But are you not obliged to allow the people at Camden a certain amount of water? 10,000,000 gallons per day is the quantity directed by the Act to be allowed to flow down the river to satisfy riparian claims.
1996. I am asking these questions because I want to know whether in case of a drought there is a possible risk of all these water-closets being thrown out of gear through the want of water? There is not any reasonable possibility.
1997. You think we may confidently recommend this immense extension of the water-closet area without any fear of the water supply running short? I quite think so. You must not forget that Botany will be available for some years hence.
1998. But we are told that the quality of the Botany water is being deteriorated by the manuring of the Centennial Park, and through other causes? Whatever deterioration there is is not to be discovered by any test that has been made.
1999. Not as yet? Not as yet.
2000. Have you had the water tested lately? Not for some time. It is unfair to test it now, since the heavy rain has washed the road sweepings into it, and it is very muddy. I should only test it in its best condition.
2001. Have you tested it since the manure was put on to the Centennial Park? Not chemically.
2002. Then you cannot possibly say whether the sand filtration has been enough to take away any bad effects of the manure? I cannot say.
2003. The tendency of settlement in that district will be to destroy by degrees the quality of the water? I am making strenuous efforts to prevent that, and to keep the water clean. The Kensington Syndicate who bought the Terry and Winder grants propose to sewer their property and to carry away the drainage from the stream altogether, allowing the stream to pass through the ground without pollution.
2004. If you can keep the water clean you have all your works in good order, so that you could fall back upon that supply? Yes.
2005. Are the pipes sufficient to bear the pressure? Yes; there would be 5,000,000 gallons a day available from Botany.
2006. The reservoir is full? We have been obliged to hasten its flow into the sea to relieve the dams on account of the wet season.
2007. The water has been running over for many months? Yes; you are probably aware that one of the dams in the Centennial Park was washed away.
2008. You are an engineer yourself, and although this matter does not come under your department, I think it is a fair question to ask you if you have looked into the scheme? I have.
2009. Do you as an engineer commend it? I do.

2010.

2010. You do not know of any better plan? I think there is no better plan which the Committee would be justified in accepting. The plan I did favour goes further in the way of excluding all rain water than this does. It is what is called the separate system, but it has had so little experience to justify it that I am going upon theory. Upon a former occasion I said that this was perhaps the best plan that could be reasonably recommended to Parliament, and I still hold the same opinion. The separate system has been so little tried that an engineer has to go largely upon theory. While this evidence is being taken a most valuable treatise by Col. Waring has been published and received here. The volume was placed on the table. Col. Waring is perhaps the highest authority in America on the question, and he has demonstrated to my satisfaction the superior efficiency as well as cheapness of the separate system, as proved from the experience of fifteen years at Memphis, U.S., as well as a large number of other towns in America and Europe.
2011. The principal advantage of the separate system would be that smaller pipes could be used and the work could be done more cheaply? That is one advantage. You could also more efficiently cleanse small sewers artificially, instead of allowing the work to be done by the rain water. There are many months in the year when no rain falls at all, so we have to make artificial provision for flooding the sewers, so we must use all the other water which we can get, such as the waste from baths, to cleanse them. In a small sewer the sewage would probably be less in quantity and more intense than in a large sewer, and if it were required to purify it before it went into the harbour, it could be more easily dealt with, while on the other hand if it were wanted for fertilising the ground it would be richer for the purpose.
2012. In order to thoroughly flush the sewer do you require a full bore of water? For a certain distance.
2013. Then the smaller the pipe the less water you waste? That is one of my reasons for advocating the separate system.
2014. You admit that the experience of large cities has not yet been sufficiently in favour of the separate system to recommend it? It has not been sufficiently tried, and therefore I take it that Messrs. Stayton and Bennett's scheme is all that could be desired, leaving out for want of proof the excellence of the other.
2015. Have you gone into Mr. Stayton's estimate of expenditure at all? No.
2016. You are not able to tell us whether he has under estimated anything? I have not gone into it at all, but I have sufficient faith in Mr. Stayton to think that his estimate will be quite correct.
2017. You think we may rely upon him? He has had large experience and has been practically connected with many sewers in England, so I think that he can be relied upon in that respect.
2018. *Mr. Copeland.*] You say that you are at present supplying about 30,000 houses in the western suburbs with water? I think the number must be about 40,000.
2019. I understood you to mention Surry Hills and other places? Surry Hills drainage is discharged at Botany, therefore in that respect it is analagous to parts of the western suburbs, or at least the lower part of it is. Still it is within the city and has been sewered for a few years. There are 30,000 houses I believe to be supplied by this scheme. I am at a disadvantage because I have not the plans with me and I am not quite sure of my figures.
2020. I understood you to say that you were supplying 30,000 houses now, and that when this scheme was completed you would have to supply 20,000 additional houses? I did not say that. I may have expressed myself badly. I take it that there will be 40,000 additional houses to be supplied when the scheme is finished.
2021. How many houses are you at present supplying with water for sewerage purposes? I think we are now supplying in the city some 20,000 houses;—rather over that number than under it in the city alone.
2022. Taking the average of five people to a house, you will have to supply a population of 250,000 inhabitants when this scheme is carried out, then? Yes.
2023. Have you any information as to the ratio of the increase of population in the suburbs and in the city? As you probably know the population has increased from 200,000 about five years ago—I am speaking from memory—to 250,000 at the present time; that is an increase of 100,000 a year by rough calculation.
2024. An increase of about 20 per cent.? Yes.
2024½. *Vice-Chairman.*] Is that in the whole of the suburbs? I am alluding now to the western suburbs.
2025. *Mr. Copeland.*] How many years would it be likely to take the Government to complete this system of sewerage? That is rather a large question; but I think the work ought to be finished in five years.
2026. Taking the increase of the population during those five years, and the additional supply of water which will be required for sewers and domestic purposes, could you give us any idea of the quantity of water which would be consumed daily;—have you computed what the population will be? I have not computed anything, but I could put it down in a very few minutes.
2027. *Dr. Garran.*] Could you send us in some statement? Certainly. I think that would be the best way. [*Vide Appendix* J.]
2028. *Mr. Copeland.*] I presume these works, when completed, will last for a great many years? Practically they will last for all time.
2029. What I should like to have is an estimate of the probable population, say twenty years hence. I think I understood you to say that the waterworks at Prospect are calculated to be able to supply the city and suburbs twenty years hence? Yes, I think the supply will be sufficient during that time without a supplementary dam.
2030. Is that calculation based upon the ordinary supply for domestic purposes, without sewerage? No; it takes into consideration the sewerage as well. It is estimated to give a liberal supply.
2031. You are of opinion that the present water supply will be sufficient to provide for the population twenty years hence if it increases at its present ratio? I am with such supplementary works attached as may be found necessary in the interim. Works may be found necessary to distribute the water; but I think the supply at Prospect will be sufficient twenty years hence.
2032. *Vice-Chairman.*] Without increasing the catchment area? Certainly; but it might be necessary to increase the storage;—to build another dam like Prospect, though I think it is doubtful that that will be necessary.
2033. *Mr. Copeland.*] You had something to do with the inspection of that dam recently? No, I was not called upon to inspect it.
2034. You stated just now that the engines at Botany were being kept in order? Yes.
2035. Is it not a fact that those engines are perfectly worn out? No.
2036. I think we had it in evidence upon a former occasion that the engines were quite unsuitable for the work? I have had them recently roughly examined, but I purpose to have a more minute examination of them made. The engines are said by an English engineer, who has just come out from home under the service of the Board, to be fit for excellent work. He also said that the boilers, which were condemned some time ago, are still fit for many years work.

J. T. Jones, Esq.
1 Aug., 1889.

2037. You are not using the works now? Not unless there is a breakage of a pipe, or some stoppage. We have been obliged to use them three times through such stoppages.
2038. Do you think any danger is to be anticipated from the connecting pipes going wrong in connection with the sewerage, and so polluting the water? Not any.
2039. I think I have known cases where that has occurred? Where the water in the pipes has been polluted?
2040. Yes? No; it could not be so theoretically. You can easily understand that the force of water is very much greater in a water-supply pipe, and any pollution with which it comes into contact is driven away from it, instead of being allowed to enter it. Water issuing from an orifice in the pipe would drive everything away—nothing could pass it, because of the great force of the water coming out. Of course we take care not to lay pipes in contact with sewerage. There is one source of pollution—and perhaps I have only just now seized your meaning. Some years ago it was found that people connected water-closets with the water system directly, without any intervening cistern.
2041. That is what I mean? Well, of course, very great care will be taken by the Sewerage Board to prevent any connections being made direct. When pipes are entered, for putting in a new service or anything like that, they will suck in anything that comes into contact with their ends; but the cocks which have been put on since I have been here, and which will be used in future, prevent any flow into the pipe. The cocks are of a high pressure, and they act by means of a valve which prevents anything going more than one way, and that is outwards.
2042. Would not the cost to the individual houses be greater under this system than it is under the present system of pans? Quite the other way. It will be a great saving.
2043. Would not the water-closets be more likely to get out of order? No. By this system there will be a great saving to the citizens.
2044. A monetary saving? A monetary saving.
2045. Do not the water-closets frequently get out of order? Very seldom. I probably do not hear of every case; but if there were anything serious I should know of it. It is very seldom that a water-closet properly managed gets out of order.
2046. I know that at the Legislative Assembly they are continually getting out of order? I am afraid they were badly laid in the first instance, then. The older sewers in Sydney are very badly laid, and the result is that the best houses are the worst sewered and the worst ventilated.
2047. Are you of opinion that the water-closet system is better than the dry-earth system? I very much prefer it to the dry-earth system.
2048. *Mr. O'Sullivan.*] What is the minimum sewage-flow allowance for these works? For an individual?
2049. What would be the allowance it would provide? About 2 gallons at each flush. That is a liberal allowance—each individual would use 5 gallons a day.
2050. I suppose on washing-days it would be greater? Yes.
2051. I find that in London the main sewers carry off half the sewage matter in six hours;—do you think that could be accomplished here with the quantity of water that you could supply? I think so. It has less distance to travel, and I should judge from that that it could be carried off in less time.
2052. I suppose it has come under your notice that upon several occasions recently in the higher parts of the city the water has not ascended to the top rooms of the houses—that has happened in Darlinghurst, for example? There is one point in Darlinghurst to which the water does not reach; but preparations are being made to carry it higher, though they will be very costly, considering that only one or two houses are concerned. The houses stand at the top of Albion-street.
2053. Does not that indicate that the pressure is very weak? It is optional with the Board to give a higher pressure. They have five sources, every one of them with an increasing pressure.
2054. Do you think it would be an improvement, as far as the sewerage scheme is concerned, if by-and-bye we carried out the Kenny Hill pressure scheme? I think the Kenny Hill scheme is too late now. I was amongst the first to advocate it; but I think it is too late now, because if you introduced it it would confuse the systems. As it is now there is a certain pressure to every zone of levels. Crown-street has its own zone, which it supplies. The next zone is 70 feet above that at Paddington, and the water is distributed from there to every place to which it can be conveniently and perfectly supplied. If the Paddington water supply cannot be distributed to a place, we are obliged, as in the case to which you have referred, to draw from the Woollahra reservoir, and if we cannot avail ourselves of that water we draw from the 360 feet level at Waverley.
2055. You have no doubt in your own mind that there will be ample pressure for flushing the sewers? I have no doubt of it.
2056. *Mr. Humphery.*] What is the total consumption of water daily at the present time? About 10,000,000 gallons.
2057. What could you supply? We could supply 18,000,000 gallons, and when the duplicate main comes in we shall be able to supply over 40,000,000 gallons.
2058. If you had to provide for the flushing of water-closets, with a population of 400,000, you would only require 2,000,000 gallons of water per diem to do it at the rate of 5 gallons a head? Yes.
2059. So that there is not the slightest probability of the water supply being insufficient? I never looked upon the sewerage system as being at all likely to trespass upon it over its capacity.
2060. Therefore the question of making provision for the flushing of water-closets gives you no anxiety? No.
2061. *Mr. Hurley.*] Have you given any consideration to a proposal made by Professor Threlfall for dealing with sewage matter by electricity? As much as I could. I read Professor Threlfall's paper, and I have spoken with other scientific men about it. It is a highly scientific paper; but Professor Threlfall does not speak of the system as the best system. He seems to be of opinion that, after all, there may be a chemical system that will answer the same purpose.
2062. Have you read a report of, or have you any information with regard to, the works at Crossness? Yes. There are a lot of things to be considered apart from such results which you get from new experiments. I never allowed myself to run after new experiments to any great extreme.
2063. You look upon this system as an experiment upon its trial? Precisely so. I think that is the state of the case at present. I am assured by other analytical chemists that this is only another way of applying

applying a chemical system which could be applied with equal efficiency chemically instead of by electrolysis. It is most efficient; but the expense is yet to be proved.
2064. I suppose you have given some consideration to the sewage farm at Botany? I have a little, though it has never come before me. It belongs to another department, and they do not supply me with any information with regard to it, so I have a little delicacy in asking for it.
2065. *Mr. Dowel.*] You have stated that you believe the water-works scheme at present is sufficient for all requirements in regard to the carrying out of this sewage scheme? Such is my opinion.
2066. For the next twenty years, probably? With such additions as may be called for during those twenty years. We may need a supplementary reservoir over Prospect; but that is not very likely.
2067. Are you aware that applications for water for hydraulic lifts have been refused because there was not sufficient water to provide for them? Yes, I am pretty well aware of that fact; but it requires a little explanation. Hydraulic lifts are worked at a time of the day when it is difficult to supply enough water for domestic purposes. When they are at work they consume very largely, and thereby deprive the domestic system of its proper pressure, and would prevent the water from being delivered to the very lofty houses now being built. For that reason it was deemed wise not to be too free in allowing water for these lifts. In Melbourne, where they have twice the pressure that we have—they have 300 feet to our 140 feet—the water elevators have been found to embarrass the supply. They have been known not to work during the middle of the day, because of the extra consumption in other places during the dinner-hour. If that is the case in Melbourne, where the pressure is twice as much as ours, it would require twice the amount of water to do the same work here, and if the water supply in Melbourne is embarrassed by these lifts it will be much more the case here.
2068. You stated that our water supply was sufficiently ample for all public requirements, and yet you now state that you could not give a little water for these lifts? I did not say a little water—it is a very large quantity.
2069. Is it not a fact that only a very small quantity of water is required? It is a fact that every lift of a ton takes 80 gallons of water.
2070. For how long? It takes 80 gallons of water in the course of a few seconds.
2071. Continuously? These lifts are very cheap. They are much cheaper than any other means of raising weights—such as by gas-engine lifts, and it appears to me that hereafter they will be so popular that every lodging-house and every public-house must have one. They are getting fashionable, and they are also very useful; but if they were so numerous they would to a certainty interfere with the domestic water supply. They would not do so of course at present, nor would they if there were fifty or 100 of them, but when they came to thousands, which I expect they would do, they would interfere. I am only nipping the matter in the bud. I have also in view that an hydraulic-power system will be inaugurated in Sydney, and I am doing my best to encourage such a state of things. It is not that we cannot supply the quantity of water, but we cannot supply it at the time when it is needed, because that is exactly the time when it is most required for domestic purposes.
2072. You practically admit that you are not able to supply that public requirement? Yes, that public requirement.
2073. And yet you stated that you were prepared to supply a sufficient quantity of water for this large and extensive sewerage scheme? It bears a small proportion to the quantity required for the system of lifts, and, apart from that, it is extended over the whole day and night. It is not all taken at once.
2074. Under any circumstances, I suppose there should be no real difficulty in duplicating all your services? You mean mains. There would be no real engineering difficulty, if it could be shown that it would pay.
2075. There would be sufficient water under any circumstances? There would be plenty of water if we could only have the mains enlarged for it.
2076. You consider that the water-closet system would be a great advantage over the present pan system? I am certain of it.
2077. A large quantity of water would have to be taken to considerable heights? Yes. Those people would be deprived of water in the event of hydraulic lifts being largely used.
2078. *Vice-Chairman.*] Where do you measure the gravitation from—from the head of the catchment area, or from the storage reservoir at Prospect? Only from Crown-street.
2079. The pressure only comes from Crown-street? For one system—the lower system. We have another system supplied from Paddington. That is a very extensive system, and goes as far as Petersham. The water comes in one way, and goes back to Petersham from Paddington. Another zone confined to the eastern suburbs, is that supplied from Woollahra.
2080. Was the storage reservoir at Petersham constructed in order to supply parts of Sydney which could not be reached by other means? No.
2081. Part of the suburbs? Part of the western suburbs.
2082. How are the high levels in Macquarie-street and North Shore supplied? They are supplied by the higher level—Paddington. This particular part is supplied from Paddington.
2083. When you tap the reservoir at Prospect, will that give you an additional pressure? If brought all the way in a pipe it would give us 25 feet more if the reservoir were full, but that pressure would be variable. It would only give us 25 feet at the highest level.
2084. Supposing you were to increase your storage supply, as you stated might have to be done, could that be done in such a way as to give you an increased pressure? As I said before, it would throw out of gear the whole system. That is where the higher pressure was desirable in the first instance; but now that everything has been arranged, and sometimes the pipes of the three systems interlace, to introduce water from a large head into all those would rather interfere with them. Still, there is nothing impossible in it.
2085. Could it not be done in such a way as to increase the storage at Prospect, and not interfere with the reticulation in any way. Supposing the increased storage were above Prospect, and its operation kept the Prospect reservoir full, would not that give you an additional pressure? It would give us 25 feet, but that would not be enough; we want another 100 feet. Then there would be no pumping worth speaking of.
2086. You are keeping your Botany dams in fairly good order? Yes. The engines are sometimes fired up in order to move them, and keep them from going out of repair.

J. T. Jones, Esq. 1 Aug., 1889.

2087. Is it the case that some of the principal dams have been giving way recently? Yes. Some fresh turf was put on to one of the dams by the Centennial Park authorities, and the by-wash carried away some of the turf. It only required that to throw the whole surface back, until one dam was emptied into another, or nearly so. If it had all been emptied considerable damage would have been done.
2088. Had the soil of the dam been shifted? Yes. As the water came to the bottom, which was newly turfed, it carried away one turf, and that was quite enough to start all the rest.

Edward H. Buchanan, Esq., Mayor of Balmain, sworn, and examined:—

E. H. Buchanan, Esq. 1 Aug., 1889.

2089. *Vice-Chairman.*] You are Mayor of Balmain? Yes.
2090. How long have you held that office? This is my second year of office.
2091. How long have you been a resident of that suburb? For fifteen years.
2092. Have you become impressed with the necessity for an improved system of drainage there? What drainage there is in existence is very good, but there are some streets still undrained. As regards the surface drains I do not think anything could be more satisfactory. We adopt a system of concrete guttering.
2093. What system of sewerage have you? We have scarcely any underground sewerage.
2094. What is done with the fœtid matter? The earth-closet system is adopted. Each bucket is emptied twice a week and the contents are towed out to sea.
2095. They are towed out to sea twice a week? At least twice a week.
2096. Have you given any attention to the proposed system of drainage set forth on the plan? I did when the matter was referred to us last year. I was in the chair when a motion was carried asking the Works Department to omit Balmain from the scheme.
2097. They do not desire to have it included? No.
2098. Is that their opinion still? The matter cropped up again about a fortnight back, when one of the aldermen moved, "That we adopt the scheme proposed by Mr. Stayton." The motion received scarcely any support, and as we were then experiencing some difficulty with regard to the disposal of our night-soil, the matter was postponed indefinitely.
2099. You would not give it as the opinion of the residents of Balmain that they are opposed to the scheme? I think that 99 out of 100 of the residents know very little about it.
2100. Of the representatives of the residents in this municipality? The majority are against it.
2101. You think that is their fixed conclusion? Yes.
2102. What is your own individual opinion? My own opinion is that the scheme will be inefficient and too expensive. We are so very far removed from the outfall, and so much of Balmain is below the level of the main sewer, and will require to be pumped up to different levels, that the scheme will not be as effectual as if it were one continuous drain, while the expense, £91,000, will be a tremendous sum with which to saddle the public. Even at that cost Mr. Stayton does not propose to sewer the whole of the borough, but to drain the lower levels into the harbour and into the river.
2103. Do you find any great inconvenience to arise from your having to carry the night-soil in carts to the punts? Lately we have been chased from pillar to post. Recently we used to take the stuff over the river into the bush, but when those suburbs became populated they objected. Then, along with other boroughs, we used to deposit it in Brown's yard, at Pyrmont; but within the last month the Mayor took action to prevent that, and we were forced to seek for a place of deposit further afield. We then went over the river again, but the Hunter's Hill people objected, and we have now been forced to purchase a piece of land at the head of Iron Cove in order to deposit the stuff there; but as it will take some time to get this system into working order, I have had to arrange for a depot at the foot of Adolphus-street, in Johnston's Bay. We have not had any objections from the people there, because we have gone to great expense in disinfecting the stuff. The municipality distribute half a pound of disinfectant to each closet gratuitously. The powder is put into the closets and the empty tins are collected twice a week.
2104. Is the dry earth system regularly used? There is no dry earth used. The refuse is simply collected in the pails, and they are emptied twice a week. The supply of disinfecting powder has reduced the nuisance which used to arise from the passage of the carts through the borough to a minimum. The question is, can the Council still maintain this course without charging the ratepayers for the disinfectant?
2105. Do you think the inhabitants of the surrounding neighbourhood, as the population increases, will become consenting parties to your system going on for any length of time? I do not think so. Of course as the place becomes more thickly populated, and improved methods of collection and disposal are discovered, we must move on with other people; but what those methods will be I do not know. I believe that we shall eventually, if we are allowed to keep outside this scheme, adopt a system of burning the refuse. Sir James Farmer's system of disposing of the refuse by fire would receive more consideration than any other system.
2106. Have you had evidence of how that system would work? Only from Sir James Farmer's writings.
2107. Do you know that there are one or two of his machines in the colony already? Yes.
2108. And that they are working very successfully? I have heard very favourable reports from the one at the Auburn Meat Works.
2109. *Mr. Trickett.*] Is the pan system universal in your borough, or are cesspits used as well? There are 4,300 pans and 300 or 400 cesspits.
2110. How much a week do you charge the people who use these pans? The average cost would be 4½d. per week for a double emptying, and 2¼d. for a single emptying.
2111. What is the total for the year? It averages upon 4,300 closets at £1 per annum.
2112. That is your revenue from the emptying of the earth closets? Yes.
2113. Is your borough generally thickly populated, or is there much vacant land? Where it is populated it is what you may call thickly populated. I had a calculation made not long ago, and the number of allotments 20 feet by 100 feet, allowing a superficial area of 2,000 feet for each allotment, is 5,000. I think there is still that quantity of land left.
2114. Are there any localities in the borough to which you can point as being prejudicially affected by the present system of drainage? Yes; what is known as "Happy Valley" is such a place. There was originally a creek there running from Beattie-street to the head of Wide Bay, and it is now a very nasty and unhealthy drain.

2115. It is a low-lying portion of ground? Yes. There is another such drain running from the head to the foot of Reynold-street, from below Lees Hotel, and the other end of Beattie-street.
2116. The same primitive drainage exists there as in other parts of the borough? We have not been able to have any drains there. We have simply cut traces in the rock and allowed the drainage to flow through.
2117. It is not kerbed and guttered? Those two places are not guttered.
2118. Is the health of those localities bad—is there much sickness there? I do not know that we could attribute any, or but very little, of our sickness to our drainage, because we keep these places flushed. We never allow the stuff to lodge there.
2119. Seeing that you do not appear to approve of Mr. Stayton's scheme as applicable to Balmain, have you or the Council generally any alternative scheme which you could suggest to the Committee? No. I did not want to propose anything until this proposal had been submitted and gone through again by the Council, but I thought of proposing the burning process. I have all the figures ready. We have a piece of land which I think could be used without any objection being taken by the Government or by surrounding municipalities, and we think that by joining three or four municipalities together the cost could be very much lessened. Five Dock and other suburbs on the western side could use this scheme. For towing the night soil we now pay per month £110; but when we, in conjunction with some twenty other municipalities, had it conveyed to Brown's yard at Pyrmont, we only paid £43 a month, so that through our working by ourselves the cost is considerably increased. In fact, we have now to go to an extra expense of £700 or £800 a year.
2120. Before, you were working conjointly with other municipalities? Yes; with some parts of Sydney, Paddington, Redfern, Leichhardt, Balmain, and the Glebe. Those municipalities all used to go to Brown's yard at Pyrmont.
2121. Do you pay a heavy sum for the water supply to flush your gutters? No; the Water and Sewerage Board allow the water free for flushing purposes, so long as we pay for the cost of stand-pipes, and maintain them. Of course this system is under the supervision of a man with a turn-cock, to whose salary we contribute some trifling sum, but I forget how much.
2122. Do you not regard your present system of disposing of both closet refuse and drainage matter as very primitive and undesirable? I think the surface drainage is right enough. Of course in some places where there are large areas to drain, it could be improved by allowing the drainage to pass through silt-beds before it reached the harbour. As regards the system of disposing of the closet refuse, there is no doubt that it is primitive, but I do not think the people would agree to pay a taxation for the interest upon an expenditure of £91,000, and that is only the probable cost of the scheme.
2123. Is the liquid matter, such as bedroom slops and soap-suds, thrown into the streets? Yes.
2124. Speaking as a representative of Balmain, would you go so far as to say that the people generally would rather not have the scheme applied to Balmain—would you say that from your general contact with them, and from your knowledge of their views? I should not like to speak of the public generally. We are very differently situated from any other suburb, because there are so many drains. The gutters are so formed that the smaller the quantity of drainage passing down them, the smaller the nuisance. We have also very steep falls. In that respect we are not like many of the other suburbs, where the gutters are flat, and the drainage is likely to be blocked by paper or some other obstacle.
2125. Speaking as Mayor, you say that the majority of the aldermen do not desire this scheme? I do not desire to say that they would give the present system the preference before a better system. Of course, I believe that the underground sewerage system, if it could be carried out for anything like a reasonable amount, would be preferable.
2126. Has the question of a sewerage rate ever been discussed by the Council? No. The lowest that we expect to pay is 4 per cent. on £90,000.
2127. *Mr. Copeland.*] You say that at the present time you send the night-soil away by punts to sea? Yes.
2128. By that system, is not a very bad smell created in the neighbourhood where the punts are loading? At times. If there is a heavy wind blowing you certainly get the effluvium. I have been down there on two or three quiet nights when the smell was scarcely perceptible. It is greatly lessened now, because the pans are disinfected, and we also use a liquid to disinfect the carts. The nuisance is nothing like as bad as it used to be.
2129. The night-soil is emptied from the carts into the punts? It is tossed into the shoot, and thus finds its way into the punt.
2130. Are there any houses in the immediate vicinity of where the punts load? The Premier does not live a stone's throw away. This was the most accessible place we could get, because the land at the back of the shoot is fairly high. Even though the carts have to pass down Adolphus-street, where there are a number of small tenements, we have not had an objection from one householder.
2131. How far out do the punts go before they discharge? According to the specifications they have to go out five or six miles—they will not go out further than they are forced.
2132. There is no supervision to see that they go out that distance? No.
2133. You say that the cost of emptying the night-pan is 2½d. per pan? For each emptying.
2134. We had it in evidence yesterday that in some of the other boroughs it cost 5d. per pan? Yes. I have paid as high as 6d. in some of the other suburbs. You had also to give notice.
2135. How is it that you manage to dispose of yours so much more cheaply? I think because in years gone by we were within easy reach of a depot. Having a depot at Hunter's Hill, we were rather favoured in the matter of price. The Council have never lost anything by that charge; in fact I think they have reaped a little profit from it.
2136. Have you noticed any sickness prevalent in the neighbourhood of where the punts are loading? No.
2137. You think the people there are just as healthy as those living in other places, notwithstanding the bad smell? I never heard of any sickness which could be attributed to anything connected with the removing of the night-soil. The contractor for collecting it has twenty or twenty-five men in his employ and they all board and lodge at his place.
2138. They seem to thrive on the smell? I do not know whether they thrive on it; but they keep themselves free from disease.

E. H. Buchanan, Esq.

1 Aug., 1889.

2139. Has this question been brought up before the council formerly? It was brought forward last year; but I do not know exactly the date. We had a letter from the Works Department asking us to take the matter into our consideration, and to forward a report, or something to that effect. The matter was gone into, and referred to the works committee, and considered by them. I think it stood over for three or four months. It was spoken of at various times, and we finally passed a resolution asking the Government to omit Balmain from the scheme.
2140. That resolution was carried unanimously by the council? Yes.
2141. Since then no public meeting has been held? I do not think the public as a whole know anything of the matter. There may be a few people who interest themselves in public works but outside of them I do not think the general public are seized of the nature or the extent of the scheme.
2142. Is the £91,000 you mentioned your proportion of the cost? I believe so. I think Mr. Garrard informed the council that that was the probable estimate.
2143. Did you calculate what rate it would be necessary to levy on property to cover the interest on £91,000? No; we took it on the lump sum.
2144. Have you information as to the number of houses in your borough? It is over 4,300. I could let you know the exact number.
2145. Then I suppose we may estimate the population at about 20,000? At least 26,000, according to the latest returns.
2146. You anticipate, I suppose, a considerable increase in the population as time goes on? If we get an electric tramway, I anticipate that there will be a very big increase, but otherwise I expect that there will only be the usual increase. Last year the buildings in the borough only increased by fifty or sixty, and the year before that by something like 150.
2147. Have you plenty of spare land? We have a fair quantity. I think in the future many of the present one-storied buildings, and especially weatherboard buildings, will come down, and be replaced by buildings of two stories. That will be especially the case on the main road.
2148. And yet you are satisfied to continue this primitive pan system rather than pay for more modern appliances which would get rid of the bad smell altogether? I should not like to answer for the whole of the public;—they are not fully seized of the nature of the scheme.
2149. Individually it is your opinion, as Mayor, that you would rather put up with the present bad smells than pay for a cleaner system? I do not admit that there are the bad smells attached to the system which we carry out, that many might imagine.
2150. *Mr. Garrard.*] I think you told us that the revenue you receive from the dry earth system is £4,300 a year? Yes.
2151. What is the total cost to the municipality of the collection, disinfecting, and disposing of the night-soil by punts? At the present time the cost of collecting per month is £210, the cost of deodorants and disinfectants £80, the cost of punting to sea £110, and the allowance for depreciation of plant in the wear and tear of the night-carts £5; making a total of £405 per month, or £4,860 per annum.
2152. Then you are losing about £500 a year through the transaction? At the present time.
2153. Because you have to dispose of the stuff yourselves? Yes; and because we charge nothing for disinfectants.
2154. But you mentioned nothing as to the cost of supervision;—I understand that you have two inspectors of nuisances? Yes.
2155. What are their salaries? £130, and £100 per annum.
2156. Is it a fact that a principal part of their duties is in connection with the disposal of night-soil? Yes; the greater part of their time is taken up in that way.
2157. Is it a fact that a large amount is owing to the council as arrears for the pan system? There is about £3,000 outstanding.
2158. Is it a fact that you have no remedy at law; that you cannot sue these people for attendance. Is the contract merely between the council and the ratepayers, or can it be enforced by law? I do not think we could sue them at law for the recovery of the money.
2159. In the event of a ratepayer not paying the debt which is due, have you any means of forcing him to do so? No.
2160. You can only discontinue the service? Yes.
2161. Will you tell the Committeee what are the average bad debts incurred per annum by the council in connection with the dry earth system? I could not answer that question. I know that last year I reduced the amount considerably, although some of the property-holders, if they had liked, might have withstood my action. Several paid, and the amount was reduced considerably.
2162. Is it a fact that the allotments in Balmain are comparatively small in area? They are very small.
2163. Therefore Balmain is likely in the future to be very densely populated? Yes.
2164. And a defective system of drainage will consequently have a bad effect upon the public health? Yes.
2165. Owing to the density of the population? Yes.
2166. Is it not a fact that the greater part of the time of the council is taken up in inquiring into and remedying complaints concerning nuisances which are supposed to arise from the pan system and the surface drainage? No.
2167. How many miles of streets are there in the borough? Forty-four.
2168. How many miles of surface guttering are there? About 30, I think, finished.
2169. And they all fall into the harbour at various points? Eventually.
2170. The two worst places that you know of being the Happy Valley drain and the Beattie-street sewer, where the drainage lies upon mud flats at the foot of the outfalls? Yes.
2171. Is it a fact that the Balmain night-soil carts have been prevented from going through other boroughs to a place of deposit? Yes.
2172. In the event of Sir James Farmer's process being adopted, the night-soil would have to be collected and carted to a depôt? Yes.
2173. That system would not deal in any way with the ordinary house and kitchen slops—those would still have to go into the surface gutters? Yes.
2174. Can you tell the Committee whether all the members of the council were present when this matter was discussed last year? I could not say whether every member was present; but certainly three-fourths of them were.

2175.

2175. Can you tell the Committee whether this scheme was decided against by a unanimous vote, or what proportion of aldermen were against it? I think the vote was unanimous. Those who favoured the scheme at first, after their objections were spoken to, withdrew them, or at any rate they did not press them, and no one voted against the resolution.
2176. What was the result of the division the other day of which you spoke when it was proposed to reopen the discussion? When the matter came up it was decided to postpone the consideration of it. Because of a paper which you sent me in reference to some evidence that had been taken with regard to the electrolysis system, I advised the aldermen that they should hold this matter over.
2177. In view of the possibility of dealing with the sewage at the local outfalls, it was decided not to reopen this question at the present time? Yes.
2178. There was a municipal election between those meetings? Yes.
2179. Do you know whether the sewerage scheme formed a platform for any of the candidates during the campaign? I do not think so.
2180. No public meeting has been held for or against the scheme nor has any protest been made against the supposed excessive burden which it would place upon the shoulders of the people? No.
2181. Then I understand that you gather from the opinions expressed at the council meetings that the objections to this scheme are;—first, the cost of the works, and, secondly, that they will not be applicable to the whole borough? Quite so.
2182. Considering the extra amount which you are now paying for the present efficient or inefficient system as you like to call it, do you not think that it would be better to have a thoroughly efficient service, although it would cost you as much or a little more than the present system? If it were only a little more.
2182½. Yes? Decidedly.
2183. Is it not a fact that at almost every meeting of the council complaints come from the ratepayers as to the inefficiency of the present method of dealing with the night-soil and the nuisance caused by the night-carts going round the borough at all sorts of hours? At the last meeting of the council a petition was sent in signed by a number of persons, complaining of the non-attendance of the night-carts on a certain street. The inspector visited this place, and it turned out that the people had been induced to sign this petition under the impression that they were signing for a water main. That is the only complaint of inattention for the last three or four months. Complaints of inattention are scarcely worth mentioning since the present contract began.
2184. One reason why you favoured Farmer's scheme was that it would deal with the house rubbish? Yes.
2185. Have you any difficulty in dealing with that now? It is hard enough now to get a place in which to deposit it, and as the locality becomes more populated it will be still more difficult.
2186. That is one reason why you favour Farmer's scheme? Yes. We thought that with an improved system of collection there would be more economy, and that good material would not be wasted.
2187. What is the population of the borough now? I think about 26,000 people, as near as I can get at it.
2188. Judging by the size of the allotments, I suppose it is capable of carrying a population of nearly double that number? I do not know about double it; I should not like to say that, but it certainly could be considerably increased.
2189. Is it a fact that the council have recently gone to considerable expense in buying land, and erecting a wharf for the purpose of getting rid of the night-soil? We bought a property for £1,150, and it will take £300 or £400 to make a shoot and construct a wharf to use it temporary for a depôt. Eventually, if we adopt the burning process we shall erect the works there.
2190. *Dr. Garran.*] Do you think that your people would grumble at 1s. rate? I think so.
2191. You say that at the present time 1s. a house is charged? That is about it.
2192. You think that a man who has a house worth £20 a year would grumble very much at a shilling rate? I think he would.
2193. What is a shilling rate on £20 a year? It would be £1 a year.
2194. Well, that is what he would be paying now? Yes. A small tenant pays 4s. 9d. a quarter, which comes to 19s. a year.
2195. And no provision at all is made for his slops? No.
2196. And no earth is provided for the pans? No.
2197. The fæces are kept in the pan for half a week? Yes.
2198. Do you think that is a nice sweet way of doing things? It would be far better out of sight, of course.
2199. And a man pays a pound a year for that? Yes.
2200. He would have to pay a pound a year for an efficient sewerage system which would take away the slops from the back yard as well? Yes.
2201. He would grumble at the sewerage rate? I do not know that an individual in that position would grumble.
2202. I want to know why he should grumble at paying a rate for a better system when he has at present to pay the same amount for a bad system? I think that if everybody was sure that the better system which you suggest could be carried out at the same price as the present system cost there would be no objections to it.
2203. You say they do object at present? The aldermen object.
2204. They object to being taxed? They object to the carrying out of this scheme owing to the many levels. There is one from the School of Arts for something like 60 feet. The sewer then goes over the next hill into Happy Valley, and I believe the scheme is to carry it over there on tressels, to connect with the main outfall sewer in the Newtown Road. They all have an idea that this will not be done for £90,000.
2205. Supposing it could be done for £90,000, it would not much matter if part of it were on tressels No; I do not think it would.
2206. Supposing it did not cost more than £90,000, that, at 4 per cent., would be £3,600? Yes.
2207. You admit that you are now paying £4,860 a year for disposing of your night-soil? Yes.

E. H. Buchanan, Esq.

1 Aug., 1889.

2208. So that you would gain by this system £1,260 per annum; what I want to know is, why the Balmain ratepayers prefer a bad system to a good one, and why they object to be £1,260 per annum to the good? When we get properly fixed up we expect to lessen the present cost very much. There is nearly £1,000 a year given away, I think, for disinfectants, and I expect that eventually we shall have to charge a rate of 1d. or ½d. in the £ to cover that.
2209. But still, with the present system, you have to disinfect, collect, and carry away the stuff, and provide a private wharf in order to ship it, besides keeping a perpetual stink on each property, and losing £1,260 a year? Yes.
2210. Yet your people prefer the dirty to the clean plan? Presuming that there are some evils connected with the present system the council are under the impression that it is better to put up with the evils they know rather than with those that they do not know. Besides, we have never been assured that this work will cost only £90,000, and we do not know that there is a length of sewer of 1,200 feet with a fall of only 1 foot, which is large enough for a population four times the present size. There is scarcely sufficient water to flush this, and the aldermen want to know where the required velocity is to come from to sweep out the sewage. We really do not find so much objection to the present system of collecting and disposing of the sewage as to wish for a system of which we are somewhat frightened.
2211. Balmain is a great district for engineers, is it not? We do boast of a few.
2212. I gather from your last answer that the great objection to this scheme is from an engineering point of view? That objection has been brought forward. I do not wish to criticise Mr. Stayton's proposal, though I have studied it. You seem to think that we prefer the dirty system to what you call a cleaner system, and I do not want it to go forth that I, as a representative of Balmain, am so thick-headed as to wish to continue a dirty system.
2213. I called it a dirty system because you say you do not use dry earth. You simply keep the human excrement in a pail for half a week at a time; I call that a dirty system, do you not? Yes; but the cesspits are worse, because they may not be emptied more than every three or six months.
2214. They rot the earth in the neighbourhood? Under the old system we had more than we have now. I think we have now only 300 or 400, and they are properly constructed with bricks.
2215. Still I understand you to admit that your existing system is a dirty one? I should not like to say that it is a clean one.
2216. You admit that it costs £1,260 more than 4 per cent. on £90,000? Yes.
2217. So that it cannot be cheaper than the proposed system? No.
2218. Then it must be dearer. The question is, what is the basis of the prejudice against having a clean and cheap system. I gather from your evidence that you distrust the engineering part of the scheme? That is one very great objection to it.
2219. You do not believe it could be done for the money? No.
2220. You do not believe that the stuff would be freely carried away? No.
2221. *Vice-Chairman.*] What disinfectant do you use? Permanganese of potash, carbolic acid, and dry ash.
2222. *Mr. O'Sullivan.*] What would happen if an injunction were taken out to restrain you from carrying the nightsoil down to the harbour, or taking it to any depot outside the municipality. What system could you adopt then? That is a very difficult matter. Of course if we could not get out of Balmain we should have to stay in it.
2223. Are you not liable to such an impediment? I do not think so, as long as we commit no nuisance. We could take our punt anywhere down the harbour and nobody would know anything about it.
2224. Possibly what you might not consider a nuisance other people would, and it is within the bounds of possibility that the Supreme Court might uphold their application? I do not think the harbour authorities, unless we emptied the stuff in the harbour itself, would be justified in doing anything of that sort.
2225. If the repayment of the cost of the scheme were extended over 50 or 60 years, and the rate reduced to 8d., do you think your aldermen would take it up? If the cost were lessened it would go a long way in removing our objections.
2226. What you are afraid of is the high rate of 1s. in the £? And, as I said before, the distance from the out-fall at Bondi, and the almost dead level of some of the lines of sewers. Another objection is, that when the sewers get down to the bottom of various valleys, the sewage will have to be pumped up again to the heights, in order that it may enter the main front sewer.
2227. But these dangers have not arisen in large cities like London and Paris, where such sewers have been constructed. You have not heard of them in those places? No.
2228. Is it not quite possible that if the scheme is based on scientific lines it will be as good as those schemes? Yes; but large cities such as Birmingham and Manchester collect their refuse and burn it.
2229. But of course you are aware that they cannot send it away by gravitation to a suitable place of deposit, like we can? No.
2230. We have every reason to believe, from the evidence of scientific experts, that this scheme is feasible. We have every reason to believe that it will be a success. That being so, and there being a possibility of the rate being lowered to 8d. in the £, do you think the people of Balmain will adopt the scheme? I think that if they get an assurance that it will not cost more than a certain amount, and that the repayment will be extended over a considerable period, they may reconsider the scheme, and, perhaps, look at it more favourably.
2231. In view of the fact that you have not had a very definite decision upon the matter, or that you appear to have had two decisions, would it not be advisable to call a public meeting of the ratepayers? I decidedly think that the people ought to know something about it. I do not believe that 99 out of 100 know anything about it at the present time.
2232. You think that if a meeting of the council were called, and you explained to them the possibility of only an eight-penny rate being charged, they would be likely to adopt it? Presuming that it is extended over the term mentioned—yes.
2233. *Mr. Humphery.*] What is the annual value of the ratable property at Balmain? You mean our annual revenue?
2234. The annual value. I suppose you charge a rate of 1s. in the £ upon it, and get a revenue in that way? We expect close upon £14,000 this year—£13,800.
2235. That is with a shilling rate? Yes.

2236. *Mr. Garrard.*] That includes gas? Yes; it is from a 1s. 4d. rate;—4d. being charged for gas.
2237. *Mr. Humphery.*] What is the annual value of the ratable property? About £180,000.
2238. Do the Committee understand that the bedroom slops from 26,000 people are cast into the streets daily? Do you mean urine, and so on?
2239. Yes? They are thrown into the pails, I presume. We should not tolerate urine being thrown into the surface gutters.
2240. But, for all you know to the contrary, these slops may be emptied into the gutters or thrown into the back yards? I do not think so. I do not think you could throw urine into the gutters or yards without creating a perceptible nuisance.
2241. Would the soil-pan hold the house slops of a family for three or four days? I think so.
2242. You gave us an estimate of the cost of treating your nightsoil at the present time, and it came to £5,090 without the £3,000 arrears. Do you anticipate to lose that £3,000? I do not anticipate that we shall lose much because, supposing property is transferred, and a debt is owing by the previous owner, we can discontinue the service to the incoming tenant or owner if he will not pay up. I think this large amount of arrears is due to the neglect of the council officers in not having been sharper with the tenants in previous years.
2243. You can make the new tenants pay the arrears of emptying previous tenants' earth-pans? We have done it in many instances, in the case of the owners of property.
2244. Do you provide the punts? No.
2245. The contractor provides the punts? The punts, all the labour, and the towing.
2246. And he provides the carts—or do you? We provide the carts.
2247. What is the cost of them? We have not had any new carts since I have been mayor? I suppose each cart costs about £40.
2248. What do you value your plant at? At from £400 to £500.
2249. It occasionally requires to be renewed? It has to be repaired. The contractor has to keep it in repair.
2250. I daresay you would be surprised to hear that you are paying now what is equivalent to 4 per cent. on £130,000? I know that it looks very bad against us in that way, but then when we get into our own place we shall be able to reduce the cost of collecting, because the place of deposit for the carts will be so much nearer home, and there will be far more competition in the way of towage. We are paying a great deal now, because we were thrown into a corner, and had to take the first man we could get. The stuff was sent back from Hunter's Hill one day and it was standing about, so that we had to try and get rid of it as soon as possible.
2251. In the face of the difficulties which you perceive before you, under the present condition of things do you not think it would be well for the Council to reconsider their resolution, and to ascertain whether the cost of treating the whole of the sewage of the borough, by its being included in the general scheme, would not be less than you are paying at present? Decidedly. After what I have heard to-day I shall consider it my duty to see the matter opened up again. I might say that after the last resolution was passed—rather than do anything that might be thought absurd or pig-headed—we wanted Mr. Stayton to come over and have an interview with us about the scheme; but in the meantime he had left the Government service.
2252. From what you have heard during your examination to-day you are inclined to modify your own views, and you think that your brother aldermen may be inclined to modify theirs when you explain to them what you know in connection with the proposed system? I think so.
2253. *Mr. Tonkin.*] You say that the rate of valuable property in Balmain is about £180,000? Yes.
2254. Do you know that 4 per cent. upon that would be £7,200? Yes.
2255. And that 4 per cent. upon £90,000—the estimated cost of the work—would be £3,600? Yes.
2256. So you would only have to levy upon your ratepayers a rate of 6d. in the £;—would they object to that? I do not think so.
2257. They are now paying, I think I understood you to say, something like £4,860 a-year? Yes.
2258. That is without counting inspectors of nuisances; and, in all probability, if this scheme were carried out, one would be sufficient to do your business? Yes.
2259. The total cost at present is £4,990, or nearly £5,000 a year. If you get the work for £3,600 do you not think it would be much better to the corporation? Decidedly.
2260. Even if the proposed system cost the same price as the present system it would be better? Yes.
2261. But if it can be done at a less price you would be perfectly satisfied? If we could get a better system we are perfectly willing to pay for it, as long as the price is reasonable.
2262. Are you not satisfied from the questions asked you that the charge upon the ratepayers would actually be less than it is not? Yes.
2263. Under the circumstances what objection could the aldermen have to the proposed scheme? Once the difficulty of the cost is got over I do not think there will be any objection, though they would like to see more fall in the sewers. However, if the ground will not permit that there is an end to it.
2264. But supposing it is proved to the satisfaction of your council that the water supply will be so much increased that it will be quite sufficient to flush the sewers, no matter what the gradient, will not the council be satisfied that they are doing a good thing? That is why we wanted to get Mr. Stayton over, so that we could ask him about the flushing, and also as to the working of the Shone system—the pumping up.
2265. Do you think that an engineer of so much experience as Mr. Stayton would bring forward a scheme of this kind without having given sufficient attention to the drains? No. That is the reason why I have never liked to propose anything against this scheme. I know Mr. Stayton personally, and I do not think he would father a scheme which he did not think practicable.
2266. You are not so much opposed to the scheme now as you were at first? No.
2267. Do you think it would be advisable to call a meeting of the council and place the matter before them in a different light? I shall certainly, next Tuesday evening, as far as I am able lay before the council a report of the information given to me, and the conclusion to which I have come.
2268. *Mr. Dowel.*] You stated that you had given some considerable attention in your official capacity to the sewerage and drainage question as affecting the borough of Balmain? Yes.
2269. Have you given attention to this particular scheme? I have read Mr. Stayton's report through; that is the only opportunity I have had of examining it.

E. H. Buchanan, Esq. 1 Aug., 1889.

2270. I understood you to say that one of your principal objections to the scheme was that the sewers were so flat; or, in other words, that they were elongated cesspools, and that you could not see a proper mode of flushing or getting rid of the contents? That was one of the objections raised at the time, that the gradients were so trifling that the question was whether the system would not be a nuisance.
2271. Have you an ample supply of water in your borough? I should not call it ample. There are hundreds of houses not yet supplied from the mains, and these people are simply relying upon tank water.
2272. Many of the allotments in the borough, I think, are very small? Very small.
2273. And the population in some parts very thick? Yes.
2274. Is it not a fact that some parts of the Borough of Balmain are as dirty as can be found in the neighbourhood of Sydney—for instance, Happy Valley? No; you could find far dirtier places than Balmain.
2275. Portions of it? No.
2276. Have you not in your travels through the borough observed very obnoxious smells? From the drainage?
2277. From surface drainage and other causes? The only places which could be taken exception to are Happy Valley creek and the Reynold-street creek.
2278. Those places are very offensive at times? In summer-time. They require cleaning almost every day to keep the nuisance down.
2279. From your knowledge of sewerage and drainage do you not think the appliances which you have at present are unsuitable for the requirements of the public health? I know they are not the best.
2280. They are anything but cleanly I should imagine? It is certainly an objection to the scheme.
2281. Although you propose to dispose of your sewage by fire, will not the present objectionable means of conveyance exist? We should still have to collect.
2282. Have not numerous complaints been made to you in your capacity as mayor, about the nightmen coming at unseasonable hours, and about other things in collection of night-soil? No, not for the last eighteen months. The system is in good working order. The men have certain districts to go to every night, and I do not think that during the last eighteen months we have had any complaints about inattention on their part, or of their entering premises at improper hours.
2283. Have you any system you would propose in lieu of this one? No.
2284. You are aware that a large portion of this scheme will be carried out with stoneware pipes? Yes.
2285. And that your objection to flushing would not stand good with regard to those pipes, that flushing would cleanse them well? No.
2286. *Mr. Garrard.*] Are you aware that Mr. Stayton has put forward an alternative scheme to bring the sewage together by gravitation and then pump it up? No.
2287. I presume you will lay this matter before the Council, and that a special meeting will be called to consider it? I could call one.
2288. I understood you to say that it would be considered on Tuesday night, and that probably there would be a meeting following that;—would the presence of an officer of the Sewage Department be of assistance to you in laying the matter before the Council? I think perhaps we had better discuss it first, and then narrow the whole thing down to the question of cost, etc; we could then have another meeting, when I shall be glad to avail myself of any assistance.

WEDNESDAY, 7 AUGUST, 1889.

Present:—

JOSEPH PALMER ABBOTT, Esq. (Chairman.)

The Hon. John Lackey.	Henry Copeland, Esq.
The Hon. Andrew Garran.	James Ebenezer Tonkin, Esq.
The Hon. Frederick Thomas Humphery.	William Springthorpe Dowel, Esq.
The Hon. William Joseph Trickett.	Edward William O'Sullivan, Esq.
Jacob Garrard, Esq.	John Hurley, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

Benjamin Robert Moore, Esq., Mayor of Leichhardt, sworn and examined:—

B. R. Moore, Esq. 7 Aug., 1889.

2289. *Chairman.*] You are Mayor of the borough of Leichhardt? Yes.
2290. How long have you occupied that position? Since February last.
2291. Had you been an alderman for any time previous to that? For five years; this makes the fifth year.
2292. You are a resident of some considerable standing? I have been a resident for about thirteen years.
2293. Have you given any consideration to the proposal to drain the western suburbs? I was at a meeting in the Public Works Office, at which the late Hon. John Sutherland presided, and the borough of Leichhardt unanimously agreed to this scheme.
2294. Have there been any meetings in the borough of Leichhardt to discuss this scheme? Not public meetings.
2295. So far as you are able to form an opinion, can you tell us what is the feeling of the people of Leichhardt in reference to the scheme? The general opinion is that a system of sewerage ought to be carried out, more especially in the lower levels of the borough. The plan does not show the lower levels, but that is really where the sewerage is required.
2296. You have done a great deal yourselves for the disposal of night-soil and drainage? Johnston's Creek and White's Creek are done down for a considerable distance with concrete inverts, and I might say the same of Wentworth Creek.
2297. The effect of that, I suppose, is only to throw the filth of your municipality into another? Into the harbour.
2298. Have you any idea what it costs you at the present time to get rid of your night-soil? The average annual expenditure for wages, salaries, tools, and sundries is £1,248 5s. 5d.; for horses' keep, feed, &c., £250; for rent of depôt and punt, £335; for deodorant, £280; making a total of £2,113 5s. 5d.

2299. You have 2,700 pans in the borough and 750 pits? Yes.
2300. And a population of 14,600? Yes.
2301. And the total income, if all paid, would be £2,500? Yes; that is under the new rule of charging for pans at 4s. per quarter, and for pits at 6d. per cubic foot. Formerly we charged 8d. a cubic foot and 6d. a pan. I might state that it is the opinion of the aldermen that the term for repaying the money incurred upon the proposed works should be extended from twenty-five to fifty years. The burden upon the ratepayers would then be lighter. If the money has to be paid within twenty-five years, I think the tax will be very heavy.
2302. *Mr. Lackey.*] You confine yourselves, I suppose, to the dry-earth system? It is called the dry-earth system; but that is all you can say.
2303. You do not regard the system as a success? I do not.
2304. You do not use any deodoriser, or any other agency, for the purpose of destroying the smell from the fœcal matter? We do use a deodorant; and I may say that some of the medical gentlemen from Callan Park have seen it tested, and are quite satisfied that it gets rid of the bad smells and disagreeableness.
2305. What becomes of the accumulation eventually? Lately we have had to carry it to a punt at Pyrmont; but there is some Government reclaimed land, where we can place it when the weather is fine.
2306. But when the weather is bad you have to place it on board the punt? Yes; and take it out to sea.
2307. When it is deposited upon the reclaimed land, is it merely thrown on the surface or dug in? Trenched in and properly deodorised.
2308. Is the land cultivated at all? It will be cultivated.
2309. Is the locality near Leichhardt? It is just within the municipality.
2310. Is there a depôt where the soil is collected in the first instance? Of course there is a depôt where the horses and carts stay, but it is never taken there.
2311. It is taken direct from the houses to its place of deposit, or to the punt? Yes.
2312. What is the state of the health of the people in your municipality—is it pretty good? At the present time the health of Leichhardt is in a very good state.
2313. What reputation has Leichhardt, as far as the health of its inhabitants goes;—have you had typhoid fever there to any large extent? We have not had any cases within the last eighteen months. The late Mayor, the Honorable Sydney Smith, inaugurated a system of underground drainage, and I think we have now 8 or 9 miles of drain pipes, which carry the filth underground instead of on the surface.
2314. They carry off surface drainage? Yes.
2315. Have you compared the sanitary condition of your municipality with those of other municipalities in the neighbourhood of Sydney? We have.
2316. How does it compare? There are less deaths from fever in Leichhardt than in any borough around. We had statements from the Prince Alfred Hospital certifying what cases might be taken away from the borough, and I believe that on the average the deaths are fewer in our borough than in any other borough around. We had a little diptheria two months ago, but that seems to have disappeared.
2317. Is it usual to provide a supply of dry earth;—how is the dry earth provided? There is no dry earth provided; a deodorant is provided. The system is only called the dry-earth system. I think there is hardly a municipality around Sydney which provides dry earth for its closets.
2318. What regulation is there regarding the emptying of the pans? They are emptied once a week, and if it is required, they can be emptied twice a week.
2319. *Mr. Copeland.*] What is the nature of this deodorant? It is an acid made up by our inspector. Dr. Ashburton Thompson in his report seems quite certain that it will kill all disease germs.
2320. It is a local production? No; we have to get it from the chemists.
2321. Has it no name? The name of it is deodorant. It seems to have done very well.
2322. Do you know the number of houses in your municipality? I should take it to be about 3,500.
2323. Is the land pretty well occupied, or do you expect that the population will increase? It will increase considerably. The borough contains 2 square miles, and there are 70 miles of streets in it at the present time.
2324. So that you have no fear of undertaking the responsibility of paying for these works, because you know that the increase in the population will reduce the rate? There is an immense amount of land yet to be occupied, not only on the Annandale side, but also on the other side of the borough. Only half the land is occupied at the present time. I think Mr. Hurley could certify to that.
2325. Do you think the people would be willing to pay a rate of 8d. or 9d. in the £ for the benefits of the proposed drainage system? The amount of money is the main thing. I believe that Mr. Stayton's estimate, if the term of repayment were twenty-five years, would not come to much more than that. If the term is extended to fifty years, it must reduce the amount of cost to the public at large. I think that a rate of from 6d. to 7d. in the £ would be quite sufficient.
2326. You think the people would willingly pay that? For the preservation of their own health they ought to.
2327. Are there any wells in the municipality—how are the people supplied with water? Pipes have been laid down by the Water and Sewerage Board through almost the whole of the borough.
2328. Are many wells used? Very few; and wherever I could have them filled in I have done so. I had several filled in the year before last, when I was in office, because of cases of fever which were brought under my notice.
2329. What becomes of the night-slops and general house-slops—are they put into the pans? I do not know. Sometimes they are thrown into the gutters, and sometimes into the yards,—you do not know what they do with the slops.
2330. *Dr. Garran.*] You think that it would be a great improvement to your district if the slops were dealt with as well as the contents of the night-soil pans? I do.
2331. Then it would be worth while paying something extra to have that done? Yes, in the interests of the public health.
2332. You think that the general public opinion in your district is in favour of a good system and a fair rate? I have never heard anyone say a word against the scheme.
2333. Do you think, if it were necessary to go as high as a 9d. rate to make the scheme a success, that there would be any opposition to it in the locality? I could not say that there would be no opposition to a 9d. rate; but I think there would be no opposition to a 7d. rate.

B. R. Moore, Esq. 7 Aug., 1889.

2334. You see, as a public man, that if we go into this system at all we must do it thoroughly and well, and run the risk of whatever the ultimate cost may be; so I ask—supposing it should turn out that a 9d. rate will have to be paid, will there be any rebellion against such taxation? As far as I am concerned, and from what I have heard, I conceive there would not be any. There is not the least doubt that health is the first consideration. This filth lying about disseminates the germs of fever. Twelve years ago doctors could not live in Leichhardt, but now there are four or five. At the time I speak of, the nearest doctors were at Ashfield and at Balmain.
2335. *Mr. Copeland.*] How many have you now? There are several, besides four or five chemists shops. When I first went to the borough to live the revenue derived from rates was not above £400 a year; but now the revenue from a shilling rate is £6,000 a year.
2336. *Dr. Garran.*] Your experience of public works leads you to expect a certain margin upon the calculation of engineers? Mr. Stayton told us at the meeting over which the Hon. John Sutherland presided, that the estimate which he had given was more than the works would actually cost.
2337. But still you always exercise a little discretion in taking an engineer's estimate? I think so.
2338. You would prepare yourself for a margin? It is my experience that most Government work costs more than the first estimate.
2339. So that if the estimated rate were 7d. your ratepayers would be prepared to see it increased to 9d.? I think they would.
2340. Is the deodorant which you use, used in other municipalities as well? Balmain on one occasion sent over to us, and got some of our deodorant. They were satisfied with it: but you have to use it in large quantities.
2341. Is it a liquid? It is a liquid.
2342. Do you distribute it? The ratepayers can have it if they wish for it. They have only to come and get it.
2343. How many people do take it? I cannot tell you.
2344. Do the majority of the ratepayers take it? No.
2345. The majority of the ratepayers prefer the smell to paying for the deodorant? They do not pay for it if they come for it.
2346. They will not even take the trouble to come for it? No.
2347. Yet you think that people who would not take that trouble would pay a 9d. rate? When the pans are deodorised the bad smell from them is got rid of. Some of the ratepayers come to get the deodorant, and some is taken to them. It is there if they like to come for it. A motion was passed in the council to the effect that anyone who wished for the deodorant could come and get it.
2348. You admit that the pans are very offensive? I do; and I think that the pan system is a terrible nuisance.
2349. I understand that your system is the dry earth system without the dry earth? Without the dry earth.
2350. This deodorant is required to make the system inexpensive. Have you made any attempt to take it round for a week, so that the people may test the improvement made by using it? It would be a very expensive affair for the borough to have to take it round every week. There are 2,700 pans in the municipality, and if we had to call at 2,700 houses to distribute the deodorant we should have to employ several people to do the work.
2351. Have you tried the experiment for a week—just to see how the people would like it, and then made them pay for it? No.
2352. If they had tried it do you think they would adopt it? Some of them would.
2353. Do you not think it would be a great improvement if they did so? I do. I may say that although the pans were emptied some of the ratepayers refused to pay for the work. They will not pay unless a great deal of trouble is taken to get the money from them, and if they are above paying for the emptying of their pans they are above paying for the deodorant.
2354. What would they do if they did not empty their pans? Bury the contents in the back yards.
2355. Or in somebody else's back yard? Yes. I have known people to actually bury their night-soil upon a property having a frontage of only 18 feet.
2356. You prevent that as far as you can? Yes.
2357. There is a by-law prohibiting its being done? Yes; stopping anyone from burying night-soil in their ground.
2358. Even if their land is 3 or 4 acres in extent? It is supposed to be the same.
2359. *Mr. Humphery.*] What is the total amount you receive from a rate of 1s. in the £? £6,000 per annum, and £2,000 as a gas rate.
2360. That would make the annual ratable value of the property about £120,000 after deducting 10 per cent., so that the average rental of the properties in your municipality would be between £35 and £40 a year? Yes; a great deal of the land in the borough is unoccupied, and not more than one half of it is really built upon. It runs away from Battle Bridge to Camperdown, and from there on to Balmain, and the foreshores of Roselle Bay. Taking the average value it would not be £40 a year.
2361. You have a large number of low-rented houses? Yes.
2362. Houses valued at from 6s. to 15s. a week. Quite so.
2363. To houses of that class the cost of the sewerage system, even with a rate of 1s. in the £ would be less than that now paid by them for the earth closets? I think it would.
2364. *Mr. Hurley.*] The cost of the dry-earth system is £2,113 5s. 5d. you say, and the receipts from it £2,500, so that the receipts exceed the expenditure by £400 per annum? Yes, they would do so if all the ratepayers paid up, but they do not do so.
2365. You say that you use a deodorant besides dry earth—practically there is no dry earth used at all? Not unless people provide it themselves.
2366. They have to supply their own dry earth? Yes.
2367. If they wish it they can have this deodorant? They can.
2368. Are they made acquainted with the fact that they can become possessed of this deodorant on making application to the council? A motion was passed in the council so that every one could know that they could have the deodorant by applying for it.
2369. Do you think it is to the interest of the health of the borough to have these pans in use, and not to supply them with earth? The men who empty the pans carry the deodorant with them, and they generally put a little of it into each pan after they have emptied it.

B. R. Moore, Esq. 7 Aug., 1889.

2370. Would you be surprised to hear that not 5 or 10 per cent. of the persons in the borough are acquainted with the fact that they can secure the deodorant by applying for it? I am not acquainted with it. It was given out officially that they could get it.
2371. You have an Inspector of Nuisances, of course? Yes.
2372. Have many pits been reported to the council recently as being dangerous to the health of the people of Leichhardt and Annandale? I have not heard of any recently. Whenever any cases of that kind are reported to me I give the Inspector power to fill them in or give the people who own them notice that they will have to be filled in within so many hours.
2373. As the Mayor of Leichhardt, you believe that the people generally are in favour of connecting with the scheme set forth on the map? I have heard no objection raised against it.
2374. *Mr. O'Sullivan.*] Have you held any meetings of the ratepayers to discuss this matter? I have not.
2375. Do you not think it would be desirable to do so? If the gentlemen present think it is requisite I shall call a public meeting.
2376. Do you think that it is desirable that the ratepayers should be called together? I have never heard anyone pass an opinion antagonistic to this scheme of sewerage. It has been well ventilated, and the ratepayers know very well that it is likely to be constructed, because at public meetings and elections it has been talked of. Every one seems to be in favour of it, and I am not aware up to the present time that anyone has objected to it.
2377. In view of the fact that your opinion now may commit the ratepayers to a charge for meeting the expenditure upon this work, do you think it would be advisable to carry it out? I think that we should not consider the interests of a few people to the detriment of those of the many. We must have a system of sewerage, whatever it costs, and the people will have to pay for it. The present system, by which the filth is cast upon the foreshores of the bays cannot continue. If something is not done soon with regard to Long Cove, I believe there will be more fever in that locality than anywhere else near Sydney. This work must be carried out in the interests of the public health.
2378. You think that on sanitary grounds you are quite justified in giving it as your opinion as Mayor of Leichhardt that work ought to be done? I think so.
2379. *Mr. Garrard.*] Has the matter been specially before your council? Yes; several times.
2380. And gone into in all its details? They had the plan sent out to them. What they are specially anxious about is the drainage of the lower levels. We can drain the higher parts ourselves; but it is the lower levels round the bay that want draining.
2381. That is to say, you can drain the high levels into the lower levels; but so far as the scheme shown on the plan is concerned, the Borough Council, as the representatives of the ratepayers, are fully in accord with it? They are.
2382. And they understand the cost and expense involved in it? They understand that they will have to pay a rate.
2383. Is there any by-law in your borough prohibiting the burial of night-soil in private properties? There is such a by-law.
2384. You stated the number of cesspits and pans in your borough. Are you increasing the number of cesspits, or are you trying to introduce the pan system in every instance? We are trying to make every one adopt the pan system.
2385. Where did you deposit your night-soil before you had the present depôt? It was taken out to Homebush to Tresseder and Bartlett's nursery for some time. The system was then altered, and we took it to Brown's yard at Pyrmont.
2386. Is it a fact that you had to pass through several municipalities in order to reach the depôt at Homebush? We had to pass through Ashfield and Burwood.
2387. Was any objection to your passing raised by either of those municipalities? No; they never objected. The carts were all properly deodorised, though there is always a sourish smell with them. We have our own carts and horses.
2388. Is it a fact that the City Council prevented you from going to Brown's wharf? Yes; they took action to prevent us from going there, but they seemed to have withdrawn their prohibition again with regard to some of the other municipalities.
2389. Owing to the action of the City Council you were obliged to secure a depôt within your own boundaries? Yes.
2390. That depôt is the Callan Park Asylum grounds? It is the reclaimed land there.
2391. The whole of your surface drainage and house slops at present find their way down to White's Bay, Roselle Bay, and Long Cove? Yes; that is where it goes.
2392. Causing a very great nuisance? At low water, and when the sun is strong, the smell is very bad.
2393. Is it a fact that the greater part of the drainage of Ashfield, and part of the drainage of Petersham, goes into Long Cove? Yes; it flows under Battle Bridge.
2394. Any sickness that occurs in Leichhardt is generally among the people residing near this locality? I cannot say that. There was a little sickness there two months ago—diphtheria, but there was no typhoid. This being winter time, the nuisance is not so bad.
2395. I suppose if there had been any objection on the part of the ratepayers you would have heard of it? They are very fond of public meetings in Leichhardt; but with regard to this matter they have not agitated at all.
2396. You think that if there were any opposition to the scheme it would have been expressed? I do.
2397. *Mr. Trickett.*] What is the area of land upon which you deposit your night-soil? I think about 40 or 50 acres.
2398. Is it all made land? It is all reclaimed land. The place was filled up with the silt from the harbour.
2399. Is it cultivated at all, or merely used for grass growing? Not at the present time. The land is lying idle, and has to lie idle for two or three years.
2400. You say that in wet weather you cannot use it? Yes.
2401. And that then you are driven to use the punt. May I ask you how long the punt lies at the wharf at a time? I do not know how long it lies there; but it is supposed to go away every night.
2402. Do you think it does? I could not say. The wharf is over in Pyrmont.

B. R. Moore. Esq. 7 Aug., 1889.

2403. You cannot tell us how long the punt remains at the wharf? No, I should not like to say how long it lies there, Mr. Brown is the owner of it.
2404. So far as you know, all the ratepayers of Leichhardt are agreed that it would be far better to adopt this system, which would take away this stuff direct from the houses, than to have it carted away? I am sure of it.
2405. What rate does the 4d. which you now charge represent upon the annual ratable value of the property in the municipality? The system that we have had in operation up to the 31st of this month makes a charge of 5s. a quarter if the money is paid in advance, or 6s. 6d. a quarter if it is allowed to stand over; but the new system only costs the ratepayers, 4s. each a quarter, which need not be paid in advance. That really only means 16s. a year, while before it was a pound or £1 6s.
2406. That is only on small houses? On all houses large or small.
2407. It is a charge of so much a pan? Yes.
2408. What rate would it represent upon a house worth £20 or £30 a year? They would still have to pay 6d. a cubic foot, or 4d. a pan, and the charge would be just the same for a house worth £50 a year.
2409. Would the people be willing to pay as much as a shilling rate? I could not say. I think that if the term of repayment is extended, the taxation of the public will be relieved, although it will take longer to pay the money off. The rate would be lowered, and the next generation would have to pay for the work as well as ourselves.

Benjamin Morgan, Esq., Mayor of Camperdown, sworn, and examined:—

B. Morgan. Esq 7 Aug., 1889.

2410. *Chairman.*] You are Mayor of Camperdown? Yes.
2411. Have you held that position during any length of time? Since February last.
2412. How long have you been an alderman? For about six years.
2413. *Mr. O'Sullivan.*] I suppose you have pretty much the same method of removing night-soil as other municipalities have? Yes, pretty much the same.
2414. Where is your depôt? At Botany.
2415. Are there any complaints made about your depositing it there? We have never experienced any difficulty as regards the depôt. The man who contracts to do the work provides his own depôt. That has always been the case with regard to Camperdown.
2416. Have you had an opportunity of testing the feeling of the ratepayers of the borough with regard to this project? Not by public meeting—only casually, by mixing with prominent ratepayers.
2417. I presume the matter has been discussed in the Council? Certainly.
2418. Are they in favour of the scheme? Yes, unanimously.
2419. And you think that the ratepayers generally would be? From my general knowledge, I think they would. I have never heard any objection to the scheme.
2420. I suppose there is no certainty at all that you can go on using the depôt at Botany? No; there is no certainty, but we have never had any difficulty so far.
2421. Supposing some one took out an injunction to prevent you from depositing it there, what would happen? I suppose the contractor would throw up his job.
2422. For that reason I suppose you think it is absolutely essential to have some such scheme of sewerage as that proposed? In my opinion, and in the opinion of the Council which I represent, it would be very desirable.
2423. There is no doubt that it would be a very great improvement to your borough from a sanitary point of view? Not the slightest doubt.
2424. Do you think that the ratepayers would be willing to pay for it? I believe they would be willing to pay a fair rate, but not too high a rate, towards the cost of carrying out the scheme.
2425. Did you come to any decision as to the length of time over which the repayments would extend? On two occasions when this matter was before the Council it was their opinion that if the time in which the money should be repaid were extended from twenty-five to fifty years it would reduce the amount which the present generation would have to pay, and make posterity pay some of it. They thought 6d. or 7d. in the £ would be a fair rate. That would about meet what we are paying at present.
2426. *Mr. Garrard.*] What system of collection of night-soil have you—do you use pans? We use both pans and cesspits.
2427. What proportion do the pans bear to the cesspits—are there more pans than cesspits? At the present time there are 707 pans.
2428. And how many cesspits? I have not got the number with me. The cost of removing the night-soil from the earth-pans is £612 14s. 8d. per annum.
2429. Is that the total cost? Yes, and the average cost of removing the night-soil from the cesspits for the past two years has been £243 1s. 9d.
2430. Did the borough make any profit out of it? In regard to the earth pans, the contractor contracts to empty them twice a week, for 4d. a pan, and he collects his own money.
2431. And does he supply dry earth to the residents? No.
2432. Does he supply deodorant of any kind? He is supposed to deodorize the pans when he empties them into the carts.
2433. He leaves the deodorant in the bottom of the empty pans? Yes.
2434. In getting to the depôt he has to pass through other municipalities? Through Newtown and St. Peters.
2435. Has there been any objection raised by these municipalities to the night-carts passing through them? I have never heard of any objection.
2436. If permission to pass through were refused what would you do—you are entirely surrounded by municipalities; you do not touch any arm of the sea? No.
2437. There is no place within your boundaries where you can bury it? No; I do not know of any place.
2438. Therefore it is of the utmost importance to you that some efficient system for dealing with this matter should be adopted? It is of great importance.
2439. How does the health of Camperdown stand with regard to that of other municipalities—is the death-rate high or low? The health is very good.
2440. Where do the night-slops and kitchen-slops go—into the surface gutters, or have you a system of underground drainage? Up to within two or three years ago it ran down the surface gutters; but within the last five years we have spent £6,000 or £7,000 upon underground drainage, so a great deal of it is now carried beneath the surface.

B. Morgan, Esq. 7 Aug., 1889.

2441. It all finds its way into Orphan School Creek? Into Johnston's Bay.
2442. Does not a great nuisance arise from the depositing of drainage upon the flats of Johnston's Bay? I have never heard of any.
2443. The Glebe and Leichhardt intervene between you and the place of deposit? Yes.
2444. You are quite willing to send your drainage to your neighbours and let them deal with it? We have to be content with that.
2445. You have no other alternative? We have no other alternative. We receive the drainage from Newtown—we all share and share alike.
2446. I suppose your Council upon the two occasions to which you refer went thoroughly into this matter as to the probable cost, &c.? Upon two occasions. The first occasion was some months ago; and the scheme was again considered when I received notice to attend the Committee.
2447. Have any public meetings been held in your borough to protest against the scheme, or to discuss it? There have not been any public meetings.
2448. The ratepayers are content to leave the matter in the hands of their civic representatives? They are quite willing to leave it in their hands.
2449. *Dr. Garran.*] The main sewer passing through your borough is marked red on the map? Yes.
2450. That would connect with the Prince Alfred Hospital sewer? Yes.
2451. Then the greater part of Camperdown would be drained into the Bondi sewer? Yes.
2452. And only a small part of the north-western portion would drain down to Webb's Grant? Yes.
2453. Your municipality is peculiarly situated in this respect, that you will be indebted to each system for doing part of the work? Yes.
2454. The main portion of the Camperdown sewage will be drained into the Bondi sewer? Yes.
2455. So that if the scheme were approved of only a small extent of sewerage would be necessary to drain three-fourths of your municipality, leaving only the north-western portion undrained? Yes.
2456. You state that you have some underground sewers; have they been made out of current revenue or by borrowed money? By borrowed money.
2457. They would be superseded? In constructing our sewers we were guided by the knowledge of the fact that this scheme was in hand, and therefore endeavoured, as far as possible, to take the sewage in the way required.
2458. But the sewers all go down hill towards Orphan School Creek? Yes.
2459. Then, can they run into a sewer the level of which will be much higher? The sewers which we have already made are upon the higher ground.
2460. They could all flow into a sewer which would join with the main sewer? The greater portion of them could.
2461. But you would have to write off a certain amount of money? Yes.
2462. What you have done is only to deal with your surface water? Yes.
2463. You admit that at the present time you are making a nuisance? Yes.
2464. Supposing the Government forbade you to do so what would you do;—at present you are creating a nuisance for your neighbours? Leichhardt and Camperdown joined in the cost of cementing the creek. We spent £100, and I think Leichhardt a similar sum. The work was done at the time when the unemployed were so numerous.
2465. Still you admit that you do foul the head of the bay? Yes.
2466. If an injunction were obtained to restrain you from doing so you do not know what you would do? No.
2467. Then it is very important that this system should be carried out? Certainly.
2468. And you think your people would appreciate that when a rate was imposed. A heavy lawsuit with an injunction following upon it would cost them almost as much as the rate. Do you not think that you should be very thankful of having the chance of getting such a scheme? I believe the aldermen are thankful that the scheme has been proposed.
2469. And they would be willing to connect with it as soon as possible, and would pay a rate as soon as the work was completed? That is the opinion of the Council.
2470. *Mr. Dowel.*] How long have you resided in the borough? I do not think I ever resided away from it, with the exception of a few months now and again in the country.
2471. I presume then that you have a thorough acquaintance with the whole of its area? I have a thorough acquaintance.
2472. What is the area of the borough? I suppose about 13 acres—I mean the populated portion; I do not include the University grounds.
2473. You have stated that yourself and your fellow councillors have given considerable attention to the proposed sewerage scheme? Yes.
2474. And that you consider it a desirable one? Yes.
2475. You have also stated that you have constructed a considerable length of sewers; what are they, brick or stoneware pipes? We have both kinds of sewers; but they are principally stoneware pipes.
2476. What provision have you for flushing them? We have no provision, except the ordinary stench traps. We have had permission from the Water and Sewerage Board to flush the gully shafts.
2477. Have you a good supply of water? A man goes round twice a week and fills the shafts with water. That prevents the stench from rising.
2478. Independently of the sewer that you have constructed for the purpose of receiving the surface drainage, is it not a fact that a large portion of the borough is now inconvenienced from the want of such drainage? Certainly.

Percy Charles Lucas, Esq., J.P., Mayor of the Glebe, sworn, and examined:—

P. C. Lucas, Esq. 7 Aug., 1889.

2479. *Chairman.*] You are Mayor of the Glebe? Yes.
2480. Have you occupied that position for some time? This is the second year of office.
2481. How long have you been an alderman? For ten years. I was Mayor of the Borough of Camperdown for four years consecutively, and an alderman for about nine years.
2482. Have you given any consideration to this proposed scheme of sewerage? Yes.
2483. What is your opinion about it? Speaking with regard to the Glebe, it appears to me that the sooner we have a system of sewerage there the better. I feel certain that the ratepayers of the Glebe will

P. C. Lucas, Esq. 7 Aug., 1889.

will have no objection to paying a rate, because we have had some experience of the benefits of the system. A few years ago the whole of the drainage of the Glebe ran along the surface gutters, and sickness was then very rife in the borough, and the death rate high. The Council then commenced to put down drain pipes, and they have spent £8,890 in laying drain pipes to carry away the kitchen slops and the drainage from the yards. As a consequence of this, the death rate has decreased from 24 in 1,000 to 15 in 1,000, while the population has increased from 12,000 to 15,000. Judging from this experience, I think that the sooner we have a system of sewerage the better. I, personally, shall be pleased to see the scheme carried out, and I have no doubt that the whole of the ratepayers are of the same opinion. While we have spent this £8,890 in putting down drain pipes, we have effected a saving of £500 per annum in the sanitary department of the borough, so that although we borrowed money for the work, the ratepayers are actually getting the benefit of it for nothing.

2484. In what way do you save £500 a year? In the cleansing of the borough. It costs us £500 a year less to keep the borough clean now, and it is kept very much cleaner than it used to be for the larger expenditure.

2485. Do you think the ratepayers of the Glebe would be satisfied to pay a rate of 10d. in the £ for the purpose of getting a sewerage system of the character proposed? I do not suppose the ratepayers of the Glebe would object to pay more than they paid in other boroughs.

2486. Do you know what it costs now to cleanse the borough? The removal of night-soil costs £1,386 per annum.

2487. You could not tell us what rate that would be? The rates received for this year amount to £7,569, but I might say that while it costs us £1,386 to get rid of the night-soil, 200 houses in the borough are connected with the existing sewerage scheme. If they had to pay to have their night-soil removed the amount would be increased. There are 3,300 houses in the borough altogether.

2488. *Mr. Garrard.*] Have you the pan or the cesspit system in operation in your borough for the collection of night-soil? Both.

2489. What proportion do the pans bear to the cesspits? There are 205 dry earth pans.

2490. And the rest of the houses are provided with cesspits? Yes.

2491. Properly constructed? Constructed according to the by-law. They are bricked and cemented, and puddled outside.

2492. How do you get rid of the night-soil in the dry earth closets;—by contract? By contract.

2493. Is dry earth supplied to the ratepayers? The contractor who removes the night-soil has contracted to supply dry earth, and as I have never heard any complaints, I presume he does so.

2494. He does not deodorise the contents of the pans in any way except by dry earth? Yes.

2495. Does he use a deodorant for each pan, or for the carts only? At the Glebe we pursue, I think, a different course to that pursued in any of the other boroughs;—we provide the disinfectant ourselves. I am now speaking with regard to cesspits. It is the duty of the Inspector of Nuisances, when he receives an application for the emptying of a cesspit to go round with the nightman to measure it, and at the same time to see that the cesspit is disinfected or deodorised.

2496. What about the pan system? In the same way he provides the contractor with disinfectant.

2497. And does the contractor leave this disinfectant in the pan every time it is emptied? Yes.

2498. Where is the night-soil taken to from the cesspits? To Johnston's Bay.

2499. To Brown's Wharf? Yes.

2500. Have you had any objection to that on the part of the city authorities? Yes.

2501. Have you been prevented from going there? The contractor has been stopped on two or three occasions; but the plan is still being continued, until the Council can adopt some other means of getting rid of the night-soil.

2502. Where did you deposit it before the punt was provided? The Council never had a depôt. They always called for tenders, and in the contract the contractor agreed to find his own depôt.

2503. You do not know where the depôt of the contractor has been? A considerable amount of the night-soil went to Moore Park, I believe, until that was stopped. Some of it went to Botany.

2504. Has the proposed system of sewerage been specially before the Council? We have never had any special meetings to consider it, but the matter has been before the Council several times.

2505. Have you held any public meetings? No. It is very difficult to get up a public meeting in the Glebe upon anything.

2506. The people there are quite content to leave these matters in the hands of their municipal representatives? Evidently.

2507. Will the proposed system of sewerage deal with the greater part of the Glebe, or will there be levels of the borough which cannot be dealt with? There will be some levels too low to be dealt with. Some parts of the Glebe are only 4 feet above high-water mark.

2508. But those parts do not embrace a very large area? No.

2509. The principal part of the borough is elevated? Yes.

2510. And only places around the shores would be left undrained? Yes. The height of the land above high-water mark ranges from 120 to 4 feet.

2511. I suppose the great part of the land which is only 4 feet above high-water level is round Johnston's and Rozelle Bay, and in Allen's Bush? Allen's Bush, Toxteth Park, and Wentworth Park.

2512. *Mr. Dowel.*] What is the population of your borough? 15,600.

2513. What is the area of it? About 1 square mile.

2514. What number of houses does it contain? 3,300.

2515. You state that you have constructed a considerable length of sewers in your borough, chiefly of drain-pipes, stoneware-pipes, I presume? Yes; though some part of it has been done with square iron-bark boxes filled in on each side.

2516. Have you any water-closets connected with the sewers? I think 200 of them are connected with the sewers. They empty themselves into the sewer running through Wentworth Park.

2517. Have you at all a good water supply? Yes, excepting on the very highest levels. The water service of the Glebe has been down for very many years. When it was first put down the houses were fewer than they are now. The service has not been replaced, but steps are now being taken to replace it. I have drawn the attention of the Water Supply and Sewerage Board to the necessity for relaying the service and putting down larger mains.

P. C. Lucas, Esq. 7 Aug., 1889.

2518. Do you think the system you have adopted of allowing the night-soil to go into the sewers by means of water-closets preferable to the pan system? Yes. The difficulty I find with regard to the pan system is the getting it properly attended to.
2519. *Mr. Humphery.*] I think you said that you have no doubt that the sanitary conditions of your municipality would be greatly improved if the proposed system were carried out? Yes.
2520. And for that reason alone, without any other, you think it advisable that there should be no delay in proceeding with the works? Yes.
2521. *Dr. Garran.*] You say that some of the houses in the municipality are drained by sewers? Yes.
2522. Where do they discharge? Into the sewer running through Wentworth Park.
2523. Into the bay? Into the bay.
2524. That does not improve the bay? I presume not. The sewer drains the whole of Chippendale.
2525. Most of the houses draining into that sewer would be capable of draining into the main sewer? Yes.
2526. It would be a great advantage to get the sewage of these houses diverted? Yes.
2527. There is only a small quantity of low flat land at the head of the bay the sewage of which would require to be elevated? Yes.
2528. Are you aware whether or not the sewage coming down the Orphan School Creek from Camperdown is very offensive? It is.
2529. It would be a great advantage if it could be diverted? Yes.
2530. No complaints have been made about it by the adjoining municipality? No; what would be the use?
2531. It would benefit you both if the proposed scheme were carried out, and it might prevent law suits being commenced between you? It would benefit not only the Glebe but also Leichhardt, because Johnston's Creek, through which the Camperdown and Newtown sewage flows, is the dividing line between the Glebe and Leichhardt, so that the whole of Annandale is drained into it.
2532. Then your neighbours are a nuisance to you, and you are both aware of the fact but cannot help it? Yes.
2533. Then you would both gain if the proposed scheme were carried out? Yes.
2534. Even if you had to pay a small rate? Yes.
2535. What is the cost of the deodorant which you use? It is almost infinitesimal; 5d. worth of it would disinfect a cesspit containing 50 or 60 cubic feet.
2536. Is it included in the £1,386? Yes.
2537. You have not tried the liquid deodorant used at Leichhardt? We use a liquid deodorant.
2538. Is it an acid? Several combined.
2539. Do you know whether it is the same they use at Leichhardt? I should not be surprised if the basis were the same.
2540. Is it any kind of patent? No; the disinfectant was made under my instructions. We had an officer who superintended the pumping of salt water to water the streets, and to save expense and to use the extra steam from the boiler I gave instructions that it was to be made at the engine-house. He, of course, learnt how to make it, and applied for and obtained a patent, and I think the disinfectant is now being called "The Frederick Disinfectant."
2541. You say that you pump up the salt water;—do you flush the drains with it? Not now. This was previous to the fresh water supply.
2542. You have given it up? Yes.
2543. The Glebe system of sewerage could be connected with the Bondi sewer? Yes.
2544. And the work could be carried out whether the Balmain chose to be connected or not? Yes.
2545. And could be put in hand as soon as it was determined to carry it out? Yes.
2546. Has it occurred to you to consider whether the cost of the Bondi sewer should be separated from that of the other sewer or whether the two should be put together? We have never taken the question into consideration at all. We thought that a thing of that sort was too large for us.
2547. You think the Glebe people would be contented whatever way it was done? We presume that when the matter is decided upon we shall be dealt with fairly.
2548. Do you think that the city and metropolitan area will be taken as one and treated as a whole? Yes; so that the cost is justly distributed.
2549. You said that a few houses in the municipality were outside the level which would enable them to be drained by gravitation. They would not be one-tenth of the whole number of houses? No; I do not suppose that there are ten houses upon land only 4 feet above high-water mark, and I hope that no more will be built there.
2550. Do you know what the level is where the sewer ends at the corner? I do not.
2551. It will have to be raised from there to the other point? Yes.
2552. You do not know the level of the highest point of the Glebe sewer? The highest point of the Glebe is 121 feet above high-water mark.
2553. But the highest point of the sewer? No.
2554. There could not possibly be at present many houses which would not be drained into it? No; very few, I think.
2555. So far as the Glebe is concerned you have a very satisfactory system? I think so.
2556. But by getting rid of the sewage as well as the night-soil we shall have a great additional gain? Yes. By the present system the death-rate has fallen considerably, and if this system were carried out it would be still further decreased.
2557. But you understand that it will be an increased cost as well as a gain? Certainly.
2558. And as Mayor of the borough you think the residents will be prepared to pay a reasonable price? I think so.

William Crispin, Esq., Mayor of Darlington, sworn, and examined:—

W. Crispin, Esq. 7 Aug., 1889.

2559. *Chairman.*] You are Mayor of Darlington? Yes.
2560. How long have you occupied that position? I have been an Alderman for 6 years, and I was Mayor 3 years ago.
2561. You have held that office twice? Yes.
2562. How long have you been a resident of the borough? I have not resided in Darlington for eighteen years; I have been residing in the Glebe.

W. Crispin, Esq. 7 Aug., 1889.

2563. You have given some consideration to the proposed scheme of sewerage for the western suburbs? The fact is, we have got our borough completely sewered.
2564. Draining where? To Bondi.
2565. You are connected with the Bondi sewer? Yes; the Government constructed a sewer running along the boundary between us and Redfern, and 3 years ago I had the whole of the borough connected with that sewer. There is not a cesspit, a pan, or anything of the sort in the municipality.
2566. Then you approve of the scheme? Yes.
2567. *Mr. Lackey.*] How far does the main sewer with which you are connected go towards Newtown? Up to Forbes-street, the boundary between Darlington and Newtown. It is only a small sewer, with a 12-inch pipe.
2568. Darlington is almost part of the city? It is close to the city.
2569. And I understand that you have a thorough system of sewerage there? Yes.
2570. And, therefore, the proposed scheme does not interest you? We have not a wet gutter in the borough. Slops and everything else are taken right away.
2571. *Mr. Hurley.*] What amount do you charge as a sewage rate? 4d.
2572. Is the health of the people in the district good? Yes, it has been very much improved by the system of sewerage.
2573. Have you had any cases of typhoid during the present year? Three or four cases were reported by the Medical Board; but we found that they occurred outside the boundaries of the municipality.
2574. The health of the residents generally is good? Very good. There was one case of typhoid last month, and the patient died. I wrote to the Medical Board complaining that his death was due to the bad smell arising from the Prince Alfred Sewer, which runs through the borough, and Dr. Ashburton Thompson came out to see it. He has since recommended to the Government that they should put up ventilating shafts to carry away the foul gas. A most abominable smell arises from this sewer in four or five places.
2575. Having complained of the smell, the annoyance to the people is all the greater? Yes.
2576. Have the Government replied to you? Yes; they sent an engineer out a week ago to-day.
2577. And the evil is likely to be remedied? Yes, if I can induce some of the property owners to allow ventilating shafts to be erected on their own properties. I have interviewed some of them; but I did not get a direct answer. I hope, however, that they will allow it to be done.
2578. What is the area of your borough? I do not know exactly. There are 4 miles of streets and lanes. I do not know how many acres it contains.
2579. Can you say what number of houses there are in the borough? 725.
2580. What is the population? 2,988.
2581. You have stated that the whole of the houses in your borough are connected with the main sewer by a proper system of sewerage. Have you an ample supply of water for flushing purposes? We have plenty of water.
2582. You were acquainted with the borough I presume previous to the present sewerage scheme being carried out? Yes, I was an alderman previous to the work being taken in hand.
2583. Have you found from experience that the present system is superior to the old one? Yes, in every way.
2584. And you would strongly recommend other boroughs to do what you have done, in the interest of the public health, not to say a word about convenience? Yes, independently of convenience.
2585. *Mr Humphery.*] To whom is the rate paid? To the Council.
2586. To the Darlington Council? Yes; 2d. will pay the interest on the money expended.
2587. By whom was the main sewer constructed? By the Government.
2588. At your cost? At their cost. We do not pay for that. It was constructed 4 or 5 years ago.
2589. At present you are not being charged anything for the use of the main sewer? No.
2590. All you have paid for is the construction of the subsidiary sewers? That is all.
2591. And the rate of 4d. is sufficient to cover that cost—in fact 2d. would be enough? Yes.
2592. You expect later on to be charged for the use of the main sewer? We expect that.
2593. And are willing to pay? Yes.
2594. *Dr. Garran.*] I understand that the rate of 2d. covers the cost of reticulation? Yes.
2595. And when you pay for the complete scheme, you will have to pay a charge not only for your own borough, but an average rate on the schemes as a whole? I do not know about that.
2596. The little piece of sewer in your borough would be of no use to you if it were not for the other 2½ miles leading to Bondi? It will be perfectly fair to make us pay our share of the cost of the sewer to Bondi.
2597. And the residents of Darlington would be quite willing to come in with their neighbours and pay a rate upon the construction of the work? Yes.
2598. At present you are in an exceptionally favorable situation. You are only paying rates upon the cost of your own subsidiary sewers, and are having your sewage carried 3 miles away from you? Yes.

John Crowe, Esq., Mayor of Redfern, sworn, and examined:—

J. Crowe, Esq. 7 Aug., 1889.

2599. *Chairman.*] You are Mayor of Redfern? Yes.
2600. And have been an alderman for some time? For seven years.
2601. And a resident for a still longer time? For 36 years.
2602. Have you given any consideration to the proposed system of sewerage for the western suburbs? I have not to this particular scheme, but I have to the Redfern scheme, which is now being carried out.
2603. What is being carried out at Redfern forms part of the whole scheme. You have given some consideration to the part which relates to Redfern alone? Yes. We borrowed money to carry out our part of the scheme some 12 months ago.
2604. Was that to connect with the sewer which the Government are making? To connect with Bondi and Shea's Creek.
2605. Does your Council generally approve of the scheme? Yes, and the residents too.
2606. And they are prepared to pay their fair proportion of the cost of the whole work? When we borrowed the money we calculated for a rate of 4d. in the £. We will carry out our scheme for £30,000.
2607. You are connecting yourselves? No, the Sewerage Department is doing the work, which is being carried out under the direction of Mr. Smail, the engineer.

2608. Will it drain the whole of the borough of Redfern? The whole of it.
2609. To Shea's Creek? Yes, and to Bondi.
2610. *Mr. Lackey.*] You said that the Redfern works are now being carried out? Yes. 500 connections have been made since February of this year. The work has been in progress for eight or nine months now.
2611. And it is being carried out in conformity with the plans and designs of the general system? Yes, under the Sewerage Department. They have taken our loan over, and they are carrying the scheme out.
2612. Have you any drainage in operation at the present time? Yes, there are about seven miles laid at the present time.
2613. Does that go to Shea's Creek? Some of it, and some into Bondi.
2614. What is the nearest point of the Bondi Sewer? I think it is at Cleveland-street.
2615. Cleveland-street is the boundary of the borough? Yes.
2616. As far as the operation of the sewerage has gone, have you found it to be an advantage? A great advantage.
2617. Do the sewers carry off the sewage pretty freely? We have never had a complaint since the system was started.
2618. Has your attention been drawn to any marked difference between the state of the health of the borough now, and before the sewerage was carried out? Redfern has always been a very healthy borough. It has had a natural drainage. Waterloo and Alexandria have had to suffer from Redfern.
2619. The surface drainage from your municipality goes into Waterloo? Yes.
2620. How long have you resided at Redfern? The whole of my life.
2621. Then I suppose you are one of the oldest authorities? I lived there before it was a municipality.
2622. When you were there first it was nothing like the populous place which it is now? It was all paddocks then.
2623. *Mr. Trickett.*] You have had the advantage of seeing the working of the old system and of the new? Yes.
2624. I suppose there is no comparison between the two—the water closet system is far the better? In my opinion it is. I have certainly approved of the sewerage scheme.
2625. You still have cesspits to empty in some parts of the borough? We have; but that will terminate at the end of the year, because by that time the whole scheme will be finished.
2626. Do you charge the people who use this particular scheme a sewerage rate? Not at present. We found that according to the Water and Sewerage Act we should have to hand the money over to the Board, and it would be a great deal of trouble for us to collect and hand it over for nothing.
2627. These people are getting the benefit now for nothing? We have the dates of their connections, and we shall hand the record over to the Department whenever they choose to ask for it, so that they can charge from the date of connection.
2628. Do you know what rate you will be asked to pay in connection with this scheme? We calculated 4d. in the £ when we borrowed the money. The Government has taken that over from us.
2629. I suppose the people would pay even more than that if necessary? I think they would complain if they had to pay over 6d.
2630. *Mr. Garrard.*] The rate of 4d. in the £ is only for the local subsidiary sewers, and does not take in the cost of the main sewers? We did not calculate for that. We thought we should be allowed to drain into the main sewer without being called upon to pay anything.
2631. Then how did you expect that the large expenditure upon the main sewer would be met? That question did not occur to the Council when they were considering the matter.
2632. They thought that the Government had provided them with two main outlets, and all that they had to do was to find their own drainage? That is the view the Council took.
2633. Before you were connected with the main sewer what was the cost of dealing with night-soil? £1,800 a-year.
2634. Is that what it is now? No, it is only £1500 a-year. now.
2635. I suppose at that time you had frequent complaints from the neighbouring boroughs of Alexandria and Macdonaldtown? We used to have complaints about our storm-waters washing the roads away.
2636. But your ordinary house-slops before you adopted this scheme were conveyed into these municipalities? They were pretty well dried up before they got there.
2637. In your own gutters? In our own gutters.
2638. Much to the detriment of the health of your own people? Yes.
2639. How are you dealing with your night-soil now, other than that which goes into the sewers? The contractor removes it, and takes it to Brown's Wharf, at Pyrmont.
2640. Have you been interfered with by the City authorities? The contractor has been fined twice.
2641. And does he still continue to go there in spite of the fine? The Poudrette Works at North Botany offered to take it, and I am not certain whether he takes it there or to Brown's Wharf.
2642. In that case he would have to go through two other municipalities? Through three.
2643. So that it is a general passing on of your nastiness through other people's domains? Yes.
2644. Do you not think that the people would be willing to recognize the responsibility by paying an increased rate? As long as it was not too high.
2645. *Mr. O'Sullivan.*] What reason have you for believing that they would be favourable to this sewerage scheme? The matter was thoroughly discussed before we borrowed the money, and whenever a resident or ratepayer of Redfern met an alderman, he would say to him, "I hope you will soon have the sewerage scheme carried out," and it is the same now. They are all anxious to see the scheme finished as soon as possible.
2646. You have had no public meeting, or any manifestation of public opinion? No; we had the matter settled twelve months ago.
2647. You feel justfied in saying that the ratepayers will approve of the scheme? Yes.
2648. You have seen the efficacy of it in regard to the outfall sewer to Webb's Grant? Yes.
2649. Does that take away some of your sewage matter? About half of it.
2650. *Mr. Dowel.*] What is the area of your borough? 750 acres.
2651. What is the population of it? 20,000.
2652. What is the number of houses in it? 4,300.

J. Crowe, Esq. 7 Aug., 1889.

2653. The system of sewerage to which you refer as being in existence comprises a large part of the borough? No; about one-third of the borough has been done.
2654. The results of the system were so satisfactory to the ratepayers that they wanted it to be extended to the whole borough? It is to be extended.
2655. They are quite satisfied with the present results? They keep urging us to have the matter finished, and the Sewerage Department is carrying out the work as fast as possible.
2656. And your opinion is that this system is far superior to the cesspit system? I am quite sure about that.

THURSDAY, 8 *AUGUST*, 1889.

Present:—

The Honorable JOHN LACKEY (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.	HENRY COPELAND, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	JAMES EBENEZER TONKIN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	WILLIAM SPRINGTHORPE DOWEL, Esq.
JACOB GARRARD, Esq.	EDWARD WILLIAM O'SULLIVAN, Esq.

JOHN HURLEY, ESQ.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

John Trevor Jones, Esq., Engineer, Water and Sewerage Board, sworn, and further examined:—

J. T. Jones, Esq. 8 Aug, 1889.

2657. *Vice-Chairman.*] Have any circumstances come to your knowledge since you last gave evidence upon the sewerage scheme for the western suburbs, which you would like to give to the Committee? Yes. When I was here last some of the members of the Committee asked me what I thought of the estimated cost, and whether the work could be carried out for the amount estimated. The question was a surprise to me, because I had not thought it my duty to go into that matter, and, as it was a very large question, I had not had time to consider it properly. I saw that the works were to cost £833,000 and my answer to the Committee was that I considered Mr. Stayton a fully competent person to furnish a reliable estimate. The question, however, came to my mind during the evening, and upon the following day I brought the matter before Mr. Henson, who, with myself, went into the matter. Mr. Henson pointed out to me that £833,000 only provided, so far as he could judge from the report, for the carrying out of the main sewers, and that a rate of 6d in the £ would only pay for the cost of that work, together with the interest upon the money. This seemed to me a very serious matter, because I knew at once that the reticulation would add to the cost very largely. As I thought the Committee were just about to report upon the matter I hastily wrote a note to the Secretary, informing him what my impression was, and as a result of that letter I am here to-day. In my letter, I stated that I thought half as much again as the estimated cost would be required for completing the work, which would bring the rate up to 9d. in the £.
2658. The gross cost of the works would amount to 50 per cent. more than the estimate? Yes. I have heard since that the Committee are aware of this, and that they have got Mr. Stayton to address himself to the question, and that he has furnished them with information upon it in the form of an appendix to his report. That appendix I have not seen. Mr. Stayton having done that, and the Commmittee having considered the matter, my anxiety with regard to it is at an end, and I do not think that I have anything further to say about it.
2659. Of course the increased charge to meet the interest upon the expenditure would be 50 per cent. more than the present estimated charge? Yes, more than the charge based upon the estimate of £833,000. I find also, through the same channel by which I obtained the other information, that Mr. Stayton's estimate for the whole work exceeds mine, that it amounts to over 100 per cent. more than the first estimate.
2660. This is then the original estimate? Yes, without providing for the reticulating mains through the streets. Nearly 300 miles of streets will be embraced within this system, and the cost of the smaller pipes required to drain those streets will be over half as much as the cost of the original works. With regard to another matter, I have something to say however, and that is, that some of the western suburbs drain, or are proposed to drain, into the existing sewer, that is to say, into the large intercepting sewer built by the Roads and Bridges Department.
2661. The main sewerage system to Bondi? The Bondi sewer. There is nothing in the report to show that the residents of the municipalities which drain into that sewer will have anything to pay towards the cost of it, and this, I think, should be added to the charge to be imposed upoon them.
2662. You think an additional charge for the main Bondi sewer would be a fair charge? Yes. I think a quota of the expense of that sewer should be met by the residents of the suburbs which drain into it.
2663. That would add to the amount they would have to pay for the sewerage service? Yes; so that when you finally came to strike a rate for those suburbs the amount would have to be added to the rate of 6d. in the £.
2664. Together with the cost of reticulation? Together with the cost of reticulation.
2665. Then the rate would be 9d. with an additional amount, which would be a proportion of the cost of the Bondi sewer? That is what I wished to convey to the Committee.
2666. You have thought no more of the system of electrolysis, which has been so much spoken of? I have had no further opportunity of inquiring into it.
2667. Have any further developments, so far as you know, taken place in reference to the electric system? No further developments, except those contained in the very excellent paper written by Professor Threlfall. Nothing with regard to the matter has come before me since I read his paper, beyond statements from chemists and others, which show that the same end might be obtained by chemical means.
2668. Some startling evidence has been given by some of the mayors of these suburbs with regard to the dry earth system. The Committee were rather surprised to find that in a great many places no dry earth is used at all? Very little indeed is used, and then only by careful persons, who wish to suppress all nuisance.

2669.

2669. Some of the mayors say the system is impracticable—that the earth cannot be used, and is not used? The practice of using dry earth always falls into disuse in large communities.
2670. And in addition to that, that the decdorant, which is given gratuitously, is not always used? It is not always used.
2671. In view of these circumstances, is it not your opinion that the community runs a great risk of plague or pestilence? There can be no doubt that sickness is greatly brought about by this system.
2672. Is it not an alarming state of things, as far as the health of the community is concerned? I quite think so. I think we are in a very perilous position with regard to this question, and the greatest haste is necessary to provide a cleaner system. I should like to say one thing further. I have found from various sources that there is more to support my views with regard to the separate system than I believed available before. If the Committee approve of the scheme as it is, there is nothing to prevent the Government considering whether the separate system should not be carried out upon the same lines, in order to effect a great saving of expense. I have found various books which support my views, from one of which (one of Colonel Waring's, a great American authority, published this year) I could make very favourable quotations. It quotes the greatest authorities in London and elsewhere upon the subject as being in favour of the system. The book is by an American author, and is the most recent work upon the subject. I never heard of it until the day before yesterday.
2673. *Mr. Garrard.*] You do not know the names of the authorities who support your views—you say that the highest authorities in the world are favourable to the separate system? Yes. The author of the book is a Colonel Waring.
2674. I suppose Sir Robert Rawlinson is an eminent man in his profession? Yes; he is in favour of the separate system, and so is Colonel Jones.
2675. Do you know whether Sir Robert Rawlinson was in favour of the system in the earlier part of his professional experience, or later on in life? He must have taken it into favour later on in life, because I know that at one time he was in favour of the combined system.
2676. Sir Joseph Bazalgelte is also a man standing high in the profession? He stands very high in the profession.
2677. He is not in favour of the separate system? He is not quoted, to my recollection, in the work to which I have referred.
2678. If the separate system were carried out the sewers would of course be smaller, but there would be two sets of them? No; there would not be two sets; that is where the mistake lies. People think that if the separate system were adopted there must be another system, providing for the rainfall; but there need be no such thing. The rain-water will follow the same course as it does now, upon the surface of the ground, where it ought to be, until you take it to the foreshores. The tank stream provides what you may call the foreshore drainage; that is to say, rain water could flow over the street gutters until, as it approaches the outfall, it becomes too bulky from aggregation. At this point an under-ground channel must be prepared for it; but these are usually short, and, moreover, are necessary under the combined system, therefore they add little or nothing to the cost.
2679. Remembering the heavy downfalls which we had during our summer thunderstorms, do you not think that a large volume of water running down the gutters would be a greater danger? It is not so now.
2680. Is it not a fact that in Melbourne, where there is no under-ground drainage, it was found to be so? Yes; but they made what is called a culvert for some distance up Elizabeth-street to carry the water away, similar to the system I now advocate.
2681. In any case, there would have to be a duplicate set of pipes near the outfall? I admit that; but it would be a very small matter, and you would have to do the same with the combined system. You could not think of repeating what has been done in Sydney before, and put the sewage into a stream like the tank stream again. You would have to duplicate that, whether you had a separate or a combined system.
2682. Do you think there is sufficient merit in the separate system to warrant the Committee putting off their decision upon this work for some time, in order to inquire into it, or do you think we have had sufficient evidence upon the subject? I think the Committee would be under no necessity—I am giving this as my own opinion—to do that on determining on the scheme put before them. The proposed scheme with regard to routes and everything like that would answer every purpose of the separate system, but the size of the sewers would be lessened.
2683. Then the whole scheme would have to be recast—in other words, the main sewers, if the separate system were brought into operation, would be too big for the work which they were called upon to do? Yes.
2684. But they are already partly built? Yes.
2685. So that only the continuation of the main sewers would be diminished in size? Yes.
2686. *Mr. Copeland.*] Do you not think it would be an advantage to have the water from the summer storms to cleanse the sewers? So long as the showers came it would be a decided advantage, but you cannot depend upon the rain to cleanse the sewers; you must have an artificial system. If you depended upon the rain, for many months in the year the sewers would not be cleansed at all.
2687. But suppose we combined the two—suppose we had artificial flushing as well as natural flushing—it would in any case be necessary to use conserved water for flushing sewers? Yes.
2688. And we could save a large amount of water whenever a storm occurred by allowing the storm water to run through the sewers? You would get, perhaps, twenty or thirty flushes in the year from the rain, whereas the sewers would require flushing much more frequently than that. An artificial system of flushing would not be a great drain upon the water. At the top of each smaller sewer a chamber could be constructed, which would be filled with water, and that water, when it was discharged, would have sufficient velocity to cleanse the sewer. Then all the small sewers pouring their contents into the larger sewer would cleanse it too.
2689. But would it not be a benefit to have these thirty natural flushes? The benefit is very dearly bought when such a large increase of cost is incurred, and when the flushing can be done artificially at little cost of water.
2690. But considering the rapid increase of population, and the consequent increase in the consumption of water, both for domestic and drainage purposes, would it not be desirable to make use of the summer storm supplies for flushing? They are so precarious that I think we had better not depend upon them, unless we can get them at stated periods, and, for that matter, they could be used under the separate system under restriction.

J. T. Jones, Esq. 8 Aug., 1889.

2691. Of course you cannot order a rain-storm at a stated period; but, supposing you were intending to have a drain flushed out with the conserved water and a storm came on, you could put off the flushing by the conserved water and use the rain water, and you would thereby save a large quantity of water. That seems to me a great object? The water scheme was designed having in view the flushing of the sewers. That was one of the first things thought of when the scheme was projected. The Government has given water free for flushing purposes.

2692. But has not our water consumption increased beyond all expectations? No; it has not come up to my expectations; but it will increase when we get a higher pressure.

2693. You stated the other day that we have not enough water to supply hydraulic apparatus? We have plenty to do so now; it is the pipe system that is too small, but I am nipping the matter in the bud, as it were, to prevent the use of water for lifts, &c., becoming general.

2694. But if hydraulic lifts are a convenience to the community, instead of nipping the matter in the bud would it not be better to allow their use to extend? If we could supply the water. I am informed that another scheme is on foot in order to supply water for this purpose, and it will perhaps be cheaper for the people to get water from a hydraulic power company than to get it from us. There would be a great increase in the number of these lifts in the future if water were allowed for the purpose, and the same thing would happen here as has happened in Melbourne—the water being largely used in the middle of the day for lifts, the top floors of private houses would be deprived of it for domestic purposes; and I think the scheme was principally designed to supply water for domestic purposes. Very tall houses are being built now, and it is my belief that it will become very popular to place the kitchens and other offices upon the top floors, so as to get rid of the smells.

2695. All this goes to show that our water supply, instead of being over-abundant, is, if anything, not too abundant? Far from that. I only say that the pipes have been laid to supply water for domestic purposes, and that the supply of water for lifts is foreign to the first design. I tried very hard at one time to get a higher head of water in order that it might be used for these purposes; but I failed to get it. I represented it to Mr. Moriarty, who was then Engineer-in-Chief, that it would be desirable to have water at a higher head for lifts and other things; but he said it would be useless to bring water at such a head for these purposes, seeing that 700 lb. would be required per square inch. You can see that the designer of the scheme had it in his mind to refuse to supply water for lifts, knowing that a very large quantity is consumed that way, and at a time of the day when it is most required for domestic purposes. It takes 100 gallons of water to lift a ton to an altitude of 40 feet. That water is drawn in a few seconds, and when there were three or four places working their lifts at the same time one would interfere with another, as in Melbourne. There they are replacing the hydraulic lifts with steam and gas-engine lifts.

2696. Still, if your water supply were unlimited, do you not think that it would be a desirable thing to encourage the use of hydraulic lifts? I do; but in that case you would have to lay a second set of mains for them. At present we could supply a large number of lifts.

2697. Is it not advisable to make our water supply go as far as it can for that purpose? It would be if we could stop it at a convenient time hereafter; but when once these lifts began to be used it would be very difficult to stop them.

2698. Passing away from that aspect of the question. You referred to the people who are now draining into the Bondi sewer, and you said that you thought a rate ought to be levied upon them to defray the cost of that work. By doing that you would reduce the general rate to cover the sewerage system? I take it that the people who will drain into the Bondi sewer will be assessed for that work. According to Mr. Stayton's scheme, Balmain, Camperdown, part of Newtown, Darlington, and other suburbs will drain into that sewer, and it seems to me that when they come to use it, it would be fair to make them pay a portion of the cost. The point I wish to bring before you is that the rate will have to be increased to meet that, and instead of it being 6d. in the £, which I conceive is the amount put before the Committee, it will have to be 9d. or more than that. According to Mr. Stayton's last estimate, it will be over 9d., and in addition to that there will be the cost of the Bondi sewer.

2699. Mr. Stayton's estimate for a rate of 6d. was based upon a period of repayment of twenty-eight years? Yes.

2700. If that time were extended to fifty or sixty years the rate would be reduced? Yes.

2701. *Mr. Humphery.*] To 6½d.? It would be less than that with a longer period—5·22d. I think.

2702. *Mr. O'Sullivan.*] Have you had any experience of this separate system? No; and that is why I did not urge it upon the Committee before, because I was not backed up by the authority of people who have tried it, although I felt certain that the theory was a good one. Without authorities I felt that I should only be drawing a red herring across the trail, as it were, in urging the matter upon the consideration of the Committee and thereby delaying the present proposals, which, though in my opinion not quite equal to the separate system, are still excellent and much required. Some years ago I was called upon to advise Newcastle as to their sewerage system, and I placed before them the advantages of the separate system. I think that was in 1884 or 1885. I advised them then to adopt the separate system altogether, shutting out every drop of rain water, and I gave them what I considered to be a proof that it was the best. The aldermen, however, kept saying, "You will have to duplicate the pipes." I said, "The city is very hilly, and the water will follow its natural channels to the foreshores. Near the foreshores you can put drains to prevent it passing over the streets and carry it out into the river." Notwithstanding that, I did not convince them. Since then I have had several occasions to speak in favour of the system, but I was all the time speaking theoretically, my arguments not being strengthened by the experience of other people. A city like Newcastle would be an excellent place in which to try the experiment.

2703. Do you know of any places where the separate system has been a success in this part of the world? No. It has not been tried in this part of the world.

2704. Do you think it would be advisable for us to alter the proposed scheme so as to fit it in with the separate system? I am positive it would, and I can produce arguments to back up my opinion.

2705. I suppose you have read Mr. Stayton's reply to Mr. Henson's paper? Yes.

2706. I see that he quotes Sir Robert Rawlinson as an authority against the system, and also Mr. James Lemon, who, he says, stated, "that the opinion of Sir Joseph Bazelgelte, coming from so eminent an authority, was a heavy blow to the separate system"? Sir Joseph Bazelgelte is against the system, but I do not know that he struck a heavy blow at it.

2707. Do you take Mr. Stayton's reply as conclusive? Not with regard to this part of the system.

2708. *Dr. Garran.*] Your first impression was that Mr. Stayton had only charged upon the original estimate of £800,000 odd? Yes.
2709. You now see that he has based his rate upon an estimate of £1,817,896? Yes, I have found that out since.
2710. Then you withdraw the statement you made in your letter to the secretary, saying that the 6d. rate would have to be increased 50 per cent. to include the cost of reticulation? No, I do not. I see that Mr. Stayton has proved my statement to be correct in a report not yet available to me.
2711. Mr. Stayton's rate of 6½d. in the £, extending over a period of sixty years, is based upon the total outlay of £1,817,896? That is only another way of looking at it; that would come to the same thing as my increase of 50 per cent. upon the smaller sum.
2712. You led us to believe by your letter that you thought that 50 per cent. would have to be added to the rate—do you still hold to that opinion? I had not anything before me then to show me what the amount of the rates were; but supposing an expenditure of £833,000 had to be paid off, and that that amount would be met by charging a certain community a rate of 6½d. in the £, that community would have to pay a rate of 9d. in the £ if the expenditure were increased by 50 per cent.
2713. *Vice-Chairman.*] That is extending the period? No. Mr. Stayton has now included the cost of reticulation, and he now says that a rate of 6d. in the £ will pay for it. That I cannot gainsay, because the community may be large enough at the time he estimates to make a rate of 6d. in the pound pay for the work.
2714. *Dr. Garran.*] You see, as an engineer, that it is important that we should have extremely clear opinions upon the point? That is my idea.
2715. Mr. Stayton in the appendix to his report, pages 24 and 25, after stating that the main sewers and other works would come to £830,304, goes on to say that 300 miles of subsidiary sewers will be required, and 100 miles of subsequent subsidiary sewers, showing clearly that the reticulation is included in the additional sum? Yes; but it was not included in the report supplied to me.
2716. There could not be 400 miles of sewers unless the reticulation were included in the scheme? I said 300 miles.
2717. He allows for 400 miles? I had not the same means of measuring.
2718. This information is contained in the appendix to Mr. Stayton's report? I have not been furnished with the Appendix—it was not attached to the copy of the report which I had.
2719. In the appendix he has added to the £830,000 other expenses, bringing the cost of the work up to £1,817,896—that is the total cost which we have been considering? I am quite satisfied now that you have got the correct information.
2720. You see that in section C of the Appendix that the comparative annual rates for the western suburbs sewerage are calculated under the existing Act, with interest at 4 per cent., and repayment in twenty-eight years; under the proposed amended Act, with interest at 4 per cent., and repayment in sixty years; and under a further amended Act, as to reduced interest, with interest at 3½ per cent., and repayment in sixty years? I believe so.
2721. You see that during the last fifteen years Mr. Stayton brings the rate down to 6½d.? I believe so.
2722. Which will pay the interest upon the full amount of £1,817,896? Yes, I can clearly see that from the information now given; but I had not the information before me when I wrote my letter. Perhaps you will allow me to withdraw it.
2723. You will easily understand that your letter was rather alarming to the Committee? I only alarmed them in the same proportion as I was alarmed myself.
2724. You see now that Mr. Stayton estimated the rate upon the larger amount? Yes. I desire to insist on the fact that I was correct so far as I went; further reports have put a new complexion on the matter.
2725. And you wish to withdraw your former opinion? Entirely.
2726. Looking at the map, and speaking of the system, as, I suppose we should, from an engineering point of view, as separate in respect to their outfalls, the scheme provides for three systems—one opening into the sea at Bondi, one into the eastern side of Webb's Grant, and one into the western side of Webb's Grant? Yes; I look upon the last two as one.
2727. The Glebe, Balmain, and part of Camperdown are to be drained into the Bondi sewer? Yes.
2728. Is the Bondi outlet at work? Yes.
2729. The sewerage is running down it now? Yes.
2730. Then we may speak of it as the Bondi system? Yes.
2731. When the Glebe, Balmain, and Camperdown are drained into that sewer, will it be the view of the Water and Sewerage Board that the whole should be treated, financially, as one work, and that a common rate should be charged upon all who use the sewer, irrespective of the local expenditure? I think so.
2732. You would not say that because Balmain was more expensive to drain than the other municipalities, the residents of that municipality should pay a higher rate? That is my view, and I think it is the view which the members of the Board will take.
2733. What rate are you now charging the citizens? The Board is not yet in possession of the rates. A rate of 6d. in the £ is charged by the City Council.
2734. Is that adequate for the outlay at present? Yes; but then the Government reduced the debt very largely, and they have some debentures which they are not paying off yet, so they are making what may be called a profit.
2735. Then financially you are not in possession of the Bondi sewer at present? No.
2736. Perhaps that explains what was told to the Committee yesterday, that the residents of Redfern are using both the Bondi and the Shea's Creek sewer, without paying anything? Yes.
2737. They are specially favoured at the present time? They are specially favoured at the present time, because we cannot make any arrangements. I have tried for years to make arrangements with the City Council, but there has always been a difficulty.
2738. As soon as the whole thing gets into your hands that will be remedied? Yes.
2739. And every district, however remote, that makes use of the main trunk sewer will have to pay its quota towards the cost of the work? Yes.
2740. Has the matter been considered by the Board, whether you are going to keep separate accounts for each of the three separate outfall systems or put them altogether, and treat the metropolitan system financially

J. T. Jones, Esq.
8 Aug., 1889.

financially as one work. Are you going to ask whether the Bondi or the Webb's Grant system is going to cost most, or will you treat them both as one? That is a very large question, and will have to be considered by the Board, but I am inclined to think that they will make two systems.
2741. Treating the two outfall sewers to Webb's Grant as one system? Yes.
2742. And the Bondi as another? Yes.
2743. Making the people who use them pay their own rates? Yes.
2744. Yo do not do that with regard to your water-rates? No.
2745. You do not charge the locality 4 miles out more than another which is nearer? No; but with regard to very distant places we do make a difference. Liverpool and Camden will not be assessed upon the city rate, unless it is found possible to do so without injustice.
2746. Simply because they should not be charged for the long length of pipes which they do not require for their own particular supply? No; but because it would make a heavy charge to so small a population.
2747. They are not on the main line? No.
2748. Will the Balmain work increase the rate, or keep it as it is? It will tend to lower it.
2749. You think by extending your business you can do more work for a smaller relative rate and expenditure? Yes.
2750. And that the extension of the scheme to the Glebe and Balmain will lighten the expense? Yes.
2751. You think that the inclusion of the Glebe and Balmain within the system will not increase the rate beyond 6d? 6d. will do. If the money can be had at 3½ per cent., and if 6d. will pay the interest upon that, the addition of those suburbs to the scheme will lighten the burden.
2752. The addition of those suburbs will be no grievance to the citizens, but rather a help? I think they will be rather a help. The cost of the sewers necessary for these boroughs bears no comparison to the cost of the large outfall sewers, and therefore the amount received will be increased by the larger number of houses, while the cost of making the sewers will be less.
2753. At the time the Bondi sewer was designed, it was not intended to include the Glebe and Balmain in the system? I think the Glebe was. I do not think that they intended to go beyond the Glebe, but I am not quite sure. Plans were very scarce until quite recently.
2754. So far as you know the Bondi sewer is quite capable of taking all that? Yes, more especially with the separate system.
2755. If we do not have the separate system, do you think they would still be large enough? For this sewage certainly, and it is proposed to include a portion of the rainfall, and to make overflows for the rest, so that they will be competent to carry it.
2756. With the partial system, in a storm the sewers will be quite full? I quite expect to see them full, although I have been informed that they never have been full.
2757. You think there is no fear of there being a bursting force? There will be safety-valves to prevent that.
2758. If we do not have the united system we shall have to get rid of the back-yard washings, and washings from the streets, by some other process? No; everything but rain water, and a proportion of that, would go into the sewers.
2759. Would you allow the drain waters from the back yards to go into them? Not necessarily. I should exclude a great deal of it unless where it flowed under the houses. That occurred at Surry Hills recently, but wherever the water could drain into the street it was made to do so.
2760. But looking at the bad way in which part of the suburbs are laid out, it is simply impossible to find an exit for water from the back yards? That may be so in some cases. There were cases in Surry Hills where the yards drained towards the houses, and then in some instances where it was quite easy, I made a drain under the house, and laid a new system to carry the sewage so as to exclude as much rain-water as possible, because the sewers there are rather small.
2761. There is another point about the separate system;—if all the surplus water is carried into the harbour, as you propose, will not an enormous quantity of clay and *debris* be washed into the harbour? That is the case now.
2762. But if the water went out to Bondi this sediment would be carried into the sea? The surface-gutters will not be done away with. When the sewage is carried out to Bondi the surface drains will not be done away with. The Bondi sewers certainly will carry away some of the surface mud, but a great part of the mud and dirt which now goes into the harbour will always do so.
2763. As long as the storm water goes into the harbour, that mud will do so, too? Yes. None of the systems will prevent the surface drainage from going into the harbour in heavy rains.
2764. So you think there is nothing to be gained by the partial system in that respect? I do not think there is.
2765. With regard to the western suburbs, and the area included, we have been told that, in order to take in that area, we must submit to large sewers and small inclinations, and that that increases the cost. Do you think anything would be gained by taking a smaller area and having a greater fall? That would be restricting the scheme.
2766. Multiplying the number of schemes, but making each one cheaper? Would that contemplate pumping from one to another?
2767. You might have to do that? It is within the bounds of possibility. I went into it once partly, with regard to Burwood, and I found that it was quite competent to have a series of small schemes, which afterwards could be combined into one large scheme.
2768. I mean that supposing we had the scheme marked out by red lines on the map, but extending over a smaller area, with a number of outfall sewers to the Parramatta River, and pumping arrangements, we should then have a steeper inclination to Webb's Grant? Yes.
2769. That would be cheaper? I am inclined to think it would. That is to say, you would have the steepest fall you could get without going very deeply underground, and you could give it a greater fall by raising its inland terminus. The sewage of the valleys you could pump up, and the sewer would then take a better grade. The subsidiary sewers would in that way be lessened, and they would carry less sediment.
2770. Then you think there is room for calculation for a scheme having small tributaries and a steeper fall? Without having made any calculations, I think it could be done.
2771. But you do not think there would be any gain which would justify the Committee in pausing in its recommendation? Unless the Committee is going to recommend that the work be carried out at once, I am inclined to think that there will be reason for pausing before recommending the construction of the large sewers.

2772. These detached pumping schemes would require large reservoirs at the head of each bay? Yes; they would require chambers.
2773. Would any nuisance arise from that? I do not think so. They would be all closed.
2774. Do you think such a scheme would be as effective as the one before us? More effective I fancy. It might turn out on calculation to be more expensive—that I will not answer for; but I think it will not.
2775. You know the configuration of the country near the Parramatta River? Fairly well.
2776. You see that there are a number of peninsulas there, many of which are not properly treated by this system? Yes.
2777. Then it becomes probable that we shall have to drain these peninsulars to some low flat, and there deal with the sewage either by electrolysis, or by pumping it up into the large sewers? Those are the two alternatives, one of which must inevitably be adopted.
2778. We call this the Western Suburbs scheme, but it really does not deal with the whole of the suburbs as far as it goes. How are we to deal with the peninsulas? In either of the two ways which you have suggested, either by pumping the sewage into the larger sewers, or by treating it by some process, and then allowing the clean water to pass into the bay.
2779. Both the Glebe and Balmain peninsulas are able to drain by gravitation into the Bondi sewer? A portion of them.
2780. As we go west the peninsulas cannot do that? No; the fall will not be enough.
2781. We cannot avail ourselves of gravitation and drain the peninsulas into the Western Suburbs sewerage scheme? No.
2782. In dealing with such places as Five Dock and Concord, we must either treat the sewage and then allow the water to go into the Parramatta River, or pump it up into the main sewers and allow it to flow to Webb's Grant? Precisely.
2783. Looking at that contingent, and the fact of the Webb's Grant sewers having to carry more sewage than is provided for, it would be a great mistake to make them smaller than they are designed? They would be ample to carry the sewage, because the quantity of sewage without the rainwater is very small.
2784. You think they are three times as large as is necessary to carry the sewage alone? Yes.
2785. And it is only because they have to carry rainwater as well that they need be so large? Yes. I should make them carry less water.
2786. Taking them at the size they are now, and looking to any contingency in the future, they are amply sufficient to take any quantity of sewage if we keep out storm waters? Yes.
2787. And has not Mr. Stayton a good reason for making them as large as he proposes, in view of the probabilities of the sewage from the lower levels being pumped up into them? They could be greatly reduced, because the sewage without the storm water is very much less.
2788. If we make the pipes unnecessarily large we shall have to use an unnecessarily large quantity of water for flushing purposes? Yes.
2789. How often in the interests of the public health should a sewer be flushed? That depends upon a great many circumstances. If the sewer is very steep, once a week will do very well. I should mention in connection with the flushing of sewers, that Sydney is a very good place to enable it to be done, because in the hot weather the people are great bathers, and if the bath water is caught near the top of the sewer, and is allowed to fill the sewer for a certain distance before being released, it provides a very effectual flushing without any additional water being taken from the water supply pipes.
2790. The mere trickling of bath water through the sewers if not collected would be of no value for flushing? No. It would have to be conserved by a valve in the main which would fill a certain part of the sewer, or it could be caught in a special chamber, and then used for flushing.
2791. Is not bath water more or less dirty? It does splendidly for flushing the sewers. In London they use very filthy water for flushing—they do not use clean water for it.
2792. Is it not undesirable to store this water? They do not store it for more than an hour.
2793. Do not the foul matters in the sewer begin to ferment and give off gases within twenty-four hours? If they are very foul; but with bath water added they would not begin to ferment in that time. If the bath water were stored for twenty-four hours it would not do much harm, because it is very nearly pure water. Of course other things would be mixed with it which would help to make it a nuisance; but I do not contemplate keeping the water for twenty-four hours.
2794. After a good storm the sewers are pretty sweet, and the foul air is all washed out? Yes.
2795. Have you had any opportunity of noticing how soon after that again the sewers begin to give off bad gases? In warm weather the next day.
2796. Then the offensiveness of the sewers depends upon the weather, to some extent? Yes.
2797. Does not that show that we must have more frequent flushings? The flushing will not carry away the sewer gas.
2798. Then we want a more thorough system of ventilation? Very badly.
2799. You look to that more than to the flushings to get rid of the bad smells? Yes.
2800. What is the flushing wanted for? To wash the sides. The sides of the sewers begin to get clogged, and the sewers give out more gas as they become more foul.
2801. Does not a good flushing wash away the greasy matter? It washes away that which is most soluble.
2802. And it is the greasy matter principally that sticks to the bricks? Yes.
2803. *Mr. Humphery.*] Do you know any part of England, or any place upon the Continent, where the separate system has been tried? I have been trying to think of the name of a place, but I cannot do so. My memory for names is very bad. The separate system has been tried in America, but I forget the name of the town. Mr. Henson will probably supply you with the names.
2804. I see a place called Abingdon mentioned in the report—are you aware what system is adopted there? I have not had the books necessary to make myself acquainted with it.
2805. You have no personal experience with regard to the matter? No.
2806. Neither in this Colony nor in Victoria? Not in any of the colonies. There has been no experience to be had upon the question. I do not profess to have had any experience with regard to the separate system.
2807. Or of any sewerage works? I have had charge of the Sydney Sewerage Works for ten years.
2808. With the exception of Sydney? No.

J. T. Jones, Esq. 8 Aug., 1889.

2809. Your experience, with regard to sewerage works, has been wholly gained from you connection with the Sydney Sewerage Works? Yes, and from what I have read with regard to other sewerage systems, though I was an hydraulic engineer before.
2810. In the event of the separate system being adopted, would there have to be separate drains in the backyards of the various dwellings. Would there be a separate drain for the house-slops? No, they would go into the sewer.
2811. Into the main sewer? Yes.
2812. What would become of the ordinary kitchen-slops? Everything would go into the sewer;—every nuisance would go into the sewer.
2813. How would you dispose of the rainwater in the yards? Very easily. It is already disposed of in Surry Hills. In some places the fall of the land takes it towards the houses, while in other places it is drained into the street or lanes.
2814. By a separate drain? Yes.
2815. Have you two drains, one for the sewage, and another for the surface-water? In such cases we have two drains.
2816. How can you be sure that the slops from the houses are not cast into the surface water drains? The construction of the drains will make it inconvenient.
2817. It is simply a matter of inconvenience then? Yes, and people are very soon caught at that work. If there is a drain to carry the rainwater into the street gutter, the gutter is always dry when there is no rain. In dry weather, if there is any wet in the gutter, the inspector soon sees it, and, if it creates a nuisance, he proceeds against the parties for allowing their sewage to flow into the gutter. In wet weather, of course, the sewage is sufficiently diluted to make it clean enough for the street.
2818. Is there not much less danger of the surface drains becoming foul, with the combined system proposed by Mr. Stayton, than there is with the system you suggest? I do not see any danger of their becoming foul—they would have a better fall, owing to the sewers being smaller.
2819. There will be a great deal of surface drainage with the system which you recommend? There will be no surface drainage whatever. The flushing will be entirely artificial.
2820. If there is no separate system will it not be necessary to have a separate set of pipes? What for?
2821. If you have only one set of pipes for sewers, and you propose to get rid of the rainfall? Not underground.
2822. Then that would be a surface drainage? Yes, there would be no objection to it, because it would clean the streets.
2823. Does it not also carry away the filth from the yards? There is no filth in the yards unless the place is very badly managed. Horse dung, etc, is washed off the surface of the streets and carried into the harbour; but that would be the same under Mr. Stayton's system. The street filth will always go into the harbour, or wherever it goes now. Mr. Stayton does not propose to get rid of the street surface water.
2824. He does of a portion of it? Only a small portion of it.
2825. Have you been to Adelaide? Yes, but soon after I got there a telegram was sent to me asking me to come back as quickly as possible.
2826. You have not investigated the sewerage system there? Not thoroughly. I have seen their sewage farm.
2827. Have you made any estimate of the cost of the separate system which you suggest should be carried out? No.
2828. You have not gone into figures? No, but I conceive it would be cheaper because of the smallness of the sewers required.
2829. *Mr. Tonkin.*] What are the advantages of the separate system which you advocate over the combined system? In the first place the economy is first cost, and in the second place, as Dr. Garran remarked, the small quantity of water necessary to flush the sewage. It might be said that the rain water would fill any sewer and flush it, but I say that the rainfall in Sydney is so precarious that the flushing by that means would be very ineffectual, because of the dryness of our climate, we must flush sewers artificially, either by collecting a quantity of water by valves, or by using the water from the water supply pipes.
2830. What do you estimate would be the difference in size between the main sewers and the separate system, and those under the combined system? I have not made any estimate, and I do not care to mention any figures, because my estimate might not turn out to my own satisfaction afterwards.
2831. You said that one of the principal advantages of the system is the decrease in the first cost of construction? Yes.
2832. How do you know that there would be a decrease, if you have not made a calculation? There would be less excavation with the separate system, because you would not have to go to such a depth with the sewers as with the combined system. The brickwork would be less, and everything else would be less, so that the total cost of the works would be decreased.
2833. But have you no idea what the difference would be. What would be the difference in cost between a sewer 4 feet in diameter and one 5 or 6 feet in diameter? I have not estimated what amount would be saved, and I do not care, as an engineer, to give an estimate which I have not made a calculation for.
2834. You have not made any calculation? No.
2835. It is only a surmise of yours that the cost would be less? It is not a surmise; I am certain that there would be a saving, but I will not give an estimate of what it would amount to.
2836. I understand you to say that it would not be advisable to flush these sewers, or even the large sewers with the storm water? You might let the storm water run into the larger sewers at the outfall, but I am speaking now of what are called the sub-mains.
2837. But do you not think it would be advantageous now and then to have the sewers completely filled with water, gorged with water as it were, so long as they were not bursted? With the larger sewers you could do that.
2838. But you would never be able to do that with the whole system; you could not waste sufficient water to gorge all the sewers? I could give sufficient water to cleanse all the sewers that would come under the name of subsidiary sewers.
2839. I am speaking now of the large sewers? You might admit the rain into those so far as they would bear it.

2840. That would be the same as the combined system? Yes; but the combined system would carry these large sewers far a-field, where I should replace them with smaller sewers which could be artificially flushed.
2841. But I understood from your answers to Dr. Garran that you considered it a disadvantage to have the rain water going into the sewers? No. It is no disadvantage. What I meant to say was that I should not build the sewers so large as to carry the rain water.
2842. *Mr. Dowel.*] Is it not a fact that the surface water, the storm water, carries a large proportion of silt with it, and that if it went into the sewers it would be a means of filling them up to a large extent? They are generally designed so as to carry it away. It is calculated that the velocity of the water will carry it away.
2843. Is your system of water works designed to cover the highest point of the sewerage system now before the Committee? Not without pumping.
2844. Can you say what is the highest point in this scheme? There are two places with an altitude of 360 feet;—Waverley and part of Ashfield.
2845. What is the elevation of the Waverley reservoir? 360 feet.
2846. Paddington? 210 feet; 214 feet we sometimes call it, but 210 feet is the top of the water.
2847. Crown-street? 141 feet, and Woollahra 280 feet.
2848. The main portion of the scheme would be supplied by water by gravitation. The only two points you state which will not be served will be Ashfield and Waverley? We have to pump to everything above 141 feet.
2849. At the present time? At the present time.
2850. Yet you say that the elevation of the Waverley reservoir is 360 feet? Yes, by pumping.
2851. How is the pressure in London obtained? By pumping.
2852. And by water towers? And by water towers.
2853. I think I understood you to tell Mr. Copeland a short time back that although you had this large water supply you could not supply a few hydraulic lifts? I did not say a few; I said a great many.
2854. Is it not a fact that very high buildings are being erected in the City of Sydney? It is.
2855. And is it not absolutely necessary to provide a pressure which will convey the water to the top stories of those houses? We are doing the best we can for that, and when we get the new pipes laid we shall be able to supply the water freely to the tops of the highest houses.
2856. I understood you to say that you declined to grant the request of the proprietors of large hotels, and of other people who own high buildings for water for hydraulic lifts? Yes, and I think the two things are quite consistent. If I allowed the water for lifts it would not rise to the tops of houses where it would be required for domestic purposes.
2857. Is it not a fact that in London the water for hydraulics lifts for a large number of years was supplied by the ordinary system of pumping and water-towers? So far as they had hydraulic lifts; but I do not think they had a large number of them. They certainly allowed them water. I am among the first to oppose the application for water. Mr. Mestayer, who is now living in Sydney, told me that when he was in Adelaide, and the people applied for water for lifts, he said to them, "Well, you can have the water, but at your own risk. In summer time there will not be sufficient to supply the lifts, so I ask you whether it is worth while to use a power which you cannot depend upon." In Melbourne they constantly find themselves without water, and a lift at times cannot work for half a day at a time. There they have had to use gas-engine lifts, or supplement the hydraulic power in some way.
2858. Is it not a fact that they use more water for flushing the sewers in Melbourne than would supply all the water lifts likely to be established in the colonies? The water comes partly from the hydraulic lifts, but on the other hand the water supply scheme was designed to allow it. It is partly a domestic purpose. What I want is not to acknowledge that our water supply scheme has been designed to supply hydraulic lifts, because otherwise there might be a run upon it which would limit the supply for domestic purposes.
2859. Melbourne, I believe, depends upon one reservoir? Yes; but it is double the height of ours. It is 300 feet high, instead of 140 feet.
2860. Do you think our supply is equal to the Melbourne supply, although we have several reservoirs? I think it may be said to be superior for that reason, though it is a little costly, because every zone of levels is able to get a proper supply of water, and the supply is more constant.
2861. The Botany supply is held in reserve at the present time? Wholly in reserve.
2862. You are aware that the Borough of Darlington is at the present time connected with the main sewer? Yes.
2863 Have you given any attention to the matter, to ascertain whether or not the sewerage system is working well there? I have not had the means of ascertaining. They were out of the City, and I had not the right to interfere. I pointed out to the City Council that they were getting the benefit of the sewers which had been constructed at the public cost for nothing, and that some representation should be made to the Government in order to have a revenue collected from Darlington for the use of the main sewers, but that is the furthest I ever went. All these works were done under another department, and I had no means of investigating the matter, or finding out anything about it.
2864. You are still of opinion that although you cannot supply water for the hydraulic machinery in the City, you have an ample supply for all the requirements of the sewerage scheme for the next twenty years? I think so. The scheme was designed for the purpose. It was one of the recognized conditions that we should have to supply water for the scouring of the sewers.
2865. *Mr. Humphery.*] When you get the pipes duplicated? There is plenty of water, but the pipes would not carry it freely enough if there were a large number of lifts.
2866. *Vice-Chairman.*] You said something about an hydraulic-power company—is there such a company? Yes.
2867. Is there such a company in course of formation, or in existence? A Bill for the establishment of such a company was brought before Parliament, but what became of it, or why the matter has not been pushed on, I cannot understand. I wish it was in existence, to supply water for the lifts.
2868. From what source do the company expect to get their water? They propose to get it from Botany, I believe.
2869. Do you think that supply would meet the requirements? Yes. I have a scheme in preparation for the purpose, and for supplying other industries which do not require the most perfect water.

J. T. Jones, Esq. 8 Aug., 1889.

2870. Is it the case that the demand for water for lifts has exceeded the anticipations of those who designed the present waterworks. Did they contemplate, when the present waterworks were being designed, that the demand for water for hydraulic lifts would be as great as it is? I am sure I don't know what Mr. Moriarty, in designing the scheme, had in view. He has laughed at and publicly ridiculed my proposal to supply hydraulic lifts with water from the pipes. He was certain then that hydraulic-power should be obtained at 700 lbs. to the square inch, and that there were no other means practical of providing for lifts. That was one of my arguments in trying to urge on a high-level scheme; but Mr. Moriarty objected to it, and gave me to understand that he did not intend to supply water for hydraulic-lifts, as it was such a low pressure.
2871. What is the high level—Kenny Hill? Yes.
2872. Of course you are aware that there were difficulties by reason of the uncertainty of that supply? I do not mean to say that Kenny Hill was a perfect scheme. What I advocated was a careful inquiry, to see whether it would not answer the purpose. It was only a branch of the Prospect scheme.
2873. Was not the scheme to convey the water to Sydney by pipes, which would have had to cross an occasionally flooded river? Yes.
2874. And there was a risk of the pipes being washed away? It was stated so, though there would have been no risk. What I wanted was a close investigation of the whole scheme.

J. B. Henson, Esq., Assistant Engineer, Water and Sewerage Board, sworn, and examined :—

J. B. Henson, Esq. 8 Aug., 1889.

2875. *Vice-Chairman.*] You are Assistant Engineer of the Water and Sewerage Board? I am.
2876. How long have you been engaged in that capacity? Since the formation of the Board.
2877. How long ago is that? May, last year—fourteen months ago.
2878. Have you had considerable experience in your profession as an engineer? I was engaged in the City Engineers' Department, under the City Council, for a period of about thirteen years, from 1874, until I was transferred to the Water and Sewerage Board.
2879. You have given some attention to the drainage of the western suburbs? I have.
2880. I think you have written to the public press in reference to it, on several occasions? I think only to the Engineering Association.
2881. You understand the whole scope of the project before the Committee? I believe I do, so far as Mr. Stayton's published report goes. I know practically nothing about his supplementary report. It never came into my hands. I tried to get it, but failed to do so; so I cannot say anything about it.
2882. I suppose you know the localities which will be drained by the proposed scheme? I may say that I have a thorough knowledge of the whole of them.
2883. You know where it is proposed to empty the sewage? Yes.
2884. You are aware that some of it will be conveyed to the sea by the Bondi sewer? Yes.
2885. It is being done now to a certain extent, is it not? Yes. The main intercepting sewer to Bondi is already discharging the sewage emptied into it from some of the existing sewers of the city system.
2886. And by any of the suburban sewers? Yes; I think Darlington is at present draining into it.
2887. Any other? Redfern goes to Shea's Creek, I think? I think it does.
2888. And half of it into the Bondi sewer. Are you aware of the configuration of the country proposed to be drained by this new system? Yes.
2889. Have you given any attention to the pumping that it is said will be necessary? In a general sense I have.
2890. As far as you have investigated that portion of the project, do you think that it is likely to be a successful one? I think the proposal to deliver the sewage on to the sewage farm at Shea's Creek is practicable from the elevation proposed; but there is an area along the frontage to the Parramatta River, and to Cook's River, including Marrickville Valley, from which the sewerage will have to be raised by pumping. It is quite practicable to raise the sewage by pumping.
2891. Have you given any attention to the system of using sewage upon a farm, and making it reproductive? I have not given very much attention to it; but I am quite satisfied that it is a practicable and very desirable application of the sewage, and can be carried out effectively. I have not the slightest doubt about it.
2892. Have you given any attention to the cost of the drainage works generally; some correspondence has taken place in reference to it? In regard to Mr. Stayton's report, estimating the cost of the western suburbs sewerage scheme at £833,000, I saw at once, when the publication came into my hands, that the estimate was misleading, that it only referred to the main intercepting sewers, and took no notice whatever of the subsidiary sewers. My experience in the construction of these minor sewers led me to see at once that that part of the work would be very costly, and I thought that the statement that the scheme would only cost a rate of 6·68d. in the pound, or 5·12d. in the pound, if the period of repayment were extended to sixty years, was not putting the matter fairly before the ratepayers. The complete cost of the whole works should have been shown from beginning to end. I thought it was misleading to the residents of the western suburbs to give only the cost of the main sewers, and not to say anything about the subsidiary sewers. Then there is another thing. It is proposed by the scheme to drain Balmain, part of Leichhardt, I believe, the Glebe, and part of Newtown, into the main Bondi sewer. Mr. Clarke, in his report, recommended that provision should be made in the Bondi sewer for the accommodation of an additional area to that which it was first proposed to drain, at the Parramatta-street end. I believe that that provision has been made. In fact, I conclude that it has, seeing that it is proposed to drain these areas into it. As the Bondi sewer has cost an immense sum of money, it does not seem to me to be fair to saddle the citizens and the residents of the eastern suburbs with the total cost of the work, seeing that it will also be utilised by the residents of Balmain and the Glebe, &c.
2893. They should contribute their share? They should contribute their share, not of the total cost, but only of the cost of the main trunk sewer by which they are served.
2894. That would apply to any other sewers made use of? Yes; and the proportionate expense of that work added to Mr. Stayton's estimate, together with the cost of the subsidiary sewers, and the accumulated interest,—I believe no rates are being paid now—would amount to a large sum. I estimate roughly that it would double the amount of the rate for the areas referred to that Mr. Stayton gives in his report.
2895. That is extending the term of payment from thirty to sixty years? Whatever the term is it would apply equally.

2896.

J. B. Henson, Esq. 8 Aug., 1889.

2896. Would it not be so much less for a longer term? If he said it would be 5·12d. for the sixty year period, and he did not take into consideration the Bondi sewer, and the subsidiary sewers, the amount would be doubled; and the same thing would be the case if he said 6·68d. for the twenty-eight year period.
2897. In the original estimate it was known that Mr. Stayton did not provide for the reticulation pipes? Yes; but Mr. Stayton has, in his report, put forth to the residents that the cost would be so much per head.
2898. Have you any means of knowing the wishes of the residents of the different suburbs—as to whether they are willing to incur the obligations which they will have to incur when their properties are drained into this system? I am afraid that they take little trouble about the matter.
2899. Some of these suburbs are thickly populated now, are they not? Yes, towards the city.
2900. How do they get rid of their night-soil fœcal matter? I am not intimately acquainted with the various methods. Some adopt the dry-earth system, and some still use the pit closets; but I believe the dry-earth or pan system is coming more and more into use.
2901. Have you had any personal experience of that system? Yes. I lived at Burwood for some time. There they had the dry-earth system.
2902. The night-soil is covered with dry earth? It is supposed to be so, but that is never done. It is really only a pan system.
2903. Do you not think it is an alarming state of things to exist among a thick population? It is to a certain degree unhealthy, but it is a long way in advance of the pit closet system.
2904. How often is the nightsoil removed? Once a week.
2905. Then the fœcal matter is allowed to accumulate for a week before it is removed? It is.
2906. Are people supposed to use any disinfectant or deodorant in the form of a liquid or powder? I am not quite certain; I believe that in some of the municipalities there are regulations in force respecting the management of the pans, but I am not aware what they are.
2907. Do the people complain of the inconvenience and the nuisance of having this matter removed from one place to another;—do you know whether it is taken out to sea or dug into the earth? Some of the municipalities dig it into the earth; I believe they do so at Burwood.
2908. From some places it is taken to sea, is it not? I believe it is taken from Balmain to sea.
2909. In punts? I believe so.
2910. *Mr. Trickett.*] You are an advocate of what is called the separate system? I am; I believe in that system—the absolutely separate system.
2911. Have you estimated the probable cost of the separate system for supplying these suburbs? It would certainly be an intricate matter to go into, and I have not had the time at my disposal to do it. Moreover, I have not had the information upon which I could base an estimate. Before the cost of any system can be estimated, the ground requires to be very carefullly surveyed, but I am not aware that a sufficiently accurate survey of the western suburbs has been made, for the purpose.
2912. Then you cannot give the Committee any idea of what the cost of the separate system would be? I can only give an approximate estimate in this way—that the size of the sewers necessary for removing the sewage alone would be much less than the size of the sewers required for removing the sewage and storm-waters. I think the proportion of sewage to storm-water is as 1 to 1·3—that is, the volume of the storm-water is nearly one and a half times the amount of sewage. Sewers, therefore, to remove sewage and storm-water would have to be greater than those required to remove the sewage only; but there is one matter to be considered, and that is the tunnelling. It costs as much to make a tunnel to carry a 6-inch pipe as it would to make a tunnel to carry a 12 or 15-inch pipe. That is the only point about which I am uncertain. I think by the separate system there would be a saving of one-third, if not more. In other places it has been carried out at a saving of two-thirds.
2913. What places are those? In some of the American cities. But that statement may be somewhat misleading if I do not supplement it with another—and that is, that in those places the rainfall admitted to the sewers may be much greater than is proposed here; so you can hardly make a fair comparison.
2914. With the separate system you have to construct drains or sewers for carrying off the surface-water have you not? No; that is one way in which a great saving is effected by the separate system—you have no need to construct a duplicate set of sewers or drains.
2915. The water runs away on the surface? On the surface.
2916. Entirely? Entirely.
2917. Is not the surface-water very apt to get into the other sewers—how can you prevent it from doing so? It can be prevented, and in a practical application it must be prevented by proper designs.
2918. Can you tell us any place where the separate system has been designed and successfully carried out? In England the separate system was not applied until recently; but in America they have made great advances. The drainage of Henley-on-Thames is carried out on the separate system. The largest sewer there, if I remember rightly, is 7 inches in diameter. They also apply the Shone system there; but it is a separate system notwithstanding. The rain-water is excluded. In America there are upwards of thirty towns drained by the separate system, and the aggregate length of the sewers is 200 miles. One of the earliest installations was that at Memphis, and another at the city of Pullman. I believe the city of Orange has recently been drained on the separate system; and the system has given such good results that James T. Gardiner, Director of the New York State Survey, and a member of the State Board of Health, investigated the matter. He condemned the combined system, and the result of his report to the State Board of Health was that they decided to recommend all applicants who came to them for information as to drainage to adopt the separate system.
2919. Do you know the date of that recommendation? The volume from which I gained the information only came into my hands yesterday. It arrived by the mail steamer, and was published in 1889. I really had not time to thoroughly peruse it.
2920. Do I understand you to say that, according to the book, the State Board of Health would be prepared to recommend a separate system without regard to locality or of the configuration of the country;—would the system be equally applicable to towns situated on hilly country and those situated on flat country? A separate system is capable of universal application, no matter what the gradients or how flat the country may be.
2921. Do you mean that it is capable of application, or that it is desirable above all others? It is above all other systems under any circumstances whatever. I know of no case in which the combined system will be preferable to the separate system. 2922.

J. B. Henson, Esq.
8 Aug., 1889.

2922. With regard to the district which we are now considering, even with the separate system, pumping stations would be required in many places to get rid of the sewage in low-lying districts? Certainly.
2923. Have you thought how many pumping stations would be required? The pumping stations would be practically the same as those designed in Mr. Stayton's report. Mr. Stayton's gravitation sewers are above certain low-lying areas, and pumping stations would have to be constructed to elevate the sewage at these places. With the separate system only the sewage would have to be pumped up at these places, but under the combined, or partially separate system, the storm waters would have to be elevated as well, consequently the cost would be increased proportionately.
2924. Have you gone thoroughly into the question of separating the sewage from the surface water, or rather of preventing the surface water from going into the small sewers? A total separation of the storm waters is very easily effected, but this scheme proposes to take in a limited amount of storm water. That limitation is absolutely impossible of attainment by the scheme which is laid down in the report.
2925. How do you get the water from yards and places of that kind into the drains, and separate the rain water? With a separate system of sewage no inlet to the sewers should be on the ground level. It need not be on the ground level. The sewage or foul water removed from a dwelling practically equals the amount of water supplied to that dwelling. The quantity of sewage is proportionate to the quantity of water used. The only inlets to the sewers would be from the water-closet, from the bath, and from the kitchen sink, and you can easily see that rain water need not get into any of those openings. The house drain to discharge the surface-water would be of brick—an open brick drain, or, in many cases, simply the natural surface of the ground. The storm water is got rid of in this way in nearly every instance in the western suburbs. At the present time the people there have few underground drains, and I think the system might continue. There is no reason to make underground drains to carry off the storm water. I may say that I have studied this question for some considerable time. The necessity for putting in two drains at first seemed to have some foundation in fact, but I do not now see any necessity for it. I might also point out that the proposed scheme would not do away with the necessity for two drains where two drains would be necessary under the separate system. The rainfall, as you are aware in the metropolitan area, is very heavy at times. In Mr. Stayton's report you will find it stated that rain very unfrequently falls at the rate of 2 inches a day. Mr. Clarke in his report upon the drainage of Sydney says the same. But it is not the amount of water that falls in a day, but the quantity which falls in a shower that you want to know. I made some inquiries from the Government Astronomer upon this point, and I found that in 1887 rain fell at a rate of 2 inches and greater per diem in showers of upwards of a quarter of an hour in duration no less than 100 times. A rainfall at the rate of 2 inches per diem is the basis upon which Mr. Stayton calculates the size of his sewers, and he takes that basis because he says the rain falls very unfrequently at that or a greater rate, but, as I just said, that is a wrong basis upon which to calculate. When I say that this is thoroughly recognised in America I quote from a paper which I received from one of the institutes there a few days ago, in which this question is largely dealt with, and in it I find confirmation of my view that a calculation based upon the daily rate of rainfall is misleading, and should be abandoned. It is the actual length of the storm, and the rate of the fall during that period which should be taken into consideration. I just now referred to some information which I received from Mr. Russell, the Government Astronomer, which showed that rain often fell at a greater rate than 2 inches per diem. As Mr. Stayton's scheme can only carry away a fall of 2 inches a day, the back premises of the various houses would be flooded unless there were escapes for the surplus water; notwithstanding the large size of some of the sewers in the City, which have been calculated to carry away rain-water falling at the rate of 2 inches an hour, I have often had to advise the holders of property to put in safety-pipes to prevent water from rushing through their houses in heavy rains, and with this proposed scheme the necessity for similar pipes in the suburbs will not be done away with. They would have to be used if this scheme were adopted as much as they would if a separate system were adopted.
2926. Are you not aware that Mr. Stayton proposes to put in safety valves, or relieving drains, to get rid of the occasional surcharging of the sewers? Yes.
2927. Will not they be effective? No; for this reason. The pressure of water in the main sewers would be relieved, but a lot of filthy stuff would be brought down by the water and would lie about the ground. Since the water would be taken from the roofs into the sewers everything would tend to gorge the sewers at once, and there would be a vertical hydrostatic pressure, which, if the pipes were weak, might crack them and allow the sewage after the storm to leak out into the soil. In a rain storm there is a very large quantity of water running off the roofs.
2928. But the quality of the surface water which would flow down the streets under your system would be much the same as that discharged from overflow pipes by Mr. Stayton's system? It would be all comparatively clean water.
2929. What would become of the horse manure, urine, and stuff like that from the streets? That should be get rid of by a proper system of scavenging. It is the duty of the Municipal Councils to see that the street filth is got rid of, and that the householders look after the filth in the yards. It should not encumber the system of sewerage.
2930. Would that be practicable in a large city. Unless the streets could be sluiced and the water run quickly away would not the city be unhealthy? The bulk of the street refuse could be got rid of, and, in fact, is got rid of at the present time, by scavenging, but under Mr. Stayton's system the surface water from the streets is to be excluded.
2931. He proposes to exclude the storm water; but not the water used for washing down the streets? I think he proposes the total exclusion of rain water which falls on the streets.
2932. I understand that your first objection to Mr. Stayton's scheme is the expense? My main objection is that it provides for the inclusion of part of the storm water when the exclusion of that water would mean a reduction in the expense and increased efficiency.
2933. *Dr. Garran.*] Supposing we adopted the separate system for these western suburbs exclusively, would earthenware pipes be large enough to take away the whole of the sewage? No.
2934. What is the largest diameter of earthenware pipes which it would be safe to use? Very good earthenware pipes are made up to 2 feet in diameter. We possess clays of very superior properties; and pipes 2 feet in diameter, and of excellent quality, can be manufactured.
2935. Would it be safe to fill pipes 2 feet in diameter with sewage? Yes, but I should not submit them to pressure.
2936. But is the pressure of sewage like a water pressure—it is not laid on from any great height? There should be no pressure in a sewer—a sewer should not flow under pressure.

2937. Would a 2-foot pipe carry all the sewage which would be carried on the ordinary inclination of sewage pipes in this district? You must have a certain grade to get rid of your sewage with a velocity which will ensure its entire removal before putrifaction sets in, and if you have a known volume of sewage, there are only two sizes of pipe which will give the desired velocity—one flowing half full and another flowing about full.
2938. It would never do to have the pipes quite full? You might have them quite full; but not under pressure.
2939. As a rule they run half full? It depends entirely upon the design.
2940. None of the principle parts of this scheme could be made with earthenware pipes? Certainly not.
2941. How far would you have to go before the branch pipes become earthenware pipes? That is a matter that would require careful calculation. To adopt the separate system you would have to increase the grades, because the rain water would not be admitted. By admitting the rain water you get a combined flow of sewage and storm water which gives a greater velocity.
2942. Sewage proper is not so fluid as sewage plus water? Practically there is no difference.
2943. But during the dry seasons, when we get no storm water, the sewage has its own fluidity? Yes.
2944. The sewers are flushed either by storm waters or artificially? Artificial flushing should be adopted.
2945. It has not been yet? Mr. Stayton according to his report proposes to adopt the system of flushing.
2946. But the ordinary sewage has a certain degree of fluidity? Yes.
2947. With that fluidity would it pass along an earthenware pipe at the same level as these brick sewers would be? In ordinary dry weather you would have an inferior flow, but a superior flow to that designed by Mr. Stayton is required.
2948. You think that if, after having carried out the proposed system we apply the separate system, the result will be unsatisfactory? It would be a failure, and the attempt would bring discredit upon the separate system.
2949. If we are to have a separate system we must alter the design? Yes.
2950. You could not apply it to Mr. Stayton's design? Not very well, without increasing the grade.
2951. To make the separate system a success we must have a uniform system of flushing? Yes.
2952. Otherwise the sewage will not move fast enough? Yes.
2953. If we could use earthenware pipes, would it not be better to use them? It would be very much cheaper.
2954. The greater the extent to which we could use earthenware pipes the greater the economy? Yes.
2955. But to do that we must have steeper gradients? A smaller pipe requires a steeper gradient than a large pipe. To get a proper flow in a large pipe we must have volume. You may have great volume and small inclination, or a sharp inclination and a small volume.
2956. Then if we were to adopt the separate system to the western suburbs, we could not include so great an area? No; you could not carry the pipes so far before you reached the surface of the ground.
2957. Then with the separate system we should have to go a certain distance, and have some subsidiary system? Not necessarily.
2958. You would pump it up? Yes.
2959. We would still have to have the present system of a number of subsidiary sewers emptying into the main sewer? Yes.
2960. But with the separate system the main sewer would not be convenient for that? By pumping you can send the sewage any reasonable distance which you desire. The principal difference between Mr. Stayton's system and the separate system is, that with the separate system the main trunk sewers—shown on the plan—could not be extended quite so far as is now proposed, but they would be smaller in size. The pumping stations would be erected in the same places, but the area draining down to each pumping station would be greater than that proposed by this scheme, and consequently a greater volume of the sewage would have to be pumped. Mr. Stayton proposes to pump both the sewage and the storm water, but against the increased volume of sewage, the diminution of storm water under the separate system would be an ample set off.
2961. What is the relative cost of pumping sewage and pumping water? I have not gone into calculations, but to pump sewage I think would cost from 5 to 20 per cent. more than to pump clean water. The reason of this is, partly, that in pumping sewage there is a great slip in the pump. The pump also does not work under such favourable conditions as when it is pumping clean water. The grit and slimy matter causes great wear and tear.
2962. You see that Mr. Stayton requires a pumping station on every peninsular to deal with the sewage on the low-lying land? Yes.
2963. You also would require pumping stations,—but you would only pump sewage and he would pump sewage and rain water? Yes.
2964. Would the volume he pumped be very much less or greater than the volume which you would pump? I do not think there would be very much difference.
2965. You think that the sewage of one of these peninsulars would not amount to very much more than the sewage and water which Mr. Stayton would pump? I am under the impression that it would be less.
2966. When there was no rain he would have less to pump, unless he pumped the water used for flushing? He would have to pump that.
2967. And in rain-storms he would have an additional quantity? Yes.
2968. You would have to pump your sewage and your flushing-water? Yes.
2969. Then he would only have the rain-water more than you? He would have proportionately more flushing-water than I should have, because the large sewers would take more water to flush them than the smaller ones.
2970. Do I understand you to say that the pumping of your sewage would not amount to much less than the pumping under Mr. Stayton's scheme? I do not think there would be much difference.
2971. Do you think this answer is given with a degree of decision and accuracy with which you are satisfied? I have considered the matter, though I have made no actual calculations, and the conclusion I have come to is that there would be practically very little difference—that the larger area which I should take in would increase the quantity of sewage to be pumped; but, as a compensation for that, I should not have to pump so much flushing-water, and I should exclude the storm-water. I am inclined to think that I would occupy a much more favourable position than Mr. Stayton would. Only the same number of attendants to look after a large pumping station would be required as to look after a small station.
2972. Would not larger pumps be required? Not any.
2973. Would there not be more expense? I do not think so.

J. B. Henson, Esq. 8 Aug., 1889.

2974. Take a peninsular like Balmain—that is a rocky promontory, and a very difficult place in which to construct sewers. Could you with the separate system, more nearly follow the contour of the ground and avoid deep cutting, than with Mr. Stayton's system? I am inclined to depart from Mr. Stayton's scheme altogether, because it will be enormously expensive. It will be all tunnelling. No tunnels can be made less than 4 ft. x 2 ft. 8 inches in diameter. You must have them that size to enable the men to work, and in many cases only a 9-inch pipe has to be put through them.
2975. With the separate system, would it be possible to drain half of the sewage of Balmain down to the western side of the peninsular, and half down to the eastern side, and have a pumping station for each side and so lift the sewage up? That would be practicable.
2976. Would you not then to a great extent avoid all this steep cutting? Certainly,—the tunnelling.
2977. Do you think it would be possible to carry out the separate system by drains comparatively near to the surface of the ground? That would be entirely a matter for calculation, to see where the outfalls could be put with a view to the greatest economy. I should not multiply the pumping stations more than I could help. There is a system by which one pumping station could serve the whole area.
2978. Suppose there were one pumping station on the eastern side towards the centre, to which all the sewage would converge, and another on the western side, would you then be able to follow the surface contour more than by the proposed system? Certainly.
2979. Could you economise in that way? I believe so.
2980. From such points you could pump into the main sewer to Bondi? Yes.
2981. Do you think that is feasible? Yes.
2982. Do you think it would be more economical? The economy would come in by excluding the storm water, and reducing the number of stations if possible.
2983. The economy would not come in by any diminution of the tunnelling? I think there would be a considerable saving on that point; but it is a matter upon which it would be impossible to give a precise answer, without a very careful examination of the levels.

WEDNESDAY, 14 *AUGUST*, 1889.

Present:—

The Honorable JOHN LACKEY (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.
JACOB GARRARD, Esq.	JOHN HURLEY, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

J. B. Henson, Esq., Assistant Engineer, Water and Sewerage Board, sworn, and further examined:—

J. B. Henson, Esq. 14 Aug., 1889.

2984. *Dr. Garran.*] When the Committee last adjourned we were discussing the separate system. I should like to put a few more questions to you about it. I understand that whether we adopt that system or the system Mr. Stayton proposes, we must have three things:—First, underground pipes; second, surface storm water channels; and third, pumps for lifting a certain portion of the sewage which cannot be otherwise disposed of? Yes; that is correct.
2985. We cannot dispense with any of these requisites in either system? No.
2986. Then it is simply a question of the relative cost of these three expedients under the two systems? Looking at it from a financial point of view, it is.
2987. If we adopt the separate system we shall allow the storm water to run off by surface channels as it has done since the Colony was founded? Yes.
2988. We shall leave the surface channels to carry the surface water? Yes.
2989. And simply make artificial arrangements underground for carrying off the artificial results of cities' sewage? Yes.
2990. The underground pipes will be devoted for that purpose exclusively? Yes.
2991. And there will always be a certain proportion of low-lying ground which will necessitate a system of pumping under any scheme? Yes.
2992. Applying these principles to the scheme you advocate; if we were to adopt the separate system for the Western Suburbs we should have to have smaller pipes? Yes.
2993. And therefore a steeper inclination? Yes.
2994. Therefore the red lines on the plan which indicate the full length of the underground sewers would not by a mile or half a mile be so long as they are shown? They would not be so long.
2995. We should practically come nearer to a scheme of following the contour of the surface of the ground by making the dividing ridge between Cook's River and Parramatta River the separation between the gravitation and the pumping area? In carrying out the separate system the course of the sewers would have to be closely considered. As you first said, it would simply mean a steeper grade and taking the drainage from a less area; but as to the exact limits of that area, I could not say.
2996. Still, in the main, the gravitation of the sewage would be all to the south? The bulk of it would be to the south.
2997. What we should have to lift would be the sewage flowing naturally towards the Parramatta River? Some of the sewage flowing towards the Parramatta River could be taken by gravitation; but the bulk of the sewage which would have to be lifted would be on the Parramatta River side of the dividing range.
2998. You think the red lines marking the gravitation sewers would go under the ridge and catch a certain portion of the sewage which would naturally fall to the north? It would be found advantageous to do so.
2999. And we should only have to pump the sewage which could not be put into the sewers by gravitation? Yes.
3000. Looking at the number of peninsulas that run into the Parramatta River, and to the impossibility of diverting their sewage by gravitation into the main outlet at Webb's Grant, is that not an additional reason why we should look forward to some pumping arrangement by which the sewage of all those peninsulas could be brought to some low-lying place and there pumped up? Yes; it will have to be concentrated.

3001. The red lines deal very slightly with the peninsulas? Very slightly indeed.
3002. Even if you carry out the scheme as proposed we shall have hereafter to provide for the drainage of these separate peninsulas? Yes. By the scheme I think ·29 of the entire area is to be pumped, that is, over ¼th will have to be dealt with by pumping.
3003. But that does not include all the land in Concord and Five Dock marked white on the plan? I do not think it does.
3004. That is not provided for at all? I think not.
3005. Supposing we had an adequate and efficient pumping scheme could we deal with Five Dock and Concord by bringing the sewage down to the head of one of the bays and then pumping it? It could all be dealt with by pumping, the sewage being transferred by means of pumps to some suitable locality such as Webb's Grant.
3006. Take Five Dock for example. Suppose that locality were populous enough to require a system of sewerage, would it not be possible by the separate system to draw the whole of the sewage of Five Dock to some low point at the head of the bay, from which it could be pumped into the sewers? That certainly could be done, but the question would be whether it was not cheaper to erect two or three minor pumping stations, and thus save the cost of large tunnels.
3007. But unless you are going to allow the sewage to flow into the river you must pump it? Yes.
3008. Is there any more convenient way of disposing of it than by pumping it into the sewers and allowing it to flow out to Webb's Grant? No. If the scheme were carried out as proposed the sewers would be very convenient to pump into.
3009. So far as the separate system is concerned you do not quarrel with the general outlet of the scheme? At the sewage farm?
3010. Yes? No.
3011. All you are inclined to dispute is that the pipes are unnecessarily large and made so for the purpose of taking away a certain quantity of storm water? Yes, that is one point—another is the sanitary efficiency of the scheme.
3012. You think that the small pipes should be kept clean more certainly than large sewers? Yes.
3013. If a sewer is larger than is necessary to carry away the sewage matter the waste space is injurious rather than beneficial? Yes.
3014. It gives room for the development of gases? Yes.
3015. Therefore for sanitary reasons the smaller the pipes as long as they are sufficient the better? Yes, because they can be better ventilated and better flushed.
3016. On the whole they are kept cleaner? Yes.
3017. If that is the case can you give us any estimate of what the saving will be on £1,800,000 by the separate system? I could not say without a very careful investigation of the whole scheme which would take a considerable time.
3018. How long would it take you? That would depend entirely upon the plans available. You could not work it out without an accurate survey of the contour of the whole area at every 5 feet of level. You could not make an accurate estimate without that.
3019. Without doing that you would not like to say whether the saving would be 10, 20 or 30 per cent? I should not like to say as to the saving or the expense of carrying out the scheme on the totally separate system without having very complete plans of the whole area.
3020. You see that the Committee is very anxious to make a speedy report upon this matter, but it materially does not wish to report favourably upon a more expensive scheme than is necessary. It is therefore extremely important that we should have reliable evidence as to whether the separate system would be cheaper and more efficient than that proposed? That is a matter that occurred to me, but I could see no way of arriving at an estimate that would be satisfactory to myself or the Committee unless the proper plans were available.
3021. You are an officer of the Water and Sewerage Board? I am.
3022. Do you know at all whether it is in contemplation to carry out the sewerage scheme by the Water and Sewerage Board or by the Public Works Department, and then hand it over complete to the Water and Sewerage Board? I do not think any decision has been come to, but I heard it mentioned that there is a probability of the Government carrying out the main works, leaving the minor works and the administration of the scheme to the Water and Sewerage Department.
3023. Do you know whether Mr. Stayton's calculations have been checked at all in your Department? No; not in the Department.
3024. Do you know whether they have been checked by anybody? I am not aware.
3025. Have you looked into them at all yourself? I did into a few of them.
3026. You will observe that Mr. Stayton makes the rate 5d. and a fraction upon the smaller amount of £800,000, and 6½d. upon the larger amount of £1,300,000;—do you know whether that small increase of rate with so very large an increase of the principal is due to the extension of the term for repaying the debentures? I am not familiar with the items to which you are referring.
3027. You have not studied the appendix? No; I have not seen it.
3028. So far as you have studied the question you are distinctly in favour of the separate system? Yes.
3029. Can you mention any place where that system is carried out? At Memphis and Pullman, in the United States. Thirty towns in America are drained on the separate system.
3030. Are there any places in England? Henley-on-Thames is drained by the separate principle.
3031. How many years has it been in operation at Henley? Not many; not more than three or four at the outside. The principle has not made so much headway in England as in America.
3032. Do you know whether it has given satisfaction in America? From the reports that I have seen I should say that it has given satisfaction.
3033. Have you seen any reports as to the working of the system at Henley? It has given satisfaction there.
3034. But the majority of English engineers at present do not favour it? I am not aware of that. From what I can learn they are in favour of it.
3035. Do the majority of American engineers favour it? They did not favour the principle of separation at first. They were against it until it was tried; but now it is making great headway.
3036. You think it is growing in favour in America? Yes.

J. B. Henson, Esq. 14 Aug., 1889.

3037. Is there any recent authority upon the subject? I have a work here upon the separate system written by Staley and Pierson, American engineers, and another by Mr. Waring, one of the leading, if not the leading, sanitary engineer in America.
3038. You think the system is growing in favour in America? Yes.
3039. And that the American experience of it justifies us in looking into the matter carefully? Decidedly.
3040. *Mr. Humphery.*] Do you know if any of the towns in America to which you have referred are near the sea coast? I could not say but I think they are chiefly inland towns.
3041. You do not know that their conditions are in any respect similar to the conditions of Sydney and its suburbs? I am not aware.
3042. *Mr. Trickett.*] Do you know the population of any of them? I do not think that the principle has been applied to any of the very large cities, but only to cities of 20,000, 40,000, or 60,000 inhabitants.
3043. *Mr. Humphery.*] Have you had any experience out of Sydney with sewerage systems? I have only been connected with the existing sewers of the city.
3044. You have not been at Adelaide? Yes, I have been there.
3045. What system is adopted there—is it the water carriage system? The water carriage system, and I believe they admit a portion of storm-water into the sewers. It is somewhat similar to what is proposed for the Western suburbs.
3046. You do not know what system is adopted in the various towns in England? No, I do not, except that at London they have the combined system.
3047. That is similar to the system proposed for the Western suburbs? No, it is similar to the existing sewers in the older portions of the city, such as the Tank-stream sewer, Hay-street sewer, and the sewers emptying into Woolloomooloo Bay.
3048. Have you any reason for saying that the separate system would be superior to the system now in use in Sydney? Decidedly.
3049. In what way would the separate system be superior to the combined system as applied to the City of Sydney? The separate system would secure the complete removal of the sewage within a few hours, and the city sewers do not do that. The Tank-stream sewer is 5 feet 6 inches in height, by about 10 feet in width, and you can walk along the floor on one side while the sewage trickles along the centre. It is the totally combimed system. It was a creek originally, and is simply a huge gas-holder—matter sticks to the sides, and in summer putrifies and gives off gases which find their way through the smaller sewers to the highest parts of the city.
3050. You think that from a sanitary point of view the separate system would be superior to the present system? It would. The separate system, from a sanitary point of view, is superior to any other.
3051. How do you propose to get rid of the storm-water from the roofs of houses? It would to a great extent have to go the way which it does now in the Western suburbs.
3052. It would not enter the pipes provided for the carrying away of refuse and excreta? No, it would not. It would run into the street gutters, and follow them down to the nearest creek or watercourse.
3053. It will be necessary to have separate drains from the houses in order to carry away the water falling from the roofs? It would not be necessary in many cases—in many instances the water would flow over the surface.
3054. Over the back yards? Yes.
3055. Would not that be very inconvenient to householders? No. In some instances it might be inconvenient; but I do not think it would be so to any large extent.
3056. But in many of the suburbs would it not be impossible to get the water away? That water could only be got away by a system of drains constructed to deal with the storm-waters exclusively.
3057. The water falling from roofs of houses could not be conveyed by the combined system? It could not be conveyed by the proposed system—not the whole of it.
3058. *Mr. Garrard.*] Have you given any attention to Liernur's system? Yes.
3059. That is a separate system? Yes, but the term separate has a different signification in that instance.
3060. Instead of gravitation a pneumatic force is brought into operation? Yes.
3061. Are you favourable to that system of dealing with the sewage from closets, &c? No.
3062. Do you believe in the water carriage system? Yes.
3063. Although in favour of a separate system you are not in favour of Liernur's system? No. That system deals only with the solid matter, and leaves the slop and dish-water to go into a system of sewer-pipes.
3064. You spoke just now of the Tank-stream being a huge gas-holder. Are there any means of ventilating it? Yes, it could be ventilated.
3065. Is it ventilated at the present time? Not that I am aware of.
3066. The whole of the storm-water of the city falling within a certain area goes into that sewer? The bulk of it does.
3067. Is that one of the reasons for making it such a large size? Yes.
3068. Could we improve it so far as the matter of gas is concerned by proper ventilation? Very little improvement to that sewer could be effected by ventilation.
3069. None of the main lines of sewers projected in the Western Suburbs Scheme approach this sewer in magnitude? No; but they will not be under similar conditions to the Tank-stream. The amount of sewage flowing into the Tank-stream is very small.
3070. Then it is more a storm-water channel? Yes, with a trickle of sewage along the bottom of it.
3071. *Mr. Tonkin.*] Do you know Mr. Stayton? Yes.
3072. What position does he hold as a sewerage engineer? I am only acquainted with him through having met him in the Colony.
3073. You do not know what position he holds as an engineer? No, I do not.
3074. Do you know that he has a preference for the combined system over the separate system? I do not know that he has a preference for the combined system. His scheme for the drainage of the Western suburbs is a partially separate system. It is between a totally separate system and a combined system.
3075. Do you not think that if we had the separate system entirely, the water running along the gutters after a heavy storm would at times be dangerous to foot psssengers? I do not think it would in the majority of cases. In places where it would be dangerous, it would be necessary to provide storm-water channels

channels or culverts to deal with the flood water; but those channels would have to be provided under the proposed scheme.

3076. You know that the forming of streets concentrates the water, so that it collects more rapidly than it would do if the streets were not formed? Yes, the formation of streets and the building of houses contentrates the water very rapidly on to the low-lying part.

3077. There would be a certain amount of danger if the storm-water were carried on the surface instead of under ground? There would be danger in certain places from the water flowing along the street.

3078. What are the principal advantages which you claim for the separate system. I think I understood you to say, that one of the principal advantages was, the saving of expense? There would be a less expenditure, and there would also be a greater sanitary efficiency. The health of the residents should be the first consideration—the cost of the scheme is in a measure a secondary consideration. The work if carried out under the separate sytem would be cheaper, and from a sanitary point of view more efficient.

3079. I suppose you have no idea as to what the difference in cost would be between the separate system and the system proposed by Mr. Stayton? It is so large a matter to go into, that I could not give any estimate.

3080. The tunnelling required for the main sewers is nearly all through solid rock? Nearly all of it.

3081. Do you know what difference there would be, if any, between the cost of a tunnel through solid rock, 3 feet 6 inches in diameter, and that of of a tunnel 5 feet in diameter? The difference would not vary according to the diameters, because the smaller a tunnel is, the more difficult it is to work in it.

3082. Then it would cost as much to drive a 3-feet 6-inch tunnel through rock as a 5 feet tunnel? I should not undertake to say that it would.

3083. It would cost very nearly as much—there would be very little difference in the cost? I could not say for certain. The difference would certainly be in favour of the smaller sewer.

3084. Then the principal advantage which you advocate for the separate system is the sanitary advantage, because if there were no difference in the cost of the tunnelling, there would be very little difference as far as the cost of construction altogether was concerned. The real advantage would be from a sanitary point of view? There would also be an advantage with regard to the expenditure. The expenditure would be less, because it does not follow that the whole of the work under the separate system would be tunnelling. If it were a mere question of large and small tunnels, I do not suppose there would be a great difference; but it is possible that under the separate system there may not be as great a length of tunnelling as under the partial system.

3085. But with the separate system which you advocate, you could not follow the contour of the ground, you would have to take sewage away by gravitation? As much as possible by gravitation.

3086. You could not follow the contour of the ground as a pneumatic system would. The sewage would have to be conveyed by gravitation? As much as possible by gravitation.

3087. *Mr. O'Sullivan.*] You appear to hold very decided views as to the superiority of the separate system, although they are in conflict with the opinions of some of the leading sewerage engineers. Has your attention ever been drawn to this opinion of Sir Robert Rawlinson, who was for many years Engineer-in-Chief to the Local Government Board in England, and who was invited on behalf of the Government of this Colony, in 1875, to advise on the question of the water supply and drainage. "Two sets of main sewers with two sets of house drains will be costly to construct; and, if constructed, would often lead to complications tending to defeat the proposed uses"? I have heard statements made similar to that, but they are very misleading.

3088. But do you not think that Sir Robert Rawlinson would be cautious before giving an opinion on this matter? It depends upon the date upon which he gave that opinion.

3089. In 1875. Further on he says "The so-called clean water sewer cannot in many cases be large enough to receive storm-water, and in dry weather it should of course be dry. The sewer proper would thus be without the flushing and cleansing given by roof water during falls of rain and the washings off yards, &c., during the first falls of heavy rain would in many cases be as polluted and as polluting as sewage in the true sewer." He there suggests a danger that might possibly exist in a warm climate like this? In regard to Sir Robert Rawlinson's remarks I would refer you to the second and final report of the Royal Commission upon metropolitan sewage discharge in 1884. The question of separation was there referred to by Sir Robert Rawlinson in answer to question 17102.

3090. Will you kindly quote his remarks? "If you had to begin at the beginning and sewer London *de novo* the Fleet ditch should not be a sewer; the Ranelagh River should not be a sewer; all the valley lines should not be sewers; they should have been surface water channels alone and the sewage should have been intercepted on both sides and carried into the main outlets which are now provided."

3091. But that does not imply that he has changed his opinion in favour of the separate system? That, I take to refer to the separation of the sewage from the storm-water.

3092. I will direct your attention now to the opinion of Sir Joseph Bazelgette who says "How to dispose of the rainfall is a question of considerable difficulty and has given rise to much diversity of opinion. This arises from the fact that whilst in itself harmless, it sometimes falls suddenly in large quantities. These considerations have induced theorists to advocate that the rainfall should not be allowed to flow off with the sewage, but should be dealt with by a separate system of sewage. The theory is however, most impracticable," how do you get over that? In the report to which I have already referred, paragraph 182, and question 19372, Sir Joseph Bazelgette says "To carry out such a scheme as I am suggesting, or any scheme suitable for those districts, it would be necessary to separate the sewage from the rain fall. The areas are so large, and the quantity of sewage is so small, that it would be impossible to take them together; they must be taken separately.'

3093. *Mr. Garrard.*] Upon what was he speaking then? The drainage of London.

3094. *Mr. O'Sullivan.*] Will you allow me to direct your attention to this paragraph of Mr. Stayton's report "It would be undoubtedly misleading to assert that any one special system of disposal is the best for adoption. Everything depends upon local conditions, or, in other words, every place must be dependent upon its own physical circumstances and requirements. Irrigation is not the universal mode of sewage purification, but where favourable conditions exist it is the cheapest and most efficient process, especially where sewage can be delivered by gravitation." So that Mr. Stayton makes it a matter of circumstance and condition, that this system should be adopted here? I have considered that point in the light of the condemnation of the present system of drainage in London, where we have the union of the storm-water and the sewage in one

J. B. Henson, Esq. 14 Aug., 1889.

set of channels. The proportion of rain water allowed for in London is at the rate of ¼ inch in 24 hours; but the admixture of rain and sewage there has been condemned. Mr. Stayton's scheme for the western suburbs is to carry a rainfall at the rate of ·31 inches in 24 hours, which is greater than that allowed for in London, so if the London sewerage system be condemned, that condemnation would apply to the system which the Committee are considering.

3095. I notice in the paper which you read before the Engineering Association that you say that the English principle of a maximum sewage-flow will not apply here;—what are the reasons for that? Mr. Stayton, in his report, page 10, near the bottom, says:—"The rule adopted for town areas in England by Mr. T. Hawksley, one of the foremost hydraulic engineers in the world, is to allow one square of roofing and one square of paved yard as the contributing area of each head of the population;" but then the rainfall in England is generally only half what it is here. I think our average rainfall is double the average rainfall in England, or at any rate is very much larger than it. Therefore, if the same principle were applied here, double the amount of rainfall would be admitted into the sewers, so that the rule cannot possibly hold good under these circumstances.

3096. Supposing the separate system is applied here, is there not a danger that it may be found ineffective through the carelessness of servants, who may throw slops into the street channel? Yes; there would be that danger, but it would be a breach of the regulations to do so, and would be followed by punishment. It is a matter of detail which is of no importance.

3097. Do you think the separate system could be safely applied to a small area like Balmain? I think so. with great advantage.

3098. Supposing that we recommend that the scheme shown on the map, with the exception of that portion draining Balmain, should be carried out, as designed by Mr. Stayton, and we applied the separate system to Balmain alone, it would very likely prove a success? You cannot very well pick out a piece and deal with it like that; you may upset the whole arrangements.

3099. It seems to me that if there is any efficacy in the separate system it might be applied to a small place? Supposing the proposed scheme were carried out to the boundary of Balmain, it would be worth while considering how the separate system could be applied to the whole of the sewage of that municipality. This scheme (Mr. Stayton's) will provide for the removal by gravitation of the sewage of a little better than half the area of Balmain, which contains altogether about 900 acres.

3100. *Mr. Garrard.*] Six hundred? Well, the proposed sewerage scheme will provide for a little over half that area, leaving the portions near the margin of the water to be dealt with in some other way, by a system of pumping. If the rainwater is combined with the sewage the pumps will have to lift both the rainwater and the sewage, but if it is separated from the sewage, and the sewage only is dealt with, it will be possible to concentrate the whole of it near the water's edge, and pump it up into the nearest sewer. I think this could be done at the same cost as it would take to put in the intercepting sewers; but then the whole of the area will be dealt with instead of only the better half.

3101. *Mr. O'Sullivan.*] Mr. Garrard questioned you about Liernur's system, has not that system been adopted by the German Government in their barracks at Prague, and in other large cities? It has been adopted in some of the towns in Europe.

3102. And found to be a success? I cannot speak on that point.

3103. Have you not heard or read that it has proved successful in many of the smaller cities and towns in Germany? I have read so.

3104. *Mr. Dowel.*] You stated that you have given considerable attention to the sewerage and water supply in various parts of the world? I have read as many accounts of the various systems as came to my hand.

3105. Have you any knowledge of the sewerage and water supply system adopted in any of the towns in England under the Board of Health? I suppose London is such a town.

3106. Any of the towns in England; you are aware that most of the towns in England have a sewerage and water supply system which is carried out under the Board of Health? I believe there is a central authority.

3107. And local boards have control of works in the various towns? I believe that is the system carried out.

3108. You have no knowledge of the nature of their works? No particular knowledge of them.

3109. Not of any one town in England? Only by the reports which I have read; and I have read so many that I really could not undertake to describe the works of any particular town.

3110. Can you refer to any one town of which you have a knowledge, either through reading or in other ways? I am aware of the system of drainage in London, and that is a representative of the system of drainage adopted in England.

3111. I think you will find that it is vastly different from the system adopted at such towns as Chelmford, Watsford, and other places similar in surroundings and population to Balmain. I understand that you have no knowledge of the system which is in vogue at those places? No.

3112. In reference to the scheme which you are advocating, can you state on the score of economy, whether you think your system would be cheaper than the system now under the consideration of the Committee? I believe it would be cheaper.

3113. You are aware that to carry out this scheme a very large quantity of water will be required? There will be a large quantity of water to be removed.

3114. A large quantity of water will be required for the purpose of flushing drains and water-closets? There will be a certain quantity of water required for flushing the drains, but that quantity will depend upon the system adopted. You may adopt a system which will require a large quantity, and you may adopt a system which will require a minimum quantity.

3115. Are you not aware that all the water-closets will be connected with this system of sewerage? That is the object of it.

3116. And a large quantity of water will be required for the purpose? Yes.

3116½. Do you consider the quantity of water which you have ample for the requirements, supposing the population were to increase considerably during the next ten or twelve years? The present water supply is one which is expansive to meet the requirements, just as the sewerage scheme is expansive. When more water is wanted it can be obtained.

3117. Knowing that a very large quantity of water will be required to make this system effective, do you think, from your knowledge of your resources, that you will have sufficient water to meet all the requirements of the system? That is a question which I can only answer by saying that the water supply is expansive, and that water can be obtained as required

3118. Are you quite certain that the rainfall of New South Wales is double that of England? I do not think that the rainfall here is as heavy as it is on some parts of the west coast of England, where I believe, it is very heavy, though it is very heavy in some parts of New South Wales. I am referring to the average rainfall.

3119. The average rainfall in New South Wales is double that of England? Not of the whole of New South Wales, but of the coast district. The average rainfall on our metropolitan area is double that of the metropolitan area of London.

3120–21. Comparing the metropolitan area of England with the coast district here, do you think that the average rainfall in New South Wales is double that of England? I believe I am correct in making that statement.

3122. *Dr. Garran.*] I want to put to you in another form a question which Mr. O'Sullivan asked you. Would it not be quite possible to make an experiment with the separate system upon some branch area of the proposed system. For instance, take the red line that marks the sewer draining Macdonaldtown—could not an experiment be made of the separate system there, and the sewage be shot into the main sewer that goes out to the Sewage Farm? It could.

3123. It does not matter whether the outlet is into a river or into a big sewer? It does not matter where the point of discharge is.

3124. Could not a similar experiment be made with regard to Camperdown? It could, but in neither case could it be a fair one. In the latter case most of the work would be tunnelling, and the minimum size of a tunnel is 4 feet by 2 feet 8 inches. No matter how small the pipe is which has to go through a tunnel, a man must have working room.

3125. And you mean to say that wherever the country is rocky the cost of tunnels under one system is much the same as that under another? Where there is a minimum size of tunnel.

3126. You said in answer to Mr. Tonkin that the greater part of the work of the proposed scheme will be through rock—would not the greater part of it be through shale? I think you would be below the shale towards Cook's River, and where the sewers dip there is rock.

3127. Taking Ashfield, Burwood, and Strathfield, how deep had you to go for rock? Some considerable depth on the top of the hills, but near the hollows the rock crops out on to the surface. At Iron Cove and Long Cove Creek it crops up.

3128. But the bulk of the sewers would not be so low as to touch that rock? I think they would be very near the rock, and if they did not go through it they would have to go through the shale, which is nearly as compact and perhaps worse to get out.

3129. Is it not true that the rainfall in England is much more distributed than it is here, but does not come in such heavy storms? Yes.

3130. Then it would be much more reasonable to provide a sewer to carry off the rainfall when it came every week than when it did not come once in two months? Yes, that is an important consideration.

3131. If we, in this country, where the rainfall is irregular and broken by long intervals of dry weather, make a sewer to carry off a certain proportion of the rainfall, we are providing for an exigency which perhaps only occurs once a month? Yes.

3132. And during the intervening periods, for twenty-nine days out of thirty, that sewer is simply a reservoir for bad gas? Yes.

3133. Do I understand that you rest one of your arguments in favour of the scheme on that view of the case? Yes? On what I consider the sanitary view of the case.

3134. Your argument is that the separate system is cheaper and more beneficial from a sanitary point of view than the proposed scheme? Those are the two chief points.

3135. Wherever you drain a manufacturing area you must carry off the refuse by sewers; you could not let it go down the gutters? No.

3136. If these suburbs could at any time become manufacturing suburbs you would want a larger capacity of sewers to carry off the refuse than you would do if you were merely providing for a residential suburb? It will be necessary to consider that, but I do not think the increase will be very much. Taking the water supply to the inhabitants at 70 gallons per head, as in the report, which is very liberal, I think that we could provide for any such contingency.

3137. If a district did become a manufacturing suburb, I suppose the value of property there would increase greatly? Yes.

3138. And an extra pipe might be laid without the increased rate being severely felt? I think so.

3139. You were asked by Mr. Tonkin about the water from the water-closets. Have you in the separate system made allowance for the full quantity of water required for the water-closets of the whole district? It would be based on a rate of about 70 gallons per head per day, which I think is very liberal.

3140. You calculate to carry away as much from each house as the water supply department delivers? Yes; but practically it would be less, excluding rainfall, because you would not take in the water used for gardens, or that used for steam engines and other purposes.

3141. Then if your pipes can carry as much as the water delivered they will be large enough for all sewerage purposes? Quite.

3142. *Mr. Humphery.*] You referred I think to the system of sewerage adopted in London having been condemned? The combination of the rainfall with the sewage.

3143. Do you know the reason why that system was condemned by the Royal Commissioners on the Metropolitan Sewerage Discharge? I tried to get their report, but was not able to do so. I gathered that the reason was that it gave them an unwieldy quantity of sewage to be dealt with at the outfall.

3144. Do you know that the difficulty in dealing with the rainfalls as well as the sewage in London is owing to the large quantity of sewage matter, caused by the enormous population there? I am not aware. If the rainfall were excluded the quantity would be reduced.

3145. There is an article upon the question in the Encyclopædia Britannica, written by Professor Ewing—is he an authority? I could not say. I have not met with his name.

3146. He discusses the two systems, separate and combined, and he seems to be of opinion that what is called the water carriage system is best adapted to meet the requirements of the present day? Certainly it is.

J. B. Henson, Esq. 14 Aug., 1889.

3147. *Mr. Trickett.*] What was the American authority which you mentioned in the early part of your examination? A work written by Staley and Pierson.
3148. That is an American work written on American sewerage systems? Yes.
3149. Judging from two paragraphs in that work does it not appear that the separate system is only in force in America, in cities having a very limited population? One paragraph says, "We see from an inspection of the table that about seven-eighths of the cities of the United States have less than 25,000 inhabitants, and about two-thirds less than 10,000 inhabitants. It is probable that most of these do not require a system of sub-surface removal for storm water, and that in the few remaining the system of conduits for sub-surface removal may be very limited." (The table referred to is a "Comparison of Cities in the United States by Population.")
3150. Reading that paragraph with another further on, does it not appear that the system has only been tried in America in places having a comparatively small population? I am not quite certain of the population of the cities to which it has been applied, but the principle is not affected whether the population is 20,000 or more.
3151. Surely the principle is affected if the city is closely built, or not closely built, beeause in a closely built city it would be a great inconvenience to have the surface water running about the streets and accumulating in the gutters? There is no other way for it to escape except along the street gutters, unless you construct an underground system of drainage, which will remove the whole of the water from the surface. Mr. Stayton's report is certainly against the taking in of the whole of the storm-water.
3152. He takes in the ordinary storm-water? Only from the roofs and the yards. I go further and say exclude that, and have none of it. In his report he recognizes the difficulty there would be in dealing with the whole of the storm-water, so that if his scheme were carried out, wherever the storm-water was inconvenient on the surface, separate channels would have to be constructed to remove it. The question is the degree of separation which should be adopted.

Robert Hickson, Esq., Commissioner and Engineer-in-Chief for Roads and Bridges and Sewers, sworn, and examined:—

R. Hickson, Esq. 14 Aug., 1889.

3153. *Vice-Chairman.*] You are Engineer-in-Chief for Roads and Bridges as well as Sewers? Yes.
3154. The sewerage works in Sydney are being carried out under your supervision? Yes.
3155. Together with the scheme under the consideration of the Committee? It will be.
3156. The designs have been made by officers in your Department? Yes.
3157. You, of course, have given your concurrence to the scheme for draining the Western suburbs which is now before us? As far as I have been able to attend to it in the short time during which I have been in the Department. I think it is the best system.
3158. I suppose you have officers whose duty it is specially to look after this particular work? Yes.
3159. Who has been in charge of it? Mr. Stayton was the officer who worked out the whole scheme. Unfortunately he is not here now; but we have two officers who have given great attention to it, and I suggest that they be examined.
3160. What is the name of the officer in charge of the work now? The sewerage branch is divided into two districts; Mr. Smail has one district, and Mr. M'Mordie the other; but the officer in charge of the sewerage generally, Mr. Baggie, together with Mr. Smail, worked out the scheme with Mr. Stayton, so that they are well up in all the details, more so than I am.
3161. Their evidence is available? Yes, I have sent for them.
3162. Have you, since the matter has been under consideration, given any attention to the system of electrolysis? Yes; I went into it.
3163. Have you made any estimate of the probable cost of the work under the electric system? Yes, I had an estimate made. [*Vide Appendix* K.]
3164. Does that show that the cost would be very much greater? Yes, considerably.
3165. Is it your opinion that a system of electrolysis would be successful—I mean that it is practicable to carry it out? I think it is quite practicable to carry it out.
3166. But it will be more expensive than the proposed system? Yes, very much more expensive. I think it will cost something like £300,000 more.
3167. Have you given any attention to what is called the separate system? Yes, as far as reading engineering works in connection with it goes.
3168. Do you think it would be advisable to adopt in any measure the separate system in carrying out the scheme? I think it would be a great mistake to make any alteration in the scheme proposed by Mr. Stayton.
3169. Then after mature consideration you consider this scheme to be the best? I do.
3170. Have you ever heard of Lienur's system? I have heard of it, but I cannot say that I have given any attention to it.
3171. So far as your information goes, has the system been regarded a success in any way? I could not say.
3172. Has it ever been tried in the Colonies? That I could not say.
3173. *Mr. Trickett.*] Have you checked the estimated expense of the scheme at all? No; it was designed before I came to the Department.
3174. Does the actual expense connected with the system of electrolysis provide for a system dealing with the sewage at more than one place, or only near the outfall at Webb's Grant? It only deals with it at one place, not at Webb's Grant at all. This plan shows where it is proposed to treat it. I should divide the city into two districts—a northern and a southern district. The whole of the drainage from the southern portion would go out to Webb's Grant, while that from the northern portion, including Leichhardt, Camperdown, and Ashfield, would go to a point between Iron Cove and Long Cove. We thought that the most suitable point at which to concentrate it. It would there be treated, and the sludge removed by water.
3175. If that system were adopted you would get rid of the stuff at two localities instead of one, as at present proposed? Yes.
3176. In what way would the expense come to the extra sum of £300,000? I have the details here. The engine and the working expenses connected with the dynamos would probably run the expenditure up to that amount.
3177. The cost of machinery and electric appliances would be the chief cause of the extra expense? And the working capitalised; that is the main expense.
3178. You have inspected Webb's Grant sewage farm? Yes.

R. Hickson, Esq. 14 Aug., 1889.

3179. More than once? Yes.
3180. What is your opinion as to its efficiency? I think there could only be one opinion, and that is that you could not get a better place for it.
3181. But as to the result; do you think that the manner of dealing with the sewage is satisfactory? I do not think that you could get a better place for dealing with it.
3182. Do you think that it is better, apart from the expense, than electrolysis? I think it is.
3183. Do you think that the area that is available at the present time will be ample for dealing with the sewage for some time to come? Yes.
3184. As far as you have been able to think over the matter, I understand that you endorse Mr. Stayton's system? I do.
3185. Have you had much experience in sewerage works? Not very much.
3186. *Dr. Garran.*] Mr. Stayton has now left the Public Service? Yes, he has gone home.
3187. You are not prepared, individually, at the present moment, to endorse his calculations, I presume? No.
3188. Could you, without much difficulty, get those calculations re-examined by some competent officer still in the Service—some responsible man? Yes.
3189. The Committee at present have only Mr. Stayton's calculations to depend upon? We can have the whole thing calculated. We have all the plans. It would take some time to do.
3190. Do you think it would be advisable, before committing ourselves to the scheme, to make sure that there is no mistake? I think you are perfectly safe in depending upon Mr. Stayton. He is a most careful man, and this is a specialty of his. I should be perfectly satisfied in taking his figures as correct.
3191. You, as an engineer, would rest your confidence upon him? I would.
3192. Do you know whether it is contemplated that your Department should carry out the work, or whether it is to be left to the Water and Sewerage Board? We contemplate carrying out the work shown on the plan. All the reticulation is to be carried out by the Water and Sewerage Board.
3193. It is not intended to put the whole work on them? No.
3194. If you become responsible for carrying out the main portion of the work you will be anxious that it will not cost more than is estimated? Yes.
3195. And in Mr. Stayton's absence you are responsible in trusting to his figures? Yes.
3196. Then we may take it that your Department endorses his figures? Yes.
3197. The rain-water which Mr. Stayton proposes to take is only from the roofs and yards? Yes.
3198. That would not be one-tenth of the whole of the rain-water—would it? About one-tenth.
3199. So that although this is a combined system it is only so to a moderate degree? Yes.
3200. You are of opinion that it would be best to deal with that portion of the rain-water in that way? I am.
3201. It is the quickest and best way of getting the yards clean? Yes.
3202. And prevents them from becoming sloppy by the water from the roofs draining upon them. You have no hesitation in recommending the system to the Committee in preference to the wholly separate system? None whatever.
3203. *Mr. Humphery.*] Are you prepared to accept the responsibility of Mr. Stayton's calculations? Yes; I am.
3204. *Mr. O'Sullivan.*] Have you given any attention to the system of electrolysis? Do you mean as a system or as applied to this scheme?
3205. As a system? As a system I believe it can be made perfect.
3206. It is perfect? Practically, I think it is.
3207. You think that it is past the experimental stage? Yes; that is the opinion I have formed.
3208. Do you think it would be wise for the Committee to recommend its adaptation to any portion of the scheme? I do not. I do not think it would be wise from a pecuniary point of view, and I think it would be very unwise to cut the scheme up into different systems.
3209. You will be the responsible officer for it? Yes.
3210. You prefer it to be carried out as designed by Mr. Stayton? Decidedly.
3211. Without any modification or alteration whatever to fit in other schemes with it? Yes.
3212. *Mr. Garrard.*] When Mr. Stayton was last before us he spoke of an alternative system for Balmain, making it all a low-level system, and pumping the whole of the sewage up into one main receiving sewer. Has anything more been done in that respect? Nothing more has been done.
3213. Supposing Balmain was made an entirely low-level area, what would be the difference between pumping the whole of the sewage up into the Bondi Sewer, and the cost of treating it locally by electrolysis;—have you given any attention to it? I did not take that part by itself, and cannot say what the difference would be; but it would be considerable, because the Committee should understand that if a system of electrolysis were adopted it would not get rid of the pumping. You must pump the sewage to a certain height to allow it to gravitate to the tanks.
3214. It would not have to be pumped more than 10 or 12 feet at the outside? Rather more than that—between 15 and 20 feet.
3215. Are you aware that under the present system only about two-thirds of Balmain is served, and that the remainder will have to be pumped? Yes.
3216. Do you know whether anything has been done in the Department with reference to the alternate scheme for Balmain? Nothing has been done.

C. H. Ohlfsen Bagge, Esq., Chief Assistant Engineer, Sewerage Branch, Department of Roads and Bridges, sworn, and examined:—

C. H. O. Bagge, Esq. 14 Aug., 1889.

3217. *Vice-Chairman.*] You are a civil engineer? Yes.
3218. And you have been engaged in the design of the scheme before the Committee for the sewerage of the Western Suburbs? I have not been engaged upon it myself.
3219. Not in any way? I have been checking the sewers in various ways. All the calculations were based upon our prices, and I supplied them to Mr. Stayton.
3220. You were engaged during Mr. Stayton's time in making these calculations? I assisted him by giving him all the information in my power.

3221.

C. H. O. Bagge, Esq. 14 Aug; 1889.

3221. To form the general estimate? Mr. Stayton's estimates are based upon the contracts let at the time for similar works.
3222. You took measurements, diameters, lengths, and all that sort of thing? Yes.
3223. You are of opinion that Mr. Stayton's estimate is approximately correct? I think it is a very fair estimate.
3224. You say that it is based upon a contract price being paid for work at the time you made the calculations? Yes.
3225. On the Government contracts? On the Government contracts.
3226. Did you consider the price of the brickwork and stonework—I suppose you did? Yes.
3227. Were you guided in that by the prices being paid then? Yes.
3228. Did you base any of the estimates upon the prices paid by private individuals? They would hardly bear comparison, since our work is totally different from private work. I think that since the sewerage works started the contractors have gradually cut down the prices to such an extent that there are scarcely any profits left, rather the reverse at times.
3229. The competition has been so keen that they have done the work at a loss in some instances? Yes.
3230. Has your particular branch of the engineering profession brought you into contact with the construction of works of that sort? I am one of the oldest living hydraulic engineers in Victoria? I have had forty-eight reservoirs under my charge there.
3231. Before you came to this Colony? Yes; reservoirs, aqueducts, and so on.
3232. Had you anything to do with the Yan Yean reservoir? I was connected with that office for eighteen months. I was at one time engineer of Goldfields Reservoirs.
3233. Have you given any attention to what is called the separate system? Yes.
3234. Do you approve of this system in preference to what is called the separate system? It is a matter of opinion; but as far as the broad principle is concerned, it is the opinion of leading authorities at home that the system here proposed is the only practicable system that can be carried out for the public benefit.
3235. That is, that this is the only system? Yes.
3236. You have also heard of Liernur's system? Yes.
3237. Have you seen it in operation? No, I know it only from books.
3238. Do you know whether it was tried in Victoria on a small scale? I am not aware.
3239. However you are clear in your opinion that this is by far the best system to adopt? I am positive that you will find it the cheapest system to carry out. There is no cheaper system than a water carriage system.
3240. Have you any misgivings as to the water supply being insufficient for working the system? Not at all; we have plenty at present, and the water-works here could be augmented if it were necessary to do so. In a large progressive town it is necessary to use plenty of water, and to provide it, and I have no doubt that it will be provided when required.
3241. Had electricity been used in your time at home as a means of separating the solid portion of the sewage from the liquid? The electric system, so far as I know, is based upon the celebrated Faraday's system, first made known in 1850. Then in 1885 lectures were given upon the same thing in Bohemia—I have forgotten the name of the university—but the water used there was manufactured for the purpose of being decomposed, whereas in this case sewage is to be experimented upon on a large scale. The theory has been known since 1850; lectures were given upon it in 1885, but it has only been turned to a practical use lately by Mr. Webster in London for dealing with the London sewage. The other waters treated were composed for the purpose. Mr. Webster's invention consists in the apparatus, and the manner and mode of using the principle for sewage.
3242. Do you think it has been found practicable to treat sewage by electrolysis? I believe it is thoroughly practicable to do so.
3243. Having regard to economy as well? I think you will find it very expensive.
3244. More expensive than these systems? Far more. I am sure there is nothing cheaper than the plain water carriage system.
3245. The use of electricity is generally found to be very expensive for other purposes besides the purification of sewage? I have prepared certain estimates from Professor Threlfall's paper, and upon Mr. Webster's estimate, and I find that this system is much more expensive than that proposed. With the best knowledge that we possess it would only be after long experiments that we could arrive at a conclusive estimate. The thing is thoroughly unknown, and has to be tried, but from what we know of what Mr. Webster has done the system must be a very expensive mode of treating sewage.
3246. *Mr. Trickett.*] The system Mr. Stayton proposes to adopt we must call, I suppose, a modified separate system? Mr. Stayton has adopted a system now in vogue in all the large towns of England. It is a modified system.
3247. It does not carry off all the surface water from the streets—it simply takes the roof water and the sewage? Just so.
3248. Have you sufficiently studied Mr. Stayton's scheme to know whether the pipes and sewers that he proposes would be large enough to carry off the sewage and the water collected from the roofs of houses and so on? Yes. I think you will find them ample.
3249. There is no fear of the water and sewage bursting up the sewers and destroying them? I think not.
3250. You are quite sure of it? In a large scheme like that which Mr. Stayton has proposed some slight alterations in details may have to be made when the working plans are designed; but I think on the whole that it is a very fair proposal.
3251. And ample allowance is made for the sewage? Yes; there is nothing to cavil at.
3252. You have read the appendix to Mr. Stayton's report? I have studied it here and there.
3253. Page 21 of that appendix gives the estimated cost of the proposed works? Yes, it is £830,304.
3254. Have you checked the figures in the preceding items which make up that amount? I have not checked every item here; but we had occasion to go through the work when we made a report upon the electrical system. We had to take Mr. Stayton's report and reverse it, and cut a trial line through it, as a surveyor would say. We came to about the same figures.
3255. But you will see that in arriving at the amount of £830,304 Mr. Stayton has divided the sewers into various parts. Have you gone sufficiently into the details of the scheme to be able to check the cost of the various sewers. He talks of the northern system, the southern system, and the western system? We have gone piece-meal through it; but not through the identical figures.
3256. You have gone through it sufficiently to check it? Yes.

3257.

C. H. O. Bagge, Esq. 14 Aug., 1889.

3257. On pages 24 and 25 Mr. Stayton gives estimate of the cost of the subsidiary sewers; have you checked those figures, or have you made calculations which would enable you to say that they would be about the cost of the subsidiary sewers. Mr. Stayton adds this foot-note, "The above sum is believed to be ample to provide for every contingency, and is inclusive of all works that can possibly be foreseen at the present time." Does that foot-note agree with your idea of what the expense would be? I think that as far as a man can foresee, without making full details, Mr. Stayton's estimate is a very fair one.
3258. Do you think that it is desirable to treat the sewage by electrolysis, or to adopt the sewage farm system, which is in partial working order at the present time? I should never adopt electrolysis unless I could help it.
3259. You therefore think that the sewage farm treatment is desirable? I think so.
3260. Have you seen the working of that farm? Yes.
3261. Do you think it is satisfactory? I do not think you could have a better site for a sewage farm.
3262. Do you think that 400 acres would be sufficient for a long time to come? I think so. We are only using 2½ acres now, and dealing with the sewage of a population of 10,000, which is hardly sufficient to supply the requirements of that area.
3263. So you approve of that treatment? Yes. When the Melbourne Sanitary Board were here, after they had gone through the whole of the Colonies they saw that farm and said, "it is the very thing we want."
3264. *Dr. Garran.*] I understand that you furnished a large portion of the material for Mr. Stayton's calculations? Yes.
3265. Was any other engineer working with you? Yes; there is a large office.
3266. Several people furnished figures for Mr. Stayton? Yes. When Mr. Stayton was preparing this scheme Mr. Bennett sent him to me with a message asking that I would give him every information, and I gave him the prices of all our contracts.
3267. You gave him the prices as far as you were concerned, but did you estimate the area of all the cuttings which you would have to make? They harmonize exactly with the sewers which we have done.
3268. But have you worked out the quantity of work to be done? Not the exact quantity.
3269. Who besides Mr. Stayton worked out the quantity of work to be done? Mr. Hammer.
3270. He worked out all the figures of Mr. Stayton? Yes.
3271. And no one else? I think Mr. Hammer was his principal assistant.
3272. Was he with Mr. Stayton all through? Yes.
3273. Will you look at page 22 of the appendix. You will see that Mr. Stayton there lowers the rate from 6d. to 5d. in the £ on the gross capital of £830,000? Yes.
3274. Now look at page 25. You will see there that with a reduced estimate for a longer term, and a lower rate of interest brings the rate down to 6½d. in the £ on the larger capital of £1,817,000? Yes.
3275. You do not know anything about these calculations? I did not check them.
3276. Did this other gentleman, Mr. Hammer, check them? It is very likely.
3277. You do not know? I could not say.
3278. *Mr. O'Sullivan.*] From your knowledge of the system of sewerage carried out in large centres of population in Europe you consider the system recommended by Mr. Stayton as the one best suited for the requirements of Sydney? I do honestly.
3279. Could you suggest how it could be improved in any direction? No. At present I do not think it is possible for any person to improve it, even with more knowledge than I have with regard to it, and I have a good deal. Even with my knowledge and cognizance of the whole scheme, it is very difficult to suggest at this moment any modifications. That cannot be done until the detailed plans are prepared.
3280. Did I understand you to say that you had assisted to supply the figures for the estimated cost? I merely said that I supplied Mr. Stayton with the cost of similar works being carried out at the time he prepared his design.
3281. I suppose in your opinion the cost of the work would be something near the estimated cost? They were the prices for which we got similar work done. I know that they were carefully checked through at the time, and that the figures put down were thought reasonable.
3282. Did you make any allowance for probable extras or variations? You cannot go in for those things in a large scheme of this kind. You allow a certain percentage and that I think Mr. Stayton has calculated for.
3283. I suppose another £100,000 would any way cover the probable extras? That is difficult to say because the population is increasing so rapidly that although Mr. Stayton's estimate may cover everything for the next ten or twenty years, by the end of that time the suburbs may have increased to such an extent that you would not know them. I have seen the most extraordinary changes during the nine years I have been here. You can understand that it is extremely difficult to say that these figures will cover everything.
3284. But did not Mr. Stayton take into account the rapid increase of the population? He did, but you have no laws of increase. The increase of population has not been calculated here as in the case of a town where during the last fifty years it has only varied from 2½ to 2⅝ths. We have not got such data here, and we can only guess the increase as near as possible.
3285. *Mr. Tonkin.*] Are we to understand that Mr. Stayton's estimate is founded on the information which he received from your office? Yes, naturally. We were the constructive office at the time, and we had all the prices in our possession showing the cost of work. We provided him with all those prices, as he was a stranger here and did not know the Colonial prices.
3286. Mr. Stayton furnished you with certain work required to be done, say tunnels to be driven, and you gave him an estimate of the cost? We gave him the cost of similar works and checked them through.
3287. Supposing he wanted half-a-mile of a certain sized tunnel driven, and wished to know what it would cost, you gave him the figures? Yes.
3288. *Mr. Dowel.*] Were you engaged on any of the surveys for this scheme? No. I was engaged all this time in getting out large contracts for the city.
3289. Did you take out a principal portion of the quantities in this scheme? No.
3290. You have only furnished the prices upon which the estimate is based? Yes.
3291. That is all you know of the scheme? Yes, and the check calculations made, when we revised a large portion of the scheme so as to adapt it for electrical treatment.*

THURSDAY,

*NOTE (*on revision*):—See reply to question 3254.

THURSDAY, 15 *AUGUST*, 1889.

Present:—

The Honorable JOHN LACKEY (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.	JACOB GARRARD, Esq.
The Hon. FREDERICK THOMAS HUMPHERY.	HENRY COPELAND, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, Esq.

JOHN HURLEY, Esq.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

John More Smail, Esq., M. Inst. C.E., Assistant Engineer, Sewerage Branch, Department of Roads and Bridges, sworn, and examined :—

J. M. Smail, Esq., M. Inst. C.E. 15 Aug., 1889.

3292. *Vice-Chairman.*] You are assistant engineer in the Sewerage Branch of the Roads and Bridges Department? Yes.
3293. You have had something to do with the scheme before the Committee? Yes; with the preliminary part of it before Mr. Stayton's appointment.
3293½. With the survey? Yes.
3294. You understand the design which it is proposed should be carried out? I do.
3295. Other than the experience which you have had in the commencement of the work, have you had anything to do with it. Has your attention been called to the work in any way as far as it has proceeded? That portion of the design which includes Macdonaldtown I am dealing with now.
3296. You are the surveyor in charge of it? Yes; and of Alexandria, which is shown green on Mr Stayton's plan.
3296½. That would not be very far from the main tunnel going to the sewage farm? No.
3297. What do you call that tunnel? The southern main outfall sewer.
3298. How far does the work extend which you are now superintending? As far as the dividing ridge between the Marrickville valley and the Shea's Creek valley.
3299. And it consists of three branches? Yes; of a main branch and two subsidiary branches.
3300. Have you completed the survey of this work? All the surveys have been completed. We are just waiting for instructions from the Minister to go on.
3301. Have you made any approximate estimate of the cost? We have taken Mr. Stayton's estimate. I have checked it; I have found that he is well within the mark.
3302. Taking the part of the work upon which you are now engaged, or the gross work? Taking the work as a whole.
3303. You think that as a whole his estimate is within fair bounds? Yes.
3304. I suppose it is usual to leave a margin in cases of this kind? Yes; to provide against contingencies.
3305. For fluctuations in prices and other circumstances? Yes. The principal item is the resumption of land. Land which has to be resumed may increase in value by the time the work is carried out.
3306. Whose duty has it been to check or correct the estimates for the proposed work all through? Mr. Hammer has taken out the whole of the quantities for the scheme, and they have been estimated at the ruling contract prices.
3307. What office does Mr. Hammer hold? He is a draftsman. He was attached to Mr. Stayton's staff, and carried out the work then.
3308. Has he been engaged in other works of a similar character? Prior to going to Mr. Stayton he was engaged on the Bondi scheme.
3309. Had he to do with the making out of the prices? No; Mr. Bagge did that.
3310. Who checked the estimate of cost in the Bondi scheme? They were made by Mr. Bagge and checked by one of the draftsmen.
3311. Has Mr. Hammer had any special experience in this kind of work; this is a large work and the Committee are very anxious to be assured that the estimates are correct, or approximately correct, and we want to know whether they have been checked in such a way as to give us a guarantee that they are satisactory? They are, as far as I know. Mr. Corbett was the other assistant to Mr. Stayton. Mr. Stayton would have had them checked before he decided on the matter finally.
3312. They have been checked practically by Mr. Corbett and Mr. Hammer? Yes.
3313. You have not gone into the matter yourself? I have checked them more as a matter of curiosity.
3314. As far as you have examined the estimates you think that they are correct? I think so.
3315. In your own mind, as far as you have gone, have you any doubt of the accuracy of the estimates? I think everything has been liberally provided for.
3316. Provision has been made for fluctuations in the price of materials? Yes.
3317. I suppose the material consists principally of brick, cement, concrete, and other things of that kind? Yes; the prices of those articles might fluctuate.
3318. *Dr. Garran.*] I understand that you have not taken out the quantities yourself at all? Yes.
3319. You have simply checked the prices? We have taken out the quantities partly, sufficiently to enable us to form a gross estimate.
3320. Have you taken out half of the quantites? No.
3321. Have you taken out a quarter? I have taken out one or two of the main lines—the western branch and the eastern branch—and I find that they are well within the mark.
3322. You found the calculations correct as far as you did check them? Not the calculation of quantities, but the estimate.
3323. You have not taken any quantities? Just sufficient quantities to get at the estimate.
3324. You have assumed that their quantities are correct? Yes.
3325. And you have compared their quantities with the prices? With the prices ruling at present.
3326. Your calculation simply amounts to this, that assuming the quantities to be correctly taken out, the prices are correct? Just so.
3327. You have not otherwise checked the scheme as a whole? No.

3328. Have you checked the ratio of rates that would pay the interest? No; there is one part which I have checked, and that is the part in reference to the reticulation. I see that Mr. Stayton, in the appendix to his report, has given £200,000 as the amount which it will cost to carry out the reticulation. Taking the ratio of the gross amount and what we have already carried out, I think he is within bounds there.
3329. Has Mr. Stayton's estimate for the reticulation been as exact as that for the whole work? I think so.
3330. We have been given to understand that the Public Works Department will only undertake the main tunnels, leaving the reticulation to the Water and Sewerage Board. I thought therefore that the reticulation might have been a mere general calculation? As a rule they go into detail more with the reticulation, because it is a more detailed work.
3331. As far as you have glanced at it, you think the estimate for reticulation is trustworthy? I think so.
3332. You know that this is called the combined system—that it is a separate system, including the water from the roofs and back yards? The partially separate system.
3333. Do you think that on the whole that system is the best for the district? Yes, and for any district.
3334. Have you given any attention to the relative merits of the two systems? I served my articles in the City Engineer's office, Town Hall, where the combined system was carried out—that is the present system.
3335. The system that at present exists in the city? Yes. That system takes the whole of the street-water and the sewage. What we are carrying out at present is the partially separate system, which excludes all the rainwater, with the exception of that from roofs and back yards.
3336. You think the sewage of Sydney would have been got rid of better by having a partly separate system, in the first instance? I think so.
3337. Are the additions to it—the Bondi Sewer extensions being made on the partially separate system? Yes.
3338. All of them? Yes; we exclude as much rain water as practicable.
3339. Can you tell me any parts which have been added on the partially separated system? Yes, Redfern. I am carrying that out now. We take no water from the streets.
3340. Only from the roofs and back yards? Yes.
3341. Has that sewer been at work? Yes.
3342. Do the pipes keep themselves clean? We have had no complaints. At one place over 1,000 people have been connected with it for nine months, and the system was fully tested by the late heavy rains. We take the water from the roofs and yards as natural flushing agents. If we did not do so the drains would become very bad.
3343. But do you not think that it is very undesirable to trust to the rain storms in a climate like this? We do not do so altogether; we trust to the water supply.
3344. Have you any artificial system of flushing? Yes. We flush by hoses; and turn each length of sewer into a tank. It is filled by the water-hoses, the plug is drawn, and the water washes out the sewer below.
3345. You use a certain length of sewer as a flushing tank? As a flushing section, to flush the section immediately below.
3346. You hold back the flow of water, and suddenly let it go? Yes. The head gives the velocity.
3347. Do you find that system satisfactory? Yes.
3348. There is no necessity for flushing tanks? There is no necessity at all, in fact I object to them.
3349. There is no danger of overfilling the small supply pipes? No.
3350. In fact during the heaviest rain storms which we had recently the water was easily carried off? Yes. Even the storm water was carried off by the storm-water sewers.
3351. Do you think the pipes are being made needlessly large? I think not; you take all the water supplied from the water mains. If we adopted the totally separate system perhaps a 9-inch pipe would do where we now use a 12-inch; but then we would have to have a duplicate set of sewers.
3352. Not if we let the rain water off by surface channels? You have to carry it out to the nearest water-course. That is an objection to the separate system, that it necessitates two sets of pipes.
3353. Allowing for the rain water which you carry off, how much of the capacity of your pipes is really occupied by the sewage proper, and how much do you allow for the occasional rain discharges? On the south we have taken 3 feet of rain water and 1 foot of sewage per head per acre, so we allow $\frac{1}{4}$ for the sewage.
3354. The pipes are four times as large as is necessary to take the sewage proper? Not necessarily. The pipes have to flow not full but about two-thirds full; according to the scientific way of designing them.
3355. But I understood you to say that the sewage proper only occupies $\frac{1}{4}$ of the pipe? Yes.
3356. Then three-fourths is ready to be filled up by air and gas as a rule? As a rule.
3357. Do you think that is a desirable space to allow for the accumulation of gases? The more gas space you have the more chance there is for its dilution, if the sewer is properly ventilated.
3358. Have you ventilated the sewers? Yes.
3359. By upright pipes? In some cases I have induced people to allow me to erect upcast pipes alongside their houses, and in the streets I have placed downcast pipes.
3360. Do you get any foul smells from the gratings in the streets? Yes; but very few.
3361. The gratings would be upcast ventilators if you got smells from them? Yes. They would be upcasts until we got ventilators at a higher level.
3362. Have you a sufficient number of high buildings to carry the ventilation to a great height? Yes. Redfern is well suited in that respect. There are many high places.
3363. Do you think there would be any means of ventilating the sewers in the district like the Western Suburbs—where there are few private houses more than two stories high? I think so. You can run the ventilating pipes up through the trees in the parks. You are not restricted to houses. In a mile of street you might only want twenty ventilator-pipes.
3364. Have you formed any kind of estimate as to the number of pipes which you want for a 4-foot sewer? That depends upon the size. If you reduce their number you must make them larger. You cannot lay down a hard and fast rule. You must act according to circumstances.
3365. Have you made any experiments in the district with which you are now dealing, to satisfy yourself that there is no great quantity of foul air imprisoned in the sewers? We have. We have tested the question

J. M. Smail, Esq., M. Inst. C.E.

15 Aug., 1889.

question in every case where we have erected an upcast pipe. We have tested the current with an anonometer and have found that there is a decided current. In the street ventilators the fresh air is drawn in.

3366. Have you tested at the top of the ventilators to find whether there was a draught? Yes, and have found that there was a decided draught.

3367. I ask you these questions, because you are now making an experiment of Redfern as it were of the whole scheme? Yes.

3368. I am trying to find out if the experiments have been satisfactory enough to justify us in recommending the expenditure? They have. The aldermen of Redfern are perfectly satisfied with the system. In the borough of Darlington they have carried out a system of their own and the sewers are totally unventilated. When the man-hole cover there was lifted, the Mayor admitted that the smell was certainly abominable; but when I took him to Redfern he said he would not know that there were any sewer ventilators unless his attention was drawn to them.

3369. You have no complaints from people getting the foul air in their bed-rooms? We have had one or two complaints, but I think it is mere sentiment.

3370. Have you ever seen the Adelaide system? No; but I have heard a great deal about it. We have two or three men in the Department now that came from there.

3371. The ventilators there are very numerous, and not very tall? Yes. Every house has to be ventilated as well as the sewers. The more you oxidise the gas the less dangerous it becomes.

3372. Except the flaps to hold back the water there are no impediments to the flow of the sewage? We divide each system into zones. Supposing we have a low flat and a rise and wish to prevent the accumulated gas from passing into the higher regions, we cut it off by means of a gas flap and cause it to rise, so that each district is shut off to itself.

3373. You never block off a district so as to prevent the gas from getting out? Never.

3374. You do not imprison it? Never.

3375. The only object of the flap is to prevent the gas from rising to the higher parts of the sewers and becoming obnoxious to the people residing in the higher districts? Yes.

3376. You leave plenty of escapes? Yes. Each district consumes its own gas.

3377. You have had something to do with the Bondi sewer? No; only with the southern sewer.

3378. You do not consider that that sewer is too large? The main outfall sewer?

3379. Yes? No.

3380. It will not have any great tributaries? It will have the whole of the subsidiary sewers, as far as the rise to Newtown and Strathfield.

3381. But not beyond that—it is comparatively limited? It is.

3382. It is not too big for the work; the sewer will not become a great gas-holder? No; but you could spoil the best system of sewers by not attending to it. These sewers will have to be properly attended to.

3383. You have no hesitation in saying that you prefer the partially separate system to the absolutely separate system? I do on sanitary grounds. I think it should be the only system adopted in hot climates.

3384. You do not think the gain through the smallness of the pipes under the separate system is worth considering? It is not, because you have to put down large storm-water sewers as well as duplicate pipes.

3385. So that one expense compensates the other? Yes; and under the separate system you have to have two sets of pipes for each house, one to carry away the water from the roofs and yards, and the other to take away the slops. In nine cases out of ten the slops go into the street gutter instead of into the sewer. I judge that from the report of the inspector which I received this morning. We can see the faults of the system by the work carried out at Surry Hills. Instead of the slops going into the sewer they flow into the gutters.

3386. But as far as I understand all the closet discharge and the kitchen discharge are connected with the sewer proper? Yes. But if you have servants they will generally put the slops down the nearest sink. A proof of that is seen at Surry Hills, where the system is now in operation.

3387. But would it not be safe to calculate that a girl would always go to the nearest sink? Yes.

3388. Would not the difficulty be met by putting the yard drain as far as possible from the house drain? Yes, but if you laid down a hard and fast rule like that you would put people to the trouble of altering their yards to suit it.

3389. You think that as the yards are built at present the people naturally throw their slops into the gutters? They naturally go to the nearest point.

3390. Still that is a matter of detail that could be obviated? It could be obviated; but with the partially separate system it would not occur at all.

3391. You think that on the score of economy the completely separate system is no gain? Most decidedly.

3392. And secondly from a sanitary point of view that there is no risk under the partially separate system of the sewers becoming dangerous gas-holders? I am sure of it.

3393. You think the ventilation you provide will be a perfect check on that? I do.

3394. *Mr. Garrard.*] Have you carried out any of the works already in operation? Yes, the whole of that sewer coloured dark green on the map which goes to the sewage farm.

3395. The main southern outfall sewer? Yes.

3396. You have carried out the whole of that? Yes, and I am dealing with the sewerage of Redfern, Waterloo, and Alexandria now.

3397. I understand that you have dealt with the whole of the reticulation of Redfern, which now falls into the Bondi and southern outfall sewers? Yes.

3398. Your work is in connection with the surveying in the first instance and then with the carrying out of the scheme? I am designing the whole of the reticulation work myself. I made all the previous surveys and helped in the designing of the original works, and carried them out eventually.

3399. Have you had anything to do with the laying out of the proposed extension of sewers shown by the red lines? I am dealing with the portion which falls into the southern outfall sewer now.

3400. In Macdonaldtown and Redfern? Yes.

3401. Have you had anything to do with the proposed sewers? Only that portion draining into the southern outfall sewer.

J. M. Smail, Esq., M. Inst. C.E. 15 Aug., 1889.

3402. I suppose the sewers that fall into the main sewer are made on the partially separate system? That is the system carried out.
3403. This is an extension of an already agreed upon principle of sewerage? Just so, and it is the principle carried out by engineers of experience.
3404. Do you know how the scheme came to be designed, and whether it was reported upon? The Western Suburbs scheme?
3405. Yes, and the Bondi sewer? That was the outcome of the report of the Sewerage and Health Board in 1877.
3406. Was it reported upon by anybody? Yes, Mr. Clarke was brought out to report upon it, and upon the Nepean water supply.
3407. It was on his recommendation that the Bondi and main outfall sewers were adopted? Yes.
3408. In other words the partially separate system? Yes. I do not believe there is a place in the world where there is what they call the absolutely separate system existing in its entirety.
3409. Except the Liernur system—that is absolutely separate? Yes.
3410. Have you given any attention to it? Just by mere reading.
3411. You do not think there is sufficient in it to warrant our considering it? I should not waste time over it.
3412. You know that it has been successful in some of the continental towns? In one or two places where it has been adopted; but it has never been adopted since.
3413. What is your objection to it? I consider that water carriage is the best.
3414. Do you object to anything but the water carriage system? Yes, because there is no gain in the Liernur system; it is only adapted to towns or flat country. It is on the exhaust principle.
3415. There is a concentration of the sewage and it has to be taken away from the depôt? Yes. What gave a start to the system was that people thought that they could get so much for the Poudrette made from it; but that idea is exploded now. It has no commercial value whatever.
3416. Have you read Mr. Henson's paper on Mr. Stayton's proposed scheme? I have. I discussed that question at the Engineering Association and I defended this scheme.
3417. Have you read Mr. Stayton's reply to Mr. Henson's paper? I have.
3418. Do you think that what he says there is perfectly correct? Perfectly correct.
3419. I suppose Mr. Stayton has been dependent upon various officers in the Department for information as to quantities and prices in designing his scheme? He has had assistance to take them out, and he has supervised the whole thing himself.
3420. Then he has corrected the whole and has based his report upon these sub-reports and other data? Yes, he has had reliable information as to the prices. The prices given to him have been those at which we have actually carried works out. There is only a question as to the quantities, and I believe that they are correct. For my part I should be quite prepared to start the work, and take them as they stand.
3421. You spoke just now of a probable increase in the price of land which would have to be resumed. Will much land have to be resumed? Land was resumed on the sewage farm.
3422. Independently of that—I mean for the main sewer? Possibly we may have to go through some market gardens to make a direct line of sewer, and it is probable that that land in five or ten years time may increase in value.
3423. That is the only part of the estimate which you think may be exceeded? Yes; but it is a contingency which no engineer can foresee.
3424. Is the tendency for the price of work to increase or decrease? To decrease, because competition is getting more keen.
3425. So that you have every confidence in believing that Mr. Stayton's estimate will not be exceeded in any way? I am quite confident on that point.
3426. You have had a good deal to do with the Cook's River sewage farm, have you not? Yes.
3427. You are perfectly satisfied with the way in which it is working? I am perfectly satisfied that from a sanitary point of view it is a perfect success. It has been proved by the chemical analysis of the effluent water which has been made.
3428. Have you had anything to do with the electrolysis experiments? Yes; it was at my suggestion that Mr. Bennett allowed Mr. Roberts to go to Botany. We had the sewage there with which to deal, and we erected the requisite apparatus. I think some of the Board saw it. We tested it on several occasions, and got a splendid result from it.
3429. Who is Mr. Roberts;—is he a gentleman employed in the office? He is a draftsman in the office. He patented the system in Sydney.
3430. He was not aware of the fact that Mr. Webster was making experiments of a similar nature? He patented his a month or so before we heard of Mr. Webster's experiments.
3431. Have your experiments been discontinued? The matter was put into Professor Threlfall's hands first; but as he waited so long we took it up ourselves. He then returned from England, where he had witnessed Mr. Webster's experiments, and we thought that we were not justified in expending any more money till the Minister had given his decision.
3432. Do you know anything about the proposed alternative scheme for Balmain? I believe that there is some alternative scheme for dealing with the sewage of Balmain by electrolysis, and turning the water into the harbour, instead of pumping it up into the northern outfall sewer.
3433. If Balmain is to be a low-lying area, do you think it would be a good place to make an experiment of the electrolysis system or to deal with the sewage by some other means, instead of pumping it up into the out-fall sewer? All down to the 30-feet contour will flow by gravitation into the main outfall sewer, and there is very little below that in Balmain. If it is intended to make an experiment, that will be a very good place to make it.
3434. Do I understand that you would favour the proposed system being carried out, or the dealing with the lower levels by a system of local purification? If you did not wish to bring the sewage on to the sewage farm, then, of course, electrolysis would supersede any other system of purification. It is by far the best.
3435. *Mr. Humphery.*] We have been told that two sets of drain pipes or sewerage pipes would be necessary in the separate system;—is that the case? I am positively sure that if the absolutely separate system is carried out two sets of pipes must be used. That is the opinion of all the engineers in England.

J. M. Smail, Esq., M. Inst. C.E. 15 Aug., 1889.

3436. We have evidence here to the effect that one set only is necessary, and that the storm-waters would run away on the surface? In some places it is possible that they might do that, but you cannot lay down any hard and fast rule. You will find even now that we have to construct storm-water sewers to carry away heavy rainfall.

3437. You think that it is a mistake to say that the whole of the rainfall could be carried away by surface gutters? Yes. As I said before I do not believe that there is a place in the world where the absolutely separate system is carried out in its entirety—it is a misnomer altogether.

3438. Have you made any estimate of the cost of the application of electrolysis to sewage? An estimate was made of the cost of treating 1,000,000 gallons from the experiments at Botany, and it showed that that process was half as cheap again as treating it with chemicals; but I would never substitute treatment by electrolysis where suitable land could be obtained upon which to deposit the sewage as at Webb's Grant.

3439. You think Webb's Grant is suitable in every way to receive the sewage and purify it? I am sure of it.

3440. And that it would be quite unnecessary to apply electrolysis? In this shape; but in detached places I certainly would apply it—in places where you would otherwise have to treat it chemically.

3441. *Mr. O'Sullivan.*] You appear to think that the separate system will not be a success in Sydney? As I understand the separate system, it would not. There are two kinds—the absolutely separate system, and the partial separate system.

3442. I am talking now of the absolutely separate system as advocated by Mr. Henson. You appear to think that that would not be a success in Sydney? I am positive that if it were introduced the whole thing would prove a failure in a few years.

3443. I suppose to work it throughly we should require a large quantity of water? That is one of the objections against it. In summer-time you would require a larger quantity of water to flush the drains and wash out the sewer gases than you would if you used the rainfall.

3444. Would there not also be another danger that damage might be caused through the streets being flooded owing to the convergence of a number of drains into one particular street? Having a duplicate set of pipes?

3445. Yes? There would not be a danger from that, because the storm-water sewers would be made large enough. There would be a danger in this way, that if there were two sets of pipes a man might connect with the one nearest to him, which might be the storm-water sewer, and then his sewage instead of going on to the sewage farm would go into the harbour. From my experience at the inlet house, Cook's River, the first rush of water is foul enough to go into any sewer, and in fact should not be allowed to go into the water-courses. I can say this without fear of contradiction. One morning at two o'clock, when I was in the house, and there was no sewage coming down the sewers, a shower of rain occurred and I can assure the Committee that the water coming down the sewer was as bad as the sewage. After a time the organic matter was washed out, and the water was pure enough to go into the river. The first shedding should not go into a storm-water sewer.

3446. You also apprehend a danger from the ignorance of servants who might allow the slops to go down the wrong channel? That is one fatal objection.

3447. Mr. Henson imagines that that could be prevented by the regulations of the Water and Sewerage Board;—do you think that in spite of those regulations there would be that danger? I think so. In England they have the best system of by-laws possible and yet their engineers find that their work cannot be carried out because of this difficulty. I think the system also puts the public to an unnecessary expense.

3448. *Mr. Trickett.*] I presume that, with the absolutely separate system, it would either be necessary to have a second pipe for the purpose of carrying off the storm waters, or to have very wide water-channels through the streets? Yes; you must have one or the other.

3449. A second sewer, or wide water-channels in the streets, similar to those which they had in Melbourne? Just so.

3450. In Melbourne after heavy rains the streets are frequently flooded, and loss of life has taken place? Just so.

3451. You have made a number of subsidiary sewers in Redfern? Miles of them.

3452. What size have you made them? They vary. The largest sewer would be 24 inches in diameter.

3453. What length of street would that be? Probably on a very flat grade. A steep grade reduces the size of the pipes. The 24-inch pipes would be in the main branch. The subsidiary sewers are, with few exceptions, not larger than 9 inches.

3454. Has experience in Redfern proved that the 9-inch pipes are quite sufficient to carry off the excreta and house slops? Yes, and the rainwater from the roofs.

3455. In a street half a mile long with a fair incline, would a 9-inch pipe be sufficient to carry off the sewage from a pretty thick population? Yes, provided a suitable grade is obtainable.

3456. Has experience proved that in Redfern? Yes.

3457. There have been no cases of the pipes being blocked up? No, and we have had them pretty well tested.

3458. Even during the last heavy rainfall the pipes were not blocked up? A 9-inch pipe that drained quite 600 houses was not even half-full. My calculations in many instances give a 6-inch pipe as ample, but it is not advisable for practical purposes to put down less than a 9-inch pipe, because there are many things to be considered, such as stoppages.

3459. In Redfern are there many manufactories that discharge their water into the sewers? Yes; Redfern and Alexandria are almost a city of manufactories.

3460. What kind of manufactories are there? Jam manufactories, boot and bedding manufactories, and others.

3461. Using steam power, and a large quantity of water? Yes.

3462. Notwithstanding that, these pipes have proved sufficient? Ample.

3463. Mr. Stayton, when examined, was asked this question—

> 665. What is the estimated cost of the subsidiary sewers? £1,000 a mile is the average. I have taken it at that rate, which makes a total of £300,000 for the first section.

What I wish to ask you is this. In constructing the subsidiary sewers in Redfern are you able to state whether that is a fair average cost for such work? Yes, for the sort of ground we shall have there, I think Mr. Stayton is well within the mark. It is a very fair estimate.

3464. It is not likely to cost more than that? I think not. There is a probability of the work being done much more cheaply.

3465.

3465. Did you come across very much rock at Redfern? Yes. The nature of the excavation of course will rule the price of the work.
3466. Judging from the other localities which have to be treated under Mr. Stayton's system, do you think the cost is likely to exceed an average of £1,000 a mile? I think not, because out there there is very little rock, except where the main ducts go. The reticulation pipes are not required to be very deep. They will probably not have to be more than 7 or 8 feet deep. That is the reason why I am sure that this is a fair estimate.
3467. *Dr. Garran.*] All the reticulation pipes will be stoneware pipes? Yes.
3468. Will any part of the main ducts be stoneware pipes? No; except the top part near Strathfield, where 24 and 18 inch pipes can be used.
3469. Stoneware would not be safe for a main sewer? No. They never make stoneware pipes larger than 24 inches, and you might want a 3-foot sewer. It is cheaper to work with concrete.
3470. Will these sewers be made of concrete and brickwork? Yes.
3471. What is the smallest? 3 feet 6 inches.
3472. What is the difference in price? ——
3473. Do you intend to use concrete? Yes. Concrete is replacing brickwork altogether. All sewers which we are making now are of concrete.
3474. Is the Bondi sewer of concrete? Yes.
3475. Is it found to be more satisfactory than brick? Yes.
3476. Taking that as a guide, the bulk of the main ducts would be in concrete? Yes. We can reckon it at so much a chain.
3477. What makes you think that the price of work may be cheaper? Competition, and the prices going down.
3478. Is cement at a moderate price now? At a very fair price. In England it costs 6s. to 8s. a cask, while out here it costs 15s. There is no doubt that when the supply increases the price will decrease.
3479. Have you considered the Balmain portion of this scheme? Not in detail.
3480. You could not say whether it is better to take what we can by gravitation or make the whole a low-level system? As a general principle, I say take all you can by gravitation.
3481. That will be expensive because of the rock tunnelling? Yes; the tunnelling is expensive.
3482. But you think it is cheaper to take one main sewer than two side contour pipes? I think so. The whole of the low-level sewage could be worked up by a Shone ejector. If you turn the whole of it into one pumping-station you have the whole cost of the lifting.
3483. You do not think there will be any serious difficulty with the two syphons between Balmain and the Bondi sewer? I do not think so. The Cook's River syphon is working so well that it justifies me in saying so.
3484. The bottom of the syphon is always full? Yes.
3485. You can blow it out whenever you wish? By impounding the water at the top end you can get an extra head of 6 feet.
3486. That is enough to scour it? Three feet would scour it out.
3487. Is the syphon under the Parramatta Road, near Newtown, at work? No; it is awaiting the consideration of this scheme. Directly the Committee report upon it we shall commence on the Balmain and the Glebe portions.
3488. The Prince Alfred Hospital sewer goes the other side of the syphon? Yes.
3489. There is no sewage going down on the Newtown side? No.
3490. So you have not tested the syphon? Not with sewage.
3491. In case of a stoppage you have a valve by which you could discharge the drainage into the bay? Yes.
3492. The other syphons are constructed in the same way? Yes. Whenever we cross a creek we have a chamber into which to discharge the sewage while repairs are being effected.
3493. So that the syphons can never be blocked up? They can never be blocked up.
3494. *Mr. Copeland.*] Are the sewage pipes which you laid down made of earthenware? They are stoneware pipes.
3495. Where are they manufactured? At Fowler's, Goodlet and Smith's, and other places.
3496. All locally? All locally. We test all the pipes that we get.
3497. Are they set in cement? If the ground is very bad we make a foundation of concrete. The pipes are laid upon that, and jointed up with a ring of gaskit; the joint is then filled up with cement.
3498. So that the pipes are made perfectly water-tight? Yes.
3499. And gas-tight? Yes. I may say that we put a length of pipe through a swamp, and when it was filled in there was no water in the pipe.
3500. With reference to the sewer-gas that generates in the pipes, is it of a greater or less specific gravity than air? It would be heavier—it is carbonic acid and other gases. There is, however, a difference between sewer-gas and sewer-air. The sewer-gas is a totally different thing, and if it does generate it has no right to.
3501. The gas will be generated in the sewers? Possibly in the outfall sewer, but not in the subsidiary sewers. It takes from twenty-four hours for matter to decompose, and in that time it should have been conveyed out to the ocean, or on to the sewage farm.
3502. But supposing there should be a stoppage. You were speaking just now about the escape of this gas. If the gas is of a greater specific gravity than the atmosphere, how can you get a current to remove it? That is one of the anomalies of sewage-gas, that the heaviest gas rises. It is according to the law of diffusion of gases.
3503. Is there not a possibility that it is forced up out of the sewers by the air below it, but that when it leaves the shaft its greater specific gravity causes it to sink? Although it is heavier than the air, it ascends, according to the theory of diffusion.
3504. Assuming that you have ventilating shafts, after the gas has left those shafts, would it not be liable to sink down to the earth again? It gets oxidized and diffused, and diluted, and is not dangerous.
3505. It would be diffused as I understand if it were lighter and rose; but as soon as the gas gets away from the current of air in the upcast shaft, if there is no other current, as on a frosty night, will it not come down again? If it came down, it would be diluted, and would be harmless.
3506. You do not anticipate any bad smells from the gas? No. 3507.

J. M. Smail, Esq., M. Inst. C.E. 15 Aug., 1889.

3507. Have you ever experimented with the ventilator popularly known as the Smelling Bottles for a mean Mr. Thornton's; I think that is more use as a monument than anything else. It is usele sewer-gas shaft. It does not affect the sewers beyond 300 feet away from it.
3508. You are not aware of any bad smells emanating from that shaft? No.
3509. You do not think there is any danger to be anticipated from the descent of the sewer gas? No. I think it would be perfectly safe to put shafts above the roofs of houses.
3510. How high? The Act says that the top of the ventilating shaft must be 6 feet above the highest point of the roof.
3511. That is where they are attached to houses; but what height must they be when they are separate? That would be according to circumstances. In a locality where the ground was high and open you would not be required to take the ventilating shafts up so much.
3512. You said it would be necessary to resume some land for the main sewers? I said that that was possible.
3513. Do you not think that it is desirable that these lands should be resumed as soon as possible? I think so. Eight years ago I recommended to Mr. Bennett that extra land for a sewage farm should be resumed, which we want now for the Western Suburbs. It was then so much an acre; it is now so much a foot.
3514. The longer it is left the more you will have to pay for it? Yes; but I must say that the public are meeting the Department very well by giving us permission to go through their land without paying compensation.
3515. You are not aware whether the Government have taken any steps towards resuming the whole of the land along the course of the drains? No.
3516. Is it your opinion that steps should be taken to resume that land as soon as it is decided to carry out the work? Yes; I should resume it.

Frederick Hammer, Esq., Surveyor and Draughtsman, Sewerage Branch, Department of Roads and Bridges, sworn, and examined:—

F. Hammer, Esq. 15 Aug., 1889.

3517. *Dr. Garran.*] Are you engaged in the Sewerage Department? Yes, at the head office.
3518. Were you engaged under Mr. Stayton at the time he made these plans? Yes.
3519. What service did you render to him? I prepared the plans and estimates.
3520. Were you engaged on the ground in surveying? No.
3521. Your work has all been in the office? Yes.
3522. Have you taken out all the quantities as to the depths of all the cuttings and all the work in the tunnels? Yes.
3523. You have estimated all the brickwork? Yes.
3524. And all the stonework? Yes.
3525. And all the earthenware pipe work? No, only partially.
3526. Did Mr. Stayton make his calculations on the basis of the figures you gave him? Yes, he approved of them.
3527. Did he check any of your calculations? All my calculations.
3528. Did any one else besides Mr. Stayton check your calculations? No.
3529. Did you go over your own calculations yourself more than once? Twice, and sometimes thrice.
3530. You are reasonably sure that the estimate of expenditure is a correct one? Yes.
3531. Did you also calculate the rate that would have to be paid to cover the expenditure? I simply checked Mr. Stayton's figures.
3532. You are familiar with his report? Yes.
3533. You will observe on page 22, when he was dealing only with the main works, and fixed them at £830,000, he reckoned that the rate would be from 6d. down to 5d. in the £ per annum? Yes.
3534. I now draw your attention to C 3 in the Appendix, where he estimates that by taking sixty years to repay the debt the rate will be 6½d. in the £ on the larger sum of £1,817,896? Yes.
3535. So that you see the estimate is 5d. in the £ on £830,000? Yes.
3536. And only 6½d. in the £ on an estimate of nearly £1,000,000 more? Yes.
3537. Have you checked both those calculations? I checked the calculations; but I cannot remember whether it was exactly on that sum, though I think it was.
3538. You see that the larger sum is the amount that the work will cost when all the reticulation is included? Yes.
3539. Therefore we have to make the rate on the larger amount? Yes.
3540. Do I understand that you are clear in your own mind that 6½d. in the £ will pay the rate, interest, and principal in sixty years on the large amount, or would you like to recalculate it? I think Mr. Stayton's calculation ought to show it, but I should like to check it.
3541. Have you his calculation? Yes.
3542. Could you look it through and send to the Committee a statement as to whether it works out this result? Yes.
3543. What the Committee wants is some check on Mr. Stayton's calculation to satisfy them that 6½d. is the correct estimate, and that it will pay off the principal and interest on the outlay.
3544. There are three estimates in the Appendix;—one calculated under the existing Act for a rate of 9¼d.; another, under the Amending Act, for a rate of 7d.; and a third, with interest at 3½ per cent. and repayment in sixty years, for the rate of 6½d. The Committee want to know whether that last amount will be the rate necessary to pay off £1,817,000? Yes.
3545. Your work is solely in the office? Yes.
3546. You have no particular business with the contractors? No.
3547. You took the current prices paid from the gentlemen who have charge of that part of the work? Yes.
3548. So far as you have noticed the prices given to you, they are the prices paid by contract? Yes.
3549. You have been able to check that? Yes.
3550. So that you are able to say that at present prices of the material and labour this work could be done for £1,817,000? It depends upon the market prices.
3551. Taking the present prices? I think it ought to be.

3552. You have worked all this out at these prices? Yes; I took the average of three or four contracts.
3553. Assuming that these contracts would not cost more than current contracts, the work could be done for this amount? Certainly.
3554. And if the Committee were to say £2,000,000 for this, you feel reasonably sure that that amount would be within the margin? It should be within the margin.
3555. What is the plan which you produce? It shows the low-level system.
3556. The blue patches show where the sewage will have to be raised to get it into the main sewers? Yes.
3557. What are the pink patches? They show part of the low-level system.
3558. What is the marking in Balmain? Also low-level, and will have to be pumped.
3559. Roughly speaking, one-fifth of the whole area dealt with by the scheme will have to be pumped? About one-fifth.
3560. *Mr. Trickett.*] How long have you been in the Department? Since 1881.
3561. Where were you before that? In Germany.
3562. Has this been your business all your life? No; I have been connected with various engineering establishments.
3563. In what capacity? As constructing engineer. I was three years at locomotive works, and some years in a shipbuilding yard.
3564. You have had considerable experience in calculating works of this kind? Yes.
3565. Has this been your chief work since you have been here? Yes, principally.
3566. How did you get the information to enable you to arrive at the cost? I made cross sections of the sewers, and calculated therefrom the various quantities, such as excavation, concrete, brickwork, &c., appertaining to an estimate.
3567. But the length of the sewers and all that kind of thing was supplied to you by someone else;—you did not make the actual survey? No; the length was taken from the map.
3568. Did you take those tunnels? Mr. Stayton and I took the various lengths of tunnels and cuttings from the plan.
3569. You went into all the details—the length of the streets and the sewers—and so on, and worked them out by scale to get at the estimate? Yes.
3570. And went into the matter carefully? Yes.
3571. Have you had experience of drainage works on a large scale elsewhere? No.
3572. Have you read much about the subject? Yes.
3573. What do you think of the scheme generally? I think generally it is a very good scheme. Probably a few improvements might be made.
3574. Only in matters of detail? Yes.
3575. Taking this as a whole, you think it is the most advisable of all the modern schemes for draining a large area like the western suburbs? Yes.
3576. *Mr. Humphery.*] How did you arrive at the cost of the subsidiary sewers; Mr. Stayton provides for about 400 miles? Mr. Stayton made the calculations; I made no estimates for subsidiary sewers.
3577. You do not know how he arrived at his estimate of cost? No; but the probability is he calculated the cost of miles in various localities and averaged it.
3578. Did he know what he would have to average, what depth? The excavation will be very little, and would not exceed the usual depth in pipe laying.
3579. Have you ascertained how he fixed the depth for these subsidiary sewers? No.
3580. It is only an approximate estimate at best? I do not know. Mr. Stayton did his own calculation; I was otherwise engaged.
3581. You do not know whether anyone checked the calculation? No; but I think it is reliable.
3582. You think the estimate for the first portion;—for the main drains is ample? Yes.
3583. You speak from your knowledge of the cost of work which you have gained in the Department? Yes.
3584. You think ample provision has been made in Mr. Stayton's estimate? Yes.
3585. *Mr. Garrard.*] The plan you produce dealing with the low levels only embraces a very small portion of some districts, such as Five Dock, and Concord, for example? Yes.
3586. What is it proposed to do in future with the remaining portions. The area you bring under the map is very small? The remaining portions are excluded, and will have to be specially considered afterwards.
3587. They are excluded because there is no population there? I think that was Mr. Stayton's main reason. He pointed that out to the Council.
3588. Much of it could be brought in by gravitation to the main sewers? The levels are too low.
3589. Valleys intervene between the present system and that cut off, necessitating either an aqueduct or a pumping station? Yes, valleys intervene, and I believe it was intended to deal with the excluded area by a separate system, as the proposed mains are not calculated to carry this sewage.
3590. Do you know anything of an alternative scheme for dealing with Balmain as a low-level system? Yes; the low-level system is shown on a special map.
3591. But we have been told that this system will not serve a great deal of Balmain, and Mr. Stayton said that he had an alternative scheme to make the whole of Balmain, and a portion of Leichhardt a low-level system, and raise the drainage by pumping? The alternative scheme referred to is that shown on the special map.
3592. Do you think it would be better to make the whole of that district—namely, Balmain and the low-lying portions of Leichhardt part of this scheme and pump the sewage into the main outfall sewers, or to deal with it locally? I would bring it into the Bondi sewer.
3593. By pumping? By gravitation, and by pumping the low-levels.
3594. You do not favour the idea of making the whole of Balmain part of a pumping system? No.
3595. Have you given any attention to the purification of sewage by electricity, or in any other way? I have only heard of it from Professor Threlfall's report.
3596. Your work has been confined to making calculations in the office from data supplied by yourself, or someone else? Yes.
3597. Who has taken Mr. Stayton's place in the Department? Nobody.
3598. Has not somebody been recently gazetted as Assistant Engineer for Sewerage? No.
3599. Was not Mr. Stayton classed as Assistant Sewerage Engineer? He was. He was specially appointed to get out the Western Suburbs scheme.

F. Hammer, Esq. 15 Aug., 1889.

3600. And was he next in command to Mr. Bennett in sewerage matters? Yes, as regards the Western Suburbs sewerage scheme.
3601. What position did Mr. Bagge occupy during that time? Mr. Bagge was and still is Chief Assistant Engineer for Sewerage. He had to do with the construction of the Bondi sewer.
3602. He was in charge of the construction? Yes.
3603. Is Mr. Bagge in charge now not only of construction, but also of general designs? Yes.
3604. Were you next in position to Mr. Stayton in preparing this scheme? We were the only two.
3605. Had you no assistants? No.
3606. Excepting the surveyors in the field, I suppose? Yes.
3607. You were furnished too with the prices of current contracts? I obtained the prices from the head office.
3608. From the office records? Yes.
3609. I understand that you do not anticipate any increase in those prices in carrying out the work? I think not.
3610. I think you have told Mr. Trickett that you have read extensively on the subject of dealing with sewage? I have read something of it.
3611. Have you given any attention to what is called the separate system? Yes.
3612. Do you favour that system as against the partially separated system? I prefer the partial system.
3613. Do you know anything about Captain Liernur's system? I have read something about it, but it is not much favoured on the continent.
3614. You have not seen it in actual operation? No.

William Dugald Campbell, Esq., Assoc. M. Inst. C.E., Surveyor and Draftsman, Sewerage Branch, Department of Roads and Bridges, sworn, and examined :—

W. D. Campbell, Esq., Assoc. M. Inst. C.E. 15 Aug., 1889.

3615. *Dr. Garran.*] Are you in the Government Service? Yes, in the Sewerage Department.
3616. Under whom? Under Mr. Smail, immediately.
3617. What experience have you had in sewerage works? I have had experience in London under Mr. Louis Angell, who is the engineer to the West Ham Local Board. We did a good deal of sewerage work in the district, and I subsequently made out the drawings for the drainage at Maidstone, on the separate system for him. I afterwards obtained a premium for one of the best designs for the drainage of Seven Oaks, in public competition. I have reported upon two towns in New Zealand since.
3618. *Mr. Garrard.*] Where are they? Hamilton and Hokitika. Altogether I have had sixteen years experience as a qualified engineer. I have examined Mr. Stayton's design, and I think it is suitable, more particularly so, as the configuration of the ground is such that it facilitates the rapid discharge of storm-water. The system that Mr. Stayton advocates is, I think, the best that can be adopted.
3619. *Dr. Garran.*] You would not change his system from one of partial separation to one of complete separation? No. I think that his is the only workable system owing to the heavy rainfall. Indeed there is no precedent for the absolutely separate system, with two sets of pipes for house connections.
3620. You said just now that you had dealt with Maidstone on the separate system? Yes, on what is known as the separate system. What is generally known as the separate system is that which Mr. Stayton calls the partially separate system. I looked through a number of accounts specially to refresh my memory upon the subject. The writers repeatedly describe instances where they have carried out the separate system, and they say that they have admitted the roof and yard water. I know of no instance, unless perhaps it is at Henley, where the absolutely separate system is carried out, but I do not think the system there could be considered as an absolutely separate system.
3621. Have you checked Mr. Stayton's calculations at all? I have looked into his figures of the population and rainfall, and such matters pertaining to construction, but I have not gone into the prices at all.
3622. Did you make calculations as to the rate that was necessary? The interest.
3623. Yes? No, I have not. I should like to say that the rate Mr. Stayton intends to adopt in taking the rainfall of the yards and roofs is about ·22 of an inch rainfall over the entire area, and that is almost equal to what the London sewers are calculated for, which is $\frac{1}{4}$ inch per day, but there all excess is discharged into the Thames by storm over-flows, after it has been contaminated by the sewerage.
3624. Have you made any estimate as to what the yard and roof area is as compared with the whole area? Yes, taking Mr. Stayton's figures at 34·11, it comes out at 15·66 per cent.—that gives ·22 of an inch over the entire area.
3625. We shall have 15 per cent. of the rainfall in these pipes? No. 15 per cent. of the entire area.
3626. The yard catchment is rather greater than the roof catchment? Mr. Stayton takes it at the same.
3627. In a place like the Western suburbs, where there are so many gardens, it surely would be greater A great deal is absorbed into the ground. I think Mr. Stayton is quite correct in taking that proportion, because where there is a large area there will be absorption, and the water will not reach the sewers at all.
3628. On the whole he takes the size of the yard as equal to the size of the roof? Yes.
3629. *Mr. Trickett.*] I understand that with the separate system if a place becomes more thickly populated the inconvenience of getting rid of the storm-waters would become greater, the greater the number of houses and the more the yards are paved the sooner the water is collected? It varies according to the nature of the ground.
3630. Supposing the place were thickly built upon the storm-water would flow along the streets in much greater quantities than if there were only a few houses, and the water was absorbed into the earth Provision is always made for a future population in laying down a sewer.
3631. Has that provision been made here? Yes.
3632. Looking at the requirements of the future as well as the requirements of to day, does this scheme sufficiently provide for getting rid of the water from roofs without a probability of the sewers becoming too small for the purpose. Do you think this matter has been well considered? I think the provision s sufficient. The reticulation is a matter which is not minutely described in Mr. Stayton's report however.
3633. Did you say just now that to your knowledge the house-water did not go into the sewers by the separate system, or that it did? No towns with which I am acquainted have adopted a separate system of sewerage in which the rain-water from the roofs and the yards does not go into the sewage.

W. D. Campbell, Esq., Assoc. M. Inst. C.E. 15 Aug., 1889.

3634. The same pipe is used for both purposes? Yes.
3635. Have you read of the separate system in America? No, I have not.
3636. You do not know anything of its working there? No; I have been acquainted with it in England, where it has been used for a great number of years. Tottenham was the first town that was drained under the separate system—in 1851. The system was similar to the one Mr. Stayton proposes here. Halstead was similarly sewered in 1863; and Canterbury, in 1868, partly. Since then a number of towns have been sewered on this principle.
3637. It is not really the separate system but the partially separate system? Yes, what Mr. Stayton calls a partially separated system.
3638. *Mr. O'Sullivan.*] Then the system which we are given to understand is a separate system exists only in theory? I think so.
3639. You know of no instance where the totally separate system has been applied in Great Britain? Henley is the only place I know of.
3640. Even there it is not an absolutely separate system? No, they take the back-yard water I understand.
3641. From your experience and knowledge you think we are perfectly safe in adopting the system proposed by Mr. Stayton as the best for the City of Sydney and the Suburbs? I think so taking everything into consideration.

WEDNESDAY, 21 *AUGUST*, 1889.

Present:—

The Honorable JOHN LACKEY (VICE-CHAIRMAN).

The Hon. ANDREW GARRAN.	JAMES EBENEZER TONKIN, ESQ.
The Hon. FREDERICK THOMAS HUMPHERY.	WILLIAM SPRINGTHORPE DOWEL, ESQ.
The Hon. WILLIAM JOSEPH TRICKETT.	EDWARD WILLIAM O'SULLIVAN, ESQ.
JACOB GARRARD, ESQ.	JOHN HURLEY, ESQ.

CHARLES ALFRED LEE, ESQ.

The Committee further considered the proposed Drainage Works for the Western Suburbs.

Frederick Hammer, Esq., Surveyor and Draftsman, Sewerage Branch, Department of Roads and Bridges, sworn, and further examined:—

F. Hammer, Esq. 21 Aug., 1889.

3642. *Vice-Chairman.*] You were examined before this Committee upon the Western Suburbs Sewerage scheme at our last meeting, and you now produce a statement supplementing the evidence which you then gave? Yes. [*Vide Appendix* L.]
3643. You now state upon oath that to the best of your belief the contents of this paper are true? Yes.
3644. Are there any further observations which you would like to make? I must state that the £2,200,000 in 1894, and the £3,300,000 in about seventeen years' time, is a fair estimate. The £2,200,000 in 1894 is about 5 per cent. of the ratable value in 1887, and the amount in about seventeen years' time is about 4½ per cent. of the ratable value in the same year.
3645. Those figures are contained in the statement you produce? No, but they are the results of calculations made after the completion of the statement I produced.
3646. *Mr. Humphery.*] £3,300,000 will be the ratable value of the property at the time when it is estimated that the work will be completed? Yes.
3647. The rate will have to be paid upon £3,300,000? Yes. It will be about 3 per cent. under the amended Act.

APPENDIX.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

(Drainage Works for the Western Suburbs.)

APPENDIX.

[*To Evidence of J. Barling, Esq.*]

A.

SEWERAGE AND DRAINAGE OF THE WESTERN SUBURBS.

Meeting of Representatives of Municipalities.

Sir, Department of Public Works, Sydney, 9 January, 1889.

Referring to the evidence given by me before your honorable Committee on the subject of the Sewerage of the Western Suburbs, in which I referred to a meeting of representatives of the various municipalities interested which had taken place, I have now the honor to request permission to have the enclosed report of the proceedings at the meeting referred to added as an appendix to my evidence.

I have, &c.,

The Honorable John Lackey, M.L.C., Chairman of the Parliamentary Standing Committee on Public Works.

J. BARLING. Under Secretary.

A MEETING of representatives of the various municipalities concerned in the Western Suburbs Sewerage Scheme was held in the Board Room of the Public Works Department, on the 6th December, 1888. The following is a copy of the letter convening the meeting, which was addressed to the several Mayors :—

Dear Sir, Department of Public Works, Sydney, 30 November, 1888.

As the proposals of the Government respecting the sewerage of the Western Suburbs will probably come before the Parliamentary Standing Committee on Public Works some time during the latter part of next week, Mr. Sutherland suggests that it would be as well for those immediately interested to have an informal meeting with the Government Engineers who have prepared the plans, &c., so that all the witnesses who will be called will have the advantage of becoming thoroughly acquainted with the scheme in all its details.

I am therefore to invite you, and any of your Aldermen who may desire to come, to meet Messrs. Bennett and Stayton at this office on Thursday next, the 6th December, at 10 a.m. If you could bring with you any statistics as to cost of the removal of night-soil, &c., by the system at present in operation in your borough, it would be of great assistance.

I have, &c.,
J. BARLING,
Under Secretary.

The following gentlemen amongst others attended :—Joseph Abbott, Esq., M.P. ; J. H. Carruthers, Esq., M.P. ; W. L. Davis, Esq., M.P. ; N. Hawken, Esq., M.P. ; J. S. Hawthorne, Esq., M.P. ; W. Henson, Esq., M.P. ; A. Hutchison, Esq., M.P. Ashfield—Alderman T. Dean (Mayor), Alderman J. Mills, Alderman J. A. Lyttle. Alexandria—Alderman J. R. Dacey (Mayor), Alderman John Turner, Alderman John Harden. Burwood—Alderman H. Lipscomb (Mayor), Alderman R. W. Hardie. Camperdown—Alderman Sparkes, J.P. (Mayor), Alderman Abigail, J.P. Canterbury—Alderman J. Quigg, Alderman P. J. Scahill, Alderman A. Brown. Leichhardt—Alderman Sadler, Alderman Moore, Alderman Walsh, Alderman Neale, Alderman Winkle. Macdonaldtown—Alderman John Baldwin (Mayor), Alderman J. Peake, Alderman H. Knight, Alderman J. Jacobson. Marrickville—Alderman Charles Moyes (Mayor). Strathfield—Council Clerk, Mr. J. H. Balmain.

The Chair was taken by the Hon. John Sutherland, Secretary for Public Works, who, in opening the meeting, stated that its object was—First, to elicit the opinions of the Municipal representatives on the scheme prepared by the Government ; secondly, to hear any objections which any of the gentlemen might have to urge against the scheme, and answer any questions which the meeting might desire to put ; and thirdly, to obtain the names of witnesses who were prepared to give evidence in favour of the Government proposals.

With regard to the first matter, the Chairman pointed out that the scheme prepared by the Government provided for the sewerage of nineteen municipalities, viz :—Alexandria, Ashfield, Balmain, Burwood, Camperdown, Darlington, Glebe, Macdonaldtown, Marrickville, Newtown, Petersham, Redfern and Waterloo, Canterbury, Concord, Five Dock, Leichhardt, St. Peters, and Strathfield ; but that three of those municipalities, viz., Darlington, Redfern, and Waterloo, were not immediately affected, as works for outfall sewers had already been provided. He further stated that copies of the report and sketch-plan referring to the scheme were sent to the boroughs concerned early this year, and up to the present time the following municipalities had expressed approval, viz. :—Ashfield, Burwood, Camperdown, Macdonaldtown, Marrickville, Newtown, St. Peters, and Strathfield.

With regard to the second matter, as the question involved was of the utmost importance to the welfare of the citizens, and affected both the sanitary conditions of their neighbourhood and also intimately concerned their pockets, Mr. Sutherland said he should be glad to have the fullest discussion on the subject. The Government engineers were present and would be prepared to give any information, and answer any

 questions ;

questions; and should any gentleman have objections to offer against the scheme, it would be the most favourable opportunity for ventilating them, and the Department would endeavour, as far as possible, to meet objections. Whatever took place, the fullest discussion, whether for or against, was, he said, invited.

With regard to the third matter, Mr. Sutherland stated that, while it would be one of the objects of the meeting to obtain the names of those gentlemen who were prepared to give evidence in favour of the scheme, and these need not be confined to those of the gentlemen present, or who were members of Municipal Councils, the Government did not for one moment wish it to be understood that they wanted to burke discussion, and it would of course be within the province of anyone who wished to give evidence against the scheme to appear before the Committee for the purpose.

He then stated he would call upon Dr. MacLaurin, the Government Medical Adviser, to give his opinion as to the urgent necessity for the sanitary measures proposed, and afterwards call upon Messrs. Bennett and Stayton to fully explain the scheme, and answer any questions which the meeting wished to put, and then obtain the names of the witnesses.

Dr. MacLaurin said: The question of the disposal of night-soil from the western suburbs has received great attention for sometime past, and he, himself, had taken an interest in the matter for more than three years, as Medical Adviser to the Government. At present, the principal way of disposing of night-soil in many parts of these suburbs was by burying, and it was now hardly possible to find any place sufficiently isolated and accessible to be suitable for this purpose. Hence it was clear that some measure must be introduced, embracing a scheme which should be general and comprehensive, for the whole of the western municipalities. It was impossible to go on as we are doing at present, as the population was increasing so rapidly that the present state of matters could not continue without causing great inconvenience. It was scarcely necessary to bring forward any arguments in this connection from a sanitary point of view as it was well known what injury would arise from an accumulation of foul matters in many ways, and particularly by contaminating the water-supply. The evil results of the accumulation of fæcal matters show themselves in two ways—first, by the existence of typhoid fever, and, secondly, by the high rate of mortality of young children under 5 years of age. With respect to both of these matters, it is very clear that the health of the suburbs is not what it might naturally be expected to be. There was a table prepared some time ago by the Board of Health which gave the relative mortality from typhoid fever between the city and suburbs, and although they would not be justified in taking these statistics as giving the absolute sickness from typhoid fever, still they might be assumed to convey a good general idea of the relative health of the different places. It would be seen from this table that whereas the death-rate in Sydney from typhoid and other infectious fevers was at the rate of 4·38 per 10,000 of the population, in the north-western suburbs it amounted to 9·48, and in the west central suburbs—that is to say, Newtown, St. Peters, Camperdown, and Macdonaldtown,—it amounted to 12·44.

Now, one would have expected that in these suburbs, where the population was not so dense as in the city, and where the allotments were larger, the death-rate, instead of being higher, would not have been so high as in the city, and the fact of the present high death-rate of the suburbs was therefore strong evidence as to the necessity for the adoption of improved sanitary measures.

The other point which he mentioned was with regard to the high rate of mortality of children under 5 years of age. According to Mr. Stayton's report the death-rate of children in the suburbs has exceeded that of the city since 1880. It might have been expected that the suburbs would have been more healthy than the city, yet the result has proved to be quite the other way.

When we considered, therefore, that the death-rate from typhoid fever in the western suburbs and the death-rate from infantile complaints were both of them excessive, and when we considered further that these were the natural results of an improper accumulation of fæcal matter, he thought there could be no doubt that the Government were justified in bringing forward a scheme which should be suitable as a general provision for the removal of night-soil from the whole of the western part of the metropolitan district. Such a scheme as that proposed by Mr. Stayton would in all likelihood reduce the excessive death-rate of the suburbs, and he thought it was one with which they should all agree.

Dr. Ashburton Thompson then spoke as follows in support of the Government scheme:—"Mr. Secretary Sutherland, your Worships, and gentlemen,—None of you, I am sure, have come here to-day prepared to argue that sewerage is unnecessary in any of the districts over which you preside. The convenient and cheap disposal of slop-water is the question which probably has given you most trouble to answer during the past few years; and although the matter has been earnestly debated from time to time, nothing practical has resulted. This has happened, I believe, not from want of earnest good will, but because it has gradually come to be seen that nothing but a scheme of water-carried sewage would meet the case. But to regard this matter from the standpoint of convenience alone is to take a superficial and therefore inadequate view of it. It is true that, with the steady and rapid increase of population, it has become more and more plain that the present unsystematised methods of nuisance removal could not much longer be followed; but in the prevalence of fevers—and this prevalence has been steadily kept before you—there is evidence that not comfort alone is being sacrificed, but life itself. I say that this has become clearer as the population has increased in density, and that is a phenomenon which has been observed everywhere. Sanitation is very fitly described as the art of living in towns. Inhabitants of isolated country dwellings can with small trouble keep their houses free from sources of illness; but as soon as houses begin to accumulate in towns, and in proportion as they so accumulate, the problem of cleanliness becomes more complicated, and cannot be solved without carefully organized co-oporation. Well, you have seen this, and you have co-operated to the best of your powers, and you have done very much valuable work. I am onxious to take this opportunity of acknowledging it, for the course of my duty has obliged me sometimes to find fault; and yet I am very well aware of the restrictions under which you labour, both in respect of powers and in respect of revenues heavily weighted with various charges. But, with your very best endeavours, what is the result? Are you not, after all, obliged to make the best of a number of intollerable nuisances—of open sewers, of garbage heaps, of night-carts? And, with that, what is the net effect of your efforts on the public health? Why, after doing the best you can do under the circumstances, I can tell you that the city and suburbs together, upon an average of ten years past, have an

an infantile death-rate of 173 per 1,000; and that that is a rate no less than 13 in the 1,000 above the rate for London. Now I must explain that I choose this infantile rate for several reasons which I need not enlarge upon now. I need only say that it is generally regarded as the best available test of the public health, in default of very elaborate calculations; for the delicate organisms of the very young respond readily to the influence of their surroundings, and succumb readily when that is unfavourable. And then I choose London for the standard of comparison for several reasons again, but among others, because in fact it is a very low standard for us, and one which we ought to excel so far that for purposes of comparison it would be useless to us, for London is a large town, and death-rates are observed to bear a constant ratio to the density of populations; the larger a town becomes the more unfavourable to infant life are many of its conditions. We, on the other hand, have a thousand advantages over the people of London, besides that inestimable advantage of a greatly lower rate of density. This being so, it may be said that London should have a much higher death-rate than we have, or rather that we should have a much lower one; and yet, in fact, notwithstanding the density of the population, the position is reversed—in truth, the London rate is lower than ours. What then has intervened to bring about this result—to counteract the bad effects of a very large city? Why I repeat that what we refer to as sanitation is in fact the art of living in towns, and the difference between us and London is that that art has been cultivated there so that that city surpasses ours. We must admit that we have thrown away our natural advantages. Now this art of living in towns is merely the art of providing the unwieldy population with the means of decent cleanliness, of which, after pure water, good sewers are the most important by far. Water, by the wise liberality and foresight of the Government—water of excellent quality—is in course of extension to the most distant corners of your very large districts, and the same authority, careful of the best interests of the country, now asks you to accept its aid to get that other essential of healthy town life, good sewers. Given these in addition to the water, and I do not for a moment doubt that our infantile mortality-rate will be reduced, not to London's 160, but perhaps to something not very distantly approaching the same rate for our own country districts, which is about 98. Now I have mentioned the mortality, the death-rate—and that of infants only. You know how prevalent typhoid has been for many years; but you may not perhaps have sufficiently observed that the importance of this disease is not to be measured by the number of deaths alone, but also by the number of non-fatal attacks of sickness, and best of all by the ages of the persons seized with it. I can tell you that here this prevalent and fatal disease attacks by preference, roughly speaking, persons between the ages of 15 and 35; persons, that is to say, at ages when their usefulness is highest, their ordinary liability to death lowest, and when their sickness causes the greatest pecuniary loss to the community. But this is not the only disease of this kind from which we suffer very heavy losses; diptheria, diarrhæa, cholera, and dysentery are others of the same kind; and all of them are preventable diseases which, under the most favourable conditions might undoubtedly be almost abolished. Now, you are asked to join in spending money; and many things in the world have to be brought to the test of the pocket. Even in matters of life and death we have to consider profit and loss, ways and means. I am afraid I cannot show that the money you are now asked to spend on behalf of your individual municipalities will clearly return a profit to your individual coffers; but I think you must be ready to admit that a life saved is in reality money saved, and above that, that a diminution in the average annual number of days of sickness (such as sewerage will undoubtedly result in) is a real and great pecuniary saving. You see, a saving of seven days sickness per annum per head upon 52,000 males means in fact a saving to the community in one year of all the profit and advantage derivable from 1,000 years of toil, for every single year that that reduction is effected in that population. Now the prosperity of nations is correlative with the prosperity of its parts—say of its municipalities. I do not wish to push this argument too far, but if you spend money in reducing sickness—and you will spend it to that end if you spend it on sewers—I think you will on reflection see that this expenditure—this bread cast upon the waters—will at last be returned to you. There is another branch of this argument which it may be well just to mention. You are, each in his district, doing with nineteen seperate and independent establishments a certain work, and you know the advantages of co-operation; you know that work is better done under it, and with that more cheaply done. Now in point of fact you have, by the exertions of the Minister, an opportunity offered of co-operating for your purposes in the very best way; these sewers will render unnecessary all your expensive separate establishments. They may or may not cost a little more—I am not sure that on a careful review it would be found that they would cost more—but it may be so; against this however is to be set the fact that they will do at least twice as much work, all of it necessary to be done; and the greater part of it, the removal of slop-waters, you have found you cannot possibly do effectually for yourselves. As to the actual scheme before you it would ill become me to attempt to criticise in detail the finished work of the accomplished engineer who has prepared it. But there are many general points on which it is my duty to express an opinion, even if I may not mention the details of grades, dimensions, and velocities. With that limitation then, I beg leave to express very high approbation of it, and to recommend it to you very earnestly. I need say no more on that point at this time."

Mr. Bennett, Commissioner for Roads, said that the details of the scheme were fully stated by Mr. Stayton in his report, which had been prepared under his instructions and in accordance with the directions of the Minister for Works. The co-operation of Mr. Stayton was very valuable, because it was advisable to have the latest information from England in such matters; he had, therefore, recommended the Government to secure the services of Mr. Stayton. This was the second work of the kind he was now connected with, and he entirely concurred in all the recommendations made with regard to the proposed scheme. He had been dealing with these matters for over forty-five years, so that he was no novice. He was prepared to answer any questions. Mr. Stayton's Report, at his request and by direction of the Minister, had been forwarded to all the municipalities, and otherwise spread as widely as possible to give the necessary information. They had been fortunate in securing the approval of municipal authorities.

Mr. Stayton said he did not think he could add much to what had been stated by Mr. Bennett. He thought that from the information regarding the proposed scheme which had been supplied, and a glance at the large map or cartoon which was exhibited in the room, they would be enabled to form a very good idea of what was contemplated. If any further explanation were needed he should be happy to give it, in order that all those present might be thoroughly acquainted with the work proposed.

The

The Chairman at this stage called for questions.

1.—*The Mayor of Ashfield* asked how long it would take to bring the scheme into operation? *Mr. Bennett*, in reply, said that the date of the completion of the works would be 1894. It was proposed, however, to bring into operation parts of the works as completed before that time.

2.—*Mayor of Ashfield*: Referring to page 17 of the report, what provision would be made by the proposed scheme for the sewerage and drainage of the places mentioned when the population had increased? *Mr. Bennett*: At present the resident population was very sparse, and there was very little sewage to be disposed of. When it ultimately became necessary the sewage could be lifted into the main sewer.

3.—*Mayor of Ashfield*: Was it the intention of the Government to construct branch sewers? Would the work connected therewith have to be done by the Municipalities? *Mr. Bennett*: The estimate provided for the construction of the works as indicated on the plan. The minor sewers would be provided for afterwards as may be determined by the local bodies.

4.—*Mayor of Ashfield*: If the sewerage works of Adelaide cost £3 per head, and London £2 per head, how will this scheme be brought into operation within the limits of the estimated cost when the higher rates of our labour are taken into consideration? *Mr. Bennett*: There are two reasons for the low price estimated for the works, compared with the cost of those in Adelaide and London. In Adelaide the sum mentioned includes the whole of the works from the sewerage farm to the ventilating pipes. The scheme proposed is not so comprehensive. In London the sewers were made 30 years ago when things were not so economically managed as now. This experiment has enabled us to reduce the amount very considerably.

5.—*Mayor of Ashfield*: The greatest difficulty was with regard to the disposal of the slop-water, and not the night-soil. That they could deal with. But a large amount of slop-water flows into the creeks, which are a source of danger to the public health. Is the Government prepared to deal with this question? *Mr. Bennett*: The Government consider that provision is made by the scheme. When the storm-waters are separated from the sewage there will be nothing to be apprehended from them.

6.—*Mayor of Ashfield*: Will the cost of dealing with the storm-waters have to be borne by the municipalities? *Mr. Bennett*: Yes. It will not be provided for by the Government.

Mr. Fred. Walsh, one of the aldermen of Leichhardt, apologised on behalf of the Mayor for not having before the present time sent in the approval of the scheme by the Council; but their Mayor had thought it best to get the fullest information possible before seeking approval of the scheme. It was acknowledged, so far as his borough was concerned, that the proposed scheme would not subject the ratepayers to more taxation than they at present paid for the removal of night-soil. Or at any rate, taking the necessity of scavenging into consideration, the increased taxation in connection with the proposed scheme would be little or none. One great obstacle was the sewerage of the low-lying portions of Leichhardt. It was found that there were 6½ miles of streets which would not be served by the scheme. This area contained 332 houses, representing a population of about 1,500, who were now suffering. There was an urgent necessity for steps being taken to apply a remedy so far as the low-lying portions were concerned. He urged, therefore, that some temporary measure should be placed before the Works Committee for consideration. He suggested that the sewage to be thus dealt with might, as a temporary measure be taken into the Parramatta River, even though it had to be dredged away afterwards. It was necessary, he said, that something should be done immediately. This aspect of the question was not touched upon in Mr. Stayton's report.

Mr. Bennett said, in reference to what Mr. Walsh stated, that a great deal of the nuisance caused to the inhabitants of the low levels arose from the sewage from the higher parts flowing down. When the proposed scheme, therefore, was brought into operation, the nuisance, it would be found, will decrease very considerably. He thought he might say that the Government did not contemplate leaving such places as those referred to exposed to the evils described when the scheme was brought into operation. He thought, therefore, that the objections pointed out would be met to some extent.

Mr. Walsh desired to add that what he had remarked was not urged as an objection. They were told that the scheme would be ready in 1894; but he thought something should be done immediately to remedy the evil complained of.

Mr. Bennett said he thought the remedy in question could be applied in very much less time than that, and thanked Mr. Walsh for supporting the scheme.

Mr. Carruthers, M.P., said he wished to know which of the alternative schemes for repayment of cost it was intended to submit to the Public Works Committee, and whether the term of such would be twenty-eight years or sixty years. He considered it only fair that it should be sixty years, as it was only just that posterity should contribute towards permanently beneficial works. He also desired to know whether it was intended to make early provision for the drainage of the low waters, as referred to in Mr. Stayton's report. It would be unjust to the people concerned to allow the present state of things to continue. Another thing he wished to know something about was whether any precedent had been established for having sewerage pumping stations in the midst of a large population. It seemed to him that the effect of furnishing such information would be to allay a certain amount of suspicion and distrust. It being intended to convey the sewage to a place known as Webb's Grant, he thought it was only reasonable to inquire whether any nuisance would be caused to the municipalities in which this depôt existed.

Mr. Bennett replied that the first matter alluded to was one for the Minister and Parliament to deal with. With regard to the storm-water arrangement at Marrickville, he thought the present one was complicated by the water being defiled by the sewage. He thought the difficulty could be met by having the dam a little higher up Cook's River. With regard to the position of the pumping station, he should be happy if some one would accompany him on a visit with a view to a suitable site being adopted.

Mr. Abbott, M.P., suggested that a return showing the actual cost of removing the night-soil should be obtained from each of the municipalities. It should, he thought, also show the cost they are put to by providing for the slop-water drainage. He considered, however, that the scheme now proposed should be brought into operation. If it were so expensive as to become a burden there should, he considered, be some expression of opinion as to whether the term of repayment would be extended to a period

period within which the rates could be paid, so as to minimise the present cost. He thought posterity should be called upon to bear a share of the burden which would be imposed. He would undertake, on behalf of the municipalities in his electorate, to get the figures to which he had referred, and he hoped all the mayors and aldermen would co-operate to the same end. He would support the suggestion advanced by Mr. Carruthers as to extending the time of repayment to sixty years. On behalf of Macdonaldtown it was stated by one of the aldermen present that the Council was prepared to come forward in support of the proposed scheme. It was not, he urged, a question of cost, but of health. Whatever the cost might be, he hoped the measures proposed would be brought into operation as expeditiously as possible. What the municipalities desired was that the work should be commenced at once. He knew, as had been explained, that the people in the low land suffered from the flow of sewage from the high levels. No one Council could undertake to bring a temporary scheme into operation, as this was a question which concerned other municipalities. The difficulty, he added, was not connected so much with the disposal of the night-soil as with the drainage of the slops. The Councils in his electorate were, he understood, ready heartily to support the scheme.

Mr. Hawken, M.P., who represented Darlington, said he concurred entirely in what had been said by the last speaker. The work, he thought, should be undertaken at once. The sewerage scheme was a necessity. He suggested, that if possible, the scheme might be carried out simultaneously. He considered the cost a matter for the Treasury and the Water and Sewerage Board. They had had enough of cesspits, and the removal of night soil in the way it had been removed. He thought the Government scheme should be accepted. He quite concurred in the view that if the sewage of the upper levels was properly dealt with the evils complained in the low lying parts would be very much less than at present. The point raised by Mr. Carruthers, with regard to the pumping machinery used in the low lying parts, was an important one, as he considered there should be no nuisance created amidst the people. It made no difference whatever how long they were allowed to make repayment for the outlay. They always had the fatherly government to fall back upon. They might safely leave the matter in the hands of the Government so far as the money was concerned. He would have liked a scheme which did not necessitate pumping machinery or a sewage farm. He had seen some of these farms, and they were an intolerable nuisance for miles around. The sewage farm at Adelaide he regarded as a nuisance. He felt satisfied, however, that the whole of the engineering ability of the Colony had been brought to bear upon the scheme under review. He hoped the work would be taken in hand simultaneously in all the municipalities.

Mr. Stayton stated, with regard to pumping-stations, that his experience in London and other parts of England where they had been established, enabled him to assure them that the operations were carried on without any nuisance whatever.

Mr. Henson, M.P., said: Taking it for granted that the proposed scheme is the most efficient and the cheapest, he thought there was some mistake in the answer given to the question put by the Mayor of Ashfield, viz., that the municipalities would have to deal with the storm-water apart from the sewage. If he was correct, it was proposed to provide overflows along the line of sewers to let off the storm-waters. This being so, the above storm-water would be let from one valley to another, which, he thought, would be illegal, and, if carried out, would lead to litigation. He also asked whether the rate of 8d. in the £ applied to all the suburban municipalities as well as Balmain and Leichhardt, and whether there would be any higher rate.

Mr. Alderman Hardie, of Burwood, said he thought the whole of the aldermen would thoroughly support the scheme proposed by the Government. He thought the work should be pushed on at once, without delay being caused by collecting statistics. There was quite sufficient information on the subject already. The Secretary for Public Works was to be commended for urging the scheme on. He did not agree with what had been said by a speaker representing Darlington with regard to money matters. He thought the Government should have a voice in the matter. He thought the Government should be asked to extend the time within which repayment was to be made to sixty years. He understood that for similar works elsewhere 100 years had been allowed. He would like to ask what arrangements it was proposed should be made financially where sewers had already been laid down by Councils.

Mr. Bennett replied that the cost of any well-constructed sewer suitable to the circumstances of the scheme would be credited to the municipality concerned.

The Chairman then spoke on the subject of the length of time within which repayment is to be made. He stated that the law did not empower engineers to alter enactments. The present law provides twenty-eight years, and therefore that was the position of the matter which had been seriously discussed in the Cabinet. The Government, he stated, intended to extend the time under the proposed Local Government Bill, but until this became law the existing provisions must be carried out.

Mr. Hardie, of Burwood, asked whether any danger to health was to be apprehended in connection with the sewers.

Mr. Bennett replied that the question had been dealt with in a paper by Mr. Stayton to be laid before the Committee on Public Works.

Mr. Hardie further asked whether, in view of the mistakes which were at first made at Adelaide with regard to the ventilation of sewers and drains, the Government would take the necessary steps to amend the law in this Colony in order to ensure ample ventilation and efficient house drainage.

Mr. Sutherland replied that he was aware that the powers in this respect given by the Metropolitan Water and Sewerage Act were insufficient, but that the Government had decided to introduce a Bill to amend that Act at the earliest possible opportunity.

One of the speakers asked, with regard to the proposed rate of 8d. in the £, what guarantee there was that the amount would not be largely increased to cover the cost of carrying out the scheme. If it should afterwards happen that the estimate was doubled or trebled it would be a very serious item, and some reasonable assurance should be given. He would therefore be glad to hear what there was to be said regarding the point.

The Chairman stated that this was a question for the engineers to deal with. They were responsible to Parliament for the estimates given.

Mr.

Mr. Stayton then read the following statement, which he had prepared after much consideration, with a view to giving a definite idea as to the ultimate outlay to be incurred, and its effect on the necessary drainage rates to be hereafter levied :—

SEWERAGE OF WESTERN SUBURBS.

STATEMENT showing the estimated ultimate cost of works for a complete system of sewerage throughout the Western Suburbs ; prepared 20th September, 1888—

		£	£
(1.)	*Works already executed or nearing completion.*		
	Northern outfall (proportionate part)	88,000	
	Southern outfall and sewage farm (proportionate part) ...	186,000	
			274,000
	NOTE.—These may be regarded as maximum proportionate amounts for the Western Suburbs.		
(2.)	*Present Scheme.*		
	Main sewers and other works, as per report		830,304
(3.)	*First Section of Additional Works.*		
	Subsidiary sewers (300 miles)	300,000	
	Canterbury and Enfield main sewer (first part)	20,741	
	Marrickville storm-water drainage	20,000	
			340,741
			£1,445,045
(4.)	*Subsequent Works.*		
	Subsidiary sewers (100 miles)	100,000	
	Completion of Canterbury and Enfield main sewer	65,410	
	Low-level systems (Shone's)	119,650	
	Completion of Western outfall sewer	48,374	
	Do. Marrickville pumping station	6,817	
	Do. sewage farm	32,600	
			372,851
	Total		£1,817,896

The above sum is believed to be ample to provide for every contingency, and is inclusive of all works which can possibly be foreseen at the present time.

Statement showing the annual ratable value of the nineteen boroughs and districts comprising the Western Suburbs of Sydney :—

In 1884	£1,116,000
„ 1886	1,437,000
„ 1887	1,571,000
„ 1888 (estimated)	1,700,000

On the completion of the first three sections of the scheme in 1894, it is estimated that the annual ratable value will have increased to £2,200,000, in which case a rate of 1d. in the £ would probably produce £8,900 net.

At the final completion of the entire scheme, in (say) from fifteen to twenty years' time or upwards, when the population would be double or nearly treble what it was in 1887, the ratable value may be fairly estimated at £3,300,000, in which case a 1d. rate would produce £13,400 net.

As to possible lower rate of interest.

The magnitude of the work and its importance to the ratepayers is such that special consideration will doubtless be necessary with regard to the financial part of the question. Under the "Metropolitan Water and Sewerage Act" the rate of interest chargeable on cost of works is fixed at 4 per cent., and the term of repayment twenty-eight years. This rate was doubtless in accordance with current rates in 1880, when the Act was framed.

It is now proved that the Government of this Colony can effect loans in London for 3½ per cent. From my knowledge of the London market I feel sure that there would be no difficulty experienced in obtaining a loan for such reproductive works as sewerage and water at 3½ per cent., especially as the money will not be wanted for two or three years, and the security would be on the rate of the whole district.

The London Metropolitan Board of Works 3½ per cent. stock is now at about 112. The Birmingham, Liverpool, Nottingham, and other corporation stock is practically as good. In all these cases the security for interest and repayment is upon the rates and for long periods.

Comparative

Comparative annual rates for Western Suburbs sewerage, including interest on outlay, repayment, and working expenses. (Prepared December 3, 1888.)

If under existing Act, with interest at 4 per cent. and repayment in twenty-eight years.

If under proposed amended Act, with interest at 4 per cent. and repayment in sixty years.

If under further amended Act as to reduced interest at 3½ per cent. and repayment in sixty years.

	Existing Act.	Proposed amended Act.	Proposed amended Act if interest be taken at 3½ per cent. per annum.
In 1894 (sections 1 to 3)...	10d½.	8d.	7¼d.
In 15 to 20 years (being final completion of entire scheme)	9¼d.	7d.	6½d.

Particulars showing the estimated annual cost of disposal of night-soil throughout the Western Suburbs under existing systems.

In the Western Suburbs the charge varies from 3d. to 6d. per week per house for emptying dry-earth pans. The charge for cesspits is probably not quite so much.

3d. per week	=	0	13	0	per annum.
4d. „	=	0	17	4	„
5d. „	=	1	1	8	„
6d. „	=	1	6	0	„

For the purpose of comparison I have taken the low average of 15s. per house as the annual cost.

In 1887 the occupied houses numbered about 34,000; in 1894 the number of houses is estimated at 44,000; 34,000 houses, at 15s. = £25,500 per annum in 1887; 44,000 houses, at 15s. = £33,000 per annum in 1894.

A sum of £33,000 per annum would be equivalent to a rate of 3·70d. in the £ throughout the suburbs; or, in other words, a house assessed at £50 would, at 8d. in the £, be rated at £1 13s. 4d. for sewerage purposes, *less* the present cost; which, if put at 15s., would merely involve an extra outlay of 18s. 4d. per annum.

With regard to the estimated cost it was pointed out by Mr. Stayton that it must he distinctly understood that it was simply an estimate based upon the present and future requirements of the districts and also upon past experience. It was therefore an approximate idea as to what the cost of the works would be.

Mr. Alderman Abigail, of Camperdown, said he had nothing to urge in opposition to the scheme. It was only about a fortnight ago that the Camperdown Council were engaged in the consideration of this question all day to see what could be done for the municipality. As to cost, it was nothing beside the importance of saving life. His own family had suffered through typhoid fever, and was, therefore, anxious so far as he was concerned, to see improved sanitary measures promptly adopted. There was a considerable quantity of filth which came down to Camperdown and Marrickville, which were low-lying districts, and it was necessary that a remedy should be applied at once. He trusted that the question would not be dealt with in a slow jog-trot sort of way, and that everything would be done without unnecessary delay in order that blooming health and prosperity might result.

One of the aldermen of Leichhardt (*Mr. Fred. Walsh*) suggested that the meeting would be more effective if some resolution could be passed on the question. He therefore moved as follows:—

"That this Conference of Mayors and Aldermen of the Western Metropolitan Districts, after considering and discussing the proposed sewerage scheme of Messrs. Bennett and Stayton, approves of the same, and respectfully urges upon the Minister for Works the necessity of obtaining legislative powers for the early and simultaneous commencement of the work at different points."

Mr. Barling, the Under Secretary for Public Works, then read the foregoing resolution, which was seconded by *Mr. Dean*, the Mayor of Ashfield, and carried unanimously.

Alderman Moore, of Leichhardt, then moved, that a vote of thanks be extended to the Chairman for the deep interest taken by him in the matter.

Mr. R. W. Hardie, ex Mayor of Burwood, said it afforded him much pleasure to second the motion. Instead of its having been necessary for the Municipal bodies to urge on the consideration of the matter the reverse had been the case. They had been urged on by the Chairman, who had afforded every facility to enable the question to be properly dealt with. The thanks of all were due to him for the deep interest he was taking in their welfare, which, he was pleased to recognize, was in safe keeping so far as this question was concerned. The motion was carried with acclamation.

The

The Chairman, in reply, said he had done no more than his duty in furthering this matter, which was of such great importance to all. The present proceedings were only of a preliminary character, and there was yet the race to win. He said he had done his best to bring the question to the present stage, and he would certainly not allow it to remain unsettled; everything he could do would be done to bring the scheme into operation. He was pleased to recognize their unanimity, and it might be reasonably expected that the matter would soon be got through Committee quickly. He hoped that every effort would be made by the Municipal bodies to render assistance by giving evidence before the Committee. Having thanked the gentlemen for their attendance in response to the invitation the proceedings terminated.

The following is a list of the names of the gentlemen who expressed their willingness to adduce evidence in support of the Government scheme before the Parliamentary Standing Committee:—

Mr. Dean, Mayor, Ashfield.
Mr. Mills, Alderman, Ashfield.
Mr. Lyttle, Alderman, Ashfield.

[*To Evidence of J. Barling, Esq.*]

A 1.

Minute by The Secretary for Public Works.

SUBURBAN SEWERAGE.

Department of Public Works, Sydney, 26 June, 1888.

My attention has for some time past been directed to the very serious condition into which things are drifting with respect to sewerage matters affecting the large population which inhabit the suburbs outside the metropolitan area. To enable me to more clearly grasp the question I should feel much obliged if my Honorable colleague, the Colonial Secretary, will instruct the Statistician to place himself in communication with this office with the view of affording me more information on the vital statistics.

It is well known that the averages dealing with this subject are taken out in connection with the population of large areas, the consequence being that the really unhealthy spots almost escape attention, while a character of apparent unhealthiness is given to districts which, if the particulars were taken out as affecting smaller areas, would be found to be really healthy.

For some months past I have been considering how I could get more definite information on the point I have referred to, and I think, after conference with Mr. Coghlan, I shall be able to obtain from him such information as will unerringly point out the plague spots of the city and suburbs.

My impression is that when this is done a startling revelation will be made on the subject which will clearly show the Department where the first efforts of amelioration should be made.

JOHN SUTHERLAND.

Principal Under Secretary.—J.B., 26/6/88. Perhaps an expression of opinion should be obtained from the Medical Adviser in the first instance.—C.W., 12/7/88. Medical Adviser.—H.P., 14/7/88. The Medical Adviser to the Government.—B.C., 16/7/88. C.W., P.U.S.

Report by Medical Adviser.

Board of Health Office, 127 Macquarie-street, Sydney, 16 July, 1888.

There are two distinct questions involved in this matter—first, the localization of the cases of typhoid fever or other infectious diseases occurring in the city and suburbs; and second, the localization of the deaths from typhoid fever or other infectious diseases in the same area.

For the first of these, as there is no provision for the compulsory registration of infectious diseases, it is at present impossible to obtain the requisite information; but it is within the power of this Department to furnish an approximate idea of the unhealthiness of the different areas from a statement of the number of cases admitted to the hospitals from particular localities.

The second question could be answered partly by the Registrar-General and partly by this Department, the former officer giving a statement of the deaths which occurred in private dwellings, and this Department furnishing a list of the places from which the patients were taken who died in the hospitals.

I may state that I have already requested the Registrar-General to be good enough to furnish me with the information above referred to in connection with an inquiry already in hand.

B.C., 16 July, 1888. H.N.M.

Inform Works Dept.—C.W., B.C., 28/7/88. The Under Secretary for Public Works. Submitted.—J.B., 31/7/88.

I am very pleased the Medical Adviser is taking this matter up, and shall be much obliged if he will kindly furnish me with the result of his inquiries at an early a date as possible. I intend to strain every nerve to grapple with the serious difficulties which the defective sanitary arrangements of our city and suburbs present.—John Sutherland, 2/8/88.

B.C., Principal Under Secretary.—J.B., 3/8/88. Retd., C.S.O., 6/8/88. The Medical Adviser.—B.C., 14/8/88, C.W. Read and considered at meetings of the Board of Health, held on the 22nd and 29th inst.—E.S., 30/8/88.

The

The Secretary to the Board of Health to The Under Secretary for Public Works.

Board of Health Office, 127 Macquarie-street, Sydney, 30 August, 1888

Sir,

In returning the enclosed minutes of the Hon. the Secretary for Public Works respecting suburban sewerage, I have the honor, by direction of the Board of Health, to forward enclosed returns showing (*a*) the localization of persons suffering from typhoid fever who have been admitted to the metropolitan hospitals; (*b*) the deaths amongst those cases; and (*c*) the distribution of persons dying from typhoid fever, measles, and scarlet fever in the metropolis of Sydney.

I have, &c.,
EDMUND SAGER,
Secretary.

The Secretary to the Board of Health to The Colonial Secretary.

Sydney, 29 August, 1888.

THE attached Returns prepared by the Board of Health, are forwarded for the information of the Colonial Secretary.

No. 1 shows the number of persons suffering from typhoid fever who were admitted to the metropolitan hospitals during the *seven* months ending July 31st, 1888, arranged according to the localities from which they were removed, together with a calculation of the ratio of cases per each 10,000 of the population. From this return it appears that the Eastern and West Central Districts have supplied by far the largest proportion of typhoid fever patients to the hospitals.

In No. 2 are shown the deaths which took place in the hospitals among the cases mentioned in the Return No. 1; in this return it has not been deemed necessary to calculate the ratio per 10,000.

In No. 3, which is based upon information supplied by the Registrar-General, as well as that obtained from the metropolitan hospitals, there is shown a statement of the mortality from typhoid fever, measles, and scarlet fever, in the city and suburbs during the *six* months ending June 30th, 1888, distributed according to the districts in which the deaths took place—those deaths which occurred in the hospitals being, however, referred to the districts from which the patients were removed to hospital. It is further to be stated that no deaths from scarlet fever or measles occurred in the hospitals, only fifty-one cases having been treated at the Coast Hospital during the first half of the present year.

It would have been more satisfactory if a return could have been given of the cases of zymotic disease actually occurring in the city and suburbs during the period in question; but, owing to the absence of any provision for the registration of infectious disease no data exist on which such a return could be founded.

By order,
EDMUND SAGER,
Secretary to the Board of Health.

* Fifty-six of these deaths occurred in the Metropolitan Hospitals.

A 2.

Sanitary Condition of the Western Suburbs.

Government Statistician's Office, Sydney, 27 September, 1888.

Sir,

In accordance with the instructions of the Honorable the Secretary for Public Works, I have the honor to transmit a plan* of the western suburbs, showing the localities where deaths from specific febrile or zymotic diseases occurred during the first six months of the current year.

* See Plan I, Diagram Plan II.

In order to make the plan complete the fatal cases in the hospitals have been assigned to the localities where the persons affected originally lived. The deaths from zymotic diseases only have been shown, as these are held to be directly traceable to the absence of sanitary measures, and therefore directly preventable. The following table shows the number of fatal cases in each municipality :—

Deaths from Miasmatic and Diarrhœal Diseases, from 1st January, to 30th June, 1888.

Municipality.	Number of deaths from							
	Measles.	Scarlet Fever.	Diphtheria.	Typhoid Fever.	Cholera.	Diarrhœa.	Dysentery.	Total.
Alexandria	.....	.....	1	3	.....	5	.....	9
Ashfield	8	4	13	7	.....	5	.....	37
Balmain	13	1	3	9	1	13	1	41
Burwood	1	.....	.....	3	.....	1	.....	5
Camperdown	1	2	2	.....	.....	6	.....	11
Canterbury	1	2	1	.....	3	2	1	10
Concord	.....	.....	.....	.....	.....	1	.....	1
Darlington	.....	.....	.....	1	.....	.....	.....	1
Five Dock	.....	.....	2	.....	.....	1	.....	3
Glebe	8	2	7	2	1	16	1	37
Leichhardt	1	.....	2	10	1	4	.....	18
Macdonaldtown	.....	1	.....	3	.....	2	.....	6
Marrickville	2	6	3	3	.....	5	.....	19
Newtown	10	1	3	14	.....	6	1	35
Petersham	2	4	3	5	.....	2	1	17
Redfern	3	.....	.....	5	2	14	1	25
St. Peters	.....	4	2	2	.....	4	.....	12
Strathfield	.....	.....	.....	.....	.....	.....	.....	.....
Waterloo	1	2	1	5	1	7	2	19
Total	51	29	43	72	9	94	8	306

It will be seen that deaths have been most numerous in Balmain, Ashfield, Glebe, and Newtown; but such was only to be anticipated from the greater density of population found in these districts. The total number of these deaths was 306, or at the rate of 3·62 per thousand of the population per annum; and although it may not be possible even with the most complete sanitation to save all these lives, there is ample evidence that an efficient sewerage scheme would have prevented the sacrifice of many lives, have saved much sickness, and have ensured a greater length of life to those who survived. That such opinion is not one of mere speculation may be shown from the experience of the cities of Sydney and London, where in the former case the death rate has declined about five per thousand since the sewerage system has been completed, while in the case of London the rate has fallen four per thousand since the main intercepting scheme came into operation.

The number of cases of each disease which have occurred cannot be given, but it may be safely assumed that the number which proved fatal practically bears the same proportion to the total number of cases in each district.

I have, &c.,

T. A. COGHLAN.

Statistician.

The Under Secretary for Public Works.

[*To Evidence of W. C. Bennett, Esq.*]

B.

Sewage Farm—Webb's Grant.

Webb's Grant, 15 November, 1888.

Sir,

I have the honor to submit for your information a short report covering the first twelve months' operations on this property under "sewage."

Although a commencement was made and a considerable amount of work done so long ago as 1884, the first sewage was only received on the land in August, 1887. During this long period the floors of the filter beds had blown so much out of level as to necessitate their almost reconstruction, and the levelled formation on the north side of the main carrier so much so as to require entirely renewing.

On the 28th of September, 1887, the first seeds were sown on a plot of about 10 perches, and on the 5th of November 2 roods of lucerne, and later on 2 roods of rye-grass; even this small patch of 1 acre 10 perches proved too large for the quantity of sewage available, and all the plants excepting the lucerne and sorghum died off.

On the 1st of February, 1888, the sorghum began to mature, and three rows were cut and weighed, showing an average weight of 60 tons an acre; the remainder yielded 3 bushels of seed, worth £3; and in April a stubble crop of 61 cwt., for which I obtained £2 0s. 6d.

The half-acre of lucerne sown in December, 1887, has been cut four times, and produced 89 cwt., and sold for £4 9s. 3d.

Half an acre of lucerne sown in March has only been cut twice and yielded 28 cwt. 2 qrs.—£1 8s. 6d.

Half an acre of barley sown in February only returned 150 cwt. 2 qrs., at 8s. 6d. a cwt., after occupying the ground six months.

Appended is a tabular statement of all crops sown, areas of ground to each crop, and money return.

Total area under crop, 1 acre 2 roods 16 perches; net proceeds, £17 17s. 5d.

In the absence of a self-recording gauge I have no reliable data to enable me to estimate what quantity of sewage this ground will take up, but for these last two months the whole supply has been taken up by 1 acre, and now that the crops are becoming somewhat bulky, they are falling off for want of more moisture and manure.

I have, &c.,

J. N. OXLEY,

Superintendent.

The Commissioner and Engineer-in-Chief for Sewerage.

C.

SEWERAGE AND DRAINAGE OF THE WESTERN SUBURBS.

(Report of Mr George H. Stayton, M. Inst. C.E., on.)

Presented to Parliament by Command.

Department of Public Works, Roads Branch, 30 January, 1888.

I forward to the Honorable the Secretary for Public Works Mr. Stayton's report on the drainage of the Western Suburbs. He has conferred with me from time to time, and I have studied the case sufficiently to enable me to concur in all his recommendations. I would suggest that the report be distributed amongst the Municipal Councils and the press for discussion before taking any definite action on it.

W.C.B.

Under Secretary, B.C. Submitted; and I would suggest that this report of Mr. Bennett form the first page of the printed matter.—J.R., 30/1/88. Approved; and distribute copies of this report as suggested; send also copies to the press. No time should be lost; the matter is one of the utmost importance.—J. Sutherland, 31/1/88.

Report on a System of Sewerage for the Western Suburbs of the City of Sydney.

With a view to the preparation of a comprehensive system of sewerage and drainage, my best consideration has been given to the sanitary conditions and requirements of the western suburbs of the city of Sydney, and I now have the honor to submit the following observations and recommendations thereon.

Extent of western suburbs.

The boundaries of the district comprised within the scope of the inquiry may be briefly described as extending from the city boundary to Botany on the east, along Cook's River to Liverpool Road on the south, through Strathfield on the west, and along Parramatta River on the north. This area contains about 31 square miles, and it includes the Boroughs of Alexandria, Ashfield, Balmain, Burwood, Camperdown, Darlington, Glebe, Macdonaldtown, Marrickville, Newtown, Petersham, Redfern and Waterloo, together with the Municipal Districts of Canterbury, Concord, Five Dock, Leichhardt, St. Peters, and Strathfield.

Extraordinary provision of streets.

In comparison with large cities in other parts of the world, the suburbs of Sydney present a somewhat peculiar feature, and one which must have an important bearing on the cost per head of population for the execution of sanitary works. I refer to the extraordinary provision of streets and roads, as formed or laid out for building purposes. In the city of Sydney the proportion may be taken on the existing population as 1 mile for 1,380 persons; for the city and suburbs generally (which contain 1,032 miles, and an estimated population of 350,000 persons) the proportion is 1 mile for 339 persons; but for the western suburbs it is 1 mile for 254 persons. By way of illustration it may be mentioned that about four years since the population per mile for large cities and suburbs in America varied from 500 to 3,640; in London it is about 2,000, and in Paris 4,000. These figures prove that the provision is largely in excess of ordinary requirements, and if the streets of the western suburbs alone were built upon to the same extent as London and its suburbs, over a million persons could occupy the area without overcrowding.

Increase of population.

The population of the metropolitan suburban area may be said to have increased by leaps and bounds during the last ten years; inasmuch as it has increased from 83,000 to 200,000 persons, or 141 per cent. The Metropolitan Suburban District includes the eastern suburbs of Paddington, Woollahra, Waverley and Randwick; also St. Leonards, East St. Leonards, and Victoria at North Shore; none of which are considered in connection with the subject of this report, as they do not form part of the western area. Reference is made on page 10 to the still greater rate of increase which is taking place in the western suburbs, viz.—100 per cent. since the year 1881, or at a rate equivalent to 166 per cent. for ten years. In certain municipalities the population is somewhat dense, whilst in others, where the houses are much scattered, it is obviously small. The latter conditions, however, will very shortly disappear, in consequence of the rapid nature of the further developments which are taking place, and of the extent of the building operations now in progress. It may therefore be reasonably anticipated that the population will continue to increase in a very marked manner.

Preliminary work.

The foregoing remarks and figures may serve to show that the question under consideration is one of some magnitude. From the extent of the area it will be readily understood that a considerable amount of time has necessarily been expended in making a close personal investigation throughout the district. Without such examination it was of course impossible to acquire a thorough knowledge of the several areas, or of the conditions and requirements of the various localities, which information was absolutely necessary prior to devising the measures hereinafter referred to.

The

Sanitary condition of suburbs.

The existing sanitary condition of the western suburbs is most unsatisfactory, and owing to the want of efficient sewerage and drainage, great inconveniences and nuisances are occasioned. The inquiries show that glaring sanitary defects exist in nearly every municipality. It is the old tale of impure air and water resulting from defective drainage, and it is doubtless owing to the favourable climatic conditions of the Colony that the existing mortality from preventable disease is not greater, especially as the evils are becoming aggravated by additional surface drainage, owing to the increase in the population.

Mode of laying out new streets.

The mode in which land is subdivided and laid out for building purposes without due regard to proper levels or drainage, and in which dwelling houses are erected thereon, is a question which materially affects suburban sanitation. The existing laws do not apparently provide regulations governing the laying out of new roads and streets and the erection of dwelling-houses, requirements which are urgently needed. Neither is there any power to restrain persons from building on low-lying areas or unhealthy sites; therefore, in the absence of proper drainage, the soil is liable to become charged with filth and fever-poison, and such premises are not only a source of danger to the health of the occupants, but to the locality generally. The present system ought to be emphatically condemned, as without doubt "fever-beds" and "rookeries" are being created in certain localities, which will not only cause endless trouble hereafter, but will be most difficult and expensive to deal with.

Building on low-lying land.

It may not perhaps be desirable to allude to any particular premises, but it must be obvious that during the course of the inspection of the suburbs my attention was naturally drawn to the existence of dwelling-houses in positions utterly unfitted for human habitation and quite contrary to all modern sanitary laws and requirements. In Marrickville, Leichhardt, and elsewhere, premises have been erected on most unsuitable sites, the level of which in some instances is scarcely above high-water mark, and where effectual drainage is out of the question, unless a large outlay is incurred at the public cost. In Marrickville Valley, drastic measures will be required to remedy the evil, and until these can be accomplished, it would certainly be for the public good to prohibit by law the further erection of dwelling-houses below a certain prescribed level, both in that and other unsuitable parts of the suburbs. The question may hereafter be raised whether portions of the lowest areas should be resumed and any specially objectionable dwellings be demolished.

Regulations for new streets and buildings.

Under the provisions of the Public Health and other Acts in England, every person who intends to lay out or form a new street is required to submit plans and sections thereof to, and receive the approval of, the authorized sanitary authority; and no dwelling-house or building can be erected without a similar application and approval. I am acquainted with several instances where the attempted creation of insanitary areas was thus frustrated by the action of the sanitary authority. It is not only important that the erection and drainage of all premises should be governed by efficient sanitary regulations, but, previous to any dwelling-house being occupied, its proper completion should be duly certified. In New York, the health authorities are even more stringent in their regulations, and any violations thereof are dealt with in a very summary manner—*e.g.*, only four or five months ago, both the owner and the builder of certain new houses were "arrested" and convicted for improper work. Considering the immense importance of efficient sanitation, it may not perhaps be a matter of surprise to find persons representing it as absolutely criminal that the creation of future plague spots should be permitted, more especially when stringent quarantine regulations for the prevention of other diseases are in operation.

Rates of mortality.

According to the Statistical Register, it appears that prior to 1885 the yearly death-rate of the entire suburban district (which includes North Shore) was less than that of the city of Sydney, but subsequently it has invariably exceeded it; the deaths for the year 1886 being 21·04 per thousand for the suburbs and 17·06 for the city. The death-rate per thousand of children under 5 years of age in the suburbs has exceeded that of the city since 1880, the figures in 1886 having been 74·58 for the former and 60·91 for the latter. These facts clearly indicate a considerable waste of human life from preventable diseases, independent of debilitating sickness, and represent a serious money loss to the community; they are therefore highly significant of the necessity for improved sanitation. The mean suburban death-rate from 1884 to 1886 has exceeded 21 per thousand per annum, but it may be confidently asserted that efficient sanitation would reduce such rate to at least 15 or 16 per thousand; in fact, a higher death-rate ought to be regarded as unsatisfactory. Irrespective of deaths from other preventable diseases, the following fatal cases of typhoid fever have been recorded in the suburbs of Sydney since 1882, viz.:—

1882.	1883.	1884.	1885.	1886.	1887.
71	93	109	130	229	164

Beneficial results of sanitary works.

The ultimate object of sanitary science is the health and convenience of communities and the reduction of the death-rate. The sanitary improvements carried out in England during the last fifty years (although much yet remains to be done) have been greater than in any other country, and the death-rate has been so much reduced that it is now 3 per cent. less than France, 6 per cent. less than Germany, 8 per cent. less than Italy, and 11 per cent. less than Austria. Since the completion of the London main drainage, the improvement in the death-rate of that city has been continuous, the annual saving of life being no less than 16,000 persons. Sanitation has very materially lessened the mortality from typhoid fever, inasmuch as official returns show a reduction from 10·8 to 1·8 per 10,000 of the population in some instances; whilst the deaths from typhoid fever, in England generally, which from 1861 to 1870 were at the rate of 19,000 per annum, fell to 7,000 per annum during the ten years ending 1880. An efficient system of sewerage lowers the subsoil water-level, and has a material effect on the healthiness of a low-lying locality; a result which has been specially well marked by a decrease in the number of deaths from phthisis.

Pure air essential.

Pure air is essential to healthy existence, and in populous towns and their suburbs it is absolutely necessary to adopt measures for its preservation. The whole of the filth which is produced, of whatever kind, should be removed at once and completely before decomposition can take place. A comprehensive system of sewerage not only provides for the effectual removal of the fæcal matter and urine, but removes the water supply after it has done its duty and become filthy.

Disposal of liquid refuse.

The method which prevails throughout the greater part of the suburbs for getting rid of household slop-water and other liquid refuse, is to allow it to flow into the surface channels at the sides of the streets, from which it eventually finds an outlet in the natural watercourses. Even where open channels have

have been formed, the sight and smell are very offensive; but where the channels are unformed and the surface inclination is slight, the nuisance is greatly intensified, especially in hot seasons, as the filth becomes stagnant and highly offensive. It is obvious that the many miles of these gutters which are in existence must cause the air to become so polluted as to be detrimental to the public health.

Existing drains.

Several of the Municipal Councils have expended considerable sums of money from time to time in the construction of drains and culverts in various streets, for the removal of refuse water from the surface channels. The adoption of these measures may have afforded relief in the immediate vicinity, but the nuisance has only been removed to an adjacent watercourse or creek. Although these works cannot be otherwise regarded than as temporary expedients for the removal of liquid refuse, they may, however, be hereafter utilized with advantage for the removal of surface waters during rainfall.

Pollution of watercourses and creeks.

It is obvious that under such a system the watercourses and creeks become fouled with liquid sewage; and owing to their imperfect condition and to the number of holes and places of deposit which they contain, most offensive smells are frequently given off. In a hot climate especially, this cannot be otherwise than dangerous to public health. As the outlet of the various creeks is either in the Parramatta River or Cook's River, the offensive matter must eventually be discharged into the harbour or into Botany Bay, and it is evident that these waters are becoming more and more polluted. The foregoing remarks refer particularly to Orphan's School, Johnstone's, White's, and Long Cove Creeks, on the north side, and to Shea's and Marrickville Creeks, on the south side; but it is only a matter of time for the watercourses which discharge into Iron Cove Creek, Hen and Chicken Bay and Homebush Creek on the north, and from Canterbury and Strathfield into Cook's River on the south, to become similarly fouled, and unless efficient measures are taken this will most assuredly result.

Recently constructed sewers.

The only portion of the western suburbs which possesses recently constructed sewers in active operation is Darlington and part of Redfern. In this instance the sewers were constructed by the Department, and form branches of the Prince Alfred Hospital sewer.

Areas omitted.

A brief inspection of the condition and requirements of certain portions of the area described on the first page, showed that no immediate necessity existed for the construction of sewers throughout Dobroyd, Five Dock, and Concord. The greater part of these districts consists of bush or partially-cleared land, the houses being much scattered. The Alexandria swamps and adjacent low-lying lands are also excluded, as from the nature of the conditions which exist, building operations will doubtless be greatly restricted upon sites so extremely unsuitable. The parts thus excluded from further consideration cover an area of about 9 square miles.

Plan and levels.

The only available map of the western suburbs, when the question first came before me, was the map of Sydney and suburbs which accompanied the Sewage and Health Board's Reports in 1877. Although the map is a compilation and consists merely of a skeleton plan showing the outlines of certain streets as they then existed, and does not extend further westward than Ashfield and Five Dock, yet it has been of great service as a foundation to work upon in preparing a revised and extended plan.

New map and levels.

The preparation of a plan showing the whole of the existing and proposed streets and the areas built upon, together with the ridges, creeks, and water-courses, and taking the levels thereof, has occupied several months, during which about 600 miles of streets have been inspected and partially surveyed, and a great number of levels taken. Levels had been taken from time to time by departmental officers between 1881 and 1885, at Marrickville, St. Peters, Redfern, Newtown, Camperdown, and Petersham, and they were of much service, but it should be noticed that they did not extend beyond Petersham or Marrickville. The new map is a compilation from various Government surveys and municipal maps. It is drawn to a scale of 20 chains to the inch, and shows approximately the position of the houses and buildings; it also shows the intended reclamations and other improvements at Cook's River. It is certainly the best map extant for the purpose of this report, but prior to the preparation of working plans and sections, detail surveys, such as are already in progress under the Surveyor-General's Department for Sydney and Suburbs, and plans drawn to a scale of 40 feet to an inch, will be necessary.

Physical conditions.

The physical conditions of the district present peculiar features, and although favorable for the discharge of rainfall and stormwaters from the surface, they render the drainage question unusually difficult to determine. A reference to the map shows that very nearly the whole area consists of ridges and valleys. Some of the slopes present considerable declivities; whilst other parts, such as the Glebe, Annandale, Leichhardt, and Balmain, extend towards the Parramatta River and are nearly surrounded by bays and coves.

Ridges.

Commencing at Redfern, near the city boundary, the main ridge which separates the northern and southern watersheds passes westward along the north side of the railway works at Eveleigh; thence along or near to Newtown Road, Enmore Road, Stanmore Road, and Canterbury New Road, to the south end of Queen-street, Ashfield. After crossing the latter it continues parallel to it on the west side; thence along Goodlet-street, crosses George's River Road near Brighton Avenue, and passes on to the Liverpool Road at its junction with Burwood Road. At Emu-street it leaves Liverpool Road and passes across Redmyre Road and Homebush Road, and continues further westward on the south sides of Busby Hill, and Albert-street, Strathfield. The northern watershed discharges into Parramatta River and the southern into Cook's River. There are six principal spurs on the north side, and they extend through the Glebe; Camperdown; Petersham, Leichhardt, and Balmain; Ashfield and Dobroyd; Burwood and Five-dock; and Burwood and Concord. On the south side there are three, viz., through Newtown and St. Peters; from the west end of Marrickville Road to the Warren, at Tempe; and along the west end of Liverpool Road. The height of the main ridge averages about 120 feet above high-water-mark, but at the summit, which is at Seaview-street, Ashfield, the surface level is 175 feet. In several instances the levels of portions of the various spurs exceed 100 feet in height.

Creeks, watercourses, and flats.

Most of the creeks and watercourses possess good natural inclinations, but the flats which call for special observation are at Marrickville and Shea's Creek. Marrickville valley is practically at a level of 1 foot only above high-water-mark for a distance of over a mile north of Cook's River, whilst considerable portions of the area are at least a foot below high-water-mark. During the heavy rains in April last no less than 141 acres were under water, and a number of dwelling-houses were flooded; the greatest depth of water, as measured at the time, being about 3 feet 6 inches. The land adjacent to Shea's Creek, between Ricketty-street and Cook's River, is at a similar level to Marrickville valley, and is inundated at high spring tides. About 53 acres of a building estate near Undercliff Bridge, Cook's River, were also flooded.

Proposals

Proposals for Sewerage.

I have perused the correspondence, reports, and minutes relating to the question, together with the statements of various deputations to the Government thereon, but there is no evidence whatever that any proposal for the drainage of the Western Suburbs has hitherto been definitely formulated. The northern and southern drainage systems for the City of Sydney, as devised and constructed by the Department, are intended however to receive the sewage from a limited portion of the suburbs. The position of these sewers is shown on the plan by black lines.

Northern system.

The northern outfall sewer is about to be extended to George-street West, terminating at the city boundary at Newtown Road; at which point its dimensions will be 45″ in diameter, and the invert level 28·68 feet above datum. This will permit the construction of a main sewer and sub-mains to drain the Glebe, the northern part of Leichhardt, and Balmain, an area (exclusive of reserves, &c.) amounting to 1,641 acres. A branch sewer to the Prince Alfred Hospital has already been constructed; its terminating dimensions are 4′ × 3′ and level 53 feet above datum. As explained on page 7, the Borough of Darlington and a part of Redfern, comprising an area of 120 acres, are drained into this system, and the proposed extensions westward of the hospital will receive the drainage from certain parts of Camperdown, Newtown, and Petersham. The total area draining into the Prince Alfred Hospital sewer will thus amount to 443 acres.

Southern system.

The southern outfall sewer is 5′ 6″ in diameter, and on the western side of Botany Road its invert-level is about 26 feet above datum. This system will receive the sewage from a portion of the City and from parts of Redfern and Waterloo (an area of 583 acres), and the construction of a branch sewer across Shea's Creek, Alexandria, will further provide for the drainage of 329 acres, being portions of Alexandria, Macdonaldtown, and Newtown.

Various methods of sewerage.

The various methods which have been devised for the sewerage of towns may be briefly described as—

(*a*) The "combined" system, by which all sewage, surface water, and subsoil waters are carried off in the same sewer.

(*b*) The "partially-separate" system, by which all sewage and a limited portion of surface water are so removed.

(*c*) The "absolutely separate" system, which involves separate sewers for sewage, for surface water, and for subsoil water.

(*d*) The "Liernur" pneumatic system, by which sewage is removed by exhausting the air in specially constructed sewers and drains; the collected matter being subsequently conveyed to works, where it is converted by evaporation into dry manure.

(*e*) The "Shone" pneumatic-ejector system, by which sewage is collected in receivers and ejected by compressed air, forced into cast-iron main pipes, and delivered to the outlet provided at a higher level.

Various dry systems of collecting and intercepting excrementitious matters (all of which, however, necessitate some system of sewers to carry off liquid refuse), such as earth-closets, "Goux" closets, and "Rochdale" pails, have been adopted in towns to a limited extent; but none of the dry systems can be considered suitable for large communities. The collection and disposal of large masses of excrement is very troublesome, and often creates much unpleasantness. In fact I can testify that the whole process of collection and removal under the "pail system," as carried out on a large scale at Nottingham (where nearly 30,000 of these closets are in use) is so offensive, that it would never be tolerated in the western suburbs of Sydney. Indeed the Medical Officer of Health for Nottingham has stated "that he did not regard the pail or tub system as perfect; but on the contrary most decidedly gave the preference to properly constructed and well ventilated water-closets, as being free from all danger." At the best, the so-called dry systems are but inferior substitutes for water carriage, which, if efficiently constructed throughout, is the cleanest and most convenient of all. Moreover, it has already been adopted for a part of the district in question, and the desirability of its extension throughout the area is obvious.

Joint sewerage scheme recommended.

From a careful study of the question of the best mode of draining those portions of the district which must necessarily be excluded from the beforementioned existing systems, I am fully convinced that any proposal which fails to embrace a joint sewerage scheme for the entire area, is undesirable. The various municipal boundaries are not concurrent with the natural watersheds, and even if they were, purely local systems for each borough would be found both difficult and expensive. I have therefore no hesitation in recommending as the most practical, efficient, and economical remedy, a comprehensive scheme upon the "partially-separate" system.

Position of Outfall.

The next question which arises has reference to the best available position for the outfall and the method of disposal to be adopted, and from the following remarks it will be observed that consideration has been given to the possibility of utilizing the existing sewer outfalls, to conveying the sewage to the sea or various rivers, to the establishment of local systems of treatment, and to the adoption of a sewage farm at Rookwood or Botany.

Existing outfalls.

The main outfall sewer of the northern system discharges into the sea at Bondi, but the sewage of the southern system will be removed by the outfall sewer which discharges at the intended sewage farm at Webb's Grant, Botany Bay. Neither the dimensions nor the levels of the above outfall sewers would permit of the remainder of the area being drained into them by gravitation, and to convey the sewage to any other point on the coast south of Ben Buckler, would necessitate the construction of an outfall sewer of great length and the erection of powerful pumping engines, involving a great outlay and large annual cost.

River outfalls.

The remarks on page 7 show that the greater part of the area to be sewered falls towards Parramatta River and the remainder towards Cook's River. Although the former is a tidal river, it contains numerous bays and coves, in several of which mud flats of considerable extent are exposed at low water; moreover, it is so situated at the head of Sydney Harbour, that any proposal to utilize its bays or heads as outlets for the discharge of sewage, without treatment, ought not be entertained for one moment. Such a system would unquestionably create serious pollution of the waters, and much inconvenience would be caused by the silting up which would ensue. In the case of Cook's River, which discharges at the head of Botany Bay, the objections are even stronger, inasmuch as above the dam at St. Peters there is little or no current; in fact the velocity in dry seasons is practically *nil*. George's River, to which the sewage of a great part of the area could be conveyed by gravitation, is nearly 6 miles further

further south. It discharges a large volume of water into Botany Bay on the ebb-tide, and having a catchment area of 375 square miles, its discharge after rainfall is very great. Notwithstanding these advantages it cannot be deemed suitable as an outfall for the discharge of a large quantity of crude sewage.

Local systems undesirable.

The objections to the discharge of crude sewage in the before-mentioned rivers are insuperable, and it does not appear that suitable sites can be procured on the south side of Parramatta River for the adoption of local systems of treatment, such as precipitation and filtration. Even if practicable, however, such systems would certainly be open to serious objection, and apart from this, they would necessitate considerable extra expense in separate management.

Sewage farm at Rookwood.

A suggestion was recently made that the sewage from the greater portion of the Western Suburbs might be conveyed to the model farm at Rookwood, and there be utilized by irrigation. I have considered the proposal and have made a preliminary investigation of its merits, with the view to the preparation of an approximate estimate of the cost. The primary objection to the scheme is the great outlay it would entail in the construction of works and erection of machinery, also in the acquisition and preparation of a large area of land, amounting eventually to 2,000 acres. Moreover, as the summit of the farm is about 160 feet above sea level, it is obvious that the cost of transmitting the sewage to the requisite altitude by steam power would be a very serious matter. The scheme would necessitate the reversal of the Western system hereinafter described, and its execution, including the capitalised cost of pumping, would involve an outlay of £1,222,000. This amount is £550,209 in excess of the estimated cost of the intended Western system (*vide* p. 21), and it would involve an additional annual charge, to cover interest and repayment of principal, amounting to £24,000. The cost of pumping would be proportionately greater as the population increased, the estimate being based on a prospective population of 100,000 persons. The strongest point in favour of the proposal is that the levels of the main sewer would be sufficiently low to enable the intended gravitation area to be increased, but I am decidedly of opinion that the adoption of such a scheme is undesirable.

Sewage farm at Botany.

The fact that the establishment of a sewage farm at Botany had already been determined upon for the Southern system was naturally a strong inducement to consider whether a sufficient area would be available for the purification of the sewage from the Western system, and if not, whether additional land could be procured and rendered suitable for the purpose. The area of Webb's grant is 309 acres; of this, however, about 270 acres only are at present available for the purpose of sewage farming; an area clearly insufficient for the Southern and Western systems combined. The resumption of about 250 acres of unused land to the south and west of Webb's grant is practicable, and its immediate acquisition is highly desirable. Of the additional area it is probable that 100 acres could easily be made available, and the remainder would need to be filled up and levelled as hereafter found requisite.

Botany site recommended.

The nature of the soil and the situation of the land render the Botany site admirably fitted for the utilization and purification of sewage. The former consists of a free sandy soil and open subsoil, and for the greater part of the area the surface level is at least 8 feet or 9 feet above the sea. The site is not only compact in itself, but is also sufficiently removed from buildings and population to enable it to be used in the manner proposed, without risk of reasonable objections being raised; it also has extensive water frontages, and convenient access could be provided. Under these circumstances I feel convinced that it would not be possible to provide a better position for the outfall and for the efficient and economical purification and disposal of the sewage of the Western area. Certainly there is none within reasonable distance, nor any which can be so confidently recommended.

Proposed Scheme.

Northern, Southern, and Western systems.

The drainage area of the proposed scheme comprises nearly 22 square miles, and the sewerage thereof can be best effected by the adoption of three systems, hereinafter referred to as the Northern, Southern, and Western systems respectively. The Northern and Southern suburban systems will embrace an area of nearly 5 square miles, and they will be drained into the existing systems which discharge at Bondi and Webb's Grant. The Western area, embracing nearly 17 square miles, will be drained by an entirely new system discharging at Botany.

Drainage area.

The total area of the district included in the scheme contains 14,077 acres; from this, however, must be deducted the area of public parks, reserves, and cemeteries therein, amounting to 449 acres; consequently the net drainage area is 13,628 acres. The latter is more or less built upon or laid out for building purposes, and as doubtless the whole will eventually require drainage, provision should be made for it in the scheme. Although it is essential that the capacity of the main sewer and sub-mains shall be devised to meet the future requirements of the entire area, it may not become necessary to construct sewers in every street within that area until a considerable period has elapsed.

The various systems into which the drainage area is subdivided are as follows, viz.:—

No.	Municipality.	Colour on plan.	Area in acres.	Total area of each system in acres.
	NORTHERN SYSTEM.			
1	Glebe, Leichhardt, and Balmain	Purple	1,641	
2	Newtown, Camperdown, and Petersham	Neutral tint	323	
3	Darlington and Redfern	Dark brown	120	
				2,084
	SOUTHERN SYSTEM.			
4	City (part of), Redfern, and Waterloo	Light brown... ...	583	
5	Alexandria, Macdonaldtown, and Newtown	Green...	329	
				912
	WESTERN SYSTEM.			
6	Marrickville, Petersham, Newtown, and Leichhardt	Light yellow... ...	1,477	
7	Marrickville, St. Peters, Macdonaldtown, and Alexandria ...	Dark yellow	1,180	
8	Marrickville, Ashfield, Petersham, and Leichhardt	Red	2,005	
9	Ashfield, Burwood, Strathfield, Concord, and Five Dock ...	Blue	4,100	
10	Canterbury and Southern slopes	Light blue	1,870	
				10,632
	Total...			13,628

Population.

At the commencement of the past year the drainage area contained about 32,704 houses, and an estimated population of 154,000 persons; but in order to determine the prospective population, the circumstances relating to each municipality have been separately considered. The existing number of persons per acre varies very materially, *e.g.*:—

In Ashfield there are 4·48 persons per acre.
„ Burwood „ 4·79 „ „
„ Marrickville „ 5·66 „ „
„ Leichhardt „ 7·80 „ „
„ Petersham „ 10·63 „ „
„ Balmain „ 26·37 „ „
„ Glebe „ 34·83 „ „
„ Newtown „ 36·03 „ „

The prospective rate per acre for the entire area has been determined in accordance with the conditions peculiar to each district, that is to say—In Redfern, Darlington, Camperdown, and other well populated parts near the city, it is taken at 47 or 45 persons; and in Glebe, Leichhardt, and Balmain, the average is 42 persons. In Marrickville, Petersham, and other districts coloured yellow on plan, it is 40; in Ashfield and those parts coloured red, it is 33; and in Burwood, Strathfield, Concord, Canterbury, and other outlying places where coloured blue, it is taken at an average of 30 persons per acre. It may be recollected that the prospective rate allowed for the city of Sydney was 47 persons, but for the eastern outlying districts it was 31 only. The following table shows that the average number of persons for the entire drainage area is estimated at 35·41 per acre, and that the total prospective population for which provision is made in the scheme amounts to 482,608 persons, or nearly three times the number of the existing population:—

System.	Area in acres.	Average number of persons per acre.	Total prospective population.
Northern	2,084	42·637	88,857
Southern	912	46·28	42,206
Western...	10,632	33·065	351,545
Total	13,628	35·41	482,608

The growth of the Western Suburbs has been enormous. According to the Census returns, the population contained within the area which constitutes the nineteen boroughs or municipal districts referred to on the 1st page, was 41,716 in 1871, and 82,273 in 1881; but it is estimated that at the present time the numbers have increased to 164,103. At this rate of increase it may be fairly assumed that the total prospective population of 482,608 will be realized in the course of eighteen or twenty years.

Sewage.

The quantity of fouled-water to be removed by the sewers, even from the existing population, amounts to a considerable volume. It will, however, be largely increased so soon as the new water supply works have been completed and brought into operation throughout the area.

The Sydney intercepting sewers provide for the removal of a daily consumption of 72 gallons per head, and although this may appear to be a liberal allowance for domestic purposes in the suburbs, it is no doubt desirable to make provision in the proposed sewers for carrying off an equally large volume of water, the consumption during the hot season of the year being especially great. At Adelaide the sewers were designed to carry off 50 gallons per head per diem, but this quantity is exceeded in the summer. The sewers are intended not only for the removal of fæcal matter from water-closets, but for all kinds of liquid refuse, such as domestic slops and urine, together with the waste-water from baths, sculleries, wash-houses, stables, dairies, and other premises.

Careful observations and experience have proved that sewage is not discharged into the sewers at an uniform rate throughout the period of twenty-four hours; but in order to provide for the removal of the maximum quantity of sewage likely to enter the sewers, provision is made in their capacity for one-half the quantity to pass off in six hours, or at the rate of 1 cubic foot per head per hour. On washing days and in very hot weather this quantity will doubtless be exceeded. The estimated maximum sewage discharge for the whole area, on a prospective population of 482,608 persons, amounts to 8,044 cubic feet per minute.

Rainfall.

The provision to be made for the rainfall to be carried off by the sewers is a question of much importance, demanding special consideration. The extent of the area to be dealt with, and the quantity of rain which sometimes falls in a short period, render it somewhat difficult to determine. In London and nearly all the principal cities and towns in England, the sewers and stormwater overflows are sufficient in capacity to carry off the ordinary rainfall from the streets, roofs, paved yards, and other surfaces; but in order to similarly remove the semi-tropical rains which from time to time are recorded in and near Sydney, the dimensions of the sewers would require to be very large, and the cost of construction, even if financially possible, would be enormously increased. From a sanitary point of view such sewers are extremely undesirable, because the maximum sewage or dry-weather flow would scarcely be sufficient to ensure a self-cleansing velocity, and the increased internal surface which would thus be exposed, would greatly facilitate the formation of sewer gases.

Catchment area for rainfall.

The principal points to be determined are those relating to catchment area and depth of rainfall. For the city of Sydney and Redfern, the late Mr. Clarke, M.Inst.C.E., recommended an allowance of 40 per cent. of the entire drainage area, as the proportion of roof and paved-yard surfaces forming the rainfall catchment. The rule adopted for town areas in England by Mr. T. Hawksley (one of the foremost hydraulic engineers in the world) is to allow *one* square of roofing and *one* square of paved yard as the contributing area of each head of the population; which, if applied to the City and Redfern at the rate of 47 persons per acre ($\frac{47 \times 200}{9} = 1{,}044$ square yards), would amount to 21·58 per cent. of the entire area. I am of opinion that it is preferable to determine the catchment area in this manner by the ratio of population per acre, instead of assuming a certain percentage of the whole area. The prospective population of the Western Suburbs is estimated to range from 30 to 47 persons per acre.

Doubtless

Doubtless the dwelling-houses in the suburbs of Sydney present a greater superficial area of roof surface per head of population than that allowed for English towns, in consequence of so many of the houses consisting of "cottage" or ground-floor residences; but to allow for the interception of more than 100 feet of roof surface per head would necessitate the construction of larger sewers than are desirable. The sewers of Adelaide were designed to carry off all the rainfall from roofs, paved yards, and courts, but during recent heavy rains they were said to be incapable of discharging the quantity of rainfall which had found its way into them, showing that the water allowed ingress was greatly in excess of the quantity intended. It is obvious, therefore, that the greatest precautions will be necessary in dealing with the quantity of rainfall to be admitted into the sewers. A further and by no means unimportant reason may be urged in favour of restricting the admission of rainfall, viz, that excessive dilution of sewage greatly depreciates its value as a fertilizer. The estimated quantity of sewage per head to be admitted to the sewers is much greater than the usual allowance; therefore all additions of rainwater will still further depreciate the market value of the sewage when applied to land at the sewage farm.

The catchment area allowed for in the Southern and Western schemes is 200 feet superficial per head of population, that is to say, 100 feet for paved yards and 100 feet for roofed surfaces. Rainfall from paved yards is invariably more or less foul, and it should therefore be admitted to the sewers; in fact it would materially help to scour out the house drains. With respect to rainwater from roofs, I think that the allowance of 100 feet superficial is the utmost provision that should be made; in which case it will doubtless be necessary, wherever practicable, but especially in the case of the low-level systems, to conduct the water which falls upon the front part of the houses to the street channels, from whence it would flow into storm-water drains or culverts, and be discharged into natural watercourses. All surface water from roads and streets should be likewise conducted to storm-water culverts and channels, and be absolutely excluded from the sewers. The estimated prospective population per acre for the Western and Southern areas is 34·11 persons ($\frac{3,9,3,7,5,1}{11,5,4,4} = 34{\cdot}11$) and the before-mentioned allowance of roof surface per head, is equivalent to 15·66 per cent. of the entire area.

In the case of the Northern area, it will be absolutely necessary to further restrict the admission of rainfall into the sewers. The main sewer in George-street West, at the point where the Prince Alfred Hospital branch sewer joins, is designed to carry 2,103 cubic feet per minute when flowing ¾ full, or 2,469 cubic feet if flowing quite full; it would however, carry more than that quantity under a temporary additional head without creating inconvenience, but it would not be desirable to allow a much greater internal pressure. Fortunately there are great facilities for the natural discharge of rainfall at Glebe, Leichhardt, Balmain, and Camperdown, and therefore the whole of the water falling upon roofs should be excluded from the sewers, and be made to discharge into street channels. The catchment area allowed in this system (100 feet superficial per head) is intended to provide for backyards only, and, if calculated at the prospective average of 42·64 persons per acre, is equivalent to nearly 10 per cent. of the entire area.

Depth of rainfall.

The depth of rainfall intended to be removed by the main intercepting sewers of Sydney is calculated at 1¼ inch per diem for the Northern catchment area, and 3 inches for the Southern. The former amounts to a discharge of 1·26 cubic feet, and the latter to 3·02 cubic feet per minute per acre for the entire area. The calculations for the present scheme are based on a rainfall measuring 2 inches in depth during twenty-four hours, and although the official returns show that the rainfall in the suburbs of Sydney sometimes falls at a heavier rate for shorter periods, in all probability it would not frequently occur during the actual period of maximum sewage flow. The foregoing allowance for the Sydney Northern area is equivalent to ½-inch in depth if distributed uniformly over the entire area, but for the Southern area it equals 1⅓ inch over all. The present scheme provides for an average of ·313 inch in depth for the Southern and Western suburban systems, the discharge from which amounts to ·79 cubic feet per acre per minute. The restricted catchment area in the Northern suburban system will reduce the discharge therefrom to ·49 cubic feet per acre per minute. The following table of areas and discharges shows that whereas the total maximum sewage flow amounts to 8,044 cubic feet per minute, the quantity of rainfall proposed to be carried off in addition thereto, is 10,143 cubic feet per minute. If, however, 40 per cent. of the entire rainfall were removed by the sewers, the resultant discharge of rainfall only would be no less than 27,483 cubic feet per minute.

Volume of sewage and rainfall.

The various details explanatory of the volume of sewage and rainfall from each of the ten areas, are given in tabulated form in the appendix to this report, and it is therein shown that the resultant flow of sewage and rainfall combined will furnish discharges in cubic feet per minute as follows, viz.:—

System.	Prospective Population.	Area in Acres.	Rainfall per Acre.	Volume of Sewage.	Volume of Rainfall.	Combined Maximum Discharge.
			Cubic feet per minute.			
Northern	88,857	2,084	·4935	1,481	1,028	2,509
Southern	42,206	912	1·071	704	977	1,681
Western	351,545	10,632	·7654	5,859	8,138	13,997
Total	482,608	13,628	.....	8,044	10,143	18,187

Proposed Sewers.

Advantage of gravity sewers.

The primary object to be attained in devising the proposed scheme is to provide for the removal of as much of the sewage as practicable by gravitation, or in other words to reduce the amount of pumping to a minimum. Nearly 29% of the entire drainage area, however, is too low to admit of the former system, and low-level sewers and branches will be necessary at Marrickville and other places. These sewers will require to be emptied by means of pumping machinery or other mechanical power, the sewage being discharged into and carried off by the gravitating sewers.

The proposed sewers are designed to carry off the foregoing combined quantities when flowing about ¾ full, but should a heavier rate of rainfall occur during the six hours of maximum sewage flow, the excess of stormwater would be carried off by overflow-weirs, which would act as safety-valves in case of sudden

sudden emergency. It must be borne in mind that the capacity of the sewers is such, that several years must necessarily elapse before the actual catchment area would become so great as to cause over-chargiug or backflooding. This, however, could always be prevented by making sufficient stormwater overflows, or by providing relief sewers hereafter, as may be found necessary. The small quantity of sewage contained in stormwater so discharged into natural water-courses, would be so greatly diluted as to be rendered perfectly unobjectionable. During the night and at other periods of minimum flow, the sewers would be available for a much larger quantity of stormwater.

Tunnelling. It will be observed that the greater part of the proposed intercepting sewers and sub-mains is intended to be in tunnel; in fact a specially close study of the topographical features of the district was not required to show that a considerable amount of tunnelling must necessarily be resorted to in their construction. Experience tends to prove that the cost of executing such sewers in tunnel, through ordinary sandstone or shale formations, is not greater than for moderately deep open cuttings, and it is obvious that much public inconvenience is saved from the fact that streets do not need to be closed to traffic for considerable periods, and that carriage-way surfaces are only slightly interfered with during the construction of the works.

Plan and sections. The plan and sections which accompany this report show the position, dimensions, and levels of the proposed sewers and works. The situations and points of termination of the various sewers and sub-mains have been determined with a view to facilitating the construction of the necessary subsidiary sewers hereafter, and securing as large a gravitating area as practicable. The plan illustrates the drainage areas and extent of the various systems, the position of the proposed sewers being indicated by red lines, but it is possible that further investigation may render it desirable to make certain minor modifications. Without entering into the detail requirements of an efficient sewerage system, it may perhaps be mentioned that the present system is designed with a view to the sewers being laid in straight lines as far as practicable, and at a sufficient depth to drain the lowest part of the adjacent premises. The main intercepting sewers are oviform, with the narrow part at the bottom; this form giving the greatest hydraulic mean depth and consequently the greatest velocity or scouring power during the periods of minimum dry-weather flow. The areas and gradients, together with steps at the intersections, are so regulated as to ensure self-cleansing, and to carry off effectively the maximum quantity of sewage and rainfall. Due provision is made by shafts for inspection and ventilation, also for storm-water overflows, for automatic flushing tanks or chambers, and for air-flaps.

Northern System.

Route and length. The main intercepting sewer for the Glebe, Leichhardt, and Balmain portion of the Northern system, colored purple on plan and referred to on page 8, commences at the intersection of George-street West and Newtown Road, at a level of 28·68 feet above high-water-mark, and after passing through the Glebe and across Johnstone's Creek, it enters Leichhardt at the east end of Piper-street, through which it is continued to and across White's Creek. On the west of White-street its direction is changed, and it passes across Bronan's Estate and enters Balmain at Foucart-street, on the west side of Brockley-street. The sewer is continued through Evans-street to Reynolds-street; it then crosses Montague-street, Palmer-street, and Booth-street, and enters Darling-street opposite Elwin-street. It continues through Darling-street to a point north of Johnson-street, where it terminates at a level of 53·54 feet. The total length of the northern main sewer is 4 miles 520 yards, and with the exception of inverted syphons at Johnstone's and White's Creeks, and at the valley at the north end of Darling-street, the sewer will be practically in tunnel throughout. Twelve branch intercepting sewers or sub-mains are intended to be constructed at the Glebe, Leichhardt, and Balmain, as shown on plan. The total length of these sewers is 5 miles 513 yards, the greater part of which will be in tunnel.

Dimensions and inclination. The main sewer for a distance of 700 yards from its commencement is intended to be of oviform section, the dimensions being 5 feet by 4 feet. A sewer of this size is necessary to carry the estimated maximum discharge of 1,947 cubic feet per minute when flowing three-quarters full, but as the intended 45-in. syphon in George-street West will only carry off 1,600 cubic feet per minute at the ordinary rate of flow, provision must be made at the inlet for the discharge during heavy rainfall of at least 400 cubic feet per minute by means of a storm-water overflow. The foregoing circumstances, however, will render it possible to secure an additional temporary head of 9 inches for the purpose of flushing the syphon whenever necessary, which will be decidedly advantageous. At the Glebe Point Branch sewer the size is reduced to 4 feet 9 inches by 3 feet 9 inches, and the dimensions are further decreased at the various branches until at the intersection of Darling-street and Ann-street, Balmain, the size is 4 feet 2 inches by 2 feet 6 inches. North of the latter it consists of 15-in. and 12-in. pipes. The parts of the sewer in tunnel are intended to be lined with concrete and faced with cement. The inverted syphon at Johnstone's Creek will consist of wrought-iron pipes, 42 inches in diameter, carried across the flat on masonry piers at a height of 12 feet above the surface for a distance of 600 feet. The syphon at White's Creek is 40 inches in diameter, and could be so arranged as to form part of the proposed bridge at Piper-street, Leichhardt. With respect, however, to the 12-in. iron pipe syphon and pipe sewer beyond it at the north end of Darling-street, Balmain, it may perhaps be found desirable to postpone the construction of the portion of the main sewer north of St. John-street, or to omit it entirely, with a view to that part of the district, both high and low level, being dealt with by pumping the sewage into the intercepting sewer. The inclination of the main sewer for a length of 5,466 yards from its commencement is 1 in 1,509, or at the rate of 3 feet 6 inches per mile, while the intervening syphons have a fall of 1 in 1,200. From Reynolds-street to Ann-street, Balmain, the inclination is 1 in 800, north of which it is 1 in 500 and 1 in 450, the syphon being 1 in 400. The levels of the sewers have been so regulated and adjusted at each branch that an uniform flow-line will be secured, and the velocity, which, at the estimated maximum flow in the 5 feet by 4 feet sewer is calculated at 165 feet per minute, will gradually decrease to 141 feet per minute in the 4 feet 2 inches by 2 feet 6 inches sewer.

The drainage area of this portion of the Northern system is 1,641 acres, of which about 1,000 acres can be drained by gravitation into the before-mentioned sewers. The remainder of the area consists of houses on the water frontages, and of various parts of the district which are below the contour level, and its drainage may necessitate the adoption of the special means hereinafter described for raising the sewage to the required height. The extent of the gravitating area is shown on the plan by green dotted lines.

The

The Callan Park Lunatic Asylum at Leichhardt contains an area of about 100 acres. The premises are fitted with a large number of water-closets, and for the drainage thereof and the removal of liquid refuse of all kinds, a complete system of sewerage and drainage has been provided. The maximum dry-weather volume discharged into the waters of Long Cove from the outfall sewer at all states of the tide, is about 13,000 cubic feet per diem. It may perhaps be mentioned that part of the liquid sewage is utilized by irrigating the vegetable garden in dry weather, but the arrangements, however, are somewhat crude. The proposed main sewer at Balmain will permit of the interception of the greater part of the dry-weather or sewage flow from the asylum, should it be deemed desirable. Callan Park Asylum.

The Prince Alfred Hospital branch sewer is proposed to be extended through Camperdown to the north end of Liberty-street, Petersham, a distance of 1 mile 140 yards. Commencing by a junction with the existing sewer, about 4 chains to the east of the hospital, at a level of 50·5 feet, it passes into and along the lane on the north side of the hospital; thence in tunnel under the ridge at Missenden Road, and through Grose-street; across Church-street; thence continuing in a westerly direction under Australia-street and the ridge at St. Mary-street to the north end of Kingston Road, through which it passes to the south end; terminating at Liberty-street, at a level of 58·36 feet. From the junction with the existing sewer to the north end of Kingston Road, a distance of 1,400 yards, the sewer is 4 feet by 2 feet 8 inches of new oval form; the rate of inclination from the commencement to Church-street being 1 in 1,150, and from Church-street to Kingston Road 1 in 1,000. The remainder of the sewer will consist of 21-inch and 18-inch pipes, laid at inclinations of 1 in 650 and 1 in 600 respectively. The area is shown by a neutral-tint color on plan; it amounts to 323 acres, inclusive of the University, and its drainage can be entirely effected by gravitation. As previously explained, the Borough of Darlington and a part of Redfern, colored dark brown on plan, and comprising 120 acres, are already provided with efficient main sewers. Extension of Prince Alfred Hospital branch sewer

Southern System.

The southern outfall sewer referred to on page 8, together with the Bourke-street sewer, will provide for the drainage of Waterloo, for the greater part of Redfern, and for the southern slopes of the city. In this case a separate scheme is nearly perfected by the Department for the construction of the necessary subsidiary sewers and for connecting the house-drains; consequently no further reference to this portion of the area need be made, beyond mentioning the fact that it contains 583 acres, and is tinted light brown on plan.

For the drainage of the district lying to the south of the ridge at Newtown Road, and between Rosehill-street, Alexandria, Macdonaldtown Park, and Erskineville-street, Newtown (colored green, and containing an area of 329 acres), it is proposed to construct a branch from the southern outfall sewer, opposite Reserve-street on the Waterloo Estate. The most practical route is across Shea's Creek Swamp and Creek to Harley-street, Alexandria, continuing across Mitchell Road and the Park, thence *via* Park-street and Henderson Road, under the Illawarra Railway at Erskineville to Burren-street, and terminating at Wilson-street, Newtown; a distance of 1 mile 780 yards. The prospective maximum discharge from the area is 590 cubic feet per minute, and a sewer of circular form will best meet the requirements of construction and level across the swamp, where, for a length of 400 yards, it is proposed to be carried as an aqueduct on masonry or concrete piers, the maximum height of the iron pipe being about 12 feet above the surface. The commencing level is 25·95 feet above high-water-mark, and at the termination at Newtown it is 78·48 feet. From the southern outfall to Mitchell Road, a distance of 1,100 yards, the sewer is 30 inches in diameter and the inclination 1 in 1,000; the fall then increases to 1 in 600 and 1 in 200. The variation of level between the south end of Burren-street and Wilson-street is about 42 feet, but, by breaking the fall of the sewer into four steps of 3 feet each, an inclination of 1 in 50 is obtained. On the west side of Mitchell Road the sewer consists of 21-inch and 15-inch pipes, except in Burren-street, where, owing to the before-mentioned fall of 1 in 50, a sewer 9 inches in diameter is ample. The maximum depth of flow in the 30-inch circular sewer is 1·8 feet, the corresponding velocity being 154 feet per minute; in the 21-inch and 15-inch sewers the velocity is 165 feet and 239 feet respectively, but in the 9-inch it is no less than 375 feet per minute when flowing half full. With the exception of the aqueduct and embankment at each end, the sewer will be in open cutting at a moderate depth. The only proposed alteration in the surface level consists in slightly raising the old Bourke-street Road at the sewer crossing. Macdonaldtown branch sewer.

A branch sewer or sub-main is intended to be constructed in Mitchell Road extending to Henderson Road, a distance of 730 yards. The sewer consists of 24-inch, 21-inch, and 18-inch pipes, laid at inclinations of 1 in 800 and 1 in 500, the terminating level being 33·98 feet above datum. These levels will permit the interception of the dry-weather flow from the sewer recently constructed by the Department in Alexander-street, Alexandria. This sewer temporarily discharges into the watercourse, which is thus rendered very offensive in hot weather. A further branch sewer is shown along Buckland-street for a distance of 500 yards; it consists of 9-inch pipes laid at an inclination of 1 in 250, the level at the upper end being 38·50 feet. The reason for devising these branch sewers to fall towards Mitchell Road is to ensure a greater dry-weather flow and more satisfactory velocity through the aqueduct, the levels not permitting a greater inclination than 1 in 1,000. Sub-mains

Western System.

Notwithstanding that the only available routes for the outfall sewer of the Western System (referred to on page 9) between Webb's Grant and the north side of Cook's River are confined within narrow limits, the question of the best position required much consideration. The main points to be determined were how best to ensure, consistently with efficiency, the highest practicable level at the outfall on the one hand, and on the other, the lowest in the penstock chamber at the termination. Also that the direction and levels of the sewer should ensure a minimum amount of interference with public roads and private property, that no interference whatever should be made with the navigation of Cook's River, and that the sewer should pass under the Illawarra Railway at the least objectionable point. Outfall sewer.

From the physical nature of the locality, the foregoing conditions practically prohibit the adoption of a direct route, and render it desirable that Cook's River should be crossed at a point to the west of Marrickville Valley; in fact, the only alternative would be to cross it by means of an inverted syphon below the dam. From the nature of the works to be constructed this would be a very costly undertaking,

and

and the route would further necessitate an embankment or aqueduct across the intended reclamation works on the north side of the river. Moreover, it would either be necessary to cross Marrickville Valley by a syphon or aqueduct of considerable length, or to make a dêtour on the north side. Either method would result in the invert level at the extremity of the various main sewers being so much raised as to materially decrease the extent of the gravitating system in the outlying portions of the suburbs.

Route

The proposed outfall sewer commences at Webb's Grant at a spot about 20 chains east of Muddy Creek, and after passing through the additional land proposed to be resumed, the route selected would enable the sewer to pass under the two main roads and the Illawarra Railway at Tempe in tunnel, across Wolli Creek, through Unwin's Hill in tunnel, across Cook's River opposite the west side of Mansion street, Marrickville, and in tunnel under the high ground on the west side of the "Warren," terminating in a penstock chamber at the junction of the intercepting sewers in Premier-street, the length being 2 miles 380 yards. It is apparent that the outfall sewer will be a work of special construction, and that, like some of the London main sewers, some parts of it will be raised above the level of the surface in an embankment; whilst in others it will be carried by aqueducts over creeks, swamps, and flats. At the crossing of Cook's River, the level of the bottom of the sewer will be at least 14 feet above high-water-mark, thus affording an increased headway of 5 or 6 feet, as compared with the Illawarra Railway Bridge.

Levels.

The importance of embracing as large a gravitating area as possible has already been mentioned, consequently each extra foot in height at the head of the outfall sewer is an important factor. The invert level at the outfall is fixed at 9 feet above datum, a height which will practically command filtration through at least 6 feet of earth, at any portion of the western part of the sewage farm. The distance from the outfall to the penstock chamber at Premier-street is 11,700 feet, and as the intended inclination is 1 in 1,700, the invert at the intercepting chamber will therefore be 15·88 feet above datum. The inclination is equivalent to a fall of 3·11 feet per mile.

Form and dimensions.

The most suitable form of sewer is circular; it combines the greatest strength and capacity with the smallest amount of brickwork; but from the following remarks it will be seen that it is most undesirable that the outfall should consist of one large sewer only. The dimensions of a sewer capable of discharging the estimated maximum flow of 13·997 cubic feet per minute, when running full, would require to be 9 feet in diameter; but as the flow-line in the largest intercepting sewer at the penstock chamber would only be 5·12 feet above the invert, it is obvious that a step of nearly 4 feet would have to be provided, a loss of level which would most seriously restrict the gravitation area. Notwithstanding that the construction of an outfall sewer of smaller dimensions in triplicate may involve a greater outlay, yet the advantages to be gained thereby are highly important. Three sewers, each 6 feet in diameter and flowing about 4 feet 9 inches deep, would not only furnish the required discharging capacity, but would obviate any loss of level by the step previously alluded to. This form of outfall would enable the intercepting sewers to be continued to Petersham, Leichhardt, Ashfield, Burwood, and Strathfield, and permit the extension of the high-level system in various districts, which would otherwise be impracticable. Further, by adopting three smaller sewers instead of a single one of larger dimensions, the crown would be about 3 feet lower; therefore greater lateral stability would be ensured where it passes above ground as an aqueduct.

Inclination, &c.

The discharging capacity of a sewer 6 feet in diameter is sufficient to enable the sewage of the existing population of the drainage area to be carried off by one only of the three intended sewers; it would, however, be advisable to construct the outfall in duplicate. This would enable internal examination or repairs to be carried on, and would also provide for sudden emergencies and future requirements. Storm-water overflows would be provided, and the works would be so arranged that the third sewer could be added whenever necessary. Another advantage may be mentioned—viz., that, inasmuch as the sewage from the existing population is relatively small in comparison with the prospective discharge, a much better velocity would be secured by conveying it through a smaller sewer for the time being. At an inclination of 1 in 1,700, each sewer will have a velocity of 189 feet per minute when flowing at a depth of 4·75 feet. The outfall sewer being a main carrier and not an intercepting sewer, the flow will be uniform throughout its length; consequently the probability of deposits taking place therein is very small, even during the period of minimum flow. Although the proposed gradient is flatter than the one adopted for the northern outfall sewer at Sydney, viz., 1 in 1,509, I have no hesitation in recommending it, having had practical experience of the working of circular sewers of similar dimensions in London, with inclinations of 1 in 1,751 and 1 in 1,915 respectively.

Intercepting sewers.

For the effectual drainage of the Western area, it will be necessary to provide for the construction of four intercepting sewers, as follows, all of which will commence at the before-mentioned penstock chamber, viz.:—

Eastern. (1).—An intercepting sewer and branches, which will provide for the eastern area colored yellow on plan, and will take the drainage of Marrickville and St. Peters, also parts of Newtown, Macdonaldtown, Alexandria, Petersham, Leichhardt, and Camperdown. The total drainage area is 2,657 acres, of which 1,477 acres are upon the gravitation principle, whilst the remainder (1,180 acres) comprises the low-lying parts of Marrickville, St. Peters, Newtown, Macdonaldtown, and Alexandria, which will be embraced in a low-level system. The latter sewers are shown by blue lines on plan. The high-level sewer

High-level system.

commences at the penstock chamber, at a height of 16·13 feet; its route is along Illawarra Road and across Addison Road, Stanmore Road, and Parramatta Road; thence along Ferris-street and Alfred-street to Booth-street, Leichhardt, a distance of 2 miles 1,590 yards, its terminating level being 32·09 feet above datum. The estimated maximum discharge from the 2,657 acres is 4,231 cubic feet per minute, of which 2,352 cubic feet is from the high-level system. The inclination of the main sewer is in 1 in 1,509 for a distance of 4,240 yards, and 1 in 1,000 for 590 yards, the remainder being 1 in 700. The dimensions to the outlet of the low-level delivery main, which is at a distance of 720 yards from the intercepting chamber, are 6 ft. 6 in. x 5 ft. 6 in.; the size is then reduced to 5 ft. 2 in. x by 4 ft. 2 in., and is afterwards decreased at the various points of interception until it becomes 4 ft. 0 in. x by 2 ft. 8 in., the termination at Leichhardt consisting of 18-inch pipes. The maximum velocities vary from 193 feet to 135 feet per minute. Except at the three depressions in Illawarra Road and at Alfred-street, Leichhardt, the sewer will be in tunnel, the greatest depth of shaft being 78 feet at Petersham. The crossing of the valley at Sydenham Road is intended to be effected by means of an inverted syphon 870 feet in length, the inclination of which is 1 in 737. An iron pipe 33 inches in diameter will ensure a velocity of

183 feet per minute, and it will be sufficient in capacity to discharge the maximum flow from considerably more than the existing population; but should it hereafter be found necessary to increase the provision, a second pipe could be added. The syphon is so devised that for the purpose of examination or repair, its contents could be temporarily drawn off into the low-level sewer.

Sub-mains. The first of the branch intercepting sewers shown on plan is on the southern side of the main ridge, the second one being at Leichhardt, north of Parramatta Road. The former commences at and passes along Addison Road, it then crosses Enmore Road and continues under the ridge in tunnel to Edgeware Road, thence through Camden-street and in tunnel under Cook's River Road to within a short distance of the south end of Toogood-street, Macdonaldtown. The length of this sewer is 1 mile 190 yards, the invert level at its termination being 34·71 feet above datum. The size of the sewer in open cutting is 24 inches and 21 inches in diameter, but where it passes under the ridges at Enmore and Cook's River Road in tunnel, the dimensions are increased to 4 ft. 0 in. x 2 ft. 8 in. The inclinations vary from 1 in 900 to 1 in 500. At the lowest places in Addison Road and Camden-street it will doubtless be advantageous to substitute iron for stoneware pipes for short distances. The northern branch consists of a 4 ft. 0 in. x 2 ft. 8 in. sewer, 1,670 yards in length; it commences at Albion-street, through which it passes to Johnstone's Creek, thence to Pyrmont Bridge Road, Camperdown, continuing under Booth-street and the ridge in tunnel, and terminating near the Orphan School Creek in the Old Parramatta Road, Glebe, at a level of 36·11 feet above datum. A short branch consisting of 12-inch pipes is also shown in Susan-street, extending to Booth-street, Annandale, a distance of 570 yards, the terminating level being 35·16 feet above datum. It is possible however that on closer examination it may be found desirable to carry the sewer along Nelson-street for a part of the distance, the levels being more suitable.

Low-level system. The low-level system will necessitate the erection of a pumping station in Marrickville Valley, the site selected as the most convenient being in the vicinity of Meek's Road, adjacent to the proposed Liverpool loop-line, and it is probable that the best position for the delivery main, which would discharge into the eastern intercepting sewer in Illawarra Road, would be alongside such railway. The invert of the low level sewer at the pumping station is 7 feet below datum, and at the upper end at Macdonaldtown, on the eastern side, it is 10·74 feet above. The levels at the extremities of the branch sewers are 5·95 feet above datum at South-street, St. Peters; 6·87 feet at the south end of Harber-street, and 11·56 feet at the south end of Mitchell Road, Alexandria. On the western side the level of the invert at the south end of Meeks' Road is 0·31 feet below datum; at the intersection of Meek's Road and Sydenham Road it is 1·61 feet below datum, terminating at a level of 6·69 feet above datum at the intersection of Victoria and Cook's Roads, Marrickville. The low-level main sewer on the eastern side would pass under the Illawarra Railway, along Bridge-street, Unwin's Bridge Road, and May-street, crossing under Cook's River Road, Mitchell Road, and the railway, thence to Devine-street, terminating at Macdonald-street, Macdonaldtown. The length of the low-level main sewers on the eastern side of the pumping station is 4,170 yards, and on the western 1,560 yards, amounting to 3 miles 450 yards in all. The prospective maximum discharge is 1,389 cubic feet per minute from the eastern section, and 490 cubic feet from the western, making a total of 1,879 cubic feet per minute to be pumped into the high-level sewer. The inclinations vary from 1 in 1,509 and 1 in 1,200, to 1 in 300 at the upper end. The largest sewer is 4 ft. 6 in. x 3 ft. 6 in., oviform in section, the dimensions being reduced by the several steps to 4 ft. 0 in. x 2 ft. 8 in. and from 21 inch to 12-inch pipes; the maximum velocities varying from 154 feet to 172 feet per minute. About 1,460 yards in length would probably be in open cutting, the remainder being in tunnel at a moderate depth, the deepest shaft being 38 feet in May-street. Due allowance is made in the estimates for increased cost in providing sub-ducts and additional concrete under and around the sewers, owing to unsound foundations and to the probable existence of sub-soil waters. The sub-main to St. Peters is a 4 ft. 0 in. x 2 ft. 8 in. sewer in tunnel, its inclination 1 in 500, and length 700 yards. The Campbell-street sub-main is also partly in tunnel and the remainder consists of 12-inch pipes, the total length being 1,000 yards. The branch to Mitchell Road is an 18-inch pipe sewer, 534 yards in length, laid at an inclination of 1 in 550, and the length of the 12-inch pipe-sewer at the south end of Meek's Road is 600 yards.

Pumping engines. In determining the measures to be adopted for raising the sewage from the low-level system into the high-level sewer, a lift of 34 feet, it is necessary to consider both existing and prospective conditions. The low-level area contains 1,180 acres, and at the prospective rate of 40 persons per acre, the estimated future population is 47,200 persons, whereas the existing population does not probably exceed 12,000 persons. To provide steam-power for raising the combined maximum flow of 1,879 cubic feet per minute direct from the sewers, without storage, would necessitate pumping engines equivalent to 120 horse-power; but it is only intended in the first instance to provide for a population of 15,000 persons, in which case the maximum discharge would be 597 cubic feet, or 3,731 gallons per minute; consequently an engine of 38 horse-power would be sufficient to perform the actual duty required. The maximum dry weather or sewage flow would not exceed 250 cubic feet per minute, the additional quantity being the limited amount of rainfall intended to be carried off from back yards. The combined quantity to be raised per annum is as follows, viz.:—

		Gallons.
Sewage	15,000 population x 50 gallons x 365 days =	273,750,000
Rainfall	15,000 population x 200 sq. ft. x 4⅓ ft. x 6·25 gallons =	78,125,000
Total		351,875,000

Type of engine. The engines generally adopted for the purpose of raising sewage were, until quite recently, compound condensing rotative beam-engines, or compound vertical direct-acting engines. This type of engine, however, is much more costly than the "Worthington" pumping engine, which is now being largely used and which is recommended in the present scheme. The "Worthington" engines will give a duty of 100,000,000 foot-lbs. per cwt. of coal, and the class of pump best fitted for the requirements at Marrickville is the "direct-acting low service steam pump," which is not only economical in first cost, but saves a very considerable outlay in the expense of foundations and buildings. Duplicate engines, each capable of raising 4,000 gallons per minute will be necessary, and it is estimated that the adoption of "Worthington" engines will ensure a saving of £5,000 on the existing requirements.

Northern (2).—A branch intercepting sewer, which will provide for the area colored red, amounting to 2,005 acres, and comprising the western parts of Marrickville, Petersham, and Leichhardt. A sub-main at Summer Hill will take the drainage of the eastern portion of Ashfield, and its capacity will be sufficient

sufficient to include Dobroyd, should that district hereafter require drainage. The main sewer commences at Premier-street, at a level of 16·88 feet above datum; and after passing under Warren Road, Livingstone Road, and Marrickville Road, it enters Wardell's Road, through which it continues and passes under the main ridge at Canterbury New Road and under the railway to Canterbury Old Road, Petersham. After crossing Parramatta Road, and passing along Flood-street, Allen-street, James-street, and Commercial Road, Leichhardt, it terminates at Church-street at a level of 38·71 feet. The total distance is 3 miles 960 yards, and, with the slight exceptions hereafter referred to, the sewer will be entirely in tunnel, the deepest shaft being 58 feet at Frazer Road, Petersham. The levels of those parts of the area which front Long Cove and Iron Cove Creek, together with a strip on each side of Long Cove Creek, as shown by dotted lines and containing an area of about 490 acres, are too low to permit of drainage by gravitation; therefore these places will probably have to be provided for hereafter in conjunction with low-level areas on adjacent systems.

Dimensions, inclination, &c.

The prospective maximum discharge from the above area is 2,635 cubic feet per minute. The inclination of the sewer is 1 in 1,509 for 2,740 yards from the commencement; it is subsequently increased at various points from 1 in 1,200 to 1 in 800, the fall at the upper end of Leichhardt being 1 in 600. The dimensions vary from 5 ft. 6 in. x 4 ft. 6 in. to 4 ft. 0 in. x 2 ft. 8 in., and the maximum velocities from 175 to 140 feet per minute. The portions of the sewer in open cutting occur at and near the crossings of Parramatta Road and Lord-street, and in James-street, Leichhardt, and at Lord-street it is intended to slightly raise the level of the surface. The branch sewer or sub-main from Frazer Road, Petersham, to Parramatta Road, Ashfield, is 1 mile 310 yards in length, the terminating level being 32·75 feet above datum. The route selected passes under Denison Road, Victoria-street, and Canterbury Old Road, at Petersham; across Long Cove Creek, and along Smith-street and Fleet-street, at Summer Hill; thence under the Railway, and across Grosvenor, Crescent, and Bogan-streets, to the intersection of Sloane-street and Kensington Road; thence to and along Parramatta Road to the watercourse near Ormond-street, Ashfield. The inclination varies from 1 in 1,509 to 1 in 500, and the size of sewer decreases from 4 ft. 4 in. x 3 ft. 4 in. to 4 ft. 0 in. x 2 ft. 8 in., nearly all of which is in tunnel; the only special work of importance being at the crossing of Long Cove Creek, where iron pipes will require to be used.

Route.

Western (3).—An intercepting sewer, extending to Strathfield. Its length is 5 miles 240 yards; and, aided by three branch-sewers on the north side, it will provide for an area of 4,100 acres. This area is shown by the blue colour on plan, and includes the western part of Ashfield and a portion of Enfield, also the Borough of Burwood, the south portions of Five Dock and Concord, and so much of Strathfield as lies south of Parramatta Road, east of the ridge beyond Homebush Railway Station, and north of the main ridge described on page 7. The main sewer commences at a level of 15·88 feet above datum; and, after passing in tunnel under the ridge at Livingstone Road, it enters Terrace Road and continues in a direct line therefrom in tunnel under the main ridge and various spurs, to the intersection of Alt-street and Albert Parade, Ashfield. It then proceeds in a westerly direction, *via* Albert Parade, across Croydon Road, Young-street, and Cheltenham Road, to the intersection of Shaftesbury Road and Victoria-street, Burwood, and passing through Victoria-street under Park Road and Wentworth Road, and across Redmyre Road, it continues along Redfern-street to Homebush Road, Strathfield, where it terminates at a level of 36·76 feet above datum. The area between the main ridge and the proposed sewer, together with the higher parts on the north side thereof, can be drained by gravitation; but the lower parts of the area in the vicinity of Iron Cove Creek at Croydon; of the water-courses which drain into Hen and Chicken Bay at Burwood, Five Dock and Concord; and of the water-courses leading to Homebush Creek at Strathfield, as shown by dotted lines on plan and containing a total area of about 1,100 acres, will not permit of that system, but will have to be specially provided for hereafter, in connection with other low-level areas.

Dimensions and inclination.

The prospective maximum discharge from the above area is estimated at 4,897 cubic feet per minute, and the inclination of the sewer being 1 in 1,509, its dimensions at the commencement require to be 6 ft. 10 in. x 5 ft. 10 in. The size will be reduced at the various points of interception, until, at the termination at Strathfield it is 3 ft. 9 in. x 2 ft. 6 in. The inclination of 3 feet 6 inches per mile extends to Redmyre Road, Strathfield, at which point the level of the invert is 34·37 feet above datum, but westward thereof the fall is 1 in 1,200. The maximum velocity of the 6 ft. 10 in. x 5 ft. 10 in. sewer is calculated at 198 feet per minute, decreasing to 146 feet per minute in the smallest sewer. With the exception of short lengths in open cutting at Terrace Road, Marrickville; at Etonville Parade, Croydon; at Burwood Road, Burwood; and at Redfern-street, Strathfield, the sewer will be in tunnel, the deepest shaft being 102 feet at Ashfield. The construction throughout will be simple, and will only interfere with the surface at the before-mentioned depressions, at which points the levels thereof will require to be slightly raised, the watercourses deepened, and a special form of covering provided; all of which, however, are mere matters of detail.

Sub-mains.

The three branch sewers or sub-mains will provide for the drainage of parts of Ashfield, Croydon, Five Dock, Burwood, and Concord. The sub-main at Ashfield commences by a junction with the main intercepting sewer at the intersection of Alt-street and Albert Parade, and passes along Alt-street in tunnel to Parramatta Road, the terminating level being 35·09 feet above datum. The dimensions of the sewer are 4ft. 0 in. x 2 ft. 8 in., and the length is 900 yards. The sub-main for the southern portion of Five Dock branches off from the main sewer at Young-street, Croydon; it then passes along Young-street, crosses Queen-street and Lang-street, and enters Church-street; thence under Bay-street, across to Parramatta Road, and along Cross-street to King's Road, Five Dock; a total distance of 1 mile 130 yards, of which about two-thirds will be in tunnel. The size of the sewer is 4 ft. 0 in. x 2 ft. 8 in., and the invert level at the termination is 40·21 feet. The Concord sub-main commences by a junction with the main intercepting sewer at Wentworth Road, Burwood; it then passes along Wentworth Road in tunnel, and crosses Parramatta Road; passes along Broughton-street, across Gipps-street, and terminates at the intersection of Crane-street and Bay Road, Concord. For a length of 970 yards the internal dimensions are 4 ft. 0 in. x 2 ft. 8 in.; the size is then reduced to a 21-inch pipe. The total length is 1,640 yards, and the invert level at Crane-street is 44·67 feet above datum.

Route, dimensions, &c

Branch to Canterbury (4).—A sewer for the future drainage of the district, coloured light blue on plan, containing an area of 1,870 acres, a prospective maximum discharge of 2,234 cubic feet per minute, and comprising the portion of Canterbury on the north side of Cook's River, together with Enfield and the part of Strathfield south of the main ridge. Cook's River, from Marrickville to Liverpool Road, forms the

the southern boundary, and the main ridge the northern. Although it may not be imperatively necessary to construct this sewer at the present time, it is desirable to make provision for it in the general scheme, in consequence of the fact that the population of Canterbury and Enfield is rapidly increasing. The position of the proposed main intercepting sewer—a considerable part of which would be in tunnel—is shown by red dotted lines ; and as the portion between the penstock chamber at Premier-street and the bend in Terrace Road would be parallel to the intended western main sewer, it would doubtless be advantageous and economical to construct such length in connection with the latter. For the reasons expressed on pages 13-14, with reference to the dimensions of the main outfall sewer, it would be extremely undesirable to provide a larger single sewer in preference to a double one as proposed. The commencing level is 17·13 feet above datum, and at the termination at Homebush, a distance of 5 miles 250 yards, it is 44·63 feet. The route west of Terrace Road, Marrickville, is across Garnet-street, Canterbury Old Road, Holden-street, King-street, Croydon Avenue, George's River Road, and Burwood Road; along part of Church Road and Dean-street, Enfield, and thence northward along Homebush Road to the watercourse near Fairhome-street, Strathfield. The inclination of the sewer varies from 1 in 1,509 at Marrickville to 1 in 500 at Strathfield, and the dimensions from 5 ft. 2 in. x 4 ft. 2 in. to 4 ft. 0 in. x 2 ft. 8 in.

Length of proposed Sewers.

The total length of sewers comprised in the foregoing systems and included in the present scheme, exclusive of the proposed main sewer for the future drainage of Canterbury, Enfield, and other districts, is 37 miles 967 yards, as will be seen by the following summary, viz. :—

System.	Mains.		Sub-mains.		Total.	
	Miles.	Yards.	Miles.	Yards.	Miles.	Yards.
NORTHERN SYSTEM.

Low-level Areas.

Description of low-level areas.

It has already been explained that, in addition to the low-level system at Marrickville, certain low-lying parts of the western suburbs are below the gravitation level. About one-fifth of the remainder of the drainage area will thus be excluded from the gravitation system ; and although at the present time there may not be any absolute necessity for the construction of sewers therein, it was necessary that the future provision for those areas should receive full consideration. There are twenty-two low-level areas in all—viz., two at the Glebe, three at Leichhardt, ten at Balmain, one at Ashfield, one at Five Dock, two at Burwood, one at Concord, and two at Strathfield. The low-level areas at the foot of the eastern slope of the Glebe would no doubt be dealt with at Blackwattle Cove, in connection with the city system of sewerage. In devising the main sewers and sub-mains, provision has been made in their capacity for the removal of the sewage from the whole of the low-level areas; but in the majority of those instances the existing conditions do not demand the immediate construction of sewers, therefore no provision has been made for the same in the present estimate. Doubtless the first areas to be dealt with will be at the Glebe, Leichhardt, and Balmain; and, as the population increases in the western districts, it will hereafter become necessary to make further provision from time to time. It would, however, in my opinion, be prudent to postpone the further consideration of any such works until the gravitating sewers are complete and in operation, as under those conditions the actual requirements of each area could be better ascertained. It is considered that the actual volume of sewage to be dealt with below the gravitating level will not only be relatively small, but, when diluted, its discharge into deep water would be inoffensive; and as portions of some of the areas front the Parramatta River, it is quite possible that under proper arrangements the drainage from the several houses thereon might be so conducted as to discharge below low-water mark, and thus obviate considerable expense in the construction of sewers in extreme cases.

The "Shone system.

One of the most efficient and economical modes of dealing with the several areas which are situate below the gravitation level would doubtless be by the adoption of the "Shone pneumatic-ejector system," which is a most valuable adjunct to a sewerage system where various parts of the drainage area are too low for gravitation, or too small in area and not sufficiently compact for an ordinary low-level system, involving pumping. Without entering into a detailed description of the machinery and apparatus, the principle of the system may be explained in a few words. In each area, ordinary stoneware pipe sewers would be laid in the streets for conveying the sewage by gravitation to an iron receiver, fixed at the lowest convenient part of the area to be drained. The sewage would then pass into an ejector, made of cast-iron and placed in an underground brick chamber. The ejectors are made to contain from 500 to 1,000

1,000 gallons each, and are fixed in groups of two, three, or four, according to local requirements. Immediately one is filled with sewage, an automatic arrangement admits compressed air into the cylinder, thus expelling the contents and forcing the sewage through an iron sewage-main into the nearest gravitating sewer. The system has been in operation for some time at Eastbourne and Southampton, where it has given great satisfaction, and it has recently been adopted in several other towns in England. A station for air-compressing machinery at the south end of Balmain would supply compressed air through cast-iron mains to ejectors at Balmain, Leichhardt, and the west side of the Glebe, and it is probable that a station in the vicinity of Hen and Chicken Bay, at Burwood, would serve for the remaining ejectors.

Sewage disposal.

Method of disposal.

Sewage is an uninteresting subject to many persons, but there is no greater problem than how to dispose of it effectually. The methods of treatment generally adopted for cities and towns were referred to in the recent report on the North Shore Sewerage and in various departmental reports, and the latest information from England shows that very little modification has since taken place. In London the Metropolitan Board of Works are now expending about £750,000 in the construction of tanks and other works for the precipitation process, in order to improve the condition of the River Thames at the main outfalls. At Portsmouth £120,000 has just been expended in the erection of additional pumping engines and in the construction of large storage tanks at the outfall which will enable 4½ million gallons of crude sewage to be discharged into the sea, within one hour from the commencement of each ebb-tide. In other important sanitary works, where irrigation is inadmissible, precipitation (*i.e.*, chemical treatment) and earth filtration appear to have been largely adopted.

Adelaide Sewage Farm.

The Adelaide Sewage Farm is 470 acres in extent; it is worked upon the broad irrigation principle, combined in the winter months with intermittent-downward filtration. The expenditure for land and works has amounted to £65,000. The experience of colonial sewage farming at Adelaide is valuable, for on the one hand it has shown that about £10,000 might probably have been saved by the non-erection of buildings for dairy purposes which are no longer used, irrespective of a considerable sum for levelling land, which might have been saved by the use of modern appliances. On the other hand, however, it shows that liquid sewage is an especially valuable fertilizer in a hot climate, and that under good management a substantial income can eventually be derived from grazing and fattening stock, and from the growth and sale of root crops, fodder, plants, fruit, and vegetables. During the first two or three years' operations the farm did not pay working expenses, but a recent return indicated a profit of £700 on the operations of the previous half-year.

Various systems of treatment.

The report of the Sewage and Health Board in 1876 renders it unnecessary to enter into details of the various systems of sewage disposal or treatment, but they may be recapitulated as follows, viz.: —

1. By discharge into the sea or into a tidal estuary or river, without treatment.
2. On land, by irrigation.
3. On land, by intermittent downward filtration.
4. By chemical treatment.

Advantages of irrigation.

It would be undoubtedly misleading to assert that any one special system of disposal is the best for adoption; everything depends upon local conditions, or, in other words, every place must be dependent upon its own physical circumstances and requirements. Irrigation is not the universal mode of sewage purification, but where favourable conditions exist it is the cheapest and most efficient process, especially where sewage can be delivered by gravitation. The conditions essential to efficiency and financial success necessitate,—

(*a*) Suitable soil of a sufficient depth;
(*b*) Sufficient area of land;
(*c*) Straining the sewage;
(*d*) An artificial filter as a stand-by for use in wet seasons.

A warm climate suits irrigation, and so far as the available area of land will allow, the process could be economically carried on at Botany in the manner hereinafter pointed out. It is essential to the success of sewage farming, when conducted under sanitary obligations—that is to say, jointly for the production of remunerative crops and for the complete purification of the sewage—that the area to be employed shall be sufficiently large to enable the cultivation to be frequently varied, and to prevent the land from becoming either drowned with water or overgorged with excretal and other organic matters.

Various allowances for land.

Mr. Hawksley states "that in the moist climate of England 6,000 tons per acre per annum is the desirable limit for broad irrigation on land of average suitability." This is equivalent to 60 inches in depth. Sir Robert Rawlinson, however, states "that 12,000 tons is not too great a volume to be used on well-prepared land without swamping it, if the sewage is equally and evenly distributed." Professor Robinson states "that open porous land, drained to a depth of 6 feet, will take the sewage of 600 or 700 persons per acre per annum, but there must be an artificial filter for use in wet seasons." Other authorities state that a less depth than 6 feet will suffice to purify the effluent after chemical treatment or precipitation. Professor Tidy recommends a combination of "precipitation and irrigation" as a sound process to adopt. It is, of course, well understood that whereas chemicals will clarify sewage, earth alone will absolutely purify it and render it unobjectionable.

Volume of sewage and rainwater to be treated.

The combined volume of sewage and rainwater to be discharged at the sewage farm from the southern and western outfall sewers will eventually assume large proportions. It is obvious that the sewage flow will vary throughout the year in proportion to the increase in the consumption of water during hot summer days, and to the decrease during the winter months. The range affects the quantity consumed very materially; for instance, for a population of 100,000 persons at the summer rate of 72 gallons per head, the daily volume would amount to 32,140 tons; at the mean rate of 50 gallons, to 22,320 tons; and at the winter rate of 25 gallons, to 11,160 tons. The rainfall catchment area being calculated at 200 square feet per head of population, a rainfall of 2 inches in twenty-four hours from a similar population would give the following results, viz.:—$\frac{100,000 \times 200 \times \frac{1}{12}}{35{\cdot}84 \text{ c. ft.}} = 93,006$ tons per day. It is therefore apparent that for a population of 100,000 persons the volume will vary from a minimum dry-weather flow of 11,160 tons per day, to a maximum flow of sewage (taken at the mean rate) and rainfall combined, amounting to 115,326 tons per day.

Assuming

Annual volume.

Assuming the commencing population at 100,000 persons, the volume of sewage and rainfall combined (the former being calculated at 50 gallons, or ·2232 tons per head per day throughout the year, and the latter based upon an annual rainfall of 50 inches) would amount to the following quantity per annum, viz.:—

	Popu. Gals. Days.		Tons.
Sewage	$\frac{100,000 \times 50 \times 365}{224 \text{ gallons.}}$	=	8,147,321
Rainfall	$\frac{100,000 \times 200 \times 4\frac{1}{6}}{35{\cdot}84 \text{ cubic feet.}}$	=	2,325,149
Total			10,472,470

or at the rate of 104·72 tons per head per annum. From these figures it is a simple matter of calculation to determine the annual volume to be dealt with as the population draining into the sewers increases; *e.g.*, the quantity would amount to 20,944,940 tons per annum for a population of 200,000 persons, whereas for the entire prospective population of the southern and western areas, as described on page 9, it would amount to 41,235,454 tons.

Arrangement of Sewage Farm and Outfall Works.

Mode of application to land.

The various volumes requiring to be utilized and purified having been described, the best mode of applying the sewage to the land, after it has been strained, will consist in the combined processes of irrigation and intermittent-downward filtration. Although the area of land at present available for this system of treatment is sufficient for a population of over 200,000 persons, it will probably be unnecessary to provide for more than half that number in the first instance. As the population further increases, it will become necessary to enlarge the effective area from time to time, and to adopt the process of "precipitation" for a portion of the additional sewage, the effluent being subjected to æration and earth filtration, or further chemical treatment. With a total area of 550 acres it will thus be practicable to utilize and purify the sewage and rainwater from a population of about half-a-million persons.

Provision for tanks and destructor.

It will be desirable to so arrange the outlet works that the contemplated "precipitation" tanks can be added whenever deemed necessary. Sewage should not be unnecessarily exposed before its application to land, and although it may materially add to the cost of construction, it will doubtless be found desirable to cover the tanks and main carriers. The results obtained will justify the extra outlay. It may possibly be deemed advantageous on sanitary grounds to establish a "Destructor" on the farm for the disposal of household and other refuse. If so, steam-power might thus be obtained for the purpose of pumping water or sewage, or for working machinery; moreover, noxious gases from tanks could be drawn off and consumed by the furnaces or be carried away by the chimney-shaft. Convenient access to the farm from each end should also be provided.

Preparation of areas.

The work of draining, forming, and preparing the effective area which will eventually be required in addition to the 370 acres referred to on p. 9, could be gradually proceeded with. A considerable quantity of superfluous material could be removed from the higher parts and levelled where required, and other parts could be filled in by the deposit of dredged material. These operations could be greatly facilitated by the use of water and suitable appliances. The solids extracted from crude sewage, after being deodorised, together with sludge from the precipitation tanks, could also be dug in and covered up with earth; thus, the swampy area would gradually be reclaimed and the level brought up to the requisite height above high-water. An effective area for the purification of a precipitation effluent, need not necessarily have its surface more than 5 feet above high-water-mark spring tides.

Annual allowance per acre.

The volume to be delivered at the sewage farm is apparently very great in proportion to the area of the land, but, under all the circumstances, I have no doubt whatever that the latter is capable of effectually purifying the sewage. The soil, which at present is uncultivated, is of an extremely porous nature, and its surface is well above high-water-mark; it is therefore scarcely possible to place a limit on its powers of absorption. It will certainly purify an exceptionally large quantity for the first few years, and under the favorable climatic conditions which exist, provided the crude sewage be first strained, an allowance of 18,000 tons per acre per annum for broad irrigation, and from 1,600 to 2,000 tons per acre per day for intermittent-downward filtration will be within a safe limit.

Filtration allowance.

The irrigation allowance is equivalent to 178 inches in depth, and 186·4 persons per acre. Broad-irrigation alone would require an area of 582 acres for each 100,000 population, irrespective of a small filtration area in reserve; and as so extensive an area is impracticable, the advantage of a combined system is obvious. A daily allowance of 1,600 tons per acre of filtration area on 120 days is equivalent to 1,833 persons per acre per annum. The allowance under this process in England varies from 1,000 to 2,000 persons and upwards per acre, consequently it may be safely assumed that the proposed filter at Botany will easily provide for the before-mentioned number. A well-formed filtration area 6 feet deep, will pass 2,000 tons per acre per day intermittently with facility; in fact, the filter at Adelaide is designed to purify sewage at the rate of about 3,000 tons per acre per diem.

Capacity of filters.

If a volume of sewage amounting to 22,320 tons (the estimated mean dry-weather flow from a population of 100,000 persons, *vide* page 18) were delivered upon a filtration area of 34 acres in one day it would cover the whole area to a depth of 6½ inches ($\frac{22,320}{34 \times 101} = 6\frac{1}{2}$), or at the rate of 656 tons per acre; but if rainfall to the before-mentioned depth of 2 inches in twenty-four hours (93,006 tons) passed into the sewers, in addition, the depth would be increased 33·6 inches, and the rate per acre would amount to 3,392 tons. In practice, however, it would scarcely ever be found necessary to discharge the entire volume on the filtration area, because some portion of the irrigation area would be available. Moreover, as the rainfall throughout the entire area of the western suburbs would only amount to or exceed 2 inches in twenty-four hours upon very few days per annum, it may be taken for granted that the capacity of the filters would seldom be tried to such an extent.

Area to be first prepared.

The existing population of the area to be drained into the southern and western outfalls is estimated at 100,000 persons, and in the appropriation and laying out of the sewage farm, provision should be made for at least that number of persons. The quantity of sewage and rainwater to be treated would thus amount

amount to nearly 10½ million tons per annum (*vide* page 19), and for its effective disposal, 254 acres of land would require to be cleared, levelled, and prepared in paddocks for broad irrigation and intermittent-downward filtration, in the following manner, viz. :—

	Acres.		Tons.		Days.		Tons per annum.
For irrigation	220	x	18,000		...	=	3,960,000
„ filtration...	34	x	1,600	x	120	=	6,528,000
			Total		...	...	10,488,000

Additional area.

In order to show the extent of the progressive areas and necessary future arrangements to meet the requirements of the constantly increasing population draining into the systems, the following figures are given, viz. :—

For a population of 200,000 persons,—

	Acres.		Tons.		Days.		Tons.
Irrigation area	300	x	18,000		...	=	5,400,000
Filtration „	73	x	1,800	x	120	=	15,552,000
			Total		...	...	20,952,000

For a population of 393,751 persons,—

	Acres.		Tons.		Days.		Tons.
Irrigation area	350	x	18,000		...	=	6,300,000
Filtration „	100	x	1,800	x	120	=	21,600,000
Additional filtration area for precipitant effluent	50	x	2,250	x	120	=	13,500,000
			Total		...	...	41,400,000

The proposed system can be confidently recommended as the one likely to secure the best results. Under special, experienced, and efficient management, there should be not only a good remunerative prospect, but an absence of any grounds whatever for reasonable complaint of nuisance or smell arising from the process, or from the discharge of the purified effluent. The latter would be removed by deep drainage, and be conducted to and discharged in deep water.

Subsidiary Sewers and House-drains.

Subsidiary sewers

It is obvious that the scheme now submitted provides only for the main sewerage of the western suburbs ; it does not therefore include the construction of subsidiary sewers, although in several instances the depth of the main sewers and sub-mains will be sufficiently moderate to permit the adjacent houses and premises to be connected. The position of the main and branch sewers has been devised to facilitate the construction of the subsidiary sewers in such a manner as to avoid all unnecessary depths and expense. The back streets and lanes will permit back-drainage to be conveniently adopted in numerous instances, and the cost of constructing a sewer in the street (or for the greater part thereof) together with increased lengths of private drains, may thus be avoided. In several instances sewers will probably cross private lands, in which cases the works will have to be carried out by arrangement, or under the compulsory powers usually provided to meet such emergencies.

Construction.

The construction and ventilation of the subsidiary sewers is a matter which will hereafter demand special consideration. The greatest care and attention will also be required in constructing sewers and drains, especially in the low-lying parts, to ensure their being perfectly watertight and capable of excluding subsoil waters. The importance of works of sewerage, when considered in reference to the health of the district, makes it desirable that the most perfect works, including the latest improvements in construction, should be adopted. To ensure the sewers being under perfect control and easily examined at any time without breaking up the ground, the chief requisite is the construction of all those which cannot be entered, as far as possible, in perfectly straight lines ; man-holes or lamp-holes being provided at every lateral point of deviation, and ventilators at every vertical deviation.

Ventilation.

Sir Robert Rawlinson, C.B., whose experience in sanitary engineering exceeds that of any other engineer, says :—" Better be without sewers and drains than have them unventilated." Efficient ventilation cannot be fully secured unless the sewers and drains are constructed with special reference thereto, and it is highly important that ample provision be made for frequent changes of the atmosphere in the sewers, and for the escape of sewer gases, in such a manner that no nuisance will be created, and all danger to public health will be avoided. At the changes of gradient in the main sewers, and at each junction or branch in the lateral sewers, a few inches should be taken at the bottom of the shafts or man-holes to form a step, in order to break the sewer into lengths. Air-flaps should be provided at each break for the purpose of preventing the sewer gas from traversing the whole length of the sewer and escaping at the summit, and for ensuring its escape up the shafts. Fresh air will be admitted into the sewers by certain shafts, and polluted air allowed to escape by others. The outlets at the top of the " upcast" shafts will be extended in such a manner that the gases will be discharged into the open air at a level considerably above the street surfaces.

House-drainage

The work of house-drainage has been forcibly described as the "crowning-point" of a system of sewerage, and unless it is efficiently carried out under proper regulations and superintendence, not only is the advantage to health and comfort of a good system lost or minimized, but a positive source of evil and expense is established. Prior to commencing the house-drainage works in connection with the proposed sewers, no effort should be spared to ensure the due framing and passing of modern regulations in reference to house-drainage. " Disconnection" or " isolation and ventilation" is a subject even now not so fully understood and practised as it should be, therefore the regulations must provide for the insertion of a disconnecting " trap" or " chamber" in each instance, together with ventilation to the open air by vertical pipes carried well above the tops of adjacent buildings. Effectual sewer ventilation will thus be ensured, and the only "open" gratings in the middle of the streets will be those intended to act as fresh air inlet or " downcast" shafts.

Cost of Proposed Works.

The entire sewerage scheme, as hereinbefore described, comprises a total length of 37 miles 967 yards of sewers, 42 automatic flushing chambers, and 351 shafts, manholes, and ventilators; and the estimated cost thereof, together with the execution of the undermentioned works, and including land and compensation, is as follows, viz.:—

	£	£
Northern System—Main sewer	75,518	
Sub-mains	70,376	
Camperdown branch	12,454	
		158,348
Southern System—Main sewer	10,289	
Sub-mains	2,856	
		13,145
Western System—Outfall sewer	190,557	
Eastern high-level main sewer	56,690	
,, sub-mains...	27,530	
,, low-level main sewer	62,076	
,, ,, sub-mains	16,217	
Northern main sewer	65,776	
,, sub-mains...	20,434	
Western main sewer	133,001	
,, sub-mains...	29,930	
		602,211
Marrickville pumping station (including duplicate engines, boilers, penstocks, buildings, &c., complete)		11,000
Outfall works (including additional land and laying out first section of sewage farm)		45,600
Total		£830,304

Note.—Should it be decided to make provision for the first section (1,620 yards in length) of the Canterbury branch main-sewer as explained on pp. 16–17, the sum of £20,741 should be added to the above estimate.

Comparative cost per head population

The above expenditure upon the proposed system of main sewerage, inclusive of the outfall and other works, represents an outlay of nearly £2 per head upon the prospective population of the western suburbs. This is apparently a large sum, therefore a few remarks upon the cost of sewerage works elsewhere may not be uninteresting. The only colonial work of importance executed to which reference can be made is the Adelaide sewerage system, and its cost furnishes certain data as to the probable outlay for sewerage works in the Colonies, when carried out under favorable conditions. The total expenditure has amounted to £360,000, which is at the rate of £3 per head on the estimated future population. In European and American cities a remarkable variation has been experienced in the cost of sewerage and drainage works. London contains some 2,400 miles of sewers, and the cost of the main and subsidiary sewers, together with pumping machinery, storm-water relief-sewers and outfall works, has amounted to over £2 per head. In a large number of English towns the cost varied from under £1 to over £4 per head, whilst in some of the more recent sewerage works, such as Reading, Oxford, and Portsmouth, the cost was about £2 2s., £2 10s., and £3 per head respectively. The recently constructed sewerage works and sewage farm at Berlin have cost £2 5s. per head, whilst the sewerage of Hamburg, Dantzic, Frankfort, and other continental cities, has cost from £1 8s. to £3 15s. per head. In American cities the cost has ranged from £1 to £5 per head.

Comparative prices.

The higher rates for labor and materials in Sydney as compared with English prices, obviously increase the cost of sanitary works; *e.g.*, the contract rates for cement concrete for sewers in tunnel is about 26s. 6d. per yard cube in England, but in Sydney it is 65s., whilst for ordinary cement concrete the respective prices are 14s. and 45s. per yard cube. Brickwork in cement in sewers costs 39s. per yard cube in London, against 85s. in Sydney. The most recent sewerage works which involved a large amount of tunnelling in rock, were executed at Torquay a few years since, where an outfall sewer 7 feet in diameter and 9,000 feet long was constructed, the deepest shaft being 205 feet. The actual cost of driving the more difficult portion of the tunnel, including shafts, was £2 17s. per foot lineal, whereas the execution of the same quantity of work calculated at the Sydney prices, would amount to £5 11s. per foot. The cost of the sewer complete for the entire length averaged less than £3 per foot lineal, against £8 11s. at the Sydney rates. It should be mentioned that the removal of the rock was effected by means of the "Ingersoll" rock-drill and "Sturgeon's" high speed air compressor, and engineers of the highest eminence assert that this enabled the work to be carried on at three times the speed as compared with hand labour; indeed, Sir John Coode stated that "foot for foot of length of holes drilled, the work would be done at one-half the cost." It was however actually found at Torquay, that three holes were drilled by the rock-drill for one hole bored by two first-rate miners.

Annual Cost.

Terms of payment.

Should the works be carried out under the provisions of the Metropolitan Water and Sewerage Act, (43 Vict., No. 32), the annual payment to repay principal and interest at 4 per cent. per annum, would amount to 6 per cent. on the sum expended for a period of *twenty-eight* years. In England, under the provisions of the Public Health Act of 1875, the Local Government Board sanction loans for the execution of water and sewerage works, not only at a low rate of interest but for a period of *sixty* years; it being deemed just and equitable that a succeeding generation should contribute towards the cost of permanently beneficial works. By extending the period to sixty years in this Colony, the annual payment would be reduced from 6 per cent. to 4·42 per cent.—a result obviously advantageous.

Ratable value of property.

According to particulars recently ascertained from the various Council Clerks and from other sources, it appears that at the commencement of the past year, the annual ratable value of the nineteen Boroughs and Municipalities which constitute the area included in the scheme, amounted to £1,460,000. During the two previous years the ratable value of the whole of the suburban area increased no less than 35 per cent., and it may be reasonably assumed that the subsequent increase in the western portion has at least maintained a similar rate. Under these circumstances the ratable value will probably amount to at least £2,000,000 at the end of 1889, in which case a rate of 1d. in the £ throughout the area to be sewered, would produce about £8,300.

The

Annual cost.

The annual cost of management and maintenance of the sewers and works, including pumping at Marrickville, also office and incidental expenses, is estimated at £5,650. It is anticipated that the working expenses in connection with the sewage farm will scarcely be counterbalanced by the receipts during the first two or three years, but the subsequent operations should undoubtedly result in substantial profits, which would go towards reducing the annual cost. The charges for interest and repayment on the outlay of £830,304 if taken at 6 per cent. would amount to £49,818, but if taken at 4·42 per cent. they would not exceed £36,699. The annual cost of the scheme may therefore be summarised as follows, viz. :—

	For repayment in 28 years.	For repayment in 60 years.
	£	£
Interest and repayment	49,818	36,699
Working expenses	5,650	5,650
Total	55,468	42,349

The balance in favour of the extended period for repayment of loan therefore amounts to £13,119 per annum, and the effect would be to reduce the amount of the drainage rate from 6·68d. to 5·12d. in the £ per annum.

Money Value of Sanitation.

It will no doubt be asserted that the scheme will entail a heavy charge upon the community, and a question may arise as to the advantages to be derived from the outlay, and also what is the probable value of human life saved and sickness prevented by efficient sanitation? In the first place it may be answered that greater cleanliness is obtained, and that purer air, and increased comfort and convenience are ensured; and secondly, that where sanitary measures have been properly carried out, experience has proved that in the course of comparatively few years the money value of lives saved and sickness averted has exceeded the full cost of the works executed.

It is well known that for every death from preventable disease there are at least twenty cases of serious sickness. Leading authorities assert that six-tenths of such deaths are those of persons over twenty years of age, and that one-tenth of that number are probably infirm. Life is priceless, therefore it is exceedingly difficult to estimate its money value; but there can be little question that the labour value of each life saved in the suburbs, in addition to the cost of maintenance, would average at least £50 per annum. The funeral, nursing, and other expenses in each fatal case would probably average £10; and the value of the labour in each case of sickness prevented, together with medical and other expenses, would no doubt average £2. Applying these figures to the existing population only of the western suburbs (164,000), that is without any allowance for the increase of population constantly going on, and assuming that the death-rate of 21 per 1,000 (see page 6) should be reduced to 16 per 1,000, it will be found that there are no less than (164 × 5) 820 deaths per annum from preventable disease, and that the annual money loss to the community, which may be stated as follows, amounts to more than the annual cost of the entire sewerage scheme, viz. :—

Lives saved—Value of labour, 443 cases	@ £50 =	£22,150
Funeral and other expenses saved, 820	@ £10 =	8,200
Sickness prevented—820 × 20 = 16,400 cases	@ £2 =	32,800
Total		£63,150

STORM-WATER DRAINAGE.

A sewerage scheme alone will certainly not meet the whole of the sanitary requirements of the western suburbs. The frequent floods at Marrickville Valley and the removal of storm-waters generally is a question which must necessarily be dealt with; and although no sum is included in the foregoing estimate for sewers and other works, the following remarks will show that the subject has received careful investigation, that it has been fully considered, and that the execution of certain works is absolutely necessary.

Drainage of Marrickville Valley.

Extent of recent floods.

The flooding of Marrickville Valley after heavy rainfall has already been referred to on the sixth and seventh pages; it is, however, a matter requiring special consideration. In June, 1885, and in the months of April and May last, the area under water extended for more than a mile in length and from 150 yards to 630 yards in width on the north side of Cook's River; the thoroughfares inundated being the low-lying parts of Marrickville and Sydenham Roads, Fitzroy-street, Meeks Road, Saywell-street, and Renwick-street, at which places the level of the surface is either below ordinary high-water-mark, or only slightly above it. The levels of the flood in April were taken, and prove that the waters rose considerably above high-water-mark. The ordinary level of Cook's River opposite Marrickville Creek is from 2 to 3 feet below high-water-mark, but on the above occasion it rose to 1 foot above. At Premier-street foot-bridge the level was 1·03 feet; at Renwick-street, 1·40 feet; at the Reserve on the south side of Marrickville Road, 1·75 feet; at Marrickville Road, 2·37 feet; and at Sydenham Road, 2·68 and 2·92 feet. In Fitzroy-street the level was about 2·34 feet; but at the store in Marrickville Road, the waters headed up to 3·84 feet; and at the tramway crossing at the corner of Victoria and Sydenham Roads to 5·37 feet above datum. A number of houses, principally cottage residences, were flooded, and it is obvious that inundations of this character not only cause public inconvenience and damage to private property, but the after effects must be very prejudicial to the health of the inhabitants.

Watershed.

The approximate area of the Marrickville watershed draining into Cook's River is 1,712 acres, or nearly 3 square miles, therefore the volume of surface-water to be carried off during continuous heavy rainfall obviously assumes large proportions. The existing conditions do not afford sufficient facility for the discharge of flood-waters. The channel is by no means straight, clear, or uniform in its course; the levels of the bottom are irregular, and at the several streets which have been formed over it, insufficient openings have been left for the passage of storm-waters. Apart, however, from these defects, the physical conditions of the locality are such, that flooding must inevitably occur during periods of continuous rainfall, unless an efficient remedy is afforded. The

Works recommended.

The works recommended to be carried out are estimated to cost £20,000, and they consist in—

(1.) Cutting and embanking a main channel of sufficient capacity to effectually carry off all storm-waters from the valley, both at high-water and when Cook's River is in flood.

(2.) Raising the levels of the low-lying streets to a prescribed height above flood-level, and increasing the facilities for the discharge of storm-waters at the various bridges, also at the intersection of Victoria and Sydenham Roads.

To give effect to the above recommendations legislation would doutless be necessary, which should also extend to the whole area, it being made compulsory that the ground-floor level of existing houses and the land on which the premises are erected shall be raised above flood-level; also, that no further building operations be permitted until the sites of the intended buildings have been filled up to an approved height. The suggested future level for the south end is 2 feet above datum at Premier-street, gradually rising to 4 feet at Sydenham Road. The levels of the remainder of the low-lying area could be raised from time to time, and if the proposed Liverpool loop-line is carried out, an excellent opportunity might be afforded for the supply of material for that purpose. I think that the foregoing provisions would, in a measure, equalise the cost between the ratepayers generally on the one hand, and the owners of land and property in the flat on the other.

To afford a really effective remedy it is necessary to provide for carrying off heavy as well as continuous rainfalls under adverse conditions. It is not an uncommon occurrence for rainfall in the district in question to amount to 1 inch per hour, which depth over the entire area would equal 103,576 cubic feet per minute. Under certain conditions the actual quantity flowing off the surface would be materially less on account of evaporation and soakage, but taking into consideration the geological formation of the area and the impervious nature of a large portion of its surface, I think that an allowance of 75 per cent. of 1 inch per hour during continuous rainfall, is not too liberal a provision to ensure safety from flooding. This would represent 45 cubic feet per acre per minute, or 77,040 cubic feet from the entire area, a small portion only of which would be carried away by the sewers.

To discharge about 75,000 cubic feet per minute into Cook's River at flood-level, allowing a fall at the rate of 24 inches per mile below Sydenham Road, would necessitate a channel flowing 5 feet deep and of an average width of 50 feet at the northern end, gradually increasing to 66 feet wide south of Renwick-street. Obviously the width of the channel could be decreased by adopting a deeper section, but as the bottom would be below the level of Cook's River, the water in it would undoubtedly become stagnant in dry seasons; which, considering the nature of the water flowing into it, might prove extremely objectionable from a sanitary point of view.

I have considered the desirability of recommending alternative measures, such, for instance, as the resumption of the flooded area, the demolition of the houses thereon, and the conversion of the site into a park or reserve; also making a smaller cutting and providing pumping power for flood-waters; also making a direct channel for storm-waters to Cook's River below the dam, or a tunnel under the ridge at St. Peters to Shea's Creek, but on examination, neither of these proposals commends itself financially or otherwise.

Creeks and Watercourses generally.

The necessity for utilising the existing creeks for the removal of rainfall has already been strongly urged. Natural streams or watercourses should not be arched over to form sewers, but should be improved, regulated, and lined in accordance with local requirements, in order to more readily remove surface water and extreme falls of rain. Owing to its impurity, the surface water from streets during slight rains will pollute natural watercourses, but during heavy rainfall it will flow off comparatively pure. A great portion of the silt from street surfaces carried off during storms could be prevented from flowing into the Parramatta River, but even if some did so, it could be easily and inexpensively removed by dredging. Certain works which have recently been carried out in parts of Johnstone's and White's Creeks at Leichhardt will facilitate the discharge of storm-waters in that locality, but it will doubtless become necessary to deal effectively with the entire length of those creeks in the course of a short time, together with parts of Orphan's School, Long Cove, Iron Cove, and Shea's Creeks. It may also be desirable to consider whether the resumptions of portions of the creeks, and reclamation in the vicinity of their outlets, would not be a prudent course to adopt.

GEORGE H. STAYTON,
M. Inst. C.E.

For summary of Northern, Southern, and Western systems combined, *vide* pages 9 and 11.

C 1.

STATEMENT showing the estimated ultimate cost of works for a complete system of Sewerage throughout the Western Suburbs, prepared September 20th, 1888 —

(1) *Works already executed or nearing completion.*

	£	£
Northern outfall (proportionate part)	88,000	
Southern outfall and sewage farm (do) . .	186,000	
		274,000

(Note.—These may be regarded as maximum proportionate amounts for the Western Suburbs)

(2) *Present scheme.*

Main sewers and other works as per Report		830,304

(3) *First section of additional works*

Subsidiary sewers (300 miles)	300,000	
Canterbury and Enfield main sewer (first part) ...	20,741	
Marrickville storm-water drainage	20,000	
		340,741
		£1,445,045

(4.) *Subsequent works.*	£	£
Subsidiary sewers (100 miles)	100,000	
Completion of Canterbury and Enfield main sewer	65,410	
Low-level systems (Shone's)	119,650	
Completion of western outfall sewer	48,374	
Completion of Marrickville pumping station	6,817	
Completion of sewage farm	32,600	
		372,851
Total		£1,817,896

The above sum is believed to be ample to provide for every contingency, and is inclusive of all works which can possibly be foreseen at the present time.

C 2.

STATEMENT showing the Annual Ratable Value of the nineteen Boroughs and Districts comprising the Western Suburbs of Sydney.

	£
In 1884	1,116,000
In 1886	1,437,000
In 1887	1,571,000
In 1888 (estimated)	1,700,000

On the completion of the first three sections of the scheme in 1894 it is estimated that the annual ratable value will have increased to £2,200,000, in which case a rate of 1d. in the £ would probably produce £8,900 net.

At the final completion of the entire scheme in (say) from fifteen to twenty years' time or upwards, when the population would be double or nearly treble what it was in 1887, the ratable value may be fairly estimated at £3,300,000, in which case a 1d. rate would produce £13,400 net.

As to possible lower rate of interest.

The magnitude of the work and its importance to the ratepayers is such that special consideration will, doubtless, be necessary with regard to the financial part of the question. Under the Metropolitan Water and Sewerage Act the rate of interest chargeable on cost of works is fixed at 4 per cent., and the term of repayment twenty-eight years. This rate was, doubtless, in accordance with current rates in 1880, when the Act was framed.

It is now proved that the Government of this Colony can effect loans in London at 3½ per cent. From my knowledge of the London market, I feel sure that there would be no difficulty experienced in obtaining a loan for such reproductive works as sewerage and water at 3½ per cent., especially as the money will not be wanted for two or three years, and the security would be on the rates of the whole district.

The London Metropolitan Board of Works Three-and-a-half per Cent. Stock is now at about £112. The Birmingham, Liverpool, Nottingham, and other corporation stock is practically as good. In all these cases the security for interest and repayment is upon the rates, and for long periods.

C 3.

COMPARATIVE Annual Rates for Western Suburbs Sewerage, including interest on outlay, repayment, and working expenses. (Prepared Dec. 3, 1888.)

If under *existing Act*, with interest at 4 per cent. and repayment in 28 years.
„ *proposed amended Act*, with interest at 4 per cent. and repayment in 60 years.
„ *further amended Act*, as to reduced interest, with interest at 3½ per cent. and repayment in 60 years.

	Existing Act.	Proposed amended Act.	Do. if interest be taken at 3½ per cent. per annum.
In 1894 (sections 1 to 3)	10½d.	8d.	7¼d.
In 15 to 20 years (being final completion of entire scheme)	9¼d.	7d.	6½d.

C 4.

PARTICULARS showing the Estimated Annual Cost of Disposal of Nightsoil throughout the Western Suburbs under existing systems.

In the Western Suburbs the charge varies from 3d. to 6d. per week per house for emptying dry earth pans. The charge for cesspits is probably not quite so much.

	£ s. d.	
3d. per week	0 13 0	per annum.
4d. „	0 17 4	„
5d. „	1 1 8	„
6d. „	1 6 0	„

For the purpose of comparison I have taken the low average of 15s. per house as the annual cost. In 1887 the occupied houses numbered 34,000; in 1894 the number of houses is estimated at 44,000.

34,000 houses at 15s. ..... £25,500 per annum in 1887.
44,000 „ „ ..... £33,000 „ in 1894.

A sum of £33,000 per annum would be equivalent to a rate of 3·70d. in the £ throughout the suburbs; or, in other words, a house assessed at £50 would, at 8d. in the £, be rated at £1 13s. 4d. for sewerage purposes *less* the present cost, which, if put at 15s., would merely involve an extra outlay of 18s. 4d. per annum.

GEO. H. STAYTON.
Dec. 3, 1888.

Sewerage Branch,
Sydney.

C 5.

DEPARTMENT OF PUBLIC WORKS, SEWERAGE BRANCH,—WESTERN SUBURBS SEWERAGE SCHEME.

MEMORANDUM upon a paper by Mr. J. B. Henson, as read before the Engineering Association of New South Wales, on September 13th, 1888, and subsequently discussed by the members of the Association.

I HAVE perused the abovenamed paper with much interest, more especially as it is the only professional criticism of the Western Suburbs Sewerage Scheme, which has appeared since the report thereon was issued in February last. The paper is ably written, but it is to be feared that the author's obvious inexperience has led him into serious error. The leading feature of the remarks contained therein *is the advocacy of the absolutely separate system of drainage*, which is by no means a new proposal; and in order to point out the fallacies enunciated by Mr. Henson, the following observations are submitted for consideration.

The author has given expression to various theoretical views, which are diametrically opposed to the opinions and practice of the most eminent engineers in the world. This, however, has occurred in older countries; and even where efficient sewerage systems have long been in operation, many persons of limited experience, or possessing only a book knowledge of the question, have fallen into similar errors, and have formulated "ideal" systems of drainage, which almost invariably are incapable of practical application. With more practical experience, the author will find it absolutely necessary to considerably modify such theories, that is, if he wishes to render them consistent with sound practice. In several instances his figures are incorrect, and certain of the statements are apt to mislead. Moreover he has failed to furnish any corroboration of his ideas, nor has he quoted any authority of eminence in support of his views.

Practically Mr. Henson's objections to the system adopted in the scheme are:—

(1.) That the dimensions of the intercepting sewers are unnecessarily large, and that owing to the large prospective population provided for, it will be many years before the maximum sewage flow will be sufficient to ensure a self-cleansing velocity.

(2.) That, owing to the adoption of the partially-separate system, the sewers will become huge gas-holders, especially during the periods of minimum dry-weather flow.

(3.) That the admission of rainfall to the proposed sewers would cause complications in their efficient working, which would be seriously felt in the case of local thunderstorms, and that all rainfall should, therefore, be rigidly excluded.

(4.) That it is contrary to the teachings of sanitary science to make the efficiency of a system of sewers dependent on so uncertain an element as local rainfall.

(5.) That the velocity of the maximum dry-weather sewage flow in the western intercepting sewer will not exceed 109·2 feet per minute for a reasonable time after the completion of the works (taken at from three to five years hence), whereas the standard velocity is 180 feet per minute.

(6.) That the provision in the capacity of the sewers for the removal of a maximum daily consumption of water at the rate of 72 gallons per head is too liberal, 36 gallons being a fair allowance at so early a period.

(7.) That the English practice for ascertaining the maximum sewage flow (viz. one half the total daily flow to pass off in six hours) will not apply, and a deduction from that rate is necessary.

(8.) That the provision for a prospective increase of population for twenty years hence is too remote a contingency.

(9.) That the horse-power of the pumping engines for Marrickville has been greatly under-estimated.

(10.) That the spyhons on the eastern branch and northern main will be injurious to public health.

The Separate System (1 to 4).

As the desirability of the adoption of the "absolutely separate" system in lieu of the "partially separate" system constitutes the key-note of Mr. Henson's objections to the scheme, it may be more convenient to discuss the question in the first instance, instead of dealing with the various points at issue *seriatim*. In support of the principle adopted in the scheme, I shall not hesitate to embrace the opportunity to quote from recognized authorities of eminence.

The separate system *per se* is a method which necessitates one set of sewers and drains for sewage, and a second set for surface waters from roofs, paved yards, and streets, and for sub-soil waters. In the few towns where the so-called separate system has been carried out, it has involved the construction of either a duplicate or triplicate set of channels, but in no single instance has it been found practicable to rigidly exclude the rainfall from roofs and paved back yards.

It is clear that the separate system requires duplicate drains for each dwelling-house. In the back-yards, therefore, there must be at least one yard-trap so placed as to be above the surface-level, into which slop waters would be discharged; whilst the inlet for surface waters would be slightly below the yard level. It has, however, been found in practice where the system has been tried (even in the southern part of Sydney) that, either through the laziness or ignorance of domestic servants or others, the surface water drain, instead of the sewer drain, has received the slop waters. The insanitary results of such a system in dry seasons must be obvious, and as the population annually increased the evil would be magnified.

On pages 10 and 11 of the official report it will be seen that the rainfall question received special consideration, and that the English practice has been considerably modified with a view to meeting Colonial conditions. The report states that wherever practicable, but especially in the case of the low-level systems, the rain-water from the roofs of the front part of the houses should be excluded from the sewers, and that all street surface waters should be absolutely excluded. The rainfall catchment, for which allowance is made is but 15·66 per cent. of the entire western and southern areas, and but 10 per cent. of the northern area. The western suburbs scheme provides for much less rain-water than the City main outfall sewers, which are intended to receive the rainfall from 40 per cent. of the entire area.

Under

Under the separate system the sewers would certainly be of smaller dimensions, but their internal conditions would invariably be less sanitary, because they would be sewage carriers only. It will therefore be readily understood that the sides of such sewers would become much fouler, and that during the periods of minimum flow, the gases given off therefrom would be more concentrated and virulent than in sewers of larger capacity in which they would be diluted, and where the limited quantity of rain water not only dilutes the sewage and retards putrefaction from time to time, but scours the internal surface. During the night period the flow would be very slight, and nearly the entire capacity of the sewers would be filled with sewer-gas, the greater part of which would be expelled on the following morning by the early morning discharges. By way of illustration, it might be mentioned that the length of the intended western branch sewer in tunnel, from Ashfield to Marrickville (the dimensions of which are 6 ft. 6 in x 5 ft. 6 in., the fall 1 in 1,509, and the length 8,580 ft.), to which Mr. Henson particularly draws attention, would require to be 5 ft. 3 in. x 3 ft. 6 in., at an inclination of 1 in 1,000, for the purpose of carrying sewage only. The following statement indicates the air capacity, wetted perimeters, and velocities for the various flows in each of the foregoing sewers from a drainage area of 3,506 acres, and an average population (*vide* p. 4) of 10 persons per acre, viz. :—

Discharge per minute in cubic feet.	Depth of flow.	Sectional area above flowline in sup. ft.	Sectional area below flowline in sup. ft.	Wetted perimeter in ft.	Velocity per minute in ft.	Remarks.
			Intended western sewer (6 ft. 6 in. x 5 ft. 6 in).			
4,186	¾ full	5·85	21·99	12·54	193	Prospective maximum combined flow.
1,753	2·76 ft.	17·16	10·68	8·30	165	Do do sewage do
1,402	2·45 ft.	18·90	8·94	7·42	159	Maximum combined flow in 1894.
584	1·58 ft.	23·30	4·54	5·52	131	Do sewage do
.....	·00 ft.	27·84	.....	.....	.....	
			Sewage sewer under "separate system" (5 ft. 3 in. x 3 ft. 6 in.)			
1,753	3·69 ft.	4·25	9·40	8·24	194	Prospective maximum sewage flow.
514	1·98 ft.	9·84	3·81	5·09	154	Maximum sewage flow in 1894.
.....	·00 ft.	13·65	.....	.....	.....	

It is obvious that the maximum sewage flow velocities are slightly in favour of the smaller sewer, but the minimum flow in either system would be under 2 ft. per second. A further calculation gives the following comparisons :—

System.	Air space in cubic feet.	Wetted perimeter in sup. feet.	Percentage of air space during night period, to max. W.P. of previous day.	Remarks.
Intended system	238,867	71,214	335	At prospective maximum sewage flow.
Separate system.....	117,117	70,699	165	Do do
Intended system	238,867	47,366	500	Maximum sewage flow in 1894.
Separate system.....	117,117	43,672	268	Do do

and shows that the sewer-gas dilution during the night period would be *less* under the "absolutely separate" system than under the intended partially separate system. Surely Mr. Henson could not have considered these points when he asserted that the sewers under the separate system were superior from a sanitary point of view ?

Mr. Henson says that a system which is dependent on rainfall for keeping the sewers clean cannot be a sanitary one. I would like to remind him, however, that the efficiency of the sewers is otherwise attained in dry weather, inasmuch as, in addition to the constant flow from ordinary subsoil waters, subsoil-water flushing wells near the sewer man-holes would be provided, which would be fitted with sluices or otherwise arranged for automatic flushing. This system is proved to be both beneficial and economical, and in dry seasons the additional water would be of great advantage at the sewage farm.

The storm-water drains for conveying rainfall and surface waters from streets, roofs, and paved yards would practically become sewers. Washings from paved yards are so highly impregnated with organic matter, that it is necessary to intercept such waters and deal with them in the same way as ordinary sewage. The sides and inverts of the storm-water sewers would become fouled, and in dry weather the gases evolved would be nearly as offensive as in the case of a sewage sewer. Thus the evil complained of would be duplicated.

The conditions where the separate system has been advocated are (1) where it is necessary to pump the sewage on to land for purification, precipitation, or filtration; or (2) where the sewers are tidelocked. In towns drained by gravitation, where there is a free discharge, it is considered that a limited amount of rainfall may be admitted to the sewers with beneficial results.

The additional fall required to ensure satisfactory working velocities in the smaller sewers under the separate system would so curtail the extent of the gravitating area of the western suburbs, and increase the extent of the low-level system, that the cost of the works and annual expense of pumping would be enormous. Moreover, such a system would necessitate the entire rearrangement of the sewers comprised in the scheme.

Neither the author nor Mr. Trevor Jones, who supports his views, has had any English experience in sewerage, and it is obvious that their Colonial experience has been of a limited nature. The only cities in Australia possessing efficient sewerage systems are Adelaide and Sydney, and in each case the schemes were

were approved by the late Mr. W. Clarke, M. Inst. C.E., an English engineer, and the works were subsequently carried out by the Government. In each instance rainfall from roofs and back yards was admitted to the sewers. On page 19 of the report on the Sydney drainage, Mr. Clarke referred to the separate system, and stated that rain-water from roofs and paved surfaces should be removed by house drains; that such course would be a benefit to the inhabitants, and that the partially-separate system is the better practice, being of even greater importance to the comfort and health of a community, inasmuch as it has the effect of scouring out the house drains.

The author does not refer to a single instance where the separate system has been successfully carried out and maintained in its entirety, nor does he quote any authority of repute in confirmation of his theories. He contends that colonial conditions vary so much from the English, that the same system will not apply here, but I am inclined to think that he would be a bold man who dare assert that the washings or scourings from the paved back yards of our suburban residences are not as foul as those in English suburban districts. The removal of these fouled waters by the sewers is, after all, the fundamental difference.

The author gives as a further reason in favour of the separate system, that rainfall cannot be depended upon to flush the sewers, it falls at such uncertain intervals; and mentions this year's drought as an instance when such sewers would become very foul. It has also been urged that as Sydney has so large a proportion of fine days, the experience gained in England will not apply. On this point I would like to remark that in London, *e.g.*, the mean annual rainfall is 25 inches, falling upon 155 days; whereas in Sydney, the average number of days on which rain has fallen during the last twenty-eight years is 151. Last year, which was unusually wet, rainfall was recorded on 190 days, upon 157 of which the rainfall would have been of service in the sewers and drains. During the present year (to October 9th) rainfall was recorded on ninety-five out of 282 days, of which the quantity falling on sixty-four days would have been serviceable for flushing. The fact may have been overlooked that the allowance of rainfall proposed to be admitted to the sewers under the scheme (2 inches per day), is only at the rate of one-twelfth of an inch per hour.

In the course of the discussion on Mr. Henson's paper, Mr. Trevor Jones is reported to have expressed himself entirely in favour of Mr. Henson's views, and to have stated that under the partially separate system large spaces would be left in dry weather in which sewer gas would accumulate. I would, however, remind him that in a recent paper on Suburban Sanitation, he said that "sewage flowing in sewers does give off deleterious gases, and which if not excluded from the dwelling, renders the breathing-air unwholesome; but in the opinion of men who have had most experience in Europe and elsewhere, such objections can be met by ventilation." He advocated the "exclusion of storm-waters from the sewers, or what is known as the separate system." He also stated that "the system now obtaining such unqualified approval in Adelaide is identical with that proposed herein, so far as the mode of conveyance is concerned. It *is called the separate system*, because if underground drainage is desired for both storm-water and sewage they shall flow in separate channels. * * * The water-carriage system is the best, it receives indifferently all sewage, *as well as a proportion of the rainfall.*" I am quite unable to reconcile the above-quoted opinions of Mr. Jones with his more recent statements.

The following opinions upon the question of the "separate system," coming from engineers of the greatest experience, may not be uninteresting, viz.:—

Sir Robert Rawlinson, K.C.B., for many years Engineer-in-Chief to the Local Government Board in England (and who was first invited on behalf of the Government of this Colony, in 1875. to advise on the question of water supply and drainage), says:—"Two sets of main sewers with two sets of house drains will be costly to construct; and, if constructed, would often lead to complications tending to defeat the proposed uses. The so-called clean-water sewer cannot, in many cases, be large enough to receive storm-water, and in dry weather it should of course be dry. The sewer proper would thus be without the flushing and cleansing given by roof-water during falls of rain, and the washings off yards, &c., during the first falls of heavy rain would, in many cases, be as polluted and as polluting as the sewage in the true sewer. Again, supposing two sewers in a street, and two sets of drains from each house on each side of such street, the house drains must interlace the duplicated sewers, the foul-water drain communicating with one, the surface-water drain with the other. Under such circumstances it would be almost impossible to prevent builders and workmen from entering the sewers with their drains indiscriminately."

In a paper on the sewerage of London, Sir Joseph Bazalgette, C.B., Engineer-in-Chief to the Metropolitan Board of Works said, "How to dispose of the rainfall is a question of considerable difficulty, and has given rise to much diversity of opinion. This arises from the fact that whilst in itself harmless, it sometimes falls suddenly in large quantities. *These considerations have induced theorists to advocate that the rainfall should not be allowed to flow off with the sewage, but should be dealt with by a separate system of sewers. The theory is, however, most impracticable.* It would involve a double set of drains to every house and the construction and maintenance of a second series of sewers to every street.**The interference with private property would alone render such a proposition intolerable." With reference to the sewerage of Abingdon, Sir Joseph more recently said, that "It might be cheaper and in many cases it was necessary to separate the surface water, the subsoil water and the sewage. Where there was a large rural district and a small town area, it was impossible to deal with the rainwater, and where the sewage was pumped, it became of the utmost importance to reduce the quantity. But in dealing with a large town where the sewage could be mainly removed by gravity, the one expense of forming a tunnel sewer, saved much inconvenience and outlay."

Mr. James Lemon, M. Inst., C. E., a strong advocate of the separate system, said that "The foregoing opinion of Sir Joseph Bazalgelte, coming from so eminent an authority, was a heavy blow to the separate system." In an able paper on the question which he read at an Annual Congress of the Sanitary Institute of Great Britain, he says, "What is the 'separate system,' so-called? Does it mean the *entire and absolute separation* of the rainfall from the sewage? If so, then I say at once that there is no town in England where it is carried out." With regard to the sewerage of the City of Winchester, which he had recently carried out, he stated that he "knew of no town where there are such natural facilities for carrying out the separate system in its integrity. In the scheme, however, he excluded surface drainage, and provided for the sewage and a small quantity of rainfall from the houses, feeling confident that a margin for rainfall under the most favourable circumstances was necessary. The city authorities passed stringent by-laws, which were ably carried out by the City Surveyor and his assistants, but in spite of all these precautions, some other portion of the rainfall is connected with the sewers." Mr. Lemon

Lemon added that "it is neither desirable nor practicable to entirely exclude rainfall from the sewers, for the reason that the rain is a scavenger and flushes the drains and sewers, and prevents noxious gases from forming therein, and he favoured the partial admission of rainfall in the interest of the separate system."

Amongst other recent instances of the so-called separate system, the Abingdon sewerage may be mentioned. Three sets of sewers and drains are provided (as recommended in Mr. Henson's paper) viz., for sewage, storm-waters, and sub-soil waters. The *sewers proper, however, admit the rain-water from roofs and back yards.* The maximum velocity of the sewers varies from 145 feet to 117 feet per minute; but the ordinary or dry weather flow is only sufficient to cause them to flow a quarter full, and with a decreased velocity. Owing to the fact that all road detritus is excluded, flushing is easily effected; it is periodically carried out and renders the sewers thoroughly efficient. The system is a costly one, and has involved an annual drainage rate of 1s. 7d. in the £. Other instances within my own knowledge where the separate system has been recommended, were for the sewerage of Oxford, Eton, and Windsor, in which cases the engineer, Colonel Ewart, R.E., proposed to carry out the system "as far as practicable" only.

In a paper on the separate system submitted to the Institution of Civil Engineers in 1884, Mr. White said, "It probably is necessary in almost all cases, in order to avoid an unreasonably complicated arrangement of branch drains, to admit the water from back roofs and back yards to the sewers, even where there are separate drains for surface water."

I venture to think that the evidence in favour of the principle on which the Western Suburbs scheme is based, and in opposition to the system advocated by Mr. Henson, is overwhelming. I must also differ with him in respect to his assertion that "the common idea as to the admission of rainfall must be relegated to that obscurity which is the fate of so many old notions which the advance of science has driven from their vantage grounds," and am inclined to reply that the very place he suggests appears to be admirably adapted for the reception of unsound theories like those propounded in his paper. I think it has been clearly shown that the system contemplated is not only in accord with common sense, but its efficiency must be obvious to all practical men. I am, however, perfectly aware of the fact that it is useless to expect to convince enthusiasts who possess a limited practical experience only.

Inefficient Working of Western Sewers (1).

Mr. Henson alleges (*vide* pages 9 and 10) that "the volume of sewage and rain-water which will pass down the *three* western sewers from the existing population will cause a variation in the flow-line of the three sewers at the point where they join," and "that the maximum sewage volume alone will cause the flow-line of the western branch to be considerably below the flow-line in the other sewers, and the result will be that it will be back-watered to a considerable extent."

To test the soundness or value of this assertion, it is necessary to first consider what the population and relative discharges will be in 1894, that being a reasonable period at which the works could be fairly in operation, and the efficiency of the system ascertained.

In 1887 the eastern drainage area averaged 11 persons per acre, the northern 8, and the western 5. In the preceding six years the population of each of the municipalities in those areas doubled itself, the increase being even threefold in some instances.

The population contributing to the rainfall and sewage discharges in 1894 may therefore be safely estimated at 22, 16, and 10 persons per acre for the eastern, northern, and western areas respectively; the maximum discharges in cubic feet per minute being as follows, viz.:—

Nature of Flow.	Eastern Branch. 6ft. 6in. x 5ft. 6in.	Northern Branch. 5ft. 6in. x 4ft. 6in.	Western Branch. 6ft. 10 in. x 5ft. 10in.	Outfall Sewer.
Combined	2,338	1,283	1,640	5,261
Sewage only	974	534	684	2,192

The depth of flow and velocity in feet per minute for the foregoing discharges is shown in the following statement:—

Nature of Discharge.	Eastern Sewer.		Northern Sewer.		Western Sewer.		Outfall Sewer.	
	Depth.	Velocity.	Depth.	Velocity.	Depth.	Velocity.	Depth.	Velocity
	Feet.		Feet.		Feet.		Feet.	
Combined	3·36	173	2·58	155	2·57	163	3·10	178
Sewage only	1·94	146	1·81	136	1·62	134	1·83	147

Mr. Henson must have overlooked the fact that the relative flow-line in the outfall sewers, which are of circular form, would be lower than that of the oviform sewers; and that, although the flow-line in the eastern and northern mains would be higher, yet the water surface in the lengths next to the intercepting chamber would form an inclined plane to the water-level in that chamber. It is obvious, therefore, that the water-level in the intercepting chamber at the head of the outfall sewers will correspond with the flow-line in the latter; and, from the above figures, it is apparent that the variation, which Mr. Henson says "will backwater the western branch to a considerable extent," will be 2½ inches only for the maximum sewage flow and but 6½ inches for the combined maximum discharge. The practical effect of such backwatering would be to temporarily decrease the mean velocities of the western branch to 118 ft. in the one instance, for a length of 1,300 ft., and to 144 ft. per minute in the other, for a length of 3,000 ft. Any inconvenience or irregularity thus created would invariably be counterbalanced towards the termination of each period of maximum sewage flow, because the length of the western sewer being considerably greater than either of the others, the higher flow and, consequently, greater velocity, would be maintained for a correspondingly longer period, thus effectually removing any temporary deposit.

A careful and impartial investigation of the question would have shown the author of the paper that the matter was altogether of too trivial a nature for consideration, especially with the knowledge that the equilibrium would be established and maintained in the course of a few years.

Velocity (5).

On page 5, Mr. Henson says:—"Many of the velocities given are below the standard of 180 feet per minute." Subsequently, he states, "that in England it has been found that a velocity of 150 feet per minute, at the least, is necessary to maintain the sewers in a sanitary condition; and considering the warmer temperature which here prevails, a velocity of 180 feet per minute is required to insure a speedy removal of the sewage before decomposition sets in." I join issue with him, both in his statement of facts and theory, and especially in a further assertion, which is to the effect that "a velocity of 180 feet per minute has been shown to be necessary." There is absolutely no authority whatever for the assertion that the standard velocity is 180 feet; doubtless, however, it suited the argument to especially assume one for the western suburbs of Sydney.

The opinions of some of the most experienced English engineers vary somewhat, *e.g.*, Mr. Bailey Denton, M. Inst. C.E., says that a velocity of 60 feet for well-watered sewage, and 150 feet for ordinary sewage, is necessary. Mr. Baldwin Latham, M. Inst. C.E., says that 120 feet should be the smallest velocity for the maximum sewage flow in sewers of a greater diameter than 2 feet; and in one of the latest sewerage schemes carried out by him and embracing an area of over 10,000 acres, the main sewers have a 120 feet velocity. The London main sewers were designed by Sir Joseph Bazalgette to have a velocity of 132 feet when flowing half-full, the dry weather flow being 31¼ gallons per day. When it was first proposed to adopt 150 feet per minute as the minimum velocity, the water supply was upon the intermittent system and only from 20 to 25 gallons per head per diem, and at that time many thousands of untrapped street gullies discharged into the sewers, causing frequent deposits of silt.

In Mr. White's paper, referred to on page 4, it is stated that "150 feet is an ample self-cleansing velocity for *ordinary* (not separate) sewers, and 135 feet is probably quite sufficient for a shallow flow."

The late Mr. Clarke reported that 3 feet per mile was a fairly good fall for main sewers; the western main, however, has a fall of 3½ feet per mile. And with reference to the Sydney main intercepting sewers that gentleman stated "that in consequence of the large extent of drainage work already in existence it will be difficult to exclude substances such as road detritus from the sewers, therefore the velocity should be *greater* than usual. It should be 150 feet per minute at maximum dry weather flow."

In the western suburbs sewerage report, page 11, it states that "all surface water from roads and streets should be absolutely excluded from the sewers."

On first checking Mr. Henson's velocities for the western branch sewer, I noticed that there was some discrepancy, and upon subsequently seeing the form of sewer which he had taken as the basis of his calculations (as illustrated in the Building and Engineering Journal of Sept. 22nd) it became apparent that he had not adopted the correct formula for determining the form of the intended sewer. He had also understated the estimated number of the population. The maximum velocities decrease from 190 feet to 146 feet per minute, the length being 9,040 yards; it should, however, be mentioned that, for 7,200 yards of that distance, the velocity averages 181 feet. The length of sewer in which temporary backwatering (see p. 4) might occur, would have ordinary velocities as follows, viz:—

Nature of flow.	In 1894.	In from 12 to 15 years afterwards.
Maximum combined flow.	163 feet.	198 feet.
,, sewage ,,	134 ,,	172 ,,

or, if the maximum sewage flow were taken at the rate of 50 gallons per head per diem, the velocity would be 125 feet at the former and 157 feet at the latter period.

In consideration of the fact that there will be an entire absence of silt from road detritus, and that the sewage of the western suburbs will be greatly diluted by a liberal water supply, it is perfectly clear that the intended velocity will be ample, even from the commencement.

With regard to Mr. Henson's inference that the temperature of sewers here is higher than in England, the statement must be received with reservation. He evidently is not aware of the circumstance, but it is nevertheless a fact, that not only in London, but in the majority of English cities and towns, various operations and manufactures are carried on, from which hot water or steam is discharged in great quantities into the public sewers. I have frequently seen such sewers nearly filled with steam day after day, and in London the vast number of warm baths alone materially raises the sewage temperature. It is quite true, as Mr. Baldwin Latham says, that heat is one of the most powerful agents at work within a sewer, and that the air of every sewer and drain is subject throughout the day to repeated expansions and contractions by the admission of hot or cold water. The entrance of hot liquids into the most perfect sewer increases the temperature of the sewer, and hence offensive gases are liberated, whereas cold water has the opposite effect. It is obvious that the western sewers will not receive discharges at so high or fluctuating a temperature, or to so great an extent, as the English sewers referred to. Barometric changes also affect the amount of foul air in sewers,—*e.g.*, a sudden fall in the barometer decreases the barometric pressure, and leads to the escape of gases from sewage solids, and favours decomposition; whereas increased pressure has the effect of retarding decomposition, and causes the retention of gases in sewage. In short, whether the maximum velocity be 134 feet or 180 feet per minute, there is a period each day when sewer gases will be given off, and although the temperature above ground in summer in this country is higher than in England, yet from the before-mentioned circumstances it would appear that the actual temperature of the sewers will not be so relatively high as to necessitate an increased velocity in the sewers. Efficient ventilation will amply provide for the dilution and egress of foul gases. And with regard to the general question of sewer gas it may not be uninteresting to state that at the annual meeting of the British Association at Bath, in September last, the president of the mechanical section (Mr. W. H. Preece, M.Inst.C.E., F.R.S., Chief Electrician to the English Government) in his opening address stated that "in electricity our sewers are likely to find in its active agency a power to neutralize offensive gases."

Water

Water Supply (6).

In referring to the sewage volume in the western branch sewer, Mr. Henson states that "72 gallons per head, however, will not be used at so early a period; 36 gallons, or one-half, is a fair estimate." He further remarks that "if the present rate of increase be maintained, the population of the metropolitan area, 20 years hence, will be 900,000, and at 72 gallons per head the daily consumption of water in the summer would be nearly 65 million gallons." Mr. Henson then proceeds to compare the Sydney water supply with that of Glasgow, but the figures and assumptions are hopelessly incorrect; in fact, the quotations from the Sydney Water Supply report are not even accurate. These errors are of so serious a nature that it is not at all surprising to find that other deductions are wrong.

With regard to the rate of 72 gallons per head on which the maximum sewage flow is based, the report distinctly states that such rate is for the summer consumption, and that 50 gallons is the average daily consumption throughout the year. Whenever it is found that the supply falls much below the mean rate it may be safely assumed that the weather is either cold or wet. The annual sewage volume is taken throughout the report at the mean rate of 50 gallons per head per diem.

In a hot climate like this, a liberal water supply is most essential; therefore 72 gallons per head cannot be deemed an excessive summer rate of consumption. Mr. Clarke concurred in such allowance for the Sydney sewers, and the works have been constructed accordingly. The western suburbs report refers to the desirability for making equal provision in the suburbs for the maximum sewage flow, and it is shown on the following page that the rate may be exceeded on washing days in very hot weather. The Adelaide water supply averages 50 gallons per day, but in summer the consumption rises to 70 gallons and upwards.

The mean daily rates per head for cities in various parts of the world, some of which have a summer heat as great as Sydney, are as follows, viz.:—

London	31¼ gallons	Boston	63 gallons
Paris	36 ,,	San Francisco	64½ ,,
Manchester (new scheme)	44 ,,	Greenock	72 ,,
Hamburg	45½ ,,	Ottawa	102 ,,
Philadelphia	54 ,,	Chicago	102½ ,,
Baltimore	54 ,,	Columbia district	143 ,,
Glasgow	55 ,,	Marseilles	158 ,,
Montreal	60 ,,	Rome	160 ,,
New York	61 ,,		

According to a statement prepared nearly a year since, it was shown that the prospective population of Sydney and suburbs, twenty years hence, is estimated at 730,000 persons, and not 900,000, as assumed by Mr. Henson; the summer rate of consumption would, therefore, amount to 52⅔ million gallons per day instead of 65 millions. The conduits from Prospect reservoir to Potts' Hill are capable of delivering 50 millions per day, and at the latter place a storage reservoir of 100 millions is being provided. The tunnels to Prospect are capable of delivering 155 millions per day, and by an extension of the catchment area the supply could be largely increased; it is, therefore, obvious that a very liberal water supply will be available. Mr. Jones, Engineer to the Water Board, recently stated that in six years time 30 millions a day would be required, which would be equal to a mean rate of 60 gallons per head. The recent Kenny Hill Water Supply Commission allowed for a mean rate of 50 gallons to be pumped to the elevated parts of Paddington and Woollahra. It will thus be seen that there is no apparent justification for Mr. Henson's "fair estimate of 36 gallons."

In his extract from Mr. Moriarty's remarks in reference to the Glasgow water supply, Mr. Henson entirely omits an important statement, which is to the effect that "Glasgow is acknowledged to be the best watered city in Great Britain," and no doubt inadvertently quoted "30 *millions per day*" as "30 *gallons per head.*" The actual figures show that the water supply of Glasgow is at the rate of 55 gallons per head. This very materially upsets the calculations, inasmuch as the estimated maximum rate for the existing population of Sydney and suburbs is 4¼ millions *less* instead of 10 millions *more*, as asserted; and at 50 gallons per day, it is 12 millions *less*, instead of being *equal to* the Glasgow consumption.

Sewage Flow (7).

The rule laid down by the Sydney Sewage and Health Board, in 1875, and subsequently adopted by Mr. Clarke, was for a maximum sewage discharge of 1 cubic foot per head of the population per hour, or 72 gallons per head per day. The Adelaide sewerage system was designed by Mr. Oswald Brown, M. Inst., C.E., to carry off 50 gallons per head per day, one-half of which was estimated to be discharged in four hours, which is also at the rate of 1 cubic foot per head per hour.

Mr. Bailey-Denton has stated "that it is always safer to consider the amount of water supply per head as sewage to be carried off by the sewers." The Kenny Hill Commission reported "that it is an established fact that *one-half* the daily supply is consumed in six hours"; and Mr. Trevor Jones, concurred therein, and stated in evidence that "he regarded such standing rule as an excellent one, and applicable in hot weather." The maximum sewage-flow allowance of 1 cubic foot per head per hour for the Sydney sewerage was also approved by Mr. Moriarty, M. Inst. C.E., who as Engineer to the Prospect Water Supply scheme has doubtless a better knowledge of the requirements of the city and suburbs than Mr. Henson; who says that "the common or English practice for ascertaining the maximum flow of sewage, viz., one-half the total daily flow to pass off in six hours, is not applicable to the conditions which will prevail in the western suburbs." He then proceeds to explain that a deduction is necessary from the estimated maximum volume of sewage on account of the use of water for gardens. Why, even assuming that over a million gallons per day were so used in 1894, it would only represent an average of 8 gallons per head. Mr. Henson first assumes that 30 gallons per head is a proper allowance for cool climates, and then asserts that a large proportion of the excess of 42 gallons (making a total 72 gallons as allowed for in the scheme) will pass into the sewers within the six hours period. Therefore we have 30 gallons ÷ 12 = 2½ gallons, and 42 gallons—8 gallons ÷ 6 = 5½ gallons, or a total maximum flow of 8 gallons per head per hour, instead of 6¼ gallons as provided. This at any rate appears to be the only logical deduction to be drawn from the observations which the author has made.

The

The London main sewers provide for the removal of one half the water-supply volume in six hours or at the rate of 2·6 gallons per head per hour. The provision in English towns generally varies from two to three gallons. Mr. Baldwin Latham, who has had great experience in various parts of the world, says that one-half the daily volume of sewage flows off in six hours.

It has not apparently occurred to Mr. Henson that the maximum discharge is always greater during the forenoon on washing days (generally speaking Monday and Tuesday in each week), and he has made no allowance whatever for subsoil waters. In Mr. Clarke's report, p. 18, it says, "In addition to house drainage and surface water there will also be a considerable quantity of subsoil water to be carried off; and by adding to the quantity, will, in the dry time, assist the flow in the main sewer."

It is well known that percolation will take place in pipe sewers, even if kept down to a minimum; and it may be regarded as absolutely certain that the many miles of such subsidiary sewers in the western suburbs, irrespective of house connections, will be no exception to the general rule. In the case of a 12-inch pipe sewer which was constructed in Sydney by the City Council last year, I am informed by a most reliable authority, that on completion it had a constant flow of clear water fully an inch in depth. In the case of one of the most recent sewerage systems carried out in England, the subsoil-water leakage into the pipes amounted to 1 cubic foot per minute per mile, and it was estimated that "one drop only of water per second from each pipe joint, would amount to 25 cubic feet per minute throughout the system."

Enough has been stated to show that the sewers must provide for the *maximum* sewage or dry weather flow, and the evidence is distinctly in confirmation of the estimated volume. The rule has also been found applicable to both American and European cities, where the climate is hotter than in England.

Prospective Population (8).

Mr. Henson is apparently of opinion that the prospective population for which provision has been made in the scheme "is only an assumption, and one that may not be realised," and that it is wrong to base the efficiency of the sewers on a contingency so remote.

The marvellous expansion of the western suburbs since 1871, but particularly the increase of the population from 1881 to 1887, has been clearly shown in the report, and there is no indication whatever that the rate of increase has decreased. In fact there is every probability of the estimate being realised, especially when measures for the improved sanitation of the district have been initiated.

When the Water Commission made its report in 1869, the population of the city and suburbs was 167,000, and the Commissioners recommended that provision be made for a prospective population of 250,000, whereas the present population is officially estimated at 360,000.

I would also remind Mr. Henson that in his paper on the "Sanitary Aspect of Sydney and Suburbs," in 1887, he said, "The growth of the metropolis during the last two decades has been very great, and instances are common where public works have been constructed of an extent estimated at the time to be ample for future requirements, but have been scarcely finished before their limited capacities have been perceived and additions demanded. * * In deciding such schemes it will be necessary to provide for a very large population."

I heartily concur in these statements, but every practical engineer knows, that in providing works for all time, it is difficult to so devise the works that they may be equally efficient for existing as well as prospective requirements. No one in his senses would dream of designing main sewers in tunnel suitable to an increase of, say, 50 per cent. only on the existing population, and in the course of a few years having to duplicate such sewers, for the sole reason that a slightly more favourable maximum-flow velocity might be attained when the system is first in operation.

Marrickville Pumping Engines (9).

With reference to the proposed power of the Marrickville pumping engines, Mr. Henson says on page 10, "If the calculations for arriving at the engine power necessary for raising sewage be accepted as the system adopted throughout, the report should be amended," and he proceeds to show that after making certain allowances, the engine-power required will be 223·2 horse-power instead of 120 horse-power as proposed.

To show how utterly wrong the conclusions are upon this question is an extremely simple matter. The author ought to have known better, considering the official position he occupies, and I am greatly astonished that in his anxiety to criticise the sewerage scheme, he should have laid himself open to correction in so obvious a manner. Any one having practical acquaintance with sewage pumping machinery would know that a 40 horse-power (nominal) engine would indicate to upwards of 70 horse-power, the latter being the figures on which the estimate of coal consumption is based.

The complete pumping arrangements comprise three 40 nominal horse-power engines, together with a fourth as a stand-by in case of repairs or accident. In the first instance it is intended to provide two only, the additions being made hereafter as the requirements increase.

With regard to the lift on which the calculations are based, I have only to remark that the formula ordinarily adopted by engineers of the highest eminence has been used, viz., to provide a margin of 10 per cent. in the net lift for friction, and to make no other allowance. The indicated horse-power of modern pumping engines so exceeds the nominal horse-power, that no further provision is necessary to overcome additional frictional head and other resistances and slip, when working at full speed.

The net lift at Marrickville is 31 feet; the 34 feet is therefore inclusive of the 10 per cent. allowance. Applying the usual rule we have:—

$$\frac{1{,}879 \text{ cubic feet} \times 1{,}440 \times 34}{762{,}088} = 120{\cdot}7 \text{ horse-power.}$$

or three engines of 40 nominal horse-power each.

In

In confirmation of my previous statement as to the practice of well-known engineers, it may be interesting to quote the following particulars, viz. :—

Abbey Mills Sewage Pumping Engines, London.

(Sir Joseph Bazalgette, C.B., Engineer.)

The duty required is to raise 15,000 cubic feet per minute to a net lift of 36 feet. Adding 10 per cent. to the latter it amounts to 39·6 feet, say 40 feet. We therefore have

$$\frac{15{,}000 \times 1{,}440 \times 40}{762{,}088} = 1{,}134 \text{ horse-power.}$$

The actual power of the engines provided is 1,136 nominal, in eight engines of 142 horse-power each.

At the Deptford pumping station the same rules were observed in the design of the engines.

Portsmouth Sewage Pumping Engines, 1887.

(Sir Fredk. Bramwell, F.R.S., Engineer.)

Duty, 18,000 gallons per minute to a maximum lift of 40 feet.

$$\frac{18{,}000 \times 1{,}140 \times 40}{4{,}752{,}000} = 218 \text{ horse-power.}$$

Two engines capable of indicating to 150 horse-power each were provided.

Kidderminster Sewage Pumping Engines.

(Mr. T. Hawksley, F.R.S., Engineer.)

Duty, 1,400 gallons per minute, 120 feet lift.

$$\frac{1{,}400 \times 1{,}440 \times 120}{4{,}752{,}000} = 50{\cdot}9 \text{ horse-power.}$$

Two engines of 25 horse-power nominal were provided, each of which actually indicated to 44·8 horse-power.

Oxford Sewage Pumping Engines.

(Mr. J. F. Bateman, F.R.S., Engineer.)

Duty required, 8,000,000 gallons per day to a 60-feet lift.

$$\frac{8{,}000{,}000 \times 60}{4{,}752{,}000} = 101 \text{ horse-power.}$$

Two engines of 50 nominal horse-power each were adopted.

Boston, U.S.A., Sewage Pumping Engines.

(Worthington type.)

Duty, to raise 25,000,000 gallons per day to a net lift of 43 feet. The latter + 10 per cent. = 47·3 feet. Therefore,

$$\frac{25{,}000{,}000 \times 47{\cdot}3}{4{,}752{,}000} = 248{\cdot}84 \text{ horse-power.}$$

Duplicate engines of 250 nominal horse-power each were supplied, which indicate to nearly double.

Norwich Sewage Pumping Engines.

(Mr. T. Hawksley, F.R.S., Engineer.)

Duty, 3,000,000 gallons per diem to a height of 150 feet. In this case, owing to the length of the rising main and height of lift, the frictional allowance was increased to 12 per cent., making the lift 168 feet.

I could give further instances as to the soundness of the rule adopted for the Marrickville engines, and numerous cases respecting the power of water-works pumping engines, the rule for which is practically the same as for sewage pumping. The Hunter River district water supply pumping engines were fully described to the Engineering Association of N.S.W. in a very able paper by Mr. H. Davies. The duty in that case was 833·3 gallons per minute to a height of 298 feet. Applying the same rule we have 298 feet + 10 per cent. = 327·8 feet lift, and

$$\frac{833{\cdot}3 \times 1{,}440 \times 327{\cdot}8}{4{,}752{,}000} = 82 \text{ horse-power.}$$

The engines actually adopted being of 80 nominal horse-power indicating up to 145·8 horse-power. In Mr. Clarke's reports on the Sydney water supply, the pumping power was determined on the same basis.

I was engaged in the designing and erection of the first set of the Portsmouth sewage pumping engines in 1872 (which were approved by Mr. Hawksley as consulting engineer, and who has designed and carried out no less than 130 water or sewerage systems) in which the same rule was adopted.

I think that Mr. Henson's assertion that "the calculation has been worked out for clean water, without any allowance for slip or friction," has been clearly shown to be wrong. He does not appear to be aware that sewage, after being strained, is practically the same as clean water, so far as the pumping power is concerned. In fact I do not suppose that he ever heard of the "clean-water" question

until it was doubtless suggested to him by the Worthington Pumping Engine Company's pamphlet, in one part of which they ask to be informed whether the liquid to be pumped is salt, fresh, acid, clean, gritty, hot, or cold. No experienced engineer would entertain for one moment so extravagant a proposition as that formulated in the paper.

The author refers to the duty of the Worthington engines, and points out what is an obvious truth, that no such high duty could be expected at Marrickville. I would mention however that the intermittent character of the pumping was well considered beforehand, and the estimate of coal consumption, which at the guaranteed duty rate would not have exceeded 100 tons per annum, is for over 300 tons. The 100 million foot-lb. rate was merely mentioned in the report to show that the Worthington type is an efficient and economical engine.

Eastern Branch-sewer Syphon (10).

Referring to the proposed syphon on the eastern branch sewer, Mr. Henson says, on page 11, that "the sewage flow from the present population will not be sufficient in volume or velocity to thoroughly cleanse the syphon out or prevent undesirable stagnation, * * more especially during the period of daily minimum flow, lasting over twelve hours." Mr. Henson also asserts "that the contents of the syphon will decompose under pressure," which, by the by would not be increased more than about 4½ lb. per square inch. On this point, however, I submit that he is entirely wrong. It is not only a most unscientific assertion, but, as will be seen from the remarks on page 5, is distinctly contrary to natural laws. It would certainly be interesting to learn on what grounds he bases his theory that sewage would thus decompose under pressure or that "gases would be liberated in volumes in the morning" to a greater extent than in a sewer for the removal of sewage only under the separate system. Mr. Henson says that "sewage should be ever on the move at quick march." Theoretically this is very pretty, and it has often been urged by various writers; but practically it is not so easy to accomplish. The separate system would not ensure it during the minimum flow period. It is a great pity that the author did not explain in detail how the "quick march" is to be constantly maintained.

The contents of the 33-inch iron pipe syphon, having a gradient of 1 in 750, would be displaced by the combined flow from the population first draining into the system above it in 4·6 minutes, the velocity being 189 feet per minute. The maximum sewage flow alone would displace the contents in eleven minutes, but the latter period would be accelerated year by year until the prospective population allowed for (40 persons per acre) is realized. By temporarily increasing the head at the inlet, the sewage flow could be so commanded as to ensure a velocity of 250 feet per minute, for short periods, sufficient to thoroughly cleanse the syphon and remove any ordinary matters therefrom.

A reference to the report shows that it will be necessary hereafter to lay an additional pipe, which could however be so adjusted as to carry off the waters above a certain level at the inlet, and that it is contemplated to so arrange the syphons that their contents could be drawn off into the low-level system whenever necessary, an advantage not usually secured in such syphons. Moreover, should it ever be found necessary, the syphons could be similarly drawn off at night, and the dry-weather night-flow be likewise diverted.

Syphons on Northern System (10).

Mr. Henson particularly mentions that "four syphons are proposed on the main line of sewer of the Northern system, viz.:—One at George-street west; one at Johnstone's Creek; one at White's Creek; and one at the north end of Balmain." With reference to the first-named, the author must doubtless be aware that it forms part of the City system and is already constructed, consequently no further reference will be made thereto. Also that on page 12 of the report, it is clearly intimated that the construction of the syphon at the north end of Balmain might be omitted entirely. Under these circumstances the syphons to be specially considered are those at Johnstone's Creek and White's Creek. Of the syphons generally, Mr. Henson says that "they will always be full of sewage in a greater or less degree of decomposition, and if the decomposition prove serious, as may be expected in warm weather, the sanitary efficiency of the whole system below them will be endangered."

Objections to sewage-syphons have been advanced more from unfounded prejudice than from positive experience. In many important cities and towns, such syphons are worked without any of the dificulties being encountered which Mr. Henson foreshadows. The only colonial experience as to the working of such syphons has been at Cook's River, Sydney, and at Adelaide, South Australia, at which place the main sewer passes under the river by an inverted syphon, which is found to work admirably. There are a great many sewage-syphons in various parts of England, and amongst such places, with which I am acquainted, may be mentioned:—

Oxford—One syphon in the city and two deep ones under the Thames.

Warwick—A 24-inch syphon under the Avon.

Rugby—A syphon 1,000 yards long, which works well and saves pumping.

Bristol—Three 42-inch syphons under the Floating Harbour, and three others for the main outfall under the river.

In Dantzic, which has a population of 100,000 persons, there are five or six syphons in all, one being 22½ in. in diameter and 480 ft. long. In Hamburg the sewer-syphon is so effective that cannon balls will pass through it. In the United States there are syphons at Norfolk and at Boston. At the latter place the main sewer passes under the bay as a syphon, at a depth of 135 ft. Its length is 7,000 ft. and diameter 7 ft. 6 in. The sewage allowance per head is 62½ gallons daily, together with ¼ in. of rainfall. The minimum velocity is 1 ft. per second, and the maximum 4 ft.; it is therefore self-cleansing.

The maximum combined flow through the Johnstone's Creek syphon would displace the contents thereof at a velocity of 158 ft. per minute in a period of 7·2 minutes, and the maximum sewage flow in 12·3 minutes; the periods at the White's Creek syphon being 6·8 and 11½ minutes respectively. It is thus obvious that there will be no time for decomposition to take place as suggested, and it has already been shown that the author's theory is wrong with regard to the alleged sanitary inefficiency of syphons and their tendency to develop sewer gas in warm weather. The syphons would be provided with catch-pits for arresting sediment, and being always full and the internal temperature very little varied, the contents would not specially decompose or give off offensive gases during the few hours of minimum flow. By closing a penstock at the upper end of either syphon for a short time, a greatly accelerated velocity could

could be temporarily secured whenever deemed necessary. The syphons could be drawn off into the intended low-level (Shone) system at Leichhardt, if required, as similar arrangements to those already explained for the eastern-branch syphon are intended to be provided.

When the general scheme was designed, alternative proposals for the syphons on the northern main sewer were considered; one being the substitution of an aqueduct for the 42-in. syphon at Johnstone's Creek, and the other to dispense with the 40-in. syphon at White's Creek and convert the remainder of the drainage area (which includes the eastern portion of Leichhardt and the whole of Balmain) into a low-level system, with a pumping station in the vicinity of White's Creek. Compared with the proposed scheme and inclusive of the "Shone system" for the low-level areas, the additional charge for interest and repayment of outlay, together with the cost of pumping to the required height, was approximately estimated at £1,500 per annum.

Surcharged Sewers (3).

Mr. Henson states that the sewers will be overcharged several times during the summer season in consequence of severe rainfall during sharp thunderstorms, and that the diluted sewage will be passed by means of the overflows, into the open water-courses. He adds: "That a thunder shower of short duration will quickly charge the sewers and no doubt perform the object for which the rainwater is admitted, viz., to scour out the drains and disturb the heavy and lingering matters that the ordinary volume of sewage has not power to remove." He also deprecates the discharge of such diluted fouled waters into the open channels in the summer time. Mr. Henson likewise says that a heavy thunderstorm may pass over the northern watershed chiefly, and surcharge the sewers, and that the diluted sewage would thus overflow into the open channels on the southern watershed, where there would be no rain falling to further dilute and wash it away. Upon first reading these objections they are apparently of a serious nature, but on examination it is evident that they are entirely groundless.

It is only right, I think, that the exact words of my report in reference thereto should be given. It is therein stated that "the proposed sewers are designed to carry off the foregoing combined quantities when flowing about ¾ full, but should a heavier rate of rainfall occur during the six hours of maximum sewage flow, the excess of stormwater would be carried off by overflow-weirs, which would act as safety-valves in case of sudden emergency. It must be borne in mind that the capacity of the sewers is such, that several years must necessarily elapse before the actual catchment area would become so great as to cause over-charging or backflooding. This, however, could always be prevented by making sufficient stormwater overflows, or by providing relief sewers hereafter, as may be found necessary. The small quantity of sewage contained in stormwaters so discharged into natural water-courses, would be so greatly diluted as to be rendered perfectly unobjectionable. During the night and at other periods of minimum flow, the sewers would be available for a much larger quantity of stormwater." It has already been shown on p. 5, that the velocity of the maximum dry weather flow even in 1894 will be sufficient to keep the sewers clean, consequently there would be very little "heavy and lingering" matter to disturb, and it is obvious that such velocity would become greater year by year until the prospective population allowed for is realized. It should also be remembered that the western suburbs will be fully provided with water, in which case a supply for the sewers would be available. Under such circumstances, and until a larger volume of sewage is attained, the discharge would be, to a great extent, from water, which would increase the velocity of the sewage flow, but would not add to the suspended matter to be carried. Practically, the conditions of discharge would thus be more favourable prior to the period when the full volume of sewage is attained.

On page 7 of Mr. Henson's paper it states that "rainwater falling on yards will no doubt be polluted, but not more so than the water from street surfaces, which, according to the report, is to be excluded from the sewers, and rightly so; and the yard water should be treated in a similar manner." It is manifest, therefore, that the author advocates the discharge of fouled waters from back yards into the open water-courses. During *heavy* rainfalls the dilution would of course be as great as in the case of the proposed sewers and such discharge would be unobjectionable, because the stormwaters from the entire surface of each watershed would effectually wash the filth down the channels; but on the other hand, the effect of *slight* rainfalls only in hot weather would be such as to merely disturb the accumulated filth and probably convey it a short distance, instead of effectually carrying it away in the sewers, as would be the case under the proposed scheme,—an obviously more sanitary arrangement.

There is therefore an inconsistency in the remarks. In the case of the proposed system he objects to highly diluted filth being discharged into the natural water-courses during times of heavy rainfall, but he apparently approves of polluted yard waters being so discharged, whether the rainfall is slight or heavy.

With reference to the statement that a heavy thunderstorm in the northern area would surcharge the main sewers and cause an overflow of diluted sewage into the open channels on the southern watershed, I think that it must have required a great stretch of imagination on the author's part to have assumed such conditions and results. It would be, to say the least, a somewhat peculiar and remarkable circumstance to find that a heavy thunderstorm should fall precisely on the northern slopes between Leichhardt and Strathfield, and that no rain should fall on the southern slopes. The thunderstorm on September 21st last, was remarkably limited in its range, but the heavy rainfall extended throughout the city and western suburbs, and on both the northern and southern slopes. Assuming however, that such a storm as Mr. Henson refers to did take place at Ashfield, Burwood, and Strathfield during the period of maximum sewage flow, the temporary rise in the flow line in the intercepting chamber at the head of the outfall sewer would not exceed 6 inches. The effect of such a storm on the western branch, although it would bring the overflows on the northern area into operation, could not possibly surcharge the sewer on the southern side of the main ridge. At the Ashfield end of the tunnel the sewer would flow about ¾ full, whereas at the Marrickville end, for the reasons already expressed on p. 4 the depth of flow would be 3·25 feet only.

Sewer Ventilation.

Reference has already been made to the presence of foul gases in sewers and to the necessity for efficient ventilation. It might also be pointed out that however possible it may be to make a wilderness "blossom as a rose," it is utterly out of the question to make and use sewers and drains which are invariably free from foul smells. The main sewers, however, will not become "huge gasholders" as asserted by Mr. Henson. They will be isolated in sections by means of flaps and shafts, and the submains and subsidiary

subsidiary sewers will also be disconnected. There is no royal road to efficient sewer ventilation, but of the various systems which have been tried, none have proved so beneficial as those by which fresh air is admitted to the sewers in sufficiently large volumes to dilute the foul air and carry it off by means of proper shafts. This can be done effectually, and is one of the best safeguards against the danger of accumulations of gas in sewers. To thoroughly prove the efficiency of sewer ventilation, it is necessary to make observations in the sewer to determine the velocity of the currents, the temperature and humidity, and the chemical constituents of the sewer air. It has been found by experience, that, with sufficient openings for the admission of fresh air and ample flushing, the temperature of sewer air can be reduced from 59° to 52°. If sewers can be kept below 55°, it is asserted that gases of putrefaction will seldom be found. Carbonic acid is the principal gas inimical to health found in fairly-constructed sewers. Pure air has 332 parts in 1,000,000; but it has been ascertained that a ventilated sewer has 1,060 parts, and an unventilated sewer no less than 23,000 parts, in 1,000,000.

One of the latest systems of sewer ventilation in England is that invented by Mr. Harrington, formerly Mayor of Ryde, in the Isle of Wight, and which was applied under my superintendence in London in 1884. Particulars of the system and results of the observations subsequently made, are to be found in the Minutes of Proceedings of the Institution of Civil Engineers for May, 1886. The plan was first tried in connection with a comparatively new sewer in Jubilee Place, Chelsea, which had frequently been complained of as smelling offensively, and the system effectually remedied all cause of complaint. The principle consists in forcing fresh air into a sewer by means of specially-devised wind cowls, fixed at a height of 20 or 30 feet above the surface, and connected to downcast shafts; thus diluting the gas generated in the sewers, and driving out the foul air above the houses by means of upcast shafts.

On testing the efficiency of the system in 1884, at a time when the wind was blowing at the rate of 4 miles an hour only, I found that 4,300 cubic feet of fresh air passed into and through the sewer in twenty-eight minutes, which was equivalent to a complete displacement of the sewer air fifty-one times a day. A further series of tests were made by Mr. G. R. Strachan, Assoc. M. Inst. C.E., between February 26th and April 11th, 1885, who recorded the results in the before-mentioned paper. He states that during the forty-four days the gaseous contents of the sewer were changed on the average every 31½ minutes, or forty-six times a day, simply by the force of the wind on a self-acting cowl. The beneficial effect of this current on the interior of the sewers was most obvious, as instead of the slimy coating of bluish-white matter so frequently found adhering to the crown and sides of sewers ventilated by ordinary "open" street gratings, there was dryness for at least 100 feet on each side of the downcast shaft. The moisture at the further end near the upcast shafts was more apparent, but clean as compared with that of an ordinary sewer. The air passing out of the upcast shafts had a very slight smell of sewer gas, but none of the inhabitants of the locality complained of any annoyance therefrom. Before I left London, the residents petitioned the authorities to extend the system, and this has been done with equally satisfactory results.

I am decidedly of opinion that the local conditions of the western suburbs are favourable to such a system of sewer ventilation. The strong winds which prevail here in the summer could unquestionably be made to act beneficially in drying the moisture on the sides of the sewers, and in constantly diluting and expelling the foul air.

Since the date of the report on the western suburbs sewerage scheme, several interesting facts having reference to the results of good drainage have appeared. It must, however, be understood that "efficient disconnection and thorough ventilation of the house drains" form a most vital part in good drainage. In a recent address, Sir George Bruce, the President of the Institution of Civil Engineers, stated that "it is now known to be perfectly easy to prevent with absolute certainty the passage of sewer gas into the interior of houses, and to mitigate almost entirely any offence from public sewers, by providing numerous openings into them, so as to secure a full and free intermixture of common air." In a paper read last year by Sir Douglas Galton, K.C.B., it was stated that "in England the average number of lives saved by sanitary improvements in the five years, 1880 to 1884, has been 102,240 per annum."

The immense importance of making proper provision for the escape of sewer gas is clearly shown by recent events at Baltimore, U.S.A., where, owing to the great number of fatal cases of scarlet fever and diptheria, the authorities instituted stringent regulations regarding the construction of house-drainage works. The regulations came into operation in 1884. The deaths from scarlet fever in the previous year amounted to 334, but they subsequently decreased to 36 in 1887. Mortality from diptheria was also greatly influenced by the reform, being reduced by one-half. We have frequently seen what has been accomplished in other parts of the world, but, coming nearer home, the results achieved at Adelaide are far too important to be overlooked. Before the commencement of the drainage works, the annual death-rate was 23·55 per thousand, but in 1886 it was reduced to 14·34, whilst the deaths from zymotic diseases were reduced from 217 to 98 per annum in the same period.

Conclusion.

Mr. Henson has had the advantage of a scheme to criticise, but beyond a general advocacy of the absolutely-separate system, he has submitted no counter proposal for consideration. It is true that in a former paper on the "sanitary aspect of the suburbs" he foreshadowed a course for the sewerage of the suburbs, viz., "to treat each valley separately, and to conduct the sewage therefrom to filter-beds on reclaimed areas in the vicinity of the heads of the bays or coves." I have only to remark that such a system would mean the establishment of a series of sewage farms throughout the district, would involve a considerable outlay for pumping, and would be enormously costly to initiate and maintain. Mr. Henson's alternative scheme was "to collect the sewage at the various outfalls and pump it to such an elevation as may be necessary to enable it to descend by gravitation to the coast or to some sewage farm." This, too, to say the least, is a proposal necessitating a totally uncalled for outlay and annual expense.

In the proposed scheme every care has been observed to adopt the latest and most scientific sanitation to both the existing and prospective conditions of the suburbs. Doubtless, however, certain of the details would be amended in practice; but the principle is sound. When the works are completed and in reasonable operation, more especially as the main sewers will intercept new sewers and drains only, instead of a network of old and defective sewers, I am convinced that the scheme will be found one of the most effective which could be desired, and that its efficiency will be undoubted.

GEORGE H. STAYTON, M. Inst. C.E.

To the Engineer-in-Chief for Sewerage.

Nov. 12, 1888.

C 6.

DEPARTMENT OF PUBLIC WORKS.—SEWERAGE OF WESTERN SUBURBS.

Reports and other papers relating to the Sewerage of the Borough of Burwood.

Letter from the Burwood Council to The Under Secretary for Public Works.

Sir, Council Chambers, Borough of Burwood, 25 July, 1888.

In reply to your letter of the 17th instant, notifying that if the plans and estimate of the sewerage scheme for Burwood, prepared by Mr. Charles Cowdery, C.E., be submitted for the inspection of the Minister for Works, a day will be appointed to receive a deputation from this Council on the subject, I have the honor herewith to enclose Mr. Cowdery's report, including therein his estimate of the cost of the works; and under cover of brown paper, also herewith, fourteen sheets of plans and section, showing the manner in which he proposes it should be carried out.

It is, of course, to be understood that the report, together with the fourteen sheets of drawings accompanying same, are the property of, and to be returned to, Mr. Cowdery.

When the date is fixed by the Minister, kindly allow sufficient time that I may notify the Mayor and Aldermen to attend.

I have, &c.,
W. REDFEARN,
Council Clerk.

B.C., Mr. Bennett, with report and plans.—J.B., 26/7/88. Will Mr. Stayton please look through the plans herewith, make a rough approximate estimate of cost, and prepare a comparison with the Departmental proposal, dealing with Mr. Cowdery's figures, and pointing out defects and discrepancies? —W.C.B., 30/7/88. Mr. Stayton, B.C. Report herewith.—G.H.S., 15/8/88.

Mr. Charles Cowdery's Report to the Burwood Council.

To the Mayor and Aldermen of Burwood,—

Gentlemen, 50, Castlereagh-street, Sydney, July, 1888.

I have much pleasure in laying before you for your consideration a scheme for the sewerage of Burwood, with plans, sections, &c., of the same.

I propose to take the whole of the sewerage by gravitation, following as nearly as possible the natural fall of the land to the Parramatta Road. Burwood is so situated that I have been able to divide the system under three sections, which I have coloured differently on plan; that going in an easterly and southerly direction blue, that in a westerly red, and that in a south-westerly yellow. By dividing the district in this way, I have been enabled to dispense with brick sewers; in all cases using glazed pipes.

From the Parramatta Road I purpose continuing the western and south-western sewers by two separate pipes through the Police paddocks into the Government reserve, to a point shown on plan, and where I purpose putting in a screening tank, after which the sewage will be taken to the sewerage farm. The easterly sewer will be conducted to the sewerage farm in a similar manner.

I propose reclaiming from Hen and Chicken Bay, some 40 acres of land, to be used as a sewerage farm, the sewage to be treated under the Intermittent Downward Filteration principle; this is carried out in the following manner:—The whole of the filtering area should be drained 6 feet under the surface, as shown on plan, and the surface properly prepared as per plan; the sewage should then be admitted on the surface through properly constructed channels, the ground being prepared for crops; all the liquid that the earth and crops do not absorb, must then pass through at least 6 feet of earth before it reaches the underground pipes; it will then be conducted by them to the effluent chamber, where it will be found to be quite bright and clear, and can be no nuisance whatever; the surface will be so arranged, and chambers made in the outfall pipes, so that the sewage can be conducted to any part of the farm at will.

In making my calculations, I have allowed for a possible population of 36,371, or at the rate of 33·065 per acre, but as there are now not more than from five to six thousand, the portion of the farm I have coloured red, will be ample for the present requirements. The other portion could be prepared as required, thus lessening the burden to the present population.

I may say that the reclaiming of this portion of the Bay will be a great boon to the inhabitants, for in its present state of mud and filth, it is an abominable nuisance, and as I purpose putting a bank or road across the Bay, 20 feet wide, it will be found of great convenience by the residents of the district. It will also immensely improve the Government reserve, which is now worthless, but will then become of value, as the tide will not be able to reach it.

In order to allow the surface of the farm to be kept as low as possible, I have allowed for an area inside the bank or road to be excavated to low water mark, with self-acting tide flaps and pipes through bank; into this all the effluent water will run, and not direct into the Bay. This area is sufficiently large to allow the effluent to be constantly discharging at any state of the tide, and will empty itself into the Bay as the tide lowers.

The material for raising the levels of the filtering areas could be procured—some from the surplus from the sewer trenches; and the rest out of the Government reserve, between Stanley and Gibbs streets, where I should think, the Government would allow it to be excavated in consideration of the immense improvement the works would be to the reserve.

Provision can easily be made for irrigating the Police paddock and Government reserve, which in dry seasons would be a great advantage.

I also purpose straightening the ditch now running through the reserve.

I have given this matter great consideration, and am of opinion that the "Intermittent Downward Filteration" is the best to meet all the requirements of Burwood. I feel sure the success of a sewerage farm here will be greater than at any place in England, as this country being so much drier, it will of necessity take more sewage per acre, and the crops will grow much more rapidly.

I cannot see that the Government can have any objection to this scheme, as I believe they purpose treating the sewage under Mr. Stayton's scheme in a similar manner. Now if there can by any possible means, be found any objection to the situation of the farm, as proposed by me, there must be an equal or greater objection to a larger one, situated at Botany. In

In Mr. Stayton's scheme he provides for a single brick sewer, running in an easterly direction through the borough, with a uniform gradient of one in 1500, the proportionate cost of which, for Burwood, will be £62,574, independent of which the whole of the reticulation pipes, some 22 miles, would have to be laid. The reticulation on my scheme I estimate at £28,995. Under Mr. Stayton's scheme it would probably cost more, as all that portion lying north of the line of the main sewer, would have to be carried against the natural fall of the land, and therefore taken to a greater depth, in any case the reticulation will have to be done, and must be added to the £62,574. Now the cost of my outfall works, that is from the Parramatta Road to and including the sewerage farm, should be taken as against Mr. Stayton's £62,574; the work actually required to be done at the present time I estimate at £14,160, but as the population increases that amount will have to be increased to £33,455. This taken from Mr. Stayton's scheme leaves a balance in favour of my scheme of some £29,119, or on the present expenditure of £48,414. The total cost of my scheme including the reticulation is £62,450, or as near as possible the same as Mr. Stayton's scheme for the main sewer only. You will also have some 40 acres of land.

It will be seen by plan that I drain the whole of the borough by gravitation, no portion of it requiring to be pumped. There is a portion of Burwood that lies too low to be drained by gravitation into Mr. Stayton's system, these on page 20 of his report, he proposes not to deal with at present. It is "considered that the actual volume of sewage to be dealt with below the gravitation level will not only be relatively small, but when diluted its discharge into deep water would be inoffensive; and as portions of some of the areas front the Parramatta River, it is quite possible that under proper arrangements, the drainage from the several houses thereon, might be so conducted as to discharge below low-water mark, and thus obviate considerable expense in the construction of sewers in extreme cases." This I contend should on no consideration be allowed, and would cause more nuisance than any sewerage farm, and as there are some 1,100 acres so situated in the western suburbs, I consider it not a very small matter, but altogether is of about the same area as Burwood.

In calculating the proportional cost for Burwood, of Mr. Stayton's scheme I have taken the total cost of the scheme £830,304 which is for a population of 482,608, the population which is possible for Burwood, 1,100 acres x 33·065 per acre equals a total of 36,371, the proportion for which will be £62,574.

My scheme could be carried out at once while Mr. Stayton's will be some years before it is in a state to admit the reticulation of Burwood.

In Mr. Stayton's scheme, the cost of main sewer for Burwood £62,574, added to the reticulation £28,995, gives £91,569 or £2 10s. 4d. per head of probable population. Total cost of my scheme £62,450, or equal to £1 14s. 4d. per head of probable population; thus showing a saving of 16s. per head in favour of my scheme.

One great advantage of my scheme is that the lengths of sewers being short the sewage matter is carried through them and treated on the farm before decomposition has had time to take place.

I will quote a few remarks from J. Bailey Denton, Esq., C.E., for whom I have carried out several works. He is, I believe, the greatest sanitary engineer using this principle.

Great Malvern.—There are 11½ acres prepared for intermittent filteration and 24 acres for surface irrigation. The filtering areas are 11 in number, each area approximately one acre in extent, and such is the absorbent character of the soil, now that it is thoroughly drained, that the whole of the present dry weather sewerage, some 350,000 gallons, has been disposed of for several days in succession on a single area, and effluent of a superior character obtained at the same time. Balance in favour of farm for 1884, £162 15s. 1d.

Kendal (Westmoreland).—Mr. Banks, Borough Surveyor, writes to Mr. Denton:—"I have now given up being Borough Surveyor, and have discontinued the management of the farm; a Committee have it in hand. I however take great interest in it, as I think it one of the most successful schemes for dealing with sewage that there is in the country."

The farmer who is farming the sewerage farm at Abingdon, Berkshire, objects to the solid ingredients of the sewage being removed from the liquid, saying, "the richer the sewage the better I like it."

Forfair (Scotland).—There was a balance in favour of the farm for the year 1882–3 of £247 6s. 2½d., and 1883–5 of £284/0/0.

The Rivers Pollution Commissioners said it would be difficult to decide between filteration and irrigation, but there are some reasons why the filteration process would seem to have the advantage. In the first place, the system and motive of working would be totally different, the purification being the principal thing aimed at, and the vegetation only secondary and subsidiary, so that the attention of the management would naturally be directed to the quality of the effluent as the chief aim.

Moreover in filteration ground properly laid out, there ought to be no communication between the influent and effluent channels, except through the pores of the land, so that the sewage, in order to get away must necessarily pass through the filter. By this means the process of purification becomes not optional (as in broad irrigation) but compulsory.

Dr. Frankland estimates that the sewage from 3,000 people can be used per acre, but Mr. Bailey Denton puts it at 1,000. This quantity has often been exceeded.

By this process no part of the crops above ground is ever touched by the sewage, the sewage being distributed by furrows of different depths so regulated as to feed the soil with the liquid and keep back the solid matter in the furrows or carriers, which solid matter after the sewage has been turned off that section quickly dries and is reduced considerably in the act of drying. It is then dug into the land and forms an excellent manure; the crops taking up what moisture they require through the roots only.

Flushing.

I propose to fix at the positions shown on plan, Doulton's Automatic Flushing Syphons. These I should advise being filled with the waste water from drinking fountains, the water running from the fountain into dog-troughs, and then to the flushing chamber; those at the head of 6 in. pipes, to hold 300 gallons, and those at the end of 9 in. 400 gallons, these to be emptied say once a day. For large sized pipes I use Disc Flushing Valves; in the manholes these will be manipulated by hand, and will effectually keep the sewers clean.

Sewers.

The sewers will all be in Glazed Stoneware, with the joints in tarred gaskin and cement, so that the joint will be perfectly watertight, the pipes to be laid in straight lines from manholes to manholes or manholes to lampholes and true to gradient. Manholes.

Manholes.

Manholes to be built at all intersections of streets and change of gradients.

Lampholes.

Lampholes to be built where manholes are more than 300 feet apart.

Ventilation.

This is a very important matter and cannot be given too much attention to. I purpose making the manhole and lamphole covers open to admit air, and air shafts to be carried up the houses, in any case; taken above the roofs or above any window of any adjacent house. This will cause a current of air to be constantly passing down through the openings in manhole and lamphole covers, and up through the air shafts, where the sewers of one line come above the level of the other sewers in a manhole. I fix a flap valve over the sewer end, this divides the sewers into sections and improves the ventilation; at ends of streets where there are no houses the air shaft can be carried up the inside of a lamp post, in fact a lamp post can be made to answer a triple purpose,—lamp, air shaft, and drinking fountain.

House connections.

In all house drainage I should recommend a combined automatic 20-gal. flushing tank, and grease interceptor, and allow the water from bath and slops to be discharged into it; this will always keep the drains well flushed.

Surface Drainage.

I keep as much surface drainage as possible out of the sewers, and it will be allowed to flow in its natural directions to the nearest streams.

Velocity.

To prevent deposit in sewers it is necessary to get a velocity of 3 feet per second or 180 feet per minute. In no case have I a less than this amount; the flatest gradient being one in 450 for a 24-in. pipe. This gives a velocity of 200 feet per minute.

Trusting you will give this your best consideration,— I am,

Yours respectfully,

CHAS. COWDERY,

Sanitary Engineer.

Letter from the Under Secretary for Works to the Burwood Council.

Sir, Department of Public Works, Sydney, 4 September, 1888.

Referring to your letter of the 25th July, forwarding the report and plans prepared by Mr. Charles Cowdery, C.E., for a system of sewerage for the Borough of Burwood, I am directed by the Secretary for Public Works to forward herewith, for the information of your Council, copies of reports thereon, which have been received from the Engineer-in-Chief for Sewerage, and I am to state that Mr. Sutherland scarcely thinks it necessary for a deputation to wait upon him in reference to the matter; but if, after considering the Departmental reports, the Council still think it desirable to adopt Mr. Cowdery's scheme, they had better take steps to appear before the Parliamentary Standing Committee in opposition to the scheme prepared by Mr. Stayton, which has, at Mr. Sutherland's instance, been referred to that body. So far as Mr. Sutherland is concerned, he has no doubt that the latter scheme is by far the more efficient and economical; but, notwithstanding this, he will be only too pleased to see the subject thoroughly thrashed out.

What, however, Mr. Sutherland desires to impress upon every Municipality is, that what is to be done should be done quickly, for every day's delay means valuable lives lost.

The report and plans forwarded by you are returned herewith. I have, &c.,

J. BARLING,

The Council Clerk, Burwood. ——— Under Secretary.

Minute from Engineer-in-Chief for Sewerage.

Sewerage Branch, Sydney, 22 August, 1888.

Subject: Forwarding Mr. Stayton's report on Mr. Cowdery's Scheme for the Drainage of Burwood.

In accordance with the Minister's instructions to supply report on Mr. Cowdery's scheme for drainage of Burwood, I have to forward a detailed report by Mr. Stayton on same. The objections as to the position and level of filter beds and appurtenances are in my opinion, as Mr. Stayton states, fatal to the project. They would be entirely inoperative, so that the project would, if carried out, ultimately have to be turned into a pumping scheme. All the appliances, filters, &c., are outside the limits of Burwood. Mr. Cowdery compares this farm or filter with that proposed by the Department at Webb's Grant, but the difference is great—one is to be clay debris or mud; the other is pure sand, and is a proved success.

Mr. Stayton points out that the outfall will discharge less than one-half the quantity stipulated for by Mr. Cowdery with maximum flow, and similar deficiencies in the adjoining main sewer.

For a length of over 4,000 feet the sewers, as proposed by Mr. Cowdery, are to be in tunnel which he does not propose to line, but simply lay an earthenware pipe along bottom of tunnel; the escaping sewage and gas would permeate the subsoil, and be a most fertile source of sewage gas and illness, and the tunnels would in time collapse, when it would be cheaper to abandon the pipes and excavate new tunnels for new pipes than to try to restore the old pipes.

It is also shown that the drainage of considerable areas within the limit is not provided for.

Mr. Cowdery, as far as can be seen, under-estimates the cost of his proposal, and over-estimates the cost of the Government scheme. Mr. Stayton shows that even by Mr. Cowdery's own estimates, the project designed by him, will cost more than that proposed by the Government.

The management of separate systems of sewerage and disposal, will inevitably cost more than a concentrated arrangement for all, and a separate staff must be provided for each; and, in addition, the real or imaginary evils of sewerage disposal will be repeated in several localities, instead of concentrated at one point as in the Government scheme. Finally,

Finally, large expense has been incurred to relieve Port Jackson from all chance of sewage defilement, both on the works to Bondi outlet and those proposed for North Shore, and all this outlay will be rendered nugatory if each separate locality is to pour its sewage after *quasi*-purification into the Parramatta River.

The Under Secretary for Public Works. WILLIAM C. BENNETT.

Report from Mr. G. H. Stayton to the Engineer-in-Chief for Sewerage.

Burwood Sewerage. Mr. C. Cowdery's Scheme.

Mr. Cowdery's scheme is stated to provide for the sewerage of Burwood by gravitation—no portion of it requiring to be pumped. He proposes to use pipes throughout, in order that the necessity for constructing brick sewers may be dispensed with. The sewage is to be conveyed by two outfall sewers to Hen and Chicken Bay, where it is intended to reclaim some 40 acres, which at low-tide consists of mud-flat and mangrove swamps, and to dispose of the sewage upon the "Intermittent-downward Filtration" principle. The scheme includes 24 miles of sewers, and the entire cost is estimated at £62,450.

I have examined the plans, sections, and report, and find that the scheme is so imperfectly prepared that if it were carried out it could only result in failure. The following remarks deal with so many important points that they are necessarily lengthy, but they have been condensed as far as practicable.

Several municipalities in the western suburbs (especially Burwood) apparently possess obvious natural facilities for drainage towards Parramatta River, but the difficulty is to secure efficient outfall sites locally, without causing nuisance to adjacent districts. This question was fully considered in connection with the general scheme for the western suburbs, and it was pointed out in the report that grave reasons exist for objecting to the discharge of sewage in any form into the Parramatta River. Apart from this, the additional expense incurred in separate management would be unnecessarily great. The proposed plan was not designed until local systems were found to be impracticable—unless at a largely increased aggregate outlay.

The fatal objection to Mr. Cowdery's scheme is the intended method of sewage disposal; but apart from this, the proposed system of sewers has evidently not received proper consideration, and it is obvious that they have not been designed upon the usual scientific principles.

The Borough of Burwood contains an approximate area of 1,100 acres, and an estimated population of 5,500 persons. The prospective population provided for in the "Western Suburbs" Sewerage Scheme is 33,000, being at a rate of 30 persons per acre. Mr. Cowdery's figures of 36,371, and his comparisons of cost deduced therefrom, are so far incorrect.

Outfall Works.

The intermittent-downward filtration process of sewage disposal has been described as similar to lung action—taking in and giving out—a "free" outlet being a *sine quâ non*. It can only be recommended where suitable land can be cheaply acquired, and where 6 feet of earth as a filtration medium can be ensured. Solids must be absolutely excluded from the filters, or the earth becomes clogged and efficient purification ceases. All authorities agree that the system does not pay commercially, except under the most favourable conditions.

Mr. Cowdery's scheme would not allow the filter beds to have full play, even if suitable and sufficient material could be obtained for their formation; neither would a free outlet be secured. The level of high water shown on his sections is 6 inches too low, and instead of the tidal range being 6 feet, the limit should not exceed 5 feet 6 inches. Low-water mark is therefore 1 foot higher than shown—an important factor in connection with the proposal.

The surface of the filter-beds, according to the sections, will be actually 6 inches below high-water mark spring tides, and as the filters are 5 feet deep, the bottom would be level with the low water springs. The tide is intended to be kept back by a bank to be formed across the bay, the top being 18 inches above high water.

The effluent from the filter beds is intended to be discharged into an area 5 or 6 acres in extent, to be formed behind the bank, by excavating to low-water mark; its final discharge into the bay at low-water being through the bank by means of two 30-in. iron pipes, fitted with tidal flaps.

The above area or reservoir would not, however, be restricted to the effluent from the river beds, for the reason that it forms the natural outlet for the storm waters from more than one-third of the Burwood watershed. During continuously heavy rainfalls, especially if such rains fell two or three hours before high water, the reservoir would fill up and the filters and bank would be seriously damaged, if not destroyed. The proposed outlet pipes would be insufficient to carry off such storm waters, even at low spring-tides; it is therefore obvious that the filters would be liable to back-flooding. The prospective maximum dry-weather flow at neap-tides would mean complete saturation of the lower part of the filter beds for several days at a time, because the entire effluent could not be drawn off as at low water spring-tides. A rainfall of 2-in. per day only, in addition to the maximum sewage flow, would rapidly fill the reservoir on a rising tide. The foregoing are some of the risks which would be incurred on the land side of the bank, but there is also a great probability that the tide flaps would occasionally fail in their action, in which case sea water would gain access to the filter beds.

The level of the filtration area is such that it would be impossible for the filters to constantly discharge a purified effluent "at any state of the tide," and instead of the beforementioned "lung action" going on, the frequent sealing of the effluent outlets by back waters would so completely drench the filter beds at the lower part as to render them utterly incapable of purifying the sewage. As the filters could not be effectually oxidised, they would speedily become congested or clogged, and thus create an intolerable nuisance—quite the reverse of the "boon" to the inhabitants which Mr. Cowdery asserts that the reclamation would effect.

The situation of the outfall sewers, the screening tanks, and the filtration areas, is entirely outside the municipal boundary of Burwood. It is in fact partly in Fivedock and partly in Concord; and the scheme could not therefore be effected without special Parliamentary powers, which would, no doubt, be opposed by both municipalities.

Neither the report nor the plans contain sufficient information to enable me to prepare any serviceable estimate of the cost of the proposed outfall works. The local conditions are unfavorable to construction

construction except at an excessive outlay. The excavated material for forming the filter beds would doubtless be of clay, shale, or other impervious nature, and it has long since been determined that the former can only be used in sewage filters, in the form of burnt-ballast. There are strong indications at the Fivedock end of the bank that rock would have to be excavated to enable filter beds to be formed, and it would be necessary to sink trial holes or make borings in other parts to ascertain the nature of the bottom and depth of mud. The greater part of the land marked "Government Reserve" on plan is too low and altogether of an unsuitable nature for irrigation as proposed, and it could not be so used unless efficient drainage is provided.

The intermittent-downward system of filtration has not been largely adopted in England on account of the expense. Mr. Cowdery states that his scheme would be successful; but can he point to an instance where such a farm has been established below high-water mark? I know of none.

From the foregoing observations it will readily be understood why the site is so strongly condemned as being utterly unfitted for the proposed process. Mr. Cowdery submits that "if there can by any possible means be found any objections to the situation of the farm, there must be an equal or greater objection to a larger one at Botany." There is, however, a most important difference in the respective schemes, inasmuch as the sewage would be delivered at Botany at a level of 9 feet *above* high-water mark instead of 1 foot *below*. Moreover, the filtration medium consists of a free sandy soil, and open subsoil of the most desirable description, entirely above sea level. The success of the farm at Webb's Grant, and its efficacy as a sewage purifier, has already been amply demonstrated. The maximum velocity of the sewers comprised in the Government scheme is such that only three hours would elapse before the sewage of Burwood would be delivered at Webb's Grant; a period sufficiently short to obviate any question of sewage decomposition during its transit, as referred to in Mr. Cowdery's report.

Outfall Sewers.

The total length of the eastern and western outfall sewers is nearly 8,000 feet, and, for an average distance of 400 yards north of the Parramatta Road, the sewers would be underground; but the remainder (5,600 feet) is entirely above the existing surface level, and would have to be formed in an embankment, the maximum height being 7 feet. The invert level of the outfalls at their extremities is 1 foot below high water mark spring tides.

The combined maximum discharge of sewage and rainfall which the outfall sewers should be capable of carrying off amounts to 1,320 cubic feet per minute, but the discharging capacity of the combined outfalls when flowing half-full, is 313 cubic feet only. The eastern outfall consists of an 18-in. pipe at an inclination of 1 in 453, and its discharging capacity when flowing half-full is 151 cubic feet per minute. It is intended, however, to carry off the contents of a 24-in. pipe sewer at 1 in 450, together with a 9-in. pipe at 1 in 74; the combined discharging capacities of which, when flowing hall-full, amount to no less than 382 cubic feet per minute. The western outfall sewer has a similar discharging capacity of 162 cubic feet, but the sewers emptying into it would deliver 483 cubic feet per minute when flowing half-full. It is therefore quite evident that in his anxiety to avoid brick sewers, Mr. Cowdery has failed to provide effective substitutes.

No extra fall has been allowed at the screening tanks or change of gradient, and no step in the invert is provided where the outfall sewers join the main sewers. In one instance this is especially remarkable, inasmuch as the junction is at a right angle, and yet the invert levels are precisely similar.

Main Sewers.

The directions and levels of the eastern and western main sewers have not been skilfully designed. In its course, the eastern main sewer contains no less than fifteen right angles, and the diameter diminishes from 24 to 6 inches. The western main has from 18 to 20 right angles and similarly diminishes. While credit is apparently taken in every case for the discharge due to the gradients shown on the sections, no allowance whatever is made for the difference in the size of the pipes, the gradients being calculated on the uniform inclination of invert; nor is there any allowance for the number of right-angled junctions, which would absorb an additional 8 or 10 feet of the fall to secure the calculated velocity. The amendments which are therefore absolutely essential would materially affect the dimensions and inclinations of the entire system of sewers shown on Mr. Cowdery's plan.

Subsidiary Sewers.

There can be no doubt whatever that the construction of the subsidiary sewers would be more costly than under the Government scheme, in consequence of the greater facilities offered by the latter in the intended main intercepting sewer which runs through Burwood and the branch sewers which extend to Parramatta Road.

Similar defects as to invert levels and absence of steps at the manholes are also apparent in the proposed lateral sewers, as already explained in reference to the main sewers. In several streets the sewers are too deep to admit of a convenient and inexpensive mode of connecting house drainage, and in others, sewers would be laid at so shallow a depth as to be useless for house drainage purposes. In some instances, the sewers would be above the existing surface-level, whilst in several parts of streets no sewers whatever are provided, the surface being too low to permit of drainage by gravitation.

In such a case as the Parramatta Road, where a portion of the sewer is over 30 feet deep, a supplemental sewer at a shallower level will be required for house drainage connections, the same as intended in similar instances in the Government scheme. The other streets, where sewers are from 20 to 33 feet deep, are Railway Parade, Conder-street, Hornsey-street, Lang-street, and Willie-street. The total length of sewers in these streets at a greater depth than 20 feet is nearly 4,000 feet, and tunnelling must necessarily be resorted to in construction. Such provision has been made in the Government scheme, and, except where the headings are in rock, they will be lined so as to provide permanent access in case of necessary repair or accidental stoppage. The sewer in Fitzroy-street, although 5 or 6 feet deep, would not be at a sufficiently low level to drain the back yards of the houses on the south side, and in Milton-street and part of Lucas Road, the sewer is about 2 feet deep only. Before devising a system of lateral sewers it is always essential to ascertain particulars of the levels of back yards, where the adjacent land is below the street level.

Sewers are shown to be above the street-levels at Parramatta Road, near the Avenue, the Avenue, Crogan-street, Lang-street, and Belgrave-street, and on the south side of Parramatta Road, towards Esher-

street. This would necessitate raising the surface level of the streets and the land before house drains could be connected. At the east end of Ethel-street the sewer is shown to pass through a house at a depth of about 4 feet.

Areas Omitted.

Mr. Cowdery submits that "by his plan he drains the whole of the borough by gravitation." I find, however, that no sewers are provided for the following streets, the levels being presumably unfavourable for gravitation, viz.:—

Shaftesbury Road, Brooklyn-street to Railway, for a distance of about	400	feet.
,, south of Parramatta Road, ,,	500	,,
Parramatta Road, lowest parts, ,,	1,600	,,
Burwood Road, north end, ,,	1,300	,,
Lang-street, part of, ,,	300	,,
Russell-street, west part, ,,	700	,,
Norwick-street, west part, ,,	600	,,
Lyon-street, west part, ,,	500	,,
Parnell-street, west part, ,,	300	,,

With regard to the proposal to ventilate certain sewers by means of street lamp-posts, I have only one remark to make, viz., that in England the plan has been found useless and dangerous, and that the idea has long since been abandoned. And with respect to Mr. Cowdery's statement that in no case would the velocity of the sewers be less than 180 per minute, I would call attention to an instance in Parramatta Road where the velocity of a 12-in. pipe does not exceed 158 feet per minute.

On page 6 of Mr. Cowdery's report he condemns an alleged proposal to drain some 1,100 acres of the low-lying areas of the western suburbs direct into the Parramatta River, and quotes a portion of a paragraph in my report. Had he carefully read the entire paragraph he would have seen that there was not the slightest intention of doing any such thing. Burwood is distinctly referred to as containing *two* low-level areas to be hereafter dealt with in such manner that the sewage therefrom would be carried away to Botany, for which purpose provision has been made in the intercepting sewers, as described in a previous sentence in the same paragraph.

Cost of Works.

Mr. Cowdery estimates the total cost of his scheme at £62,450; but, in the absence of details of construction and other particulars upon which estimates are usually based, I am not in a position to state what the probable cost would amount to. I have seen sufficient, however, to enable me to form the opinion that his outfall and sewage farm works would entail a very large outlay. Mr. Cowdery's mode of comparing the cost of the Government scheme according to the prospective population is entirely wrong; but even on his principle the figures should not exceed £56,776 for the main sewerage, or £85,776 in all. It will be seen by the accompanying extract from the *Sydney Morning Herald* that Mr. Cowdery recently gave the proportional cost of the Government scheme as £109,222 (instead of £56,775), and he asserted that a local scheme could be carried out at one-third of the cost of the former. Now, one-third of £85,770 is £28,590, whereas his local scheme is now estimated to cost £62,450. Mr. Cowdery entirely omits any reference to working expenses and maintenance.

Annual Cost.

The proper basis on which the cost of sewerage works should be apportioned is the annual ratable value of the district in question. The expense of the sewerage of London and suburbs and of all large cities in England has been satisfactorily decided on this principle. The ratable value of Burwood was recently returned at £55,000, or about 1-26th of the entire ratable value of the western suburbs. If, on completion of the works, the ratable value is 1-26th of the estimated total of £2,000,000, it will have increased to £77,000.

Annual cost of Mr. Cowdery's scheme.

6 per cent. on £62,450	£3,747
Add working expenses and general maintenance	400
Total	£4,147

Estimated annual cost of Government scheme.

Rate of 6·68d. in the £ on £77,000	£2,143
Add interest and repayment on cost of subsidiary sewers, 6 per cent. on (say) £25,000	1,500
Add proportional cost of pumping sewage from low-level area ...	350
Total	£3,993

Assuming therefore that Mr. Cowdery's scheme could be carried out at his estimate, and setting aside for the moment the question of its impracticability, the financial question proves beyond doubt that the annual cost of the Government scheme compares favourable with a local one.

GEO. H. STAYTON,
M. Inst. C. E.

Sewerage Branch, August 15th., 1888.

Letter from the Burwood Council to the Under Secretary.

Council Chambers, Borough of Burwood, 25 September, 1888.

To the Under Secretary for Public Works, Sydney,—

Sir,

Sewerage Scheme for Western Suburbs.

I have the honor to give you below copy of a resolution passed at a special meeting of this Council held last night on the above subject: "That this Council having considered the sewerage schemes of the Government and of Mr. Cowdery, gives its hearty support to the comprehensive scheme of the Government."

I have, &c.,
HENRY LIPSCOMB,
Mayor.

Letter

Letter from the Burwood Council to the Under Secretary.

Council Chambers, Borough of Burwood, 22 October, 1888.

To the Under Secretary for Public Works, Sydney,—

Sir,

By the request of Mr. C. Cowdery, C.E., to this Council, and under a resolution carried thereon, I have the honor, by direction of His Worship the Mayor of Burwood, to forward you, under a separate cover per book post, Mr. Cowdery's reply to the criticisms of Messrs. Bennett and Stayton upon his sewerage scheme for the Borough of Burwood, and to ask that you will kindly submit same to the Honorable the Minister for Works for his perusal.

I have, &c,

W. REDFEARN.

Council Clerk.

Roads.—J.B., B.C., 24/10/88. Mr. Stayton for reply. The best course in this case will be to prepare a paper for the Committee.—W.C.B., 26/10/88. Mr. Stayton, B.C. Memo. submitted.—G.H.S., 27/11/88.

Mr. Cowdery's reply to the Departmental criticisms.

50 Castlereagh-street, Sydney, 24 September, 1888.

To the Mayor and Aldermen of the Borough of Burwood,—

Gentlemen,

I now beg to lay before you my reply to Mr. Stayton's criticism on my scheme for the sewerage of Burwood. I could not have expected a very favourable report from the author of a rival scheme, and think the criticism should have come from some independent person; but I will endeavour to answer any objections Mr. Stayton has made. I should therefore be glad if you would read Mr. Stayton's report with this as I purpose taking each item as they appear.

Mr. Stayton states the question was fully considered in connection with the general scheme, and it was pointed out that grave reasons exist for objecting to the discharge of sewerage of any form into the Parramatta River. Why, may I ask, under these conditions, does Mr. Stayton terminate his sewer at Strathfield? What is to become of Rookwood, Auburn, Granville and Parramatta, all having a watershed toward the Parramatta River, and with a considerable population? I suppose that it was not convenient to go farther than Strathfield, where his sewer ends at a level of 36·76 feet, above high water, the sewer ending at a size of 3 ft. 9 in. by 2 ft. 6 in. He evidently does not intend to continue this farther. If, therefore, it is not intended to include the abovenamed places, why should he include Burwood at such an enormous cost.

The separate management will not cost so much as the proportional cost of pumping it. In fact there will be a profit from the farm. This I will show further on.

Mr. Stayton accuses me of not properly considering my scheme, and that I have not designed it upon the usual scientific principles. I will call Mr. Stayton's attention to the old proverb: "Those who live in glass houses should not throw stones," and leave it with you to judge which is the more suitable scheme.

Population.

This is too trivial, the difference in population is so small. I have taken the average prospective population of the western suburbs. (See p. 8 of Mr. Stayton's Report.) Mr. Stayton has taken Burwood alone.

Outfall Works.

Mr. Stayton states that the system does not pay commercially, except under the most favourable circumstances, therefore he spends some £56,775 to take it to what he considers a most suitable place. Wouldn't it be more advisable to spend £14,160 now, or £33,455 distributed over (say) 20 or 30 years, in the neighbourhood, to make a suitable place, and thus save £42,615 and £23,320 respectively?

Solids, Mr. Stayton states, must be absolutely excluded from the filters. We will see what Mr. Bailey Denton says on this matter. "Experience has not warranted these fears; but at the same time, it appears to be advisable previously to separate the solids" to some extent. It is certain that the more the liquids approach clarification the less land will be required, and the less danger will there be of unpleasant odours. For a small number of people (say 500 to the acre), the sewage may be applied as it comes, leaving the grosser matter to become amalgamated with the soil; but if the number be increased the previous removal of the sludge would be desirable, and for 1,000 or more, it would probably become absolutely necessary.

Levels.

Mr. Stayton is in error here. He has evidently not tried the levels, and should not make statements without first proving them. My high water is taken from actual high-water in the Bay, the levels being connected to the levels of streets in your possession. Mr. Stayton has evidently taken high-water at Sydney, which is not the same as at Hen and Chicken Bay. It will thus be seen that he is in error about the levels of filtering areas. I may also state that the surface of each bed towards Burwood is 3 inches higher than the one more remote.

Mr. Stayton states that the area for water inside the bank is not restricted to the effluent from the filter beds, but is the natural outlet for more than one-third of Burwood. Again Mr. Stayton is in error. It is a fourth, and this is not intended to be allowed to run into the water area. The major part will be conducted outside the filter area. This will reduce the area which will drain into the water area to about 50 acres, or a twenty-second part of the area of Burwood. Now, as the area inside the bank is 5¾ acres, it is obvious that if the 50 acres are subject to the very heavy downpour of 1 inch per hour it could only raise the water in the reserve a little under 9 inches per hour. At the same time, the effluent would be discharging at the rate of about 4 inches per hour, so that it would be seen that if the pipes through the bank were not discharging at all it would take something like five hours before any damage could possibly be done; but as the outlet pipes will be discharging (say) half that time, they will be reducing the water at the rate of about 4 inches per hour. This amount of rainfall is never likely to occur; but even if it did it could not damage the irrigation works, as all the effluent chambers will be provided with tidal valves.

It

It will be seen, Mr. Stayton states 2 inches per day; I have allowed 5 inches in five hours. If, providing the flap-valves on tide side of bank fail—a very improbable case—no damage would be the result. It would simply stop the action of the lower filter-beds whilst the tide was up.

Mr. Stayton seems to harp about the level of the filter areas, but, as I have previously shown that he is not correct, it is unnecessary for me to refer further to it. The filters can act at any state of the tide, and in the event of a heavy rainfall the beds at the higher level would be used, and nothing would cause "an intolerable nuisance." The ordinary fine-weather discharge from the effluent chambers will not raise the water area more than $1\frac{1}{2}$ inches per hour.

The filter area is, I take it, in neither Five Dock or Concord, but on neutral ground, and I do not anticipate much opposition from either. I have lately had an interview with the Mayor of Five Dock, and he stated that they should only be too pleased to have a farm there; and I believe one of the aldermen wished they had several of them in their neighbourhood. They would also be pleased to join with Burwood to drain a portion of their borough situated near Burwood. This would cheapen Burwood's work, and be a convenience to Five Dock. From Concord I do not anticipate much opposition, for only at the last meeting of the Council one alderman proposed that they should oppose a sewage farm, but could not get a seconder.

Again, I will refer to Mr. Bailey Denton as to material for filters:—"Withington, Lancashire.—The land situated for the treatment of the sewage is situated close to the Mersey, at a point where Charlton Brook joins that river. Before embanking, this land was subject to frequent floodings. The soil is an alluvial deposit, partly of a free character, well adapted for filteration, and partly of a loam, inclining to clay, which, though porous as clay, is very much less active than the remainder of the farm. The whole of the utilised land has been drained about 5 feet deep at intervals between the drains, varying according to the porosity of the soil." This is very similar to what we shall have to contend with. Again, speaking of Merthyr, he says: "No arbitrary law applicable to all soils was intended to be laid down at Merthyr. Every day's experience since that work has served to prove that with the most suitable free soils it is hardly possible to overcharge them with liquids, or to overtax their cleansing powers; whereas in less suitable clayey and peaty soils the limit of absorptive power is reached before one-quarter of the liquid that would be absorbed by gravity, and sandy land is applied." If we avoid the denser clays as altogether unsuitable (unless they are so altered in their condition by mixing, burning, &c., as to lose their natural character), and regulate the application of the sewage to other soils within the limits of 1,000 persons to the acre of those most suitably constituted, and 250 persons to the acre to those least suitably constituted, all other descriptions of cultivatable land may be made capable of filteration, and the advantage of being able permanently to cleanse the sewage of a district where any land more or less suitable is to be purchased or leased in sufficient quantity to meet these limits cannot be over estimated.

The intermittent downward filtration has been largely used in England. Mr. Stayton evidently knows very little about the country towns in England. I certainly cannot point to a similar place in England, because I know no place geographically the same; but a man is no engineer who cannot adapt himself to the material to hand, and there are many engineers who would only be too glad to reclaim some 40 acres for the purpose at a comparatively cheap cost, especially when the only alternative scheme would cost the borough £56,775.

Mr. Stayton states that the sewage is discharged (under his system) in three hours. How does he make this out? His western sewer begins with a size of 6 feet 10 inches by 5 feet 10 inches, and is reduced to 3 feet 9 inches by 2 feet 6 inches. He does not give lengths of each, so I will take it as 5 feet 6 inches by 3 feet 8 inches new form as the average. This, if we turn to Baldwin Latham's on Sewerage, the velocity when running one-third full, at 1 in 1,500, will give 126 feet per minute. This, for a distance of 5 miles 240 yards, or 27,120 feet, will take three hours fifty-one minutes, to which, added the outfall 6-ft. sewer 11,700 feet long, at 1 in 1,700, gives a velocity of 177 feet per minute, equal to one hour six minutes, or a total of four hours fifty-seven minutes as against Mr. Stayton's three hours or nearly two-thirds longer. Now that I am on the question of velocities, Mr. Stayton continues his sewer for the western suburbs at a uniform gradient of 1 in 1,500 without the *slightest regard* to the size of sewer. I will therefore take the sewer on the last length which he gives at 3 feet 9 inches by 2 feet 6 inches. This, when running full, only gives 128 feet per minute. Now, as the sewer for many years is not likely to be running one-third full it will only have a velocity of about 100 feet. Now what will be the result? The velocity will be totally insufficient to prevent deposit, which will quickly accumulate, and the district will be saddled with an elongated cesspit which will require a large expenditure to keep clean. If the sewer should by any possible means ever run full it will then not be capable of removing deposit.

Mr. Stayton seems fond of running into error. He states the greatest depth of embankment to carry pipe to outfall would be 7 feet, whereas it is 5 feet.

It is my intention of separating the storm water from the sewage before it is carried to the filtering area. An 18-inch pipe will therefore be sufficient for many years. Should another eventually be required it could be laid by the side of the other. All this would be shown on detail drawings.

It is not necessary to put steps in manholes. Thousands are put in without them. I have put in hundreds during the last fifteen years. Steps are only necessary where flap-valves are required, or where a gradient wants checking.

What does Mr. Stayton mean by complaining about the sewers being at right angles to each other? Does he mean that streets should not be laid out at right angles to each other, or does he wish to increase the cost by introducing more manholes, or by curving the sewer—which is not now done? Neither of the above are necessary or desirable: the direction being given on the invert of the manholes where the sewers join.

I have certainly not supplied Mr. Stayton with any of my calculations respecting gradients, &c. Although he asserts no allowance is made in the difference in the size of pipes, I fail to see how he has arrived at this conclusion, and must treat it as merely an assertion on his part.

I do most emphatically deny that the reticulation under my scheme would cost more than under his. It does not require an engineer to tell that. It will be the other way about, as all that portion of Burwood lying to the north of his main sewer will have to be carried against the natural inclination of the land.

Parramatta Road—Where deep, does not require a supplemental sewer, as the houses can be drained into Burwood-street and Park Road. There is also a private road running in a southerly direction and which I take it must be sewered by the proprietor. *Railway*

Railway Parade,—As there will eventually be a sewer up the proposed road this will obviate an additional sewer.

Conder street—There will only be the school, which will be drained into road at back, and the Council Chambers, which can be taken to manhole.

Hornsey street—Portion of this is only 11 feet deep.

Lang street—About 5 chains of this is more than 20 feet deep.

Willie street—Is under 4 chains, and this can be drained into Henry-street.

Fitzroy street—Does not require sewer deeper than shown, as there is a sewer at the back of the south side and it would be folly to put the sewer deeper.

Lucas Road—Nearly all 4 feet deep and not 2 feet as stated by Mr. Stayton.

Milton street—Is shallow for a very short distance, but the houses can be drained.

It will thus be seen that I have disposed of the question as raised by Mr. Stayton for additional sewers. At the same time I wish to state that the plans as prepared by me were done at my own expense, and are only intended to show you that it is practicable to sewer the district as shown, and I have no doubt that in some cases it would be necessary to deepen the sewers and in some cases to make them shallower—the cost being practically the same. I have worked the streets from the levels in your possession.

I believe there is a new house built at the end of Ethel-street, but there is plenty of room at the side for a sewer.

What Mr. Stayton terms "areas omitted" are Shaftsbury Road. Brooklyn-street to railway does not require a sewer as part will be drained into Park-street, and the remainder into Railway Parade.

Shaftsbury Road, south of Parramatta Road, can be drained when required down Parramatta Road to Lucas Road. This also takes the lower part of Parramatta Road, but is not required at present, as there is only an old brickyard.

Burwood Road (north end) not required. No houses on west side. East side can be drained into private lane at back.

Lang-street.—The houses on this are, I believe, very near, and can be drained into manhole at Crogan-street. [This part, in the event of Burwood joining with Five Dock, will be slightly altered.]

Russell, *Norwick*, *Lyons*, and *Parnell Streets* are intended to go with Strathfield if arrangements can be made.

Lamp-post ventilators are used at Slough, near Windsor. It is not my intention to use these permanently, but only at the highest points of sewers, where there are no houses near.

The sewer in Parramatta Road will have to be increased from a 12 in. to a 15 in. pipe, which will give a velocity of 178 ft. per minute.

Why does Mr. Stayton make the assertion that he is of opinion that my sewage farm will cost more than I have estimated it at? All I can say is, I can get a contractor to do the work at the price named; and may I ask—How are we to know that his scheme will cost as little as he states? We have no detail plans to base an estimate upon; but simply a plan with a line of sewer drawn down it, for which we are told we shall have to pay £85,770. Before receiving Mr. Stayton's report, we had not the least idea what proportion would be charged to Burwood. I am very glad he has been able to estimate it £5,859 less than I estimated.

Respecting my previous estimate, as published in the *S. M. Herald*, I acknowledge I was wrong. The error arose in this way: in Sands' Directory the area of Burwood is given as 1,920 acres.

What I quoted in my report respecting drainage direct into the Parramatta River, will be found on page 20 of Mr. Stayton's report. He distinctly states that the pumping of this low-lying area can be postponed.

Annual Cost.

The way Mr. Stayton has worked this out is, I should think, enough to condemn his report entirely. He endeavours to show that his total cost of £85,770 should be at a less yearly cost to the borough than my £62,450. This he very easily does by working his one way and mine another. This is very convenient for him. This, I think, everyone will admit is a very unfair way of placing the relative cost before the public. We now know what his calculation of cost in his scheme is. I see he has allowed £350 cost of pumping, &c. This is for night and day men, coal, oil, and deterioration of plant (duplicate engines, pumps, etc.). This item, I should think, will be nearer £1,000. We will now see what my yearly cost will be. In the first place, I don't require £62,450, but £48,414, which, at 4½ per cent. at which price your clerk informs me you can get money, will amount to £2,178 12s. 7d. Mr. Stayton has put my working expenses as £400. Why it should be more than his, I fail to see, without it is to make the yearly difference more. I shall be able to pay more than working expenses off the farm. I can thus cut out the £400, which will leave a balance in favour of my scheme of £1,814 7s. 5d.

List of some farms at Home, with profit on same.

	£	s.	d.
Merthyr Tydvil (South Wales)	1884=452	9	7
" "	1883=247	6	2½
Forfair (Scotland)	1884=284	0	1

7,	1,701	11	11½
	£243	0	0

an average of £243 above expenses.

I fail to see why better results cannot be obtained here.

Trusting I have explained matters to your satisfaction,—

I am, &c.,
CHARLES COWDERY.

MEMORANDUM

Memorandum to the Engineer-in-Chief for Sewerage *re* Mr. Charles Cowdery's Sewerage Scheme for Burwood.

Mr. Cowdery's reply, dated 24th September last, to the departmental criticisms upon his proposed Sewerage System for the borough of Burwood has received consideration.

Only the more salient points will be dealt with in the following rejoinder; in which, for convenience, Mr. Cowdery's remarks and the replies thereto are placed in juxtaposition.

I venture to assert that he has entirely failed to satisfactorily answer the objections to his scheme. There is absolutely no necessity to modify any of the remarks in my former report, but on the contrary I have again to correct errors on Mr. Cowdery's part.

Outfall Works (1).

From Mr. Cowdery's Report.	Remarks thereon.
"Mr. Stayton spends some £56,775 to take the sewage to what he considers a most suitable place."	This assertion has no foundation. The error is fully explained under the headings "Cost of Works" and "Annual Cost" (13 and 14).

Levels (2).

"My high-water is taken from actual high-water in the Bay. Mr. Stayton has evidently taken high-water at Sydney, which is not the same as at Hen-and-Chicken Bay. It will thus be seen that he is in error about the levels of filtering areas. The surface of each bed towards Burwood is 3 in. higher."	In the report in question it will be observed that I referred to high-water *spring* tides, not to ordinary high-water. A series of levels extending over spring and neap tide periods would confirm the accuracy of the departmental figures. Assuming that Mr. Cowdery's contention, that the range of tide at Burwood is *less* than at Sydney, is correct, the argument is obviously against his own scheme. The plan shows three filter beds only on each side of the area, consequently the beds nearest to Parramatta Road are 6 in. higher than the lowest. This variation in level makes no practical difference in the objections to the proposed filters, and Mr. Cowdery appears to entirely ignore the serious question of their ineffectiveness at neap-tides.

Effluent Area inside Bank (3).

"The area of the watershed is not as Mr. Stayton says, *more* than one-third; it is a *fourth* of Burwood. It is not intended to allow the storm-waters to run into the water area; the major part will be conducted outside the filter area."	The area of the watershed contains over 400 acres. The area of Burwood is 1,100 acres, but a part of the 400 acres is in Concord and Five Dock. Further comment is unnecessary. Mr. Cowdery's detail plan and sections show most distinctly that the storm-waters referred to are intended to be discharged into the head of the area by means of a new direct channel. It would be a very costly matter to properly and effectually conduct such waters outside the filtration area. It is impossible to reconcile his more recent statement with his former plans and report.

Situation of Filtration Area (4).

"The filter area is neither in Five Dock or Concord, but on neutral ground." "From Concord I do not anticipate much opposition, for only at the last meeting of the Council one alderman proposed that they should oppose a sewage farm, but could not get a seconder."	The portion of the area at the bank-end is doubtless outside the boundaries of Five Dock and Concord, and within the waters of Port Jackson, but a considerable part of the land proposed to be dealt with is within these municipalities. The facts of the case are as follows:—At the meeting referred to a resolution was moved as stated, but on the Mayor remarking that he was under the impression that action was not required, as the Government would not be likely to sanction the proposal, the question dropped.

Withington Sewage Farm (5).

"This land is close to the Mersey. Before embanking it was subject to floodings. It has been drained about 5 ft. deep."	It must not be overlooked that the tidal-range in the Mersey is 27 ft. 6 in. for spring tides instead of 5 ft. 6 in. as in the Parramatta River, and there is nothing to show whether the site is at the outlet of a large watershed as at Burwood, or what the levels are. Obviously a tide five times greater than that at Hen and Chicken Bay, would enable the land to be more effectively drained to a depth of 5 ft.

Period of Discharge in Western Main Sewer (6).

"Mr. Stayton states that the sewage is discharged in three hours. His western sewer begins with a size of 6 ft. 10 in. × 5 ft. 10 in. and is reduced to 3 ft. 9 in. × 2 ft. 6 in. I will take it as an average of 5 ft. 6 in. × 3 ft. 8 in., the velocity of which when running one-third full at 1 in 1,500, is 126 ft. per minute. This for 27,120 ft. will take 3 hours 51 minutes, and the 6 ft. outfall, 11,700 ft. long, and 1 in 1,700, with a velocity of 177 ft. per minute, makes a total of 4 hours 57 minutes."	I stated in the report that "the maximum velocity is such that only 3 hours would elapse before the sewage of Burwood would be delivered at Webb's grant." This is perfectly correct, and refers of course to the conditions for which the sewers were designed. Mr. Cowdery's figures are wrong and his method of reasoning is absurd. The distance from Burwood to the outfall sewer is 16,840 ft., not 27,120 ft., and the velocity for the prospective dry-weather flow averages about 164 ft. per minute. This equals a period of 1 hour 42 minutes for the main sewer, to which must be added 1 hour 6 minutes for the outfall sewer, making 2 hours 48 minutes in all. If Burwood road be considered as the commencing point instead of the eastern municipal boundary, thirty-three minutes should be added.

Velocity

Velocity of Western Main (7).

From Mr. Cowdery's Report.

"Mr. Stayton continues his sewer at an uniform gradient of 1 in 1,500 without the slightest regard to the size of sewer. The sewer on the last length, 3 ft. 9 in. × 2 ft. 6 in., when running full, gives 128 ft. per minute. Now as the sewer for many years is not likely to be running one-third full, it will only have a velocity of about 100 ft."

Remarks thereon.

This statement is absolutely incorrect. Mr. Cowdery must have observed in the report that the sectional areas and gradients of the sewers, together with steps at intersections, are so regulated as to ensure uniformity of surface gradient. He ought also to have noticed on page 18 that the fall of the 3 ft. 9 in. × 2 ft. 6 in. sewer is 1 in 1,200; the velocity of which, when flowing one-third full, is 117 ft., and when two-thirds full, 149 ft. per minute.

Outfall Sewers (8).

"Mr. Stayton seems fond of running into error. He states the greatest depth of embankment to carry outfall pipe would be 7 ft., whereas it is 5 ft."

The report states that "the sewer would be formed in an embankment, the maximum height being 7 ft." Mr. Cowdery's statement is obviously wrong; moreover, his sections show that the embankment is 7 ft. high, as asserted.

"It is my intention of separating the storm water from the sewage before it is carried to the filtering area. Should another pipe sewer eventually be required, it could be laid."

The plans and report make no mention of this intention. The cost of constructing a proper storm water outfall, together with the two additional sewer outfalls, should be added to the estimate.

Manhole Steps and Junctions (9).

"Steps are only necessary where a gradient wants checking."

Mr. Cowdery seems to be unaware that the term "step" (sometimes called "drop") is a mere technicality for increased fall to compensate for sudden changes of direction or increased sectional area. Mr. Cowdery's sections clearly show that no such allowance has been made in the invert level at the numerous junctions. This is emphatically wrong.

"What does Mr. Stayton mean by complaining about the sewers being at right angles to each other?"

"Neither steps nor curves are necessary, the direction being given on the invert of the manholes where the sewers join."

No *complaint* was made against the principle of right-angled junctions; it was the neglect to provide the extra fall for the change of direction on the invert of the manholes which was referred to.

Calculations for Gradients (10).

"I have certainly not supplied Mr. Stayton with any of my calculations respecting gradients. Although he asserts no allowance is made in the difference in the size of pipes, I fail to see how he has arrived at this conclusion."

From the manner in which the sections have been designed, it is quite obvious that Mr. Cowdery "failed to see" why I arrived at the conclusion that it was improper to have a continuous invert level where the size of pipes diminished. The "inverts" shown on the sections so clearly demonstrated the reason for my statement that calculations were unnecessary.

Cost of Subsidiary Sewers (11).

"I most emphatically deny that under my scheme the cost would be more than under his. It will be the other way about, as all that portion of Burwood north of the main sewer will have to be carried against the natural inclination of the land."

In five or six instances only will the sewers require to be carried as Mr. Cowdery states. It is, therefore, incorrect to include *all* the portion to the north of the main sewer.

Mr. Cowdery has made no reference to the fact that, in addition to the main sewer (which runs right through the borough), two submains are continued to Parramatta Road. These will give greater facilities for street sewers, consequently the latter will be less costly than under the three systems which he proposes.

Depth of Sewers, and Areas omitted (12).

Sewers over 20 ft. deep.

Parramatta Road, Railway Parade.

Conder-street, Hornsey-street, Lang-street, Willie-street.

It is admitted by Mr. Cowdery that additional provision must be made.

The explanation is extremely vague and unsatisfactory, and entirely fails to meet the objections named in the report.

Shallow Sewers.

Fitzroy-street.

The sewer referred to by Mr. Cowdery would be on private land some 300 ft. away, and constructed entirely for another purpose.

Milton-street.

No specific reply given.

Lucas Road.

The level of the road at the part in question has been recently raised, and is now above the level of the adjoining land.

Sewers above existing street surfaces.

Parramatta Road (part of), The Avenue, Crogan-street, Lang-street, Belgrave-street, Parramatta Road, near Esher-street.

Mr. Cowdery has made no comment or explanation whatever on this question.

Areas omitted.

Shaftesbury Road, near Railway; Shaftesbury Road, north end; Parramatta Road (part of), Burwood Road, north end; Lang-street, Russell-street, Norwick-street, Lyon-street, Parnell-street.

Mr. Cowdery has failed to prove that the levels will allow these places to be sewered by gravitation. The fact remains, notwithstanding his observations, that no provision is made in his estimate for their effectual drainage.

Cost

Cost of Works (13).

From Mr. Cowdery's Report.

"We have no detail plans to base an estimate upon; but simply a plan with a line of sewer drawn down it, for which we are told we shall have to pay £85,770. Before receiving Mr. Stayton's report we had not the least idea what proportion would be charged to Burwood."

Remarks thereon.

There is not the slightest foundation for this statement. My report distinctly explained that the principle on which that amount was ascertained was Mr. Cowdery's (viz., on the prospective population instead of the annual ratable value—an entirely wrong basis), and it showed that £56,776 was for the main sewerage; or, £85,770 for the complete system. It is obvious from further remarks in my report that there is not the slightest intention of charging Burwood £85,770, and that Mr. Cowdery's version is a complete distortion of the facts.

Annual Cost (14).

"The way Mr. Stayton has worked this out is, I should think, enough to condemn his report entirely. He endeavours to show that his total cost of £85,770 should be at a less yearly cost to the borough than my £62,450. This he very easily does by working his one way and mine another."

I have already explained that the cost would not be assessed at £85,770, and that it would be apportioned *pro rata* on the annual ratable value. Under these circumstances it did not appear possible to work out the comparative cost in a clearer manner. Taking the ratable value of Burwood at one twenty-sixth of the entire western suburbs, the proportional cost would be £31,935 only for main sewerage, instead of £56,776.

"I see he has allowed £350, cost of pumping, &c.; this is for night and day men, coal, oil, and deterioration of plant. This item I should think will be nearer £1000."

The sewage would be raised from the low level areas under the "Shone" pneumatic system. A central station at Burwood would also supply the necessary power for low-level areas at Ashfield, Five Dock, Concord and Strathfield, at a gross annual charge of £4,516. The £350 was stated to be the proportional cost.

"The yearly cost of my scheme for interest at 4½ per cent. on £48,414 will amount to £2,178 12s. 7d. In the first place I don't require £62,450."

Mr. Cowdery has made no provision for repayment of loan. At the 28 years period this alone would amount to £1,729 for the smaller outlay. At 4 per cent. for 28 years the annual charge on £62,450 is shown to be £3,747.

"I shall be able to pay more than working expenses off the farm. I can thus cut out the £400, which Mr. Stayton allows, leaving a balance in favour of my scheme of £1,814 7s. 5d."

I would call attention to the following words in my report, viz.:—"All authorities agree that the system does not pay commercially, except under the most favourable conditions." I re-affirm that under Mr. Cowdery's scheme it is proposed to do here more than has ever been attempted in England to my knowledge, and that the conditions would be most unfavourable. A provision for working expenses is therefore most essential.

The financial question, however, can be best illustrated as follows, and it is obvious that by participating in a joint-sewerage scheme for the whole of the western suburbs, Burwood would have not only a sanitary but a financial advantage. According to a calculation which has been carefully prepared for the Parliamentary Standing Committee on Public Works, it is shown that a drainage rate of about 8d. in the £ throughout the suburbs would pay interest and repayment, together with working expenses for the main and subsidiary sewers and the low-level systems complete. At similar rates for interest and repayment, under Mr. Cowdery's scheme, Burwood would have to pay at least £3,160 per annum, which would be equivalent to a local drainage rate of 10d. in the £. Mr. Cowdery's balance of £1,814 is therefore a complete myth.

Of course it will be understood that under either scheme the ratepayers would have the present cost of emptying the earth closets (about £1 per house per annum) as a set-off against the new rate.

Sewerage Branch, Sydney,

C 7.

THE LIERNUR SYSTEM OF SEWERAGE.

[*Extract from Sydney Morning Herald*, 16 *July*, 1888.]

SUBURBAN SEWERAGE.

To the Editor of the Herald.

Sir, Sydney, July 11.

In the public interest I beg to call the attention of the suburban municipalities to the enclosed letter from Captain Liernur to Dr. Mackellar, sent through me in answer to one from the latter asking for information as to places on the Continent of Europe where the system is in operation. It is now published with Dr. Mackellar's assent, as it explains how any public body or company should proceed to obtain specifications and estimates of works required for small or large districts. I assert confidently that relief can be obtained this way in perhaps one-fifth of the time, and at one-fifth the cost of the methods proposed in the reports already submitted for treating the suburbs. If I can be of any service in explaining or affording documentary evidence of the Liernur system I shall do so with pleasure; and before closing this letter I desire briefly again to epitomise some of the advantages of this system.

1st. It requires no costly main sewer to be first constructed, but can be applied at once to a single street or a populous section of a district.

2nd. Pollution of the atmosphere by foul gases is impossible.

3rd. Excrementitious and deleterious matters are dealt with, harmlessly and in a cleanly manner; a valuable manure, made conveniently portable, is saved.

4th. The cost is less than the water-carriage system.

5th. Some of the best sanitarians and civil engineers of the day declare that in the pneumatic system alone we have the solution of the sewerage system, the combined water-carriage system being wrong in principle, cumbrous in working, costly and wasteful.

I am, &c.,

BENJAMIN BACKHOUSE.

"Berlin, 78 Thurmstrasse, 10 December, 1887.

"My dear Dr. Mackellar,—I gladly would have answered your favour of December 1 at once if only you had not forgotten to give some address to forward the letter to. Having, however, been daily disappointed in hearing from you from some Continental town, I will not wait any longer, but answer under cover to Mr. Backhouse in the hope he will know your whereabouts, or will meet with you before leaving for Australia.

"My system is introduced in Amsterdam (at present to about 85,000 inhabitants) and in Leiden to portions of the city; in Riga (Russia) and Hanau (Germany), to the county hospitals; in Prague, Brunn, and Olmutz (Austria), to a number of military barracks; and in St. Petersburg, to the Zemenosky district. In all these instances the arrangements are different, a standard form being, as a matter of course, impossible.

"Only the principle is in all cases alike—namely, the removal of excremental matter and putrescible fluids by means of suction through a subterranean network of iron air-tight pipes.

"By these means I remove (which no other system does) with the substances also the gases and micro-organisms contained therein and developed in the pipes, and I discharge these in the hearths of my vacuum-engines at the pumping-station, so that all that is dangerous or noisome is destroyed by heat.

"At the same time, the matter itself is collected at the pump-station in large vacuum-reservoirs in order to be converted into a dry manure powder. This has now become financially possible on account of the manurial ingredients being neither mixed with large masses of worthless street detritus nor diluted with enormous quantities of valueless rain-water, as is the case with the very stupid so-called 'combined' system in use in England, this resulting in all sorts of abominable stinks in the town, a horrible pollution of the rivers and harbours outside of it, and perplexities of the most embarrassing kind for State and town authorities.

"As to the comprehensive description of the plant required for my system, I am happy to be able to point to the pamphlet recently published by Mr. Backhouse, which contains everything required for giving a general idea. With questions of detail of the plant the thing stands differently to non-professional men, who naturally are not versed in the various ways in which physical and mechanical laws can be made subservient to our purposes. The applicability of the system to a special case can only be made evident by a plan exhibiting the application in that particular case. It suffices for this to have prepared a few drawings showing the leading features of the principal apparatus, and a so-called skeleton plan showing their general disposition. This, in conjunction with an approximate estimate of cost, goes further towards proving the fitness of the system for any particular place in question than thousands of descriptions in the most eloquent language, and does not cost much besides. If, therefore, there is at Sydney an actual want for the sanitary improvement effected by my system, I cannot practically give any better advice than to get the authorities to order me to make for them a general plan, with approximate estimate of cost. I assure you it will be very promptly attended to.

"I remain in the meantime, my dear doctor, yours very respectfully,

"CHARLES T. LIERNUR."

[*Extract from Sydney Morning Herald*, 6 *August*, 1888.]

SUBURBAN SEWERAGE.

To the Editor of the Herald.

Sir, Sydney, July, 1888.

Referring to my letter under the heading "Suburban Sewerage," and with a view to the avoidance of future mistakes and wasteful outlay with regard to sanitary and sewerage matters, I now ask you to insert for the information of the public the undermentioned extracts:—

The Secretary of the State Board of Health, Maryland (C. W. Chancellor, M.D., member of the American Public Health Association, Fellow of the Society of Science, Letters, and Art, London, &c., &c.), a man fully qualified to make the inquiries sought, was not long since directed by resolution of that board to proceed to Europe to investigate the most recent plans in practical operation for the disposal and utilisation of household sewage, and I desire to prominently bring under notice the conclusions which he arrived at, believing them to be worthy of serious consideration. They were presented by him in May, 1887, to His Excellency Henry Lloyd, the Governor of the State of Maryland, U.S. "1. That the proper disposal of sewage involves the beneficial appropriation of refuse matters, so as to make them actually productive, avoiding interference with those domestic uses of inland waters for which they are properly adapted. 2. That sewage matters should be made available for agricultural purposes, and the results in this respect are limitable only by considerations of expense as weighed against the value of the result. 3. That the great importance of avoiding all sources of unhealthy and offensive effluvia, and of preserving the foundations of buildings and the sub-strata of towns and cities in a dry and clean condition, creates an absolute necessity for relinquishing cesspools and all receptacles for sewage connected with any building or other place, except such as are thoroughly water-tight and, for the most part, air-tight. 4. That all unhealthy putrescible matter should be removed at short intervals from within the limits of centres of population, either by means of air-tight pipes or in vessels or tanks hermetically closed. 5. That privy pits, unless they are perfectly water-tight, will infect (*a*) the surrounding soil by transudation of their liquid contents; (*b*) the air by exhalations or gaseous emanations through a polluted soil; (*c*) the sources of domestic water supply by percolation through intervening strata of earth. 6. That the use of water from dug wells should be prohibited for drinking and culinary purposes in every instance where privy pits not absolutely water-tight exist in proximity to or within 1,000 feet of such wells. 7. That, without considerable fall or grade, flushing is utterly inefficient for cleansing sewers, except where the matter is carried by pneumatic pressure or aspiration, even in the case of small sewers with large quantities of water. 8. That the impermeability of brick sewers can never be absolute; and, therefore, should they convey excrementitious matters, the surrounding soil and the water of the neighbouring wells will be at all times liable to dangerous contamination. 9. That excrementitious matters ought to be rigidly excluded from all storm-water sewers. 10. That the epuration of sewer water by soil alone is not efficient in a sanitary point of view, as has been demonstrated by both experience and chemical analysis.

11. That no system of sewage can be approved which permits the pollution of either air, water, or soil; and that, in order to fulfil the requirements of proper sanitation, all excrementitious matters and kitchen slops should be conveyed from towns by pipes absolutely air-tight, or in hermetically-closed vessels to a point sufficiently distant, where they may be manufactured into a dry manure powder without offence."

I have advocated from time to time in your columns, during the past five years, the adoption of the pneumatic system of Liernur, because it appears to fulfil more completely than any other the conditions required by the above extracts; but any system that will do this will have my hearty support. Look to it, ye suburban authorities and low-lying untouched city districts, ere it is too late. Let the proposed oppressive water rates (mild by comparison) warn you against the adoption of a cumbrous, extravagant, costly, old world system of sewage removal.

I am, &c.,

BENJAMIN BACKHOUSE.

Mr. Sutherland would like a report from Mr. Bennett on this.—J.B., 7/8/81. Mr. Stayton.—W.C.B., 8/8/88.

I have given this to Mr. Stayton to deal with. He has not yet had time. I think the best thing would be for the Minister to have him down to deal with Mr. Backhouse. Mr. Stayton is the last authority from England, and dealt extensively with such questions there.—W.C.B., 8/8/88. The Under Secretary, B.C.

Return to Mr. Bennett.—J.B., 9/8/88. Mr. Stayton.—W.C.B., 10/8/88. Report herewith.—G.H.S., 21/8/88. See 88-6,075.

Report by Mr. G. H. Stayton, M.Inst.C.E., upon the Liernur Pneumatic System.

Suburban Sewerage.

I have perused the letters which Mr. Backhouse recently wrote to the *Sydney Morning Herald*, in which he strongly advocated the adoption of the "Liernur Pneumatic" system of sewerage for the western suburbs of Sydney. I have also read his latest pamphlet, containing an account of his inspection of the system at Amsterdam in August, 1887. These papers do not, however, contain much serviceable information concerning the details and working of the system in the several continental towns in which it has been adopted, other than that which has previously appeared either in pamphlets or in the public press; neither are the necessary figures supplied as to the actual cost of constructing the complete system where no sewers already existed; nor are any official statements quoted showing the financial and other results of recent operations. It appears, however, that Captain Liernur's system of evaporating the liquid excreta into *poudrette* has not been adopted in Amsterdam, owing to the opposition of the City Council.

The Liernur pneumatic system is certainly an ingenious invention for the removal of excreta and urine from dwelling-houses; but, however well-fitted it may be for flat and thickly populated cities in Holland or for other continental towns, it cannot be recommended as being applicable to the conditions of the western suburbs, where the existing population only averages about twelve persons per acre, and where the estimated prospective population does not exceed an average of 35·41 persons per acre. The density of the population in that part of Amsterdam which is drained by the Liernur system (about one-quarter of the entire city) averages no less than 121·5 persons per acre.

The latest information of practical value which has appeared in print, so far as I am aware, is a paper by Dr. R. Blasius, of Brunswick (*vide* the German quarterly papers for Public Health) who in 1885 had recently inspected the operations of the Liernur system at Amsterdam. After describing the nature of the works and explaining the *modus operandi*, he gave the cost of the treatment as set forth in an official report of the City Engineer, by which it appears that the working expenses of removing and evaporating the excreta (including interest on cost of construction, renewals and repairs, &c.), amount to 4s. 10d. per head per annum. It should, however, be particularly noted that the quantity of sewage treated and evaporated is only 385 gallons per head per annum, and this is supposed to represent the excreta and urine of each person, together with the water used for ablution in bed and dressing rooms, and a small quantity for keeping the closet pans clean. With regard to this small allowance per head, I might here remark that Professor Tidy, F.R.S., has recently shown that the annual quantity of urine and fæces amounts to over 300 gallons per head. It is obvious, therefore, that either the quantity treated has been understated or else a large volume of impure water must have passed into the sewers, in which case the expense of evaporating it would be avoided.

Dismissing for the moment all question as to the alleged superiority of the Liernur system over the scheme proposed for the western suburbs, the greatest objection to the former is in the unnecessarily large outlay it would entail. The system requires—

(1.) Cast iron airtight sewers and house-drains for the removal by pneumatic force of all excreta and urine from closets, together with bedroom slops and sedimentary products of kitchen sinks.

(2.) Sewers proper for removal of rainfall from street gullies, together with a second system of house-drains for carrying off by gravitation the rainfall from roofs and back yards, the sub-soil waters and all liquid refuse from kitchen, scullery, and wash-house sinks, and from baths, dairies, stables, &c. The excreta is evaporated and converted into *poudrette*, and sold as an agricultural manure, but the liquid sewage and waters carried off by the sewers proper are passed through filters of gas-coke before being allowed to pass into streams. Where the supply of water is limited, a specially shaped "pneumatic" or "air" closet is recommended, in which no water is used for cleansing.

The social habits of the majority of the inhabitants of the suburbs are similar to those in the old country, but they greatly differ from those in many of the continental towns in respect to the quantity of water made foul in their dwelling-houses. And as the relative population covers so much larger an area here, it is apparent that the cost per head for collecting and evaporating the excreta and liquid refuse would be greatly in excess of the figures quoted for Amsterdam. It has already been stated that the cost of the Liernur system in that city is 4s. 10d. per head per annum, but neither Dr. Blasius nor Mr. Backhouse has given the amount of the annual receipts from the sale of liquid manure. Mr. Backhouse explains that time did not allow him to obtain such particulars from the city authorities; but Dr. Blasius states that from the experience gained at Dordrecht, where the complete system is in operation, the value of the *poudrette* is £6 8s. per ton. He therefore assumes that as each person yields 50 kilograms per annum, its value is 6s. 5d., showing an estimated annual profit of 1s. 7d. per head.

In

In order, however, to ascertain the probable cost of the Liernur system, if adopted in the suburbs of Sydney, I have compared the Amsterdam statistics with the local conditions, and find—

(1.) That the working expenses and interest on cost of construction (inclusive of evaporation) instead of being 11·23d. per head would be relatively increased to 39·87d., in consequence of the smaller prospective population per acre; and as these items are at the Amsterdam rates it is tolerably certain that the prices for material and labour in Sydney would amount to at least double.

(2.) The value of sulphuric acid instead of being 4s. 1d. per cwt. is quoted at 16s. per cwt. in Sydney, an increase of 1s. 6d. on the allowance per head.

(3.) That the labour item ought to be at least doubled, labourers wages in Holland being from 3s. 6d. to 4s. only per day of ten hours; and that as the cost of construction, together with maintenance and renewals would amount to at least 100 per cent. more here than in Amsterdam, the item of interest should be similarly increased. Labour and materials should, therefore, be 18·72d. more. The total working expenses and interest would thus amount to 13s. 6d. per head, which, after crediting the assumed value of the *poudrette*, leaves the annual cost per head at 7s. 1d. nett.

On the other hand I estimate the cost per head on the prospective population of the southern and western areas of the Government scheme, including interest and repayment of loans for constructing the main and subsidiary sewers and low-level systems, and the working expenses of the sewage farm at 3s. 10d. per annum or about one-half the estimated cost of the Liernur system. After a few years of efficient management at the farm this amount should be reduced by the profits derived from the sale of crops.

It would take too long to refute the errors advanced by Dr. Chancellor and various advocates of the Liernur system. I have shown that the cost is greater instead of less than the water-carriage system, and that costly main sewers would be necessary for the western suburbs. And as to pollution by foul gases being impossible, I do not hesitate to assert that unless the sewers proper and house-drains are disconnected and ventilated as in an efficient water-carriage system, the stinks in them would be unbearable. I cannot admit that a system by which excreta, urine, and fouled waters are retained in closet pipes and traps on the premises for nearly twenty-four hours, or which fails to purify liquid refuse through land can be regarded as pre-eminently sanitary. These are doubtless, some of the reasons why the Liernur system has not been adopted in any city or town in England, where sanitary engineering has achieved the leading position throughout the world, and where the most eminent sanitarians have deemed it unsuitable and too costly.

The modern systems of water-carriage sewerage and house drainage in England are perfect in principle and in action, and I can imagine no arrangement more convenient, cleanly, or healthy than some of the recently constructed sewers and house-drains which I have seen. And with respect to the purification of sewage, it must be remembered that the Farm at Webb's Grant will not only purify the sewage in the best manner, but will utilize it under most favourable circumstances.

21 August, 1888. GEO. H. STAYTON, M. Inst. C.E.

The Engineer-in-Chief for Sewerage.

It is hardly necessary that I should add to all that has been written on this. Papers herewith contain information extending back to 1877. There is really nothing new of any importance. The question was exhausted by the old Sewage and Health Board. I personally conferred with Sir Robert Rawlinson when in England in 1881, and he advised me not to waste time going to Amsterdam to see what had been done there.—W.C.B., 24/8/88. The Under Secretary.

Submitted.—J.B., 24/8/88. Send copy to Mr. Backhouse with my compliments.—JOHN SUTHERLAND, 27/8/88. Write.—J.B., 27/8/88. B. Backhouse, Esq., 31/8/88. Roads.—D.C.M'L. (for U.S.), B.C., 1/9/88. File.—W.C.B., 3/9/88.

C 8.

SCHEMES FOR SUBURBAN SEWERAGE.

[*Extract from Sydney Morning Herald, 27 February, 1888.*]

GOVERNMENT SCHEMES FOR SUBURBAN SEWERAGE.

(Communicated.)

THE problems which had to be dealt with by Mr. Stayton in his reports on suburban sewerage are so difficult and so urgent that critics may well hesitate about raising objections. Still, it is for the express purpose of eliciting the fullest possible light that these reports are now under consideration by the suburban councils concerned; and, for obvious reasons, the municipal authorities will be the better of independent suggestions. For years past the vexed question has pressed upon them like a night-mare, and the temptation will be strong to welcome with scant scrutiny any scheme that offers relief. In the first place, it ought to be noted that whereas the question of city sewerage was maturely considered by a board of no fewer than fifteen experts before the country was committed to an estimated expenditure of a quarter of a million, this much larger and more complicated matter, involving an estimated expenditure of nearly a million, has been left in the hands of a single engineer. It may be said that Mr. Stayton had the advantage of the board's inquiries and conclusions, and that, having these, time and money were economised by a single authority. But, as a matter of fact, it will be found that in one of his schemes Mr. Stayton has greatly developed the proposal of a sewage farm, which the board only admitted into their recommendations as an experiment to be tried on a moderate scale; and that in the other he has relied upon chemical treatment, in the face of the board's strong opinion as to its impracticability on any thing like a large scale. * * * * * * * * * * * * * * * * *

With regard to the much larger questions covered by Mr. Stayton's recent report on the sewerage of the western suburbs, similar difficulties present themselves in a still more aggravated form. An area of 31 square miles has to be provided for with a respective population of nearly half a million within eighteen or twenty years, according to Mr. Stayton's estimate. For nearly half the area the altitudes admit of connection with the Bondi sewer, but the remaining 17 square miles present difficulties which seem to have driven Mr. Stayton to adopt a system, which in the nature of things, can only serve as a temporary recourse. The "Sewage Farm" at Webb's Grant, which seems to have been reluctantly turned to by the board of 1875, as an outlet for the sewage of the southern parts of the city, is now to be deliberately fixed upon as a receptacle for the sewage of all the southern and the low-lying western suburbs. An immense volume of sewage is to be concentrated in a swamp, from which, after such processes of filtration as are possible, the liquid portions will flow into Cook's River. This is what the board of 1875 said of such a scheme:—"Such systems may be well-adapted to large establishments, whether private or public, but are obviously inapplicable to the sewage of a populous city." The probability is that if this extensive experiment is tried at Botany the term "farm" will serve as a mere euphemism to cover, as long as the rapidly extending population will allow, a huge sink of disease-breeding matter. At best this scheme can only serve as a temporary relief for the perplexed authorities of the southern and western suburbs. Shea's Creek was endured a long time, too long for the health of hundreds of families, but it had to be dealt with at last. So will it be with any attempt at a sewage farm after the fashion of Webb's Grant, in the neighbourhood of the city. Till science finds a better way, the example of London and other British coastal cities will have to be followed as closely as possible, in sending all sewage to the sea. As

As to questions of cost, effective works must be paid for at a proportionate rate. But less the municipal authorities who are now considering Mr. Stayton's figures should forget the lessons of experience in their natural anxiety to find a solution of sewerage problems, it may be as well to remind them that for Government works of this kind the actual cost usually exceeds the estimate by 50 to 100 per cent., as witness the Bondi Sewer and the Nepean Waterworks.

Mr. Stayton in the first instance. Urgent.—W.C.B., 3/3/1888. Memorandum submitted to Engineer-in-Chief.—G.H.S., 12/3/88.

MEMORANDUM upon the Government Scheme for Suburban Sewerage.

THE principal objections to the proposed scheme for the sewerage of the western suburbs of Sydney, as contained in a communicated article to the *Sydney Morning Herald*, on the 27th ultimo, appear to be based upon the report of the Sewage and Health Board of 1875.

The evidence which the Board procured, the opinions which they expressed, and the recommendations which they submitted, were thoroughly and entirely in accord with the practice and experience of the most eminent authorities at the time, but since that period the science of sewage treatment has undergone considerable modification. Subsequent experience has proved, that several points which were then considered doubtful and processes which the Board deemed somewhat experimental, have satisfactorily emerged from that stage.

Since the publication of the report of the Local Government Board in 1876, several lengthy and important investigations have taken place in England, and the reports of the Royal Commission (Lord Bramwell's) on the London sewage discharge in 1883, the Thames Valley Main Sewerage inquiry in 1884, and the papers and discussion at the Institution of Civil Engineers in 1887, have been issued, and contain most valuable information.

The intention of the following remarks is to demonstrate the groundlessness of the objections to the proposed processes of sewage treatment at Botany. I venture to remark that it is obvious that the writer has no practical knowledge of modern sewage treatment; in fact, his own observations support this assertion. My recent reports show that due consideration was given to the question generally, and that the treatment recommended is in full accord with modern practice.

Nearly the whole of the more recently executed sewerage systems in England (not on the sea coast) have comprised either irrigation or precipitation combined with earth filtration. It is therefore manifest that both "sewage farming" and "chemical treatment" have made great headway, the local conditions entirely determining which is the better system to adopt. These methods of disposal are recommended by such eminent engineering authorities as Sir Robert Rawlinson, K.C.B., Sir Joseph Bazalgette, Mr. Thomas Hawksley, F.R.S, Professor Robinson, M. Inst. C.E., and Mr. Baldwin Latham, and by chemists of the highest eminence, including Sir Frederick Abel, F.R.S., Professor Tidy, F.R.S., Dr. Odling, Dr. Dupré, and Mr. Dibdin.

The Board's hesitation to recommend experimental sewage farming on a large scale had special reference to the sewerage of Sydney, and they very properly decided to adopt the Bondi outlet in preference. At the same time they reported that the land at Botany was well adapted for sewage farming, and that this climate would produce results far more favourable than in the north of Europe.

The science of sewage farming as then practised in England had been subjected to much hostile criticism, partly because it had been greatly abused by improper management, and next by the false hopes which certain enthusiasts had raised as to the agricultural value of liquid sewage.

The Board of 1875 had evidence before them as to the results of sewage farming at Croydon, Bedford, Dantzic, Carlisle, Romford, Doncaster, Rugby, Banbury, Cheltenham, Warwick, and Leamington. These farms are now administered with much better financial success, and create no nuisance. There are also sewage farms at Worthing, Tunbridge Wells, Northampton, Norwich, and Birmingham, and since the Board's report was issued the towns of Nottingham, Wolverhampton, Reading, and Oxford have laid out large farms, and as recently as 1886 an irrigation farm of 1,375 acres was established at Leicester. These facts ought to convince the most sceptical that sewage farming is growing in public favour—the result of being better understood.

That the Board were right in their view as to the Australian climate being favourable for sewage farming is very apparent, inasmuch as the recently established farm at Adelaide has proved successful—both practically and financially. The probabilities of a sewage farm proving remunerative depend mainly upon capable and experienced management, and upon local conditions, such as suitable soil and the absence of pumping.

I cannot recall any place in England where so favourable a site exists for a sewage farm as at Webb's Grant. My opinion is that if the municipal authorities of any city elsewhere had so available a site for sewage purification, they would literally have jumped at it. The quality of the sewage delivered at the farm would be of the most favourable class for treatment, because the greater part of the rainfall is to be excluded, and no noxious-trades refuse—such as dyes or chemicals (which caused so much trouble in English manufacturing towns), will be discharged into the sewers. I feel confident that if the area is judiciously laid out, drained, and skilfully managed, it will prove to be one of the best natural sewage-filters in existence.

The article infers that Webb's Grant is a swamp. This is incorrect, the greater part being a sand bank averaging at least 8 or 9 feet above the level of the sea. It has also other advantages for purification, as explained on page 8 of the report.

The system of filtration proposed to be carried out is very different to the filtration process which the Board of 1875 reported as inapplicable to a populous city. The Board's final report (paragraph 34) had special reference to such processes as were then in use at the Stoke-upon-Trent workhouse. The extent of the drainage area favourable for Bondi is only 5 and not 15 square miles as inferred, the area draining to Webb's Grant being 17 miles.

The late Mr. W. Clarke, M. Inst. C.E, agreed with the principle of utilising the sewage of the southern part of the city and suburbs by irrigation, and thoroughly believed in its possibility. In his report he stated "I am however unable to point to any instance where this is accomplished without some loss to the community, and where an alternative of discharging the sewage at once into deep water, without nuisance, presents itself, I should have no hesitation in adopting it. Botany Bay is too shallow a basin to receive the sewage without causing great nuisance, and the necessity for some process of dealing with the sewage, either by irrigation or otherwise, would be imperative. The

The process of precipitation which the Sewage and Health Board considered and reported upon as undesirable in 1876, is entirely different to the combined system of "straining, precipitation, aeration, and earth filtration," now in use in England. The modern process is carried on without creating nuisance, the effluent is purified and clear, and the sludge is reduced to one-fifth of its bulk by the use of "filter-presses," and is thus rendered fit for agricultural purposes.

Prior to 1875 various processes had been tried; in fact, over 400 patents for sewage purification had been taken out during the previous ten years, very few of which had any practical value. For several years past, however, the systems adopted have become more consolidated, patent processes being generally avoided.

One of the latest proposals for the defecation of sewage is the use of electricity. The outline of such a process has recently appeared in the London newspapers, and according to the *Standard*, satisfactory experiments have been made, and enough has been demonstrated to gain for the new process a respectful consideration, if not something more; but the financial part remains to be proved. In addition to steam engines and dynamos, the system necessitates outfall works, tanks, and machinery, as in an ordinary precipitation process, the practical difference being the substitution of electricity for chemicals.

Lastly, as to the estimates; the accuracy of which has been doubted. In this matter I desire to point out that they have been most carefully prepared, that the prices are based upon the Contract Schedules and experiences gained by the department in the construction of the Bondi and other sewerage works, and that they will bear the most critical investigation. It is certainly incorrect to assert that the cost of the Bondi sewerage system has exceeded the estimate by 50 to 100 per cent., but doubtless this question will be dealt with by the Commissioner and Engineer-in-Chief.

GEO. H. STAYTON, M. Inst. C.E.

Department of Public Works, Sewerage Branch, 12 March, 1888.

[*To Evidence of J. Ashburton Thompson, Esq., M.D.*]

D 1.

REMARKS ON THE SEPARATE SYSTEM OF DRAINAGE, MADE BY DR. J. ASHBURTON THOMPSON AT THE ANNUAL MEETING OF THE ENGINEERING ASSOCIATION OF NEW SOUTH WALES, DECEMBER 19TH, 1888.

Sir, Health Department, 21 December, 1888.

I enclose with this note a copy of a speech I made by invitation at the annual meeting of the Engineering Association last night, upon the comparative merits of the separate and combined systems of sewerage, for the consideration of the Chairman of the Parliamentary Standing Committee. I venture to do this both on account of the importance of the subject in connection with the Western scheme, and because I have observed that it is one but ill-understood by some engineers who have remarked upon Mr. Stayton's proposals.

Faithfully yours,

J. ASHBURTON THOMPSON.

The Secretary, Parliamentary Standing Committee on Public Works.

Mr. President,

I thank you for your invitation to be present this evening and to join in the discussion this Association has initiated on a most important subject. I have read Mr. Henson's communication with great care and close attention; and I find that he deals with a good many technical points very fully. Upon these I have not the least intention of saying much before this Association. But his criticisms are so sweeping and so energetic—in some cases even so novel—that I must mention one or two of these points, which in fact pass my comprehension. I am at a loss to conceive, for instance, what he means when he refers to a standard velocity of 180. It is impossible to refer to a standard velocity except in relation to a sewer of specified dimensions. But then, if he is speaking of that standard in relation to the western outfall sewers, I am obliged to remember that no engineer with whose works I am acquainted ever has recommended a velocity of 180 for sewers at all resembling in their dimensions those of Mr. Stayton's plan. Nor do I understand, for another instance, the objections he raises to the employment of syphons. I fail entirely

entirely to feel their force on the one hand, while on the other I know very well that syphons are used successfully in several parts of the world, and indeed that in some situations they are practically indispensable. He does not pretend to show how they may be dispensed with here. He relies entirely on theoretical objections to them; and this being the case he makes a most serious omission in neglecting to refer to the working of a syphon which he might easily watch, and in failing to tell us what amount of practical support to those objections is furnished by this contrivance as it stands in use to-day on the southern outfall sewer. There are other points to which I take exception; but I conclude that as far as I am concerned—as far that is as it is suitable for me to join in a discussion between civil engineers—the paper before you resolves itself into an advocacy of the separate system. Now, Mr. Henson concludes with a very judicious remark; he observes that it will not be safe in planning sewerage for Sydney to trust too much to English practice. I entirely approve of that, as must every man with the least pretension to thoughtfulness. English principles—the principles of engineering science as they are taught by English professors—those are applicable all over the world, for they are deduced from a right appreciation of natural laws; but English practice merely exemplifies the manner in which those professors are guided by universal principles under the special circumstances in which they work. Those circumstances are in very many respects different to ours, and the so-called separate system finds in them much to recommend it. But Mr. Stayton has just considered our circumstances; and after deliberate study he has rejected the separate system, and has adopted the partially separate plan. This—unless, indeed, Mr. Henson is prepared to show that Mr. Stayton has not given the matter careful and intelligent consideration—this course, I say, one would expect to meet with the approval of a gentleman who crowns his essay with the sentence just quoted. But he falls into the very error which he points out for avoidance; his whole argument advocates the separate system—a theoretical plan which, in practice, is nowhere to be seen.

I wish to be quite clear; and I must therefore ask you to excuse me if I define the sense in which I use certain expressions. By the word "sewer" then, I understand a conduit to carry off liquid filth; by "drain" I mean a conduit designed to collect liquid of which filth is an accident; by "separate" system I understand the exclusion from sewers of all clean-water, whether that be rainfall or water from land; and by "partially separate" system I understand that plan by which the greater part of the rainfall, surface-water, &c., is excluded from the sewers, but by which a small proportion is admitted to them. Those are the meanings usually attached to the several expressions; and it is necessary to bear them in mind, for a very great deal of tedious argument would have been saved the world had they not too often been forgotten. Now the separate system finds its chief advocates in England; they first appeared there, and not less than forty years ago in the persons of the late Mr. J. O. Ward and of Mr. Edwin Chadwick. You are acquainted with Mr. Ward's aphorism "the rainfall to the river and the sewage to the soil." It is an excellent aphorism, sound in principle; we are, I do not doubt, to go as near to realizing it as we may; but we can only do what is possible—we work under limitations. What gave rise to this idea? Why, the circumstances of the country suggested it; the laws, the physical configuration, the moist and cold climate of England. Until about 1813, you will remember, it was penal to turn sewage into drains; and then as population increased it was found absolutely necessary to provide for sewage, and in 1847 it was made penal, on the contrary, not to turn sewage into those drains. But the majority of the important towns of England stand on rivers; and the consequence of turning sewage into surface-drains which very properly fell into the rivers was that presently pure drinking water was hardly to be got. Hence the Rivers Pollution Commission and its several reports; and thence the enactment under which it became penal to turn crude sewage into rivers—the enactment under which, in fact, it once more became penal to turn sewage into drains. Then, local authorities being compelled to bring their sewage to a certain degree of purity before they could get rid of it by means of natural channels—of the rivers—all that long and expensive series of experiments on the practical scale began, which yet are far from being concluded, to ascertain the best, speediest, and cheapest way of effecting the necessary purification. These soon showed that there were but two plans worth serious attention—precipitation and filtration; and while it was at last found that the best effluent could be got only by a combination of these two, it was learned that the filtration could be sufficiently well done by a plan which allowed of the use of the sewage as a fertilizer. Then a new problem presented itself, namely, how most money could be made out of sewage by farming, and how the heavy expenses incurred by local authorities could be best lightened. But, you see, as soon as sewage farming became a feature in the sewerage schemes of those authorities, as soon as they began to look to the farmer to lighten their expenses, the latter became a factor in the problem, and his convenience had to be consulted. He found that he could not utilize the immense volumes of combined sewage and drainage which in that cold and moist climate were brought to the farm by the combined system; and indeed, besides that, it was found that these immense volumes of very dilute sewage could not by cheap processes of irrigation be sufficiently purified. Besides, to reduce even expenses out of pocket it became necessary to reduce the volume. Hence, in towns to be newly sewered, systematic attempts began to be made to exclude drainage; so that the farms—or I may even add the filter-beds—instead of receiving variable quantities of fluid often in quite unmanageable volumes, might receive a nearly steady flow of sewage of tolerably constant constitution, and so that the farmer might get a chance to raise his crops with reasonable certainty. These, in fact, are the considerations which led to the prosecution of the search for an effectual means of separating drainage from sewage; and they are considerations to a large extent not furnished by our conditions. Now I may be thought thus far to have referred to rainfall alone, in speaking of drainage; and at all events I have not yet specifically mentioned subsoil waters. But it is not the rainfall alone which on the combined system dilutes sewage. England has a much smaller rainfall than we have; but the manner of its fall is vastly different. It falls so that the tendency is to keep the subsoil saturated; and since not all that falls finds its way into the ground, for even in England the loss by evaporation is very considerable, that saturation is there ensured by defect of heat. Are our circumstances then so similar to these that we should advocate the separate system here, merely because it has much to recommend it there? I think not. We have (I speak of the neighbourhood of Sydney which is the area to be sewered) for the most part a comparatively shallow soil which overlies the sandstone and the shale; we have a country of good surface grades, consisting in part of a series of anti-clinal ridges with ample falls by valleys to the sea; we are not environed by rivers whose waters must be kept pure; and we have a sun which sometimes we think almost too brilliant, too constantly seen in his splendour. Under these circumstances we are not at all likely to be embarrassed by the excessive volume of our sewage as compared with our cultivable area. We may safely reckon on evaporation for much. Our climate—I do not say our soil—is more like that of Italy than of England; and perhaps

the

the difference may be pointed by a reference to sewage farming as it has for very many years been successfully carried on at Milan. There no attempt is made to separate drainage from sewage. The sewers converge to an open canal called the Vettabbia, and thence the sewage is drawn off to the surface of about 4,000 acres of land arranged for broad irrigation, which for very long it has fertilized in a remarkable manner. Notwithstanding the extremely dilute character of the liquid it is actually possible from time to time to pare down the surface of several meadows, not to preserve the levels, but in order to sell the parings which are carted away as manure to more distant estates. We have, I say, a climate—and we are to make use of a soil—which renders the dilution of our sewage of small consequence; we are better placed in these respects than the Milanese, successful as they have been. And how much more fortunately situated than the people of Berlin; yet the new sewers of that city are calculated to carry off a rainfall of $\frac{5}{16}$ of an inch per hour, and that although every drop of it has to be raised to a vertical height of no less than 33 feet before it can run on to the several farms. I believe I have now said enough to show that the choice between the separate and the combined systems is one which must be guided by the circumstances of the place to be sewered; that like a good many other things which here we have to decide upon for ourselves it is not by its essential qualities absolutely good or absolutely bad; and therefore is not to be advocated in any place merely because it has been found suitable to some other different place. Thus, in fact, it happens that at Portsmouth, where the area to be sewered is in small part raised, and in a larger part is below the level of ordinary spring-tides—actually within this one area in the very birth-place of the separate system—both the separate and the combined systems are exemplified. For it was thought necessary to relieve the lower levels of the surface water running off the higher level, and therefore to the sewers of the latter all surface waters were admitted; but as the sewage from the lower level had to be pumped it was thought desirable there to exclude *as far as possible* all rain-water from the sewers. That appears to me to be a truly scientific application of principles, and to form a striking contrast to a course which involves the irreflective adoption of mere practice.

It is to principles that I have thus far addressed myself; but, even at the risk of being tedious, I cannot sit down without saying something upon the degree of separation which hitherto has been found practicable. I concluded a sentence just now by observing that the separate system should not be adopted here just because it has been successfully employed elsewhere. But what do I say? Has it ever been, not successfully employed, but has it ever been found possible anywhere? I do not know of any place—at least not any place in area and population at all resembling Sydney—where it exists.* But such a place might be known, though not to me; and I will therefore repeat what is said by its very advocates. You are acquainted I have no doubt with the name of Mr. Lemon; and perhaps you know that the city of Winchester, sewered by him, is often referred to as an example of the working of the separate system. Well, here is what Mr. Lemon said about Winchester at the annual meeting of the Association of Municipal and Sanitary Engineers, held in London in 1879:—He said, "In the city of Winchester there is not a single gully connected with the sewers * * * some people called that the separate system, but he said it was nothing of the kind; it was impossible to prevent houses being connected with the sewers in all directions, or to prevent houses being drained into the sewers in all directions; if they carried out the separate system in its integrity they must have a double set of conduits, and that in his opinion was an absurdity and could not be carried out." And again he said—he is often regarded as a main advocate of this system—"He had little difficulty in carrying out the separate system, and it is astonishing how that system is growing, but he had not yet been able to keep the water of back-yards out of the sewers, and did not consider that practicable." So also Mr. Angell, at one time borough engineer for Portsmouth, said,—"The separate system can, of course, only be carried out in its general features and not in every detail; it would be a mistake to have a duplicate set of drains to each house; back yards would usually drain into sewers, but for the most part roofs can be drained into road-channels or surface drains; about 90 per cent. of surface waters can be diverted without causing difficulties of detail." Professor Robinson is an eminent authority on all matters of sewerage, and this is what he says of the separate system:—"Its advantages appear chiefly where sewage is disposed of by irrigation, and where it is absolutely necessary to lift sewage by pumping; for irrigation it appears desirable to have sewage as concentrated as possible, but when pumping is unnecessary dilution within certain limits is not detrimental—a duplicate system involves greater cost—it would also exclude from the sewers street and road-washings which are unfit to be admitted to streams, and it would also prevent natural flushing." Some of these objections have but little force here; as I said before we are not in danger of fouling streams, from which drinking water might be taken; and it would in my opinion be a mistake to consider our extended road-surfaces from just the same standpoint as the less extensive road-surfaces in England. With proper catch-pits intervening there can be no objection to the passage to the harbour of such surface-water. I don't wish to continue these quotations with which most of you are already doubtless familiar; but I cannot conclude them without repeating the following lines from Mr. Denton's invaluable work:—"If," he says, "we recognize, as we certainly ought, a difference between towns situated in districts of rapid inclinations, impervious surfaces, and heavy rainfalls, and those where the reverse conditions prevail, it will be considered advisable to admit into the sewers of the former only such rain as falls on the back parts of dwellings, on impervious surfaces so situated that there would be a difficulty in connecting them with any system of surface drainage, and on those streets and courts which from their position collect refuse almost as foul as sewage itself; in the latter having flat inclinations, porous surfaces, and smaller rainfalls, it is better to admit such additional quantity as may be advantageously turned to account in flushing." To which of these sets of conditions do you think ours are most like?

I conclude my quotations with this one, apologizing to you indeed for detaining you to hear their twice-told tale. Now, what do they amount to? Why they amount to this, that the separate system is a practical impossibility however desirable it may be thought on theoretical grounds. Whenever an author speaks of the "separate system" you may find that he is speaking loosely, and that in fact he means the partially separate system. The difficulty is a purely practical difficulty; and although it is inadvisable for a hundred different reasons to admit all waters to sewers, it is not possible either to exclude all. As for subsoil waters, you know that unless you are prepared to lay iron pipe-sewers with gas-tight joints you cannot entirely keep them out except by laying in the same excavation a special drain for them. This it is often very

* The separate system was adopted by Colonel Waring at Memphis. Granting that it exists there in the strict sense, this city contains but 35,000 inhabitants altogether, and a very large proportion of them are concentrated on a single square mile of country.

very necessary to do in the case of pipe-sewers but not necessary in the case of main-sewers; while as for rain-water, although the greater part can easily be excluded, the exigencies of house-building simply render it impossible to keep the whole of it out. In the latter case there is also the difficulty which arises under the general heading of working errors. The separate system demands a double set of conduits and a double set of yard-gullies; besides the very great expense of the former there thus arises an intolerable confusion beneath the soil of the two sets of pipes; and in the very few places where these have been laid it has been found by practical experience that even authorized workmen inevitably confuse the two and from time to time connect the sewers of houses with the drains and *vice-versa*. And then in respect of the two yard-gullies you import into the elaborate scheme the domestic servant, and place it entirely at his mercy; for wherever yards slope towards houses there the two must be side by side, and wherever yards are already formed they are so graded that any gully to take their water must be placed next to the present gullies, unless you are prepared to cause all the yards to be relevelled. Now I have drawn illustrations on other points from several different parts of the world; but on this I believe I need not go farther than our own Surry Hills. I ventured to find fault with Mr. Henson just now for not availing himself of the opportunity of watching the action of a syphon as it may be watched in Sydney; and now I must ask Mr. Trevor Jones, who I see supports Mr. Henson's views why he did not detail to the Association his own experience of the working of the separate system as instituted by himself at Surry Hills? For, sir, although you may not know it, Mr. Jones, with the courage of his opinions, has initiated the separate system in this very city; and I want him to tell you whether it is not the case that in the district mentioned there are to be found in back-yards two gullies, and whether it is not the case that those two gullies are confused in the manner I have just suggested, so that although the houses I refer to are sewered, sewage from them not infrequently still finds its way by the drain to the road gutter?

I am afraid that I have addressed you on this subject at unconscionable length; its importance must be my excuse for one part, and for the rest its inherent difficulty. The drift of my argument has been first to show that the separate system has been advocated in England to meet that country's special requirements; secondly, that our circumstances differ from those to an extent and in a manner which renders it unnecessary to seriously consider the separate system here; thirdly, that the separate system is deemed by the best practical authorities to be impossible of execution, and, as a matter of fact is nowhere carried out, or at least in no city at all resembling ours in the matters of area and population; and lastly, that the partially separate system is both practicable, economical, and wise. But then the partially separate system is exactly what Mr. Stayton adopts. "About 90 per cent. of surface-water may be diverted without causing difficulties of detail," says Mr. Angell. Well, Mr. Stayton proposes to divert exactly that amount over a part of his area, and over the rest 85 per cent. In short he adopts the approved practice.

[*To Evidence of T. A. Coghlan, Esq.*]

E.

RATES OF MORTALITY IN SYDNEY AND ITS SUBURBS, AND IN THE COLONY OF NEW SOUTH WALES.

Sir, Government Statistician's Office, Sydney, 2 January, 1889.

In accordance with the desire expressed by you at the conclusion of my evidence before the Parliamentary Standing Committee on Public Works, I beg to transmit herewith returns showing,—

(1.) The density of population in the city and suburbs of Sydney.
(2.) Rates of mortality in the city and suburbs for the past 18 years.
(3.) Tables showing the rate of mortality, per thousand of population, of the suburbs of Sydney, for the year 1887.
(4.) Tables showing mean death-rate of the colony, city and suburbs of Sydney, as well as country districts, for the period 1872–79 and 1880–87.

I have, &c.,
T. A. COGHLAN,
Statistician.

The Honorable John Lackey, M.L.C.,
Chairman, Parliamentary Standing Committee on Public Works.

No. 1.

RETURN showing approximately the density of population in the city of Sydney and the principal suburban Municipalities, June, 1888:—

Municipalities.	Approximate population in June, 1888.	Area in acres.	Population per acre.	Municipalities.	Approximate population in June, 1888.	Area in acres.	Population per acre.

F.

ELECTRICAL PURIFICATION OF SEWAGE.

Report by RICHARD THRELFALL, Esq., Professor of Physics, University of Sydney.

Dear Sir, University of Sydney, 25 June, 1889.

I send herewith my report on the Webster's process; it would have been sent in much sooner had I obtained the information asked for at an earlier date, but I daresay it was tiresome to get together. I have estimated the cost of a large experiment, but there is no reason why one should experiment on such a large scale, except that other things being equal the larger the scale of the experiment the more reliable and instructive the results. You will perhaps be kind enough to let me know at what time the Committee would like to examine me. Wednesday is my best day.

Yours very truly,
RICHARD THRELFALL,
Professor of Physics.

I enclose papers containing answers to my questions, for which I desire to express my thanks.—R.T.

J. Barling, Esq.

Report

Report on William Webster's process for the electrical purification of sewage.

University of Sydney, 23 June, 1889.

Limitation of Report.

THE general question of the treatment of sewage has been admirably dealt with by so many authorities that it will be only necessary to refer to the properties of sewage in so far as is necessary for the elucidation of the problem under discussion. A sufficient account of other chemical processes is given in a book on "The Treatment of Sewage," by Dr. Meymott Tidy, published by Van Nostrand, of New York. The book in question is an abridgment of an essay on the subject, originally published in the "Journal of the Society of Arts," and is as good a concise account as I have seen.

Conditions of Problem.

Sewage may be roughly said to consist mainly of water carrying in suspension flocculent organic and granular inorganic matter; and in solution organic matter of indeterminate composition, inorganic and ammonium salts; gases—chiefly nitrogen, carbonic acid, and ammonia—and the germs of organisms capable of producing putrefaction of the organic matter. There may also clearly be contained germs of organisms capable of producing changes in the constituents of the human body—the amount of these depending on local and variable sanitary conditions. Larger bodies, such as cats, dogs, rats, walking-sticks, &c., can be separated by strainers before the sewage comes up for treatment. Any system of purification has for its object the removal or oxydation of the organic matter present in the sewage, as well as the destruction as far as possible of the lowly organisms existing in it. The separation of the suspended matter is in all cases the first step towards purification, the second step being the oxydation of the soluble organic matter—which otherwise is liable to subsequent putrefaction—accompanied if possible by the direct killing of the living constituents. The precipitated flocculent organic matter, together with its precipitant and any inorganic insoluble matter separated from sewage with it, is generally called "sludge." The liquid flowing away from this precipitate is called the "effluent." In some chemical processes it is claimed that the sludge has a manurial value, but it is now a matter of experience that this value is almost proportional to the cost of the chemicals used to produce it, and it remains questionable whether any chemical process has yet been devised capable of producing manure profitably (except under very exceptional circumstances) when all costs are taken into account. Mr. Webster does not claim any marketable value for the sludge produced by his process; but on the other hand, shows tolerably clearly that the amount produced is as near as may be an absolute minimum.

Statement of Webster's Process.

The process of Mr. Webster depends on the decomposition of the components of sewage by subjecting the sewage itself to electrolysis between iron electrodes. The sewage as it flows through a long shoot, passes backwards and forwards between the iron plates, between which the current is passing. Briefly, part of the iron is dissolved, and reappears as hydrated ferric oxide in the liquid; as the treated sewage flows into a settling tank this ferric oxide sinks to the bottom, carrying with it all suspended matter. A certain amount of oxydation of the soluble organic matter has also been brought about through the action of the chlorine and oxygen, liberated by the electrolysis. Hydrogen is given off. If the effluent is not now sufficiently purified to become completely oxydized through exposure to atmospheric oxygen, it may be run through a second shoot, where the electrodes are of iron and carbon, or of carbon only, and there receive the complete oxydation which nascent oxygen, ozone and chlorine habitually bring about.

Electrical Principles Involved.

A liquid capable of being decomposed by an electric current is called an electrolyte; the conducting plates, by means of which the current enters the liquid are called electrodes. With sewage the chief primary products of decomposition are oxygen, hydrogen, chlorine, caustic soda, and ammonia. The current to be used is supplied by a dynamo driven by a steam engine; the brushes of the dynamo require to be connected to the electrodes by copper conductors generally called "leads." In order to arrive at an estimate of the most efficient way of coupling-up the plates to the dynamo, as well as of constructing the latter and setting up the leads, we refer to fundamental principles. Faraday long ago discovered that the amount of decomposition produced in a given electrolyte depends only on the time-integral of the current. The time-integral of a current is called for convenience, "a quantity of electricity." So that we may say a given quantity of electricity always produces a given amount of decomposition when forced through a given electrolyte. Now, the purification of sewage depends on the amount of electrolytic decomposition produced in it, and consequently our object is so to arrange matters that we get the greatest quantity of electricity forced through the electrolyte with the least expenditure of coal in the boiler of the steam engine. Without going into details it will suffice to state that this condition is fulfilled when the "resistance" of every part of the installation is reduced to a minimum. In practice this may be taken to mean that the iron plates in the electrolysis tanks, or shoots, should be large, numerous, and close together, and that the leads should be as short and thick as possible (within limits determined by the price of copper), and that the dynamo should be so built as to have a resistance small—say 5 per cent.—compared with the resistance of the rest of the arrangements. For the sake of economy in the leads, &c., I should recommend that the dynamo have an electro-motive force of about fifty volts, and that the plates in the shoot be arranged in groups, and these groups put in series. The electro-motive force required to get the current through each group will then be about two volts, plus the product of the current used by the resistance of the groups. As Mr. Webster's plant is at present arranged, these principles have not been very carefully attended to, and consequently he is using more coal than would be used in treating the same quantity of the same sewage with a properly thought out installation. It is clear from what has been said that the efficiency of the process will depend in a measure in keeping down the resistance. Now, there can be no doubt that samples of sewage from different sources will not all have the same specific resistance (resistance of a cube of unit size). By this I mean that with plates of a given size and at a given distance apart, more electro-motive force will be required to produce a given current,—and hence a given amount of decomposition

and

and purification—in some cases than in others. Roughly speaking, the more dilute the sewage the higher will be its specific resistance, or looking at it from another point of view, the worse the sewage the greater will be the comparative economy of its treatment. The quantity of salt in solution will also greatly affect the specific resistance. The more salt the lower will the resistance become, and consequently the more efficient the process. The quantity of salt is also a very important consideration from a chemical point of view, as will be shown directly.

Chemical Actions.

Roughly speaking the chief ultimate results of the chemical electrolysis process are as follows :—Hydrogen is given off at the negative pole ; and iron is dissolved from the positive pole. I have some reason for thinking that the iron is dissolved first as chloride, and it certainly appears as hydrated ferric oxide in the liquid—probably as a result of the subsequent decomposition of the chloride by the trace of caustic soda present as the product of another part of the reaction. Common salt is thereby reformed. Whatever the details of the chemical process may be, however, we find that after the electrolysis has gone on for a certain time, we have a flocculent precipitate of ferric hydrate buoyed up in the liquid by entangled bubbles of gas—chiefly hydrogen. As the sewage rests in the precipitating vats the hydrogen is given off, and the ferric hydrate subsides, carrying with it the flocculent suspended matters of the sewage and thus forming the sludge already noticed. It will thus be seen that the employment of *iron* plates is a very essential feature of the process, and it fortunately happens that iron is on merely economical grounds about as good a material for electrodes as can be obtained. The plates should be roughly and strongly cast from ordinary pig iron, the graphite crystals of which will do no harm, but quite the contrary, as will be shown directly. The positive plates will require renewing every now and then, as there is a continual and essential solution of them going on. Mr. Webster considers that London sewage is sufficiently treated by the solution of about two grains of iron per gallon. In order to carry the purification still further, Mr. Webster has a further device. The last few sets of plates are formed of lumps of carbon (gas-coke) cast in the iron, so that the plates expose a mixed carbon and iron surface. The result of this is that some free chlorine is evolved, and has an opportunity of acting in its characteristic violently oxydizing manner on the sewage, especially as it is presented to it in the nascent state. In this part of the process the free chlorides will diminish in amount, and a corresponding oxydation of the organic matter will take place. Personally I am of opinion that this part of the process had better be effected on the effluent after it has left the sludge, for then all the oxydation would take place in the soluble matter, and I should suggest that the final portions of the shoot be fitted with gas carbon plates of large size and thickness free from iron ; at all events the positive electrodes should be so. The negative plates may be of iron or carbon, according to considerations of economy. I venture to add the further suggestion that in cases where the chlorides are deficient a certain amount of sea-water might be advantageously run in with the sewage to help the final treatment. The effluent after passing through this process is very good indeed—a good deal better, I fancy, than is ordinarily required. If this be so the latter portion of the process may be suppressed. If, on the other hand, the effluent be required for drinking or similiar purposes it is advisable to allow it to filter through a tract of sandy country ; or an artificial filter made of broken ironstone.

It must be remembered that though great stress has been laid on the precipitating action of the iron it corresponds to a small part only of the chemical changes taking place in the shoot. There is a good deal of free oxygen given off, as well as some chlorine, and these together produce a very energetic oxydizing effect on the organic matter in solution. In the analyses which follow the latter part of the process here described (with the carbon electrodes) has not been used. The purification is simply due to the two grains per gallon iron plate electrolysis.

Description of Crossness Apparatus.

The plant at work at Crossness has been put up and is being maintained in action by Mr. Webster at his own expense, and is therefore of a temporary and experimental character, though large enough to allow of the treatment of about a million gallons of raw sewage during the twenty-four hours. The engine is an ordinary portable engine of the kind generally in use for agricultural purposes, and capable of working up to, or rather over, 30 h.p. The dynamo was built specially by Messrs. Mather and Platt, of Manchester, and has a capacity of 1,600 ampères at 20 volts. Mr. Webster considers that it would be advisable to use a higher E.M.F. for reasons already given. The sewage is passed through a coarse straining arrangement consisting merely of a hurdle, and then flows direct into the electrolysis shoots. These shoots are in the form of long wooden troughs of square section (or nearly so), and measuring somewhere about 18 in. by 15 in. The shoot is not continuous but in several sections, each section being rather lower than the preceding one, as will be seen by a glance at the picture contained in the appendix. The plates of the electrodes are arranged alternately at a distance of about an inch from one another ; arrangements are made for letting the electrolysed product flow without too great disturbance into the settling vat. The troughs in which the electrolysis took place were perhaps somewhere about 100 yards long in all. The settling pits were two in number, so that one could be cleaned out while the other was in use. The sludge was black and very nasty looking, but it had not much smell at the time I visited the works. This was possibly due to the weather being very cold, for there is no reason why the sludge should not be foul under ordinary circumstances. The quantity of sludge appeared to be comparatively small, but the sewage was rather dilute when I saw it, owing to continued rain. Each pit was about 65 feet long by 28 feet wide, and deep enough to hold about 6 feet of sewage. The size of the pits depends, like all the other arrangements, on the average composition of the sewage, but is probably considerably less for this than for other chemical processes. The effluent was clear to look at, and almost free from smell. I should certainly call it a good effluent. I saw no signs of frothing or subsequent putrefaction, and was informed that the experimenters had not been troubled by anything of the kind. Possibly a visit at another time of year and during warm weather, might have been more instructive on this point. On the other hand it is fair to recollect that with a rise of temperature the electrolytic resistance would be diminished, and consequently rather more electrolysis might be done for the same money in hot weather than in cold.

Mr. Webster drank half a tumbler of the effluent to show me that it was safe, but I did not consider it any part of my duty to accept a courteous invitation to join him. I did, however, accept a sample which I saw prepared from the raw sewage in the laboratory, and found the taste suggestive of

" warm

"warm flat-irons," but otherwise not unlike that of ordinary brook water. Some attention requires to be given to the running of the treated sewage into the settling pits. A certain amount of agitation is necessary to enable the gas bubbles to escape from the flocculent precipitate; and consequently to promote deposition of the latter. On the other hand, if the agitation is too violent, the flakes get broken up and the settling takes longer. The rate at which the sewage runs through the shoots is also a matter depending on circumstances. It is clear that the flow must be strong enough to prevent settling in the vats (shoot) themselves, and in the case of sewage heavily laden with inorganic sediment (as at the beginning of heavy rain) would require to be more rapid than under ordinary circumstances. But this is just the time when the sewage is in other respects most foul, and comes down in greatest quantity. In any complete system therefore, it would be necessary on all accounts to have some precipitating tanks in reserve, for I do not consider it desirable to have spare reservoirs to catch an unusual flow of sewage during stormy weather. As I have not, however, had any practical experience in treating sewage, I offer the above remark as a suggestion merely, which must not be taken for more than it is worth. Mr. Webster was good enough to perform a good many laboratory experiments before me, whereby I saw the way in which the precipitate is produced, and had an opportunity of judging of the efficacy of a coke filter, together with several other matters of analysis which would be out of place in this report. The sewage treated was drawn from the main sewer draining South London, and falling into the Thames at Crossness, on the south bank of the river. I may, perhaps, be permitted to add that I found Mr. Webster extremely anxious to give every kind of information, and dwelling at least as much on his difficulties as on his successes. Two letters which I received from Mr. Webster in answer to various questions appear in the appendix. The following analyses, however, may be fitly introduced here. It will suffice to say that they were taken in the interest of a Company against Mr. Webster. The degree of purification, as I take it, represents the degree fixed by the Metropolitan Board of Works for sewage passing into the Thames, or, for all I know, may exceed that degree by any amount.

For comparison there is also added an analysis of average Sydney sewage, for which I am indebted to the kindness of Mr. William M. Hamlet.

* Contaminated with tidal water.

Taking Mr. Webster's estimate of 2 grains of iron per gallon as a basis, I will proceed to calculate roughly the plant and expenditure required to treat a million gallons per twenty-four hours. When the quantity treated is greater the relative expense will be less. The outline of the calculation is given so that the results may be easily checked. Mr. Webster's estimate, based on his practical experience of London sewage, will be found in his letters and notes contained in the appendix; they approximate very closely to the theoretically calculated results.

Calculation of engine-power and plant required to precipitate 1,000,000 gallons of sewage per diem, on the basis of 2 grains of iron being required per gallon of sewage.

2 grains = ·1296 grams.

Hence 129,600 grains of iron have to be brought into solution daily.

Now, from the known Electro-chemical equivalents of silver and iron, and from the experimental fact that one ampère of current will deposit 4·025 grains of silver per hour, we find that if the iron is dissolved in the ferric state the amount per hour will come to 1·042 grams, while if the iron goes into solution as a ferrous salt an amount of ·692 grains only will be removed from the plates. The action being rather indefinite, we will assume that the smaller quantity is taken and call it ·7 grams, which will be near enough for the purpose.

Hence 1 ampère per diem will dissolve 16·8 grains of iron.

Hence to dissolve 129,600 grains of iron per diem, we shall require 7,715 ampères, nearly.

The electro-motive force required is 2 volts per cell, consequently the horse-power required is $\frac{2\times7715}{746}$ which comes to 20·7.

To this must be added, say, 20 per cent. for loss in leads, dynamo, shafting, &c., bringing up the total horse-power required to 25 horse-power.

Mr. Webster's experiments show that 27 horse-power is requisite, an agreement which in itself is very satisfactory, and tends to show that his figures are probably reliable.

I shall assume that it is proposed to erect a plant capable of dealing with 1,000,000 gallons daily, and will proceed to estimate the cost of plant on the assumption that a 34 horse-power indicated engine is requisite. The cost of the items is as follows, assuming that the plates must last one year :—

PLANT.

	£
Two portable high pressure steam engines to deliver 34 horse-power (indicated) each	1,000
Two settling tanks, 65 x 28 feet, to hold 6 feet of sewage, concreted lightly ...	1,100
1,000 feet of wooden shoot 2 ft. x 18 in. redwood boards 1½ inch thick £60, fitting £14	74
100 tons iron castings for plates at £8	800
(50 tons of these plates will be left at the end of the year, worth perhaps £300.)	
Coal at 5 lb. per horse-power per hour, and margin 700 tons at 17s. per ton, say	600
Wages, three engine-tenders at 12s. per diem	657
Wages, three labourers at 7s. per diem	383
One Manchester dynamo to give 50 volts and 360 ampères, at Sydney, with spare brushes, tightening gear, &c., about	250
Copper leads, fixing plates, &c., say	150
Engine-shed and store, and sundries, say	200
	£5,214

After a year's experimenting, the engine, dynamo, and about 50 tons of iron plates would remain as an asset. The settling tanks would probably be as good as ever but would be of no further service except for further experimenting.

To the above would be added cost of superintendence; this I do not think could be adequately obtained under a salary of say £600 for the year's work. I should not advise apparent economy in this item.

It would be premature to estimate the cost in detail of a large permanent plant, subject to a depreciation of 10 per cent. per annum, as it so much depends on the nature of the sewage and on the degree of purity required for the effluent. Local conditions also would greatly affect the price of settling pits and the cost of sludge removal. In the face of these uncertainties it seems to me unadvisable to endeavour to form an estimate. In addition to which, Mr. Webster's estimate for London sewage is available, and I have no reason to think it too favourable. The estimate is about 13s. per million gallons; if we add 50 per cent. to this for Sydney—though on what grounds one should do so except for the higher price of labour and machinery it would be hard to say—the cost would seem to be of the order of £1 per million gallons.

This

This would give as cost for—

	£
North Shore with 15,000,000 gallons	5,400 per annum
Parramatta with 4,000,000 gallons	1,440 „
Newcastle with 30,000,000 gallons	10,800 „

It must be borne in mind that these prices are 50 per cent. higher than Webster's estimate, and we can only hope to form a really reliable judgment in the matter after a proper experiment has been made. Throughout this report I have endeavoured to look at the process in the most unfavourable light.

Various details will be found in the appendix. A good account has been published in the "Engineer" for March 28th, 1889.

APPENDIX.

Letters from Mr. Webster.

8, St. Martin's-place, Trafalgar Square, London, W.C., 14 February, 1889.

Dear Sir,

Enclosed are copies of analyses of the sewage before and after treatment. The E.M.F. necessary for treatment varies with the quality of the sewage, that is, the percentage of chlorides present; but taking the average of the London sewage, the actual E.M.F. is 2 volts, and this multiplied to the number of sections will give the total E.M.F. required, subject to a slight allowance in loss of leads, the said sections being in series. For instance, at Crossness we have been able to run with a total loss in the leads, &c., of 2 volts—for instance, 14 volts at the terminals of the dynamo, and 12 at the terminals of the shoot—and this loss can easily be reduced to a minute amount, as the present works should have had the dynamo working in the centre, instead of one end of the shoot; this of course would shorten all the leads and reduce the resistance. The dynamo I use at Crossness has a capacity of 20 volts and 1,600 amperes, but, after a multitude of experiments, I find that the E.M.F. of this machine is too low; it is better to arrange more than six sets in series, but Dr. J. Hopkinson recommends at least twenty—this would mean a dynamo with the E.M.F. of 42 volts. The quantity of current required under the above conditions is only 200 ampères delivered from the dynamo, which passing through six sections, gives a total of 1,200 in the shoot.

In reference to the secondary decomposition, I find that the effluent I produce is particularly free, and if properly treated by this process no secondary decomposition will take place. I have in some cases kept effluent for months without any decomposition taking place, but of course this is only the case when the effluent is separated from the precipitated organic matter. This goes without saying. I have treated putrified sewage on a small scale, obtained from a cesspool, with the result that 97 per cent. of the suspended matter was precipitated. In some cases of treatment on a large scale I have obtained an effluent entirely free from suspended matter, but in this case the sewage acted upon was protected from the wind, so as to prevent any particles of dust, &c., blowing into it.

The analyses enclosed have been taken in the interests of the Electrical Association against me. Please note that the number in one of the analyses, the total of 48·85, was reduced to ·74, which goes to prove that the larger the quantity of suspended matter in the crude sewage the better the quality of the effluent obtained. You will notice there is no reduction in the chlorides. This I have reason to believe is entirely due to the fact that the surface of iron was reduced to about 1 foot per gallon, for in every other case there is a reduction in the chlorine, and a corresponding larger reduction of the organic matter in solution. This will show you that it is necessary to have a larger surface of electrodes if the organic matter in solution is to be reduced by at least 50 per cent. With respect to the sludge I am trying a new process, which I hope will prove suitable for all conditions.

The consumption of iron, as far as we have been able to obtain results, does not exceed 2 grains per gallon. If shoot is arranged with plates 1 inch apart, then 1 horse-power = 1,000 gallons per hour; if half inch apart, 1 horse-power = 1,500 gallons. This applies to London sewage, which requires ·25 ampère hours per gallon, and contains only an average of 10 grains of nacl per gallon. Better results can be obtained from stronger sewage.

The above has been delayed, as I wished to give you the results of experiments tried at Crossness, when you visited the works. Only the matters in suspension are given, as that portion of the analyses is very important.

Yours, &c.,
WILLIAM WEBSTER.

Professor Threlfall.

7 March, 1889.

Dear Sir,

I have waited until your return to England before replying to your note of the 17th ultimo.

In reference to the quality of the sewage in Australia, I think your suggestion of erecting experimental works there a very good one. The average reduction of organic matter in solution you may take to be somewhere about 60 per cent., but by special arrangement of electrodes it is possible to exceed that, although on a large scale, I should imagine, this is not necessary, as the oxygen of the air would do all this, especially as by running the effluent through an artificial channel containing broken rocks or ironstone the said effluent is churned up with the air, which, of course, oxidises the organic matter left in solution. One of the reasons why aeration will not oxidise sewage is due to the fact that the large amount of organic matter in suspension prevents any sensible reduction of the organic matter in solution, for, if particles of organic matter are churned up with pure water, the result is that a certain proportion becomes dissolved, but, if suspended matter is removed first of all, one can easily understand that oxygen will purify, as there is nothing to supply fresh organic matter to replace that which is oxidised. As to the horse-power required per million gallons it will be possible to work with twenty-seven, but, of course, this very much depends upon the quality of the sewage. I think you had better deal with depreciation of plant as 10 per cent. per annum. The cost per million gallons for London sewage should not exceed 14s. per million gallons. You will, of course, understand that this cost is taken at per 1,000,000, treating at least 20,000,000 gallons per diem. At foot I hand you the average results of forty analyses.

Yours, &c.,
WILLIAM WEBSTER.

Professor Threlfall.

SECOND

SECOND SERIES OF NOTES ON SEWAGE PURIFICATION BY ELECTROLYSIS.

By W. Webster, F.C.S.

Since writing my former notes on the above question I have carried out a long and exhaustive series of experiments at my Experimental Works at Crossness, which have proved beyond doubt that I can produce on a commercial scale results at least equal to those obtained in the laboratory, and probably better. The mode of treatment adopted is the same, with the exception that for the slight motion of the electrodes, which was found necessary to bring the sewage into intimate contact with the plates, a movement of the liquid to be treated is substituted, the sewage being acted upon as it passes through the electrolytic channels leading from the sewer to the reservoirs or settling tanks. The enclosed plan shows the arrangement of the Experimental Works referred to.

Starting with the engine shed, the engines, of an old type, made some twenty-five years ago are each 20-horse power nominal. By the arrangement of gear, one engine is only used at any one time, both for pumping and for driving the dynamo.

The dynamo is an Edison-Hopkinson, capable of developing an energy of 43-horse power. From the dynamo the leads run through resistance frames, by means of which the amount of current can be regulated without varying the speed of the engine. These are then connected with the iron electrodes in both the precipitating tanks and the shoot. The precipitating tanks are used for taking experimental measurements, so as to discover the best mode of arranging the electrodes, hereinafter called plates, made of cast iron, run direct from blast furnaces, a quality of iron commonly known as "pig."

Owing to want of space I have found it desirable to fit the shoot with wrought iron plates, which of course are more convenient for experimental work, as they are thinner and weigh less than if made of cast iron.

The shoot is of wood; but in any permanent work it would be built of bricks, concrete, or iron, and the bottom would be lined with asphalte or other suitable material.

The sewage is discharged into the shoot from the pump connected with the main sewer. The shoot is fitted with plates, as shown in the accompanying drawing. In travelling along the shoot every particle of the sewage comes in contact with the plates, and finally the whole is received into one or other of the settling tanks.

The plates in this shoot are divided into twelve sections. All the plates in each section are connected in parallel, and the sections can be connected either in parallel or in series, as may be most convenient.

I find it best in this instance to run them arranged as six sections in series, as, owing to the low tension of the dynamo, it is inconvenient to split them up into a greater number of sections. I may here casually observe that the dynamo should be near the centre of the shoot, and practice has proved * that it must be so constructed that as many sets of plates as possible may be arranged in series; but the space at my command in these works does not admit of the most effective arrangement being adopted.

It is not my intention to enter into any electrical technicalities. I therefore content myself by stating that my experiments prove that with 27-horse power it is possible to treat one million gallons of sewage in twenty-four hours. With this statement I must couple the remark, that the figures relate to average London sewage.

As to the cost of the engine power, I need hardly state that the newest type of engines suitable for driving dynamos may be taken to consume two pounds of coal per horse power hour, and according to the price of the coal will be the working cost. The experiments carried out with reference to the amount of iron consumed by this process tend to prove that the consumption in continuous working should not be more than two grains per gallon. Here again the cost entirely depends upon the position of the works, or more properly speaking, the district in which the works are situated. The prices in the pig iron market are so well known that I need not enlarge on this point. The plates are one inch thick, and if used in sufficient numbers would last for many years when once fixed. For instance, I will take a town with a flow of ten million gallons of sewage per day, corresponding to a population of 330,000 at 30 gallons per head. To treat this amount of sewage, the consumption of iron should not exceed 464 tons per annum.

On calculating the amount of mechanical power required per head of the population, I find it represents $\frac{1}{12\frac{1}{2}}$ of a horse power, or 8-horse power per 10,000.

It will be seen that the above plant is practically in lieu of the mixing tanks, machinery, and chemicals employed in chemical processes for the treatment of sewage, and if such electrical plant is designed to meet the peculiar requirements of any particular district it must, in my humble opinion, cost less and have a greater efficiency than any other process known, for not only does this electrical method precipitate the matters in suspension, but it also removes organic matter in solution, and forms a precipitating and disinfecting process in one operation.

The cause of any successful precipitation of suspended matters in sewage is entirely due to the formation of flocculent particles by means of chemical action. In the ordinary processes used this is obtained by the introduction of chemicals in a liquid form, and a large amount per gallon of sewage must be used to produce the necessary flocculency. Electrolysis with oxidizable plates produces this effect, with a consumption of material ranging from one grain per gallon, and the stronger the sewage the less the power required to produce the effect. The action that takes place manufactures the necessary precipitating agent in the sewage, whereas precipitation with solutions of chemicals means a consumption of several grains per gallon of sewage, if the action is intended to cause an adequate deposition of matters in suspension, and the resulting effluent requires further treatment with some oxidizing agent to remove the organic matter in solution.

With my electrolytical process, at the same that the precipitation of the suspended matter is taking place, the organic matter in solution is being oxidized by means of free nascent chlorine and oxygen given off at the positive plate.

The appended analyses of sewage and effluents show the reduction of both suspended and soluble matters by means of one treatment and also at the smallest possible cost.

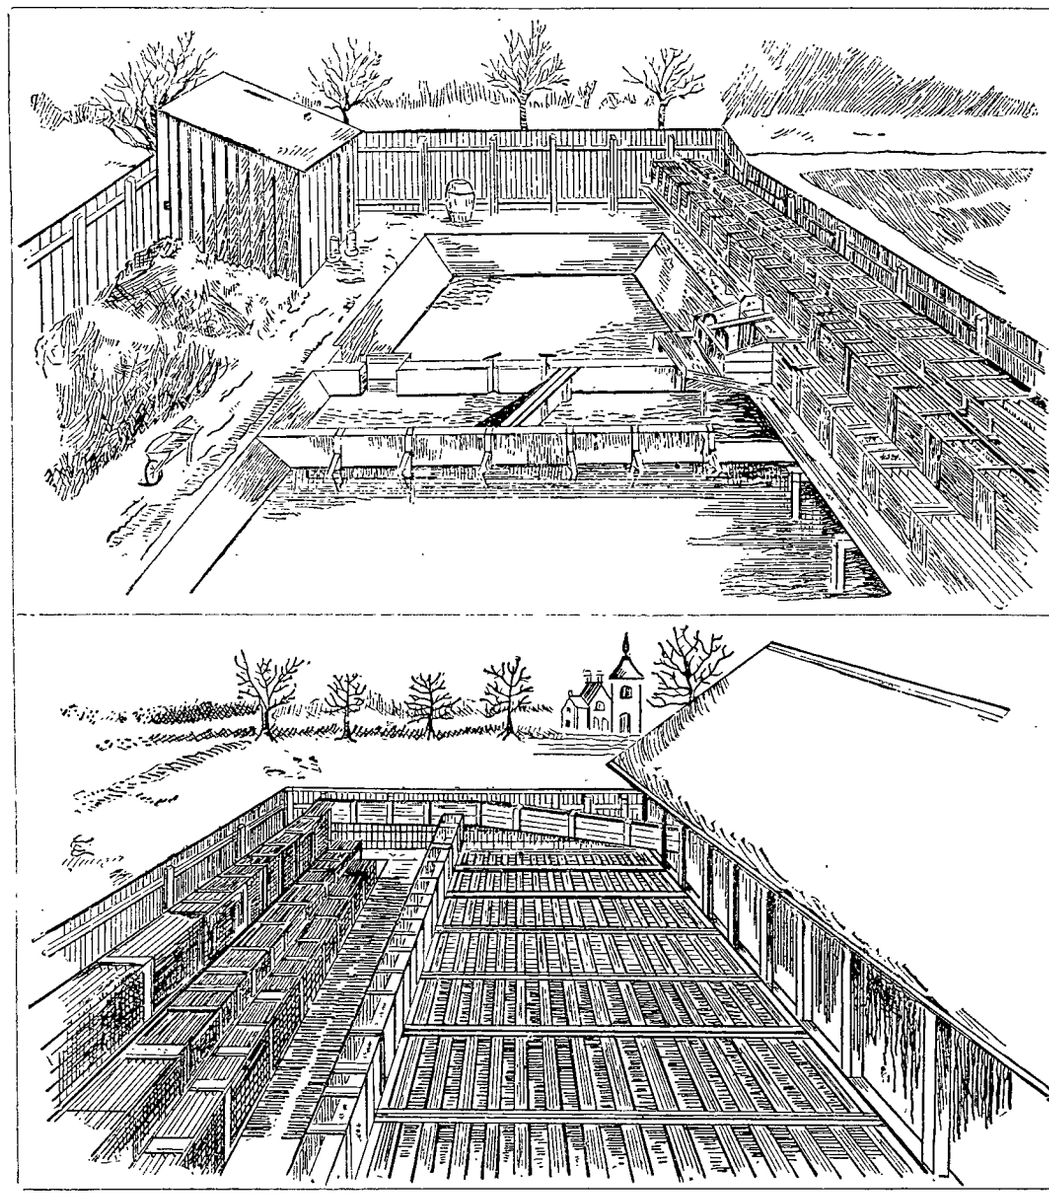
ELECTRICAL

* Theory would have shown this at once.

ELECTRICAL TREATMENT OF SEWAGE.

[From *The Metropolitan*, March 30, 1889.]

FOR nearly 130 years past the question of the disposal of sewage has occupied the attention of scientific and practical men. As a rule, some kind of chemical process has been the form chosen, and up to a certain point it was successful. Sewage can easily be deprived of its noxious qualities by the addition of chemicals, but it has been found that in most cases when the combination so formed came in contact with certain other salts, &c., in clear water, some other chemical result was produced as objectional as the original sewage. The use of lime and other ingredients has the effect of increasing the bulk of the sludge, which in the case of large quantities, as in London, is not desirable. Since the year 1762 upwards of sixty processes have been introduced, but no one can say any of them is entirely satisfactory. The great, though occult, power of electricity is, however, a feature in sewage treatment which has not wholly escaped the notice of scientific men; but till lately no practical step has been taken in the matter. For some ten years Mr. William Webster, F.C.S., of St. Martin's-place, has been engaged in experiments with electricity in connection with sewage treatment; but a decade since there was not that perfection of current-producing apparatus which is now available. He has succeeded in perfecting a process of sewage treatment by which the necessary chemical changes requisite to render the sludge and the effluents innocuous are effected by electricity, or, scientifically speaking, by electrolysis.



It is not our purpose to make this article too theoretical or technical, but it is necessary before describing the mechanical part of the matter to touch upon the principles which are brought to bear upon it. Electrolysis is the operation of decomposing a compound substance—in other words, of separating the component parts of a liquid or other material. Despite all assertions to the contrary, it is quite possible to decompose water by electricity, provided the currents be strong enough; but it does not require so powerful a current to electrolyse other substances, such as sewage, that may be found in water. Thus the chemical changes which takes place in electrically-treated sewage are based upon the fact that the water and sodium, magnesium, and other chlorides are split up into their constituent parts. At the positive pole chlorine and oxygen are set free, and in such a powerful condition that the organic matter in the sewage is burnt up or oxidized, and thus rendered inorganic and harmless. At the negative pole ammonia, potass, soda, magnesia, &c., are freed. These electrodes have pieces of carbon cast into them, so as to secure a supply of ferrous hypo-chlorous acid, which is most powerful oxidizing agent. As some of the iron is dissolved at the positive pole, these electrodes are of thick cast iron, but the negative plates

may be of thin rolled sheet iron. The consumption of iron occurring at the positive poles is equal to about one grain per gallon, but upon the negative plates there is no deterioration. Successful precipitation of suspended matters in sewage is entirely due to the formation of flocculent particles by means of chemical action. In the ordinary processes used this is obtained by the introduction of chemicals in a liquid form, and a large amount per gallon of sewage must be used to produce the necessary flocculency. Electrolysis with oxidizable plates produces this effect, with a consumption of material ranging from one grain per gallon, and the stronger the sewage the less the power required to produce the effect. The action that takes place *manufactures the necessary precipitating agent in the sewage*, whereas precipitation with solutions of chemicals means a consumption of several grains per gallon of sewage, if the action is intended to cause an adequate deposition of matters in suspension, and the resulting effluent requires further treatment with some oxidizing agent to remove the organic matter in solution. Analysts and statisticians will note with interest the subjoined table, showing analyses of raw sewage, and subsequent effluents, showing the reduction of both suspended and soluble matters.

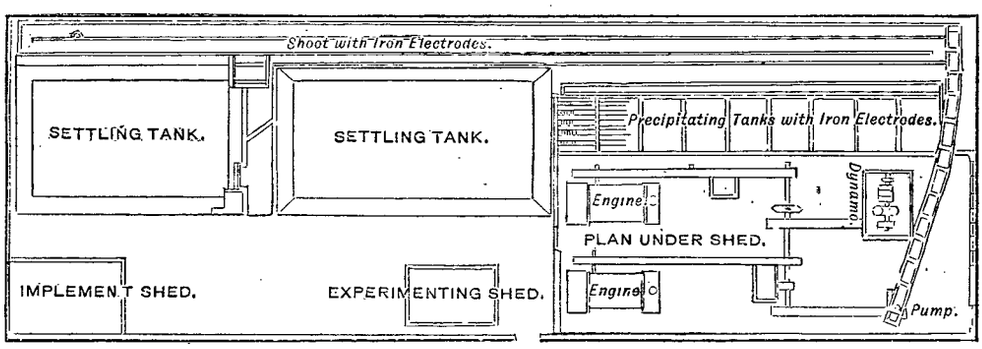
	Effluent, clear.	None.	3·22	0·2	18·62	0·52	1·56	not estimated	

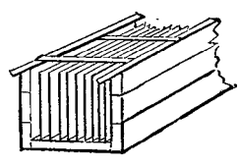
(A) Time of Settlement 1 hour in open reservoirs.

We fear we must not go further into the chemistry of the matter and treat of precipitated hydrates, &c., but will content ourselves by saying that to such a degree can sewage be purified that it will become itself a disinfectant by reason of the hypo-chlorous acid produced.

In order to show that the system is practicable outside the laboratory, Mr. Webster has erected, at considerable private cost, some experimental works at the Crossness pumping station, the accompanying sketches showing the general arrangement. On Wednesday last a number of gentlemen visited the works and witnessed the process in operation, the amount of sewage under treatment being 14,000 gallons per hour. So that the visitors might the better understand the action of his invention, Mr. Webster also performed the operation upon a small scale. A glass jar was filled with crude London sewage and a pair of electrodes plunged therein, the poles being connected with a small battery. In a few seconds a com-



motion was perceptible in the black turbid liquid. Small bubbles began to rise, and soon film was apparent on the surface. This increased in thickness, while the lower part of the liquid was visibly becoming clear. In about two minutes the electrodes were withdrawn, sufficient electric action having been set up. The ilquid was now found to be of a straw colour, but thickly interspersed with light flocculent matter, which soon found its way to the top, leaving the liquid clear, the chemical action described in the preceding paragraph having taken place. Although "precipitated," the solids were, however, at the surface, being held there by the bubbles of hydrogen that had been formed, but in about an hour they began to descend to their proper position at the bottom of the jar. This is precisely what happens on the larger scale in the precipitating tanks and shoot, as seen in the engraving. The sewage is discharged into the shoot from a pump connected with the main sewer; the shoot is fitted with iron plates or electrodes, and the sewage, in travelling along the shoot, comes in contact with the plates, and the electrolysed liquid then passes into one of the settling tanks. The dynamo employed is an Edison-Hopkinson, and the leads run through resistance frames, by which the amount of current can be regulated.



Detail of Shoot, with Iron Electroides.

Naturally the cost is an important item, and is generally the crucial point in all systems. This will compare most favourably with any chemical system, for it averages, for cost of working, abont 13s. per million gallons; so that the cost of treating the sewage of London, which is about 160 millions per day, would be about £37,960 per annum. What is to become of the sludge is another matter, this being a puestion for the consideration of the local engineers. What Mr. Webster professes to do is to rapidly precipitate a sludge that is harmless and to produce an effluent which cannot set up any deleterious chemical action when discharged into the river. In this he has unquestionably succeeded, and there is now a prospect of settling one of the most vexed questions of the day—namely, how to dispose of the sewage of great cities and towns.

G.

G.

NOTES ON SEWAGE PURIFICATION BY ELECTROLYSIS.

By WILLIAM WEBSTER, F.C.S.

[Proceedings of the Association of Municipal and Sanitary Engineers and Surveyors, Vol. XIV, 1887-8.]

THE question of the disposal of sewage has occupied the attention of engineers and chemists for many generations past, and regarded from a hygienic point of view cannot be too thoroughly considered.

Before entering into the particular subject upon which I have the honour of being invited to address you, I should like to turn your attention to the various processes tried, and found wanting, since the year 1762.

We have lately heard a great deal about the treatment of sewage with sulphate of iron, lime, sulphate of alumina, permanganates, &c., &c.; it is a most remarkable fact that claims have lately been made *in re* the sulphate of iron process as if it were entirely new. The following list will show the fallacy of this :—

Names of Substances.	Inventor.	Date.
Sulphate of iron	Deboissieu	1762
Chlorine	Hallé	1785
Lime	Estienne	1802
Powdered charcoal	Giraud	1805
Chlorine and chloride of lime	Guyton Morveau	1805
Ashes	Chaumette	1815
Sand	Duprat	1818
Sulphate of iron	Briant	1824
Chloride of soda	Labarraque	1824
Waste chloride of manganese	Payen and Chevalier	1825
Sulphate of lime	Siret	1827
Animal charcoal	Frigerio	1829
Peat	Guibourt and Sanson	1833
Charcoal and calcined marl or river mud	Pottevin	1836
Sulphates of iron and zinc with tan and tar	Siret	1837
Earth, lime, and waste substances	Rossier	1837
Peat ashes	D'Arcet	1840
Metallic oxides and carbon	Krafft and Suequet	1840
Chloride of zinc	Sir Wm. Burnett	1840
Schist coke	Hompesch	1841
Trade refuse, charcoal, and ashes	Albert	1842
Powdered lignite	Jourdan	1843
Impure alum	Siret	1843
Sulphate of zinc, charcoal, and clay	Gagnage and Regnault	1844
Persulphate of iron	Baronnet	1845
Schist coke	Du Boisson	1845
Chlorides of iron and zinc	Dubois	1846
Lime and precipitating tanks	Higgs	1846
Nitrate of lead	Ledoyen	1847
Waste salts of iron, lead, zinc, &c., with pyrolig matters, ashes, &c.	Brown	1847
Pyrolignate and perchloride of iron	Ellerman	1847
Impure chloride of manganese	Young	1847
Dried seaweed, lime, and sulphate of lime and zinc	Salman	1848
Peat charcoal	Rogers	1848
Charcoal, soot, mineral salts, &c.	Legras	1849
Spent tan, carbonised	Tarling	1850
Fresh bark, sulphate of iron, and peat charcoal	Angely	1850
Metallic sub-salts, as of iron, alumina, &c.	Browne	1850
Milk of lime and collecting the deposit	Wicksteed	1851
Acids and metallic salts, and filtrations through charcoal, clay, peat, gypsum, &c.	Dover	1851
Lime, sulphates of alumina, and zinc and charcoal	Stothert	1852
Lime, magnesian earth, sulphate of zinc or iron, and vegetable charcoal	Gilbee	1852
Sifted ashes, breese, or peat charcoal	Perks	1852
Sulphate of zinc, potash, alum and sand with waste tan, ashes, lime, soot, &c.	Pinel	1853
Metallic sulphates, metallic chlorides, or charcoal and magnesian salts	Herapath	1853
Salts produced in working galvanic batteries	Dering	1853
Peat or bog earth containing salts or oxides of iron	Dimsdale	1853
Peat and other charcoal and chloride of sodium, &c.	Macpherson	1853
Animal charcoal, alum, carbonate of soda and gypsum	Manning	1853
Magnesia and lime with sulphurous and carbolic acids	Smith and McDougall	1854
Lime and finely-divided charcoal	Wicksteed	1854
Boghead coke	Herapath	1854
Soft sludge from alum works with lime and charcoal	Manning	1854
Peat charcoal carbonised with oil of vitriol	Longmaid	1855
Alum schist or shale, and other aluminous minerals, with lime and charcoal	Manning	1855
Manganates and permanganates	Condy	1857
Superphosphate of lime with magnesia and lime	Blyth	1858

To this list may be added others containing combinations of the above, ringing the changes upon iron, lime, alumina, &c., which illustrate the reckless way in which inventors endeavour to apply their knowledge without first ascertaining what has been previously done in the matter, and how far it has been found to be successful.

In

In the year 1844 lime, mixed with water, was used for the precipitation of sewage: the sewage precipitate was called sewage guano, and, to cut a long story short, it was found that the product had little or no agricultural value. The late Dr. Letheby (whose pupil I was) in the year 1857 recommended the Metropolitan Board of Works to adopt the lime process to precipitate the sewage of London. He also suggested that sulphate of iron might be tried. In this short paper it is not my intention to criticise the many processes in use at the present time, as there is no doubt all are doing their best to solve the question; but I must protest against sewage farms, where sewage is allowed to percolate through the land without previous treatment. Rye-grass is grown and ultimately eaten by cattle; sewage contains myriads of ova; they become attached to the grass and other green fodder. This affects the cattle, produces measly meat, and I need hardly enlarge upon the results of eating it.

It may perhaps seem curious that I should say so much about chemical treatment, when the special subject of my paper is electrolytical; but electrolysis is nothing more than a chemical action produced by an electric current.

It is quite ten years since I carried out my first experiments in electrolysis, but in those days the available electric apparatus had not attained such completeness as we now have it. I first of all wish to remove an impression which, I have been given to understand, is lurking in some minds—that it is impossible to electrically decompose pure water. Water is easily decomposed provided the current of electricity is of such intensity that it can overcome the resistance. Nicholson Carlisle decomposed water in the year 1800; the decomposing effects produced are precisely in accordance with the chemical equivalents of the substances electrolysed; for instance, the same amount of electricity that would reduce 56 parts of iron from its solution would reduce 207 parts of lead, or 16 parts of oxygen, &c., &c. This is practically the explanation of the whole system; for the chemical changes which take place in sewage when it is electrolysed depend chiefly on the well-known facts that water and sodium, magnesium and other chlorides (which are always present in sewage) are split up into their constituent parts. Thus we have at the positive pole chlorine and oxygen set free, and these elements are liberated in a nascent state, a condition in which they are intensely active, so that the organic matter in the sewage is rapidly oxidised and burnt up to innocuous compounds. So rapid is this action that I will now act on a little Crossness sewage, and produce a disinfecting liquid, which is nothing more nor less than hypochlorous acid, the strongest oxidising agent that is known. To obtain this quickly I must separate the positive action from the negative by a porous diaphragm. At the negative pole I obtain ammonia, potass, soda, magnesia, &c. So strong is the action of oxide of chlorine that I have found no pressed carbon plates would stand its action; I am therefore compelled to use cut carbon or coke.

It was this fact that made me investigate the cost, and the result was, knowing that iron salts were of great use in precipitating organic matter in solution, that I experimented with iron electrodes, for the oxidising acids produced by this action being probably 100 times more active than any acids produced by chemical processes alone, it necessarily followed that the iron salt produced must have similar properties. The nascent chlorine and oxygen generated partly unite, and, with the water, form hypochlorous acid, the positive iron plate being attacked, and ferrous hypochlorite formed; but a portion of the hypochlorous acid attacks the organic matter, for it is well known that putrefying sewage has a strong affinity for oxygen.

To still further strengthen this action I have lumps of carbon cast into the iron plates, thus securing a supply of the before-mentioned acid.

The iron plates are common casts run direct from the furnace into this form instead of pigs, and are used for the positive poles, the negative plates being thin rolled sheets. The positive plates are gradually acted on by the acids produced, but the negative plates are not acted on, and will remain in the same condition for years; this is so well known that I need not enlarge upon it. I have estimated that the waste of iron at the positive pole is about one grain per gallon, but of course this entirely depends upon the electric current used. The hypochlorite of iron formed at the positive pole is acted on by the free ammonia, sodium, potassium, and magnesium hydrates and the ferrous hydrated oxide precipitated. This particular oxide of iron has the property of combining with organic matter, and it is a peculiarity of this salt to take a white hue, and then by exposure to the atmosphere to become green, and ultimately an ochrey red colour.

This action can be seen almost daily in any dye-house during the dyeing of buffs; the cotton goods (representing organic matter) are dipped into an iron solution, and then passed through an alkaline bath; the shade is green, but slight exposure to the air produces the buff colour; the oxide of iron being precipitated within the fibres of the cotton. The ferrous hydrate or protoxide of iron is so beautifully precipitated, one may say, in its most active condition by this electrolytic process, that it takes up more organic matter than if precipitated chemically, for by chemical precipitation the iron oxide carries a large part of the suspended matter in the sewage with it, but only traces of the dissolved organic matter. In the electrical process the whole of the matter suspended is carried with the oxide of iron, together with a considerable portion of the organic matter in solution, and, if necessary, the whole of the soluble organic matter can be oxidised. The precipitate itself is carried to the surface by the numerous bubbles of hydrogen issuing from the negative pole, and the effluent may be run off quite clear from below, or may be run with the precipitate into settling tanks, where the deposit will take place in from half an hour to two hours; the precipitate being exceedingly flocculent subsides readily. The sludge formed does not hold so much water as by chemical process, and presses without any addition of lime. The effluent is less alkaline than the natural sewage, and, if necessary, can be rendered neutral by passing through coke filters arranged in such a way that the electric current can be applied, thus further purifying the effluent and delivering it in such a state that, personally, I should have no objection in drinking it. The reason of the alkalinity being reduced is that a small quantity of free ammonia is carried off with the hydrogen gas at the negative pole, and also by the formation of hypochlorous acid. It is by means of this coke filter that potable water can be purified either on a large or small scale, and the treated sewage is not liable to secondary fermentation, nor does it form a precipitate when mixed with ordinary river water. The chlorides are slightly diminished in quantity owing to the escape of nascent chlorine at the positive pole. The amount of soluble mineral matter is not increased in quantity as in ordinary precipitating processes,

The

The chloride of lime of commerce is really hypochlorite of lime. It has been suggested that the hypochlorous acid may possibly be as objectionable in its after effects as the salts of lime, but this is not the case, as hypochlorous acid is an unstable compound, which, having delivered up its oxygen in oxidising organic matter, changes into hydrochloric acid, which neutralises the alkalinity of the sewage.

As I have already demonstrated that hypochlorus acid can be obtained in quantities by means of a porous cell enclosing positive pole, so likewise by enclosing the negative pole a solution of ammonia, &c., can be obtained from the raw sewage.

I have brought with me a weak solution of the disinfecting fluid obtained from sewage twelve months ago, also a sample of an effluent eight months old. I have shown that the sewage can be purified to any extent, even to conversion into a disinfectant; it therefore only remains for me to enter into the question of cost, which I will do as briefly as possible, and it is just as well to mention that this will be partly ruled by the particular state of purity you require in the effluent.

The chief expense is the engine-power. My experience up to the present time is limited to treatment of about 100 gallons of sewage at any one time; and from a large number of experiments I found it would be possible to treat this quantity with about one-third horse-power. The dynamo and engine were unsuitable for my experiments, as the dynamo was only fit for electric lighting, and the engine twenty-five years old, without a governor; I should therefore prefer to think the horse-power over-estimated. The time occupied in treating every 100 gallons varied from 5 to 10 minutes. The consumption of iron was 1 grain per gallon. The cost of this is easily estimated when one knows the market price of pig-iron. By kind permission of the Metropolitan Board of Works I have erected works at my own expense at the Crossness Outfall of sufficient capacity to treat sewage at the rate of 1,000,000 gallons per diem, as I have sufficient confidence in this process to risk the large outlay entailed. For this I have had an Edison-Hopkinson dynamo specially constructed, giving an output of 1,600 ampères and 20 volts.

Unfortunately the electrical portion of the works is not yet completed, or I should have hoped to have had the pleasure of inviting you to inspect them.

The question of cost resolves itself into this: The more iron plates you introduce into the system the greater the surface and the lower the resistance, consequently the less horse-power required. The increase of the iron plates is only an increase of prime cost, and does not mean a greater waste of iron. This means a saving of labour, as the more iron originally used the less frequently it would require renewal.

I hope to prove that by using positive plates 1 in. thick their duration will be from five to ten years. If the proportion of one-third horse-power to 100 gallons in 10 minutes holds good, as I am inclined to think it will, then twenty-five actual horse-power would be capable of purifying 1,080,000 gallons of sewage in twenty-four hours. I should much have liked to have gone into more minute details connected with these experimental tests, but until I have verified the present results on a practical working scale I feel it would be premature to quote figures.

Appended are the results of a few Analyses of Sewage before and after treatment:—

THE ELECTRICAL TREATMENT OF SEWAGE.

(From *The Engineer*, March 29, 1889.)

On Wednesday Mr. William Webster gave a practical demonstration of his electrical method for the purification of sewage, at the main drainage outfall at Crossness. The electro-chemical features of this process have already been described in our columns, and the physical success of the method invented by Mr. Webster seemed sufficiently proved some time back. But it was necessary to show that the process could be carried out on a working scale at a cost that should not be excessive. For this purpose permission was obtained from the Metropolitan Board to erect temporary experimental works on a piece of vacant ground at Crossness, the expense being defrayed by the inventor, who had his sewage for nothing, except that he bore the cost of pumping. On the present occasion Mr. Webster showed how he could deal with a flow of sewage equal to 12,000 gallons per hour. The works were avowedly not the best that could be devised for the purpose, the ground being limited in extent, and experience being wanting at the outset. By the time the works were finished it was easy to propose some better mode of setting them up. The dynamo was not in the best place. The two portable engines, used alternately, were made a quarter of a century ago, and the provisional nature of the works showed itself in various ways. On Wednesday one engine was absent, having been removed for a temporary purpose. The experimental works have a capacity for dealing with half a million gallons of sewage per day.

Mr. Webster describes his invention as consisting of an improved mode of electrolysis for oxidising and precipitating organic matter, and decomposing inorganic salts, such as chloride of sodium, potassium, magnesium, &c., and all salts contained in sewage. For this purpose, in treating sewage and similar impure liquids, he subjects the liquid, while flowing through channels or reservoirs, to the electrolytic action of positive and negative electrodes made of iron and having very extended surfaces. Ammonia and other alkalies are evolved at the negative electrode, and assist the precipitation of the iron salts formed at the positive pole, where at the same time nascent oxygen and chlorine are evolved, partly acting on the iron and producing an acid reaction whereby the organic impurities in suspension are precipitated, while those in solution are oxidised and converted into innocuous compounds. Of course the nascent chlorine will have much greater efficiency than the chlorine present in chloride of lime, and the nascent oxygen will have much more effect on the organic matter in the form of albumenoids than the oxygen of the atmosphere.

The mode in which this process is made to operate will be seen by the accompanying engravings. The ground plan, Fig. 1, representing an area of about 250 ft. by 60 ft., shows the position of the two

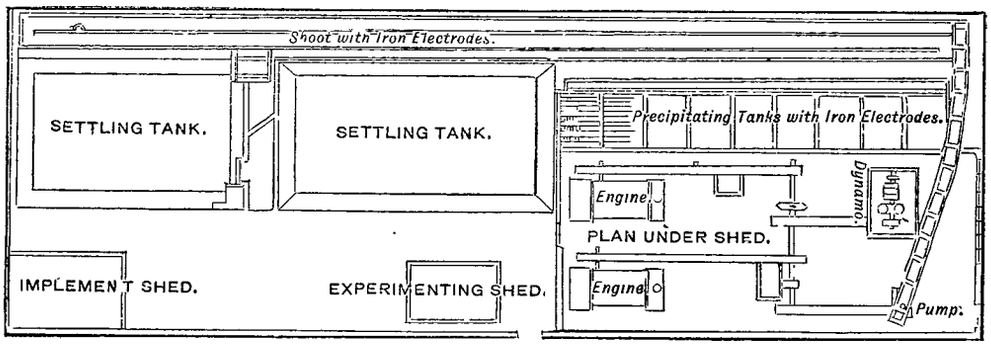

Fig. 1.—Ground Plan of Experimental Tanks.

engines and the dynamo. At a little distance to the rear of the latter is the pump for raising the sewage; the shed containing the engines and dynamo appears on the right in the perspective engraving, Fig. 2.

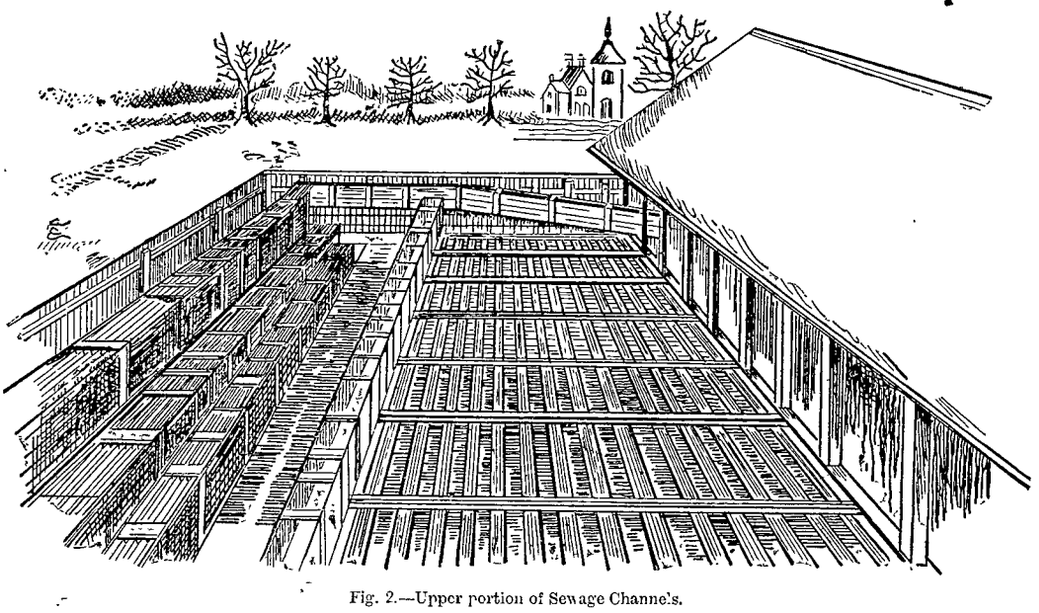

Fig. 2.—Upper portion of Sewage Channels.

Facing the shed in this engraving and in the ground plan are a range of precipitating tanks. These tanks were used for taking experimental measurements, so as to discover the best mode of arranging the electrodes. Practically they form no part of the present working arrangements, and they would not be repeated

repeated in any future works. The sewage raised by the pump passes on through the shoot which runs along one side of the ground plan, and is finally received into one or the other of the settling tanks. A portion of the shoot appears on the right-hand side in Fig. 3, opposite the implement shed. Between the

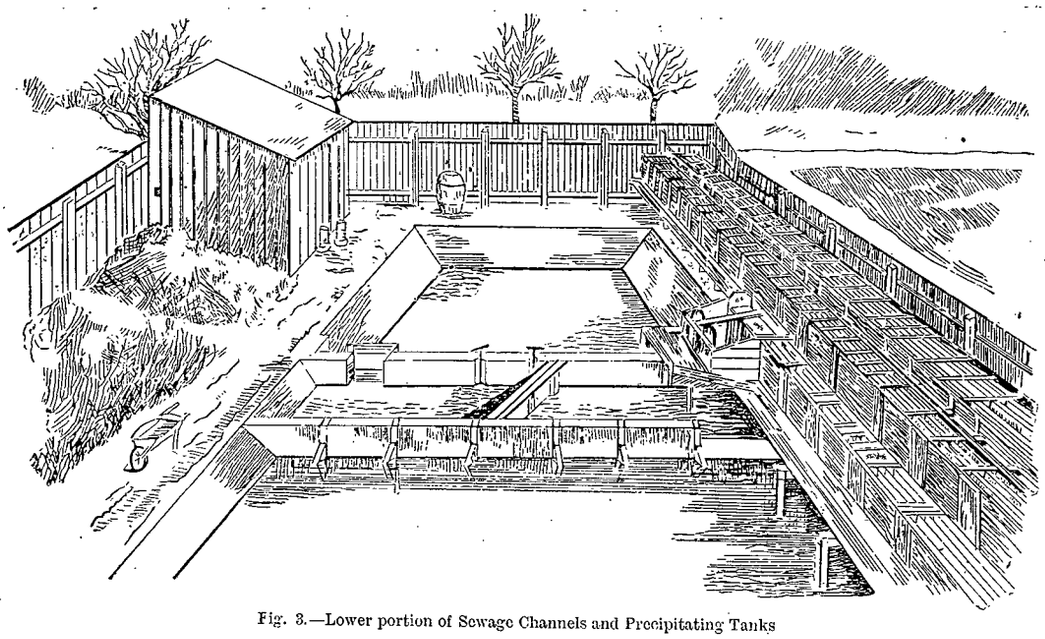

Fig. 3.—Lower portion of Sewage Channels and Precipitating Tanks

shoot and this shed appear the tanks, as on the plan. In Fig. 2 another portion of the shoot is seen opposite the engine-shed, with the precipitating tanks intervening. The shoot is an electrolytic channel in which are the iron electrodes, arranged as shown in the small sectional drawing, Fig. 4. The shoot is made of wood, but in any permanent work would be constructed of some stronger material. Owing to the restricted space, the shoot at Crossness is fitted with wrought-iron plates, but in practice it is intended to make use of cast-iron, run direct from blast furnaces. As the sewage travels along the shoot, every particle of the liquid comes into contact with the plates, and is thereby subjected to the electrolytic action. A separation of the solid particles from the actual liquid speedily shows itself, and increases in its intensity as the sewage approaches the settling tank, into which it ultimately descends, and where the separation reaches its final stage.

Each of the portable engines is of 20-horse power. Only one engine is used at a time, both for pumping the sewage and for driving the dynamo. The dynamo is an Edison-Hopkinson, capable of developing an energy of 43-horse power. From the dynamo the leads run through resistance frames, by means of which the amount of current passing on to the electrodes can be regulated without varying the speed of the engine. From the statements made by Mr. Webster it appears that with 27-horse power it is possible to treat 1,000,000 gallons of sewage in twenty-four hours, presuming the sewage to be of the same strength as average London sewage. In estimating the cost of the engine-power, reference is made to the fact that the newest type of engine for driving dynamos may be taken to consume 2 lb. of coal per horse-power hour. The price of coal regulates the result. As for the iron consumed in the process, the experiments tend to prove that the consumption in continuous working should not exceed 2 grains per gallon of sewage. Plates 1 in. thick, if used in sufficient numbers, would last for many years when once fixed. By way of illustration, it is stated that the consumption of iron in the case of a town with a population of 333,000, having a volume of sewage equal to 10,000,000 gallons per day, or 30 gallons per head, should not exceed 464 tons per annum. The amount of mechanical power required per head of the population is shown to be $\frac{1}{12\frac{1}{2}}$-horse power, or 8-horse power per 10,000 of the population. A very small electro-motive force, only a little over 2 volts, is used and about 11 square feet of iron electrode surface per ampère. There seems to be no polarisation of the electrodes in the channels.

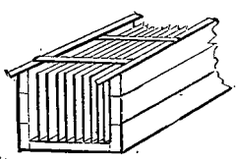

Fig. 4.—Detail of Shoot with Iron Electrodes.

Running from the shoot, and allowing one hour for settlement in the open tanks, the average of twenty analyses shows that under this treatment raw sewage of a very turbid and opalescent character yields a clear and odourless effluent. Estimated in parts per 100,000, the suspended matter is reduced from 33·35 to 1·56. Nitrogen as free ammonia is reduced from 4·34 to 3·32, and albumenoid matter from 0·5 to 0·2. Chlorine as chlorides becomes 18·62 instead of 21·64, and the oxygen required to oxidise the organic matter becomes 0·52 instead of 1·24. A sample of raw sewage, very turbid and opalescent, and with a bad odour, yielded a clear effluent without odour. The sewage contained 14·52 parts of suspended matter, 5·95 being mineral and 8·57 organic. In the effluent these quantities became respectively 1·48, 1·05, and 0·43. The free ammonia declined from 3·57 to 2·9, the albumenoid matter from 0·6 to 0·28, and the chlorine as chlorides from 14·61 to 13·39. The oxygen required to oxidise the organic matter was 4·03 in respect to the sewage, compared with 1·34 for the effluent.

The disposal of the sludge is a final consideration in this as in other processes where precipitation takes place. But the sludge from the electrolytic action is not swollen by the admixture of any foreign ingredients beyond one or two grains of iron per gallon, which as oxide becomes somewhat more.

In the course of the day's proceedings Mr. Webster stated that he estimated the working cost of this process at 13s. per million gallons of sewage treated. This was irrespective of interest on capital, and the allowance to be made for depreciation, except that it included the waste of iron. On 150,000,000 gallons per day, representing the whole of the London sewage, north and south, at the present time, the cost

cost at the rate abovenamed would amount to £36,000 per annum. Mr. Webster, in reply to various questions, said he had not undertaken any calculations as to anything beyond the working cost. He subsequently stated that the charge for interest on capital and depreciation of plant would not be likely to exceed £5,000 per annum.

Dr. Thudicum, who was present, said he was induced, from what he had seen, to look upon the process with the utmost hope. If Mr. Webster succeeded, as he trusted he would, the process would open up a new era in the history of the sewage question.

Sundry experiments followed, showing the action of the electric current on samples of sewage in glass vessels. In another instance the current was made to act on water coloured with an aniline dye, in order to illustrate the effect of organic matter in solution. In each case the solid particles were buoyed up by the liberated hydrogen, and collected on the surface of the liquid. On the escape of the gas the solid particles began to descend so as to form a precipitate.

The parties present were shown over the works by Mr. Webster, accompanied by his electrician, Mr. March. Attention was also given to an automatic weir, invented by Mr. F. Houghton, jun., dealing with eight or nine million gallons of sewage per day. By this apparatus a great saving of labour is effected, it being completely self-acting, while the process of precipitation is materially assisted, water flowing in or out without disturbing the deposit at the bottom of the tank.

[*To Evidence of R. W. Hardie, Esq.*]

I.

CHARGES FOR REMOVAL OF NIGHTSOIL, BOROUGH OF BURWOOD.

Burwood, 29 July, 1889.

Sir,

I have the honour, as directed by yourself, to supplement my evidence respecting the "Western Suburbs Sewerage Scheme" by the following statements as to present charges in the Borough of Burwood, for emptying earth closets:—

(i) The *minimum* charge is 6d. per pan, of which 5d. goes to the contractor, and 1d. to form a sinking fund to cover cost of pans.

(ii) The number of houses within the Municipality is about *one thousand*, and the average rent value may be stated at £100 yearly.

(iii) The following table will show the relative cost under the present imperfect municipal system and under the proposed Government sewerage works, taking the latter rate at 8d. in the £.

Rent value of dwelling.		Annual cost if pans are emptied		Annual cost if under a sewerage rate of 8d. in £.
		Once weekly.	Twice weekly.	
s.	£	£ s. d.	£ s. d.	£ s. d.
10 weekly,	26 yearly	1 6 0	2 12 0	0 17 4
15 „	39 „	1 6 0	2 12 0	1 6 0
20 „	52 „	1 6 0	2 12 0	1 14 8
25 „	65 „	1 6 0	2 12 0	2 3 4
30 „	78 „	1 6 0	2 12 0	2 12 0
35 „	91 „	1 6 0	2 12 0	3 0 8
40 „	104 „	1 6 0	2 12 0	3 9 4

Up to £78 yearly the 8d. rate for a perfect and continuous system is more economical than the present primitive and dangerous system. *i.e.*, taking as a basis that pans are emptied twice weekly. The charge appears heavier up to and beyond £100 yearly, but I feel sure no valid objection could be made to a charge of £3 9s. 4d. on a £100 a-year dwelling.

Many houses have two, three, or four closets, and the owners of these would, I think, prefer the proposed comprehensive system to the present one, which necessitates the visitation of their homes by the nightmen between the hours of 10 p.m. and 5 a.m.

I would emphasise what I stated before the Committee, that I am confident nine-tenths of the residents in the Western Suburbs would welcome the new scheme on the grounds of domestic comfort and as absolutely necessary for health, especially as there never have been any restrictions as to buildings.

I have, &c.,

The President, Public Works Committee, Sydney. ROBERT W. HARDIE.

[*To Evidence of John Trevor Jones, Esq.*]

J.

PROBABLE POPULATION AND CONSUMPTION OF WATER AT THE PERIOD OF COMPLETING THE WESTERN SUBURBS SEWERAGE SCHEME.

Sir, Water Supply and Sewerage Department, Sydney, 27 August, 1889.

I forward herewith, at your Committee's request, an estimate of the increase of population in city and suburbs, based upon the ratio of the increase that took place between 1879 and 1889, which was furnished me by Mr. Coghlan, statistician.

The population in 1879 was 200,009; the population in 1889 is 374,755.

This ratio represents 6½ per cent. nearly per annum. At this rate the population will double its present number in twelve years, and at the end of that time would, under these conditions, amount to 749,510 in city and suburbs.

This

This is my own deduction, based upon the above ratio ; Mr. Coghlan refuses to pledge himself to an estimate, but adopting the above figure of (say) 750,000, and allow a consumption of 40 gallons per diem per individual, the daily consumption of Sydney and suburbs will then demand 30,000,000 gallons daily.

The delivering capacity of the 6-feet pipe at Potts' Hill is 50,000,000 gallons per day. The proposed duplicate along with the present mains thence to the city and suburbs will be capable of delivering together 36,000,000 gallons.

I am inclined to think that the estimated ratio of increase if it err at all is on the side of excess ; nevertheless it is plainly evident that the supply is abundant for at least fifteen years, unless for some abnormal increase of population or other excessive demand for water.

I have, &c.,
J. TREVOR JONES,
Board Engineer.

The Secretary Parliamentary Standing Committee on Public Works.

[*To Evidence of Robert Hickson, Esq.*]

K.

COST OF APPLYING ELECTROLYSIS TO THE WESTERN SUBURBS SEWERAGE SCHEME.

Roads and Bridges Department, Sydney, 7 August, 1889.

Sir,

Since Professor Threlfall's evidence before the Public Works Committee with reference to the purification of sewerage by Webster's process my attention has been directed to ascertain how far this system could be economically used in connection with the Western Suburbs Sewerage Scheme, and I submit herewith a statement made out by Mr. Bagge, which, I suggest, should be sent on to the Committee.

Mr. Bagge has gone as fully as time would permit into the whole matter, and from his figures I think any doubt as to the inapplicability of this process as applied to the Western Suburbs Sewerage Scheme is at once removed. Roughly speaking, he estimates it would cost something like £300,000 extra to adopt this system.

ROBERT HICKSON.

The Under Secretary for Public Works.

Forwarded for the information of the Public Works Committee.—J. Barling, 7/8/89.

Roads, Sewerage Branch, Sydney, 7 August, 1889.

Subject :—Comparative cost of Western Suburbs Sewerage Scheme as proposed by Mr. Stayton and when proposed to be purified by electrolysis.

Northern Division.

1. In order to arrive at a comparison of the relative probable cost of the two different schemes, I had to ascertain first : what areas could be judiciously drained into one outlet on the shores of the harbour ; where the apparatus for purifying the sewage by electrolysis could be conveniently placed and constructed ; and from where the sludge could be easily shipped and deposited in deep sea water.
2. This outlet, I find, may be placed on the northern point of the peninsula between Iron and Long Coves, and the following areas : part of Strathfield, Concord, Burwood, part of Enfield, part of Five Dock, Ashfield, Petersham, Leichhardt, part of Camperdown, and Balmain, comprising a total of about 7,574 acres, can be drained to this point.
3. The Glebe, of about 371 acres, is drained as before into the Bondi sewer.

Southern Division.

4. The now, much curtailed, Southern Division, draining south as before, and proposed to be discharging on to the Sewage Farm, Webb's Grant, comprises the following areas : parts of Strathfield, Enfield, Canterbury, Marrickville, St. Peters, part of Newtown, part of Macdonaldtown, and part of Alexandria, of about 4,328 acres.
5. The revised scheme comprises, therefore, viz. :—

	acres.
Northern Division (paragraph 2)	7,574
The Glebe (paragraph 3)	371
Southern Division (paragraph 4)	4,328
Total	12,273

6. Mr. Stayton's original areas of the same territory are :—

	acres.
Western System (page 30 of his report)	10,632
Northern System (Balmain, Glebe, and Leichhardt)... ...	1,641
Total	12,273

The

The probable estimates of the cost of construction of main and branch sewers (reduced in size where practicable, &c.) for, and of purifying the sewage from the northern 7,574 acres by electrolysis, &c., would be as, viz. :—

	£	£
Cost of main and branch sewers		330,593
Probable cost of plant for electrical treatment :—		
10 100 h.-p. engines	10,000	
20 45 h.-p. boilers, at £450	9,000	
10 dynamos, at £350	3,500	
Copper, lead, fixing plates, machinery, etc....	2,800	
Engine sheds, stores, etc.	3,000	
3 settling tanks	18,000	
Cement troughs	7,300	
Cast iron plates	8,400	
Straining chambers, penstocks, etc.	2,000	
Land resumption at Long Cove	6,000	
Probable total	£70,000	70,000
Probable working expenses of cost—electrical treatment :—		
NOTE.—According to Professor Threlfall's published reports the working expenses would come to £4 19s. per million gallons; according to Mr. Engineer Macdonald's calculations it would be £3 2s. per million gallons; and in this calculation it has been reduced to £2 16s. per million gallons approximately.		
	£	
Coal, 9,400 tons, at 15s. per ton	7,050	
Salaries and wages, per annum	5,000	
Sundries	1,000	
Approximate annual working expenses	£13,050	
Which, capitalised at 4 per cent., gives		326,250
Probable cost of all main and branch sewerage works for the Glebe		32,507
Probable cost of construction of main and branch sewers (reduced in sizes where practicable) to discharge the sewage of the 4,328 acres of the revised Southern Division on to the Sewage Farm at Webb's Grant... ...		294,293
The working expenses of this scheme at £5,200 per annum, capitalised at 4 per cent.		130,000
NOTE.—The cost of removing the sludge from the settling basins to the deep sea is not included in the grand total, but is left to final consideration.		
Approximate total cost of the revised sewerage scheme... ...		£1,183,643

Mr. Stayton's original scheme of Western Suburbs would be :—	£
Original Western system, as per his report (*see* page 25)	602,211
Northern system	145,894
Working expenses at £5,650 per annum, capitalised at 4 per cent. ...	141,250
Total of Mr. Stayton's original estimate	£889,355

From the foregoing it will appear that the revised scheme including the electrical treatment would cost £1,182,393, whereas Mr. Stayton's proposed works for the same areas are set down at a total of £889,355 ; this shows the original scheme to be £293,038 cheaper than the revised electrical scheme.

C. H. OHLFSEN BAGGE, 7/8/89.

The Engineer-in-Chief of Sewerage, &c.

[To

[*To Evidence of Frederick Hammer, Esq.*]

L.

RE WESTERN SUBURBS SEWERAGE SCHEME—CHECK CALCULATIONS.

Roads and Bridges Department, Sewerage Branch,
Lincoln's Inn Chambers, August 19, 1889.

Sir,

In accordance with instructions received last Thursday from you, I forward herewith the result of my calculation of the points in question. My figures agree within a very small fraction with those of Mr. Stayton's. The slight increase of rate from 5·12d. in the £ per annum on £830,304 (cost of main sewers and other works) to 6½d. in the £ per annum on £1,817,896 (cost of final completion of entire scheme) results from Mr. Stayton's estimated ratable value in 1889 of £2,000,000 increasing to £3,300,000 on the final completion of the entire scheme.

The result of my calculation is as follows:—

Interest 4 per cent.

Section 2 of Appendix C1.

Interest and repayment on £830,304 in 28 years.

Interest and repayment	£49,829
Working expenses	5,650
Total	£55,479

Estimated ratable value in 1889, as per Report, £2,000,000.

1d. rate thereon will produce about £8,300 net.

Rate in pence per £: $\frac{55,479}{8,300}$ = 6·68d.

Section 2 of Appendix C1.

Interest and repayment on £830,304 in 60 years.

Interest and repayment	£36,778
Working expenses	5,650
Total	£42,428

Estimated ratable value in 1889, as before.

Rate in pence per £: $\frac{42,428}{8,300}$ = 5·11d. against 5·12d.

REPAYMENT UNDER EXISTING ACT.

Interest 4 per cent.

Sections 1, 2 and 3 of Appendix C1.

Interest and repayment on £1,445,045 in 28 years.

Interest and repayment	£85,532
Working expenses	5,650
Total	£91,182

Estimated ratable value in 1894, as per Report, £2,200,000.

1d. rate thereon will produce about £8,900 net.

Rate in pence per £: $\frac{91,182}{8,900}$ = 10·24d. against 10·25d.

Sections 1, 2, 3 and 4 of Appendix C1.

Interest and repayment on £1,817,896 in 28 years.

Interest and repayment	£109,097
Working expenses	12,296
Total	£121,393

Estimated ratable value on final completion of the entire scheme, £3,300,000.

1d. rate thereon will produce about £13,400 net.

Rate in pence per £: $\frac{121,393}{13,400}$ = 9·06d. against 9·25d.

REPAYMENT UNDER PROPOSED AMENDED ACT.

Interest 4 per cent.

Sections 1, 2 and 3 of Appendix C1.

Interest and repayment on £1,445,045 in 60 years.

Interest and repayment	£63,874
Working expenses	5,650
Total	£69,524

Estimated ratable value in 1894 as above.

Rate in pence per £: $\frac{69,524}{8,900}$ = 7·81d. against 8d.

Sections 1, 2, 3 and 4 of Appendix C1.

Interest and repayment on £1,817,896 in 60 years.

Interest and repayment	£80,355
Working expenses	12,296
Total	£92,651

Estimated ratable value on final completion as above.

Rate in pence per £: $\frac{92,651}{13,400}$ = 6·91d. against 7d.

REPAYMENT UNDER FURTHER AMENDED ACT.

Interest 3½ per cent.

Interest and repayment on £1,445,045 in 60 years.

Sections 1, 2, and 3 of Appendix C1.

Interest and repayment	£57,930
Working expenses	5,650
Total	£63,580

Estimated ratable value in 1894, as above.

Rate in pence per £: $\frac{63,580}{8,900}$ = 7·14d. against 7·25d.

Interest and repayment on £1,817,896 in 60 years.

Sections 1, 2, 3, and 4 of Appendix C1.

Interest and repayment	£72,874
Working expenses	12,296
Total	£85,170

Estimated ratable value on final completion as above.

Rate in pence per £: $\frac{85,170}{13,400}$ = 6·35d. against 6·5d.

The Chairman,
Parliamentary Standing Committee on Public Works.

F. HAMMER.

NEW SOUTH WALES.

COUNTRY TOWNS WATER AND SEWERAGE ACT OF 1880.

(BOROUGH OF GOULBURN—AMENDED BY-LAWS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 14, sec. 13.

Colonial Secretary's Office,
Sydney, 25th January, 1889.

GOULBURN MUNICIPALITY--AMENDED BY-LAWS UNDER COUNTRY TOWNS WATER AND SEWERAGE ACT.

THE accompanying Amended By-Laws, made by the Council of the Borough of Goulburn, under the "Country Towns Water and Sewerage Act of 1880," having been confirmed by His Excellency the Governor, with the advice of the Executive Council, are published in accordance with the requirements of the above cited Act.

GEORGE R. DIBBS.

AMENDED BY-LAWS OF THE BOROUGH OF GOULBURN.

THE following rate shall take effect from the first day of January and the first day of July in each year upon all lands and tenements within the area of any water district within which water is authorized to be supplied :—

1. The rates and charges hereinafter specified are those which the owners and occupiers of lands and tenements shall pay in respect of water supplied.

2. On every house, tenement, or plot of unimproved land there shall be paid to the Council for water supplied, otherwise than by meter and for domestic purposes only, the annual minimum sum of ten shillings, and in no case shall water be supplied at less than that sum.

3. On every house or tenement for water supplied otherwise than by meter and for domestic purposes only there shall be paid the rate of five shillings per room for each and every room in such tenement; all out-houses to be included except water-closets; in all stables every two stalls to be rated as one room.

4. The charges for water supplied by meter for steam-boiler purposes shall be at the rate of one shilling per thousand gallons, the minimum quantity to be charged for water supplied to any such boiler shall be five thousand gallons per month.

5. The charge for water supplied by meter for manufacturing and other purposes, unless otherwise specified, shall be at the rate of one shilling per thousand gallons; the minimum quantity to be charged for water supplied shall be three thousand gallons per month.

6. The charge for water supplied by meter to charitable institutions (hospitals excepted) for all domestic purposes shall be at the rate of two shillings per thousand gallons, the minimum quantity to be charged for water supplied shall be five thousand gallons per month.

7. The charge for water supplied by meter to cricket and bowling clubs, and all other pleasure or show grounds whatsoever shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for shall be two thousand gallons per month.

8. The charge for water supplied by meter for irrigation, gardens, nurseries, and private fountains shall be at the rate of two shillings per thousand gallons; the minimum quantity to be charged for shall be at the rate of two thousand gallons per month.

9. The charge for a temporary supply of water during the erection of new buildings and required for building purposes shall be at the rate of ten shillings per centum on the amount of contract for stonework, brickwork, and plastering, or the council may require a meter to be fixed and the charge shall be two shillings per thousand gallons.

10. The charge for warehouses and stores not being domiciles, shall be two shillings per thousand gallons; the minimum quantity to be charged for water supplied shall be two thousand gallons per month.

11. The charge for water supplied for motive power, public baths, and troughs in streets, shall be at the rate of two shillings per thousand gallons; the minimum to be charged for shall be two thousand gallons per month.

12. The Council may in any case in which it thinks fit where water is being used by any person for any purpose other than domestic purposes compel such person to use a meter, and such person shall either hire a meter from the Council, or purchase one at his own expense; and any person using water for such purpose as aforesaid, after being cautioned by the Council, or any of its duly authorized officers, not to do so until a meter shall be fixed, shall be liable at the discretion of the Council to have any of the pipes by or through which water is supplied to such person or for his or her own use cut off until a meter shall be provided and fixed for such person.

13. In case of a meter being hired from the Council by any consumer of water, such person shall pay for the hire of same in the following manner, viz. :—For three-quarter inch meter at the rate of five shillings per year, for one inch meter at the rate of seven shillings and six pence per year, and for one and a quarter inch meter at the rate of ten shillings per year.

14. All accounts for water supplied under special agreement or by meter shall be paid monthly.

15. Upon receiving a petition signed by two-thirds of the ratepayers in any public way in the said city or in any part of such way, the Council may cause the same to be watered, or they may in their discretion cause any public way to be watered, and may impose on the tenants or owners of buildings in such public way a uniform rate sufficient to cover the expense, which rate shall be assessed upon, and according to the amount for which such buildings are assessed for the purposes of the city rate, in addition to every other rate hereby authorized and made payable, and every such rate may be made, levied, enforced, and received in like manner as any city rate.

Amended by-law in substitution of existing by-law 143, and sub-sections 1 to 13, adopted by the Municipality of the Borough of Goulburn, this twenty-ninth day of November, 1888.

(L.S.) H. S. GANNON,
Mayor.

J. B. SALMON, Town Clerk.

NEW SOUTH WALES.

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND UNDER, FOR SEWERAGE PURPOSES, AT PADDINGTON.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16.

NOTIFICATION OF RESUMPTION OF LAND UNDER 44 VICTORIA No. 16.

NEW SOUTH WALES, to wit. } By His Excellency The Right Honourable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

(L.S.) CARRINGTON, *Governor.*

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the sewerage of the City of Sydney and its suburbs, in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the Loans Vote 52 Vic. No. 17: And whereas the lands hereinafter described are required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said lands are situated, declare that the lands hereinafter described have been resumed for the public purposes hereinafter mentioned, that is to say, for and in connection with the sewerage of the said City of Sydney and its suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said lands shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee, with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the lands hereinbefore referred to, that is to say:—

All that piece or parcel of land containing by admeasurement 2 roods 27 perches and four-tenths of a perch, situate in the parish of Alexandria, county of Cumberland, and Colony of New South Wales: Commencing at the north-west extremity of Good Hope-street, in the Municipality of Paddington; and bounded thence on the north by a line bearing north-westerly 101 degrees 20 minutes 36 seconds for a distance of 293·5 links; on the west by a line bearing south-westerly 30 degrees 53 minutes 51 seconds for a distance of 466·53 links to the northern boundary of a resumption for sewerage purposes, dated 18th July, 1881, and published in the Government Gazette No. 287 of 22nd July, 1881; thence on the south by a line running along the northern boundary of said resumption bearing south-easterly 296 degrees 24 minutes for a distance of 100·3 links; thence on the east by a line bearing north-easterly 210 degrees 53 minutes 51 seconds for a distance of 388·06 links; thence further on the south by a line bearing south-easterly 101 degrees 20 minutes 36 seconds for a distance of 195·9 links to the western extremity of Good Hope-street; and thence further on the east by Good Hope-street, being a line bearing north-easterly 26 degrees 25 minutes for a distance of 103·56 links, to the point of commencement, and being a strip of land one chain in width, said to be the property of J. R. Street.

Also, all that piece or parcel of land containing by admeasurement 1 rood 27 perches and six-tenths of a perch, situate in the parish of Alexandria, county of Cumberland, and Colony of New South Wales aforesaid: Commencing at a point on the western boundary of Alma-street, being the first angle in that street after it leaves Glenmore Road, and distant from said road about 280 links; and bounded thence on the south by lines bearing north-westerly 302 degrees 34 minutes and 96 degrees 43 minutes 37 seconds for distances of 141·63 links and 241·12 links respectively to Good Hope-street; thence on the west by the eastern boundary of that street, being a line bearing north-easterly 9 degrees 40 minutes 40 seconds for a distance of 47·3 links, and by a line curving westerly, having a radius of 66 feet for a distance of 54·3 links; thence on the north by lines bearing south-easterly 95 degrees 43 minutes and 97 degrees 11 minutes 52 seconds for distances of 116·8 links and 271·66 links respectively to Alma-street; and thence on the east by the western boundary of that street, being a line bearing south-westerly 11 degrees 20 minutes 30 seconds for a distance of 162·25 links, to the point of commencement, and said to be the property of J. H. Cole.

In witness whereof, I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this fifteenth day of March, in the year of our Lord one thousand eight hundred and eighty-nine, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

GOD SAVE THE QUEEN!

1889.

NEW SOUTH WALES.

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION, FOR EXTENSION OF SHEA'S CREEK CANAL.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16 sec. 6.

NEW SOUTH WALES, to wit. } Proclamation by His Excellency The Right Honourable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

(L.S.) CARRINGTON, *Governor.*

WHEREAS the Minister for Public Works is desirous of extending the navigable channel of Shea's Creek on the land described in the Schedule at the foot hereof, and for the purpose of confining the waters thereof within defined limits; and it is estimated that the cost of carrying out the said works will not exceed the sum of nineteen thousand nine hundred pounds: And whereas, under the provisions of the Public Works Act of 1888, I, the Governor aforesaid, with the advice of the Executive Council, have in due form directed that the said works shall be carried out under the provisions of the said Act by the Minister for Public Works aforesaid, who, in respect of the said works, I have declared shall be deemed to be the constructing authority; and also, that the land required for carrying out the said works shall be acquired under the provisions of the said Act: And whereas the land described in the Schedule at the foot hereof is the land required for carrying out the said works: Now, therefore, I, CHARLES ROBERT, BARON CARRINGTON, the Governor aforesaid, by this notification, to be published in the Government Gazette, do declare that the said land in the said Schedule described has been and is hereby appropriated for the purpose of making the channel of Shea's Creek navigable and abating the nuisance arising from its present undefined limits. To the intent that upon the publication of this notification in the Gazette, the legal estate in the said land hereafter described shall forthwith be vested in the Minister for Public Works, as the constructing authority on behalf of Her Majesty, under the provision in that behalf in the 21st section of the said Public Works Act of 1888: And I declare the following is the description of the lands hereinbefore referred to, that is to say:—

1st. All that piece or parcel of land situated in the parish of Alexandria, county of Cumberland, and Colony of New South Wales, being part of a grant of 1,400 acres to William Hutchinson, known as part of the Waterloo Estate, and containing 20 acres 2 roods 24 perches or thereabouts: Commencing at a point on the northern boundary of a grant of 12 acres 2 roods to P. and T. M'Guire, distant westerly 760·6 links from the north-eastern corner of the said grant to M'Guire; and bounded thence on the west by other part of the grant to W. Hutchinson, as follows:—By 539·38 links of a concave curve of 2,968·17 links radius, the chord of which bears north 55 degrees 56 minutes east 538·5 links; then north 61 degrees 8 minutes east 1,234·34 links; then by 733·56 links of a convex curve of 2,431·8 links radius, the chord of which bears north 52 degrees 29 minutes east 730·77 links; then south 46 degree 9 minutes east 1,136·3 links; then by 1,037·5 links of a concave curve of 3,568 18 links radius, the chord of which bears south 52 degrees 11 minutes west 1,033·8 links; then by a line bearing south 89 degrees 56 minutes west to the eastern boundary of the aforesaid grant of 12 acres 2 roods to P. and T. M'Guire; thence on the west and south by that grant, to the point of commencement, and said to be in possession of W. Cooper, and in the occupation of Hop Kee and others not yet ascertained.

2nd. Also, all that piece or parcel of land situated in the parish of Botany, county of Cumberland, and Colony of New South Wales, being part of a parcel of land adjoining the Gardener's Road on the northern side, grantee unknown: Commencing on the northern side of Gardener's Road, at a point distant 6,668 links westerly from its intersection with the western side of the Botany Road; and bounded thence on the east by 217 links of a concave curve of 1,831·81 links radius, the chord of which bears north 57 degrees 49 minutes east 213·12 links; then north 61 degrees 8 minutes east 1,234·34 links; then by 39·12 links of a convex curve of 3,568·18 links radius, the chord of which bear north 60 degrees 49 minutes east 39 links; thence on the north by a line bearing south 89 degrees 56 minutes west to the eastern boundary of Collins' 12 acres 2 roods grant; thence on the west by that grant southerly to the northern side of Gardener's Road; thence on the south by that road bearing north 89 degrees 47 minutes east 660·6 links, to the point of commencement,—containing 6 acres 2 roods 21 perches, or thereabouts. Owners and occupiers unknown.

3rd. All that piece or parcel of land situated in the parish of Petersham, county of Cumberland, and Colony of New South Wales, containing 10 acres 0 roods 26¾ perches or thereabouts, being part of portion 11: Commencing on the north-east side of a road 50 links wide from Botany to Newtown, known as Ricketty-street, at a point on the northern side of the said road, distant 269 5 links south-easterly from the southern corner of portion 10 of 4 acres 1 rood; and bounded thence on the west by other part of the said portion 11 as follows:—Bearing north 24 degrees 23 minutes east 98·5 links; then by 1,364 links of a concave curve of 2,968·17 links radius, the chord of which bears north 37 degrees 36 minutes east 1,352·14 links; thence on the north by W. Hutchinson's 1,400 acres bearing easterly 760 6 links to the foot of the embankment; on the south-east by that embankment south-westerly to Shea's

Creek; and by Shea's Creek downwards, dividing it from T. Walker's 11 acres and from part of T. Walker's 12 acres, to its intersection with the aforesaid road known as Ricketty-street; and on the south-west by that road, dividing it from part of portion 8 of 4 acres and 1 rood, bearing north 46 degrees 52 minutes west 601½ links, to the point of commencement,—being part of the land sold in pursuance of the proclamation of the 21st February, 1859, and said to be in the possession and occupation of — Collins.

4th. All that piece or parcel of land situated in the parish of Botany, county of Cumberland, and Colony of New South Wales, containing 3 acres 2 roods and 30 perches or thereabouts, being part of a grant of 11 acres to Thomas Walker: Commencing at a point on the southern side of a road 1 chain wide, known as Gardener's Road, distant westerly 6,781½ links from its intersection with the western side of the Botany Road; and bounded thence on the east by other part of the said grant, being 648·48 links of a convex curve of 1,831·81 links radius, the chord of which bears south 39 degrees 11 minutes west 645·4 links; thence on the south by T. Walker's 12 acres grant bearing north 89 degrees 10 minutes west 585½ links to Shea's Creek; thence on the west by that creek northerly to the southern side of the Gardener's Road aforesaid; thence on the north by that road easterly 931 links, to the point of comment, being part of the land sold as lot No. 80, in pursuance of the advertisement of the 11th May, 1839, and said to be in the possession and occupation of T. Walker.

5th. All that piece or parcel of land situated in the parish of Botany, county of Cumberland, and Colony of New South Wales, containing 1 acre 1 rood and 20 perches or thereabouts, being part of a grant of 12 acres to Thomas Walker: Commencing on the northern side of a road 50 links wide, known as Ricketty-street, at its intersection with Shea's Creek; and bounded on the south by that road bearing easterly 508·32 links; thence on the east by other part of the said grant as follows,—North 24 degrees 27 minutes east 151·76 links, then by 150 links of a convex curve of 1,831·81 links radius, the chord of which bears north 26 degrees 58 minutes east 149·74 links; thence on the north by a grant of 11 acres to T. Walker, bearing westerly 585½ links to Shea's Creek; thence on the west by that creek, to the point of commencement, being part of the land sold as lot 81 in pursuance of the advertisement of the 11th May, 1839, and said to be in the possession and occupation of — Keep.

Given under my Hand and Seal of the said Colony, at Government House, Sydney, this thirteenth day of June, in the year of our Lord one thousand eight hundred and eighty-nine, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,

BRUCE SMITH.

NEW SOUTH WALES.

LANDS FOR PUBLIC PURPOSES ACQUISITION ACT.

(RESUMPTION OF LAND FOR SEWERAGE, CITY OF SYDNEY AND SUBURBS.)

Presented to Parliament, pursuant to Act 44 Vic. No. 16, sec. 6.

NOTIFICATION OF RESUMPTION OF LAND UNDER 44 VICTORIA No. 16.

NEW SOUTH WALES, to wit. } By His Excellency The Right Honourable CHARLES ROBERT, BARON CARRINGTON, a Member of Her Majesty's Most Honourable Privy Council, Knight Grand Cross of the Most Distinguished Order of Saint Michael and Saint George, Governor and Commander-in-Chief of the Colony of New South Wales and its Dependencies.

(L.S.) CARRINGTON, *Governor.*

WHEREAS I, the Governor aforesaid, with the advice of the Executive Council of the said Colony, have duly sanctioned the carrying out of certain works for and in connection with the Sewerage of the City of Sydney and its Suburbs, in the said Colony, for and towards the completion of which said works public funds are available under the provisions of the Loans Act 52 Vic. No. 17: And whereas the land hereinafter described is required for the construction of the said works: Now I, the Governor of the said Colony, with the advice of the Executive Council of the said Colony, in pursuance of the powers in this behalf given to or vested in me by the "Lands for Public Purposes Acquisition Act," do, by this notification published in the Gazette and in a newspaper, that is to say, in the "Sydney Morning Herald," circulated in the Police District wherein the said land is situated, declare that the land hereinafter described has been resumed for the public purpose hereinafter mentioned, that is to say, for and in connection with the Sewerage of the said City of Sydney and its Suburbs, to the intent that upon the publication of this notification in the Gazette, the legal estate in the said land shall forthwith be vested in the Minister for Public Works and his successors, on behalf of Her Majesty, for the purpose of the said last-mentioned Act, for an estate of inheritance in fee simple in possession, freed and discharged from all trusts, obligations, estate, interests, contracts, charges, rates, rights-of-way, or other easements whatsoever; and to the intent, further, that the legal estate therein, together with all powers incident thereto or conferred by the said Act, shall be vested in the said Minister as a trustee with the powers stated in the said last-mentioned Act: And I declare that the following is the description of the land hereinbefore referred to, that is to say:—

All that piece or parcel of land containing by admeasurement 5 perches and three-fifths of a perch more or less, situated in the parish of Alexandria, county of Cumberland, and Colony of New South Wales, and being part of allotment number eight, section fifteen, on the plan of the subdivision of the Underwood Estate deposited in the Lands Titles Office, Sydney, and numbered 238: Commencing at the south-east corner of allotment 8 on the said plan; thence bounded on the south-west by a line, being the south-west boundary of said allotment 8, bearing north-west 309 degrees 21 minutes for a distance of 154·4 links to Point Piper-lane; thence bounded on the north-west by the south-eastern boundary of that lane, being a line bearing north-east 27 degrees 3 minutes 39 seconds for a distance of 23·26 links; thence bounded on the north-east by a line bearing south-east 129 degrees 21 minutes for a distance of 154·6 links to Point Piper Road; and thence bounded on the south-east by the north-western boundary of that road, being a line bearing south-west 207 degrees 34 minutes 30 seconds for a distance of 23·21 links, to the point of commencement, and said to belong to H. Zions.

In testimony whereof I have hereunto set my Hand, and caused the Great Seal of the Colony to be hereto affixed, at Government House, Sydney, this seventeenth day of June, in the year of our Lord one thousand eight hundred and eighty-nine, and in the fifty-second year of Her Majesty's Reign.

By His Excellency's Command,
