## INSPECTION OF MINES OTHER THAN COAL AND SHALE MINES.

The Chief Inspector of Mines (Mr. Slee, F.G.S.) reports that during the past year there have been 19 fatal and 24 non-fatal accidents in connection with the metallic mines of this Colony, being an increase of 1 fatal and a decrease of 4 non-fatal accidents as compared with 1892. The percentage of fatal accidents, it is gratifying to observe, is much lower than in 1892, being '96 as against 1'04, so is also the non-fatal accidents, which is 1'20, as compared with 1'60 during the previous year. Of the fatal accidents 3 were caused by falling down shafts, 9 from fall of earth, 3 from explosion of shot, 1 through being crushed by machinery, 1 from being run over by truck, and 2 from miscellaneous causes. The non-fatal accidents—5 were due to falling down shafts, 4 to fall of earth, 1 to explosion of shot, 7 to run-away cage (6 of them being due to the one accident), and 7 miscellaneous. During the year there was 1 fatal accident for every 1,037 miners employed as against 1 in every 963 miners employed during 1892. The number of persons employed in all classes of metallic mining was, at the end of the year, 19,709, as compared with 17,332 in 1892. The principal increase is in connection with alluvial gold-mining, no doubt due to the large number of fossickers sent from Sydney to the various gold-fields.

The undermentioned localities were visited and inspected during the year:—

*By the Chief Inspector.*

Adelong, Gundagai, Gunning, Goulburn, Temora, Barmedman, Yalgogrin, Grenfell, Forbes, Parkes, Burra Burra, Mount Hope, Mount Allen, Billigoe, Bee Mountain, Cobar, Peak Hill, Alectown, Wellington, Lucknow, Bathurst, Orange, Dubbo, Nymagee, Armidale, Uralla, Sherwood, Hillgrove, Glen Innes, Glen Elgin, and Deepwater, the Chief Inspector at the same time dealing with applications under the Prospecting Vote.

*By Inspector Milne.*

In the Northern District:—Nana Creek, Grafton, Cangi, Mann River, Glen Elgin, Dalmorton, Newton Boyd, Tenterfield, Drake, Rivertree, Deepwater, Emmaville, Torrington, Glen Innes, Bear Hill, Inverell, Tingha, Kookabookra, Bingara, Tamworth, Swamp Oak, Niangala, Armidale, Hillgrove, and Copeland.

In the Southern District:—Wagonga, Bodalla, Nerrigundah, Araluen, Nelligen, Brimbramalla, Tarago, Bungonia, Nadgingomar, Goulburn, Crookwell, and Coolamin.

In the Western District:—Kerr's Creek, Ophir, Lewis Ponds, Orange, Forest Reefs, Burnt Yard, Carcoar, Woodstock, Mandurama, Galley Swamp, and Mount McDonald.

The Inspector observes a very noticeable improvement both on the surface and underground workings, due, no doubt, to the more frequent inspection of the mines, the regulations being generally complied with. Mr. Inspector Milne, as a member of the Prospecting Board, has also reported on a large number of applications for aid during his visits of inspection.

*By Inspector Hebbard.*

Mr. Hebbard's head-quarters are at Broken Hill, and he makes frequent inspections of the very important mines in that district. He also inspected during the year the districts of Thackaringa, Umberumberka, Purnamoota, Day Dream, Tarrawingee, Euriowie, Nuntherungie, White Cliffs, Mount Browne, and Tibooburra. The Inspector reports that the regulations in his district are generally complied with.

*By Acting Inspector Godfrey.*

In the Southern District, Pambula, Cobargo, Bimbimbie, Nelligen, Yalwal, Braidwood, Major's Creek, Boro, Captain's Flat, Cooma, Kiandra, Adelong, Gundagai, Temora, Cullinga, Young, Grenfell, Junee, and Albury. In the Northern Districts, Deepwater, Emmaville, Dalmorton, Nana Creek, Cangi, Hillgrove, Nundle, Stewart's Brook, Moonan Brook, Niangala, and Swamp Oak. With very few exceptions the regulations were found to be generally complied with.

*By Acting Inspector Atherton.*

The urgent need for retrenchment was the sole occasion of dispensing with Mr. Atherton's services at the end of the year. Although only a short time in the Department, Mr. Atherton has always performed his duties very satisfactorily. During the year he visited and inspected the following districts:—Drake, Orange, Lucknow, Carcoar, Blayney, Mandurama, Woodstock, Canowindra, Wattle Flat, Sofala, Hill End, Hargraves, Windeyer, Stuart Town, Wellington, Ironbarks, Cobar, Peak Hill, Alectown, Parkes, Forbes, Newbridge, Rockley, Oberon, Gulgong, Denison Town, Trunkey, Tarana, Sunny Corner, King's Plains, and Bathurst.

## DIAMOND DRILLS.

The aggregate depth bored during 1893 was 1,903 feet 7 inches, or 2,235 feet 6 inches less than during the year 1892.

The average cost per foot for boring in 1893 was 18s. 1½d., as compared with 16s. 0½d. in 1892, the extra cost being due to larger diameter, deeper boring, and difficult nature of strata passed through.

Diamonds used in 1893 cost 3s. 3¼d. per foot, as compared with 2s. 2d. in 1892. But

But for the diamonds used in 1893 for clearing the Cremorne and Yacaaba bores of obstructions the cost per foot would have been considerably less than in 1891 or 1892.

The earnings of the diamond-drills during the year amounted to £2,489 0s. 8d., and the amount paid into the Treasury was £1,900 9s. 11d.

#### GOVERNMENT METALLURGIST.

This officer (Mr. James Taylor, B.Sc., A.R.S.M.) arrived in Sydney middle of February, 1893. On the 23rd February, visited Mt. Stewart, where several days were spent in going over the mine and works and the discussion with the managers of proposed changes in the treatment of the ores. Also visited Dynever Mine and mines at or near Pine Ridge.

On the 28th, reached Mitchell's Creek Mine, Wellington, and spent a couple of days about one of the most substantial mines in the Colony. Thence, on the 4th March, reached Peak Hill and inspected the various batteries and mines, leaving on the 8th for Orange. From here inspected the Lucknow and Lewis Ponds mines, and also the Ironclad and other mines at Cargo. On the 13th visited Mandurama, for Burnt Yards, Junction Mine, and Galley Swamp. On the 16th reached Tuena, and saw Mt. Costigan, the Abercrombie alluvial deposits, and subsequently Mt. Grey, Hidden Treasure, and other mines in the neighbourhood of Trunkey Creek. On the 18th inspected the Silver battery, at Back Creek, near Rockley, and thence proceeded to Sunny Corner.

At Sunny Corner went all over the works and through such of the mines as were accessible, also visiting at Dark Corner the Lackey Mine, Homeward Bound Mine, and Johnson's Prospecting Shaft, returning to Sydney on the 24th March.

On 12th April proceeded to Rivertree, by direction of the Minister, at the request of the directors of the Rivertree Prospecting Silver-mining Co., to inspect their works, and to meet the directors on the ground, and to advise them; and subsequently a report was made to the Under Secretary. Other mines in the district were visited, but excessively wet weather somewhat hampered one's movements.

On 17th April reached Fairfield, and inspected White Rock, Mt. Carrington, Mascotte, Long Gully, and other mines in the vicinity, returning to Sydney on the 21st.

On 26th June went to Emmaville, and from thence visited the tin deposits about that district at Y Waterholes, Tent Hill, and Butler's Reef; also the argentiferous mines at Webb's Consols, Mt. Galena, and Webb's Mine. On 3rd July, went to Deepwater, and from thence visited Castle Rag, Pearce's Hill, Nine-mile, Castle Wellington, and Trollope Swamp. On 8th July, reached Glen Innes, and thence to Glen Elgin. Here, with unlimited water power and apparently a sufficiency of ore, the field should repay attention.

On 10th July reached Hillgrove, and inspected the various mines and works, also paying a visit to the Rockvale Mine. This field affords much scope for metallurgical investigation, and well-directed effort must result in considerable economies in the treatment of the combined antimony and gold ores which abound here. Returned to Sydney on the 15th.

On 17th August started for Marulan and the south, as far as Pambula. Reports were furnished on the Carrington Mine, at Marulan, on Captain's Flat, and a general report on Boro, Major's Creek, Araluen, Moruya, Nerrigundah, Mount Dromedary, Montreal, Coolagolite, Nelson, and the Pambula Fields. Returned to Sydney on 16th September.

On 14th November went to Mitchell's Creek Mine, Wellington, to inspect the McArthur-Forrest cyanide process at work there treating old tailings. Returned on the 18th and reported.

On 5th December left for Bingera and Barraba. At the former place inspected the Top Bingera Gold-mine, a newly-opened mine at Barrack's Creek, more recently named the Perseverance, Low's Shaft, on the basalt, about 8 miles from Bingera, and an old shaft a mile from that; the Monte Christo Diamond-mine, Smith's claim, and others, also Smith's Cinnabar Mine and All Nations battery, now standing. From Barraba, visited Wood's Reef, where good gold is being found, thence to Wyeth's claim and King Solomon's Mine.

The chief object in going to Barraba, however, was to visit the copper mine and smelting works at Gulf Creek, 20 miles from Barraba. Unsuccessful attempts had been made to smelt the ore, and the directors of the Cornish Copper Company wrote to this Department for assistance in their difficulty. As a result of the visit they are now successfully smelting copper there, and sending it to Newcastle for refining, much to the satisfaction both of directors and smelters. Returned to town on 14th December.

The Peak Hill Proprietary Gold-mining Company, owing to lack of water, had to make use of the water pumped from their mine. This contained copper, sulphuric acid, and other compounds, and the amalgamation was seriously prejudiced. A sample of the water was supplied to the Department for analysis

analysis and experiment. Eventually it was recommended to add to the 12,000 gallons daily taken from the mine about 2 cwt. of quicklime. The result of this treatment is reported to be exceedingly satisfactory; much less trouble is experienced with the copper-plates, and the assay value of the smelted gold is very decidedly increased.

#### SITE FOR METALLURGICAL WORKS.

Owing to the uncertainty as to the action that would be taken by Parliament on the question of a special site for noxious trades, nothing could be done towards securing a site for the proposed works. As soon as action could be taken, possible sites were visited, and it is expected that a suitable one will shortly be secured, and it is hoped that during 1894 the necessary buildings will be erected, and the works placed in going order.

The visits of the Metallurgist to the various mining localities have served the double purpose of acquainting him with the character of our deposits, and enabling him to advise mine-owners upon the modes of treating ores, and suggesting improved methods. It is gratifying to note that some mine-owners have acknowledged that the advice given has enabled them to treat successfully ores that had previously baffled all their efforts.

#### SCHOOL OF MINES.

Provision has now been made for giving in this Colony as complete and effective a training in mining as can be obtained even in Great Britain. As the projector (if I may be permitted to apply that term to myself) of the Ballarat School of Mines, I am perhaps prejudiced in favour of that very excellent institution, but, notwithstanding that, I feel bound to say the training which is being provided in Sydney is, or will shortly be, in every respect equal to the instruction in mining obtainable there.

Indeed, when the Government metallurgical works shall be in operation, there will, thanks to the kindness of the owners of private metallurgical works, and the owners of mines who permit students to visit, inspect, and have explained to them the various processes, be nothing wanting to make the course of instruction here as complete as could be desired, unless it be (and that I trust will come in good time) that mine-owners may permit their managers to take as articulated pupils or otherwise young men who desire to become mining managers or mining engineers, for, say, one or two years practical mine work, with this addition to the course provided, we should be able to turn out mine managers and mining engineers equal to any in the world.

The course at the School of Mines recently established at the Sydney University includes chemistry, practical chemistry, geology, mineralogy, microscopical petrography, metallurgy, assaying in all its branches, mining, engineering, mechanical drawing, surveying, mathematics, &c. The students in mining and metallurgy, in addition to the instruction in the class-room, are accompanied to metalliferous mines, collieries, and ore-reducing and smelting works, where the operations are explained to them by the lecturers. The course of instruction leads up to the degree of Bachelor of Mining Engineering, but the various classes are open to occasional students, or students who do not desire to take the whole course as well as to matriculated members of the University.

The School of Mines was in operation during the whole of 1893, and though the number of students was small it is confidently expected that, as the advantages of the school become more generally known, the number will increase, and that ere long a sufficient number of trained mining engineers will be turned out to meet the requirements of mining in this Colony. A very fine building, containing lecture-rooms and class-rooms for practical instruction is nearing completion, and will very shortly be supplied with a valuable collection of models to illustrate the lectures on mining, &c., which are being obtained from Europe.

At the Technical College in Sydney, instruction (including laboratory practice) in all branches of geology, mineralogy, chemistry, metallurgy, and mining is provided, and students are taken, in charge of a teacher, at convenient times, to different localities, where they can obtain a practical insight in geological field work and mining operations.

The Technical Education Branch of the Department of Public Instruction, to meet the requirements of young people in the country, also provides instruction locally at the Branch Technical Schools, as follows:—

*Bathurst—*  
Chemistry,  
Geology,  
Mineralogy,  
Mineral Prospecting.

*Goulburn—*  
Chemistry,  
Assaying,  
Geology,  
Mineralogy.

*Newcastle—*  
Chemistry,  
Metallurgy,  
Geology,  
Mineralogy,  
Coal-mining,  
Mine Surveying.

And special facilities are offered by the Senate of the University for students at the Technical College to complete their course at the University.

While

While fully recognising the skill and great practical experience of the managers of our mines, I trust I may be pardoned for saying that the value of having thoroughly trained scientific men available as mining managers cannot fail to effect improvements in our methods of mining and treatment of ores; and it must be an advantage to the youths of this Colony to have such facilities for qualifying for these important positions.

#### MINERAL PRODUCTS.

I am pleased to be able to report that the total value of our mineral products at the end of 1893 exceeded the sum of one hundred million sterling, the exact figures being £104,280,711 4s. 7d. A large decrease is shown in the output of coal during the year, the quantity raised in the year 1893 being more than half a million tons less than in 1892, representing a loss of £290,664. The decrease in the output of shale, tin, and copper is also very serious. This loss is, however, more than made up by the large increase in the value of the gold, silver, and lead produced, bringing up the total value of the minerals won during the year to £5,438,532 3s. 2d., which exceeds the output of 1892 by £132,716 15s. 6d., and the decennial average by £1,117,809.

It is to be hoped that we shall ere long be able to recover our export trade in coal, and if some means could be devised whereby the traffic charges could be so reduced as to admit of ores being brought to coal, it might perhaps be possible to treat successfully poor ores, of which we have vast quantities which cannot be profitably treated on the mines owing to the cost of fuel. This problem is now engaging the attention of the Department, and if the difficulties which at present appear insuperable can be overcome, the home consumption of coal will be enormously increased, as will also our output of minerals. The decrease in our output of tin is no doubt mainly due to the exhaustion of the principal known shallow deposits of alluvial tin ore. There is, however, a strong belief that deep leads of alluvial tin exist, and prospecting operations have for some time past been carried on in the Northern districts, but, owing to the heavy influx of water to be contended with, these operations have not so far been successful.

In view of the financial depression of the year, and the low price of several of the metals produced in this Colony, the result shown in the following must, I venture to think, be regarded as eminently satisfactory.

The following table shows the aggregate value of minerals, the produce of New South Wales, for the years 1892 and 1893 respectively compared:—

| Minerals.                   | Quantity.         |  | Value.    |      | Quantity.         |  | Value.    |      | Increase in Value. |       | Decrease in Value. |      |
|-----------------------------|-------------------|--|-----------|------|-------------------|--|-----------|------|--------------------|-------|--------------------|------|
|                             | 1892.             |  | £ s. d.   |      | 1893.             |  | £ s. d.   |      | £ s. d.            |       | £ s. d.            |      |
| Gold .....                  | 156,870·00 oz.    |  | 569,177   | 17 4 | 179,288·02 oz.    |  | 651,285   | 15 8 | 82,107             | 18 4  |                    |      |
| Silver* .....               | 350,661·50 „      |  | 56,884    | 0 0  | 531,972·00 „      |  | 78,131    | 0 0  | 21,247             | 0 0   |                    |      |
| Coal .....                  | 3,780,967·71 tons |  | 1,462,388 | 9 4  | 3,278,328·36 tons |  | 1,171,722 | 4 6  |                    |       | 290,666            | 4 10 |
| Shale .....                 | 74,197·15 „       |  | 136,079   | 6 0  | 55,660·30 „       |  | 101,220   | 10 0 |                    |       | 34,858             | 16 0 |
| Coke .....                  | 7,899·00 „        |  | 8,852     | 8 6  | 17,858·00 „       |  | 20,233    | 2 0  | 11,380             | 13 6  |                    |      |
| Tin .....                   | 3,492·10 „        |  | 314,114   | 0 0  | 2,784·90 „        |  | 229,743   | 0 0  |                    |       | 84,371             | 0 0  |
| Copper .....                | 4,834·20 „        |  | 187,706   | 0 0  | 2,067·00 „        |  | 58,426    | 0 0  |                    |       | 129,280            | 0 0  |

\* The greater part of the silver produced is exported in the shape of silver lead.

† Not manufactured from the ore, but old iron.

The following Return shows the Quantity and Value of Gold, Coal, Shale, Copper, Tin, Silver, Silver-lead Ore, and the several other Metals and Minerals produced in the Colony of New South Wales during the last ten years:—

## GOLD.

The output of gold from the opening of our gold-fields to the end of 1893 amounts to 10,709,610 oz., valued at £39,853,941 10s. 10d. The quantity won last year was 179,288 oz., valued at £651,285 15s. 8d., being the largest output of any year since 1875. No doubt this satisfactory result is due somewhat to the large number of unemployed men assisted to the gold-fields as fossickers, and to the important discoveries made from time to time by parties aided out of the Prospecting Vote. It affords me much pleasure to note that some of the discoveries made towards the end of the year appear to give promise of a moderate revival in gold-mining and to justify the belief that our output of gold for 1894 will exceed that of the past year. If my anticipations in this direction should be realised, it is possible that the trouble in regard to our own unemployed will be to some extent solved, but unfortunately our efforts to help them have, I fear, had the effect of attracting the unemployed from other colonies to this.

TABLE showing the Quantity and Value of Gold won in the Colony of New South Wales from 1851 to 1893.

| Year.    | Quantity in oz. | Value.          | Year.    | Quantity in oz. | Value.           |
|----------|-----------------|-----------------|----------|-----------------|------------------|

The following extracts taken from the reports, sent in by the Wardens and Mining Registrars, indicate the condition of mining in the various Mining Districts and Divisions in the Colony during last year:—

## BATHURST DISTRICT.

During the earlier part of the year mining matters were very dull in this District; but the advent of a large number of fossickers to the District helped to liven up matters considerably. Some of these men did very well, making full wages, and the winter being wet, it let the sluicers get to work, who had been idle for want of water.

At Trunkey 200 men are at work on that field, and the gold won during the year was 700 oz. The majority of them, however, arrived about the end of the year. M'Vicar and party, at the Mountain Run, have spent a large sum of money during the year, in the construction of a race from Ford's Creek, about 12 miles away. They have just begun work, and are well pleased with their prospects; the largest nugget they found weighed 6 oz. Vivian and party are still hard at work on their gold lease; but the large influx of water is a great drawback. A Bathurst syndicate is, however, preparing to pump the water out of their shafts. Several parties have taken up ground on the range in front of the township, and are hard at work, with good prospects. At Scabbing Flat a Calcutta syndicate have been working for the last eighteen months some gold leases, and their representative, Mr. C. H. Clarth, is now in Calcutta on business in connection with the better working of the property. The Mount Gray Leases have only been employing half labour during the year. I understand the proprietor has succeeded in forming a syndicate in London to work the mine. The syndicate sent out a gentleman to furnish a report to them, and it is probable that something definite will be known very shortly as to their intentions.

At Burruga a good many men are fossicking in the vicinity, with some success; they can, at any rate, earn a living. Reid and party, at Golden Gully, on the Isabella River, have, after doing a considerable amount of work, been successful in striking the reef, showing good gold. Mann and party, near Mount Werong, are working the surface with some success.

In the Rockley Division 428 oz. of gold were won, valued at £1,607.

At Bunnamagoo a rich patch of alluvial was struck by Taylor and party, but it was soon worked out. A little work is being carried on at Native Dog Creek.

In Oberon Division about 50 men are at work, and produced 185 oz. of gold, valued at £670. It is difficult to trace all the gold won in this Division. As there is no battery in the vicinity the miners live by picking out the specimens and crushing them by hand. At a place called Tugalow, about 25 miles south of Oberon, there is one claim on payable gold, and as there is a lot of prospecting being done in the locality, it is expected that other claims will be paying expenses before long.

In the Lithgow Division about 60 men are engaged in gold-mining, but the quantity of gold won by them is not ascertainable.

The Sunny Corner Division has produced for the year 1,163 oz. of gold, valued at £4,437.

The Paddy Lackey Mine raised 789 tons of quartz, but only crushed 389 tons, which yielded £1,236 worth of gold, and the balance is expected to yield £1,600 at least.

The St. George Company put through 800 tons for 350 oz. of gold. About 150 men are fossicking on the Willawa, Daylight, Mitchell, and Bob's Creeks, and are apparently making a living.

In the Bathurst Division the Napoleon Reef Company, of Glanmire, is the only company at work, but nearly 200 men are fossicking in the neighbourhood. The total output of gold for this Division being 461 oz., valued at £1,535. Newbridge reports that the total amount of gold won in the Division during the year was 508 oz., valued at £1,905. Two batteries have now been erected, which crushed during the year 790 tons, for a yield of 293 oz. Luck and party, working on Smith's Freehold, obtained 58 oz. in a very short time from a rotten quartz-vein. A new reef was discovered about midway between Trunkey and Newbridge, at the head of the old workings at Garibaldi Gully, by M'Kellar and party, 5 tons from which yielded 11½ oz. of smelted gold. Maybury and party, at the Sugarloaf, crushed 30 tons for 32 oz., and had a similar crushing ready at the end of the year, expected to give a better return than that.

At

At Lucknow operations are being vigorously carried on, and about 330 persons are employed in connection with the mines.

The Wentworth Proprietary Company crushed, during the year, about 10,000 tons of stone for a yield of 8,992 oz., valued at £35,262, and the Aladdin Lamp Company 2,500 for 5,636 oz., valued at £21,966.

At Forest Reefs several parties are hard at work, sinking through the basalt.

Lawler and party have succeeded in bottoming on wash-dirt yielding half an ounce to the load. There is a good future before this field, and the last discovery has caused quite a stir.

At Lewis Ponds and Ophir mining is very dull; but at Cadia a lot of work has been done at Swallow Creek, and a large sum spent in the erection of machinery, but no very great results have yet been achieved.

In the Blayne Division 1,590 oz. of gold were won, valued at £5,007 7s. 1d.; of this the Brown's Creek Gold-mining Company crushed 1,760 tons of conglomerate vein-stone, for a yield of 440 oz. A rush took place to Marsden's paddock (freehold), where 50 oz. were taken by the prospectors from a shallow trench. The land was thrown open by the owner, when a large number of claims were taken up; but in most cases the results were not up to expectation.

The Carcoar Division returned 2,640 oz. of quartz, and 119 oz. of alluvial gold during the year, valued at £10,389.

The Nil Desperandum claim, at Galley Swamp, contributed £1,280 worth of that amount, and the Duke Claim crushed 67 tons for 149 oz., valued at £522.

Jarvis's sluicing claim, at Flyer's Creek, put through 10,000 loads for an average yield of 4 dwt. per load.

The Mount McDonald Division yielded 1,271 oz., 738 oz. of which were taken from 3,470 tons of old tailings.

There is a prospect of the Hong Kong Company, who own the Balmoral leases, resuming work at an early date.

At Scrubby Rush, about 6 miles from Mount McDonald, several leases are working with very fair prospects; but the want of a battery on the field prevents the ground being properly tested, and retards progress.

At Canowindra mining operations are being carried on vigorously, the discovery made by Messrs. Mylechrae and party on the London Reef, Boney's Rocks, having caused quite an excitement. The party were receiving aid from the Prospecting Vote, and from the drive at the 250-ft. level took a parcel of 6 tons stone, which yielded 10 oz. to the ton.

The Blue Jacket Reef at Belmore, about 2 miles from Canowindra, yielded 735 oz. during the year.

At Cowra mining matters are very quiet, and only 200 oz. were won, valued at about £750, principally obtained at Tenandra, about 9 miles from Cowra, by McGuinness Brothers, from their own selections, for which they have obtained permits.

The Tuena Division yielded 1,217 oz. of alluvial gold, valued at £4,563 15s., and 345 oz. of quartz gold, valued at £1,196 10s. To the total yield the Excelsior Company contributed 100 oz. from 186 tons of stone; the Enterprise Company, 30 oz. from 40 tons; and Donnelly and Davidson, 155 oz. from 155 tons. The latter party have, however, sold out to the Harrogate Gold-mining Company, who are proceeding with the erection of a 10-head battery, and as there is a large quantity of fair quality stone to put through, the crushing plant will be kept busy for some time to come. Lawson and party's race and dams are nearly completed, and they will be in full work at an early date. Good returns are expected from this party.

#### MUDGEE DISTRICT.

A great deal of prospecting is being done in this District, a large number of the men being assisted fossickers, who who are earning a living, some of them doing fairly well. In the Mudgee Division of this District 3,975 oz. of gold were won, which is a large increase on the yield for last year. Several parties are working in Crossing's paddock (private land), and all of them are on payable gold. In Cadell's paddock three parties are obtaining payable gold at a depth of 5 feet. A large number of fossickers are working at Apple-tree Flat and making good wages. About fifty men are working on Lowe's and Blackman's selection, and some on the mining reserve. A miner named Lynch got a 5-oz. nugget on the reserve at a depth of 6 feet.

In the Gulgong Division about 250 men are at work, and 1,436 oz. of gold have been won. The English Company are still at work on the Black Lead, but they have not met with the success their perseverance and the amount of capital they have expended deserves. Work is proceeding in Morrissey's paddock, and good results have been obtained. There is a large quantity of wash-dirt from this paddock awaiting treatment, which promises to turn out well. In the Hargraves Division mining matters have been rather dull during the year. The New Hargraves Gold-mining Company have with great perseverance carried on operations, but, unfortunately, without finding a payable reef. This Company have expended a very large sum of money on this property in prospecting work. About 150 men are earning a living by fossicking in the vicinity, and have produced about 750 oz. of gold, averaging 76s. per oz.

In the Windeyer Division the quantity of gold produced was 1,800 oz., principally from alluvial. One hundred and twenty Europeans and 60 Chinese are at work on the field. Since the stoppage of the Mount Stewart Silver Mine, at Denison Town, about 30 men have been prospecting for gold at Tucklan, which lies 9 miles south-westerly from Denison Town. The wash is thin and patchy, but still they have been able to earn a living, and some of them rather more than wages.

In the neighbourhood of Rylstone a few miners are at work fossicking for gold, and obtained about 60 oz.

The Peak Hill Division produced during the year 11,380 oz. of gold as compared with 10,070 oz. during 1892, 8,908 oz. of the yield being from lode-stuff, and the balance 2,472 oz. from alluvium.

The Proprietary Company crushed 10,164 tons for 4,727 oz. the Great Eastern, 1,678 tons for 1,194 oz.; the Great Western, 1,481 tons for 527 oz.; the Crown of Peak Hill, 500 tons for 200 oz.; Wythes and Mooney, 311 tons for 165 oz.; and various other mines, 1,276 tons for 2,035 oz. The return of about half an ounce per ton from such a large body of stone as that crushed is very satisfactory, and as there is an immense body of similar stone in the mines the permanency of this field is, I think, assured. Some of the companies are proceeding with the erection of further crushing machinery. A great drawback to the field is, however, the want of a permanent and sufficient water supply. The bark huts at first erected are gradually giving way to commodious and permanent structures in the township.

In the Wellington Division over 200 men are employed in gold-mining, principally by the Mitchell's Creek Freehold Gold-mining Company, under the management of Mr. Philip Davies. During the year this Company raised 5,756 tons of quartz, which yielded 3,095 oz. of gold, and treated 316 tons of pyrites for 1,379½ oz. There is every reason to believe that this Company will be in a position to give permanent employment to a large number of men for many years to come. Under an arrangement with the Company, the M'Arthur Forrest Company, have erected cyanide works for the treatment of tailings; about 20 men are employed in the work, and 70 tons are twice turned over daily. The tailings are estimated to contain 8 dwt. to the ton, and about 70 per cent. of the average is being obtained. The total quantity of gold won in this Division being 305 oz. from alluvium and 4,475 oz. from quartz valued at £16,958 6s. 7d.

#### TAMBABOORA AND TURON DISTRICT.

The Hill End Division of this District yielded 2,916 oz. of alluvial and 1,211 oz. of gold from 1,169 tons of quartz valued in all at £15,888 14s. 1d., as compared with £11,555 9s., the value of the gold produced in 1892. The principal companies in this Division are the Hill End United, on Prince Alfred Hill, the Hawkins Hill Mining Company, on Hawkins' Hill, and the Chambers' Hill Mining Company, at Chambers' Creek, and they employed the bulk of the miners in the district. Two private parties are on payable gold, viz., Carver and Davey, and Clymo and party. These parties were in receipt of aid from the Prospecting Vote, and the discoveries have given an impetus to prospecting work in the locality with very fair results. The number of men employed on the field are 153 Europeans and 47 Chinese.

The Sofala Division produced 5,326 oz. of gold during the year, being an increase of 844 oz. on the previous year. This was no doubt owing to the wet season, which allowed a large number of men to get to work in the creeks, and also to the number of "fossickers" sent to that locality from Sydney, some of whom were fairly successful. Wrench and party obtained 31 oz. in six weeks, all nuggety gold, from 10-oz. pieces down. Herriott and party also secured, in a very short time, 64 oz. at Maitland Bar, and at Golden Point, Bennett Bros. won 85 oz. from their sluicing claim; Meni and party, at the Big Oakey, crushed 725 tons for 1,480 oz. of gold, and the No. 1 Surface Hill crushed 335 tons of rubble for 46 oz. of gold. In Little Oakey Creek Campbell and party sluiced away some of the old workings, and obtained a large quantity of gold. At Redbank Gully, Johnstone and Prosper found a rich run of gold in some partially tested ground, and obtained 200 oz. of nuggety gold, one piece weighing 30 oz. As the nuggets were slightly mixed with ironstone, strict search was made for a lode, but without success. Reilly and party, at Middle Creek, have been steadily at work during the year with payable results, their last crushing being 30 tons for 42 oz. Two parties are at work in Reilly's Creek, and have struck a reef running from 2 to 4 feet thick, averaging 11 dwt. per ton. A large increase in the output of gold is expected from this Division during the present year.

The

The Ironbarks Division returns show that 200 gold miners are employed, principally in alluvial, and won 2,493 oz., valued at £9,450. The Golden Gully Gold-mining Company are still working, and crushed during the year 679 tons for 221 oz., and Curnow and party, on the Chump Reef, 317 tons for 270 oz. In this locality the principal quartz reefs have now been worked out to water-level, and pumping machinery is now a necessity before further operations can be carried on to any great extent. To this cause is attributed the reduction in the quantity of quartz gold won during the year, which was about one-half that produced in 1892.

#### THE LACHLAN DISTRICT.

In the Alectown Division of this district mining operations are very quiet, the alluvial ground being to a great extent worked out. A few claims are, however, still being worked in Watts' Paddock and on Crown lands. The Prospector's Claim is still producing a little gold, 187 loads being washed during the year for 104 oz. 6 dwt. 10 gr. The returns from the quartz reefs being worked in the vicinity have not reached expectations, but it is expected that the returns will improve as greater depth is reached. A company erected a battery on the field, but they disposed of it fortunately to a local syndicate, so it will probably remain on the field. As the surrounding country is still being prospected it is expected that some reefs of greater richness will be struck, when the battery might be kept in full work.

In the Forbes Division about 150 men are mining for gold, but the quantity won by them is not ascertainable. The Britannia Co-operative and The Pinnacle Reef Quartz-mining Company have both been wound up. A few parties are prospecting in the vicinity of Strickland's Reef, and they are sanguine of striking something payable before long. Chesher, Sully, and party have been receiving aid during the year to sink a shaft on the South Lead. They have succeeded in bottoming their shaft at 215 feet on wash prospecting  $\frac{1}{2}$  oz. to the load.

Parkes, as regards reefing, is the most important part of the Lachlan Mining District, and work during the past year has been carried on with considerable vigour in some of the more extensive mines by tributors. The operations of the tributors of the Hazlehurst and Quayle's Mines have not been so very satisfactory during the past year, but at the Bushman's, where 30 men are employed on tribute stone was crushed for a return of gold to the value of £5,273 3s. 11d., the stone averaging 2 oz. 5 dwt. per ton. East of the Bushman's, Baxter and Saddler have sunk a main shaft 200 feet deep, and it is intended to continue it to 438 feet to cut the same run of gold as was worked by the Tributors in the Bushman's. The men working the Kohinoor are making wages, and three small crushings from the Ben Nevis line of reef at M'Guigan's Lead returned  $\frac{1}{2}$  an oz. per ton, which is considered payable. At the Nibbler's Hill, Williams and party are down 116 feet, and are stopping with good prospects. Wright and party, at Barkley's Creek, are on payable stone, their last crushing averaging 1 oz. per ton, with plenty similar stone in sight. The tributors of the Dayspring Mine crushed 137 tons for 204  $\frac{1}{2}$  oz. The returns from this mine were usually about 6 dwt. per ton, but at the 200 feet level the party were fortunate enough to strike the richer stone. This discovery is a very important one, as it is believed there is an abundant supply of the same class of stone in the mine. It is thought a quantity of gold is sent through privately, and as far as can be ascertained the quantity of gold won in the Parkes Division during the past year was 1,506 oz. from alluvial and 3,672 oz. from quartz, valued at about £17,584.

At Billy's Look-out a few miners are at work. Ryan and party bottomed on 2 feet of wash, which averaged from 2  $\frac{1}{2}$  to 3 dwt. per load. The sinking was only 8 feet, but as water is very scarce, it will not be possible to do much work during the summer months.

At Condobolin, Shepherd and party, during the year discovered a payable reef about 3 miles north of the township, but as there is no machinery within many miles of the place, the development of the reef must, I am afraid, await its erection.

Mining in the Barmedman Division has experienced a considerable revival during the year, owing to the discoveries of gold-bearing reefs at Yalgogrin and Wyalong, the former place being 50 and the latter 20 miles from Barmedman, where the nearest battery is to be found. The stone would pay well with a battery on the ground, and steps are being taken to effect that end. The shaft of Neild and party, the prospectors of Wyalong, is down 40 feet, the reef at that depth being 4 feet wide, and prospects from 1 to 1  $\frac{1}{2}$  oz. per ton. This reef, at the surface, was only 5 or 6 inches wide, but has kept widening all the way down. The Princess Edith Company have made a fresh start at the "Hard to find reef,"  $\frac{1}{2}$  mile south from Barmedman; and a local syndicate has been formed to reopen the claims on the Fiery Cross line of reefs. The prospects of this field are really better now than they have been for years back. The stone raised during the year was 341 tons for a yield of 412 oz. 8 dwt. 18 gr., valued at £1,577 11s. 6d.

In the Temora Division about 100 men are employed, who won 520 oz. of gold, valued at £2,007. Hensler and party, Gundibindyal, raised 62 tons of stone, which yielded 55 oz.; and Henry Morris puddled 303 loads of wash-dirt for 2 dwt. per load.

In the Cargo Division very little mining has been done, and only 274 oz. of gold were won, valued at £1,041. The Ironclad and Goldenclad Mines have been shut down until some decision has been come to as to the best mode of treating their ore, which is refractory. Alexander Timmök struck a rich patch during the year, about 2 feet from the surface, which yielded 80 oz. of gold, but after sinking a few feet the shoot cut clean out.

In the Young Division, about 1,958 oz. of gold have been won, valued at £7,525 14s. 2d. The South Burrangong Company were engaged during the year sinking a new shaft to properly work their ground, so their out-put of gold was nil during 1893. In 1892 this company won gold to the value of £14,000. The returns from Cullinga have not come up to expectations; but prospecting work is still being pushed forward. The Tilden Proprietary Company are still at work, with fair prospects of success.

The returns from the Grenfell Division show that 767 oz. of quartz and 187 oz. of alluvial gold have been won during the year, valued in all at £3,698 11s. 7d., the work employing 119 men. The most important event connected with gold-mining in this Division, was a discovery by the Young O'Brien Company of a completely new make of stone, 494 tons of which yielded 361  $\frac{1}{2}$  oz. of gold, valued at £1,387, and even better results are expected from the next crushing. This mine was in receipt of aid from the Prospecting Vote. The Homeward Bound Company have done a lot of prospecting during the year, and only treated 59 tons, for 72 oz. of gold. I understand the mine has now been let on tribute. Several parties are working the alluvial at Quondong, Seven-mile, and appear to be doing fairly well.

#### THE TUMUT AND ADELONG DISTRICT.

From the Albury Division the Warden reports that a marked degree of improvement has taken place in mining prospects generally throughout the Division during the past year, and considerable activity in mining upon private lands has been observable consequent upon the discovery of gold in localities hitherto untried. At Jindera, on Mr. Turner's property, 40 or 50 men are at work, and the crushings are fairly payable. With the exception of the claim in Portuguese Gully there is very little work doing on the Black Range, and the same condition of affairs exist on the Nailcan Range. The Corowa Prospecting Association are proceeding with boring operations in search of the Rutherglen Deep Lead, supposed to cross the Murray River near that place. Indications are favourable to the opinion that it does cross there, and in the Quat Quatta Reserve, near Corowa, payable gold has been discovered in a river claim. In this Division (Albury) the quantity of gold won was 450 oz., valued at £1,710.

In the Germantown Division about 7 gold miners are at work, and won 72 oz. of gold during the year.

In the Cootamundra Division about 70 gold miners are at work, and produced 245 oz. of quartz gold, valued at £923 15s. The Excelsior Company raised 125 tons of stone which returned 74 oz., valued at £281. Juliff and party at Muttama raised 186 tons for 121 oz., valued at £342 17s.

In the Tumbarumba Division the yield was 2,080 oz. principally from alluvium. The tributors of the Tumbarumba Flat Sluicing Company's claim is doing fairly well, owing to a rather better water supply there. Formerly mining was carried on with more success than usual in this Division, employing about 220 men.

The gold won in the Kiandra Division during the year amounted to 1,150 oz., valued at £4,600, all from alluvium, and the number of men employed is 114. The Township Hill is still being prospected, and Heinz Hooper and party, who were in receipt of aid to further test the hill, have been fortunate in striking the wash, which they consider payable. The tributors working the sluicing claim on the New Chum Hill have been earning full wages the year round.

In the vicinity of Nimitybelle very little mining is going on, and the few miners at work are barely making a living. In the Queanbeyan Division there is very little work being done, about 190 oz. being the quantity of gold won during the year. A little prospecting is being done at Brindabella and Coolamon with very fair prospects.

In the Batlow Division there is a slight increase in the quantity of gold won as compared with 1892, the value being £1,947. Timmis and party are at work on a very large dyke, the whole of which carries a little fine gold. Special machinery has been erected to save it, and the results have proved very satisfactory. A

A number of miners are earning a living by fossicking along the banks of the Tumut River, and when the water is low full wages can be made.

In the Adelong Division the gold won was 1,739 oz. from alluvium and 2,920 oz. from quartz, valued in all at £17,705, employing about 260 men, or an increase of £3,676 on the year 1892.

The Gibraltar Hill Company crushed 656 tons of stone for 2,090 oz. of gold, valued at £8,140 13s. 9d. The Adelong Proprietary Company, 304 tons for 271 oz., and the Lady Mary Company, 217 tons for 168½ oz. The Lady Mary Company are on fair stone at present, and there is every prospect of this company being recouped for their many years of expense and toil. The Gibraltar mine is also looking well.

In Shepard's Alluvial Lease a mundic vein was struck carrying a fair proportion of gold. It is now being prospected, and should it turn out as well as expected, a new line of gold bearing country will be opened up.

In the Gundagai Division about 127 men are at work on the alluvium, and won 1076 oz., valued at £4,169 10s., as compared with 232 oz. in 1892, the principal part of the gold being got on Lindley's freehold property.

On Mount Parnassus, close to the town, Field and party struck a rich patch of gold on the summit. Although strict search has been made the vein from which the specimens were detached has not yet been found. A large nugget was also found on the south-eastern slope of the Mount by Vaughan and party about the same time.

At Upper Tarcutta mining generally is very dull, a few men at work on the alluvial barely making rations. The only quartz-mining is at Lower Tarcutta, where Woodbridge and Best are sinking a shaft on a promising vein. They are being aided from the Vote.

In the Junee Division there is a satisfactory increase in the gold yield, the amount being 251 oz. as compared with 78 oz. in 1892. A small rush took place during the year to McCarthy's land at Eurongilly, where a number of shafts were bottomed at from 40 to 60 feet, on wash varying from 12 to 18 inches in thickness, and carrying from 2 to 3 dwt. per load. Owing to the scarcity of water, however, the ground would hardly pay and was abandoned. Prospecting work is still going on in the vicinity of the Junee Reefs.

In the neighbourhood of Grong Grong, some good looking reefs are being sunk on, and much confidence is expressed in the future of this locality.

About forty miners are at work on the alluvial ground around Murrumburrah, and won 252½ oz., valued at £975 10s. There is a large increase in the return from the Cooma Division, the quantity being 1,124 oz. as compared with 652 oz. in 1892, and about 130 men are employed. The bulk of the gold was obtained at the Cowra Creek Diggings, and with the advent of another battery, which is in course of construction, the output for 1894 is expected to be considerably larger.

The returns from Fiery Creek were somewhat less during the year, owing to a rush to Macanally, which however did not prove of much importance.

The St. John Sluicing Company on the Big Badja River, put through 9,060 loads for 109 oz.

#### THE SOUTHERN MINING DISTRICT.

In the Braidwood Division of this District there is very little mining going on, a few fossickers manage to win as much gold from the banks of the Shoalhaven River as keep them on the field; the total quantity won being about 60 oz. of alluvial gold.

In the Araluen Division, the returns of gold won are much the same as for 1892; there being 2,940 oz. of alluvial gold, and 260 oz. of quartz, valued at £12,217. From a quartz claim at Bell's Creek, 350 tons yielded 14 dwt. 21 gr. per ton.

In the Major's Creek Division, 106 gold miners are employed, and the gold won was 1,144½ oz. of alluvial and 50 oz. of quartz gold, valued in all at £4,315, an increase of about 80 oz. on the yield for 1892. There are about 24 men working at Snowball, where some nuggetty gold is being got. The Prospecting Board recommended a small sum in aid to drain a part of the swamp, and it is in this ground that some heavy gold has been got lately, the last piece weighing over 19 oz. A syndicate has taken up the old Snob's Reef, and they propose giving it a good trial.

The Nerriga returns give 470 oz. of alluvial gold won, valued at £1,833; and 120 men at work employed principally by the Golden Terrace Hydraulic Sluicing Company. The operations of this Company have unfortunately not been so successful as was expected.

In the Division of Little River there was 1,394 oz. of gold won nearly all alluvial, valued at £5,241. Mining operations in this Division are confined to the partly worked creeks, and as ground sluicing is the chief mode of working, the best returns are obtained during a rainy season.

The Day Dawn Mine, worked to a depth of 205 feet with good results, is likely to be sunk another 100 feet.

At Yalwal, the Homeward Bound claim crushed 13,574 tons of stone for 1,968 oz. of gold, valued at £6,224. This mine is worked open-cast, and the crushing stuff can be handled very cheaply.

In the Milton Division there is very little mining work going on, with the exception of the Phoenix Company at Currawan.

In the Wagonga Division, about 100 men are employed gold mining, and the returns were 102 oz. of alluvial and 789 oz. of quartz gold. The Mount Dromedary Company is let on tribute, and has yielded fair returns to the tributors. In the vicinity of Bermagui a good deal of fossicking is being done, and a little gold is being got.

In the Division of Nerrigundah gold to the value of nearly £3,000 was won, representing 287 oz. of quartz and 441 oz. of alluvial gold. The principal quartz mine in this Division is the Gulph Proprietary. The main shaft is down 160 feet on a reef averaging about 2 feet in width, which shows signs of improving with depth, 213 tons from which crushed 174 oz., worth £4 per oz.

At Brimbramalla a good many gold leases have been taken up, consequent on some rich crushings being got out Stevenson and party got 200 oz. from 116 tons of stone; Britten and party 32 oz. from 22 tons; McMillan and party 45 oz. from 21 tons; Park Hill got 170 oz. from 50 tons; and Robinson and Thorburn from 216 tons got 250 oz. of gold.

The quantity of gold won in the Moruya division is more than double that of 1892, being 385 oz. from alluvial and 1,330 oz. from quartz, valued at £6,610. At Bimbimbe, Keating and party raised 182 tons, which yielded 196 oz. of gold. Their deepest shaft is 30 feet, and lode is 3 feet wide. To increase their output the party have just purchased a new crushing plant. At Mogo some of the mines have obtained suspension, and on the flat a few fossickers are at work, where sufficient gold can be got to obtain rations.

At the Big Hill in the vicinity of Bateman's Bay several gold leases have been taken up and a battery erected. A small crushing of 27 tons from Fullarton's claim yielded 29 oz.; 19 tons from Fitzgerald's claim gave 21 oz.; and 7 tons from Batt and Sons mine returned 10½ oz. of gold. Several other crushings from this locality have been made with payable results, and all engaged on this field express themselves as perfectly satisfied with it.

In the Pambula Division there are 13 mines at work, from which 5,433 tons of stone, yielded 3,508 oz. of gold, valued at £13,408 7s. 3d. The principal mines are the Mount Gahan, which yielded 1,223 oz. from 2,550 tons of stone; The Hidden Treasure Company, 120 tons for 621 oz. with 300 tons at grass expected to go 5 oz. per ton; Axam and party who treated 243 tons for 354 oz., and the Pambula Company, who crushed 526 tons for 274 oz. of gold. Recent rich crushings by the Mount Gahan and Hidden Treasure Companies have given a great impetus to mining on the field.

In the Bombala Division the gold won is hardly up to that of 1892, being only 320 oz., and of that quantity the Delegate River Hydraulic Sluicing Company contributed 215 oz.

#### THE HUNTER AND MACLEAY MINING DISTRICT.

In the Copeland Division of this District very little work has been done during the year. The Centennial is still at work, but the heavy water at the lower levels prevents them getting at the richer stone which is supposed to exist there; 20 tons were however raised from near the surface, which yielded 1½ oz. per ton. The Hidden Treasure has been taken up by a Newcastle syndicate, who propose continuing the main shaft another 100 feet from the 480 feet level, and for this purpose pumping machinery is being erected. The Lady Belmore Claim yielded 212 oz. from 46 tons of stone, valued at £747. The vein is thin, but it generally gives a return of about 5 oz. per ton. At Cobark, Stoddart and party, who were in receipt of aid from the Prospecting Vote, struck payable gold at a depth of 50 ft. A company has been formed to work the ground, and a battery is being erected to be worked by a water-wheel. A few fossickers are at work in this locality, and they just manage to earn a living.

In the Dungog Division there were 344 oz. of quartz gold won during the year, as compared with 96 oz. in 1892, a large increase, due principally to the Wonga Wonga mine, at Lower Wangat. This mine has been steadily worked during the

the year, and 225 tons raised yielded 319 oz. of gold, valued at £1,038. The results of a trial crushing from a reef on the Cherry-tree Hill, 4 miles from Dungog towards Stroud, has, I understand, proved satisfactory, but the figures are not yet available. It will be a good thing for the locality should it come up to expectation, and will lead to the re-starting of a battery situated right at the foot of the hill. Some attention has been drawn of late to the reefs to be found on the Bulbie Mountains in the Taree Division, where about twenty men are prospecting. A parcel of 3 tons of stone from this locality was treated in Sydney and yielded 15 dwt. to the ton. A small rush set in to Port Macquarie, and proved to be of no permanency. In the Kempsey Division the Deep Creek Gold-mining Company are still at work, and is the only reef being worked in the locality for gold at present.

#### THE PEEL AND URALLA DISTRICT.

In the Glen Innes Division of this district the quantity of gold won was 1,598 oz., valued at £5,344. The mines at Glen Elgin turned out 967 oz. of gold during the year, and as machinery for the treatment of pyritous tailings is on its way to the mine from England, it is expected that the product of gold for the ensuing year will greatly exceed these figures. There is very little doing in alluvial mining in the district of Glen Innes, the only discovery of any importance being that made by a party of prospectors at the Round Mountain, about 28 miles from Glen Innes on the Kookabookra Road. A tunnel was put in, and they were successful in striking the old river bed under the basalt which yielded at the rate of 9 dwt. of gold to the load. The wash lies on a granite floor, and is thin and narrow, but it is thought, were it followed, it might yet give better results. A few mines are still at work in the Kookabookra Division, the total value of the gold won not exceeding £1,500, a big reduction on 1892, which was £5,648, but those mines yet working return a fair profit. If the available water power were utilised in reduction of the expenses of a crushing plant, no doubt some of the claims now idle might be worked at a profit.

The Hillgrove Division is the centre of the gold-mining industry in the Northern Districts. The principal mine is that owned by the Baker's Creek Gold-mining Company, has been continuously at work during the year, and employs about 200 men. The gold won by this company during the year was 21,027 oz., valued at £74,645, from 9,757 tons of stone, exceeding the quantity won in 1892 by 2,100 oz. I understand that £35,000 was paid in dividends by this company during the year.

The Eleanora Company has made excellent progress in the work of development during the year, the chief work being confined to the 400-ft. level. Two furnaces have been employed, and the stone treated was 6,101 tons, yielding 3,163 oz., valued at £11,274.

The Baker's Creek No. 1 Extended Company, which adjoins the Baker's Creek Mine on its southern side, has done a large amount of prospecting during the year, and has been rewarded by striking Smith's Reef, and the Big Reef in the Baker's Creek Mine, both carrying gold. This mine received aid from the Prospecting Vote, and will probably turn out a valuable property.

The Garibaldi Gold-mining Company has been worked on tribute during the year, and fair returns have been got—865 tons yielding 710½ oz. of gold, and 93 tons of antimony. The New Baker's Creek Consolidated Company treated 1,165 tons from the mullock tip for 391 oz., and 393 tons of mine stone for 507 oz. The number of miners employed in the Division is about 450, and the total quantity of gold won was 25,798 oz. valued at £91,522.

*Hillgrove West Division.*—Mining in this Division has been somewhat dull during the year owing to the closing down of the Earl of Hopetoun Mine. The West Sunlight Gold-mining Company have been crushing all the year, and put through 5,715 tons for 3,162 oz., valued at £11,070, the Sunlight Company crushing 3,227 tons for 1,454 oz. Very little alluvial prospecting was done in this locality. A few shafts were put from 50 to 100 feet without bottoming. In the Armidale Division about eighty men are at work mining for gold, and won about 1,017 oz. A rush set in to Herbert Park where a little alluvial gold had been got at a shallow depth, but the area was small and was soon worked out. In the vicinity of Uralla, a large number of assisted fossickers are at work on the Rocky River Diggings, and have been doing fairly well. Some of them have sent for their families and have settled on the field permanently. The quantity of gold won was 2,900 oz. as compared with 1,620 oz. in 1892. In the vicinity of Bendemeer, a few men are at work ground sluicing with moderate success.

The returns from the Nundle Division show a substantial increase in the quantity of gold won during the year, being 3,873 oz. as compared with 2,709 oz. in 1892.

The Mount Sheba Hydraulic Sluicing Company were unfortunately compelled to discontinue operations not being able to cover expenses, but I believe an attempt is being made to reform the company. Isaacsohn's and Thompson's claim is still yielding well, with no sign of the good shoot of gold giving out.

The Peel River Proprietary Company's Mine, at Bowling Alley Point, is still at work, and has done fairly well during the year. A new gully has been opened at Quacka Nacka, and gives promise to provide employment to a number of men by sluicing.

In the Niangala Division, the output of gold has been much less than the previous year, machinery now being required to cope with the water. The Starlight Mine changed hands during the year, and new machinery has been erected, which treated 75 tons for 247 oz. of retorted gold. The Jersey Mine, which is let on tribute, raised 55 tons for 222 oz. Preparations are being made to thoroughly prospect this mine. The Just-in-Time Claim has been idle during the greater part of the year, but put through 114 tons for 139 oz. The Golden Spur Mine has been sadly neglected during the year, and only crushed 66 tons for 72 oz. retorted gold; the Morning Star Claim, 83 tons for 96 oz.; the Surprise Claim, 32 tons for 27 oz.; and the Joker Claim, 44 tons for 32 oz. At Paradise Creek, which is about 10 miles from Niangala, has an area of about 2½ square miles of auriferous country. Two batteries have been erected during the year, and fair progress has resulted. Howlett and Party crushed 114 tons for 114 oz. of gold, and Dark and Party, 48 tons for 52 oz. A small rush set in early in November to Terrible Billy Creek, where six parties are at work on a reef about 3 feet wide, easily worked, and yielding about 15 dwt. per ton.

The Swamp Oak Field has been very dull during the year, the output of gold being only 1,397 oz., about half that of 1892. The practical miners on the field are inclined to think that a second shoot of gold will come in, richer than the first, but they have no capital to prove it. The Highland Mary Company crushed 155 tons for 396½ oz.; the Rainbow Company, 264 tons for 159½ oz.; the Routine Flush, 130 tons for 103½ oz.; the Rising Moon Company, 120 tons for 78 oz.; the Great Britain Mine, 67½ tons for 111 oz.; Cleghorn and Party, 58 tons for 61 oz.; and the Storm King, 35½ tons for 75 oz. The last-named mine is idle, although aid was offered them to continue the shaft another 100 feet.

In the Walcha Division, the quantity of gold won during the year was 789 oz., worth, on an average, 70s. per oz. Watt and Party, at the Tia, are now down 150 feet. They raised 300 tons of stone during the year, which yielded 100 oz. of gold. The Mount Carrington claim is being worked by Mr. H. Whitton, who has a tunnel in about 300 feet, and expects to cut the wash-dirt during this year. The Boggy Creek Hydraulic Sluicing Company put through 20,000 loads for 300 oz. In the neighbourhood of Barraba a few gold-miners are at work, principally in the alluvial ground, and the quantity of gold won was about 300 oz.

In the Bingara Division very little progress has been made in the discovery of new leads or reefs, although prospecting is being carried on in every direction with much energy. A large number of men are fossicking in the district, and manage to earn a living, one man securing an 18 oz. nugget quite close to the surface. The King Solomon Claim, near Ironbarks, is putting out good stone. The Stewart's Brook Division shows a marked decrease in the quantity of gold won, being 1,686 oz., as compared with 2184 oz., in 1892. The United Bluey Company raised and crushed 1,425 tons for 687½ oz.; the Mutual Gold-mining Company, 486 tons for 163 oz.; the New Royal Standard, 57 tons for 68 oz.; and the Ethel May Gold-mining Company, 486 tons for 163 oz. At Denison, about 6 miles over the mountains from Stewart's Brook, a few reefs are being worked with varying success. Baker and Party, on Collet's Reef, crushed 42 tons, which yielded 1 oz. 6 dwt. per ton; and from a reef on Spencer's Flat, 4 tons yielded 5 oz. per ton, and 6 tons at the rate of 2½ oz. per ton.

#### THE NEW ENGLAND DISTRICT.

The Fairfield Division shows a large increase in the yield of gold during last year, being 564 oz. of alluvial and 3,912 oz. of quartz gold, valued in all at £15,666, an increase of £5,121 on 1892, which is very gratifying. In this Division there is a very large tract of auriferous land where the industrious miner may find profitable employment for years to come; in fact, the township of Drake, with its 600 inhabitants, is entirely supported by the mining industry carried on in the vicinity. The principal mine in the Division is the "Lady Jersey," situated in Long Gully, 6 miles south of Drake, where thirty-five men are regularly employed, producing 2,109 oz. of gold during the year. This mine was originally discovered through aid granted from the Prospecting Vote some years ago.

The Nil Desperandum comes next with 588 oz., the All Nations with 320 oz., and the Golden Bluff with 150 oz. The All Nations were in receipt of aid from the Prospecting Vote, and when their grant became exhausted and they were about to abandon the mine they luckily struck a rich patch of gold near to the surface, from which they took in a very short time gold to the value of £1,180. The vein in which the gold is got is 2 feet wide and has been proved to a depth of 60 feet. At Poverty Point, Mr. Horton is at work testing a large body of auriferous granite, which is said to yield from 3 to 5 dwt. of gold per ton. Machinery has been erected to crush 100 tons per week.

At Pretty Gully, about 15 miles from Drake, about 100 men are working on the alluvial ground and doing fairly well. Mining in the neighbourhood of Lionsville is in a very languishing state, a few parties are sluicing on the Naggregah Creek, and others are earning a living by fossicking on Cedar Creek. A little gold-mining is going on in the neighbourhood of Boonoo-Boonoo, there are about fifty men employed and the gold won was 120 oz. of alluvial, and 100 oz. of quartz gold.

#### THE CLARENCE AND RICHMOND DISTRICT.

In the Dalmorton Division of this District, the value of the gold won was £5,247, as compared with £8,764 in 1892. A number of unemployed took the Mount Poole Marvel on tribute, but were compelled to leave after the first crushing. A. Cadell's Black Slate Mine employs from twenty to thirty men, and 241 tons of stone were raised which yielded very well. There are seven different reefs in this mine all carrying gold, and the quartz is conveyed from the top of the hill to the battery by means of an aerial tramway.

The Golden Hill Mine is doing good work, 100 tons crushed yielded 238 oz. This is a flat reef running into a hill and easily worked. The tributors of the Excelsior claim are doing very well, the 113 tons of quartz raised yielding 185 oz. This is another flat reef, and the stone can be raised cheaply.

The Chandler's Creek Gold-mining Company have sold the machinery and cleared it off the ground. Some of their leases were forfeited, but were readily taken up again by some miners who think they can make a living working them. M'Annulty and Wolfe struck a rich vein, a trial crushing from which 8 tons yielded 26 oz. Downey, Lonsdale, and party were also successful in striking a reef which crushed 17½ oz. from 3½ tons. The Tower Hill Gold-mining Company have driven their tunnel about 1,000 feet, following a large reef. They have been granted suspension of labour to enable them to raise funds to continue the development. The New Era Mine is considered a payable property, 326 oz. of gold being taken from 400 tons of stone. Cosgrove and Brennan are about to start work on Mount Rea, on the Mann River, where the indications are said to be promising, 57 tons being crushed for a return of 100 oz. of gold.

The Nana Creek Division shows a slight increase in the gold won during the year, the quantity being 301 oz. The Mount Orara Gold-mining Company have done a good deal of prospecting work during the year. A bulk sample of 2½ tons taken from the 70-ft. level yielded at the rate of 10 dwt. per ton. With the introduction of suitable machinery it is thought this property would pay. The claim known as "Nana's Daughter," on the Lady Bella line of reefs, had only one crushing during the year of 42 tons, which returned fully 1 oz. of gold per ton. The Lady Bella Mine, during the latter part of the year, crushed 71½ tons for 8 oz. 12 dwt. This is not considered the fair average value of the stone. The Jubilee Claim is still working, and in the northern tunnel a 5-ft. reef was cut, which yields 7 dwt. per ton. It is believed that this return will improve. The party working the Surprise Reef crushed 84 tons for a return of 93 oz. The total quantity of stone crushed from this field during the year was 313 tons for a return of 271 oz., employing about forty-five men. A good deal of prospecting is going on along the beach at Woogoolga, and as far down as Corindi, where some very promising returns have been got. To Chambigne, in the Grafton Division, a small rush took place during the year, owing to Elliott and Party striking an 18-inch reef at a depth of 60 feet which assayed from 10 to 13 oz. of gold per ton. This mine was aided from the last year's Prospecting Vote. H. J. Cook and Party have taken up some gold leases in the neighbourhood of Horton's Creek on the Grafton to Armidale Road, about 12 miles from the Nymboi Punt. From a depth of 20 feet they raised 9 tons of stone which yielded 37 oz. of gold which was sold for £126 7s. 7d. The Sir Walter Scott Mine at Cangai are driving a tunnel, and when it is completed it is expected some good returns will be the result. During the last six months of the year they crushed 87 tons of stone for 132 oz. of gold. The company are using the *Hyperphoric* treatment, which I understand has proved a success.

In the Ballina Division the gold-mining is confined to working the black sand along the sea beaches, running north from Clarence Heads to Byron Bay. The quantity of gold won could not have been less than 1,220 oz., chiefly got during the last six months of the year. About 250 men are employed in the work, and the wages earned run from 15s. to as high as £6 per week per man. A new find of gold was discovered near Ghostly Creek in a beach terrace about three-quarters of a mile inland. This discovery is of great importance inasmuch as it should lead to further prospecting from the main beaches to which it has hitherto been confined. M'Geary and Party were the prospectors of this terrace, the auriferous sand in their claim being 3 feet thick and 100 feet wide, the stripping being from 18 to 20 feet thick.

#### THE COBAR DISTRICT.

In the Cobar Division of this district a very large increase in the product of gold has taken place, the value being £15,271 as compared with £5,883 in 1892, due principally to the rich find at Mount Drysdale. This is the name of a new township recently laid out, about 2 miles north of the old Billygoe Diggings. The prospectors of this field, R. McPherson and Party, were originally in receipt of aid from the Prospecting Vote, and when gold was struck, the Mount Drysdale Gold-mining Syndicate was formed, and the ground is now being worked by them with much success. The gold won by them during the year was valued at £5,920.

The Occidental Company, on the United Hill, crushed 4,400 tons of stone for 1,090 oz., and thirty-seven men are employed in the mine. There are several claims at work along the Cobar line of reef, who raised during the year 1,747 tons of quartz, which, treated at the Chesney Battery, returned 784 oz. of smelted gold. A good deal of prospecting is being carried on in the neighbourhood of the Peak, but up to the present nothing of a payable nature has been struck, although the indications are promising. In the Hillston Division, the Mount Allan Gold-mining Company is turning out well, the return being 988½ oz. of gold from 872 tons of stone. This mine is situated about 10 miles from Mount Hope and is considered a valuable property. The great drawback is the want of water, the carrying on of work depending entirely on the rainfall which is not plentiful in that part of the Colony. Suspension has been granted to the Company while a shaft is being sunk near the mine in search of water. The Errebendery Gold-mining Company, near Euabalong, are now in a position to crush and put through 120 tons for 49 oz. The prospectors of this field had 9 tons crushed at Parkes for 49½ oz., but much better returns are expected. In the Nymagee Division the only discovery during the year was that made at Burra Burra. About the month of May, a great rush set in and at one time there were as many as 800 men on the field. The prospectors of the field were Einfeld, Rand, and Party, who bottomed at 31 feet on 12 inches of wash 3½ loads of which yielded 2½ oz. of gold. The lead was very narrow, only measuring about 15 feet. A very large amount of work was done on the field, but the greater number of the claims were not payable. About 100 men are still on the field and doing fairly well, but the scarcity of water retards the progress of the place considerably. The value of the gold won during the year was a little over £2,500. Of that amount the prospectors contributed 310½ oz., valued at £1,164, got from 514 loads of wash-dirt, and from the No. 1 South claim, 43 oz. from 189 loads.

#### THE ALBERT DISTRICT.

The Milparinka Division shows a substantial increase on the previous year, being 798 oz., an increase of 505 oz., about 100 men being now employed on the field. Owing to the scarcity of employment, more men than usual tried gold-mining, but there were none of them successful in striking anything very rich. The rainfall during the last twelve months was under the average, preventing washing from going on as briskly as usual. During the year several new dams have been made, and others deepened, and with a good rainfall mining will revive. The owner of a dam can make more than good wages while the water lasts. At Stringer's Hill a number of men can still make a living working the old ground. At the Six-mile payable gold has again been discovered, and fair results obtained. In the early days of the diggings good returns were got at this place; but the dry state of the country drove the miners from the place, although only 4 miles from Milparinka. The recent discovery may encourage further search in that locality. At Tiboburra the miners appear to have done fairly well, ninety men having won 1,450 oz. of gold, or on an average about £64 per man.

From the only gold-producing mine on the Barrier (the Broken Hill Proprietary), 3,279 oz. of gold has been saved from their silver lead bullion at the company's refinery at Port Pirie, valued at a little over £18,000.

I am indebted to J. MacDonald Cameron, Esq., the Deputy Master of the Royal Mint, for the following information:—

QUANTITIES of Gold, the produce of New South Wales, received into the Royal Mint, Sydney, during 1892 and 1893 compared.

| District.                  | Division.                            | 1892.      | 1893.      | Increase. | Decrease. |

| Hunter and Macleay.....                    | 204.95     | 58.37      |
| Clarence and Richmond.....                 | 918.48     | 716.68     |
| New England.....                           | 575.75     | 657.55     |
| Mixed—Western, Northern, and Southern..... | 31,513.88  | 35,511.58  |
| Localities unknown.....                    | 35,534.34  | 48,903.05  |
|  | 144,259.48 | 171,097.07 |

From the foregoing table it will be seen that the quantity of gold sent to the Mint in 1893 exceeds that sent in 1892 by 26,838 oz. The principal increase was from the Western District, which produced 4,142 oz. over 1892, and the Northern District 1,102 oz. over the previous year. The largest increases came from the Sofala, Carcoar, Braidwood, Adelong, and Tumbarumba Divisions. The Mudgee, Lachlan, Southern, Hunter and Macleay, Clarence and Richmond, show decreases.

The following table is compiled from information kindly furnished by the Collector of Customs :—

## EXPORT OF GOLD, 1893.

| Gold.     |        | Quartz Tailings and Pyrites. |        | Total.    |        |
|-----------|--------|------------------------------|--------|-----------|--------|
| Quantity. | Value. | Quantity                     | Value  | Quantity. | Value  |
| oz.       | £      |                              | £      | oz.       | £      |
| 6,817     | 25,885 | 3,826 packages .....         | 15,742 | 11,015    | 41,627 |

The quantity of gold sent to the Royal Mint, *plus* the quantity exported in 1893, equals 182,112 oz., but of the 11,015 oz. exported, we are informed that 2,824 oz. passed through the Mint, and is included in the return furnished by the Master. The out-put of gold for 1893 may, therefore, be set down as 179,288 oz., an increase of 22,418 oz. as compared with 1892. Last year the Broken Hill Proprietary Company won from their silver-mine 3,279 oz. of gold, valued at £13,000, but saved no gold in 1892.

## RETURNS OF GOLD for 1893, from Mint and Mining Registrars compared.

| District.  | Mint       | Mining Registrars. | Excess.   | Deficiency.  |
|--|------------|--------------------|-----------|--------------|
|  | oz.        | oz.                | oz.       | oz.          |

|                                  | 152,112 | 173,341 | 25,857    | 4,628     |
| Less Decrease .....              | .....   | .....   | 4,628     | .....     |
| Increase in yield for 1893 ..... | .....   | .....   | 21,229    | .....     |

The Mining Registrars returns of gold for 1893 show an increased yield of 21,229 oz. The total increase for the year, as shown by the Mint and Customs return is 22,418 oz.—a difference of only 1,189 oz. This is very satisfactory, and shows that the Mining Registrars have taken greater care than usual in collecting correct information. In some cases these officers experience great difficulty in procuring correct returns.

COMPARATIVE Statement of Average Yields from Alluvial Mines for 1892-93.

The foregoing table shows the results obtained from working alluvial ground in the several districts named. It is a difficult matter to obtain correct information on this subject, the miners very seldom keeping a record of the quantity of wash-dirt put through, and in many cases are reluctant to disclose the result of their work. The table would be a valuable one were it complete, but it is given as full as possible under the circumstances.

COMPARATIVE Statement of Average Yields from Quartz-mines for 1892-93.

| District.                | 1892.     |                  |      | District. | 1893.     |                  |     |                          |         |     |      |     |        |      |     |

|                          | 99,223    | 0                | 19   | 19        | 98,369    | 12               | 20  |                          | 105,886 | 0   | 16   | 11  | 85,085 | 10   | 0   |

The foregoing table shows the average yield of sundry parcels of stone treated in the various mining districts. There is much less difficulty in procuring this information relating to quartz than alluvial mining. This table is more complete than usual, and shows the result of crushing 105,886 tons of stone, as compared with 99,223 tons in 1892. The average yield per ton is, however, less by 3 dwt. 8 gr. than in 1892, but the average yield of 16 dwt. 11 gr. from such a large quantity of stone as 105,886 tons is considered fairly satisfactory.

The number of miners employed in gold-mining during 1893 was 5,684 Europeans, and 717 Chinese in alluvial, and 5,556 Europeans in quartz-mining, a total of 11,957, an increase of 2,038 on the previous year.

Dividing the quantity of gold won by the number of miners, the result obtained is that each miner appears to have won 14.99 oz., or equal to £54 9s. 4d. during the year, as compared with 17.33 oz., or £62 18s. per man during 1892.

This is evidently a rough mode of computing the earnings of each man during the year, as it is understood that a large number of the men stated were only engaged in prospecting, and others in comparatively new fields, from which little returns have yet been obtained.

During the year 2,634 samples were assayed for gold in the laboratory of this Department.

1,713 yielded nil.

612 ,, under 10 dwt. per ton.

## COAL.

THE output of coal, I regret to say, for 1893 shows a decrease of 502,640 tons, and in value £290,666, as compared with 1892. The value of the output for last year is the lowest for eleven years past, and the average rate per ton, which was 7s. 1.78d., is the lowest for the past thirteen years. The lowest averages since the opening of our coal-fields were 7s. 0.47d., in 1871, and 6s. 9.40d. in 1831. The decrease in the home consumption is comparatively small, but the falling off in the exports to intercolonial and foreign ports has been very serious.

The decrease in the home consumption is, no doubt, due to the depression in the various trades, and to the need for retrenchment in various directions. The decrease in the intercolonial trade is probably due to the discovery of workable coal-seams in Victoria; and while we may be pardoned feeling regret at the loss of so good a customer, we cannot fail to congratulate our neighbour on a discovery which adds so materially to the wealth of the Colonies as a whole.

## QUANTITY and Value of Coal raised from the opening of the Coal-seams to 1857, inclusive :—

| Year.    | Quantity. | Average per ton. | Value. | Year. | Quantity. | Average per ton. | Value.  |

A very valuable discovery of coal was made during the year at Cremorne, Sydney Harbour, by means of the Government diamond drill, at a depth of 2,929 feet. At that depth a seam of good steam coal was struck, 10 feet 3 inches in thickness, 9 feet 2 inches of which is workable, and money is now being raised in London to develop it.

One important effect of this discovery is that it may now be regarded as proved that the seam in question extends from the Newcastle to the Illawarra district.

The opening of a colliery on the shores of Port Jackson will probably prove an additional attraction to large ocean-going steamers, as it may afford special facilities for obtaining their coal supply.

The number of collieries under inspection at the 31st December, 1893, was 97 coal and 4 shale, as compared with 101 coal and 5 shale on the same date of the previous year.

The following statement shows that the output of the Northern collieries in 1893 was less in quantity by 408,251 tons, and in value by £222,476 10s. 2d. than the output for 1892. In the Western District the decrease in quantity was 45,985 tons, and in value by £14,172 19s. 3d., and in the Southern District it was less in quantity by 48,403 tons, and in value by £54,016 15s. 5d. than the previous year. There was a decrease in the average price per ton on the total output, the largest decrease being in the Southern and South-western Districts, which was 10.24d. per ton.

COMPARATIVE

## COMPARATIVE Statement of Output of Coal in the Northern, Western, and Southern Districts.

The number of men actually employed in and about the coal and shale mines during 1893 was 10,413, as compared with 10,910 in 1892. The total number of fatal accidents was 13, and non-fatal 45. Of that number, 10 of the fatal and 31 of the non-fatal accidents occurred in the Northern District, 2 of the fatal and 14 non-fatal accidents in the South-western District, while in the Western District there was only one accident which proved fatal. The death-rate in this Colony for 1892 compares very favourably with the death-rate for the same year in the United Kingdom.

SUMMARY of persons employed, number of fatal accidents (deaths), and ratios of the number of persons employed, and the number of fatal accidents in and about the "United Kingdom" and "New South Wales" Coal Mines, since 1874:—

| Year. | United Kingdom.   |                         |                                 |   | New South Wales.  |                         |                                 |   |
|-------|-------------------|-------------------------|---------------------------------|---|-------------------|-------------------------|---------------------------------|---|
|       | Persons employed. | Lives lost by accident. | Persons employed per life lost. | Death rate from accidents per 1,000 persons employed. | Persons employed. | Lives lost by accident. | Persons employed per life lost. | Death rate from accidents per 1,000 persons employed. |

\* Excessive number of falls of coal and Lithgow disaster caused this high death-rate.

† Bulli catastrophe and excessive falls of coal caused this high death-rate.

‡ Hamilton pit crush, excessive falls of coal, and over winding of four men at South Burwood sinking pit, caused this high death-rate.

During

During the year 42 Analyses were made of Coal, 29 of which are published:—

| Official number. | Locality.  | Description of Mineral.                                | Analysis in 100.00 parts |                        |               |       | Sulphur.  | Specific Gravity. | Remarks.   |
|------------------|--|--|--------------------------|------------------------|---------------|-------|-----------|-------------------|--|
|                  |  |  | Hygroscopic Moisture.    | Volatile Hydrocarbons. | Fixed Carbon. | Ash   |           |                   |  |
| 781              | Awaba (3 miles north of) 8 foot seam.                  | Coal Block, about 4 feet square.                       | 3.55                     | 33.85                  | 53.90         | 8.70  | .549      | 1.382             | Coke, 62.6 per cent., well swollen, firm, and lustrous. ## COKE.

TABLE showing the quantity and value of Coke made in the Colony of New South Wales.

| Year.       | Quantity.          |      |                                 |      | Total Value.  |
|-------------|--------------------|------|---------------------------------|------|---------------|
|             | Northern District. |      | Southern and Western Districts. |      |               |
|             | tons               | cwt. | tons                            | cwt. | £ s. d.       |
| 1890        | 15,886             | 2    | 15,211                          | 0    | 41,147 3 7    |
| 1891        | 9,474              | 2    | 20,836                          | 5    | 34,473 5 10   |
| 1892        | 5,245              | 0    | 2,654                           | 0    | 8,852 8 6     |
| 1893        | 12,262             | 0    | 5,596                           | 0    | 20,233 2 0    |
| Totals..... | 42,867             | 4    | 44,297                          | 5    | 104,705 19 11 |

From the foregoing table it will be seen that the quantity of coke manufactured during 1893 is more than double that of the previous year. The works of the Purified Coal and Coke Company, situated at Wallsend in the Northern District, made during the year 11,500 tons, and the Australian Coke Company, at Unandera, manufactured 4,351 tons. The report furnished by the Government Geologist in 1892, shows that the coke made in this Colony is capable of great improvement, and it is probable that the demand would be largely increased if the quality were improved.

## SHALE.

The out-put of bog-head mineral, or petroleum oil cannel coal, commonly called shale, during 1893 was less by 18,537 tons than during the previous year, but the average price per ton was only about 4d per ton lower.

The

The following table shows the quantity and value of kerosene shale produced during the years 1865 to 1893 :—

| Year. | Quantity. | Average price per ton. | Total value. | Year. | Quantity. | Average price per ton. | Total value.   |
|-------|-----------|------------------------|--------------|-------|-----------|------------------------|----------------|
|       | tons.     | £ s. d.                | £ s. d.      |       | tons.     | £ s. d.                | £ s. d.        |
| 1865  | 570       | 4 2 5·47               | 2,350 0 0    | 1881  | 27,894    | 1 9 2·59               | 40,748 0 0     |

#### SILVER AND LEAD.

There has been a very satisfactory increase in the quantity and value of silver and lead produced in the Colony during the year, the amount of increase being £553,884. The total value of the output during the year was £3,031,720, which was only exceeded in 1891 since the opening of the silver-mines. Our great silver-mines at Broken Hill on the Barrier Ranges contributed nearly the whole of the output, and approximately the quantity of silver in ounces produced from these mines during 1893, was little short of 16,000,000. This will probably be increased should the companies be successful in devising a mode of treating their low-grade sulphide ores at a profit.

#### QUANTITY and Value of Silver, and Silver-lead, and Ore exported.

\* NOTE.—In the Annual Report for 1888, 11,739 tons 7 cwt. of silver ore, valued at £164,820, was omitted from the table. The bulk of the silver is exported in the form of silver-lead.

The following information relating to the silver-mining industry is taken from reports sent in by the Wardens and Mining Registrars:—

#### THE ALBERT MINING DISTRICT.

At Broken Hill operations are now almost entirely confined to the Broken Hill lode, the principal mines at work thereon being the Broken Hill Proprietary Company, the Block 14 Company, the Block 10 Company, the British Block Company, the Junction Company, the North Company, the Central Company, and the Broken Hill South Company.

Some of the mines are still experimenting with the object of discovering the best mode of treating the immense bodies of sulphide ores existing in their mines, and there is every probability of the experiments proving successful.

The great depreciation during the year in the value of silver has led to the closing of some of the smaller mines and the restriction of the output in others. Work has gone on smoothly during the year, and the absence of labour troubles has been the means of greatly increasing the quantity of ore raised as compared with 1892, during which year the mines were closed for about four months.

The quantity and value of the minerals exported from this field during the year was:—Silver ore, 155,099 tons, valued at £924,290; silver bullion, 38,058 tons, valued at £2,003,562; and 345,770 oz. of pure silver, valued at £51,457.

A very great difficulty is experienced in arriving at the exact quantity of pure silver won on this field, as it is nearly all exported in the form of silver lead, but approximately the quantity was 15,677,345 oz., as compared with 12,969,195 oz. in 1892.

The New Broken Hill Extended Company, which is contiguous to the main lode, is in receipt of aid from the Prospecting Vote to crosscut the course of the main lode at the 1,330 feet level. The mines at Nuntherungie are now almost abandoned. The water supply, which used to be a source of trouble to the companies, causing vexatious stoppages in their smelting operations, has now been happily overcome, a plentiful supply being available from Stephen's Creek and the Acacia Dam. The number of miners employed on the Barrier is given at 4,300, a few hundred less than during 1892, and the population of the Broken Hill District is 22,000.

#### THE BATHURST MINING DISTRICT.

In the Mitchell Division the Sunny Corner Company's mine has been let on tribute to Mr. Charlestone for a period of three years. He appears to be running it with some success, having smelted 5,102 tons for 37 tons of matte, valued at £2,200, and that during seven months' work. The Phoenix and the Silver King mines are both idle.

In the Rockley Division there is still a little silver being got at Back Creek, the quantity during the year being about 4,680 oz., worth £600. The mine has, however, changed hands, and furnaces are being brought from Sunny Corner for the better treatment of the silver ore.

At Tuena the Mount Costigan lead and silver mine was worked for a short time in the beginning of the year, the output being about £5,000 worth of matte. There is a probability of the mine being re-started at an early date. The Cordillera mine, which has been shut down for some considerable time, has been taken up by Mr. Samuel Fuge, who has four men employed in cleaning up the old workings and effecting repairs. At Lewis Ponds all the silver-mines are idle.

#### MUDGEY MINING DISTRICT.

At Denison Town the Mount Stewart Company has, unfortunately, been compelled to stop operations, owing to the low price of silver. In the meantime suspension of the labour conditions has been granted the company.

#### THE SOUTHERN MINING DISTRICT.

At Captain's Flat the Lake George Copper-mining and Smelting Company employ 130 men, and smelted during the year 7,710 tons of ore, from which was extracted over 60,000 oz. of silver found associated with gold and copper in considerable quantities. The new Koh-i-noor Company are busily engaged continuing their main shaft with assistance from the Prospecting Vote. The company smelted during the year 4,264 tons of ore, which returned 58,092 oz. of silver, 784 oz. of gold, 137 tons of copper, and 2½ tons of lead, valued in all about £15,739. This company employs about seventy men, and as the treatment of the silver ore has not been paying they have during the last two months of the year been working for gold.

#### THE NEW ENGLAND MINING DISTRICT.

In the Fairfield Division the White Rock Silver-mining Co. are about to make another start after being idle about a year, but it is feared that if the present low price of silver continues, it will prevent the mine being worked at a profit. The company have erected new works on the cyanide principle, which is said to be very suitable for the class of ore to be treated. At Rivertree the silver-mining companies have practically shut down in the meantime, or until they have decided on the best system of treating the ore, which abounds in the locality. The returns from several parcels of ore sent to the Aldershot Works in Queensland were very satisfactory. The companies jointly erected a very extensive leaching plant, costing over £3,000, but it did not work up to expectation, and is now idle.

#### THE PEEL AND URALLA MINING DISTRICT.

There is still a little silver-mining going on in the Emmaville Division of this district. The amount of ore concentrates of this mineral forwarded from the Deepwater Station for treatment elsewhere was 285 tons, valued at £5,848 14s. Of that amount Webb's mine contributed 194 tons; the balance came from the Webb's Consols mine near Strathbogie. It is considered that a slight rise in the price of silver would make these mines payable concerns. The concentrates from the Webb's mine yielded 155 oz. of silver to the ton.

During the year 2,622 samples were assayed for silver in the laboratory of this Department, 1,477 yielded nil; 1,062 yielded under 20 oz. per ton; 83 yielded as follows:—

| Official number. | Locality.            | Description.  | Per ton.     |              |
|------------------|----------------------|---|--------------|--------------|
|                  |                      |   | Silver.      | Gold.        |
|                  |                      |   | oz. dwt. gr. | oz. dwt. gr. |

## TIN.

THE following table shows that during the year there has been a reduction of £84,371 in the value of the tin won as compared with 1892, during which year a revival in this industry was manifested. The Vegetable Creek tin-field, near Emmaville, is still the chief seat of tin-mining in this Colony, and produced during the year 1,035 tons, valued at £46,833 15s., about 250 tons of this being lode tin. This is a reduction of £9,504 on the yield for 1892, but considering the low price ruling for tin during 1893—the average price being £45 5s., as compared with £53 10s. in 1892—the output may be looked upon as fairly satisfactory. One promising feature on the Vegetable Creek field is the steady, although slow, growth of lode-mining. The division of Glen Innes produced 80½ tons of stream tin, valued at £4,351 14s. 3d. The bulk of this tin was got in the valley of the Mann River, about 8 miles from Glen Innes, where tin of good quality is very generally found as a surface deposit on the granite slopes from the basaltic tableland, which locality is attracting some considerable attention of late. A decrease of about £4,000 in the value of the output for the year has also taken place in the Wilson's Downfall Division, the total output being 176 tons, valued at £8,335 10s.

In the Tingha Division of the Peel and Uralla Mining District the output for the year was 700 tons, valued at £32,900. The alluvial tin deposits in this division are, to a great extent, worked out, and more attention is being paid to reefing. Numerous leaders are found on this field, many of which have been profitably worked, but they usually pinch out at a shallow level, when capital is required to follow them down. A good deal of fossicking is going on in this Division, and the men can generally make a living. In the neighbourhood of Deepwater, 350 tons, valued at £14,000, were won, as compared with 420 tons in 1892. At Bendemeer a little tin-mining is going on, the quantity won during the year being 6 tons 16 cwt., valued at £330 17s. 4d. On the Gundle Tin-field, in the Kempsey district, there are only two leases at work, and what tin is got is of good quality. It is thought that deeper sinking on this field would lead to much better results. The most important mineral discovery made of late in the Albury district was the tin deposit at Dora Dora, on the Upper Murray. The company so named have erected a large dam for sluicing, and have carried on steady work during the past winter. The output of the company is about 2 tons of tin per month, which allows of a dividend being paid. At Basin Creek, some miles distant from the Dora Dora Company's ground, but on the same line of country, an Albury syndicate

is carrying on boring operations, with indications of success. At Euriowie, in the Broken Hill district, there are still a few companies at work prospecting for payable tin, but up to the present with only indifferent results.

TABLE showing the quantity and value of Tin exported from, and the product of, the Colony of New South Wales, since the opening of the Tin-fields in 1872.

#### COPPER.

During the year copper to the value of £7,360 was extracted from the silver ore raised from the mines at Broken Hill. The Great Cobar Mine, at Cobar, which has been shut down since August, 1889, has been re-started on tribute, and will probably give employment to about 200 men. At Nymagee, the Nymagee Copper-mining Company, as also the New Burra Burra Company, closed during the year, owing to the low price of copper, but arrangements are being made, I understand, to restart the Nymagee Company's Mine on the tribute system. At Nyngan, the Girilambone Copper Mine is let on tribute to the

the Messrs. Richardson, who put out during the year copper to the value of £957 7s. 4d. In the Hillston Division the New Mount Hope Copper-mining Company produced copper to the value of £6,501 8s. This Company have a good plant, and employ over 40 men.

At Captain's Flat, the Lake George Copper-mining and Smelting Co. saved from the ore treated by them 238 tons of copper, besides gold and silver, and the New Koh-i-noor Co., 137 tons, besides gold, silver, and lead. The Burruga Copper Mine, situated in the Abercrombie Mountains, near Burruga, which has been shut down for two years, was re-started in November last by the owner, Mr. Lewis Lloyd, and 150 men are now employed, but this number will probably be doubled when the mines get into full working order. This mine is being worked at the 750-foot level; the lode is 9 feet thick, and appears to improve with sinking. The value of copper put out during the time the mine was at work was about 40 tons, valued at £1,800.

The Mount Costigan Mine, at Tuena, is now on tribute, and steps are being taken to re-open the Cordillera Lead and Silver Mine, with the intention of working it for copper. The Burley Jackey Mine, near Cowra, put out something like 200 tons of copper during the year, and parties are at work in the locality prospecting for that mineral.

The Belara Copper Mine, at Goolma, near Wellington, which had been idle for some time, started work in October last, and employs 20 men. A little copper is being got in the Fairfield Division of the New England Mining District, the quantity last year being valued at £251 5s.

TABLE showing the quantity and value of Copper, the produce of the Colony, exported from the Colony of New South Wales, from 1858 to 1893.

| Year. | Ingots.   |           | Ore and Regulus. |         | Total.      |           |
|-------|-----------|-----------|------------------|---------|-------------|-----------|
|       | Quantity. | Value.    | Quantity.        | Value.  | Quantity.   | Value.    |
|       | tons cwt. | £         | tons cwt.        | £       | tons cwt.   | £         |
| 1858  | .....     | .....     | 58 0             | 1,400   | 58 0        | 1,400     |

| 1887  | 4,463 19  | 195,752   | 299 8            | 3,350   | 4,763 7     | 199,102   |
| 1888  | 3,786 1   | 272,110   | 113 6            | 2,924   | 3,899 7     | 275,034   |
| 1889  | 3,983 16  | 203,319   | 198 4            | 3,322   | 4,182 0     | 206,641   |
| 1890  | 3,165 9   | 163,537   | 580 9            | 9,774   | 3,755 18    | 173,311   |
| 1891  | 3,860 3   | 191,878   | 665 8            | 13,215  | 4,525 11    | 205,093   |
| 1892  | 3,535 0   | 160,473   | 1,299 4          | 27,233  | 4,834 4     | 187,706   |
| 1893  | 1,051 0   | 44,235    | 1,016 0          | 14,191  | 2,067 0     | 58,426    |
|       | 98,514 2  | 6,090,694 | 7,642 14½        | 178,869 | 106,156 16½ | 6,269,563 |

As will be seen from the foregoing table, the value of the copper exported from the Colony last year was less than in any year since 1868, no doubt due to the great drop in the price of copper, which led to the shutting down of some of the largest of our copper-mines. A slight rise in the value of this metal has taken place, which, if maintained, will undoubtedly lead to the output being greatly increased in 1894.

During

During the year 100 assays were made for Copper in the Laboratory of this Department, the following yielding over 10 per cent. —

| Official number. | Locality.                            | Description   | Per cent Metallic Copper | Per ton |              |
|------------------|--------------------------------------|---|--------------------------|---------|--------------|
|                  |                                      |   |                          | Gold    | Silver       |
|                  |                                      |   | oz. dwt. gr.             |         | oz. dwt. gr. |

#### IRON.

Nothing tangible has yet resulted from the efforts made during late years to establish the iron-making industry in this Colony, although attention has from time to time been directed to many natural advantages possessed by several districts of the Colony, namely, deposits of iron ore, with coal and flux in close proximity. The iron made in the Colony at the present time is not from ore, but from scrap, and the quantity so manufactured during the year was 2,190 tons 11 cwt. 1 qr. 4 lb., valued at £14,786 6s. The Eskbank Iron-works, where this industry is carried on, are situated at Lithgow, and employ about 150 men. The owner is Mr. W. Sandford.

In the Broken Hill District there were raised during the year 1,051 tons of iron ore, valued at £1,198. The bulk of this comes from Balaclava, about 8 miles from Broken Hill, the rest of it being taken by the Proprietary Co from the outcrop of the lode. It is solely used as flux.

During the year the following assays and analyses were made for iron in the Laboratory of this Department. —

| Official number. | Locality                                    | Description of ore                 | Assay or analysis  | Iron % |

## ANTIMONY.

The antimony veins at Taylor's Arm, Bowraville, and Deep Creek have been worked vigorously during the year, and a fair quantity of ore is shipped at regular intervals. The ore is of good quality, varying from 63 to 67 per cent. Smelters are being put up on a new process, which will treat the ore, it is said, at a cost of about 5s. per ton. Should they prove as great a success as anticipated, it will admit of the second class ore being worked at a profit. The output from the Kempsey District may be put down as 866 tons, valued at £7,466 10s. At Hillgrove, in the New England District, the yield of antimony is more than in 1892, although the value is less, owing to the low price ruling for that metal during the past year, the quantity being 1,376 tons, valued at £15,270, as compared with 1,135 tons, valued at £25,658 during 1892. In consequence of the fall in price there are very few men employed independently in working the numerous veins abounding in the district, and the principal producer of antimony on the field is the Hillgrove Antimony Mining and Smelting Co. In the Hillgrove West Division the total amount of antimony sold during the year was about 400 tons, the whole of which was raised by miners for themselves, and sold in its crude state at an average rate of about £6 5s. per ton.

During the year 38 assays were made for antimony in the laboratory of this Department, the following giving the best results:—

| Official number. | Locality.   | Description.   | Per cent. metallic antimony. | Per ton.     |              |
|------------------|---|--|------------------------------|--------------|--------------|

## BISMUTH.

Mining for bismuth is nearly a dead letter. The Great Jinger Company at Pambula sent away a few tons during the year, but the mine is now shut down. On the Red Range, about 15 miles from Glen Innes, a party are opening up some old workings that were worked for bismuth some years ago. When ready for work, the mine will be let on tribute.

During the year 33 assays were made for bismuth in the laboratory of this Department, the following giving the best results:—

| Official number. | Locality.              | Description.                                   | Per cent. metallic bismuth. | Per ton.     |              |
|------------------|------------------------|--|-----------------------------|--------------|--------------|
|                  |                        |  |                             | Gold.        | Silver.      |
| 1783             | Hillgrove (near) ..... | Felspathic lode-stuff, with galena .....       | 4·74                        | oz. dwt. gr. | oz. dwt. gr. |
| 1723             | Nimitybelle .....      | Quartz containing sulphide of bismuth, &c..... | 6·45                        | Trace.       | 6 17 3       |
|                  |                        |  |                             | Nil.         | Nil.         |

## ZINC.

During the year twenty assays were made for zinc in the laboratory of this Department, the following giving the best results :—

| Official Number. | Locality                          | Description  | Per cent metallic zinc | Per ton.            |                      |
|------------------|-----------------------------------|--|------------------------|---------------------|----------------------|
|                  |                                   |  |                        | Gold                | Silver               |

## PLATINUM.

In the northern sea beaches bordering the Clarence and Richmond Mining District in this Colony, platinum is to be found in payable quantities, but up to the present time little attention has been paid to its production. Several leases have been granted to mine for this metal, but only Martin Anderson, near Ballina, has got to work, and he has already a considerable quantity of concentrates on hand. Many of the men who are working the beach sand for gold are paying more attention to the saving of the concentrates, in the hope that some effective mode of saving the platinum will yet be found. The extreme fineness of this metal, as found on these beaches, and the want of knowledge how to separate it from its associated minerals, renders it of little commercial value at present to the miners of the district. Prospecting has shown that there are on the Northern Coast inner beaches which it is thought contain both gold and platinum. Prospecting is still going on in the neighbourhood of Mulga Creek, about 12 miles north-east from Broken Hill, where the indications are favourable to the existence of platinum in payable quantities. About 3 tons were raised during the year from this locality, which realised £5 per ton.

During the year twenty-two assays were made for platinum, the following giving the most favourable results .—

| Official Number | Locality   | Description   | Per ton platinum  | Per ton gold.       | Per cent tin |
|-----------------|--|---|---|---------------------|--------------|
| 978             | Broken Hill (Little Stephen's Creek).                    | Ferruginous ore, with a little malachite, &c. ; metallic copper, 15 1 per cent ; nickel, 0 848 per cent ; cobalt, 0 089 per cent. | oz. dwt. gr. 0 19 12<br>Iridosmine, 2 dwt.<br>Silver, 10 oz 6dwt 21 gr                          | oz. dwt. gr. ## CHROMIUM.

There was some excitement in the neighbourhood of Gundagai during the year owing to the discovery of large deposits of chrome ore in that locality. The principal deposit is on private land, but as capital will be required to open up the mines, no practical results have followed the discovery.

During

During the year twenty-eight assays were made for chrome in the laboratory of this Department, the following giving the best results:—

| Official Number | Locality                                    | Description                               | Chrome per cent. |
|-----------------|---|---|------------------|

#### MANGANESE, NICKEL, AND COBALT.

A large lode of ironstone, carrying manganese, is about to be worked at Darbalara, about 12 miles from Gundagai. Should this deposit prove payable it may be the means of employing a large number of men.

The only actual mining for cobalt going on at the present time in the Colony is on M'Killop's selection, at Carcoar. A few tons of ore were raised during the year.

Five tons of cobalt ore were shipped from Port Macquarie to test its value. There is no lode discovered there yet, the ore shipped being taken from bunches, but it is thought that by sinking, a true lode may be discovered.

DURING the year the following assays were made for manganese, cobalt, and nickel in the laboratory of this Department:—

| Official Number. | Locality                         | Description.   | Per cent. Binoxide of Manganese. | Per cent. Metallic Manganese. |
|------------------|----------------------------------|--|----------------------------------|-------------------------------|
| 1404             | Camden Haven Heads (near)        | Psilomelane (cobalt and nickel under 0·5 per cent)   | 58·03                            | 36·69                         |

#### WOLFRAM.

The quantity of this mineral won in the Colony during the year was 1 ton 2 qr. from the Emma-ville Division of the New England Mining District, and 7 cwt. from the Broken Hill District. The value of it could not be ascertained. Prospecting operations are still going on at Berridale in the Cooma District for this mineral, and the indications are considered very satisfactory.

TUNGSTEN.

## TUNGSTEN.

A little prospecting work is going on in the vicinity of Frogmore, in the Burrowa District for tungsten. It is said fair prospects have been found in that locality. During the year eighteen assays were made for tungstic acid in the laboratory of this Department, the following giving the best results:—

| Official Number. | Locality.                            | Description.   | Tungstic Acid per cent. |
|------------------|--------------------------------------|--|-------------------------|
| 187              | Bald Hill (Pullitop Station).....    | Stream tin and wolfram (tin 20·60 per cent.) .....                       | 47·70                   |
| 2754             | Berridale .....                      | Wolfram in quartz.....   | 54·35                   |

| 542              | Tenterfield District .....           | Granular wolfram in clayey matrix .....                                  | 57·25                   |

## ALUM.

The Australian Alum Company, Bulladelah, have not manufactured any alum at their works there, but have shipped a large quantity of alumite to their works in England.

## DIAMONDS.

Bingarā is the principal seat of the diamond-mining industry in the Colony, and is carried on at the now famous Monte Christo Mine, owned by Captain Rogers. This mine is situated about 4 miles from Bingara township, and on a hill about 800 feet above the Gwydir River.

The diamond-bearing gravels have been covered by lava, which still forms the summit of the main range, but has been removed by denudation from the Monte Christo Mine and the other low parts, whence most of the diamonds have hitherto been extracted. The mine has been steadily worked during the year, and as much as 10½ carats of diamonds have been obtained from 80 lb. of wash-dirt, which also yields a little gold. Capital is, however, required to develop the property, and an attempt is being made to raise money on the London market. A large area of diamondiferous ground has been taken up adjoining the Monte Christo, but little work has been done owing to the scarcity of water. The output of the Bingara District is said to have been 15,000 carats, valued at £15,375, or an average of 20s. 6d. per carat, which shows that the majority of the stones are not very large in size. A few men are still prospecting in the Inverell and Berrima Districts for gem stones, but no really payable wash carrying these stones has yet been discovered in these localities.

## OPAL.

The White Cliff opal-field, situated in the Wilcannia Division of the Albert Mining District, has assumed some considerable importance during the year. A township has sprung up, and the population is estimated to be about 700, with a line of coaches running frequently between the field and Wilcannia, 60 miles distant. An immense amount of work has been done on the field, but only a few of the claims are worked on wages, the majority of them being worked on tribute, and whilst some of the tributors are doing remarkably well, a large number are not making anything. The real good opal is found in patches, and a large percentage of the opal raised is of little or no value. The opal-bearing country at present being worked covers an area of 12 miles in length by 2 miles in width, and is found at an average depth of from 10 to 12 feet from the surface, although, in a few instances, it has been found at depths varying from 20 to 50 feet, which may indicate that the opal may be distributed at great depths, and, if so, the field may become one of a permanent character for many years to come. It is seldom that any surface indication shows the presence of the noble opal. A shaft is started, which generally passes through 12 to 14 feet of red clay, then a layer of about 6 feet of gypsum, and then about 2 feet of hard sandstone, when the opal-bearing country is struck, but it has been found in drives at a depth of about 50 feet, although in some cases it has been found on the top of a claystone band at from 12 to 15 inches from the surface. The ground is, however, generally worked by open-cuttings, a face being opened out 30 or 40 feet wide and 10 feet deep. Some magnificent stones have been found on this field, valued as high as £60 each, and the green stones or green stones with fire in them, being the most valuable, although they are found in all colours. The scarcity of water is a great drawback to the field, the nearest supply being a private tank on the Momba Pastoral Company's Holding, 4 miles from the township. A Government tank is, however, being excavated, which will, it is hoped, overcome the difficulty. The sum realised from the sale of opal raised during the year is given approximately as £17,000.

## LIMESTONE FLUX.

The Tarrawingie Flux Company's limestone quarries are situated at Tarrawingie about 30 miles north of Broken Hill, and are connected with Broken Hill by means of a tramway. The output of flux during the year was 130,635 tons, valued at £111,041, a very large increase over the previous year, which was only 74,057 tons representing £35,357. This is a very important mining industry in the Barrier District, about 200 men being employed in the work.

## LOCALITY—PORT STEPHENS.

(1288) Gritty, white clay, yielding :—

|                                |             |
|--------------------------------|-------------|
| Moisture at 100° C. . . . .    | 1 84        |
| Combined water . . . . .       | 4 36        |
| Silica . . . . .               | 74 57       |
| Alumina . . . . .              | 16 47       |
| Lime . . . . .                 | 17          |
| Magnesia . . . . .             | trace.      |
| Ferric oxide . . . . .         | 1 18        |
| Manganous oxide . . . . .      | trace       |
| Potash . . . . .               | 1 03        |
| Soda . . . . .                 | nil.        |
| Phosphoric anhydride . . . . . | "           |
| Sulphuric . . . . .            | trace.      |
| Titanic acid . . . . .         | nil         |
|                                | <hr/> 99 62 |

## LOCALITY—STOCKTON COLLIERY.

(1551) Inflow water :—

The sample was contained in a small spirit flask, holding about 8 oz. Gave an alkaline reaction. The bottle on being opened emitted a foul odour—due to sulphuretted hydrogen, and at the bottom of the bottle was a black sediment, which was found to be sulphide of iron. The water consists largely of chloride of sodium, magnesium, and calcium; with lesser amounts of sulphide of iron (sediment), ferrous oxide (in solution), silica, and a small amount of alkaline carbonates, &c.

No sulphates, phosphates, or nitrates detected.

## LOCALITY—VICTORIA FALLS (100 FEET ABOVE THE).

(1935) Calcareous shale, yielding :—

|                             | Per cent. |
|-----------------------------|-----------|
| Carbonate of lime . . . . . | 47 0      |

## LOCALITY—WELLINGTON CAVES.

(998) Well water :—

| Results expressed in.                   | Grains per gallon. | Parts per 100 000 |
|---|--------------------|-------------------|
| Free ammonia . . . . .                  | nil.               | nil.              |
| Albuminoid ammonia . . . . .            | 001                | 002               |
| Nitrogen as nitrates . . . . .          | present.           | present.          |
| " nitrites . . . . .                    | nil.               | nil.              |
| Oxygen absorbed in 15 minutes . . . . . | nil.               | nil.              |
| " " 4 hours . . . . .                   | 0046               | 0067              |
| Appearance in 2 foot tube . . . . .     | Pale green colour. |                   |
| Odour when heated to 100 F° . . . . .   | nil.               | nil.              |
| Total solid matter . . . . .            | 28 352             | 40 493            |
| Chlorine as chlorides . . . . .         | 1 900              | 2 714             |
| Poisonous metals . . . . .              | nil.               | nil.              |

The total solid matter consists mainly of lime and magnesia, with lesser quantities of chloride of sodium, silica, and traces of alumina, sulphuric acid, &c. A spring water of excellent purity, and suitable for all domestic purposes.

## LOCALITY—WHITE ROCK.

(1671) Sample of ore, yielding :—

|                                       | Per cent.     |
|---------------------------------------|---------------|
| Moisture and combined water . . . . . | 1 25          |
| Silica . . . . .                      | 70 31         |
| Alumina . . . . .                     | 1 27          |
| Manganous oxide . . . . .             | trace.        |
| Lime . . . . .                        | 1 15          |
| Magnesia . . . . .                    | trace.        |
| Sulphide of iron . . . . .            | 6 64          |
| " zinc . . . . .                      | 14 80         |
| " lead . . . . .                      | 3 70          |
| " copper . . . . .                    | 23            |
| " cadmium . . . . .                   | trace.        |
| " arsenic . . . . .                   | minute trace. |
| " silver . . . . .                    | *304          |
|                                       | <hr/> 99 674  |

\* Fine silver at the rate of 86 oz 11 dwts 8 gr. per ton. No gold.

## LOCALITY—WINGEN.

(2394).—Greenish unctuous clay (Fuller's Earth), yielding :—

|                                |             |
|--------------------------------|-------------|
| Moisture . . . . .             | 13 73       |
| Combined water . . . . .       | 6 45        |
| Silica . . . . .               | 50 61       |
| Alumina . . . . .              | 19 35       |
| Ferric oxide . . . . .         | 3 55        |
| Ferrous . . . . .              | nil.        |
| Manganous oxide . . . . .      | "           |
| Lime . . . . .                 | 1 37        |
| Magnesia . . . . .             | 3 24        |
| Potash . . . . .               | 92          |
| Soda . . . . .                 | 47          |
| Phosphoric anhydride . . . . . | trace.      |
| Sulphuric . . . . .            | nil.        |
|                                | <hr/> 99 69 |

## LOCALITY—WOLLONGONG.

(1249) White clay, very pure, yielding :—

|                             |              |
|-----------------------------|--------------|
| Moisture at 100° C. . . . . | 1 87         |
| Combined water . . . . .    | 8 13         |
| Silica . . . . .            | 53 80        |
| Alumina . . . . .           | 21 77        |
| Ferric oxide . . . . .      | 37           |
| Ferrous oxide . . . . .     | 14           |
| Manganous oxide . . . . .   | trace.       |
| Lime . . . . .              | 1 17         |
| Magnesia . . . . .          | 12 89        |
| Potash . . . . .            | 40           |
| Soda . . . . .              | trace.       |
| Phosphoric acid . . . . .   | nil.         |
| Sulphuric . . . . .         | "            |
| Titanic . . . . .           | "            |
|                             | <hr/> 100 54 |

The sample contained some lumps, which when broken, were of a reddish brown colour.

## LOCALITY—WOLLONGONG.

(2321).—Supposed fireclay, yielding :—

|                                |              |
|--------------------------------|--------------|
| Moisture at 100° C. . . . .    | 2 05         |
| Combined water . . . . .       | 7 39         |
| Silica . . . . .               | 58 80        |
| Alumina . . . . .              | 23 33        |
| Ferric oxide . . . . .         | 1 10         |
| Ferrous . . . . .              | "            |
| Manganous oxide . . . . .      | trace.       |
| Lime . . . . .                 | 1 06         |
| Magnesia . . . . .             | 65           |
| Potash . . . . .               | 2 09         |
| Soda . . . . .                 | 15           |
| Phosphoric anhydride . . . . . | 07           |
| Sulphuric . . . . .            | 11           |
| Organic matter . . . . .       | 3 71         |
|                                | <hr/> 100 51 |

Bricks made of this clay in heating at a severe temperature show no sign of fusion, their sharp edges being retained.

SUMMARY.

## SUMMARY.

The total value of the mineral products of this Colony to the end of 1893 is £104,280,711 4s. 7d., details of which are given in the following table:—

|  | Quantity.   | Value.           | Total Values.    |
|--|---|------------------|------------------|
| Quantity and value of coal raised prior to 1st January, 1893 .....                         | 57,631,711·59 tons  | £ 27,271,429 0 3 | £ s. d.          |
| Quantity and value of coal raised in 1893 .....  | 3,278,328·36 "  | 1,171,722 4 6    |                  |

Department of Mines and Agriculture,  
12th March, 1894.HARRIE WOOD,  
Under Secretary for Mines and Agriculture.

CHIEF

CHIEF INSPECTOR OF MINES' REPORT.

Sir,

In submitting my annual report for the year 1893, I do myself the honor to inform you that the following is a list of accidents reported on by Wardens, Coroners, Inspectors of Mines, and Mining Registrars as having occurred during the year 1893 in the metalliferous mines of New South Wales.

TABLE A.  
Fatal and Serious Accidents, 1893.

| No of Accidents. | Date.  | Name of Mine or Company | Locality.      | Persons killed. | Persons seriously injured | Occupation.   | Cause of death or injury.                  | Fatal           |               |            |                     | Non-fatal         |               |                 |               |            |                    |               |                |   |
|------------------|--------|-------------------------|----------------|-----------------|---------------------------|---------------|--|-----------------|---------------|------------|---------------------|-------------------|---------------|-----------------|---------------|------------|--------------------|---------------|----------------|---|
|                  |        |                         |                |                 |                           |               |  | Fall down shaft | Fall of earth | Explosion. | Killed by machinery | Run over by truck | Miscellaneous | Fall down shaft | Fall of earth | Explosion. | Collapse of timber | Runaway cage. | Miscellaneous. |   |

Table A gives the number of accidents, date, name of mine or company, locality, persons killed or seriously injured, occupation, and cause of death or injury.

Table B gives, in addition to the percentage of persons killed or injured, the number of persons employed, and the value of machinery in, on, or in connection with, the metalliferous mines of New South Wales.

Out of the total of nineteen persons killed during the year, nine lost their lives in auriferous quartz-mining, two in alluvial gold-mining, seven in silver-mining, and one in tin-mining, being an increase of accidents as compared with 1892 of three in auriferous quartz-mining, and one in silver-mining, but a decrease of two in alluvial gold-mining, and one in cobalt-mining, making a total increase of one of the fatal accidents during the year.

Table C gives a list of the minor accidents, of which there were fourteen, or ten less than during the year 1892. Some of these accidents were so slight that the persons injured were able to keep to their work, but as they were reported on by the local officers, they were thought of sufficient importance to be noted here.

The total number of persons employed on the metalliferous mines, or on the machinery in connection with said mines, during the year 1893 was 19,709, or 2,317 persons more than were employed on said mines in 1892. The value of machinery in connection with metalliferous mining has increased during the year to the extent of £114,183, which may be considered very satisfactory in the face of the ordeal of financial depression New South Wales passed during the year 1893. The reports of Inspectors Milne, Hebbard and Godfrey, are also attached herewith. These Inspectors have carried on their work of inspection energetically and satisfactorily, ever ready and willing to assist me when their services were required. As will be seen by their reports, Messrs. Milne and Godfrey have travelled all over the various mining districts with the exception of Broken Hill, in which mining district Inspector Hebbard is at present stationed.

The following districts were visited by me during the year, in the capacities of Chief Inspector of Mines or Mining Warden, on various official duties:—Adelong, Gundagai, Gunning, Goulburn, Temora, Barmedman, Yalgogrin, Grenfell, Forbes, Parkes, Burra Burra, Mount Hope, Mount Allen, Billigoe, Bee Mountain, Cobar, Peak Hill, Aleetown, Wellington, Lucknow, Bathurst, Orange, Dubbo, Nymagee, Armidale, Uralla, Sherwood, Hillgrove, Glen Innes, Glen Elgin, Deepwater (Nine Mile).

The clerical work of my branch has considerably increased during the year, owing to the assistance afforded to certain of the unemployed to proceed to the gold-fields for the purpose of fossicking out a living. No less than 2,630 persons were so assisted during the year through my recommendation as a member of the Fossicking Board and an officer of the Mines Department. This, no doubt, greatly accounts for the increase of 2,317 persons employed in the metalliferous mines of New South Wales during the year 1893 as compared with 1892.

The

The following is the important minute written by the Under Secretary for the purpose of providing an outlet to certain of the unemployed on the gold-fields of New South Wales, the action of which has proved very beneficial to many deserving persons.

The minute referred to of Mr. H. Wood, the Under Secretary, reads as follows:—

“*Providing an outlet for the Unemployed.*—In view of the distress existing amongst the unemployed in the centres of population, it is a question whether an outlet might not be found on some of our gold-fields. I raise this question with considerable hesitation, because at best it cannot be regarded as other than a *pisaller*, but I am inclined to think that on many of our deserted or partially deserted gold-fields a few shillings per week can be earned without special skill and with moderate industry, and there is always the off-chance of finding a stray patch or nugget. Then, as to the cost of living. A miner's right (cost, 10s. for the year, or 5s. from July to December) entitles the holder to occupy one-quarter acre of land, and to take from any Crown lands any timber and bark that he may require for building a hut and fencing in his land. Upon his quarter-acre he can grow as much vegetables as will supply a moderate family. He can, free of cost, keep a few goats to supply milk and food, and his earnings, small though they may be, would probably suffice to provide the other absolute necessities of life. In this way many poor families might be saved from starvation or pauperism until more prosperous times may enable them to find some more congenial and profitable outlet for their energies. If approved, the matter might be referred to the officer in charge of the Labour Bureau, and if he thinks any number of the unemployed would be willing to avail themselves of this opening, I would endeavour to ascertain through the officers of this Department which fields offer the best prospects.”

The above minute of the Under Secretary received the Minister's approval, the outcome of which was that a Board, consisting of H. Wood, Esq., J.P. (Under Secretary for Mines and Agriculture), Mr. Dowel, M.P., Mr. Creer (Superintendent of the Labour Bureau) and myself (Chief Inspector of Mines), were appointed.

The Board decided, amongst other important matters, that all applicants for assistance to proceed to our gold-fields should, in the first instance, make application to me, and if found eligible a letter should be given them to Mr. Creer, for the issue of free railway passes, a miner's right, and in some cases, where really needed, rations, in the shape of flour, tea, and sugar, sufficient for about a fortnight. As stated above, no less than 2,630 persons were assisted to proceed to the gold-fields, which, in the majority of cases, has given beneficial results. By these means, not only was the labour market relieved in and about the centres of populations, but many were able to make happy, comfortable homes who otherwise would have been a drag on the labour market.

While the clerical work in connection with the Prospecting Vote has decreased during the year, owing to the fact that only £20,000, instead of £40,000 had been voted, that of the Chief Inspector of Mines has greatly increased, owing to the action taken in assisting some of the unemployed to proceed to our gold-fields for fossicking purposes.

| Letters written in 1893. |     |     |     | Papers registered in 1893. |       |
|--------------------------|-----|-----|-----|----------------------------|-------|
| Prospecting Vote         | ... | ... | ... | 2,649                      | 5,282 |
| Chief Inspector of Mines | ... | ... | ... | 1,875                      | 3,002 |
| Total                    | ... | ... | ... | 4,524                      | 8,284 |
| Diamond-drills...        | ... | ... | ... | 516                        | 1,318 |

The total number of letters written in my branch during the year was 5,043, and papers registered 7,602. Mr. M'Culloch, with his energetic habits and ability, has, as usual, overcome this large amount of clerical work with apparent ease, which is certainly very highly creditable to him, more especially when it is considered that the whole of the Annual Report is compiled by him. Mr. Stone has ably assisted Mr. M'Culloch throughout the year.

I have, &c.,

W. H. J. SLEE,  
Chief Inspector of Mines.

REPORT on the Sherwood Mine by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines.

Sir,

12 January, 1893.

I have the honor to inform you that I have inspected the Sherwood mine, which is situated about 26 miles south-east of Armidale, 22 miles from Uralla, and 1 mile north-east of Bora Creek. The present workings consist of an open cutting, about 20 feet in depth, and 10 feet in width, on a large bed of quartzite, through which very small veins of auriferous quartz occur, with which the gold is associated. These quartz-veins are too small, and cannot be “culled” from the quartzite, which in itself contains no gold, but which has to be crushed, by which the yield of gold is reduced very considerably. Some of these quartzite beds may be of very great width and extent, and it is of the greatest importance to this district that they should be tested to a greater depth than hitherto obtained as they occur through miles of country, and if the Sherwood mine should prove dividend-paying other quartzite deposits would be worked, and a large number of persons find profitable employment. The quartzite beds of the Sherwood mine are similar to those so profitably worked in the Yalwal Gold-fields, Nowra District, and, like Yalwal, richer shoots of gold may probably be discovered at the Sherwood mine after the quartzite beds have been opened up to a greater length and depth. The Company have a 10-stamp battery crushing night and day, and out of 1,054 tons obtained 259oz. 2dwt. of gold. But as quantity, rather than quality, must be looked forward to, more crushing-power will be required to ensure a larger production of gold, with lesser expenses at per ton than hitherto obtained.

I have, &c.,

W. H. J. SLEE, F.G.S.,  
Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

FURTHER Report by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines on the Burra-Burra Gold and Tin Rushes.

Sir,

Parkes, 30 May, 1893.

In continuation of my previous reports, *re* the Burra-Burra gold and tin rushes, I have the honor to inform you that since my last report a party of miners, named Pepper and party, washed a load of dirt from their claim at the gold rush about half a mile distant from the prospecting claim, which yielded

6 dwt. of gold to the one-horse load, with a thickness of wash of about 9 inches. This find strengthens the opinion expressed by me that the gold will occur in patches. The yield obtained by Pepper and party, although small, will pay wages to industrious experienced miners. Nothing fresh has, however, been discovered at the tin-rush; but as the mineral is found in patches, and shepherding adjoining claims is of no avail, I think fresh discoveries may be looked forward to at any moment. Parties are now scattered in all directions over the Burra Burra, Murrumbogie, Melrose Plains, Carlyle, and other stations, prospecting for gold and other minerals, and as this part of the country has already been reported on by me in 1884, nine years ago, has a decided auriferous appearance, and, in addition, stanniferous and argentiferous deposits have been discovered over a large tract of country in the Burra Burra, Melrose Plains, Murrumbogie, Carlyle, and Yellow Mountain Pastoral Holdings, on to Dandaloo, the newly-formed township of Burra Burra is likely to become the permanent centre of this large area. The majority of the persons congregated at these rushes belong to the respectable industrious class; there are, however, the usual followers after the miner and business-men—the drones of our gold-fields—and some very rough characters too. Persons without money, tools, or provisions should not come to the rush, as they would necessarily have to undergo great hardship and privation, as there are already too many of these unfortunates on the rush, and the strain on the stores of the settlers is becoming too great, and cannot be expected to be kept up much longer, as on some stations some twenty to thirty persons have daily received food free of cost. Grass and water are at present in abundance in this part of the country. I leave to-morrow for Orange, and hope to be in Sydney on Saturday, the 3rd proximo.

I have, &c.,

The Under Secretary for Mines and Agriculture.

W. H. J. SLEE,  
Chief Inspector of Mines.

COPY of a Report by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on a Mine on the Bletchington Estate, Orange.

Sir,

Sydney, 5 June, 1893.

*Re* your instructions to report on a mine on the Bletchington Estate, near Orange, when on my return from Burra Burra to Sydney, I have the honor to inform you that I inspected said mine on the 1st instant, and found that a new shaft had been sunk to a depth of 95 feet, and a drive put in a westerly direction for 20 feet towards a shaft said to have been sunk several years ago, and out of which a few tons of quartz were taken and crushed at Lucknow, yielding about 1 oz. of gold per ton. In the drive referred to can be seen all the characteristics of the Lucknow formation—that is, the diorite and serpentine—also the quartz veins occurring in the diorite, and terminating at the points of the serpentine rock. I was informed that the quartz crushed was taken from a brown vein (decomposed pyrites), which has not, however, yet been met with in the new workings. A prospect was washed in my presence from some quartz veins lying on top of the old shaft, which yielded a very fair prospect of fine free gold. There is no doubt in my mind that at the Bletchington Estate a similar formation to that of the Lucknow deposits exists, the latter of which were so successfully developed by that energetic and able mining manager Mr. H. W. Newman, M.P. This also verifies the opinion frequently expressed to me by the late Mr. C. S. Wilkinson, Government Geologist, when on our joint official travels through the Orange District, that the joint or crack of the Lucknow formation could be traced for miles through the Hon. A. T. Kerr's; Lane's; Dalton's; and other properties, and that probably such auriferous deposits would be met with along the formation in a north-westerly direction. Therefore, although nothing payable has so far been discovered in Mr. Dalton's property, known as the Bletchington Estate, systematic prospecting may bring to light payable auriferous deposits, if even on a smaller scale than those of Lucknow, still, of sufficient importance to induce capitalists to invest their money for the development of said tract of country, or property-holders to prospect their land.

I have, &c.,

The Under Secretary for Mines and Agriculture.

W. H. J. SLEE.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the New Rush at Yalgogrin, situated 55 miles west from Barmedman.

Sir,

Barmedman, 26 August, 1893.

Having returned to Barmedman from Yalgogrin, Nariah, and Wallandra, of which I advised you by wire this morning, I do myself the honor to furnish you with further particulars concerning the prospects of the locality as a gold-field, and other matters in connection therewith. I arrived at Yalgogrin on Monday morning, the 21st instant, which is situated about 55 miles from Barmedman in a north-westerly direction. Having been supplied by Mr. Love, Warden's Clerk at Barmedman, with a list of applications for permits to dig and search for gold on Messrs. Payne's and Waldron's conditional purchases and leases, I at once commenced in my capacity as Warden to mark off, per order of date of application, the several areas applied for. No sooner had I started to measure than disputes arose, and I found that it would require more time and consideration than I had anticipated, as several parties were claiming the same areas, irrespective of date of application and the fact that pegs had been put in in all directions, regardless of regularity, size of area applied for, or the interest and feelings of adjoining applicants. Some had specified no site in their application; hence they were ready to claim a site at or near where gold had been discovered by someone else. There were several instances where not only no site was specified, but only one name appeared as applicant, still the latter wanted to claim eight men's ground, or 480 x 400 feet. If such a system were encouraged or allowed, then eight men each applying for eight men's ground could hold 3,840 feet along the line of reef by 400 feet in width. These two systems, if allowed, would be detrimental to the best interests and development of any mining-field. To remove the muddle into which matters had drifted, and bring them to something like a satisfactory conclusion for all parties concerned, I saw no alternative but to measure the areas already held under permits, as well as those already under application, amounting in all to about 120. This took me several days, from early morn till late at night, as disputes for the same pegs, boundaries, or areas were numerous, and cropped up very frequently during the day. I have now good reason to believe that, in defining the boundaries of all the areas, things will work more smoothly at Yalgogrin in the future than they have done in the past. The localities above named, for a distance of several miles, not only in the conditional purchases and conditional leases above referred to, but also the Crown lands, have a decided auriferous appearance, and, in some parts, stanniferous

stanniferous and argentiferous deposits are likely to be met with; and if the same energy were displayed in prospecting for gold in the Crown lands at Yalgogrin, Nariah, and Wallandra, as is displayed on this selection, the results would probably be equally as good, if not better. So far, although no payable prospects have been obtained from the alluvial, and, in fact, not much prospecting has been done for alluvial gold, nevertheless the indications are very favourable for the existence of auriferous leads. The great scarcity of water, notwithstanding the favourable season, will always prove a great obstacle against thoroughly prospecting that part of the country, there being no natural waterholes or springs to be found. Therefore, the conservation of water must be accomplished by artificial means, such as the construction of dams or tanks. Were it not for the great kindness and forbearance of the selectors in allowing permit-holders the use of water and other privileges, the latter could not have prospected the country to the extent they have already done. The report that from 7 to 8 dwt. of gold to the dish had been obtained is not correct, but about four different parties are obtaining gold in irregular masses of quartz in Payne's selection, and about the same number in Waldron's. So far, the best-defined vein, which has been sunk upon to about 30 feet from the surface, is M'Mahon's Reef, on Payne's selection. From this reef three small crushings, in the aggregate 26 tons, were taken, which yielded a total of 55 oz. 16 dwt. of gold. The quartz vein is from 6 to 16 inches in thickness, occurs in the granite, and, characteristic of that formation, is met with in short blocks. Payne, Thompson, Gibson and party, and one or two others, are also obtaining gold in quartz. In Waldron's selection, O'Brien and party, Campbell, Organ and party, and Shelley and party, are obtaining very fair gold in irregular masses of quartz and quartzite, but as (with the exception of M'Mahon's) only surface scratchings have been made, it is premature to pass a decided opinion. Present appearances are, however, against the belief that they are of a permanent nature. In some of the auriferous quartz, chloride of silver was detected by me. Owing to the fact that the resumption and throwing open to the public for mining purposes, of the 1,280 acres conditional purchases and 2,560 acres conditional leases, at present owned by Messrs. Payne and Waldron, would cost at least £7,000 or £8,000 of public money, as the whole area is surrounded by rabbit-proof fencing of first-class character, it appears to me that the land has not been sufficiently prospected, and what gold discoveries have been made are not of sufficient importance to warrant resumption at the outlay required.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the Burra Burra Gold and Tin Field.

Sir,

Parkes, 20 October, 1893.

I do myself the honor to inform you that I returned here from a visit of inspection to the Burra Burra Gold-field. The male population of Burra Burra, in the parish of Murga, may now be put down as about 150, in addition to which there are a few families with probably a sufficient number of children to form the nucleus of a Provisional Public School. I was informed by the miners themselves that a large number of men had lately left the field owing to the scarcity of water for gold-mining purposes, and on account of it being the shearing season, many have obtained employment on stations in the immediate neighbourhood. I may, perhaps, incidentally mention that this season's wool-clip in these parts of the western back country has lightened the hearts of the settlers, having exceeded their most favourable anticipations. The crops, too, are looking wonderfully well, in consequence of which the settlers (squatters and selectors) are jubilant, and it is thought in these parts at least the wave of depression has passed, and with the lesson taught, the future is being looked forward to with the greatest of hope and confidence, which, indirectly, must also have a beneficial effect on our mining community, they being great consumers of the commodities produced by squatters and selectors.

The prospectors of the Murga or Fifield part of the Burra Burra rush are still working their claim with payable results, and though by personal inquiries made from the miners at work, I could not ascertain that any extraordinary finds had been made, nevertheless several expressed themselves satisfied with their earnings, looking hopefully for something better as soon as a more copious water supply could be obtained. Taking the gold-field as a whole, I am of opinion that its permanency is assured, and that a small population of a few hundreds will make a living for years to come, though, of course, the number of the population will always depend on the rainfall in these localities. The rush has now a Post Receiving Office, name Fifield, after one of the prospectors. A hotel is in course of erection, and there are the usual baker's, butcher's, and blacksmith's shops and stores to form the foundation of a mining township. As permanent buildings are now being erected, the business people thought it was time to have a street laid out, and interviewed me to that effect, with which request I complied, and in my capacity as Warden marked out a street, leaving it an open question whether the township be named after the parish of Murga or after one of the prospectors, Fifield, the name under which the Receiving Office is now known. The following is a list of washings which have taken place on the field, for which information I am indebted to Mr. H. Biltoft, one of the prospectors:—

| Prospector's claim  | 209 loads yielded ... | ... | ... | ... | ... | ... | oz. dwt. gr.   |
|---------------------|-----------------------|-----|-----|-----|-----|-----|----------------|
| Newton and party    | 52                    | "   | ... | ... | ... | ... | 158 6 8        |
| Cole and party      | 64                    | "   | ... | ... | ... | ... | 8 0 0          |
| Machattie and party | 40                    | "   | ... | ... | ... | ... | 14 0 0         |
| Fleming and party   | 55                    | "   | ... | ... | ... | ... | 10 0 0         |
| Ferguson and party  | 14                    | "   | ... | ... | ... | ... | 17 15 0        |
| Stamp and party     | 14                    | "   | ... | ... | ... | ... | 2 2 0          |
| Kennedy and party   | 43                    | "   | ... | ... | ... | ... | 0 7 0          |
| Harry the Puddler   | 52                    | "   | ... | ... | ... | ... | 6 0 0          |
| Phillip and party   | 17                    | "   | ... | ... | ... | ... | 12 0 0         |
| Armstrong and party | 51                    | "   | ... | ... | ... | ... | (about) 1 10 0 |
| Hall and party      | 25                    | "   | ... | ... | ... | ... | 11 10 0        |
| Wharton and party   | 13                    | "   | ... | ... | ... | ... | 9 10 0         |
| Houghton and party  | 57                    | "   | ... | ... | ... | ... | 2 12 0         |
| And sundry others   | ...                   | ... | ... | ... | ... | ... | 13 18 2        |
|                     |                       |     |     |     |     |     | (about) 10 0 0 |

From the above it will be seen that nothing rich has so far been obtained, the gold seemingly occurring in small, irregular patches; thus, in the prospector's claim, as high as 9 oz. of gold to the prospecting-dish

dish has been obtained; but as the ground is shallow, and sinking and driving easy, a living can be made by a few hundreds as soon as the dams and water-holes are once more filled by rain, which at present is sadly needed. Some excitement was caused through the washing up of 18 loads by Smith, Warner, and party, from W. Simmons' conditional lease No. 10, as it was thought that the ground was payable, and that the conditional lease might be resumed for mining purposes. I waited on the field till the washing was completed, which yielded 2 oz. 6 dwt. of gold and about 2 oz. platinum to the 18 loads, or about  $2\frac{1}{2}$  dwt. of gold per load, which, considering the shallow, easy sinking and driving, would give small wages if water were plentiful and near at hand, but the yield is not of sufficient importance to warrant the resumption of the conditional lease. The tin-field has been quite deserted by the Europeans, and a man named Litchfield is now negotiating with some Chinese to work these tin deposits. I am, however, still of opinion that gold discoveries are likely to be made in the Burra Burra, Melrose, Murrumbogie, Carlyle, and other localities similar to those workings at present carried on near the boundary of Burra Burra and Murrumbogie Runs.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture, Sydney.

REPORT by Mr. W. H. J. Slee, Chief Inspector of Mines, on Gold-mining in the Parkes District.

Sir,

Parkes, 23 October, 1893.

I do myself the honor to inform you that the quartz and alluvial industry in this district is on the eve of revival, and that in the near future the Parkes district may again come to the front as a great gold-producing locality. Several of the quartz reefs worked on the tribute system have of late given excellent returns, such as the Bushman, Dayspring, and others. Extensive prospecting operations are also carried on in the Phoenix, Gladstone, and other mines. For alluvial, great hopes are entertained of Lynch Brothers prospecting works, situated about 4 miles southerly of Parkes. This party have bottomed a shaft at the depth of 93 feet on about 18 inches of wash containing gold. They intend to wash from 6 to 8 loads of dirt by the end of this week, and have great hopes of favourable results. The party have been receiving aid from the Prospecting Vote. I examined the auriferous wash below ground, which has a very promising appearance. Although so far no payable gold has been reported, the ground has been marked off for a considerable distance in all directions from the Prospector's shaft, and it is likely that one or more shafts will be bottomed by the end of this week. Ryan and party have reported gold on the Scrubby Plains, about half-way between Parkes and Forbes, and about  $1\frac{1}{2}$  miles from Judd's Hotel. Their prospecting-shaft is 138 feet deep, with about 15 inches of wash, yielding about 7 dwt. per load. The sinking is comparatively easy, and quite dry. The ground has been marked off for a considerable distance, and there are favourable indications of the existence of an alluvial lead. Egan, Lamb, and party are also obtaining gold at a depth of 130 feet. At Strickland, about fifteen parties are earning, from "tucker" up to small wages, but so far the favourable anticipations formed at the outset of the rush have not been realised. These new discoveries, although at present of no great extent, may yet profitably employ a large number of persons, and could not take place at a more opportune time, as, owing to the near completion of the Molong to Parkes and Forbes railway, a large number of persons are at the present time idle throughout the district.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the mines situated in the Mount Hope and Mount Allen Districts.

Sir,

Mount Hope, 7 December, 1893.

I do myself the honor to inform you that I completed my inspection of the Mount Hope and Mount Allen mines, and will return to Cobar for the purpose of inspecting the mines in that district. At Mount Hope, the tributors of the Mount Hope Copper-mine, are just able to keep one furnace going, and are making and sending away from 17 to 18 tons of copper per month. The total number of men at present employed, including wood-carters, averages about fifty. The Great Central Mine, about 5 miles from Mount Hope, has been taken on tribute, and mining operations are to be started again at an early date. At Mount Allen, about 10 miles north-west from Mount Hope, a township has been laid out, within about  $\frac{1}{2}$  a mile of the Mount Allen mine, and several small buildings for residence and business purposes are being erected, the total population numbering about 200. This number would be greatly increased if the Mount Allen Gold-mining Company had sufficient water in their tank to keep their 20-stamp battery continually going. This Company, under the able management of Mr. John Hutchings, has just completed a crushing of 274 tons, yielding 343 oz. of smelted gold, making a total of 1,591 tons crushed out of the mine for a total yield, in round numbers, of 1,826 oz. of smelted gold, which is very satisfactory, but unfortunately the supply of water has again run out, and crushing operations are once more at a standstill. These stoppages, from want of water, are greatly retarding operations for the development of the mine. The greatest depth so far obtained is 70 feet, and it would be to the interest of the Company to continue the sinking of their main shaft as quickly and to as great a depth as circumstances will allow.

The workings or cuttings out of which the crushings have been taken are about 55 feet in length by several feet in width, but whether the lode occurs in lenticular blocks or the saddle formation similar to the quartz reefs at Bendigo, or the Proprietary Mine, Broken Hill (to the latter of which public attention was first drawn by Mr. Pittman, Government Geologist), cannot be determined until further development has taken place, or "horse" or mass of rock occurring at present in the lode, which makes the latter appear as a saddle formation. Personally I favour the theory that the Mount Allen auriferous and iron ore deposits originate through the agency of mineral springs. Captain Cause; Penhale, and Brentnall have, in conjunction with others, taken up a mine on the Dromedary Mountain, about 3 miles from Mount Allen, from which several tons of bulk samples were taken to a crushing-machine at Parkes, yielding from 7 to 8 dwt. of gold per ton, from a lode several feet in width. A further number of claims have been taken up on these auriferous iron deposits in the district, with a view to thorough prospecting. The great drawback to the mining industry in this part of New South Wales is the scarcity of water, although

although sufficient rain has fallen during the last two years to cause abundance of grass, which is now unfortunately destroyed by extensive bush fires all around this district, the rainfall has been so light and at such long intervals that the storage of water in the tanks and reservoirs is comparatively small; in fact, in some parts of the district almost nil.

I have, &c.,

W. H. J. SLEE,

The Under Secretary, Department of Mines and Agriculture.

Chief Inspector of Mines.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines on the new gold and tin discoveries at Burra-Burra.

Sir,

I do myself the honor to more fully report to you on the new gold and tin discoveries at Burra-Burra Rush than I was able to do by the telegrams forwarded by me. Burra-Burra is situated about 65 miles from Parkes, about the same distance from Peak Hill and Alectown, and about 55 miles from Dandaloo. It is situated on the Murrumbogie, and Burra-Burra Mining Reserve in the parish of Murga, county of Cunningham. On my arrival I found about 800 persons on the ground, and large numbers arriving hourly, I at once proceeded to the prospecting claim of Fifield, Rand, and party, who had reported payable gold to the Warden's Clerk at Alectown, to whom they gave the information that they had washed  $2\frac{1}{2}$  loads of wash-dirt, which yielded 1 oz.  $7\frac{1}{2}$  dwt. of gold. As a large crowd of persons collected round the shaft, I selected two miners who had no interest in the prospecting or surrounding claims, and proceeded with them down the shaft, and knocked out two prospects which were washed in my presence, and yielded at the rate of about 6 dwt. of gold per load. The prospectors, in addition to the two loads (one-horse tip-dray load), had knocked out a load before my arrival, which was washed in my presence, and yielded 1 oz.  $2\frac{1}{4}$  dwt. per load, making a total of about  $2\frac{1}{2}$  oz. of gold out of  $3\frac{1}{2}$  loads of wash. The depth of sinking is 31 feet; thickness of wash, 12 inches; and width, 15 feet. There are strong indications that whatever gold will be obtained is likely to be very patchy without the probability of anything like a continuous load. After I had allowed about a dozen miners to go below on behalf of the miners on the field, I declared the prospectors' claim payable, and advised one and all to go to work, and not to idle away their time waiting for others to find the gold, as in patchy ground it would be useless to shepherd, and that in my capacity of Warden, I should strictly enforce the Mining Board Regulations. The consequence was that large numbers started to sink, but although fully 100 holes have now bottomed, none, so far, obtained any payable gold except the Prospectors. I settled a few mining disputes on the ground, and then posted up notices around the dam formerly belonging to the Nymagee-Cobar Gold-mining Company, reserving same for domestic purposes, and cleared away all parties camped above the dam, to prevent the water becoming polluted and unfit for human use. Numbers of persons are hourly arriving, but I feel confident that the rush will not be able to support a large number of persons. The Prospecting claim is only about  $2\frac{1}{2}$  miles from Cavanagh's gold workings, and the same distance from the prospecting operations, for which Connolly and party obtained aid out of the Prospecting Vote.

I then proceeded to the tin discoveries in the parish of Burra-Burra, about 10 miles westerly from the gold rush, and found about 200 persons on the ground. About six parties are on payable tin, and the sinking is from 6 feet to 20 feet in depth. I will report more fully on this discovery after I have completed my trip of inspection to Bullock Creek, and Lightning Creek the latter locality being about 40 miles from Dandaloo.

I have, &c.,

W. H. J. SLEE,

The Under Secretary for Mines and Agriculture.

Chief Inspector of Mines.

REPORT by Mr. W. H. J. Slee, F.G.S., Chief Inspector of Mines, on the Bee Mountains, Billigoe, and Cobar Districts.

Sir,

Cobar, 13 December, 1893.

I do myself the honor to inform you that I have completed my inspection of the Bee Mountains, Billigoe, and Cobar districts, and will also inspect Girilambone before returning to Sydney.

At the Bee Mountains, prospecting operations are still carried on by Thomas O'Brien and party, but so far nothing of a payable character has been discovered.

Several of the gold mines within 3 miles of Cobar, on the Fort Bourke and Occidental lines, have of late yielded highly payable results. Commencing on the southern part of the range is the Occidental Mine, under the able management, of Mr. G. Fawl. This company have crushed from a large mass of country rock over 25 feet in width, over 1,746 loads since September last, yielding 325 oz. 8 dwt. of smelted gold—a payable yield, considering the large quantity of stuff taken for crushing purposes. At present, twenty-five men and three boys are employed at the mine. With a large water supply and increased crushing plant, even 4 dwt. per ton ought to give payable returns. North of the Occidental is the Albion Mine (Crow and party). This party crushed lately 180 tons, yielding 106 oz. 4 dwt. of smelted gold, the last 38 tons yielding 48 oz. of smelted gold. The crushing stuff is taken for about 4 feet in width, and the deepest level so far obtained is 40 feet. A large number of tons of stuff is now at grass ready for crushing before the end of this year.

Next, and northerly of this mine, are two leases idle, not complying with the labour conditions.

Adjoining this is the Wood Duck Mine (A. Mallott, Hunt, and party). This party has lately crushed 107 tons, yielding 88 oz. 11 dwt. of smelted gold. The width of the lode taken for crushing purposes is 4 feet, and the deepest level 34 feet. About 30 tons more are likely to be crushed before the end of this year.

North of the Wood Duck Mine is a 5-acre lease; only one man at work.

Next comes the No. 3 Chesney—Hunt, Beard, and others—a tribute party who have lately crushed from the 186-ft. level 328 tons, yielding 222 oz. 9 dwt. of smelted gold. The thickness of the lode taken averages from 3 to 5 feet in width, which gives highly remunerative returns.

The Reform North Chesney (Gellard and party) are still prospecting, so far without any payable results, although there is a great probability that payable shoots of gold will be discovered in the ground.

Cooper and party, still further northerly, have for some considerable time carried on prospecting operations, which so far have not proved successful.

By the above, will be seen that payable auriferous deposits in large quantities exist in the whole of the above-mentioned tract of country, that the gold-mining industry is now the principal mining done in this district, and that by indications the auriferous deposits may perhaps be worked profitably, to the depth of 200 feet or water-level, after which depth the sulphides are almost certain to make their appearance, and, in the near future, the output of these mines will be changed from gold to copper. It is only a matter of time, and probably a short time, when Cobar will once more rank as the premier copper-producing district of Australia.

The market value of copper is now on the rise, and should it continue to do so, then the Great Cobar Copper-mine is sure to make a start again. As it is, I am still of opinion that the new-find on the 60-fathom level, near Besker's shaft, would, even in the present state of the market value of copper, prove payable if opened out on higher levels. Unlike the old lode, the dreggy part is slate, instead of iron, and could, therefore, be dressed up to a higher percentage by jiggers and otherwise than the copper ore of the old lode, which was largely associated with iron.

The Billigoe field, which is distant about 25 miles from Cobar, has lately received a great impetus by the striking of very rich auriferous deposits in the Drysdale Mine. This is the result of aid out of this year's Prospecting Vote.

The vein in which the gold is obtained varies from a mere thread to, in one place, 12 inches in thickness, and has been opened for fully 100 feet in length, and although the main shaft has been sunk to 80 feet in depth, the present workings are carried on at the 40-ft. level. To give an idea of the richness of the vein, I may state that, through the courtesy of Mr. MacGregor, the Company's secretary, a return, in round numbers, of the crushing and yield are appended herewith. It appears that some sixteen samples were crushed, some at Chesney local battery, at the Clyde Works, Sydney, and Wallaroo, South Australia; in all 125 tons, yielding 1,297 oz 18 dwt. of smelted gold. In addition, 40 tons, known as seconds, are now *en route* to the Clyde Works, Sydney, which are expected to yield 1 oz. per ton; and 33 tons *en route* from Wallaroo, estimated to yield about 10 oz. per ton. In addition to the above, payment for silver at the rate of about 5 oz. per ton treated has been made.

A party at the Old Billigoe, about 2½ miles north of the Drysdale Mine, are also obtaining payable gold. This mine was aided out of the last year's Prospecting Vote.

So far, no other mines have made any payable discoveries. The whole of the population at both places is about eighty. Provisions are plentiful on the field, but water is very scarce.

I have, &c.,

W. H. J. SLEE,

Chief Inspector of Mines.

The Under Secretary for Mines.

#### INSPECTOR MILNE'S ANNUAL REPORT.

Sir,

Sydney, 17 January, 1894.

I have the honor to submit my annual report of the inspection of mines in the following districts for 1893.

Nana Creek, Grafton, Cangi, Mann River, Glen Elgin, Dalmorton, Newton Boyd, Tenterfield, Drake, Rivertree, Deepwater, Emmaville, Torrington, Glen Innes, Bear Hill, Inverell, Lingha, Kookabookra, Bingera, Tamworth, Swamp Oak, Niangala, Armidale, Hillgrove, and Copeland in the north

Wagonga, Bodalla, Nerrigundah, Araluen, Braidwood, Snowball, Nerriga, Nelligen, Brimbramalla, Tarago, Bungonia, Nadgingomar, Goulburn, Crookwell, and Coolamin in the south.

Kerris Creek, Ophir, Lewis' Ponds, Orange, Forest Reefs, Burnt Yards, Carcoar, Woodstock, Mandurama, Gally Swamp, and Mount McDonald in the west.

In the different districts inspected a great improvement is noticeable both on the surface and underground workings.

This is due no doubt to the mines being more frequently inspected, and the managers generally complying with the regulations for the inspection of mines other than coal and shale mines.

In the whole of the Northern District two fatal and two serious accidents have occurred during the year.

Both fatal accidents were from falls of earth in shallow workings of prospecting claims, the men themselves being shareholders.

The constant and heavy rains during the early part of the year were to a great extent the cause of these accidents, having thoroughly saturated the ground, rendering shallow workings very treacherous, and extra precautions required in securing the ground.

In conjunction with the above, as a member of the Prospecting Board, I have inspected and reported on 187 applications for aid out of the Prospecting Vote.

I have, &c.,

DAVID MILNE,

Inspector of Mines.

The Chief Inspector of Mines, Sydney.

#### INSPECTOR HEBBARD'S ANNUAL REPORT.

Sir,

Broken Hill, 31 January, 1894.

I have the honor to present my annual report as follows:—

During the year, in addition to constantly visiting and inspecting the mines, machinery and boilers, in this immediate neighbourhood, I have visited the following out-lying districts:—

Thackaringa, Umberumberka, Purnamoota, Day Dream and Apollyon Valley, Tarrawingee and Euriovie, Nuntherungie, White Cliffs, Mount Browne, and Tibooburra.

Work in this district is now almost entirely confined to the Broken Hill lode, and on that, all work is embraced in the operations of the following companies:—

Broken Hill North.

Junction North.

Junction.

British, Block 14.

Broken Hill Proprietary, Block 10.

Central, Broken Hill South.

Of

Of the mines contiguous to the main lode, only the A.B.H. Consols and the New B.H. Extended are in operation; the latter partly by means provided by the Prospecting Vote to crosscut the course of the main lode at the 1,330-ft. level.

In the mines on the main lode some are now confined to experiments in the treatment of the immense deposits of sulphide ore, and, judging from results obtained in concentrating, these experiments are likely to have a successful issue.

At Euriowie some of the tin mines are again at work, and I am informed that the ore-dressing plant at Mount Euriowie is to be started early in the year to dress ore for the public.

Those interested and having charge of these mines speak with confidence of a certain measure of success.

At Nuntherungie the mines are almost entirely abandoned.

The opal fields at White Cliffs have received a large access of population, and a large quantity of the precious stone has been found during the year.

Mount Browne and Tibooburra remain in practically the same condition as during last year.

Occasional patches of good ground are found, but not sufficient, I should judge, to pay wages to those employed in the industry.

There has been a total of sixty-one accidents in and about the mines and machinery of the district. Of these, five were fatal, twenty-eight serious, and twenty-eight slight. Of these the great majority were preventable.

During the year I have made numerous reports on applications for aid from the Prospecting Vote, but in cases where work has been done under the Vote no good discoveries have yet been made.

I have also reported on several applications for the suspension of the labour covenants of leases at the request of Mr. Warden Barnett.

I have, &c.,

JAMES HEBBARD,

Inspector of Mines.

The Chief Inspector of Mines, Department of Mines, Sydney.

---

ACTING INSPECTOR GODFREY'S ANNUAL REPORT.

Sir,

Sydney.

I have the honor to submit to you my Annual Report on the mines inspected by me during the year.

The principal mining centres visited by me were:—

In the Southern District: Pambula, Cobargo, Mount Dromedary, Bimbimie, Big Hill, Nelligen, Yalwal, Braidwood, Major's Creek, Boro, Captain's Flat, Cooma, Jindabyne, Kiandra, Adelong, Gundagai, Coolac, Muttama, Temora, Cullinga, Young, Grenfell, Junee, and Albury.

In the Northern District: Deepwater, Emmaville, Dalmorton, Nana Creek, Cangri, Hillgrove, Nundle, Stewart's Brook, Moonan Brook, Niangala, and Swamp Oak.

For the greater part of the year I was engaged in the Southern District, travelling round it systematically, and during the year a considerable improvement was noticeable in many of the mines visited.

Four accidents, other than minor accidents, occurred in the Southern District. Two of these, at Nerrigundah and Mount Adrah, were fatal; and two, at Nerrigundah and Temora, were serious.

The returns for the year prove that a systematic and regular inspection of the mines is a great safeguard, as it renders the men more careful and causes the managers to comply with the mining regulations.

The most common fault observable was a want of care in handling and keeping explosives, which was consequently a fruitful cause of accident.

I also inspected and reported on several applications for aid under the Prospecting Vote.

I have, &c.,

J. R. GODFREY,

Acting Inspector of Mines.

The Chief Inspector of Mines, Sydney.

---

## SUPERINTENDENT OF DIAMOND-DRILLS' REPORT.

## The Superintendent of Diamond-drills to The Under Secretary for Mines and Agriculture.

Sir, Department of Mines, Diamond-drill Branch, Sydney.

In submitting my Annual Report on the working of the diamond-drills for the year 1893, I do myself the honor to attach to said Report the following Appendices:—

*Appendix A.*—Return showing the locality, strata, depth bored, percentage of core extracted, and rate per foot, exclusive of office salaries, store wages, and rent; also Superintendent of Diamond-drills' travelling expenses.

*Appendix B.*—Summary of diamond-drills showing the number of feet bored, working cost to the Department, average cost at per foot, and amount receivable for the year 1893.

*Appendix C.*—Balance-sheet of diamond-drills.

*Appendix D.*—Diagrams from No. 1 to No. 3 sections of borings during the year 1893.

*Appendix E.*—Summary showing total cost to the Department for reaming, clearing, and repairing at Cremorne and Yacaaba bores.

The total depth bored with the diamond-drills during the year 1893 was 1,903 feet 7 inches, or 2,235 feet 6 inches less than in 1892. The average cost per foot for boring, exclusive of office salaries, store wages, rent, and Superintendent of Diamond-drills' travelling expenses, also of clearing bores, reaming, and repairing, was 12s. 4 $\frac{7}{8}$ d., or 5 $\frac{7}{8}$ d. less than during the year 1892.

The cost to the Department for boring, exclusive of clearing from obstruction and reaming the bores at Cremorne and Yacaaba, near Port Stephens, was £1,724 6s. 11d., equal to 18s. 1 $\frac{3}{4}$ d., or 2s. 0 $\frac{1}{4}$ d. more than the year 1892. But the total cost to the Department, including boring, clearing bores of obstructions, reaming, and repairing, also office salaries, store wages, rent, and Superintendent's travelling expenses, was £2,930 4s. 2d., equal to 30s. 9 $\frac{1}{4}$ d. per foot for the total depth bored.

The above average rate per foot may at first sight appear to be high, but it must be remembered that the Cremorne bore has reached the total depth of 2,929 feet, the diameter of the bore from surface to the 2,356-ft. level being 5 $\frac{1}{2}$  inches, and from that depth to the bottom of bore, 4 inches in diameter.

By the balance-sheet it will be observed that there is a debit balance of £914 4s. 11d., which amount was expended in clearing the bores of obstruction and also reaming, or otherwise a balance on the right side would have been the case.

The core saved during the year was very satisfactory, that saved at Cremorne being 97·88, at Bulli 86·94, and at Yacaaba 82·62, or a total percentage of 92·81. The smaller percentage of the Bulli and Yacaaba bores is due, the former to very soft shales, and the latter to the great thickness of sand—no less than 163 feet of sand and clay had to be passed through, before actual boring could be proceeded with.

The cost of wear and tear of diamonds during the year is 3s. 3 $\frac{3}{4}$ d., or 1s. 1 $\frac{3}{4}$ d. per foot more than during the year 1892.

The principal cause of the extra cost per foot for wear and tear of diamonds during the year is due to the strata at Yacaaba and the large diameter of the Cremorne bore.

The decrease in the number of feet bored during the year is solely due to the great financial depression under which the Colony is now suffering, as the Government drills are only worked at the expense of those who use them.

No. 7 drill completed a bore at Bulli to the depth of 1,010 feet 7 inches, of which 261 feet 7 inches were bored during the year. No. 11 drill completed the important bore at Cremorne at a depth of 2,929 feet, of which 1,054 feet were bored during the year. No. 13 completed a bore at Yacaaba to the depth of 675 feet, of which 588 feet were bored during the year.

The most important bore during the year is No. 2 bore at Cremorne, which was brought to a successful termination on the 9th November last. It has solved the problem as to the existence of good coal under the harbour and the city of Sydney. As the difficulties of the boring operations were very great, owing to the great weight of rods and the frequent breaking of same, the raising and lowering of the rods took on an average six hours—that is, three hours each way; and, while on this subject, I may mention that a letter received from the M. C. Bullock Manufacturing Company, Chicago, U.S., introducing an invention, by which the core-barrel could be brought to the surface without raising the rods, stating that the advantage was very considerable, as by the so-called "come along attachments" the core could be raised to the surface in from twenty minutes to one hour, instead of as now, over ten hours from a 2,000-foot bore. In reply to this the Bullock Manufacturing Company was informed that, with every due respect to the new invention, which, if used with our diamond-drills would require expensive alteration, the lowering and raising of rods to the depth of 2,750 feet had never occupied a longer time than six hours, to which the following characteristic reply was received from the President of the Bullock Manufacturing Company:—"Your record of handling 2,750 feet of rods in six hours is certainly very remarkable. American workmen claim to be about as expert as any in that line, and the best record that we have been able to make is 2,000 feet in ten hours for regular work. Of course it might be done probably in five or six hours for once, but for regular every-day work ten hours is the best general average we could get."

The regular work at the Cremorne bore to the bottom of bore, 2,929 feet, has never been more than six hours from the time of raising the rods and have them ready again for boring, which, even by such authority as the President of the Bullock Manufacturing Company, Chicago, is very remarkable.

It is, however, only fair to state that the raising and lowering of the rods on the drill used at Cremorne was done by a steam-winch, and not by the regular winding gear attached to the drill. As the  
Cremorne

Cremorne coal discovery is of such great importance, I have attached to my report all the reports in connection with said discovery, made by Professor David, B.A., F.G.S., of the Sydney University, the report by Mr. Mingaye, F.C.S., on the analysis of the coal, and my report.

The clerks of the Diamond-drill Branch, Messrs. M'Neil and Leigh, have done everything possible to assist me in the drill work, the latter, in addition of being the storeman, has also helped me in connection with assisting the unemployed to our gold-fields.

I have, &c.,

W. H. J. SLEE,

Superintendent of Diamond-drills.

REPORT by Professor David, B.A., F.G.S., on Cremorne Bore, No. 2.

University of Sydney, 9 November, 1893.

Sir,

In the absence of Mr. E. F. Pittman, the Government Geologist, I have the honor to report that I was present with Mr. W. H. J. Slee, the Chief Inspector of Mines, at the site of the No. 2 bore at Cremorne yesterday and to-day, and witnessed the boring through of the Bulli coal-seam. I examined the core from the coal-seam, and have the honor to submit a brief report. The detailed report will, of course, be furnished later by the Government Geologist.

The seam was struck at a depth of 2,917 feet from the surface.

The drill had penetrated the seam to a depth of 8 inches before our arrival, and during yesterday and to-day a further depth of 9 feet 7 inches was bored before the floor of the coal-seam was reached. The bore was continued 1 foot 9 inches below the floor of the seam. The total thickness of the seam was proved to be 10 feet 3 inches. The floor of the seam lies at a depth of 2,927 feet 3 inches, and the total depth of the bore is 2,929 feet.

Altogether about 8 feet of coal-core was recovered, besides a large quantity of coal-dust, resulting partly from the coal pulverised by the sawing action of the diamond-drill, and partly from the waste of the coal-core through friction of the loose fragments of coal-core upon one another in the core-barrel. In view of the great depth of the bore the proportion of core obtained is unusually large.

With the exception of a thickness of about 1 foot 1 inch, the whole of the coal in the seam appears to be of good quality, and is a useful splint and bituminous coal. The total thickness of workable coal in the seam is thus about 9 feet 2 inches. During the boring yesterday evening a large quantity of coal-dust was floated up rather suddenly by the hydraulic feed-water at the top of the bore-hole, and formed a thick scum, from which coal-gas was given off in such quantities that it could readily be ignited, burning with a bluish flame, 6 to 8 inches long.

The so-called natural gas at Narrabeen may have had a similar origin, being derived in all probability from a fissure in the rocks, communicating with the Bulli coal-seam at a depth.

The following is a generalised descending section of the coal-seam:—

Depth to roof, 2,917 feet. Roof, clay shale.

| ft. | in. |   |
|-----|-----|---|
| 0   | 1   | Coaly clay shale.   |
| 0   | 8   | Splint coal, somewhat inferior, with minute veins of calcite (?).                           |
| 3   | 0   | Coal, splint and bituminous, of good quality.   |
| 0   | 0½  | Band, dark brown clay shale, adhering firmly to coal.                                       |
| 6   | 2½  | Coal, splint and bituminous, of good quality, the last 3 inches rather soft and bituminous. |
| 0   | 3½  | Coal, soft bituminous, a trifle clayey.   |

Total ... 10 3

Floor, black carbonaceous clay shale, containing impressions of the fossil plant *Vertebraria*.

The site for this bore was chosen by Mr. E. F. Pittman, after a careful geological examination of the neighbourhood, and was located in a position calculated to be as far as possible removed from the damaging influence of volcanic dykes, such as the one encountered in the first Cremorne bore. With the exception of the minute veins of calcite in the uppermost few inches of the section, the coal in this seam shows no evidence of its having been in any way altered or damaged by the influence of dykes, a result which may be considered very satisfactory, especially in view of the fact that the bore is distant only about quarter of a mile from one of these dykes, as it proves that the damaged portions of coal under Port Jackson will be found to be only quite local and of small proportion in relation to the area of good coal.

I have, &c.,

T. W. E. DAVID.

The Under Secretary for Mines and Agriculture.

REPORT by Mr. W. H. J. Slee, F.G.S., Superintendent of Diamond-drills, Cremorne Bore No. 2.

Department of Mines, Diamond-drill Branch, Sydney, 10 November, 1893.

Sir,

I do myself the honor to report that No. 2 bore, Cremorne Point, between Mossman's and Neutral Bays, has been brought to a successful issue, and has demonstrated the soundness of the frequent predictions made by the late Mr. C. S. Wilkinson, Government Geologist, that payable coal deposits existed under and in the vicinity of Sydney.

It will be remembered that No. 1 bore reached the total depth of 3,095 feet, and that at a depth of 2,801 feet a burnt seam of coal, about 8 feet in thickness, was pierced through, but as there are few, if any, of our known coal-seams which have not been disturbed by volcanic action in some portion or other, it was thought by the scientific staff of the Mines Department that as No. 1 bore at Cremorne had proved the existence of a thick seam of coal, it would only require further search to prove that valuable deposits of coal existed in the immediate vicinity. The Sydney and Port Hacking Company holding the same opinion, requested that a report might be obtained from Mr. T. W. E. David, B.A., F.G.S., then a geological surveyor of the Mines Department, now a Professor of the University of Sydney.

Mr. David's report pointed out that, although burnt coal had been obtained in No. 1 bore, he saw no reason why valuable coal should not be discovered in close proximity of same. In fact, it may be reasonably expected that such would be the case. Thus, encouraged by perhaps the highest opinion which could possibly be obtained on the extensive coal-measures of New South Wales, the Company were induced to make fresh arrangements for a second bore.

In the meantime Professor David discovered the existence of one volcanic dyke which caused the disturbance in No. 1 bore, and Mr. Pittman discovered another, both dykes crossing or intersecting each other in No. 1 bore-hole, which site had been selected by the Company without the aid of the scientific staff of the Mines Department.

To

To avoid further disappointments, if possible, Mr. Pittman, the present Government Geologist, was requested and selected the site of No. 2 bore just completed, and the most important and successful diamond-drill bore ever put down in the Colony of New South Wales.

The bore was started in July, 1892, but through circumstances over which I had no control, several months were lost without any actual boring. It had been my intention to carry down a 5-inch diameter bore to the full depth required, but finding that the soft shales at the depth of about 2,400 feet commenced to cave in, I had 5-inch tubing inserted to that depth, and started a 4-inch diameter bore, which was carried down to the present depth. At the depth of 2,917 feet the top of the coal seam was struck, and Mr. Pittman, Government Geologist, being unavoidably absent from Sydney on official duty, I obtained the valuable services of Professor David to see the coal bored through and measure thickness of same.

We started boring through the coal at 10.10 a.m. on the 8th instant, and boring 6 feet 6 inches the core barrel jammed, which compelled me to have the rods raised to the surface—an operation which takes fully three hours' smart work to accomplish. Four feet ten inches of coal out of the 6 feet 6 inches bored were brought to the surface. For the second and third time the same operation had to be performed before the whole coal-seam was pierced through, and at 10 a.m. on the 9th instant, after twenty-four hours' continuous boring, lowering and raising of rods and core-barrel, the seam of coal, with an additional 1 foot 9 inches of rock, was bored through, giving the total depth of bore from surface, 2,929 feet, and a total thickness of 10 feet 3 inches of coal-seam, of which 8 feet coal-core was saved, 2 feet 3 inches having been ground away and flowed with the water to the surface. Sufficient of this ground-coal was saved to fill fully 5 feet of a 4-inch tube rammed down to the exact diameter and almost same density of the coal-core, one-third of which may, perhaps, be credited to the coal ground up by the thickness of the boring-bit (Crown head), one-third as belonging to the coal-core saved, and one-third to the actual thickness of the coal-seam. It may, therefore, be granted that about 9 feet of coal-core, out of a possible 10 feet 3 inches, has actually been saved—a result highly satisfactory from such a great depth. Outside of a scientific point of view, which must alone be given a high place, the discovery made at Cremorne through the agency of a Government diamond drill, is, in a broad, national point of view, incalculable, as it has increased the known wealth and national assets of this favoured land by many million pounds sterling. The company received for their No. 2 bore aid out of the Prospecting Vote at per foot on the actual rate of boring, they having to defray direct the full cost of all carriage, fuel, and water required for boring operations.

Mr. Pittman has carefully taken the whole core section from surface down to the depth of 2,898 feet, and Professor David has noted the remainder to the full depth of 2,929 feet, including the coal-seam; and further, although no analysis of the coal could at this juncture be made, Professor David expresses the opinion that the quality will be good.

In conclusion, I beg to add that my thanks are due to the foremen, Messrs. Ayles and Fryer, also to Mr. Leigh, and the men employed at the drill, for having, one and all, done their duty faithfully and well to bring this important boring operation to such gratifying results.

I have, &c.,

W. H. J. SLEE,

Superintendent of Diamond Drills, &c.

The Under Secretary for Mines and Agriculture.

REPORT by J. C. H. Mingaye, F.C.S., M.A.I.M.E., on Analysis of Coal from the Cremorne Bore.

Geological Survey, New South Wales,

Sir,

Department of Mines and Agriculture, Sydney, 27 November, 1893.

I have the honor to inform you that the samples of coal from the Cremorne Bore have been analysed with the following results:—

2572—No. 1. Average sample from the first 18 inches below the 8 inches of coal with calcite veins:—

|                             |        |                          |
|-----------------------------|--------|--------------------------|
| Hygroscopic moisture .....  | 65     |                          |
| Volatile hydro-carbons..... | 17.30  |                          |
| Fixed carbon .....          | 71.75  | } =Coke, 82.05 per cent. |
| Ash .....                   | 10.30  |                          |
|                             | 100.00 |                          |

|                       |                |
|-----------------------|----------------|
| Sulphur in coal ..... | .795 per cent. |
| Specific gravity..... | 1.207          |

Ash, reddish tinge, flocculent.  
One pound of this coal, by experiment in a Thompson's calorimeter, will convert 12.7 lb. of water into steam.

2573—No. 2. Average sample from the next 18 inches:—

|                             |        |                          |
|-----------------------------|--------|--------------------------|
| Hygroscopic moisture .....  | 70     |                          |
| Volatile hydro-carbons..... | 17.80  |                          |
| Fixed carbon .....          | 71.60  | } =Coke, 81.50 per cent. |
| Ash .....                   | 9.90   |                          |
|                             | 100.00 |                          |

|                       |                |
|-----------------------|----------------|
| Sulphur in coal ..... | .562 per cent. |
| Specific gravity..... | 1.365          |

Ash, reddish tinge, flocculent.  
One pound of this coal will convert 13.3 lb. of water into steam.

2574—No. 3. Average sample from the next 14 inches:—

|                             |        |                          |
|-----------------------------|--------|--------------------------|
| Hygroscopic moisture .....  | 80     |                          |
| Volatile hydro-carbons..... | 16.90  |                          |
| Fixed carbon .....          | 71.05  | } =Coke, 82.30 per cent. |
| Ash .....                   | 11.25  |                          |
|                             | 100.00 |                          |

|                       |                |
|-----------------------|----------------|
| Sulphur in coal ..... | .617 per cent. |
| Specific gravity..... | 1.398          |

Ash, reddish tinge, flocculent.  
One pound of this coal will convert 12.9 lb. of water into steam.

|  |                                |

| Mean sulphur   | ·724 per cent                  |
| „ specific gravity   | 1·346                          |
| „ calorimetric value   | 13 0                           |

*Remarks*—The samples are good descriptions of coals for household purposes, the percentage of ash being low as compared with the average ash present in the Bulli and Wollongong coals. They may be described as excellent steaming coals, as proved by the high calorimetric values found by experiment in a Thompson's calorimeter.

*Coke*—They yield an excellent coke, having all the physical properties of the southern cokes—*i.e.*, Bulli and Wollongong—and are well suited for all metallurgical purposes.

I have, &c,  
JOHN C. H. MINGAYE, F C S, M A I M E,  
Analyst and Assayer.

The Under Secretary for Mines and Agriculture

REPORT by Professor David, B A , F G S , &c , on taking the temperature in No 2 Borehole, Cremorne Point

Sir, University of Sydney, 27 November, 1893 .

I have the honor to report that, in the absence of Mr E F Pittman, the Government Geologist, I have, with the assistance of Mr W. H. J. Slee, the Chief Inspector of Mines, made some determinations of the temperature of the Cremorne Bore.

The bore being filled with the water pumped into it during the process of boring to within about 300 feet of the surface, it was necessary to take special precautions to protect the bulbs of the thermometers against the great pressure to which they would be subjected at the bottom of the bore. The bore is 2,929 feet deep, but the last 29 feet (about) is silted up with the powdered rock produced by the cutting action of the diamond drill. From 2,900 feet, therefore, to within 300 feet of the surface, the bore was filled with water, the column being 2,600 feet high, and giving a maximum pressure of, approximately, a trifle over half a ton per square inch.

By the advice of Professor Threlfall and Mr. H. C. Russell, the Government Astronomer, the thermometers were enclosed in a strong wrought-iron tube, 2 ft. 3 in. long, and 1½ inch inside diameter, with two strong cap pieces screwed on at either end, the threads of the screws being heated and dipped in molten solder immediately before they were screwed on. This work was executed by Mr Gilchrist, of 174 Pitt-street, in a thoroughly satisfactory manner, not a drop of water finding its way into the hermetically-sealed tube, although it was left down the bore on one occasion for twenty-seven hours consecutively, and the pressure on the whole tube being equal to about 60 tons.

Two of the thermometers were lent by Mr. Russell, and were maximum thermometers of the overflow type, and two were supplied by Mr Wiesener, one being a maximum overflow and the other a maximum and minimum thermometer, with two small piston-shaped indexes inside the glass tube.

The thermometers were packed in brass filings and brass turnings. On Wednesday last the two thermometers provided by Mr. Russell were used alone. The bulbs were protected by a few folds of soft paper, and, after being placed in the iron tube and hermetically sealed, were lowered down the bore to a depth of 2,730 feet, it being found impossible to lower them deeper on account of some obstruction in the bore at that depth—probably a small piece of shale fallen in from the side of the bore.

After

After having been left down the bore for three quarters of an hour the thermometers were drawn up and the tube unsealed, but neither of the two thermometers had altered as compared with their reading at the surface, the paper round the bulbs probably having prevented the conduction of heat from the water in the bore-hole.

On the following day the four thermometers above described were sealed up in the tube, with brass filings and shot packed round their bulbs. Owing to a break in the steel wire by which they were lowered, it was found impossible to draw them up until the following day, when Mr. Slee succeeded in grappling the broken end of the wire, and the tube was drawn to the surface, after having remained continuously for twenty-seven hours at a depth of 2,730 feet.

The tube being unsealed at once on the spot by melting the solder with an oxygen blow-pipe, the thermometers were found to read as follows:—

|  |              |
|--|--------------|
| 1. No. 1,590 (H. C. Russell) ... ..            | 97.38° Fahr. |
| 2. Wiesener's maximum ... ..                   | 98.00° "     |
| 3. No. 1,591 (H. C. Russell) ... ..            | 94.00° "     |
| 4. Wiesener's maximum and minimum—maximum ...  | 95.00° "     |
| The minimum temperature recorded was about ... | 63.00° "     |

On Saturday last the same four thermometers were again lowered, in order to verify the results, and, after being down the bore for one hour, were hauled up to the surface, and now read as follows:—

1. 95.5° Fahr.
2. 96.0° "
3. 96.0° "

The bulb of the fourth was found to have been broken, so that the reading was unreliable.

The lower readings afforded by the second series of observations were doubtless due partly to the local chilling of the water column on the previous day by the lowering of the large iron coupling for grappling the wire, and partly to the chilling of the water by the tube in which the thermometers were cased. The first set of readings of the thermometers 1 and 2 may be considered the most reliable, and, provisionally, it may be concluded that the rock temperature at a depth of 2,730 feet is about 97½° Fahr. at Cremorne.

The mean surface temperature at Sydney being about 63° Fahr., the temperature was therefore increased by about 34½° Fahr. at a depth of 2,730 feet—that is, an increase at the rate of 1° Fahr. for about every 78 feet 10 inches.

At the bottom of the bore, therefore, at 2,929 feet (nearly 200 feet deeper than the point at which the measurements of the temperature were taken), the temperature would be about 2½° Fahr. in excess of the temperature at 2,730 feet—that is, 97½° + 2½° = 100° Fahr. This temperature is less by 3° Fahr. than was anticipated, and should not occasion any apprehension as to the possibility of successfully ventilating the mine. A fuller report on this aspect of the question will no doubt be furnished by M. Pittman on his return to Sydney.

I have, &c.,

T. W. E. DAVID.

The Under Secretary for Mines and Agriculture.

J. S. McNEIL.  
J. S. LEIGH.

Comparative statement of diamonds used per foot:—  
 1883 = 3/8            1887 = 1/61½            1891 = 1/92½  
 1884 = 2/0½            1888 = 1/0½            1892 = 2/2  
 1885 = 1/5½            1889 = 1/8½            1893 = 3-3½  
 1886 = -/8½            1890 = -/7½

W. H. J. SLEE,  
Superintendent of Diamond Drills.

## EXAMINER OF COAL-FIELDS REPORT.

Report of the Examiner of Coal-fields for the Colony of New South Wales for the year 1893.

In accordance with the provisions contained in the 26th section of the Coal Mines Regulation Act, 39 Vic. No. 31, I have the honor to submit reports from Messrs. Dixon, Bates, and Humble, Inspectors of Collieries, for coal-mines at work and opening out in the counties of Northumberland, Durham, Gloucester, Buckland, and Pottinger, called the Northern District; and Mr. Rowan, Inspector of Collieries, for coal and shale mines at work and opening out in the counties of Cumberland, Camden, Cook, and Roxburgh, called the Southern and Western Districts, with this my general report for the year ending 31st December, 1893.

The information I have the honor to submit with respect to the condition and progress, &c., of the coal and boghead mineral (yielding large quantities of gas and oil per ton) mines during the year 1893 is as follows:—

In 1893, the year under notice, there have been 13 fatal and 45 non-fatal accidents. Ten of the fatal accidents happened from falls of coal, 1 from fall of stone, 1 by loaded waggon on surface, and 1 by descending cage at bottom of shaft.

Four of the non-fatal accidents occurred from the explosion of gas, 22 from falls of coal, 5 by skips, 5 by falls of stone, 2 by ignition of loose powder, 1 by waggon on surface, 1 on railway-line, 1 falling down shaft on to cradle, 1 by an explosion of a shot, 1 by crank-shaft of engine in motion, 1 by a piece of coal falling down shaft, and 1 by falling-prop.

In 1892 the fatal accidents were 8, and the non-fatal accidents 77. Four of the fatal accidents happened from falls of coal, 3 from falls of stone roof, and one from skips in motion.

Thirty-eight of the non-fatal accidents occurred from falls of coal, 10 from falls of stone roof, 12 from skips, 6 from explosion of blasting-powder, 1 kick from a horse, 5 from ignition of fire-damp, 1 bursting of a steam-pipe, 1 from pit-cage in shaft, 1 from explosion of a shot, 1 from haulage-rope, and 1 from a block on jetty.

In 1891 the fatal accidents were 21, and the non-fatal accidents 54. Seven of the fatal ones happened from falls of coal, 1 by fall of roof-stone, 4 from falls of stone in sinking-shafts, 2 by skips, 1 by a pit inundation, 1 by being suffocated in a coal-hopper, 1 by being injured at screens, 1 by fire-damp, and 3 by waggons.

Twenty-six of the non-fatal accidents occurred from falls of coal, 8 from falls of stone roof, 8 injuries from skips, 1 by a descending cage, 4 by blasting-powder, 1 by a horse-whim, 1 blow from a sprag, 1 by winch handle, 1 by a horse, 1 by a prop, 1 by a waggon, and 1 by a trolley.

SUMMARY showing the number of fatal and non-fatal accidents in 1893, the names and occupations of the persons who died or were injured, cause of death or serious injury, and the names of the collieries where they occurred

| No of accidents | Date of accident | Name of Colliery           | Where situated     | Name of person killed  | Name of person injured | Occupation | Cause of death or serious injury                           | Fatal            |                   |            |         | Non fatal           |                 |          |                  |                             |            |                 |                    | Total fatalities | Total non fatalities |                      |                |                         |                 |   |    |   |

OUR COAL TRADE—THE CALIFORNIAN MARKET.

(From the *Newcastle Herald and Advocate*, 8 February, 1894.)

ADVICES from California received last mail are more encouraging, and the outlook for our coal trade with that country is brighter than it has been for some time. The firm of Mr. R. B. Wallace has received Mr. J. W. Harrison's annual report of the coal trade of California for 1893. The report says:—"The coal trade for 1893 has been very steady, the highest and lowest values not varying over 50 cents per ton. Importers have profited by last year's experience, and at no time has the market

market been overloaded by the arrival of unsold cargoes Business for the moment has come to a standstill, and will show no vitality until we shall ascertain whether bituminous coal shall remain dutiable or not It really appears a travesty on common intelligence to justify the maintenance of 75 cents per ton duty on an article which costs only 10 cents per ton more to produce in Pennsylvania, of which 46,000,000 tons were produced last year Coal should never have appeared on the tariff, as outside California the revenue collected from it is merely nominal There will be less than one million dollars collected for duties on coal in the United States in 1893, and we in California will contribute at least 690,000 dollars " The report then goes on to show the prices of the various coals during each month of the year in San Francisco. The lowest prices during the year were in January, when Newcastle coal sold at 6 dollars 37 cents per ton, English steam, 6 dollars 50 cents; Scotch splint, 7 dollars; West Hartley, 7 dollars 50 cents The highest prices ruled from April to September, when Newcastle coal sold at 6 dollars 75 cents, English steam coal at the same figure, while Scotch splint was quoted at 7 dollars 25 cents, and West Hartley at 7 dollars 50 cents

The figures showing the imports of coal into California in 1893 are interesting The total quantity imported was 1,479,785 tons, as compared with 1,593,850 tons in 1892, 1,702,833 tons in 1891, and 1,204,555 in 1890. Last year Australia sent to San Francisco 202,017 tons, against 314,280 tons in 1892, 321,197 tons in 1891, and 194,725 tons in 1890. British Columbia heads the list as usual, having sent 588,527 tons to the State, as compared with 554,600 tons in 1892, 652,657 tons in 1891, and 441,759 tons in 1890 The quantity of English and Welsh coal received in 1893 was 151,269 tons, while in 1892 the imports of this coal amounted to 210,660 tons; in 1891, 168,586 tons; and in 1890, 35,662 tons The coast mines of California continue to be developed rapidly, and last year Carlen Hill and South Prairie sent to Frisco 261,435 tons, as against 218,390 tons in 1892, and 196,750 tons in 1891 The importation of the much advertised Japanese coal into California is very small, and in 1893 this source of supply sent only 7,758 tons, as against 4,220 tons in 1892, 20,679 tons in 1891, and 13,170 tons in 1890

The following notices were received during the year of new mines opening out or in course of development, mines re-opened, sinking of shafts, changing name of colliery, and colliery manager:—

*North Co-operative Colliery.*

Thomas Hill notified on 17th January having commenced mining operations on a portion of the Co-operative Estate.

*Wallarah Colliery.*

Mr. Thomas Parton, on 16th January, notified having appointed Joseph Sperrings colliery manager for the Wallarah Mine from date hereof.

*South Stockton.*

C. Faul and Son, on 9th February, notified that they were preparing to commence mining for coal at the South Stockton Colliery, Fennell's Bay.

*Abram Colliery.*

Mr. R. Tilden-Smith, on 10th March, notified having commenced to work the lower seam of the Abram Colliery.

*Cullen Bullen Colliery.*

Mr. Louis B. Blackwell, on 24th March, notified having appointed Mr. M. H. Coates his representative during his absence from the Colony.

*Denton Park Colliery.*

Mr. James H. Paul, on 8th April, notified having commenced to dig coal at the above colliery, lately worked by Messrs. Horsfield and Russell.

*Old Dog and Rat Colliery.*

David Hughes notified, on 17th April, his intention of opening out a portion of the Old Dog and Rat Colliery, on the east side of Lambton line.

*Lidsdale, Mudjee Road.*

Mr. John Maddox, on 4th May, notified having opened out a seam of coal at Lidsdale, near the Mudjee Road, for the purpose of supplying the inhabitants of Wallerawang and Lidsdale.

*Northumberland Colliery.*

Messrs. A. L. and J. Donaldson, jun., on 5th of May, notified their intention of working the Northumberland Land and Coal Company's mine, Fassifern.

*Rawden Colliery.*

Messrs. Cox Brothers notified, on 17th May, having leased the Rawden Colliery to miners on tribute, and that they will shortly be getting coal out.

*South Rathluba.*

Mr. William Shelton notified, on 6th June, having sunk a new pit on property adjoining Rathluba, within 2 miles of East Maitland. Size of pit, 8 ft. x 6 ft.; depth of pit, 80 feet; thickness of coal, 7 feet, including bands.

*Pioneer Colliery.*

Mr. James H. Paul notified, on 8th June, that he had started to get the water out of the Pioneer Colliery, and would start hewing coal as soon as possible.

*Dunkirk Colliery.*

Walter Hayes notified, on 11th July, having started a small colliery at New Lambton, formerly known as Dunkirk, near East Waratah tunnel.

*Gowrie Estate, Singleton.*

Mr. F. W. D. Parkes notified, on 24th July, of having taken a mineral lease of a piece of land from the Rev. Dr. White, of Singleton, to sink for coal, &c.

*Waratah Land-sale Colliery.*

Messrs. Tonks and Key notified, on the 5th September, that they were driving a tunnel to work a portion of the Waratah Company's land for coal to sell land-sale.

*Piper's Flat.*

Mr. G. Raffin notified, on 14th of September, having opened a coal-mine at Piper's Flat, on the Mudjee line.

*Tulip's New Colliery.*

Mr. Matthew Tulip gave notice (not dated), of his intention to open a coal-mine on Mr. F. Reynolds' Rathluba Estate, East Maitland.

*Electric Land-sale Colliery.*

Mr. William Metcalfe, on 13th October, notified having commenced coal-mining and working a shaft for land-sale purposes, better known as Charltons.

*Morrissett Colliery.*

Messrs. G. and D. Murray notified, on 16th October, of their intention to start working a little at the Morrissett Colliery, Lake Macquarie.

*Oakvale Colliery.*

Mr. F. W. D. Parkes notified, on 30th October, having commenced a tunnel near the Dulwich Colliery known as the Oakvale Colliery, on the east side of Dulwich Colliery, on Mr. Cunneen's ground, south side of the railway line.

*Beside*

*Bebside Colliery, Grovetown.*

On 18th December, Sarah Robson notified having a seam of coal underlying her allotment at Grovetown; had the same opened out.

*Sunlight Colliery.*

Mr. Hugh Sneddon, on 18th December, notified that he had sunk a shaft on his allotment and found coal.

*Grovetown, North Lambton.*

On 27th December Mr. Thomas Green gave notice that he had opened a coal pit on his allotment at Grovetown, North Lambton.

*Changing name of Colliery.*

Mr. Morgan Jones notified, on 3rd August, that the colliery formerly known as the "Northern Colliery" is now the "Pacific Colliery," owned by the Pacific Co-operative Steam Company.

COAL-MINES ABANDONED OR WORK SUSPENDED DURING THE YEAR 1893.

*Denton Park Colliery.*

Mr. C. Horsfield notified, on 28th January, that Denton Park Colliery had stopped; failed to get the coal seam.

*Richmond Hill.*

Mr. F. Robbins, of Illawarra, on 8th March, sent the following notice:—"I beg to inform you that work is for the present suspended at Richmond Hill—that is, the Richmond Hill and Coraki Coal and Fire-clay Company, situated at Swan Bay, Richmond River. The suspension is indefinite."

*Pioneer Colliery.*

Mr. James H. Paul notified, on 8th April, having suspended work at the Pioneer Colliery for the present. Rutherford Estate, at the Pioneer Colliery, is flooded.

*Morrissett Colliery.*

Mr. P. Murray, on 24th April, notified, that, as there is no trade for their colliery at Lake Macquarie, they have decided to close the same for a time.

*Denton Park Colliery.*

On 8th June Mr. James H. Paul, managing proprietor, notified having resigned the management of Denton Park Colliery, and would not be in any way connected with it in future.

*Dog and Rat, Waratah.*

On 8th August David Hughes gave notice that he had ceased all work at the Old Dog and Rat, and filled up all shafts.

*Inganee Colliery.*

On 25th September Mr. Matthew Tulip notified his intention to suspend operations for a time at his coal-mine, Inganee, Four-mile Creek.

*Coal property, Awaba.*

On 10th October Mr. W. D. Bedlington gave notice that operations upon the property of the New South Wales Coal Company, at Awaba, have been temporarily suspended.

*Dunkirk, New Lambton.*

On 18th November Richard Lathlean notified having abandoned Dunkirk Colliery.

*Sunderland Colliery.*

On 3rd December Mr. Matthew Tulip notified that, owing to the quantity of water and inferiority of the coal at Rathluba, he had abandoned the same finally.

This is a section of the Lithgow coal seam, worked on Maddox's 21½ acres, adjacent to Cox's River, in the parish of Lidsdale, county of Cook.  
The coal seam has a slight dip to the north-east.

The above is a section of the Lithgow coal-seam, now being worked at the Ivanhoe Colliery by Mr. George Raffan on his 1,280 acres (Lawson's grant) at Piper's Flat, opposite railway station, in the parish of Falnash, county of Cook.

The above is a section of the boghead mineral (petroleum oil cannel coal) opened out by Messrs. Corbett and others on mineral lease 20, adjacent to Capertee River, near Glen Alice, in the parish of Gindantharie, county of Cook, at a height of about 1,608 feet above sea level.

The above is a section of the coal worked at the Box Vale Colliery at the Nattai River, near Mittagong, in the parish of Jellore, county of Camden.

## COMPLAINTS MADE OF DEFICIENT VENTILATION, &amp;c.

Sundry complaints of deficient ventilation and non-compliance with the requirements of the "Coal Mines Regulations Act, 1876," have been inquired into, and proceedings, where necessary, have been taken to enforce the provisions of the Act, and reports furnished thereon.

## COAL UNLAWFULLY TAKEN FROM CROWN LANDS.

Reports and surveys have been made on coal unlawfully taken from Crown lands by the Stockton, Wickham and Bullock Island, Hetton, and Burwood Coal Companies, and large sums of money have been paid to the Department for coal so taken.

In conclusion, I have only to add there were 97 coal and 4 boghead mineral (petroleum oil cannel coal) mines under inspection, and that notices have been received of 23 new mines opening out, or in course of development, reopening, sinking, &c., and of 10 having suspended operations. Also, that the year's returns show a large falling off in the coal trade of the Colony, especially in the Northern District, of 408,251 tons of round and small coal raised, and £222,476 in value. This year's decrease in the output of coal in the Newcastle District is greater than that of any previous year, with the exception of 1890, when there was a decrease of 504,301 tons, owing to the closing of the mines through a struggle for mastery between labour and capital commenced by the Maritime Labour Association, which lasted ten weeks, viz., from 28th August to 7th November, on which day most of the collieries resumed operations.

In the South and South-western Districts there has been a decrease of 48,404 tons and of £54,016 in value, and in the Western a decrease of 45,985 tons and £14,172 in value.

I have, &c.,

JOHN MACKENZIE, F.G.S.,  
Examiner of Coal-fields.

THE Half-yearly Report of the Inspector of Collieries on the state of the various Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein for the half-year ending 30th June, 1893.

The Examiner of Coal-fields,—

Sir,

Wollongong, 13 July, 1893.

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this, my six-monthly report, on the state of the various collieries for the half-year ending 30th June, 1893.

During the last six months two new collieries have been added to the number, viz., Piper's Flat Coal-seam, about half a mile north-east from Piper's Flat railway-station; Maddix's Coal-mine, about 2 miles north from Wallerawang.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is 36. Western District, 17 coal-mines and 4 shale-mines; Southern District, 12 coal-mines; Berrima District, 2 coal-mines and 1 shale-mine; making in all 36 collieries.

## PRESENT STATE OF MINES.

## WESTERN DISTRICT.

*Lithgow Valley Colliery.*—About 46 men and horses are employed underground, and served with 22,500 cubic feet of air per minute in two separate splits. The intake and return airways and second ways to the day, in good order. The provisions of the Act in all respects are complied with.

*Hermitage Colliery.*—About 43 men and horses are employed underground, and supplied with 20,000 cubic feet of air per minute in one current. The travelling-road, intake and return airways are in good order. The Act in every respect complied with.

*The Vale Colliery.*—About 40 men are employed underground, and served with 20,000 cubic feet of air per minute in one current. The air-current is well sustained, and the Act in all matters complied with.

*Zig-Zag Colliery.*—About 40 men and horses are employed underground in this mine, and are supplied with 15,000 cubic feet of air per minute. The provisions of the Act complied with.

*Oakey Park Colliery.*—There are about 38 men, &c., employed underground, and served with 18,000 cubic feet of air per minute in one current. The airways and all other matters in connection with the Act complied with.

*Eskbank and Old Tunnel.*—About 50 men and horses are employed underground and served with 23,000 cubic feet of air per minute in two separate currents. Travelling road intake and return airways in good order. The Act in all matters complied with.

*Vale of Clwydd Colliery.*—There are about 36 men employed and served with 16,000 cubic feet of air per minute. The ventilation is satisfactory and the provisions of the Act in other matters also is complied with.

*Cullen Bullen Colliery.*—About 20 men are employed underground and supplied with 15,000 cubic feet of air per minute. The Act in every respect complied with.

*New South Wales Shale Mines (Hartley).*—About 80 men are employed underground and supplied with 12,000 cubic feet of air per minute. Shaft division of workings, 40 men are employed and served with 6,000 cubic feet of air per minute. Brick-yard tunnel 40 men employed and served with about 6,000 cubic feet of air per minute. The shaft and tunnel are worked on the Longwall system, and every care taken by the manager to ensure safety. Coal tunnel, 6 men are employed and served with 4,000 cubic feet of air per minute. The Act in all respects complied with.

*The Australian Kerosene Oil Company's Shale Mines (Katoomba), Mort's Shale Mine.*—About 95 men and horses are employed underground and served with 12,000 cubic feet of air per minute in three separate currents. The colliery is worked on the Longwall system. The pack walls and propping are well carried out in every bord. Ruined

*Ruined Castle Shale Mines.*—About 23 men are employed and served with 3,500 cubic feet of air per minute. The Act in all matters complied with.

*Irondale Colliery.*—About 12 men are employed underground, and served with 6,000 cubic feet of air per minute. The Act in other matters complied with.

*Genowlan Shale Mine.*—About 20 men employed underground and supplied with 6,000 cubic feet of air per minute. This colliery is worked on the Longwall system and substantial pack-walls built in every bord. The Act in all other matters complied with.

*Cooverwull Mine.*—Only one man employed getting a few tons of coal weekly for the tweed factory. The Act complied with.

*Rawden Colliery.*—During the last half year little work has been done. Only two men getting coal. The Act complied with.

*Piper's Flat Coal Seam.*—The main heading has been driven in a distance of 40 yards. An air shaft has been sunk. No men are working underground at present, but several men are employed on the surface making a tram-railway to connect the colliery with Cullen Bullen lime works.

*Maddix's Coal Mine.*—Only one man driving a heading to prove the thickness of coal.

#### SOUTHERN COLLIERIES.

*Metropolitan Colliery.*—The main north intake, 277,200 cubic feet of air per minute; main south intake, 88,000; total intake for the colliery, 365,200 cubic feet of air in circulation per minute. Nos. 5 and 6, 19 men and horses are employed, and supplied with 28,560 cubic feet of air per minute. No. 2 west, 30 men, and supplied with 18,000 cubic feet of air per minute. No. 4 left, 48 men and horses, and served with 36,495 cubic feet of air per minute. No. 4 right, 40 men and horses, and served with 23,625 cubic feet of air per minute. South jig, right hand, 28 men, and served with 44,550 cubic feet of air per minute. South jig, left hand, 21 men and horses are employed and served with about 2,000 cubic feet of air per minute for each man and horse. North jig, 11 men and horses, and served with 43,200 cubic feet of air per minute. All the miners in this colliery work with locked safety-lamps, and every care exercised by the management to ensure safety. The Act in every respect complied with.

*Coal Cliff Colliery.*—An average of 15 men during the last half year have been employed, and served with 10,000 cubic feet of air per minute. The Act in all respects complied with.

*South Clifton Colliery.*—About 74 men employed underground, and served with about 30,000 cubic feet of air per minute in two separate currents. The colliery is well ventilated throughout, and the Act in every other respect complied with.

*North Illawarra Colliery.*—About 70 men and horses are employed underground, and served with about 20,000 cubic feet of air per minute. The Act in all other matters complied with.

*Bulli Pass Colliery.*—About 20 men employed underground, and served with 12,000 cubic feet of air per minute. The intake and return air-ways and second way to the day in good order.

*Bulli Colliery.*—No miners have been at work during the last half year, only a few day men keeping the airways in repair.

*Bellambi Colliery.*—About 70 men employed underground, and served with about 18,000 cubic feet of air per minute. The Act in all matters complied with.

*South Bulli Colliery.*—About 200 men and horses employed underground, and served with about 45,000 cubic feet of air per minute. During the half year, several of the main returns have been repaired and brick stoppings have been put in the main intakes. The colliery is well ventilated throughout, and the Act in all other matters complied with.

*Corrimal Colliery.*—About 60 men employed underground, and served with 18,000 cubic feet of air per minute in two separate splits. The Act in all matters complied with.

*Mount Pleasant Colliery.*—About 120 men employed underground, and served with about 30,000 cubic feet of air per minute in two separate splits. The ventilating currents are well directed round the workings, and the bords are exceptionally well timbered. The Act in all other matters complied with.

*Osborne Wallsend Colliery.*—About 95 men and horses employed underground, and served with about 30,000 cubic feet of air per minute in 3 separate splits. The bords are well timbered, and the Act in all other matters complied with.

*Mount Kembla Colliery.*—An average of about 200 men and horses are employed underground, and served with about 45,000 cubic feet of air per minute in 4 separate splits. None of the districts are overcrowded with men, and the provisions of the Act in all matters complied with.

#### BERRIMA DISTRICT.

*The Australian Kerosene Shale Mines (Joadja).*—About 80 men are employed underground. Incline tunnel, about 30 men employed, and served with 5,000 cubic feet of air per minute. No. 2 tunnel, about 20 men employed, and served with 4,000 cubic feet of air per minute. No. 5 tunnel, 12 men employed, and served with 5,000 cubic feet of air per minute. About 18 men are employed in various portions of the mountain side driving adits in order to prove the thickness and quality of shale. The Act in all matters complied with.

*Box Vale Colliery (Mittagong).*—Only 2 men employed getting a few tons of coal weekly for local consumption.

*The Great Southern Colliery (Berrima).*—About 5 men employed underground, and supplied with 6,000 cubic feet of air per minute. The Act in other places complied with.

#### ACCIDENTS IN MINES.

During the last six months, I have investigated 9 separate accidents which have been fully reported upon. I have also investigated several other slight accidents which are not embraced in this report.

The first was a fatal accident to a deputy named George Patterson, at the Metropolitan Colliery, on 21st January, who was severely crushed by a fall of stone from the roof while drawing props in the pillar work, from the effects of which he died the same day. An inquest was held by the City Coroner, which I attended and fully agreed with the verdict of accidental death, as returned by the jury.

The second was a non-fatal to an onsetter named A. McGeachie, at the Metropolitan Colliery, on 13th February, who had his skull fractured by coal falling down the shaft.

The

The third to a wheeler named William Thomson at Corrimal Colliery, on 22nd February—leg broken, jammed by a skip on the road side.

The fourth non-fatal to a miner named W. Broadhead, at South Clifton Colliery, leg broken by a fall of stone.

The fifth non-fatal to C. Chesterton, at the Metropolitan Colliery, 15th April; thigh fractured by a fall of coal.

The sixth non-fatal to a miner named James Grills at the Metropolitan Colliery; skull fractured by a fall of coal.

The seventh non-fatal to a miner named James Mathieson, on 10th May, Metropolitan Colliery; leg broken by a fall of coal.

The eighth was a fatal accident which happened to a miner named O. A. Welch, who received fatal injuries by a fall of coal on 11th May, at the Metropolitan Colliery. He lived a few days, and died from the effects. An inquest was held by the District Coroner, at the Paragon Hotel, Helensburgh, which inquest I attended, and fully agree with the verdict of accidental death, as returned by the jury.

The ninth non-fatal to a miner named John Ripon, on 8th June, at the Metropolitan Colliery; ankle bruised by a fall of coal.

I have, &c.,

JAMES ROWAN,  
Inspector of Collieries.

TABULATED LIST of fatal and non-fatal accidents in the Southern and Western Districts of New South Wales Collieries investigated by the Inspector of Collieries during the half-year ending 30th June, 1893:—

| No. | Date.   | Colliery.     | Sufferer.         | Occupation. | Remarks, &c., on the nature and extent of injuries. | Killed while   | By coal falling | By a horse | By a stone at | By a fall of coal | By a fall of coal | By a fall of coal | Fatal. | Non-fa |

The Half-yearly Report of the Inspector of Collieries on the state of the various Collieries in the Southern and Western Districts of the Colony of New South Wales, and Accidents therein, for the half-year ending 31st December, 1893.

The Examiner of Coal-fields,—  
Sir,

Wollongong, 25 January, 1894.

In compliance with the requirements of clause 26 in the Coal Mines Regulation Act, 1876, I have the honor to transmit to you this, my six-monthly report, on the state of the various collieries for the half-year ending 31st December, 1893.

The total number of collieries under inspection in the Southern and Western Districts during the last six months is thirty-two:—

|                  |     |     |     |                                   |
|------------------|-----|-----|-----|-----------------------------------|
| Western District | ... | ... | ... | 14 coal-mines, and 3 shale-mines. |
| Southern         | "   | ... | ... | 12 "                              |
| Berrima          | "   | ... | ... | 2 "                               |
|                  |     |     |     | 28 "                              |
|                  |     |     |     | 4 "                               |
| = 32 collieries. |     |     |     |                                   |

PRESENT STATE OF MINES.

WESTERN DISTRICT.

*Australian Kerosene Oil Company (Katoomba) Shale Mines, Ruined Castle.*—About 80 men are employed underground, and served with 10,000 cubic feet of air per minute, in six separate currents. *Mort's Tunnels.*—Eighty-five men are employed and supplied with 12,000 cubic feet of air per minute in three separate splits. The shale mines are worked on the Longwall system. *Coal-mine.*—Six men employed, and served with 6,000 cubic feet of air per minute. The Act in all respects complied with.

*New South Wales Shale Mines (Hartley).*—About 140 men are employed underground, and served with 18,000 cubic feet of air per minute in four separate splits. During the last half-year several adits have been driven, to further test the extent of the shale deposits. The Act in all respects complied with. *Coal Mine.*—Five men are employed.

*Oakey Park Colliery.*—About 30 men are employed underground, and served with 15,000 cubic feet of air per minute, and the Act in all matters complied with.

*The Vale Colliery.*—About 36 men are employed underground, and served with 36,000 cubic feet of air per minute. The ventilation is good throughout the mine, and the Act in all other matters complied with.

*Zig-Zag Colliery.*—About 33 men are employed underground, and served with 15,000 cubic feet of air per minute. The Act in all respects complied with.

*The Vale of Clwydd Colliery.*—About 30 men are employed underground, and served with 18,000 cubic feet of air per minute. The Act in all other respects complied with.

Eskbank

*Eskbank Pit.*—About 26 men are employed underground, and supplied with 20,000 cubic feet of air per minute. The Act in all respects complied with. *Old Tunnel.*—Six men employed, and served with 6,000 cubic feet of air per minute.

*Lithgow Valley Colliery.*—Thirty-six men employed, and served with 22,000 cubic feet of air per minute. The ventilation is good, and the Act in every respect complied with.

*Hermitage Colliery.*—About 30 men are employed underground, and served with 18,000 cubic feet of air per minute. Intake and return airways in good order. The Act in all other matters complied with.

*Coerwill Mine.*—One man employed getting a few tons of coal weekly. The Act complied with.

*Piper's Flat Colliery.*—About 12 men are employed underground and served with 8,000 cubic feet of air per minute. The ventilation good, and the Act in all matters complied with.

*Ivanhoe Colliery.*—About 12 men employed, and served with 9,000 cubic feet of air per minute. Intake and return airways and second way to the day in good order. The Act in all matters complied with.

*Cullen Bullen.*—About 18 men are employed, and served with 18,000 cubic feet of air per minute. The Act in every other respect complied with.

*Genowlan Shale Mine.*—About 20 men are employed underground, and served with 2,500 cubic feet of air per minute. The mine is worked on the Longwall system, with good pack walls on each working place. The Act in all respects complied with.

*Rawden Colliery.*—Very little work has been done during the last half year, on account of no sale for the coal.

#### SOUTHERN DISTRICT.

*Metropolitan Colliery.*—About 280 men are employed underground, and served with about 330,000 cubic feet of air per minute in eight separate splits. All the miners and wheelers in this colliery work with locked safety lamps. The colliery is examined twice every twenty-four hours, and the condition of the mine recorded in a book and signed by the persons who make the examination. The Act in every matter complied with.

*Coal Cliff Colliery.*—About 26 men are employed underground, and served with 20,000 cubic feet of air per minute. The Act in all other respects complied with.

*South Clifton Colliery.*—About 140 men are employed underground, and served with 51,000 cubic feet of air per minute in two separate currents. The colliery is well-ventilated, and the Act in all matters complied with.

*North Bulli Colliery.*—About 80 men are employed underground, and served with 16,000 cubic feet of air per minute in two separate splits. The Act in all matters complied with.

*Bulli Pass Colliery.*—About 25 men are employed underground, and served with 10,000 cubic feet of air per minute. The Act in all matters complied with.

*Bellambi Colliery.*—About 60 men are employed, and supplied with 26,000 cubic feet of air per minute in two separate splits. Throughout the mine the roof at the working faces is very bad, but great care is taken by the management and miners to ensure safety. The Act in all respects complied with.

*South Bulli Colliery.*—About 200 men and horses are employed underground, and served with about 40,000 cubic feet of air in four separate splits. The ventilation is good throughout the mine. The Act in all respects complied with.

*Corrimal Colliery.*—About 130 men employed underground, and served with 24,000 cubic feet of air per minute in three separate splits. The roof, as a rule, is very bad, but every care is taken to ensure safety. The Act in all respects complied with.

*Mount Pleasant Colliery.*—About 130 men are employed underground, and served with 30,000 cubic feet of air per minute in two separate splits. The Act in all respects complied with.

*Osborne Wallsend.*—About 130 men and horses are employed underground, and served with 30,000 cubic feet of air per minute in two separate currents. The ventilating currents were well conducted round the workings, and the Act in all other matters complied with.

*Mount Kembla.*—About 200 men are employed underground, and served with 68,000 cubic feet of air per minute in six separate splits, each split being supplied with a separate and distinct current of fresh air. None of the splits are overcrowded. The requirements of the Act are also complied with in other respects.

#### BERRIMA.

*Australian Kerosene Oil Company (Joadja Creek).*—About 90 men are employed and served with about 20,000 cubic feet of air per minute in three separate currents. The above shale tunnels are worked on the Longwall system, and every care is taken to ensure safety. The Act in all respects complied with.

*Box Vale (Mittagong).*—Three men at work, and served with 6,000 cubic feet of air per minute. The Act in other matters complied with.

*Great Southern (Berrima).*—Six men are employed and served with 10,000 cubic feet of air per minute. The intake and return airways and second way to the day in good order. The Act in other matters complied with.

#### ACCIDENTS IN MINES.

The accidents investigated by me in the southern and western districts during the half-year ending 31st December, 1893, are eight in number, one of which was fatal.

The first non-fatal happened a miner named James Craddick, on 12th August, who had his leg bruised while tipping a full skip at the screens at Corrimal Colliery. The second was a fatal accident, and happened at the Vale Colliery, on 23rd August, to an onsetter named Alex. Hogg. At the time of the accident he was lifting a piece of coal out of the bottom of the shaft, when the descending cage struck him, from the effects of which he died. An inquest was held on the following day by the district Coroner (near the Vale Colliery).

Inspector Dixon attended the inquest, and fully agreed with "Accidental" death as returned by the jury. The second non-fatal accident happened a miner named Thomas Evans, at Corrimal Colliery, on 3rd October, who had his leg broken by an empty skip on the surface incline. The third non-fatal accident happened a miner named John Edwards, at the Metropolitan Colliery on 6th October, who received injuries while drawing a prop in the pillar work.

The fourth non-fatal accident happened a miner named Peter Owen, at North Illawarra Colliery on 8th November, who had three of his toes chopped off by a fall of stone. The fifth non-fatal accident happened

happened to a lad named John Riddley, greaser, at the Metropolitan Colliery, on 27th November, who had his leg severely crushed by a full skip at the bottom of the shaft; afterwards the leg was amputated. The sixth non-fatal happened a lad named Albert Askew, who had his shoulder dislocated by an empty skip at Osborne Wallsend Colliery on 27th November. The seventh non-fatal happened to an onsetter named John McGeachie, at the Metropolitan Colliery, on 29th November, who had his leg broken by a piece of coal falling down the shaft.

The usual tabulated list of accidents is hereto appended.

I have, &c.,

JAMES ROWAN

Inspector of Collieries.

TABULATED LIST of Fatal and Non-fatal Accidents in the Southern and Western Districts of New South Wales Collieries, investigated by the Inspector of Collieries during the half-year ending 31 December, 1893.

THE Half-yearly Report on the Collieries in the Northern District of New South Wales and accidents investigated by the Inspector of Collieries during the six months ending 30th June, 1893:—

The Examiner of Coal-fields, Sydney,—

Sir,

Newcastle, 15 July, 1893.

Pursuant to the provisions of section 26 in the Coal Mines Regulation Act, 1876, we have the honor to transmit to you this, our six-monthly report, on the state of the various collieries in the Northern District for the half-year ending 30th June, 1893.

The total number of collieries in the Northern District is 75, of which 60 have been under inspection during the half-year.

Fifteen collieries have not been under inspection during the half-year, as no work has been done, viz., Killingworth, North Stockton, Teralba, Shamrock Hill, North Borehole, Young Wallsend, Swansea, Richmond Vale, Stanford Greta, Maitland, Leconfield, Oakvale, Fern Valley, Richmond Hill, and Nicholais' Tunnel.

The following collieries have been added, viz., Inganee, North Co-operative, Dog and Rat, and South Rathluba.

Two collieries have been abandoned, viz., Enterprise and Tulip Sinking Shaft, and are not included in this report.

#### PRESENT STATE OF MINES.

*A. A. Co.'s No. 2 Colliery.*—There are about 210 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 100,000 cubic feet per minute. The face workings are divided into five separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*A. A. Co.'s New Winning.*—About 300 men, &c., are employed in this mine during the day, and the total quantity of air circulating in the mine is about 80,000 cubic feet per minute. The face workings are divided into seven separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

*Newcastle Wallsend Colliery.*—There are about 750 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 170,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*Newcastle Co.'s Colliery.*—About 375 men, &c., are employed in this mine during the day, and supplied with about 170,000 cubic feet of air per minute. The face workings are divided into eight separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Co-operative Colliery.*—There are about 300 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 40,000 cubic feet per minute. The face workings are divided into separate and distinct districts. The provisions of the Act in other respects also are complied with.

*Lambton Colliery.*—There are about 350 men, &c., employed in this mine during the day, and are supplied with about 80,000 cubic feet of air per minute. The face workings are divided into ten separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with in other respects also.

*Burwood Colliery.*—About 120 men, &c., are employed in this mine, and the quantity of air circulating in the mine is about 17,000 cubic feet per minute. The districts and number of men in each district are in accordance with the Act. All produce now drawn at No. 3 shaft; old drawing-shaft used as second opening. The provisions of the Act are complied with. Stockton

*Stockton Colliery.*—There are about 200 men, &c., employed in this mine, and supplied with about 25,000 cubic feet per minute. The Act is complied with, except subsection 5, section 12, as, on 17th February, owing to an inrush of water, the manager withdrew the men, and afterwards readmitted and allowed them to continue working before it has been stated by the Examiner or Inspector that the mine is safe. Proceedings have been taken against the Company, and two penalties inflicted. Third (sinking) Shaft.—Cylindrical tubbing, 10 feet in diameter, has been sunk about 135 feet through the alluvial measures. About 6 men are employed.

*Wickham and Bullock Island Colliery.*—About 300 men, &c., are employed in this mine during the day, and the quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into separate and distinct districts, and the provisions of the Act are complied with.

*Hetton Colliery.*—There are about 280 men, &c., employed in this mine during the day, and are supplied with about 80,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*Ferndale Colliery.*—About 60 men, &c., are employed in this mine, and the total quantity of air circulating in the mine is about 10,000 cubic feet per minute. The provisions of the Act are complied with.

*Brown's Colliery.*—There are about 350 men, &c., employed in this mine during the day. The total quantity of air circulating in the mine is about 51,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with in other respects also.

*Duckenfield Colliery.*—About 250 men, &c., are employed in this mine during the day, and are supplied with about 53,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*South Waratah Colliery.*—This mine has been idle for some time past owing to a mishap by a collapse of surface strata in the main shaft. Men have been engaged in effecting repairs, and the mine is now about ready for work. The provisions of the Act are complied with.

*New Lambton C Pit.*—About 125 men, &c., are employed in this mine during the day, and are supplied with about 20,000 cubic feet of air per minute. There are two separate and distinct districts. The Act complied with in every other respect also.

*Ebbw Vale Colliery.*—About 40 men, &c., are employed in this mine during the day. The total quantity of air circulating in the mine is about 11,000 cubic feet per minute. The Act is also complied in every other respect.

*West Burwood Colliery.*—About 28 men, &c., are employed in this mine, and are supplied with about 3,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Hillside Colliery.*—Thirteen men, &c., are employed in this mine. The ventilation is good, and the Act complied with in every respect.

*East Lambton Colliery (Adamstown).*—About 40 men, &c., are employed in this mine during the day. The total quantity of air circulating in the mine is about 7,000 cubic feet per minute. Other provisions of the Act are also fully complied with.

*Rotunda Colliery (North Lambton).*—Only 2 men at present employed in this mine. The Act fully complied with.

*Dog and Rat Colliery (North Lambton).*—This mine has been commenced during the six months. There are 4 men, &c., employed, and the Act complied with.

*Elemore Vale Colliery (Wallsend).*—About 12 men, &c., are employed in this mine, and supplied with about 3,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Summerhill Colliery (Plattsburg).*—There are 10 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Maryland Colliery (Plattsburg).*—About 15 men, &c., are employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*North Co-operative Colliery (Plattsburg).*—About 6 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Dudley Colliery (Charlestown).*—There are about 220 men, &c., employed in this mine during the day. The total quantity of air circulating in the mine is about 60,000 cubic feet per minute. The provisions of the Act are complied with.

*Durham Colliery.*—About 12 men, &c., are employed at the second shaft in connection with an under-level drift for water standage. Several men are also employed at the surface in the erection of the pit-head gear and machinery at the main shaft. Everything in good order, and the Act fully complied with.

*Burwood Extended Colliery.*—This mine has been idle for a considerable time, but is in readiness for work at any time. The provisions of the Act are fully complied with.

*Toronto Colliery (Lake Macquarie).*—Two men are employed at this mine. The ventilation is satisfactory, and the Act complied with.

*Morrisett Colliery (Lake Macquarie).*—This mine has been under inspection during the half-year, but operations are now temporarily suspended.

*Wallarah Colliery (Catherine Hill Bay).*—There are about 110 men, &c., employed in this mine, and supplied with about 20,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Awaba Colliery.*—Work at this mine is at present temporarily suspended.

*Northumberland Colliery (Fassifern).*—Only 2 men at present employed in this mine. The ventilation is satisfactory, and the Act complied with.

*South Stockton Colliery (Teralba).*—There are 4 men employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*Northern Colliery (Teralba).*—About 120 men, &c., are employed in this mine during the day. The quantity of air circulating in the mine is about 30,000 cubic feet per minute. The provisions of the Act are complied with.

*Gartlee Colliery (Teralba).*—There are about 30 men, &c., employed in this mine. The quantity of air circulating in the mine is about 9,000 cubic feet per minute. The Act is complied with.

South

*South Wallsend Colliery (Cardiff)*.—About 45 men, &c., are employed in this mine, and supplied with about 10,000 cubic feet of air per minute. The provisions of the Act are complied with.

*West Wallsend Colliery*.—There are about 250 men, &c., employed in this mine. The total quantity of air circulating in the mine is about 65,000 cubic feet. The face workings are divided into separate and distinct districts. The provisions of the Act are complied with.

*Seaham Colliery*.—About 180 men, &c., are employed in this mine. The total quantity of air circulating in the mine is about 25,000 cubic feet per minute. Steps are being taken to erect a new waddle fan, 30 feet in diameter, for ventilating purposes. The provisions of the Act are complied with.

*Thornton Colliery (Thornton)*.—About 23 men, &c., are employed in this mine during the day. The ventilation is good, and the Act is complied with in other respects also.

*Thornley Colliery (East Maitland)*.—There are 12 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Bloomfield Colliery (East Maitland)*.—Eight men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Marshall's Colliery (East Maitland)*.—Only 2 men are employed in this mine. The ventilation is good, and the Act complied with.

*Ingancee Colliery (East Maitland)*.—About 4 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*South Rathluba Colliery (East Maitland)*.—Four men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*East Greta Colliery (West Maitland)*.—About 15 men, &c., are employed in the two adits at this mine. The ventilation is satisfactory, and the Act complied with.

*Abram Colliery (Farley)*.—Two men are at present employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*Pioneer Colliery (Farley)*.—There are two men employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Denton Park Colliery (West Maitland)*.—Only 2 men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Greta Colliery*.—This mine has been idle for some time, but everything is in readiness for resuming work at any time. The provisions of the Act are fully complied with.

*New Anvil Creek Colliery*.—There are about 20 men, &c., employed in this mine, and supplied with about 6,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Ellesmere Colliery (Singleton)*.—About 30 men, &c., are employed in this mine, and supplied with about 10,000 cubic feet of air per minute. The provisions of the Act are complied with.

*New Park Colliery (Singleton)*.—There are about 20 men, &c., employed in this mine, and the quantity of air circulating in the mine is about 8,000 cubic feet per minute. The Act is complied with.

*Elliott's Colliery (Singleton)*.—About 8 men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Rosedale Colliery (Singleton)*.—About 15 men, &c., are employed in this mine. The ventilation is good, and the Act complied with.

*Dulwich Colliery (Singleton)*.—About 10 men, &c., are employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

*Kyuga Colliery (Muswellbrook)*.—Only 2 men are employed in this mine at the present time. The Act is fully complied with.

*Morley Colliery (Gunnedah)*.—Two men and 1 boy are employed in this mine. The work is not constant, as trade is slack at times. The Act is complied with in every respect.

*Gladstone Colliery (Gunnedah)*.—Only 2 men are occasionally employed in this mine as trade demands. The ventilation is good, and the Act complied with.

*Centenary Colliery (Curlerwis)*.—Only 7 men are employed in this mine at present. The ventilation is good, and the other provisions of the Act are also fully carried out.

#### ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending 30th June, 1893, are 30 in number. Of this number, 19 were fully reported on at the time, and 11 were found to be of a minor character, and full reports were not written thereon. Of the 19 accidents in the annexed tabulated list, 6 proved fatal, all from falls of coal. Of the non-fatal accidents, 7 were caused by falls of coal, 4 by explosion of gas, 1 by ignition of powder, and 1 by falling down shaft.

The first fatal accident occurred to a miner named John Bartholomew Carey, by a fall of coal in Elliott's Colliery, Rix's Creek, near Singleton, on 3rd January. The District Coroner, Wm. Walker, Esq., held an inquest on the body of deceased, at Singleton, on 3rd and 4th January. The inquest was attended by Inspector Bates, who heard all the evidence and fully agrees with the verdict of "accidental death," as returned by the jury.

The second occurred to a miner named Theophilus Jones, by a fall of coal at Burwood Extended Colliery, on 17th January. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased, at Charlestown, on 18th January. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third occurred to a miner named Robert Pritchard, by a fall of coal at Duckenfield Colliery, on 2nd March, terminating fatally on 11th June. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased, at Newcastle, on 12th June. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fourth occurred to a miner named Thomas Lewis, by a fall of coal, at Brown's Colliery, on 24th April. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Minmi, on 25th April. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The fifth occurred to a miner named Francis Sanderson, by a fall of coal, at Newcastle-Wallsend Colliery, on 29th May, terminating fatally on 7th June. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Plattsburg, on 7th June. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The

The sixth occurred to a miner named Benjamin Miller, by a fall of coal, at Brown's Colliery, on 8th June. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Plattsburg, on 9th June. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a miner named Ephraim Hargreaves, at Seaham Colliery, on 6th January, by explosion of gas, resulting in burns on arms, head, and chest.

The second occurred to a manager named James Race, at Thornley Colliery, East Maitland, on 24th January, by explosion of gas, resulting in burns on head, arms, and chest.

The third occurred to a shiftman named Saml. Somerville, at Thornley Colliery, on 24th January, by explosion of gas, resulting in burns on head, arms, and chest.

The fourth occurred to a shiftman named John Stevens, at Thornley Colliery, on 24th January, by explosion of gas, resulting in burns on head, arms, and chest.

The fifth occurred to a miner named Samuel Dresser, at Hetton Colliery, on 9th February, by a fall of coal, resulting in fracture of leg.

The sixth occurred to a miner named William Dowsen, at Newcastle-Wallsend Colliery, on 3rd March, by a fall of coal, resulting in fracture of leg.

The seventh occurred to a miner named Thos. McNaughton, at A. A. Co.'s No. 2 pit, on 21st March, by a fall of coal, resulting in internal injuries.

The eighth occurred to a miner named Robert France, at Newcastle-Wallsend Colliery, on 12th April, by a fall of coal, resulting in fracture of collar-bone.

The ninth occurred to a miner named John Donaldson, at Newcastle Co.'s pit, on 3rd May, by ignition of loose powder, resulting in burns on arms, chest, and head.

The tenth occurred to a miner named Guivano Missi, at Dudley Colliery, on 16th May, by fall of coal, resulting in injury to head.

The eleventh occurred to a miner named Antony Weirs, at A. A. Co.'s New Winning, on 23rd May, by a fall of coal, resulting in severe internal injuries.

The twelfth occurred to a shaftman named Henry Williams, at South Waratah Colliery, on 3rd June, resulting in injury to leg, head, and arm, by falling down shaft on to cradle.

The thirteenth occurred to a miner named James Robertson, junr., at Seaham Colliery, on 19th June, by fall of coal, resulting in severe internal injuries.

#### ACCIDENTS ON SURFACE.

One fatal accident occurred to an engineman named Alfred Nuttall, by loaded coal-waggons, at New Anvil Creek Colliery, on 24th April. The District Coroner, J. N. Brooks, Esq., held an inquest on the body of deceased at Anvil Creek, on 24th and 26th April. The inquest was attended by Inspector Bates, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first non-fatal accident occurred to a stoker named Henry Hawkes, at Wallarah Colliery, on 12th May, resulting in injury to head and arms, by empty waggons.

The second occurred to a surfaceman named Henry Markes, at Wallarah Colliery, on 1st June, resulting in injury to leg, on railway.

The tabulated list of accidents is hereto appended.

We have, &c.,

JOHN DIXON,  
THOS. L. BATES,  
WILLIAM HUMBLE,

Inspectors of Collieries.

TABULATED LIST of Fatal and Non-fatal Accidents in the Northern Collieries of New South Wales, investigated by the Inspectors of Collieries during the half-year ending 30th June, 1893.

| No.                   | Date.           | Colliery.               | Person killed or injured. | Occupation. | Remarks on nature and extent of injuries.                                  | Non-fatal.        |               |                     | Fatal.              | Total.        |            |        |

The Half-yearly Report on the Collieries in the Northern District of New South Wales, and accidents investigated by the Inspectors of Collieries during the six months ending 31st December, 1893.

The Examiner of Coal-fields, Sydney,—  
Sir,

Newcastle, 22 January, 1894.

Pursuant to the provisions of section 26 in the Coal-mines Regulation Act, 1876, we have the honor to transmit to you this our six-monthly report on the state of the various collieries in the Northern District for the half-year ending 31st December, 1893.

The total number of collieries under inspection in the Northern District during the half-year is 69.

No work has been done at the following 14 collieries during the half-year, viz.:—Awaba, Killingworth, North Stockton, Teralba, Shamrock Hill, Young Wallsend, Swansea, Richmond Vale, Stanford-Greta, Maitland, Leconfield, Fern Valley, Richmond Hill, and Nicholais Tunnel.

Eight new collieries have been added, viz.:—Electric, Liddle's, Rosehill, Sunlight, Ray's, Green's, Bebside, and Oakvale.

PRESENT STATE OF MINES.

*A. A. Co.'s No. 2 Colliery.*—About 200 men, &c., are employed in this mine during the day, and are supplied with about 80,000 cubic feet of air per minute. The face workings are divided into six separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*A. A. Co.'s New Winning.*—There are about 300 men, &c., employed in this mine during the day, and the total quantity of air circulating in the mine is about 80,000 cubic feet per minute. The face workings are divided into seven separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

*Newcastle-Wallsend Colliery.*—There are about 700 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 170,000 cubic feet per minute. The face workings are divided into separate and distinct districts, none of which are overcrowded. The provisions of the Act in other respects also are complied with.

*Newcastle Co.'s Colliery.*—About 430 men, &c., are employed in this mine during the day, and are supplied with about 90,000 cubic feet of air per minute. The face workings are divided into eight separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Co-operative Colliery (Plattsburg).*—There are about 200 men, &c., employed in this mine during the day, and supplied with about 36,000 cubic feet of air per minute. The face workings are divided into five separate and distinct districts. The Act is complied with.

*Lambton Colliery.*—There are about 380 men, &c., employed in this mine during the day, and the quantity of air circulating in the mine is about 80,000 cubic feet per minute. The face workings are divided into ten separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Burwood Colliery.*—There are about 110 men, &c., employed in this mine during the day, and supplied with about 26,000 cubic feet of air per minute. The face workings are divided into three separate and distinct districts, none of which are overcrowded. The Act is complied with.

*Stockton Colliery.*—There are about 200 men, &c., employed in this mine, and supplied with about 30,000 cubic feet of air per minute. The Act is complied with in regard to ventilation.

*Wickham and Bullock Island Colliery.*—There are about 340 men, &c., employed in this mine during the day, and are supplied with about 60,000 cubic feet of air per minute. The face workings are divided into seven separate and distinct districts, none of which are overcrowded. The Act in other respects also is complied with.

*Hetton Colliery.*—About 200 men, &c., are employed in this mine during the day, and the quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into five separate and distinct districts, none of which are overcrowded. The provisions of the Act are complied with.

*Ferndale Colliery.*—There are about 60 men, &c., employed in this mine, and supplied with about 12,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Brown's Colliery.*—This colliery has been under inspection during the half-year, but all work is now temporarily suspended.

*Duckenfield Colliery.*—About 300 men, &c., are employed in this mine during the day, and the quantity of air circulating in the mine is about 50,000 cubic feet per minute. The face workings are divided into separate and distinct districts. The Act in other respects also is complied with.

*South Waratah Colliery.*—There are about 160 men, &c., employed in this mine, and supplied with about 30,000 cubic feet of air per minute. The face workings are divided into separate and distinct districts. The provisions of the Act are complied with.

*New Lambton C. Pit.*—There are about 61 men, &c., employed in this mine during the day. The quantity of air circulating in the mine is about 20,000 cubic feet per minute. The districts are in accordance with the Act. The Act in other respects also is complied with.

*Ebbw Vale Colliery.*—About 43 men, &c., are employed in this mine, and supplied with about 12,000 cubic feet of air per minute. The Act is complied with in other respects also.

*West Burwood Colliery.*—About 27 men, &c., are employed in this mine, and supplied with about 6,000 cubic feet of air per minute. The Act is complied with.

*Hillside Colliery.*—About 14 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*East Lambton Colliery (Adamstown).*—About 25 men, &c., are employed in this mine, and supplied with about 10,000 cubic feet of air per minute. The provisions of the Act are complied with.

Dunkirk

*Dunkirk Colliery (New Lambton).*—This mine has been under inspection during a portion of the half year, but is now finally abandoned.

*Rotunda Colliery (North Lambton).*—Two men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Dog and Rat Colliery (North Lambton).*—This colliery has been under inspection during a portion of the half-year, but is now finally abandoned.

*Electric Colliery (North Lambton).*—Only 2 men are employed in this mine. The ventilation is good, and the Act complied with.

*Liddle's Colliery (Waratah).*—Three men employed in this mine. The ventilation is satisfactory, and the provisions of the Act complied with.

*Rosehill Colliery.*—Two men are employed in this mine. The ventilation is good, and the Act complied with.

*Ray's Colliery (Lambton).*—One man occasionally employed getting house coal. The Act is complied with.

*Green's Colliery (Grovestown).*—One man opening a small mine for household coal. The Act is complied with.

*Sunlight Colliery (Grovestown).*—One man occasionally employed getting house coal. The Act complied with.

*Beaside Colliery (Grovestown).*—One man occasionally employed getting house coal. The Act complied with.

*Elemore Vale Colliery (Wallsend).*—About 15 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Summerhill Colliery (Plattsburg).*—About 9 men, &c., are employed in this mine. The ventilation is good, and the Act complied with.

*Maryland Colliery (Plattsburg).*—About 16 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*North Co-operative Colliery (Plattsburg).*—About 14 men, &c., are employed in this mine, and supplied with about 4,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Dudley Colliery (Charlestown).*—This colliery has been under inspection during a portion of the half-year, but all work is at present temporarily suspended.

*Durham Colliery.*—There are about 48 men, &c., employed in connection with this mine. The surface arrangements, machinery, &c., are nearing completion, and so far will bear favourable comparison with any colliery machinery yet erected in the Colony. Everything in and about the colliery is in good order, and the provisions of the Act fully complied with.

*Burwood Extended Colliery.*—Only a few persons employed in connection with this colliery, keeping the workings in repair and the mine free from accumulations of water. Everything on surface and below ground in good order, and a splendid current of air is circulating through the workings. The Act is fully complied with.

*Toronto Colliery (Lake Macquarie).*—About 3 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Morrisett Colliery (Lake Macquarie).*—Three men are employed in this mine. The ventilation is good, and the Act complied with.

*Wallarah Colliery (Catherine Hill Bay).*—There are about 120 men, &c., employed in this mine, and supplied with about 15,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Northumberland Colliery (Fassifern).*—Four men at present employed in this mine. The ventilation is satisfactory, and the Act complied with.

*South Stockton Colliery (Teralba).*—Four men employed in this mine. The ventilation is good, and the Act complied with.

*Pacific (formerly Northern) Colliery (Teralba).*—There are about 160 men, &c., employed in this mine. The quantity of air circulating in the mine is about 40,000 cubic feet per minute. The provisions of the Act in other respects also are complied with.

*Garlee Colliery (Teralba).*—About 34 men, &c., are employed in this mine, and supplied with about 6,000 cubic feet of air per minute. The Act is complied with.

*South Wallsend Colliery (Cardiff).*—About 35 men, &c., are employed in this mine during the day. The ventilation is satisfactory, and the Act complied with.

*West Wallsend Colliery.*—Only 6 men are at present employed in this mine. The quantity of air circulating in the mine is about 40,000 cubic feet per minute. The provisions of the Act are complied with.

*Seaham Colliery.*—There are about 230 men, &c., employed in this mine, and supplied with about 35,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Thornton Colliery (Thornton).*—About 25 men, &c., are employed in this mine, and supplied with about 5,000 cubic feet of air per minute. The Act in other respects also is complied with.

*Sunderland Colliery (East Maitland).*—This mine has been under inspection during a portion of the half-year, but is now finally abandoned.

*Thornley Colliery (East Maitland).*—About 10 men, &c., are employed in this mine, and supplied with about 4,000 cubic feet of air per minute. The provisions of the Act are complied with.

*Bloomfield Colliery (East Maitland).*—About 8 men are employed in this mine. The ventilation is good, and the Act complied with.

*Marshall's Colliery (East Maitland).*—Two men are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Inganee Colliery (East Maitland).*—This mine has been under inspection during the half-year, but all work is at present suspended.

*South Rathluba (formerly North Borehole) Colliery, East Maitland.*—Three men are employed in this mine. The ventilation is good, and the Act complied with.

*East Greta Colliery (West Maitland).*—There are about 20 men, &c., employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Abram Colliery (West Maitland).*—Two men are employed in this mine. The ventilation is good, and the Act complied with.

*Pioneer Colliery (West Maitland).*—Only 2 men are employed in this mine. The ventilation is good, and the Act complied with.

*Denton Park Colliery (West Maitland).*—Two men are employed in this mine. The ventilation is good, and the Act fully complied with.

*Greta Colliery (Greta).*—There are about 250 men, &c., employed in this mine. The quantity of air circulating in the mine is about 60,000 cubic feet per minute. The face workings are divided into separate and distinct districts. The Act in other respects also is complied with.

*New Anvil Creek Colliery.*—About 30 men, &c., are employed in this mine, and supplied with about 9,000 cubic feet of air per minute. The provisions of the Act in other respects also is complied with.

*Ellesmere Colliery (Singleton).*—About 25 men, &c., are employed in this mine, and supplied with about 8,000 cubic feet of air per minute. The Act is complied with.

*New Park Colliery (Singleton).*—About 25 men, &c., are employed in this mine. The quantity of air circulating in the mine is about 5,000 cubic feet per minute. The Act is fully complied with.

*Elliott's Colliery (Singleton).*—Six men are employed in this mine: The ventilation is satisfactory, and the Act complied with.

*Rosedale Colliery (Singleton).*—About 15 men, &c., are employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Dulwich Colliery (Singleton).*—There are 13 men, &c., employed in this mine. The ventilation is good, and the provisions of the Act complied with.

*Oakvale Colliery (Singleton).*—Two men are employed driving an adit at this mine. The provisions of the Act are complied with.

*Kyuga Colliery (Muswellbrook).*—Two men are employed in this mine. The ventilation is good, and the Act complied with.

*Morley Colliery (Gunnedah).*—There are 3 men employed in this mine. The ventilation is satisfactory, and the Act complied with.

*Gladstone Colliery (Gunnedah).*—There are 4 men employed on this mine. The ventilation is satisfactory, and the provisions of the Act fully complied with.

*Centenary Colliery (Curlewis).*—There are 16 men, &c., employed in this mine, and supplied with about 6,000 cubic feet of air per minute. The provisions of the Act are complied with.

#### ACCIDENTS IN MINES.

The accidents investigated by us in the Northern District during the six months ending 31st December, 1893, are 26 in number. Of this number, 18 were fully reported upon at the time, and 8 were found to be of a minor character, and full reports were not written thereon. Of the 18 accidents in the annexed tabulated list, 3 proved fatal, all from falls of coal. Of the non-fatal accidents, 10 were caused by falls of coal, 2 by falls of stone, 1 by explosion of shot, 1 by ignition of loose powder, and 1 by a falling prop.

The first fatal accident occurred to a miner named Joseph Holmes, by a fall of coal at Seaham Colliery, on 3rd July, terminating fatally on 17th July. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Newcastle, on 18th July. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The second occurred to a miner named Thomas Dix, by a fall of coal at Wickham and Bullock Island Colliery, on 30th October. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased on 31st October, at Newcastle. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The third occurred to a miner named Edward Fanning Lister, by a fall of coal at the A. A. Company's New Winning, on 7th December. The District Coroner, G. C. Martin, Esq., held an inquest on the body of deceased at Hamilton, on 19th December. The inquest was attended by Inspector Humble, who heard all the evidence, and fully agrees with the verdict of "accidental death," as returned by the jury.

The first of the non-fatal accidents occurred to a miner named John Speers, at Duckenfield Colliery, on 18th July, by explosion of shot, resulting in severe burns.

The second occurred to a miner named Richard Mooney, at Lambton Colliery, on 19th July, by fall of coal, resulting in fracture of leg.

The third occurred to a miner named Samuel Rundie, at Dudley Colliery, on 3rd August, by fall of coal, resulting in injury to hip.

The fourth occurred to a miner named Jonathan Holland, at Hetton Colliery, on 3rd August, resulting in fracture of collar-bone, by fall of coal.

The fifth occurred to a miner named William Hope, at Newcastle Company's "A" pit, on 17th August, by fall of coal, resulting in fracture of ribs.

The sixth occurred to a miner named Richard Mason, at Hetton Colliery, on 24th August, resulting in fracture of leg, by fall of coal.

The seventh occurred to a miner named John Welsh, at Seaham Colliery, on 24th August, resulting in injury to hip, by fall of coal.

The eighth occurred to a miner named William Anderson, at Burwood Colliery, on 24th August, by fall of coal, resulting in fracture of leg.

The ninth occurred to a wheeler named Alfred Lever, at Elemore Vale Colliery, on 29th August, resulting in burns on face, by ignition of loose powder.

The tenth occurred to a miner named John McLaughlan, at Maryland Colliery, on 12th September, resulting in fracture of collar-bone and ribs, by fall of coal.

The eleventh occurred to a miner named Robert Price, at Hetton Colliery, on 7th October, resulting in fracture of leg, by fall of coal.

The twelfth occurred to a miner named George Birchnall, at the A. A. Company's No. 2 pit, on 16th October, resulting in injuries to head, by fall of stone.

The thirteenth occurred to a miner named William Yates, at New Anvil Creek Colliery, on 16th October, by fall of coal, resulting in internal injuries.

The

The fourteenth occurred to a miner named James Hall, at Ebbw Vale Colliery, on 6th November, resulting in fracture of thigh, by fall of stone

The fifteenth occurred to a miner named Charles Fretwell, at Newcastle-Wallsend Colliery, on 18th December, resulting in fracture of leg, by a falling prop

ACCIDENT ON SURFACE

One non-fatal accident occurred to an engine-boy named John Durie, at South Waratah Colliery, on 13th September, resulting in injury to foot, by a crank shaft.

The tabulated list of accidents is hereto appended.

We have &c,

JOHN DIXON,  
THOS. L. BATES,  
WILLIAM HUMBLE,

Inspector of Collieries.

TABULATED List of Fatal and Non-fatal Accidents in the Northern Collieries of New South Wales, investigated by the Inspectors of Collieries during the half-year ending 31st December, 1893:—

| No | Date    | Colliery                   | Person Killed or Injured   | Occupation | Remarks on Nature and Extent of Injuries         | Fatal        |                   | Non-fatal    |                          |               |                |       | Total     |   |   |  |   |
|----|---------|----------------------------|----------------------------|------------|--|--------------|-------------------|--------------|--------------------------|---------------|----------------|-------|-----------|---|---|--|---|
|    |         |                            |                            |            |  | Fall of coal | Explosion of shot | Fall of coal | Ignition of loose powder | Fall of stone | Fall of timber | Fatal | Non fatal |   |   |  |   |
| 1  | 1893    |                            |                            |            |  |              |                   |              |                          |               |                |       |           |   |   |  |   |

GEOLOGICAL SURVEY OF NEW SOUTH WALES.  
Progress Report for 1893 by the Government Geologist.

Sir,

I have the honour to submit the following progress report for the year 1893.

On the 5th of February I proceeded to Tamworth, and thence to Bowling Alley Point and Nundle, where I made an examination of the belt of serpentine which traverses this country, and of the deposit of chrome iron ore which occurs in it. On my return to Sydney I made a report with reference to the question of specially reserving this land for mining for chrome iron.

On the 24th of February I visited Burradoo, and examined some quartz pebble drift in the Parish of Mittagong, near Doudle's Folly Creek, where Mr. F. Griffiths had gone to considerable expense in erecting a diamond-washing plant, under the impression that the drift contained diamonds and other gems. A considerable quantity of this drift, taken from different parts of the land, was washed without discovering any gems, although three small diamonds were said to have been found in the preliminary work. Ultimately the work was abandoned by Mr. Griffiths. The following is a description of the *modus operandi*:—The drift was taken away from the face in trucks, which were emptied into an inclined revolving trommel of 1-inch mesh. The large stones were thus excluded and fell into a truck, by which they were removed to the dump. The small drift passing down the trommel was carried by a flow of water into a puddling-machine (made of wrought-iron), in which it was disintegrated by a number of knives fixed on four arms, which revolved about a central axis. The muddy water escaped by an overflow, carrying with it the light stones, and was then raised by an elevator, at the top of which it fell upon a screen, where the stones were discarded and fell down the dump. The muddy water fell through the screen into a gutter, whence it was returned to the trommel. When the contents of the puddling-machine had been well puddled they were run out of an aperture at the bottom into a pit which was kept locked, and from which they were taken as required to the washing-tubs. They were here washed on sieves of three different meshes, and the pebbles were then carefully sorted on an iron plate, with the object of picking out any gems that might be present. The pebbles remaining on the coarsest sieve were sorted first, then those on the second sieve, and lastly those remaining on the finest sieve. This drift was found to contain doubly-terminated quartz crystals, titaniferous iron, and zircons, but no sapphires or diamonds were found by Mr. Griffiths.

I also visited the drift known as Southey's Diamond-mine, 7 miles south-east of Mittagong. This drift is much coarser than that just described, and resembles more the diamantiferous drift of Bingara. It is stated that more than twenty diamonds have been found in this drift at different times, and it also contains fine gold, zircons, &c. A shaft was sunk some years ago close to this drift to a considerable depth, and on the spoil-heap can be seen pieces of volcanic breccia. Unfortunately the shaft was full of water, so that I was unable to observe the mode of occurrence of the volcanic rock, but its presence has given rise to the belief in the minds of some people that the diamonds may have had a similar origin to those of the celebrated Kimberley Mines of South Africa. An application for aid from the Prospecting Vote to test this drift having been made, I recommended the granting of a sum sufficient to sink a shaft that would either prove or disprove this theory. My recommendation was approved, but I regret to say that the money has never been taken up by the applicants.

On the 8th March I proceeded to Braidwood, *via* Tarrago, and inspected the work then being done by Mr. Geological-Surveyor Anderson, *viz.*, the geological survey in detail of the country between Major's Creek and Braidwood.

From March 15th to 19th I was, in company with Professor David, in the Wallerawang and Rydal district. We made a special examination of the Mount Lambie beds, with the object of settling the disputed question as to whether the fossil plant *Lepidodendron australe* is found in rocks of Devonian age, or does not descend below the lower Carboniferous rocks. The question is important in connection with the classification of the geological formation. We succeeded in proving that the fossil does occur in Devonian rocks, and subsequently published a paper on this subject in the Records of the Geological Survey. We also found a number of marine fossils not previously described as occurring in the Mount Lambie beds, and one, a species of *Pteronites*, recognised by the Palæontologist as new to Australia.

On the 20th of March I inspected a galena lode, known as Meyer's Reef, situated about 11 miles East of Tarrago. A copy of the report which I had the honour of furnishing you on this lode is appended hereto.

On the 29th March I proceeded to Scrubby Rush, between Woodstock and Mount M'Donald, and inspected the auriferous reefs there, several applications having been made for aid from the Prospecting Vote. The reefs at Scrubby Rush are, for the most part, what are known as segregated lodes, *i.e.*, they occupy fissures conformable with the bedding-planes of the country rock, instead of cutting across the latter, as is the case with true fissure veins. The general direction or strike of the slates at Scrubby Rush is north and south, but they have been contorted laterally in places, and consequently the segregated veins which filled the fissures between these beds have, generally, a north and south, but occasionally (for a short distance only) an east and west, direction. The reefs are widest where their direction is east and west, and they narrow where they resume their meridional course. The average yield of gold has been found to be about half-an-ounce per ton.

On the 6th June I inspected a Forest Reserve on Bogalara Run, near Bowning, and reported against the proposal to proclaim it a reserve for gold-mining purposes.

In July I visited the Sugarloaf Reefs, near Newbridge, and reported upon a number of applications for aid from the Prospecting Vote.

On the 23rd September I inspected the area of land constituting the Pitt Town Settlement, near Windsor, with the object of reporting upon the question of an artesian water supply for the settlement.

On the 20th October I visited Wellington, and inspected some areas which it was proposed to withdraw from the temporary common. I also visited the Mitchell's Creek Mine, and inspected the works which have recently been erected there for the purpose of treating a large parcel of tailings by the MacArthur-Forrest or cyanide of potassium process. Owing to the presence (in the tailings) of a certain amount of copper, it is doubtful whether this process is the best that could be adopted; for not only is a considerable proportion of the cyanide wasted in dissolving the copper, but the dissolved copper

Section of Bore No 2 No 11 Diamond Drill at Crenorne

Main table with columns: Nature of Strata, Thickness of Strata (ft/in), Depth from Surface (ft/in), Borehole 5" Diam, and Nature of Strata. Includes detailed stratigraphic descriptions and measurements.

Coal Seam (section enlarged)

Table detailing the composition and thickness of a coal seam, including layers like 'Coal soft bituminous, a trifle clayey' and 'Coal splint & bituminous of good quality'.

is subsequently deposited on the zinc shavings, and retards the action of the latter in precipitating the gold. Moreover, the gold which is finally precipitated is found to be mixed with a large proportion of copper, instead of being pure.

On the 25th October I proceeded to Lewis Ponds and inspected some land which it was proposed to alienate, but which I reported would probably be required for machinery-sites in the future.

From the 6th to the 27th November I, in company with Mr. Boulton, Superintendent of Public Watering Places, travelled over a considerable area of the Western District. I reported upon proposals for putting down bores for artesian water at Tarrion, near Brewarrina, and at the Quarry Reserve, near Bourke, and I also inspected and reported upon a supposed find of gold on the Fort Bourke Run. Copies of these reports are appended. During this trip I was enabled to obtain much valuable information in regard to the Cretaceous water-bearing basin, and to make several corrections on the Geological Map of the Colony.

On the 28th November I visited Gulgong in company with Mr. Crouch, District Surveyor. We made an inspection of the Temporary Common, and agreed upon certain recommendations as to its curtailment.

On the 18th December I proceeded to Narrandera, and travelled thence to the newly-discovered auriferous reefs on Portion 80, Parish of Fennel, County of Bourke. I subsequently had the honour to furnish you with a report on the question of the resumption of the land for mining purposes.

On the 28th December I travelled to Burragorang, *via* Camden, and inspected a coal-seam which Messrs. Barry & Co. propose to prospect by boring with the diamond-drill. The summit of Burragorang Mountain is about 1,950 feet (by aneroid observation) above sea-level, and is composed of beds of Hawkesbury Sandstone, which are here about 550 feet thick. The chocolate (Narrabeen) shales outcrop, as one descends the cut road on the mountain side, at a height of 1,400 feet above sea-level, and lower down the outcrop of the coal-seam is met with at an elevation of about 1,025 feet. The seam, which appears to have a good roof, appears in section as follows:—

|                                 | ft.   | in. |
|---------------------------------|-------|-----|
| Banded bituminous coal .....    | 0     | 6   |
| Splint and bituminous coal..... | 3     | 10  |
| Shale band.....                 | 0     | 0½  |
| Splint and bituminous coal..... | 0     | 11½ |
| Friable bituminous coal .....   | 0     | 6   |
|                                 | <hr/> |     |
|                                 | 5     | 10  |

A sample of the "splint and bituminous" coal taken haphazard was analysed by Mr. J. C. H. Mingaye, F.C.S., Analyst to the Department, and gave the following result:—

|                             |        |                 |
|-----------------------------|--------|-----------------|
| Moisture at 100° .....      | 2.80   |                 |
| Volatile hydrocarbons ..... | 26.80  |                 |
| Fixed carbon .....          | 62.50  | } Coke, 70.4 %. |
| Ash .....                   | 7.90   |                 |
|                             | <hr/>  |                 |
|                             | 100.00 |                 |

Sulphur, .576 per cent. Specific gravity, 1.345.

One pound of this coal will convert 12.1 lb. of water into steam.

Considering that the sample was taken from the outcrop, the analysis must be considered as warranting the opinion that the seam will be found to consist of good steam-coal. It must be remembered, however, that the sample analysed was not representative of the whole thickness of the seam.

During my absence in the Western District the No. 2 bore, which was put down at Cremorne under the supervision of the Superintendent of Diamond Drills, struck a 10 foot 3 inch seam of coal at a depth of 2,917 feet. The successful issue of this bore, proving as it does the continuity of workable seams of coal from Newcastle to Illawarra, is of immense importance to the future of New South Wales, for it not only adds enormously to our proved reserves of coal, but it assures the future of Sydney as a manufacturing port.

I have made a detailed geological section of the strata passed through by the bore from its commencement, and a complete record of it will be found appended hereto.

The last 30 feet of the section, including the coal-seam itself, were examined by Professor David, who was good enough to act for me during my absence.

Professor David also ascertained (by means of thermometers in a specially-constructed apparatus) the temperature of the rocks at a depth of 2,733 feet to be 97° Fah., which is considerably lower than was anticipated. This represents a rate of increase of temperature as we descend of 1° for every 80 feet, and at this rate the actual temperature at the level of the coal-seam (2,917 feet) should be 99.3° Fah., a temperature which could of course be considerably reduced by ventilation.

The coal proves to be of good quality for steam purposes. The following analysis by Mr. J. C. H. Mingaye, F.C.S., shows the mean composition of the seam:—

|                             |        |
|-----------------------------|--------|
| Hyroscopic moisture .....   | 0.66   |
| Volatile hydrocarbons ..... | 17.57  |
| Fixed carbon .....          | 71.09  |
| Ash .....                   | 10.68  |
|                             | <hr/>  |
|                             | 100.00 |

Sulphur, .724 per cent. ; specific gravity, 1.346 ; calorimetric value, 13.0 ; coke, 81.77 per cent.

During the year a new edition of the Geological Map of the Colony was published. Considerable care was exercised in obtaining the very best colours in the market, and in consequence of this, and the excellence of the draftsman's and lithographer's work, the new map is generally considered to be in advance of anything of the kind yet issued by the Department. The boundaries of the different formations were drawn by Mr. O. Trickett, L.S., and the printing was done at the Lithographic Branch of the Lands Department, under the supervision of Mr. J. Taylor. The map has been awarded a medal at the Chicago Exhibition.

The senior Geological Surveyor, Mr. Wm. Anderson, was engaged during the first half of the year in continuing his detail survey of the Shoalhaven Valley. During the month of March, as already stated, I made an examination of his work, which I found very satisfactory, and he was making good progress

when, in accordance with the retrenchment proposals, his salary was removed from the Estimates, and his services had to be dispensed with from the 30th June. I desire to place on record here my appreciation of Mr. Anderson's work, and my regret at the loss of so intelligent and zealous an assistant.

Mr. J. E. Carne, F.G.S., is now the senior Geological Surveyor on the staff, but he has been absent since the 23rd January, having proceeded to Chicago in charge of the New South Wales mineral exhibits at the World's Fair. It is satisfactory to know that owing to a great extent to Mr. Carne's skill and experience in similar work the mineral exhibits attracted a great amount of attention and admiration from visitors of all nationalities, and it is fair to assume that the Colony will in the future reap the benefit of the attention which its wonderful mineral exhibits received. I venture to hope that during the coming year Mr. Carne will be able to devote his time to the work of the Geological Survey Branch.

The appended report by Mr. Carne shows that he visited a number of mines and smelting-works in America.

In connection with the report on Colonial Coke which I had the honour to furnish last year, it is interesting to note that in large silver-smelting works in America Mr. Carne found that the coke used (of American manufacture) was very inferior to our New South Wales coke, both in regard to the strength or density and in the percentage of ash; and he was informed that they found it more economical to use this inferior coke, taking into consideration the difference in price between it and the best Welsh coke.

Mr. Geological-Surveyor G. A. Stonier, F.G.S., has done a very considerable amount of travelling during the year, his time having been principally occupied in dealing with applications for aid out of the Prospecting Vote, and reporting upon the advisability or otherwise of alienating certain areas of land within gold-fields. He has also reported upon a number of cases in which the Lands Department desired to cancel gold-field reserves, curtail temporary commons, &c., &c. His annual report is appended.

Mr. Geological-Surveyor Jaquet, A.R.S.M., F.G.S., has been engaged during a considerable part of the year in preparing the manuscript, plans, and sections of his Monograph on the Geology of the Broken Hill Lode. This Monograph is now in the press, and it will, I think, be found to be well worth the time and labour which Mr. Jaquet has devoted to its preparation, both in the office and in the field.

During the month of January, Mr. Jaquet made a careful examination of the Mount Allen Mine, in connection with the question of compensation to be paid to the New Mount Hope Copper-mining Company, on account of the resumption of the M.C.P. on which the Mount Allen Mine occurs. He also visited the Nymagee and Cobar Copper-mines. In August he inspected and reported upon a silver-lead lode at Belconon, near Queanbeyan. In October he reported upon the gold and silver lode at Back Creek, near Rockley, the alluvial gold deposits at Neville, near Carcoar, and also the recently-discovered auriferous deposits in Marsden's Paddock, near Blayney. He has also reported upon a recent-discovery of auriferous ground near Queanbeyan. On 22nd October, Mr. Jaquet proceeded to Braidwood, to take up the work which had been interrupted by the retirement of Mr. Geological-Surveyor Anderson, viz., the geological survey of the Shoalhaven Valley. With the object of ensuring a practical outcome from Mr. Jaquet's work at as early a date as possible, I instructed him to proceed at once with the mapping of the auriferous drifts which are known to occur in the valley of the Shoalhaven. Mr. H. G. M'Kinney, M.I.C.E., has recently furnished a report to the Minister for Works on the practicability of bringing to this locality a supply of water sufficient to work the auriferous drifts by hydraulic sluicing (*vide* Annual Report of the Department of Works for 1892), and it is hoped that Mr. Jaquet's report will, in connection with Mr. M'Kinney's, result in the opening up of employment for a number of miners.

Mr. Jaquet also dealt with several applications for aid out of the Prospecting Vote, and reported upon several areas which the Lands Department desired to alienate.

Mr. G. W. Card, A.R.S.M., F.G.S., in addition to his ordinary duties as Curator of the Museum, has done good work in the microscopical examination of rocks. He has also supplied a considerable amount of information to the public in answer to inquiries. In consequence of the space lately occupied as a Geological Museum being required for offices for the Agricultural Branch, the geological collection has, in accordance with your instructions, been removed to the old building in the Domain, formerly occupied by the Technological Museum. I venture to express the hope that this arrangement will be only a temporary one, and that a more suitable structure for the display of our fine collection will be provided as soon as practicable.

Another new mineral has been found at Broken Hill during the past year. It was discovered in the Australian Broken Hill Consols Mine by Mr. George Smith, at that time Assistant Manager, and now General Manager. A careful analysis of the mineral was made by Mr. J. C. H. Mingaye, F.C.S., Analyst and Assayer to the Department. At the request of the finder, I read a short description of the new mineral at one of the monthly meetings of the Royal Society. The composition of the mineral is sulph-antimonide of nickel and cobalt ( $\text{Co S}_2$ ,  $\text{Co Sb}_2$ ,  $\text{Ni S}_2$ ,  $\text{Ni Sb}_2$ ), and I have given it the name Willyamite, after Willyama, the native name for Broken Hill.

At the Laboratory a large amount of work has been performed by and under the superintendence of Mr. J. C. H. Mingaye, F.C.S. A total number of 3,015 samples were received during the year for analysis and assay. The analyses included thirteen samples of well and artesian waters, a number of rocks from the Broken Hill district, numerous coals, fireclays, &c., &c.

At the request of the Trustees of the Australian Museum, Mr. Robert Etheridge, jun., the Palæontologist and Librarian, was allowed to act for Dr. Ramsay (who was absent on sick leave) during a considerable part of the year. Notwithstanding this fact, Mr. Etheridge, with the assistance of Mr. Dun, has found time to keep the current work of the Department fairly well up to date.

Mr. W. S. Leigh, the Superintendent of Caves, has also done good work during the year. Besides making periodical visits to the different caves and reporting on several fresh discoveries, he has designed and supervised the construction of the various improvements necessary for the safety of visitors.

On the 20th February the keeper of the Jenolan Caves, Mr. J. Wilson, discovered another large and distinct branch of the Imperial Cave. The new cave is, in point of beauty and interest, equal to anything yet found. It has been reported upon by Mr. Leigh, who, in company with Messrs. Etheridge and Barber, has also, during the year, explored a number of caves in the Cooleman limestone, about 20 miles north-east of Kiandra.

In conclusion, I have to report that all the officers of this Branch of the Department have shown energy and care in the discharge of their duties.

I have, &c.,

EDWARD F. PITTMAN,

Government Geologist.

The Under Secretary for Mines and Agriculture.

APPENDIX

## APPENDIX I.

Sir,

Department of Mines, Sydney, 13 February, 1893.

I have the honour to report that I have made an examination of the country in the neighbourhood of Bowling Alley Point, with the object of ascertaining the advisability or otherwise of making a reserve to protect the deposits of chromite existing there. A belt of serpentine runs for some miles on the eastern side of the Peel River. The direction of this belt is about N. 30° W., and its width appears to be about 300 yards. At a point (within this belt of serpentine) about three-quarters of a mile east of the "Bowling Alley Point Hotel" there are several small outcrops of chromite. One big mass, which is lying on the surface, is about 8 or 10 feet square, and a number of smaller masses are to be seen embedded in the surface rock. Beyond a narrow costeaning trench across the strike of these bunches, no prospecting has, however, been done, and in view of the uncertainty as regards the persistency in depth which characterises chromite deposits, it is impossible to say what quantity of the mineral exists there until its depth has been defined.

A number of assays of chromite from this district have been made from time to time in the Geological Survey Laboratory, and have yielded from 37½ to 47 per cent. of Cr<sub>2</sub>O<sub>3</sub>.

Although the deposit alluded to was the only one of which I could hear in the district, it is possible that other deposits may occur anywhere within the belt of serpentine shown on the lithograph, or between it and the belt of diorite which extends along its western boundary.

With regard to the question of a reserve, however, it is pointed out that a considerable area of the land referred to is held under gold-mining lease, while the outcrop of chromite already described is the subject of a mineral lease application (20 acres) by B. D. Williams, and it is probable that a number of areas near the banks of the Peel River are held under miners' rights.

I have, &amp;c.,

EDWARD F. PITTMAN,  
Government Geologist.

## APPENDIX 1A.

## Report on Galena Lode known as Meyer's Reef.

Geological Survey Branch, Department of Mines, Sydney, 2 May, 1893.

I HAVE inspected the lode known as Meyer's Reef, which is situated on portion M.L.L., Parish of Cullulla, County of Argyle, about 11 miles East of Tarrago, and have to report as follows:—

The country in which the lode is situated consists of slates, shales, and sandstones—probably of Upper Silurian age. About four years ago several shafts, the deepest of which was about 70 feet, were put down by O'Neill, Blake, and Party, about 5 chains north of the present workings, on a lode having a dip W. 20° S. at 20°. This lode was found to contain slugs of carbonate of lead, which were also scattered through the shales and mudstones close to the outcrop.

These were evidently the result of the oxidation of a galena lode, but no solid deposit of the latter mineral appears to have been discovered by this party (possibly because sufficient prospecting was not done), and the workings were abandoned.

The galena lode (Meyer's Reef) on which mining operations are at present being carried on bears N. 30° E., and dips E. 30° S., at an angle of about 70°. Two shafts have been sunk upon it; the first, which was aided out of the Prospecting Vote, reached a depth of 60 feet, when work was discontinued.

The second shaft is situated about 50 feet N.E. by N. of the first, and at the time of my visit was down to a depth of 96 feet. The galena lode, which was very narrow at the surface, was said to be 6 feet wide at the bottom of the shaft; but I was unable to inspect it there, as there were about 5 feet of water in the bottom. At a depth of 92 feet from the surface, however, I found the lode showing in the face of a small drive (which had been put in for a distance of 5 feet), and here it consisted of a dark shaly gangue with streaks and bunches of fine-grained galena, and with occasional patches of carbonaceous shale.

The lode proper was about 3 feet 6 inches wide in this drive, and about 18 inches East of it, was what appeared to be a well-defined hanging-wall, showing that the galena had not filled the fissures for its entire width. I took a representative sample from across the full width of the lode (viz., 3 feet 6 inches), and on my return to Sydney it was assayed by Mr. J. C. H. Mingaye, F.C.S., Analyst to the Department. The result showed that the average contents of the lode for the width mentioned above, were 15.45 per cent. of lead and 2 oz. 9 dwt. of silver per ton. It is quite probable that the lode may continue to improve, as it has already done from the surface down to the depth from which I took the sample referred to; but it is evident that, unless a material improvement does take place, the deposit cannot be worked at a profit, in view of the cost of cartage and railway freight to Sydney.

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

## APPENDIX 1B.

Geological Survey, New South Wales, Department of Mines, Sydney, 25 September, 1893.

At the request of Mr. Backhouse, I visited the site of the settlement at Pitt Town Common on Saturday the 23rd instant, and find that it is about 3 miles east of the Mulgrave Railway Station, and about 150 feet above sea-level. The settlement is situated on undulating country, consisting of Wianamatta shale, underneath which, at a depth probably of less than 100 feet, will be found the Hawkesbury sandstones. There is, in my opinion, no probability of an artesian water supply being obtained by boring. The settlers at present obtain their drinking-water from a number of small holes in the gully or watercourse, which receives the whole of the drainage of the horseshoe range upon which the dwelling-houses have been or are being erected. It is evident, therefore, that every successive shower of rain must help to render this water unfit for domestic use, and it is of the utmost importance that some other less objectionable source of supply should be obtained as soon as possible, for should the coming summer be a hot and dry one, the settlers will probably have considerable difficulty in obtaining sufficient water for their necessities. It is possible that a little soakage-water might be obtained (owing to the late wet season) by sinking wells in the valleys, but I am of opinion that if dry weather were to set in this source would be quite inadequate. Some of the surrounding gullies appear to be eminently suitable for the construction of dams, and this would probably be the cheapest and most expeditious way of meeting the difficulty. I understand that a supply could be obtained by pumping from Cattai Creek, but this would be a comparatively expensive scheme.

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

APPENDIX

## APPENDIX 1C.

Department of Mines, Sydney, 7 December, 1893.

I HAVE the honor to report that I have inspected the site of the supposed deposit of gold on the Fort Bourke Run. The locality is situated about 16 miles north of Bourke. I found a miner named Whitehead in charge of the claim. Three shafts have been sunk on the edge of a nearly circular plain or dry lake, the material penetrated being; (1st) about 5 feet of dark blue or purple clay—the joints being coated with carbonate of lime; (2nd) about 2 feet of whitish clay stained red in places by peroxide of iron; (3rd) dark bluish or blackish clay. These clays undoubtedly belong to the Lower Cretaceous Series, and at the back of the shafts, and bordering the plain referred to are low spurs formed of Upper Cretaceous sandstones, quartzites and beds of kaolin.

Two samples of the clays which were said to be auriferous were brought to Sydney by me, and were carefully assayed in the Geological Survey Laboratory by Mr. Mingaye, but were found to contain neither gold nor silver. These results confirm the opinion which I formed from an inspection of the ground, which has no appearance of being an auriferous formation, and which differs in no respect from the Cretaceous plains which are characteristic of the district generally.

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

## APPENDIX 1D.

Sir, Geological Survey Branch, Department of Mines, Sydney, 15 December, 1893.

I have the honour to report that, in company with Mr. Boulton, Superintendent of Public Watering-places, I have made a geological inspection of the country between Byerock and Brewarrina, for the purpose of ascertaining whether artesian water is likely to be obtained by boring along that road. The trip outwards to Brewarrina was made along the road, *via* Gongolgan and Mr. Willis' Tarrion Station, while the return journey was made by the direct road (*via* Pink Hills), so that a good scope of country was examined.

From Byerock to within half a mile of Gongolgan the road lies over gently undulating country—the valleys or depressions being covered by shallow Pleistocene or recent deposits, while on the summits of nearly all the low ridges may be seen outcrops of altered slates (of Upper Silurian age) intersected by quartz reefs. It is not to be expected, therefore, that artesian water would be found anywhere between Byerock and Gongolgan.

These Silurian sediments are succeeded by granite as the road approaches Gongolgan. A fine outcrop of granite is seen in the bed of the Bogan close by the bridge on the northern side of the town, and other outcrops of the same rock occur at intervals along the road for a distance of 10 miles towards the Tarrion. In between these outcrops the country is covered by black soil—the flood-drift left by the over-flow of the Bogan River; but there seems little reason to doubt that granite would be found underlying it at no great depth, and that, therefore, the occurrence of artesian water for a distance of 10 miles along the road north of Gongolgan is improbable.

After leaving the last outcrop of granite the road runs (still in a northerly direction) over black-soil plains for a distance of 7 or 8 miles. It is quite possible that these black-soil plains may overlie beds of Lower Cretaceous age, although there is no geological evidence at the surface to prove this assumption. If the Cretaceous beds do underlie this area, however, I am inclined to think (from a consideration of the geological evidence to be seen further along the road towards Brewarrina), that they are of no great thickness, and that, therefore, the occurrence of artesian water in them is somewhat doubtful.

Just south of the Tarrion an isolated hill, known as Mount Bendemeer is reached. This hill is composed of coarse quartz-pebble conglomerate and sandstone beds, having a strike N. 50° E., and dipping E. 50° S., at angles varying from 10° to 20°. These beds possess characters in common with both the Devonian and Upper Cretaceous rocks, and in the absence of palæontological evidence I am not yet in a position to state their precise age, though I am inclined to regard them as Devonian.

Almost immediately after leaving the Tarrion, granite is again met with to the west of the road to Brewarrina, and the same formation extends to within a mile and a half of the town. The granite ends in a low ridge, from the northern flanks of which horizontal beds of typical Upper Cretaceous quartzite extend towards Brewarrina. These beds are not continuous however; between the granite ridge and the town they have been denuded and replaced by black-soil deposits. They reappear, however, in the banks of the river (the Barwon) at Brewarrina, where they are seen to lie upon the upturned edges of a series of slates and shales, traversed by lenticular quartz veins. There is little doubt that these slates and shales are of Palæozoic (Upper Silurian) age. They can be traced (outcropping in the gullies) for several miles to the west of Brewarrina. They have an east and west strike, and their dip is northerly at an angle of 80°, showing that they have probably been tilted by the intrusion of the granite, which has already been described as reaching to within a mile and a half of the river. A section of this mile and a half of country would therefore appear as follows, and it will be seen that there is no probability of water-bearing (Lower Cretaceous) belts occurring between the Tarrion Station and Brewarrina.

On the direct road back to Byerock (*via* the Pink Hills) the granite continues to near the Tarrion Creek Crossing, then black-soil country to within 6 miles of Tarcoon on the Bogan River. Here granite is again met with, and continues to within 28 miles of Byerock, after which the road passes over 6 miles of Silurian slates, then 5 miles of granite, and then Silurian country into Byerock.

Summary

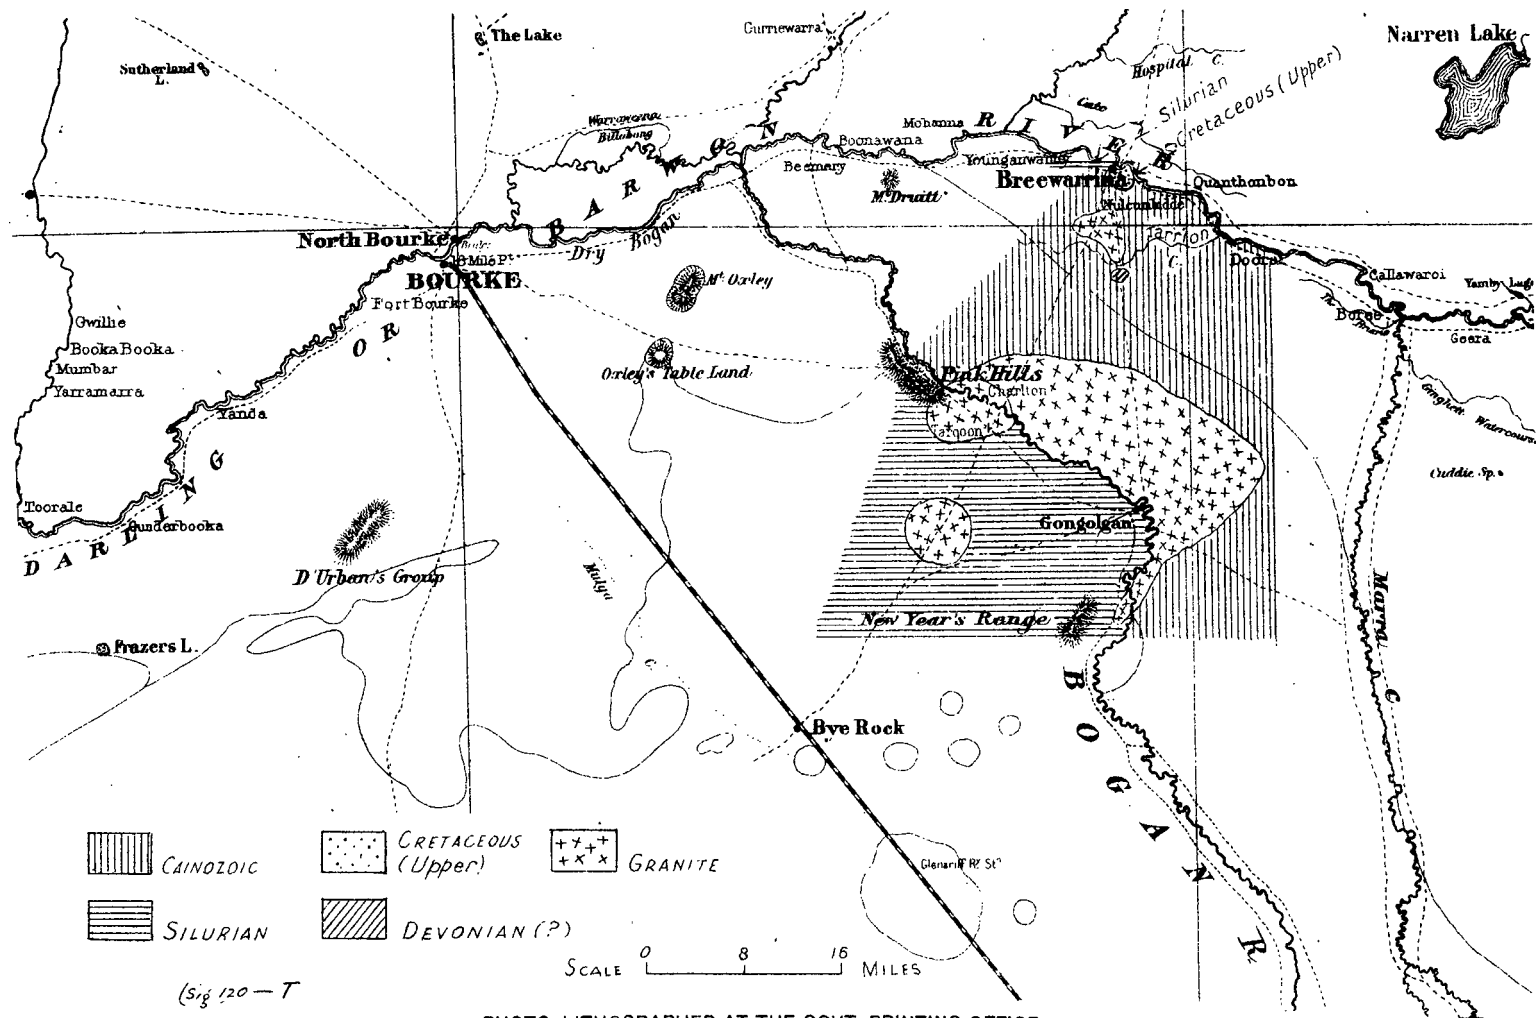

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE,  
 SYDNEY, NEW SOUTH WALES.

*Summary.*

My examination of the country along the road from Byerock, *via* Gongolgan to Brewarrina leads me to the conclusion that, for the greater part of the distance, there is little or no probability of artesian water being found. There is a possibility that Lower Cretaceous beds may underlie the black-soil plains over part of the area extending from 10 to 18 miles north of Gongolgan. On the other hand, it is possible that this area may be overlaid by granite, and indeed it may be said that this hypothesis is quite as likely as the former.

In any case I am of opinion that if Lower Cretaceous beds do occur here, they are probably very near the shore line of the old Cretaceous sea; in other words, they are likely to be of no great thickness, and therefore the chances of obtaining artesian water would not be sufficiently great to justify the putting down of a bore at Government expense, unless it were considered that the requirements of travelling stock rendered it imperative that a supply of water should be provided at this point.

The accompanying geological sketch map shows the result of my examination of the district.

The Under Secretary for Mines and Agriculture.

I have, &c.,

EDWARD F. PITTMAN,  
Government Geologist.

## APPENDIX 1E.

Sir,

Geological Survey, Department of Mines, Sydney, 22 December, 1893.

I have the honour to report that I have inspected the auriferous reefs recently discovered on A. C. P. Portion 80, Parish of Fennel, County of Bourke, distant about 18 miles, N.E. of Narrandera.

The prospector of the reef was Mr. Smith, who now holds a permit to search for gold, and who has performed a considerable amount of work, including an underlay shaft 24 feet deep (disclosing a well-defined reef, varying in width from 1 to 3 feet) and a vertical shaft which has struck the same reef on the underlay at a depth of 35 feet. The reef here has a strike of N. 20° W., and dips W. 20° S. at about 45°. The country rock consists of somewhat felspathic slates and sandstones, and I could see no indications of intrusive dykes in the vicinity. Smith has a fair amount of stone at grass. I examined this stone carefully, and could not see any gold with the aid of a glass, nevertheless samples taken indiscriminately from the paddock and dollied, yielded very fair prospects of fine gold when washed in the dish.

Next to Smith's claim is O'Farrell's, which is also held under permit, and adjoining O'Farrell's, is Duval's, junior, which is the subject of an application for a permit. There is a dispute between O'Farrell and Duval, junior, the latter asserting that O'Farrell's ground has been laid out in a different way to that in which he applied for it, and that the alteration has given him (O'Farrell) a considerable amount of the ground applied for by Duval. There is no doubt that O'Farrell's application is prior to Duval's, but Duval states that the alteration in O'Farrell's description was made *after* he (Duval) had sunk his shaft and found gold. This is denied by O'Farrell; but the facts can doubtless be ascertained upon enquiry.

Duval has undoubtedly done more work than O'Farrell, and, as a matter of fact, the declaration as to payable gold having been found was made by O'Farrell on account of a small hand specimen taken from a small hole, the depth of which does not exceed 3 feet or 3 feet 6 inches, and which, Duval asserts, is outside O'Farrell's ground and inside that applied for by him. The reef here bears about N. 40° W., and dips in a contrary direction from that in Smith's claim. Two samples were taken by me from the small hole just referred to. The first, which weighed about 1½ lb., was dollied and washed, but did not yield a colour of gold. The second sample weighed about 5 or 6 lb. It was first roughly crushed, and then about one-third of it was dollied and washed, and yielded a fair prospect of gold. A sample was also taken from Duval's shaft, and yielded, if anything, a better prospect than that from O'Farrell's.

Meyer's Claim is to the South of Smith's, and is on a rubble reef, which is quite distinct from the reef being worked by Smith and Duval, junior. Meyer's application for a permit has not yet been granted, but he is systematically prospecting the ground, and has done a considerable amount of work, including several shafts, the deepest of which is 30 feet, with a drive from the bottom 15 feet long. Two samples from Meyer's reef were taken, and both gave good prospects; in fact, colours of gold can be obtained almost anywhere in the vicinity of the reefs.

I am of opinion, however, that O'Farrell's declaration of payable gold is decidedly premature. No crushing whatever has been done on the field beyond dollying hand specimens in a mortar, and O'Farrell himself has done very little work—certainly not sufficient, in my opinion, to warrant him in declaring payable gold. As far as I can ascertain it has been known for some time past that colours of gold can be obtained from stone taken out of the reefs, and there appears to be an opinion current amongst some of the miners that the first man to declare payable gold will obtain special privileges. It is more than probable that this opinion has to some extent been responsible for the declaration which has been made.

It must not be forgotten that although very rich gold was obtained at the Gladstone and Belmore reefs (not 3 miles distant from the present find), the deposits were decidedly patchy, and in view of this, and of the fact that such a small amount of work has been performed at the new find, I do not feel justified at present in recommending the resumption of any part of the land. In my opinion that course would not be warranted until the results of one or more bulk crushings were known, and, if possible, one of the bulk samples should consist of stone taken from a depth of at least 50 feet. Smith has one shaft already down 35 feet, so that it should not take long to sink the extra 15 feet and extract a few tons of stone. Another crushing might be taken from Duval's shaft at the other end of the reef.

There are at present only four claims on the field on which work has been systematically performed. These are Smith's, Masey's, Duval's (junior), and Meyer's, and of these only the first two are held under permits. I venture to recommend that permits should be issued to Meyers and Duval, junior, as soon as possible, as they are using every effort to prospect the land. It is also, in my opinion, very necessary that survey of the principal claims should be made as soon as possible, as there is a dispute already between two of the applicants, and this can only be satisfactorily settled by defining the boundaries of the ground. It would, I think, be preferable to have the surveys made by one of the surveyors on the staff of the Department.

I would also strongly urge that all permits should be cancelled promptly if not worked in a satisfactory manner, as there are evidently many speculative applications, the only effect of which is to prevent the proper prospecting of the ground.

A large ironstone lode, bearing N. 60° W., runs through Masey's permit. A sample of this was taken by me, and has been sent on for assay.

I have, &c.,

EDWARD F. PITTMAN,  
Government Geologist.

The Under Secretary for Mines and Agriculture.

#### APPENDIX 2.

Progress Report by Mr. J. E. Carne, F.G.S., Geological Surveyor,

Sir, Geological Survey Branch, Department of Mines and Agriculture, 19 February, 1894.

I have the honour, in accordance with your instructions, to furnish the following brief notes summarising the work performed by me during the past year, reserving for a later date a more detailed report of mining exhibits and appliances inspected:—

During the whole of the period mentioned I have been occupied in connection with the representation of the mining interests of New South Wales at the World's Columbian Exposition, Chicago, U.S., pursuant to an agreement entered into early in the previous year between the Honorable the Minister for Mines and Agriculture and the New South Wales Commission to the Exposition, whereby I was chosen to undertake, on behalf of each, the work necessary to secure an exhaustive and imposing display of the known mineral resources of the Colony at the above Exposition; and to increase the certainty of obtaining this result I was supplied with the able and experienced services of the late Mr. T. Ford, to whose untimely death in September last I will allude further on.

To the large quantity of exhibits held in stock from previous exhibitions, others were added from the latest discoveries and developments, special prominence being given to such as have so far baffled all attempts at economic treatment, with a view of taking advantage of any new processes or appliances which it was confidently anticipated would form a notable feature in the mining and metallurgical display at the World's Fair, an anticipation, however, not to be realised.

With the exception of a few cases, the mining exhibits were despatched by the 23rd January, on which date I also took my departure for America. The total number of packages forwarded reached 2,550, of a net weight of 275½ tons, and a measurement of 11,106 cubic feet. The exhibits by the s.s. "Alameda," which sailed on the 28th November, 1892, were the very first to arrive at the Exposition.

Upon my arrival in Chicago, on the 24th February, I found the two first consignments of mineral exhibits spread over a large area in the Mines and Mining building, on account of the weakness of the flooring. The first operation, therefore, was the strengthening of it under the spaces on which trophies were to be erected, an expense which should justly have been borne by the Exposition authorities, but which was imposed upon exhibitors.

After a careful examination of the space—8,250 square feet—set apart for the New South Wales Mines Court, I prepared a plan of arrangement which met the approval of the Executive Commissioner—the Honorable A. Renwick, M.D., M.L.C.—and work was vigorously begun. Early in March Mr. Ford arrived, *via* London, having been engaged for two weeks, by instruction from this Department, assisting in the identification and arrangement of the mineral exhibits in the New South Wales section of the Imperial Institute, and he at once joined in the work of preparation at Chicago with the energy and hearty co-operation which always characterised his labours on behalf of the Colony. Aided by the counsel and full confidence of the Executive Commissioner, we were enabled to have the Mines Court practically complete on the opening day, 1st May, notwithstanding that the facilities for handling heavy exhibits, and obtaining necessary materials and supplies, were the crudest we had yet encountered at any exhibition in which we had taken part, a matter for intense surprise to visitors who had indulged in anticipations based upon a knowledge of the labour-saving appliances invented in America.

As the rest of the courts in the Mines and Mining building were, with two or three exceptions, in a very backward condition on the opening day, the New South Wales display was thrown into prominent relief, owing to its finished appearance amongst so much disorder; and even when all were ready, the extent, variety, and massiveness of the exhibits evoked most favourable comment; the freely expressed opinion of the public being that in minerals, wools, and hardwood timbers, New South Wales took the lead from all competitors.

The experience of each exhibition in which I have had the honor to take part, strengthens the opinion that to produce an effect at once imposing and attractive, massiveness must be aimed at as much as superficial extent, the general public being more impressed with bulk than small picked specimens, and the mining community better able to form a just conception of the size and value of the veins and deposits from which the various exhibits are taken.

As before stated the area of the New South Wales Mines Court was 8,250 square feet, which is less than was occupied for a similar purpose at at least two of the previous exhibitions; but it was only with great difficulty that the Executive Commissioner was enabled to secure even the above area, as space was in great demand. But as regards quantity of material used in the display, the last occasion greatly exceeded any previous attempt, the trophies being of necessity closer together. The wall space devoted to geological maps, sections, and mining views amounted to about 1,500 square feet. The Court had a frontage of 87 feet to the main central avenue of the building, and a depth of 160 feet at right angles. Its main features were the handsome silvered column of the Broken Hill Proprietary Company, 40 feet high, the large triple archways springing from four pillars of coal and shale, with a superstructure bearing statistical information of the quantity and value of the mineral productions of the Colony, the whole having a dimension of 56 ft. by 28 ft.; the huge coal sections forming an avenue in the main portion of the Court, the large metal and ore trophies, and the gold and gems and polished marbles.

I venture to think that New South Wales has never before had such a creditable and exhaustive display of her natural resources before the world, nor yet one which excited such universal attention. As a national advertisement, the New South Wales exhibit at the World's Fair was unrivalled. Though in one sense it was unfortunate that just at the moment when the Colony was worthily holding its place among the nations of the earth at the greatest World's gathering yet attempted, and inviting and attracting attention, her financial affairs should have been disturbed by a bank panic, yet such an unfortunate occurrence

occurrence could not have happened at a more opportune time, when she had on view at a World's Exposition such abundant evidence of her vast natural resources as must, and did, convey a feeling of confidence in her future prosperity, which no temporary monetary uneasiness can really disturb.

It is also gratifying to note that at no previous exhibition of late years has such abundant evidence been afforded of intelligent interest on the part of the general public, which took the form of frequent inquiry and practical note of whatever struck the observer as specially worthy of remembrance; a large sprinkling of the visitors of both sexes and all ages being supplied with note-books for this purpose.

Unremitting efforts were made during the currency of the Exposition to direct attention to, and stimulate research in, the treatment of the argentiferous zinc-lead sulphides of the Broken Hill and other silver-fields of the Colony; but the general verdict of mining men was that the question of the admixture of the sulphides of the metals mentioned was, to a more or less intense degree, agitating silver-miners and smelters in all silver-producing countries. In Missouri and some other localities in the United States zinc and lead sulphides are separated by mechanical means, but so far as I could judge, in each case the condition of the two ores was coarsely granular or crystalline, and more or less separate, and not, as in the case of the Broken Hill sulphides, finely and intimately mixed to a degree which renders mechanical separation nearly, if not quite, impracticable. Samples of the latter were freely distributed to individuals for test purposes, and supplied to several zinc oxide and metallic zinc works. One ton was handed to the agent of the Krupp Company for practical experiment at the works in Germany. The balance of the 10 tons exhibited by the British Broken Hill Company was handed to the Field Columbian Museum, which is now being temporarily fitted up in the Fine Arts building at the World's Fair, under the direction of Mr. F. J. V. Skiff, late Chief of Mines and Mining, and from whom samples can be obtained by those desiring to carry on research work. Instructions had been received to sell this exhibit with others from Broken Hill, but the terms offered for the sulphide ores by the only available smelting works within reasonable distance of Chicago were such as to leave no margin. In the case of zinc-lead ores a deduction of 50 cents (2s.) per unit was made for every unit of zinc over 10 per cent. in addition to the ordinary smelting charges.

In view of the development of the iron industry in New South Wales, special attention was drawn to the exhibits of iron ores. The quality of the brown hematite from Mittagong, Picton, and Blayney districts, and the magnetites from near Blayney and Cowra, was very favourably commented on; but the magnetite from Iron Mountain, Port Stephens, was not regarded with favour, owing to the excessive percentage of titanitic acid present, to say nothing of the excess of silica.

The Port Stephens ore is, as far as I am aware, the only extensive bedded deposit of iron ore as yet known in the Colony. Professor David describes it\* as evidently the result of beach concentration. It is a compact, granular admixture of magnetite, ilmenite, and quartz sand. Believing that the two latter minerals could possibly be separated from the magnetite by crushing and treatment with an electromagnetic separator, I ventured to send samples to the celebrated electrician, Mr. Edison, who has given considerable attention to the treatment of the titaniferous magnetite beach sands of New Zealand, as well as concentration of lean magnetic iron ores of America, but I regret to say I received no acknowledgment of either letters or samples.

I was informed by Mr. John Birkinbine, Mining and Civil Engineer, of Philadelphia—an authority on the iron ores of America—that ores containing over two per cent. of titanitic acid are hardly marketable in the United States.

Titanium in the form of sphene (silicate of titanium and lime) is not very objectionable in an iron ore, as it fuses and slags off; but in the form of ilmenite (oxide of titanium and iron), it is very infusible, and rapid destruction of the furnace lining results.

The iron ores smelted in America are chiefly from the Lake Superior region, and consist mostly of red hematites of very high grade, yielding from 60 to 66 per cent. of metallic iron, the latter from hand-picked ore.

These lodes are remarkable, not only for their enormous surface development, but also for their persistence in an unaltered oxidized condition to great depths.

In addition to the compact ores, very rich earthy varieties occur in great abundance, and are most cheaply and quickly mined by means of steam shovels.

In New York State lean crystalline magnetites are concentrated to a high degree of purity by magnetic concentrators.

The iron ores of America are not smelted at the mines, but are shipped to the most advantageous localities for reduction works, just as will be necessary in New South Wales when iron-smelting operations are begun.

Considerable attention was given to coke in America, and especially to the quality of the article used in smelting operations. From observation and inquiry it was elicited that coke, containing what may be regarded as an excessive proportion of ash, is used with satisfactory results in silver and other smelting works in the western States, the saving effected in the cost price of the lower grade local coal as compared with that of the superior article from England, or even from Pennsylvania, far more than compensating for any loss occasioned in smelting with the former. It need hardly be stated that great skill, experience, and close attention to detail is requisite in the operation.

As a notable instance in corroboration of the above statement, at the Germania Silver-lead Smelting Works, at Salt Lake, Utah, the fuel used is a mixture of Colorado and Utah coke, with local coal. The Colorado coke averages upwards of 11 per cent. of ash, whilst the Utah averages from 14 to 16 per cent., and is very soft and brittle, resembling cinders in the coke heap. At the time of my visit coke from Trinidad, Colorado, was being used, which contained 22 per cent. of ash, and from the manager's books I learned that coke has been used with 27 per cent. of ash.

The coke most largely produced and used in America is the Connellsville coke, manufactured by the H. C. Frick Company, of Pennsylvania, which is stated to contain an average of from 8 to 10 per cent. of ash; the average of analyses made by the Carnegie Steel Company of a year's consumption being 9.79 per cent.

When the Germania Smelting Works of Salt Lake were first started, some twenty-one years ago, coke was imported from South Wales, England, and afterwards from Pennsylvania (U.S.) Gradually, on the score of economy, the English article gave way to the latter, and later on the Pennsylvania to the local Utah and Colorado coke,—the Welsh coke costing 22 dollars (about £4 8s.) per ton at the smelting works, whilst the very low price of the Pennsylvania coke at the Ovens (now about 5s. 6d. per ton) was increased abnormally by the cost of railway transport.

Attention

Attention was paid to the display of coal from Vancouver, British Columbia, and Japan, in view of their competition with New South Wales coals in the Pacific and other neighbouring seas, and the country bordering them. In both of the above fields the coal measures are of Cretaceous age, and, therefore, much younger than the productive measures of New South Wales, and hence are brittle coals. In Japan there is but one small coal basin, on an island, from which lump coal can be obtained; the specimens exhibited in the Japan Mining Court being encased in cement to keep them in 1-foot cubes.

Some of the Vancouver coal is of excellent quality as regards composition; but for steaming purposes, owing to excess of volatile constituents, about 10 tons more per day are required to produce a given working power as compared with the best southern steam coals of New South Wales. The brittleness of the Vancouver and Japan coals will probably place them at a disadvantage for ocean transport when firmer coals are offering. The local selling price of Vancouver coal is excessive, the Canadian-Pacific S.S. Co. paying 14s. 6d. per ton for Nanaimo coal at Vancouver, against 10s. per ton for Southern coal in Sydney. The advertised local retail price of the former is 28s. per ton at Vancouver.

It is unnecessary to specify here the exhaustive coal display from the enormous coal-fields of the south-eastern states of America, as their coals are unlikely to come in direct competition with ours.

Probably a use may yet be found for the inferior graphite from Undercliff, New England. At several exhibitions efforts were made to ascertain its suitability for industrial purposes, but hitherto without avail. A sample was tried at Chicago as a lining for sand moulds for iron castings with hopeful results, and at the close of the fair about 1 ton was supplied to a firm of iron-founders in Pennsylvania, who have promised a report upon the practical test they will thus be enabled to make.

The calcining of sulphide ores—chiefly of copper—in revolving cylindrical and other furnaces was made the subject of special observation and inquiry. At the Germania works before mentioned the argentiferous sulphide ores are roasted in Brückner furnaces, the charge being 15 tons and the time of roast about forty-eight hours. At the time of charging, the fires are driven full until the ore ignites and combustion ensues, when they are slacked until near the finish of the operation, and then again forced. A jet of steam is driven into the furnaces during the process of calcining.

Ores averaging from 9 to 11 per cent. of zinc are treated, the zinc being wasted. A special parcel on the company's books contained 26 per cent. of lead, 17 per cent. of zinc, and 8 per cent. of copper, but this was exceptional.

The copper mines and reduction works of Butte and Anaconda, in Montana, were also visited. The ore raised and treated in this important copper-producing region—second only to Lake Superior—consists of iron pyrites with copper glance, yielding on an average from 4 to 7 per cent. of metallic copper, though large bunches of rich copper glance occur, which are sent direct to the smelter. The great bulk of the ore, however, requires concentrating, which is performed either by means of Harz or Cullen jigs and Frue Vanners, or jigs and tables.

The concentrates are then roasted in Brückner cylindrical revolving furnaces, or in the O'Hara, or modified Spence, forms of reverberatory furnaces.

Stall-roasting is also in vogue in some works. The roasted concentrates are reduced to matte in water jacket or reverberatory furnaces, both forms being in use at each plant; in most instances no flux is used. The matte is converted into blister copper of from 98 to 99 per cent. purity in Manhés Bessemer converters.

The Butte copper lodes were originally worked for silver, and at the present time the ore contains a fair percentage of that metal, which is separated locally from a portion of the output during the electrolytic refining of the blister copper at Anaconda and Great Falls. The silver contents add appreciably to the value of the Butte copper ores.

The celebrated Comstock Silver-lode of Nevada was also visited, but here, as in Colorado, the mines were practically shut down owing to the fall in silver, due to the repeal of the Sherman Silver Purchasing Bill.

The marbles from New South Wales attracted considerable attention, especially the slabs from Mullion Quarries, near Orange, which were the largest at the fair. The freestone and syenite exhibits were also favourably commented on. In connection with the latter a trial was made of the Pittsburgh crushed steel for cutting and polishing purposes, and apparently with satisfactory results.

The paint ochres of the Gordon Emery and Color Company's property, near Orange, and from J. Clabby's land, were highly commended by persons interested in ochres, and some practical inquiries made.

Inquiries were also made for gem stones, particularly opals, but unfortunately the display of the latter was very poor, both as regards quality and quantity, notwithstanding that every effort was made to secure suitable specimens from White Cliffs, either as private exhibits or by purchase.

The new Geological Map of the Colony, prepared under your direction during the year, reached the Exposition in time for examination for award. The judge, Mr. H. Lundbohm, Director of the Geological Survey of Sweden, in his report, highly commended the progress displayed in scientific detail and artistic finish.

From the 15th July to the 15th October I was actively engaged on the Committee of Judges in Mines and Mining, to which I was appointed on behalf of New South Wales on the recommendation of the Executive Commissioner; and, though taking no part in the judging of the Colony's exhibits, other than fully representing their claims, I was enabled to closely watch the progress of examination, and report in Committee.

New South Wales secured eighty-seven awards in the mining section, a list of which is herewith appended. It is necessary to point out that under the Thatcher system of judging adopted at the World's Fair—much against the wishes and opinions of the Foreign Commissioners—there is but one class of award, which is represented by a bronze medal and a diploma. The fundamental principle underlying the system is non-competition. The merit of an exhibit was to be recognised independently of any similar ones in the same class, and the use of the terms "better" and "best" were prohibited. The public is believed to be able to decide by inference from the wording of the judges' reports, embodied in the diplomas, as to the best exhibits in any class, the diploma being supposed to specify the special points of excellence in each case. The idea of thus enabling a distinction in merit to be drawn between awards having an equal value as regards medal and grade, may be very well in principle, but, unfortunately, like other things excellent in principle, may not be practicable, and especially so, as, under the above system, each judge had to work independently of his colleagues in the same section; therefore, the terms used in depicting

depicting the merits of an exhibit do not possess the same uniform weight and value as they would in the report of a jury, in which each adjective has a special and equal value. Again, some judges write full reports, while those of others are terse and scanty. The practical result of the judging at the World's Fair may be summed up in the statement that the inferior exhibits have been weeded out, and the public is left to judge, as best it can, from the diplomas, as to the most meritorious of these selected for awards.

On the 22nd September occurred the untimely death of Mr. Thomas Ford, Assistant Superintendent of the New South Wales Mines Court. In his death the Colony has lost an officer who has rendered valuable services in connection with her official representations, and I, an esteemed friend and able assistant, whose worth has been amply demonstrated during several years of co-operation. Whatever measure of success has attended our efforts at the various exhibitions in which we have taken part, has been largely due to his zealous and energetic assistance. Unfeigned regret was expressed by all the official representatives in the Department of Mines and Mining at the World's Fair, to whom he had endeared himself by his manly, courteous bearing.

The Exposition closed on 30th October, and packing was at once commenced. In accordance with the wishes of the Executive Commissioner to reduce the expense of returning the exhibits to the lowest possible amount, in view of the financial depression, all bulk exhibits which could be easily replaced when occasion required were disposed of either by donation or sale on assay, reserving only good representative specimens of each for the Mining and Geological Museum. The private exhibits were disposed of in like manner, in accordance with the owners' instructions.

The New South Wales mineral exhibits were in great request for scientific and scholastic institutions in the United States and other countries; hence the donations and exchanges effected will be the means of making our mineral resources widely known.

From the various courts in Mines and Mining, valuable additions to our Museum collections were obtained.

Having completed the packing on the 13th December, I had nearly a month at my disposal before the departure of the next Vancouver mail steamer. This was occupied in visiting such of the principal mining centres and metallurgical works of America as time would permit.

Before closing my report I desire to express my appreciation of the great courtesy and consideration which I received at the hands of the Honorable Arthur Renwick, M.L.C., &c., Executive Commissioner, and of the friendship and assistance of my colleagues in the New South Wales Courts, and especially acknowledging the services of my two assistants—Charles Tanner and William Walker—who rendered most painstaking help, particularly after the death of Mr. Ford.

My best thanks are due to the Chief of Mines and Mining, Honorable F. J. V. Skiff, and his staff (especially the able and courteous Secretary, Mr. E. L. Burchard), for their unfailing courtesy and kindness. Mr. Skiff and his officers extended at all times the heartiest goodwill and assistance to the New South Wales mining contingent.

To the President and Commission of the Colony to the World's Columbian Exposition, I am indebted for the full confidence reposed in me, which I trust has not been misplaced.

I have, &c.,

JOSEPH E. CARNE,  
Geological Surveyor.

The Government Geologist, Sydney.

LIST of Awards to New South Wales Exhibits in the Department of Mines and Mining at the World's Columbian Exposition, Chicago, 1893.

| Exhibitor.                               | Exhibit.  |
|--|---|
| Minister for Mines and Agriculture ..... | Collection of gold-bearing ores.                                |
| " " .....                                | " " (in bulk).  |
| " " .....                                | " reef and alluvial gold specimens.                             |
| " " .....                                | " silver ores.  |
| " " .....                                | " " (in bulk).  |
| " " .....                                | " tin ores.   |
| " " .....                                | " " (in bulk).  |
| " " .....                                | " copper ores.  |
| " " .....                                | Copper ore, Burraga.  |
| " " .....                                | Collection of antimony and bismuth ores.                        |
| " " .....                                | " iron, manganese, and cobalt ores.                             |
| " " .....                                | Iron ore, Fitzroy mines.  |
| " " .....                                | " Glasson's mine, near Blayney.                                 |
| " " .....                                | Gilkrist's mine, near Blayney.                                  |
| " " .....                                | Chrome iron-ore, Nundle.  |
| " " .....                                | Manganese oxide, Woodstock.                                     |
| " " .....                                | Collection of coal specimens.                                   |
| " " .....                                | " building stones.  |
| " " .....                                | " marbles.  |
| " " .....                                | " inlaid table (N.S.W. marble).                                 |

## APPENDIX 3.

Report by Mr. G. A. Stonier, Geological Surveyor.

Sir, Geological Survey Office, Department of Mines, 31 January, 1894.

I have the honour to hand you the report of my work for the year 1893. From the commencement of the year till 12th January, I was engaged in office work in Sydney, leaving on the following day for Yalwal, to report upon the alienation of some of the town allotments. From Yalwal I travelled to Marulan, and examined the Caloola Silver-mine and a deep lead, to test which aid was asked from the Prospecting Vote. Several patches of alluvial gold had been obtained, but they had not extended any distance, and the run of gold could not be followed. The lead is worth prospecting, and is said to have been traced to Nerriga with very few breaks. I examined a wash at Nerriga two years ago, which crosses the Shoalhaven River. It is practically untested, although a fairly large sum of money has been spent in prospecting in the immediate neighbourhood.

From Marulan, I went to Mogo, Moruya, Bermagui, Bega, and Bombala, dealing chiefly with the alienation of certain lands, and returning to Sydney on 10th February. At Nelbothery, near Bombala, a considerable sum of money has been spent in the construction of a well-equipped pumping-station and a reservoir, to which the water is forced from the Little River, and then gravitates to a deposit of drift. The drift is undoubtedly of large extent, and for many years miners asserted that it would pay if sluiced on a large scale. Ultimately a company was formed, the necessary capital supplied, prospecting shafts were sunk, and the yield of gold supposed to have been ascertained; on the completion of the machinery a large paddock was opened out, but the first washing proved much below expectations. I understand that it is intended to test other portions of the drift, which can be done without the expenditure of much money. At Mahratta, 5 miles south-east from Bombala there is an unprospected and narrow strip of basalt, which is worth attention. Several shafts were sunk and bottomed in shallow ground.

I returned to Sydney on the 10th February, and left again on the 20th for the Northern District, visiting Murrurundi, Melrose, Herbert Park, Rockvale, Dundee, Wilson's Downfall, Emmaville, Nine-mile, Inverell, Elsmore, Warialda, Kookabookra, Cell's Creek, Niangala, and Swamp Oak, dealing with various land alienation and Prospecting Vote cases. At Rockvale there is a quartz vein known as "The Buck," from 3 to 8 feet wide, which can be traced on the surface for a considerable distance. It is well defined, but has not been proved to any depth. The gold which it carries is particularly fine, and appears to have been set free chiefly by the decomposition of pyrites, so that, when the upper portion of the vein, some 30 feet, has been crushed, much of the gold in the remaining portion will not be free, and the method of treatment will require modification. The mine is within easy distance of the battery, to which it is connected by a tramway with a fair down-grade. The shoot of gold is exceptionally long, and, like most shoots of any length, the metal will probably be found to be somewhat irregularly distributed through it. North of Glen Innes it is surprising to find the number of men who are making a living at tin-mining. At Dundee there are fully seventy men working on a wide alluvial deposit following Hogue's Creek. At Emmaville, Nine-mile, and Wilson's Downfall, the ground has been worked several times, and miners

miners are still able to make a living by fossicking. At Collas Hill, near Inverell, a considerable sum of money has been spent in attempting to prove the diamondiferous drift, but it appeared to me that the drives were heading too much to the west, and I therefore recommended aid from the Prospecting Vote to drive from the southernmost tunnel in a southerly direction. The old river-channel is remarkable for the number and size of the granite boulders which it contains. At Elsmore the work in progress is of importance and interest, as much from a practical mining as from a scientific point of view. Three miles in a direction east-south-east of the township of Elsmore, a company is tracing the continuation of the old Newstead lead, which is passing into 200 feet ground, with a good show of stanniferous wash. Nearer to the township, Mr. Bottrill expects his shaft to be 120 feet deep before striking bed-rock. At Elsmore itself the leads are being traced gradually into the deep ground, but it is as uncertain to-day as it was several years ago which way the channel really goes. A mile to the south-west of the township, a bore has been put down, and, at the time of my visit, was thought to have been bottomed. In consequence, however, of my opinion that bed-rock had not been reached, the bore was continued; at a depth of 178 feet the basalt was pierced, and a bed of wash struck, which is said to be 14 feet thick, and to carry good tin. It is intended to sink a shaft at the spot where the bore was put down. The importance of these developments cannot be over-estimated, for it is the first time that a determined effort has been made to test the deep ground. That the leads existed, and carried rich deposits of tin was maintained at all times by the late C. S. Wilkinson, and only the expense of prospecting in deep and wet leads has prevented the work being undertaken earlier. From the Newstead shaft I secured a good collection of seed-vessels, which are described in *Appendix*. At Ashford I had an opportunity of examining a coal-seam already described (Annual Report, Department of Mines, 1885, p. 139), and was fortunate in procuring specimens, which Mr. Etheridge describes as being "probably *glossopteris*."

I returned to town on the 29th April, and left again on the 7th May for the Western District, visiting Cudgegong, Tannabutta, Meroo, Hargraves, Hill End, Sofala, Crudine, and Wattle Flat. This portion of the Colony has yielded a large amount of gold in the past, and a number of men are "making tucker" by reworking the alluvial deposits. There have been several new discoveries, but they have not proved to be extensive, and most of the work is confined to the old ground. The gold is associated both with felsite and diorite, but more frequently with the former than with the latter. There are several good sections of the sediments of the district, and one of the best is developed along the road from Hill End to Sofala, the rocks consisting to a great extent of thin-bedded mudstones, which have been subjected to a number of faults, and are without a persistent dip, forming probably several anticlines and synclines. The existence of an anticline has been demonstrated at Hill End (E. F. Pittman, Annual Report, 1880). Some of the flat veins, referred to in that report, appear, as suggested by Mr. Ackermann, to have resulted from the infiltration of siliceous water into the opened bedding planes at the rounded apex of the anticline. Immediately to the west of the township of Hill End there are good sections showing that the cleavage planes are not coincident with the bedding planes; and at Monkey Hill, a fine section of the alteration of the sediments by an intrusive felsite. The beds are considered to be of Upper Silurian age, but confirmatory evidence, in the shape of good collections of fossils, is much needed; the lithological resemblance of some of the beds to portion of the New England *Lepidodendron* area is interesting.

The trip was completed on the 31st May, and from 5th June to 21st I was in the Narrabri and Gunnedah districts. At Narrabri I examined a deposit of gravel, reported to yield  $\frac{1}{2}$  dwt. of gold to the dish, but on inquiry the statement was amended to  $\frac{1}{3}$  dwt. to the load. The oldest rocks in the district consist of slates, &c., with intrusive granite of several types, and serpentine carrying auriferous and other metalliferous veins. Unconformably on these rocks are sandstones, &c., with the Gunnedah coal-seams, the upper portion of which are conglomeratic, having a large number of jasper pebbles. From one of these conglomeratic beds, possibly redistributed, the gold has been obtained. One of the shafts which has been sunk is 20 feet deep, but the so-called wash does not average more than a few feet, and occupies a maximum area of 3 square chains. There are no facilities for bringing a head-race on to the deposit, even supposing that the wash contained sufficient gold to pay the cost of sluicing. Mr. McNeill pointed out the places where he had obtained the best prospects, and washed two dishes of dirt which gave several particularly fine and flaky specks, but I felt considerable doubt about their being gold. It is said that ten loads were washed and yielded  $\frac{1}{2}$  dwt. of gold to the load. At Burindi, between Barraba and Gunnedah, some fossil bones were supposed to have been discovered, but they proved to be merely the result of jointing, &c., in a series of thin-bedded argillaceous limestones; the beds immediately above the limestones are fossiliferous, and the specimens which I collected are enumerated in *Appendix*. At Gunnedah I inspected portion of the coal-field. Since the publication of the first report (Annual Report, Department of Mines, 1886, p. 151), coal has been found on Mineral Purchase 2, Parish Gunnedah, and appears to be a continuation of one of the Gunnedah seams. The relation of the Gunnedah to the Curlewis seams has not been worked out, but from the information I was able to gather during my last visit it would seem that the Curlewis are below the Gunnedah seams, and are separated by about 250 feet of sandstone, conglomerate, &c.

From 23rd June to 13th July my annual leave of absence was spent at the University, doing petrological work.

On 20th July I left Sydney and visited Parkes, Molong, Wellington, Woodstock, Young, Oberon, and Tannabutta. At Parkes I secured a good collection of rocks to illustrate the petrology of the district. At the time of my visit the various old alluvial leads were being fossicked; but of much more importance was the attention being paid to the veins. At the Bushman's Reef the payable shoot of gold, which had been lost, had been struck at the 375-foot level, which meant not only several months of work in sight, but an accurate knowledge of the dip of the shoot. The aid granted to Ramsay's reef has been expended, and the results are highly encouraging. For several years the reefs have not looked as promising as at the present time. The bedded character of the limestone at Molong has been referred to in previous reports. I collected various fossils, and amongst them is a new species.

I returned to town on the 7th September, and from the 18th September to 23rd December I was in the Northern District, and visited Woolomumbi, Bingara, Drake, Timbarra, Boonoo, Cangi, Woodburn, (Evans River), Wellingrove, Hillgrove, Tia, Nowendoc, Baraba, and Manilla. At Cangi I inspected the Sir W. Scott Mine, where a well-defined vein from 6 inches to 4 feet in thickness has been proved to a depth of 139 feet. The shoot has a length of 115 feet, and dips to the north. A tunnel is being driven to cut the shoot, and when the drive is completed there will be some 60 feet of backs ready for stoping.

The

The stone, from the outcrop to what is known as the 130-foot level, has been mined and crushed, and has yielded up to 1 oz. 14 dwt. of gold to the ton. The stone to be worked from the tunnel is expected to yield fully 2 oz. to the ton. The quartz contains galena, zincblende, and copper, iron and arsenical pyrites, and, on account of the presence of these minerals, the gold was somewhat difficult to save by the ordinary amalgamation method, and when retorted in the usual way was worth £2 7s. 6d. per ounce above the 75-foot level, and £2 13s. 6d. below that level. It is remarkable that the vein has not been traced into the adjoining leases, and it is not likely that there will have been only one place where the walls opened and admitted of the deposition of auriferous quartz. At Tia, Oxenbridge and Party have prospected an old river channel of Pliocene (?) age, and have found payable gold on the siding of the channel, and not in the deepest ground; the wash in sight does not average more than 9 inches, and will take several months to block out. The channel is very wide, and in places the basalt rests directly upon the bed-rock. The Tiara Mine, now being worked by Orange and Party, has a well-defined vein, in which a payable shoot of auriferous quartz has been worked to a depth of 130 feet, and is well worth further attention. The owners of the mine have commenced to sink the main shaft deeper, with a view of testing the vein at the lower levels, and it would be advisable to carefully try the outcrop of the reef, in order to ascertain if there are not other shoots of gold. A five-head battery run by water-power is in working order, and within a reasonable distance from the mine. At Evans' River a number of men, in all about 90, are employed in "combing" the present sea-beach, and in working a deposit of black sand a quarter of a mile inland from the coast, and evidently an ocean placer. The deposit is covered by drift-sand, which latter occupies a large area, and has been but little prospected.

Wherever it has been possible I have collected specimens of minerals, fossils, and rocks, which have been forwarded to you from time to time. While in Sydney I have been occupied with office work, and the preparation of various reports, and contributed two papers, viz., Leucite Basalt at Lake Cudgellico, and Tachylyte at Bulladelah, to the Records of the Survey.

I have, &c.,  
GEO. A. STONIER,  
Geological Surveyor.

The Government Geologist.

#### APPENDIX 4.

##### Progress Report by Mr. J. B. Jaquet, Geological Surveyor

Sir, Geological Survey Camp, Warri, Braidwood, 23 January, 1894.

I now have the honour to furnish you with my Progress Report for the year 1893. From the 2nd until the 12th January I was engaged in writing my report on the geology of the Broken Hill lode and in work relating thereto.

On the latter date mentioned above I left Sydney *en route* for Mount Hope, and, travelling *via* Carrathool and Hillston, reached this town on the 17th. The object of my journey was to map out and sample the deposits of ironstone occurring at Mount Allen, near Mount Hope. I was engaged in the neighbourhood of Mount Hope for seven days. I afterwards visited Nymagee and Cobar in order to make certain inquiries having reference to the nature of the copper ores mined at these localities, and the methods adopted for their treatment.

I arrived back in Sydney from Cobar on the 1st February, and on my return was engaged in writing my report and in work connected therewith.

On the 24th February, after having devoted a few days to my Broken Hill work, I left Sydney for Canowindra and the Cudgegong River. In both of these districts I dealt with papers having reference to the alienation of certain lands. I returned to Sydney from Wellington on the 4th March.

From the 4th March until the 22nd of August I was engaged uninterruptedly upon my Broken Hill monograph, and in work relating thereto.

I also reported from a personal knowledge of the localities on two applications for aid from the Prospecting Vote coming from the Barrier Ranges District.

On the 22nd August I left Sydney for Queanbeyan, and on the following day inspected the recently-discovered silver lead lode at Belconon, near that town. My report on this metalliferous deposit forms *Appendix*.

On the 1st September I left Sydney for the new Menangle Gold-field, near Kiandra, and was engaged during the first eight days of this month in journeying to and from this field and in dealing with papers having reference to the alienation of certain land.

During the remaining portion of September I was occupied with my Broken Hill report.

On the 2nd October I left Sydney for Rockley for the purpose of inspecting the gold and silver lodes occurring at Back Creek, near this town. My report on these deposits forms *Appendix*.

From Rockley I journeyed to Carcoar and inspected the alluvial gold deposits, distant 10 miles from this town, at Neville.

Before returning to town I inspected the deposits of gold then recently discovered in Mr. Marsden's paddock, near Blayney. My report on this gold deposit forms *Appendix*.

On my return to town I completed the monograph dealing with the geology of the Broken Hill lode, &c. This work is now in the hands of the printer.

On the 22nd October I left Sydney for the Braidwood District, and, taking up my residence in camp, proceeded to carry out the detailed geological survey of the Shoalhaven Valley, commenced by my late colleague, Mr. W. Anderson.

On the 30th October I journeyed to Major's Creek and dealt with a paper having reference to the alienation of land near that town.

On the 6th November I left camp for Queanbeyan and examined some auriferous ground which had been discovered in a water-course near this town. My report on this deposit forms *Appendix*.

On the 7th December I left camp for Nerriga, and having inspected a reserve near this town, reported as to its revocation.

On the 16th December I journeyed to Araluen, and on the following day dealt with a paper having reference to the alienation of land near Bell's Creek.

On the 6th November I received your further instructions having reference to the mapping out, &c., of the Shoalhaven Auriferous Drifts.

I may mention that I have now nearly completed my mapping out and prospecting of those auriferous drifts which will be available for sluicing should the first section of the proposed Government race be constructed and shall be in a position shortly to write my report concerning the same.

In carrying out this work I have been ably seconded by my assistant, Mr. E. C. Whittell.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist, Sydney.

APPENDIX 4A.

Report upon the Deposit of Galena at Belconon, near Queanbeyan.

Sir, Department of Mines, Geological Survey Branch, Sydney, 31 August, 1893.

I now have the honour to report upon the deposit of galena occurring at Belconon, near Queanbeyan, which I have recently examined, in accordance with your instructions:—

*Position of the metalliferous deposit.*—The metalliferous lode is situated in the County of Murray, on the right bank of the Murrumbidgee River, and about 200 yards below the point where this river junctions with the Molonglo.

*Geology of the district.*—The country is composed of Silurian (?) slates, possessing for the most part an almost vertical dip, interstratified with beds of crystalline limestone, these sedimentary formations being intruded by large bosses and by dykes of quartz felsite. It is on the side of a hill which overlooks the Murrumbidgee River, composed of quartz felsite in which the Belconon ore deposit occurs.

*Nature of the lode.*—The lode trends N. 20° E., and, as far as one is able to judge from the work already performed, dips about 80° at S. 30° E. A good western wall—which can be readily recognised by reason of the slickenside faces and deposits of flucan upon it—has been discovered in one place, but no defined eastern wall would seem to exist. At present, however, in no place has a complete section of the lode been exposed in the workings. Immediately adjoining the western wall the deposit would seem to be composed entirely of quartz, galena, and other commonly-occurring veinstones, but these give place beyond to country rock (quartz felspar) in which thin veins and small nests of ore occur.

*Probable dimensions of lode.*—The plane of faulting, which forms the western wall, has evidently determined the position of the ore deposit, and in considering the probable extension of the latter, both in a vertical and horizontal direction, this slide may be placed as a favourable indication of its permanency.

*Work done.*—The lode has been opened from the hillside, on its western wall, by means of an open cutting, 35 yards long, which has penetrated into the rock for distances varying from 4 feet to 10 feet; the face is still in ore.

*Ore contained in lode.*—The ore at present won consists of galena, copper, pyrites, and iron pyrites, associated in part with a gangue of quartz and in part with quartz felsite.

*No oxidised ore present in the lode.*—Very little oxidation appears to have taken place, and the only evidence in the workings situated on the outcrop which suggests that the ore has been affected by its proximity to the atmosphere is the presence of a small quantity of copper carbonate.

*Results of assays of samples from lode.*—I selected four samples of the best ore from various places where the lode was exposed, and these samples were on my return to town assayed by Mr. J. C. H. Mingaye, F.C.S. They yielded as follows:—

|                 |                              |
|-----------------|------------------------------|
| A.—Silver ..... | 1 oz. 19 dwt. 4 gr. per ton. |
| Gold .....      | a trace.                     |
| Lead .....      | 27·71 per cent.              |
| B.—Silver ..... | 1 oz. 19 dwt. 4 gr. per ton. |
| Gold .....      | a trace.                     |
| Lead .....      | 37·71 per cent.              |
| C.—Silver ..... | 1 oz. 8 dwt. 6 gr. per ton.  |
| Gold .....      | a trace.                     |
| Lead .....      | 10·65 per cent.              |
| D.—Silver ..... | 1 oz. 8 dwt. 6 gr. per ton.  |
| Gold .....      | a trace.                     |
| Lead .....      | 15·33 per cent.              |

Having regard to the results of these assays, I am unable to speak favourably of the Belconon lode, nor am I able to recommend its further exploitation at the present time.

*Low value of ore.*—The average quantity of lead contained in these picked samples is only 22·8 per cent., and, taking lead as worth £13 per ton, the utmost value of the prospects of the ore after treatment would be £2 17s. Now, it will, I think, at once be apparent that this sum of money would not be sufficient to pay for the cost of mining, dressing, and smelting at a spot distant 20 miles from the railway. The silver and gold, it need hardly be said, are not present in sufficient quantities to pay for their own extraction.

*Prospects of the district as regards future metalliferous discoveries.*—I was shown elsewhere on Mr. Campbell's run a spot where shode-stones of galena had been obtained, and the district for some distance around would appear to be likely to contain metalliferous deposits; hence I am of opinion prospecting operations should be continued.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

APPENDIX 4B.

MINUTE on Report on Gold Find at Blayney.

11 October, 1893.

It appears from Mr. Jaquet's report that the gold which has been found near Blayney has probably been shed from a quartz reef close by, and has retained its angular form owing to its being embedded on the side of the hill in stiff red clay, the product of the decomposition of the augite andesite which Mr. Jaquet describes as forming the surface rock higher up the hill.

It

It is advisable that costeaning trenches should be dug, with the object of discovering the reef which probably formed the matrix of the gold, and the flat should also be prospected for alluvial gold.

Attention is directed to that part of Mr. Jaquet's report in which he states that until further prospecting has been done a large rush of men, especially if unprovided with the means of subsistence, would be unwarranted.

The Under Secretary for Mines and Agriculture.

E. F. PITTMAN,  
Government Geologist,  
11/10/93.

Geological Survey, New South Wales, Department of Mines,

Sir,

Sydney, 9 October, 1893.

I have the honour to report that, in accordance with your instructions, I have inspected the recently-discovered deposit of gold near Blayney, and beg to report concerning it as follows:—

*Locality of discovery.*—It is situated about a mile and a half west of the town of Blayney, on Portion No. 269, Parish Errol, owned by Mr. S. Marsden.

*Circumstances leading up to gold discovery.*—About five weeks ago two prospectors—Messrs. H. Coker and E. King—having obtained permission of the owner of the land, started to sink a shaft on the flat, at a point distant about 7 chains in a south-south-easterly direction of the spot now being worked. The shaft was sunk with a view of proving whether auriferous wash existed below. After sinking through 12 feet of stiff clay, they bottomed on decomposed andesite, and on this bottom they found a layer, about 3 inches thick, of angular and sub-angular fragments of quartz, which deposit, on being washed, yielded colours of gold. The result obtained did not encourage further prospecting at this spot, and, moreover, in the immediate vicinity of the new shaft were several old ones, now filled in, which were put down some years ago, with, as their abandonment indicates, disappointing results. The prospectors now directed their attention to the ground in the neighbourhood of the cutting "A," from which a quantity of quartz rubble had at one time been removed for the purpose of paving a yard. The surface soil here gave in the dish colours of gold, and on this account the present workings were commenced.

*Work carried out.*—An irregular-shaped excavation, "B," 36 feet long, which varies in width from 2 feet to 12 feet, and in depth from 2 feet to 3 feet. A trench, "C," situated on the hillside immediately above the last-named working, which trends approximately N.E. and S.W., is 24 feet long, 3 feet wide, and from 3 to 5 feet deep. A shaft, "D," 8 feet deep, into which the trench opens. Two small shafts, "E" and "F," each 5 feet deep. A costeaning trench, "G," 15 feet long and 3 feet deep.

*Mode of occurrence of the gold.*—The material removed from the workings enumerated above is a stiff ferruginous clay—produced on the decomposition of the underlying andesite—which has scattered through it angular fragments of reef quartz. In some places the quartz is present in greater quantities than others. It is only the larger shaft, "D," that has passed through the clay, and reached the surface of the bedrock, nor did the gold occur along the bottom, but scattered in a more or less irregular manner all through the clay. Excepting about an ounce got in the trench "C," I was informed by the prospectors that all the precious metal hitherto won was obtained in the shaft. A dishful of clay raised from the trench "C" was washed under my supervision, but it only yielded a few colours of gold.

*The gold already won.*—Up to the time of my visit 45 oz. of gold had been obtained, for the most part in pieces weighing several pennyweights, while the largest nugget scaled over 3 oz. A few pieces of gold, intimately associated with quartz, have been met with. None of the metal in a parcel containing 7 oz. examined by me was water-worn.

*Reefs will probably be found in the hill above the present workings.*—The general appearance of the gold won, the occurrence of fragments of reef quartz in the clay, and the occasional finding of pieces of gold imbedded in quartz, all indicate that the gold has been derived from a reef near at hand. The trench "A," from which quartz rubble was raised some time ago, appeared to me to follow pretty closely the back of a reef; but the excavation was not deep enough to permit me to speak with certainty on this point. Copper lodes occur, and were at one time worked with considerable advantage in the vicinity of the gold discovery. I am of opinion that success may attend the prospecting for gold reefs, not only upon the hill where the rich gold discovery has been made, but also throughout the district where the same geological features prevail.

*Methods which should be adopted in further proving the ground.*—Having regard to the irregular distribution of the metal in the clay, there is but little to assist the miner in his search for shed gold. It will probably be found that all the ground situated between the flat and that point on the hillside at which the auriferous reef or reefs occur, will contain gold in small, and, for the most part, not payable quantities, and that occasional patches of rich clay, like the one recently worked by Messrs. Coker and King, will be met with. Several shafts should be sunk on the flat immediately below the present workings, for it is possible payable patches of ground may occur there. The question as to whether a quartz reef is outcropping in the trench "A," which I have referred to elsewhere, should at once be ascertained, for if such is the case it may contain in places rich shoots of gold ore. Again, the determination of the dip and strike of any one reef will be of valuable assistance in search of others, as they will probably be found to pursue a parallel course. With this purpose in view the costeaning trench "G" should be deepened until it reaches the bed-rock, and then continued in a south-easterly direction.

*Water for washing the gold-bearing ground.*—No perennial water-course is to be found near the site of the gold discovery, and in order to obtain a supply of water for gold-washing purposes, it may be advisable to erect a dam across the blind gully shown on the accompanying plan at the point where it junctions with the flat. I may mention here that gold-bearing ground obtained on the hillside will require first to be puddled, and it is necessary that machines for this purpose should be erected.

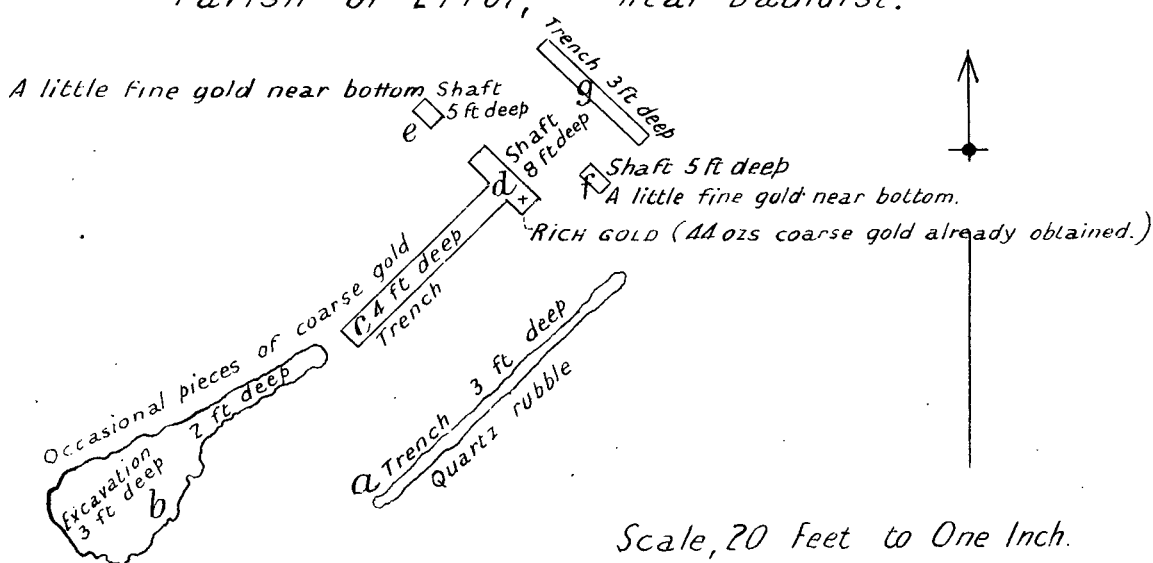

*Should Mr. Marsden throw open the ground the circumstances render the immediate rush of a large number of miners to Blayney inadvisable.*—If gold reefs be discovered, as I have previously stated I believe will be the case, their exploitation may eventually give employment to a large number of miners; but before several shafts have been bottomed on the flat, and other prospecting works have been proceeded with, I am of opinion that a large rush of men unprovided with means of subsistence, to Blayney, would probably be followed with disastrous results.

*Description of the country rock.*—Since writing the above report I have received from the lapidary a thin section of the andesite rock, and hence am now enabled to describe it more in detail. It is a much altered

altered augite andesite,\* consisting essentially of porphyritic crystals of augite and plagioclase, with some magnetite embedded in a cryptocrystalline groundmass. The augites are frequently twinned, and have been in many places more or less altered into chlorite; elsewhere crystals of this mineral have passed into urallite, and good sections of this paramorph are to be seen. The feldspars are lath-shaped, and much kaolinised. I may mention here that while the north-western side of the shaft "D" has bottomed on andesite, yet in the south-eastern corner a rock which appeared to me to be a much-decomposed micaceous schist has been met with. I did not observe any of the latter rock cropping up at the surface, but its presence in the shaft referred to suggests that in places the andesite may occur embedded in schistose rocks.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

APPENDIX 4c.

Report upon a Geological Examination of the Back Creek Gold and Silver Field.

Sir, Department of Mines, Geological Survey Branch, 31 October, 1893.

I have the honour to report that, in accordance with your instructions, I have made a geological examination of the Back Creek Gold and Silver Field, and have to report concerning it as follows:—

Back Creek is situated within the Caloola Gold-field, in the Parish of Bringellet, County Bathurst, and is distant about 6 miles in a north-north-westerly direction from the town of Rockley.

The geological formations consist of much-flexured micaceous slates and schists; interstratified with these schistose rocks occasional beds of crystalline limestone occur.

Both gold and silver ores have been mined on the field. Rich alluvial ground has been worked on the slopes below and around the claims now being prospected; but the deposits of shed-gold have long since been exhausted, and at the present time the miners are directing their attention to the reefs, &c., where the metal occurs *in situ*.

The accompanying sketch will explain the general mode of occurrence of the gold ore. It would appear as if contemporaneously with the flexuring of the rocks in places lenticular cavities were produced along their bedding-planes, and that these openings were afterwards filled by segregation (?) with auriferous quartz. The gold, however, occurs not only in the quartz lenses, but also in the country immediately around them.

I was informed that in some instances the schist lining a vein had yielded gold, while the quartz itself was barren. The quartz is somewhat peculiar in that it always has a quantity of white mica or talc associated with it.

Now, the absence of permanent reefs and the general nature of the auriferous deposits makes mining on the field somewhat hazardous. One can never be certain as to how far a quartz vein when found will extend, either in a vertical or horizontal direction, nor is there any indicator to guide the miner from the pinched end of one vein to the commencement of the next; perhaps, however, the lodes more often follow one another in a direction coincident with the dip and strike of the containing rock. The only course that the explorer can pursue is to push forward his workings in that direction where the prospect obtained shows the country rock to be carrying the most gold.

On M.L. Portion 198, Parish of Bringellet, worked by the Back Creek Gold-mining Company, a vertical shaft has been sunk to a depth of 15 feet, and from the bottom an underlay shaft has followed the auriferous rock, which is about 2 feet wide, and consists here, as elsewhere, on the field in part of quartz and in part of schist, for a distance of 30 feet. In some of the stone free gold can be seen, and I was informed by the manager, Mr. McKay, that 2 tons of the ore which was treated by the Clyde Works, at Sydney, yielded at the rate of 2 oz. 5 dwt. per ton.

In another place on the Company's property a tunnel has been driven into the hillside for a distance of 60 feet, and in this tunnel some quartz reefs have been met with.

The Company owns a battery of ten head of stamps, situated on Back Creek.

On Block 30, which is now known as the Boss Gold and Silver Mine, a wide deposit of silver ore has been worked. I was informed by Mr. Seaver, who is now in charge of the property, that several tons of rich silver ore had been raised and sent away to Europe for treatment.

The lode, as seen in several cuttings, has no defined walls. It would seem as if it represented a band of schist which has been more or less replaced by quartz, together with some silver ore, for it possesses bedding-planes which are conformable with those of the rock enclosing it; in places lenticular patches of quartz similar to those met with in the gold-workings occur. The argentiferous rock is from 3 to 6 feet wide, and it dips from 15° to 45° in a direction east-north-east. A shaft has been sunk on the hanging-wall side of the lode, about 60 feet distant from the outcrop; but, inasmuch as at the present time it is full of water, an examination of the ground was not possible.

Owing to the silver-bearing mineral or minerals being finely disseminated through the quartz, it is in consequence difficult to determine the exact form in which the metal is present, but it occurs, at any rate in part, as chloride. I understand that experiments have been undertaken which show the ore to be amenable to treatment by pan amalgamation, and that it is the intention of the proprietors to erect a plant with a view of adopting this method of extraction.

On Blocks 193 and 195, leased by Holsten and Party, in a shallow cutting, the cap of a quartz reef impregnated with iron oxide has been exposed.

Some ore which was obtained from this cutting yielded, on being assayed by Mr. J. C. H. Mingaye, F.C.S., gold at the rate of 2 dwt. 4 gr. per ton, and silver at the rate of 3 dwt. 6 gr. per ton.

Elsewhere on this property were several small excavations; but in no instance, other than that referred to above, was any reef or deposit that might reasonably be expected to yield either silver or gold in payable quantities pointed out to me.

I have, &c.,

JOHN B. JAQUET,  
Geological Surveyor.

APPENDIX

\* The Rev. J. Milne Curran, F.G.S., described (Journ. R. Soc., N.S. Wales for 1891 (1892) xxv, p. 221), an augite porphyrite from near Blayney, but the description which he gives of this rock shows that it differs from the one referred to above.

## APPENDIX 4D.

## Report upon a Deposit of Auriferous Drift near Queanbeyan.

Sir, Geological Survey Camp, near Braidwood, 8 November, 1893.

I have the honour to report that, in accordance with your instructions, I have examined the deposit of auriferous drift recently discovered at Queanbeyan.

The place where the gold is found is situated upon a low hill, distant about half a mile from the centre of the town of Queanbeyan, on the right-hand bank of the river.

The precious metal was obtained from a deposit of gravel, which is seen exposed on the walls of a small watercourse. The auriferous drift is 1 foot thick, and rests upon altered slates, while it is covered above by a bed of clay and alluvium 3 feet thick. I was informed by Mr. J. J. Wright, J.P., that he had seen a dish of this drift washed, and that it yielded 2 or 3 grains of gold.

The great difficulty which would beset the miner endeavouring to win gold from the shallow drift in and around the watercourse would be the inadequate supply of water available for sluicing or other washing purposes. The numerous small creeks upon the hillside only flow for a short time after rain has fallen, when they carry off the storm-waters. Water could be pumped up from the river, situated about 60 feet below, or it might, perhaps, be obtained by means of a race from a point higher up the Queanbeyan River; but I do not think a sufficient profit would accrue on sluicing the ground to pay the interest contingent on the latter method being adopted, nor the pumping charges which would accompany the former. Should any large extent of ground yielding gold in the proportion mentioned above be met with, a handsome profit would undoubtedly follow on its being carted to the river, and there washed.

In any case, I would recommend prospectors to direct their energy to the exploration of the deeper ground in the vicinity, where a probability exists of payable drift being discovered on the bottom. The hill upon which the discovery of payable gold was made, for the most part, consists of layers of quartz gravel interbedded with bands of clay. Several shafts have been sunk in the drift, the greatest depth reached being 25 feet. The gravel raised from these shafts yielded a little gold, but their abandonment would seem to indicate that no payable prospects were obtained. However, it must be pointed out that the bed-rock was never reached, and so no evidence is at present available as to the value of the deepest ground.

The circumstances would seem to me to warrant the putting down of one or more shafts for the purpose of proving the gold contents of the drift on the bottom.

I have, &c.,  
JOHN B. JAQUET,  
Geological Surveyor.

The Government Geologist.

## APPENDIX 5.

## Progress Report of the Curator and Mineralogist.

Sir,

I have the honour to submit my report of progress made during the past twelve months.

The duties allotted to the Curator being very varied, they will be referred to under different headings.

*The affording of information.*—A large amount of information bearing upon mining matters has been given to the public. For this purpose the office is open at all times. Every possible assistance is given, and many minerals are determined by the application of simple tests. There is at present no system of recording such inquiries.

*Preliminary examination of samples submitted for the purpose of assay or analysis.*—The number of samples selected for treatment in the Departmental laboratory has been over 3,000. This number falls short of that for last year, owing partly to the acquisition of a few pieces of apparatus, such as specific-gravity instruments, the use of which has rendered further examination unnecessary. The recognition of a strontium-mineral (celestine) from Bourke district, and of fuller's-earth from Wingen, may be mentioned here. The whole of the clerical work connected with the receiving of samples and the despatch of returns has been done in this office, necessitating the writing of between 2,000 and 3,000 letters.

*The microscopic examination of rocks.*—The use of the microscope in the examination of rocks has been of very considerable service. In accordance with your instructions, I have examined in this way a number of bore-samples, with a view to obtaining evidence that might throw light upon the prospects of obtaining artesian water. The study of thin sections has been made use of as far as opportunity offered in investigating rock-samples, and the results obtained have been of considerable service to several miners. It is very satisfactory to find the science of petrography developing a most important practical side, more especially in America.

*The Museum.*—Although at present under the cloud resulting from the sudden removal of the whole of the collections to the old iron building in the Domain, the year's work has been encouraging. The interest taken both by visitors and by persons to whom applications for specimens have been made has been greater than could have been expected. The response made by mine-managers and others has been so generous that the necessity of sending a collector to replenish our stock has been obviated. The list of persons to whom we are indebted for donations is a lengthy one (see below). Among the many valuable additions may be mentioned marshite and willyamite, from Broken Hill; a magnificent mass of crystallised-pyrite, from Mount Stewart; several important collections from Broken Hill, and a beautiful series of North-of-England minerals. Several officers of the Department have rendered us great assistance in procuring specimens, among whom Messrs. Hebbard and Atherton have been indefatigable. To all who have helped in any way our cordial thanks are due.

The work of remounting the fossil series has made considerable progress under the superintendence of the Palæontologist. Several cases have been arranged tentatively by myself with the object of rendering assistance to prospectors and others desirous of learning rough-and-ready methods of determining common minerals. It has been gratifying to notice the interest that has been taken in this "Instruction Series," and to know that it is valued and appreciated by the public. Every effort will be made to make the arrangement of the Museum during its temporary stay in the Domain as satisfactory as possible. Among the objects in view is the arrangement of a series of specimens illustrative of the structure of the principal ore deposits of the Colony.

Thirty-

Thirty-one collections of geological specimens have been prepared, of which those for the Imperial Institute and the Geological Museum, Perth, were very complete. The places to which they have been sent are given below, those marked with an asterisk being in exchange:—

- Albury—Mechanics' Institute.
- Austria.
- Colombo, N S. W.—School of Arts.
- \*Darlington, England—Mr. S. Watson.
- Dubbo—Mechanics' Institute.
- \*Dublin, Ireland—Royal College of Science.
- Enfield—Municipal Council.
- Gundagai—Literary Institute.
- Gunnedah—Mr. Van Weenen.
- Hunter's Hill—St. Joseph's College.
- \*Kapunda, S. A.—School of Mines.
- London—Imperial Institute (two).
- \*Melbourne—Mr. J. Mitchell.
- Merewether—School of Arts.
- \*Mount Victoria—The School (two).
- \*New Caledonia—(1) The Museum, Noumea; (2) The Topographical Survey.
- Parramatta—The Marist Brothers
- \*Perth, W. A.—The Geological Museum.
- \*Petersham—Mr. A. Lambert.
- Richmond—Agricultural College.
- Riverview—St. Ignatius' College.
- Sale, Vic.—School of Mines.
- Sydney—(1) Mr. Macdonald; (2) The Mint, per the Deputy Master; (3) The University (two).
- \*United States—Mr. G. Pennypacker, Pennsylvania.
- \*Wallangarra, Queensland—Mr. W. A. Dalton

Three short papers have been contributed to the "Records" of the Geological Survey.

It is with great pleasure that I conclude my report with a testimony to the great diligence that has been shown by the officers with whom I have been directly associated. It is not too much to say that the large amount of work alluded to above could never have been accomplished by mere machine-like attendance to duty. It is my earnest hope that nothing may interrupt this loyal co-operation and mutual good feeling during my tenure of office.

Mr. E. C. Whittel acted as Curator's assistant until Easter. He attended the Agricultural Show at Glen Innes in charge of the Departmental exhibit, and remained there a few days to collect specimens in the Kingsgate District.

Mr. L. H. Harper succeeded Mr. Whittel, and, while being capable of rendering assistance in any portion of the work when required, has developed a most useful aptitude for label-writing.

Mr. Morrison has been principally engaged in the clerical work of the office, and Mr. Allen in the sorting of specimens and the preparation and despatch of collections.

As a carpenter can only be engaged for work of great urgency, Mr. C. Cullen, the collector, has rendered great assistance in attending, as far as possible, to the repairs and other matters inseparable from the current work of a museum.

The Lapidary, Mr. W. H. Gilding, has been principally occupied with miscellaneous work. It is to be hoped that more of his time may be available during the ensuing year for work in which his skill as a lapidary may be better displayed.

The rock sections referred to above have been cut by Mr. C. Murton with his accustomed skill and care.

The Government Geologist.

I have, &c,  
GEORGE W. CARD, A.R.S.M., F.G.S.

#### DONATIONS to the Mining and Geological Museum.

| C. Wooller.....             | Altered sandstone, quartz from igneous dyke.  |
| W. Wright.....              | Bornite.  |
| Warden, Mount Stewart ..... | Pyromorphite.   |
| R. Young .....              | Crystalline oxide of manganese, bone-breccia.   |

## APPENDIX 6.

## Annual Report of the Palæontologist for the Year 1893.

Sir, Geological Survey, N.S. Wales, Department of Mines, Sydney, 2 January, 1894.

I have the honour to hand you herewith a Progress Report of the Palæontological work done during the Year 1893.

In June last my services were requisitioned by the Trustees of the Australian Museum to take up the Curatorial duties during the absence of Mr. E. P. Ramsay, LL.D., the Curator, on sick leave. I occupied the position of Acting Curator for seven months continuously, three of which should have been devoted to the work of this Department. Absence, thus accounted for, will explain the non-completion or further preparation of parts of the Palæontological Survey Memoirs.

*Records.*—Parts 3 and 4 of Vol. III of the *Records of the Geological Survey of New South Wales* have been published. These contain the following Official Papers by myself:—

- (a.) On the Occurrence of a Plant allied to *Schizoneura*, in the Hawkesbury Sandstone; Part 3, pp. 74-77, t. 3.
- (b.) Idiographic Carvings of the Aborigines at Point Piper, Rose Bay, Port Jackson, &c.; Part 3, pp. 80-86, t. 15.
- (c.) On the Occurrence of *Trigonia semiundulata*, McCoy, in New South Wales, and its Significance; Part 4, pp. 115-118.
- (d.) Note on an Aboriginal Skull from a Cave at Bungonia; Part 4, pp. 128-132.

The following in conjunction with Mr. W. S. Dun:—

- (a.) The Australian Geological Record for the Year 1891; Part 3, pp. 86-109.
- (b.) The Australian Geological Record for the Year 1892; Part 4, pp. 132-153.

*Miscellaneous Determinations.*—The following are the more important Miscellaneous Determinations made during 1893:—

1. Notes on Corals from the Palæozoic Limestone of Waratah Bay, Victoria. Forwarded by Prof. Sir F. McCoy, Director of the National Museum, Melbourne.
2. Miscellaneous Foreign Fossils for the Technological Museum, Sydney. Forwarded by J. H. Maiden, Esq., Curator.
3. Encrinital Limestone, containing *Fenestella*, *Spirifera*, and *Aviculopecten*, from the Permo-Carboniferous rocks, 6 miles west of Kempsey; Flesh-coloured Limestone, containing *Trachypora Wilkinsoni*, Eth. fil., from the Upper Marine beds of the same locality. Forwarded by Mr. E. Rudder.
4. Diatomite from Wyrallah, containing sponge spicules and feeble frustrules of *Melosira*. Forwarded by Mr. J. Brackenridge.
5. *Thinnfeldia odontopteroides* and other plant-remains from a bed of shale in the Hawkesbury Sandstone at Mount Piddington. Forwarded by Mr. H. G. Rienits.
6. Fossils from the Jenolan Caves Limestone. *Palæoniso Brazieri*, Eth. fil., *Loxonema antiqua*, De Kon., and a large *Favosites*. The two former species were previously only known from the Yass Limestones. Collected by Mr. W. S. Leigh, Superintendent of Caves.
7. *Trigonia*, from the Arumpo Bore, at a depth of 647 feet. [See above, under *Records*.] Forwarded by Mr. J. W. Boulton, Officer-in-Charge, Public Watering Places Branch.
8. Fossil Fruits from the Tertiary Deep Lead at Newstead Mine, Newstead, near Inverell. Forwarded by Messrs. J. Penberthy and D. Anderson.
9. Fossils from the Upper Devonian of Mt. Lambie, and Permo-Carboniferous rocks of the Western Coal-field. Forwarded by Mr. H. G. Rienits.

10. Cretaceous Fossils (*Inoceramus*, &c.) from the White Cliff Opal-field. Forwarded by Messrs. Rodgeron, Warden and P M, and W. G. Mackenzie.
11. Silurian Corals from the Molong District, *Syringopora* and *Halysites*. Forwarded by the Rev. J. M. Curran.
12. Devonian and Cretaceous Fossils from the White Cliff Opal-field. Forwarded by Mr. W. H. Clouston.
13. Permo-Carboniferous Fossils from Burragorang. Forwarded by Mr. W. A. Cuneo.
14. Silurian *Orthis* from Cowra. Forwarded by Mr. D. C. J. Donnelly, M L A.
15. A new plant allied to the Genus *Cingularia*, from the Newcastle Coal-measures. Forwarded by Mr. J. B. Henson.
16. Rich Diatomite, containing *Cocconeis* and *Navicula*, said to be from a New South Wales locality, but probably Victorian. Forwarded by Mr. Beale.
17. *Martiniopsis oviformis*, M'Coy, from Permo-Carboniferous rocks of Ulladulla. Forwarded by Mr. W. P. Allan.
18. A Mesozoic Cycad (*Otozamites*) from volcanic ash in Western Victoria. Forwarded by Mr. J. Dennant.
19. Portion of a Crocodilian jaw from Yallaroo. Forwarded by Mr. E. Quinn.
20. Permo-Carboniferous Fossils from the Nowra Grit (Upper Marine). at Nowra. Forwarded by Mr. Kelly.

*Exchanges*—The following exchanges have been prepared —

1. Professor F W. Hutton, F.R.S, Canterbury College, N.Z. Small general series of New South Wales fossils
2. G. Sweet, Esq, Melbourne—A similar collection, and a small series of Fish from the Hawkesbury rocks of Gosford.
3. B. Dunstan, Esq., Technological College, Sydney—Teaching collection of characteristic New South Wales fossils.
4. Professor R. Tate, Adelaide—Permo-Carboniferous fossils from New South Wales.
5. Professor C. Eg -Bertrand, Lille, France—Specimens of Kerosene Shale, &c.

*Collections prepared.*—Collections for teaching purposes, have been either named, or prepared, for the following —

1. Rev. J. F. Paul—General New South Wales fossils.
2. Albury Museum (N S.W.)—The same.
3. B. Dunstan, Technological Museum, Sydney—Silurian and Permo-Carboniferous fossils of New South Wales.
4. St. Vincent's High School, Sydney—Collection of New South Wales fossils.

*Field-work*—During January, in company with Mr. W. S. Leigh and Mr. R. A. Barber, of Humewood, near Yass, an examination of the Coleman Caves, Coleman Creek, at the head-waters of the Goodradigbee River, was made, the party proceeding cross-country from Yass. A separate Report has been furnished.

In conclusion, I have to again call your attention to the efficient manner in which Mr. W. S. Dun has assisted me, and had it not been for his exertions during my late absence the work must have fallen hopelessly into arrear. During the year Mr. Dun has prepared a paper and two Bibliographical Indices as follows:—

1. On Palatal Remains of *Palorchestes azael*, Owen, from the Wellington Cave Bone deposit. *Records Geol. Survey, New South Wales*, 1893, iii, Pt. 4, pp. 120-124, t. 16.
2. A Locality Index to the Reports of the Geological Survey of New South Wales, from 1875-1892 inclusive. *Ibid*, pp. 154-194.
3. Bibliography of the Geology of the Broken Hill District—*J. B. Jaquet's Geol. Broken Hill Lode and Barrier Ranges Min. Field—Appendix* (in litt.)

The Government Geologist.

I have, &c,  
R. ETHERIDGE, JUNR,  
Palæontologist.

#### Fossils registered during 1893

| Fossil  | Locality                              | Donor or collector            |
|---|---------------------------------------|-------------------------------|
| <i>Cambrian.</i>                                  |                                       |                               |
| <i>Archæocyathina</i>                             | Wirrialpa, South Australia            | Prof. R. Tate.                |
| Miscellaneous fossils                             | South Australia                       | "                             |
| <i>Conocephalites</i> and <i>Dikelocephalus</i> . | Caroline Creek, Tasmania              | T. Stephens.                  |
| <i>Silurian and Siluro-Devonian</i>               |                                       |                               |
| Graptolites                                       | Tarilta, near Castlemaine, Victoria   | R. A. F. Murray.              |
| "   | Victorian localities                  | "                             |
| Corals  | Humewood, Yass                        | R. Etheridge and W. S. Leigh. |
| "   | Old Lamekilns Ridge, Humewood, Yass   | " "                           |
| " and <i>Pentamerus</i>                           | Murray Cave, Coleman River            | " "                           |
| <i>Stromatopora</i> (?)                           | Boambola, Haggetty Point              | " "                           |
| "   | North of Murray Cave, Coolaman River  | " "                           |
| <i>Helolites</i>                                  | Falls, Sally Flat, Goodradigbee River | " "                           |
| Annelid markings                                  |                                       | E. F. Pittman.                |
| Coral   | Cudgegong                             | J. McCauley.                  |
| <i>Pentamerus Knightii</i>                        | Yarrangobilly                         | W. S. Leigh.                  |
| " &c  | "                                     | "                             |
| <i>Syringopora</i> and <i>Halysites</i>           | Molong                                | J Milne Curran.               |
| <i>Orthis</i>                                     | Cowra                                 | D C J. Donnelly.              |
| Coral (?)   | "                                     | "                             |
| <i>Favosites</i>                                  | Hill End                              | T. Atherton.                  |
| "   | Gordon River, Tasmania                | "                             |

| Fossil   | Locality.   | Donor or collector    |
|--|---|-----------------------|
| <i>Latvites</i> (?)  | Jenolan Caves   | W. S. Leigh.          |

## APPENDIX 7.

## Annual Report of the Librarian for the year 1893.

Sir, Geological Survey, N.S. Wales, Department of Mines, Sydney, 2 January, 1894.

I have the honour to herewith report on the work performed in the Departmental Library since 1st January, 1893.

During the year 107 works and pamphlets have been received, of which 35 were purchased, and the remainder, 72, presented and received as exchanges. Of Societies' Proceedings, Reports, and Serial Publications, 1,185 volumes and parts of volumes have been acquired, 225 by purchase and 960 as presentation and exchanges, giving a total of 260 purchased and 1,032 presentations and exchanges, or a grand total of 1,292 works, reports, and parts of volumes registered during the year.

The Library is now in correspondence with 163 institutions, from 142 of which exchanges have been received.

An exchange of duplicates was made with Messrs. Angus and Robertson, with your approval, by means of which several desirable works were acquired for the Library.

All presentations have been suitably acknowledged immediately on receipt of the present.

The general register, register of periodicals, letter-book, and invoice ledger have been regularly kept up to date.

The General Library Slip Catalogue is complete to date.

During the year the following Departmental publications were distributed through the medium of the Library:—

- (1.) Records of the Geological Survey of New South Wales, Vol. iii, Pt. 2.
- (2.) Do do do Vol. iii, Pt. 3.
- (3.) Do do do Vol. iv, Pt. 4.
- (4.) Annual Report of the Department of Mines and Agriculture for 1892. (To Societies and Institutions.)
- (5.) Geological Map of New South Wales. (New Edition.)

The larger portion of the Library work has been conducted by Mr. W. S. Dun, to whom I am indebted for a great deal of valuable assistance.

I have, &c.,

R. ETHERIDGE, JUNR.,  
Librarian.

The Government Geologist.

APPENDIX

## APPENDIX 8.

Progress Report by Mr. J. C. H. Mingaye, F.C.S., M.A.I.M.E., Analyst and Assayer.

Department of Mines, Geological Survey Branch, Laboratory,

Sydney, 6 February, 1894.

Sir,

I have the honour to hand you herewith the following progress report on the work performed in the laboratory under my supervision during the year 1893:—

Three thousand and fifteen numbered samples were received for analysis and assay; 177 ultimate and proximate analyses were furnished, and 16 qualitative analyses made.

The total number of assays performed, exclusive of those made for gold and silver, are 628.

From 1883 to 1893 the following numbered samples were received in the laboratory for analyses and assay:—

|                 |              |                 |                |
|-----------------|--------------|-----------------|----------------|
| Year 1883 ..... | 242 samples. | Year 1889 ..... | 3,287 samples. |
| „ 1884 .....    | 664 „        | „ 1890 .....    | 3,323 „        |
| „ 1885 .....    | 1,428 „      | „ 1891 .....    | 4,082 „        |
| „ 1886 .....    | 1,807 „      | „ 1892 .....    | 3,570 „        |
| „ 1887 .....    | 2,222 „      | „ 1893 .....    | 3,015 „        |
| „ 1888 .....    | *5,245 „     |                 |                |

\* The large increase this year due to the mining boom.

A large amount of varied work has been performed for the Government Metallurgist.

The whole of the analytical work required by the Public Watering-places Branch has been performed in the laboratory, and consisted chiefly in the analysis of the artesian and well waters, with a view of ascertaining their value for stock and irrigation purposes.

Some thirteen samples were received from this Department:—

|                                    |
|------------------------------------|
| Water from Mongulla Artesian Bore. |
| „ No. 2 Corrella Bore (artesian).  |
| „ No. 3 „                          |
| „ Well at Bingara. „               |
| „ Sibraa's Artesian Bore.          |
| „ Kelly's Camp Artesian Bore.      |
| „ Yantabulla „                     |
| „ Enngonia „                       |
| „ Belalie „                        |
| „ Kerribri „                       |
| „ Warroo Springs, Hungerford Road. |

Also two samples of soil taken from the neighbourhood of the Barrigan artesian bores near Bourke.

The total solid matter in these waters ranged from 34.35 to 70.112 grains per gallon, and consisted mainly of alkaline carbonates, chloride of sodium, with lesser amounts of carbonate of lime and magnesia, silica, alumina, organic matter, &c. Nearly the whole of the solid matter is soluble in water, giving a strong alkaline reaction. The waters were slightly alkaline before evaporation. The composition of the soils in the neighbourhood of these bores is one of great interest. The soluble matter found in the two samples furnished was 1.0328 per cent. and 0.9416 per cent. An analysis of each was made.

A large number of fire-clays have been examined, and analyses made with a view of ascertaining their values for the manufacture of fire-bricks, pottery, &c. Reports were furnished in each case as to the refractory nature of the clays, the sample being fashioned into small bricks, and heated at a high temperature in a coke assay furnace. On comparing the bulk of the analyses of our fire-clays with British and Foreign ones, it is found that the alkalies present are much higher than usually contained in the best fire-clays utilised for the manufacture of a first-class fire-brick.

A sample of coal obtained from the Leconfield Colliery, near Branxton, was observed to contain patches of a greenish-yellow substance. From its character the presence of vanadium was suspected, and on examination the presence of that metal in small quantity was detected. An estimation being made on the coal ash, yielded 0.07 per cent. of vanadic anhydride.

A mineral furnished from the Bourke district was found to be celestine. The presence of strontia, in this mineral was suspected by Mr. Card, A.R.S.M., who had previously tested it by the blow-pipe. Although a large number of minerals have been examined in the laboratory for strontia, this is the first discovery of a strontia mineral on record.

A number of analyses of rocks peculiar to the Broken Hill district were made for Mr. Geological-Surveyor Jacquet's report on the Broken Hill district. These minerals are as follows:—Diorite, quartz felsite, coarse granite, pitch stone (?), serpentine, amphibolite, and diorite. A large number of analyses and examinations were made of samples of iron ochres, with a view of ascertaining their value for the manufacture of paints, &c.

A sample of water was examined from Kelso, and a report given as to its fitness for brewing purposes.

A mine water taken from a shaft in the Peak Hill Gold-mine was tested, and was found to contain free sulphuric acid, also a large amount of sulphates of iron, copper, alumina, and magnesia.

A large number of platinum sands and concentrates have been examined for the presence of platinum, platinoid metals, gold, and tin. Some of these samples gave results which, if the sample represented anything like averages, should pay to work for the gold, platinum, and tin present.

Every care has been exercised in keeping down working expenses in the laboratory, the strictest economy being observed.

In concluding my report, I beg to state that my thanks are due to the Assistant Analyst Mr. White, also to the assistants, Messrs. Hildebrandt and Neilson, for the highly satisfactory manner in which they have carried out the work entrusted to them. Messrs. H. Fletcher, Dolan, and Burns have also largely contributed to a share of the work.

I have, &c.,

JOHN C. H. MINGAYE, F.C.S., M.A.I.M.E.,  
Analyst and Assayer.

The Government Geologist

## APPENDIX 9.

Progress Report by Mr. W. S. Leigh, Superintendent of Caves.

Department of Mines and Agriculture, Geological Survey Branch,

Sydney, 14 February, 1894.

Sir,

I have the honour to submit the following progress report on the caves for the year 1893 :—

During the year I have inspected the following caves in connection with their general supervision, improvement works, and new discoveries, &c., viz., Jenolan (four visits), Wellington, Bendithera, Wombeyan, and Cooleman.

The most important new discovery was made at Jenolan, where Mr. J. Wilson, keeper, discovered on the 20th February, another large and distinct branch of the Imperial Cave, which, in point of beauty and interest, is equal to any other known cave of the group. It branches off from the "Right Imperial," near the "Gem of the West," and its passages, intersecting each other at various points, total over 2,000 feet in length. (*See Appendix M.*)

Subsequently, further extensions, consisting of two small branches, were discovered in this cave. (*See Appendix N.*)

In January, Mr. Etheridge, Palæontologist, and myself, accompanied by Mr. R. A. Barber, of Humewood, Yass, visited the Cooleman Limestone, situated about 20 miles north-east of Kiandra, with the view, principally, to the examination of a number of caves there, the existence of which had long been known to the local residents. In addition to examining the three caves located for us, viz., the "Cooleman," "Murray's," and "Barber's," five or six other openings in the limestone were discovered and partly explored. Had time admitted of it, and with proper appliances at our disposal, I feel certain some good finds would have resulted. For the reasons given in our report (*see Appendix L*), it is perhaps as well that the caves in this limestone remain locked up for the present. The reserve was inspected, and an extension thereto recommended. Geological notes on the surrounding country were also taken by Mr. Etheridge. (*See Appendix L.*)

The total amount collected at the different caves for the use of the magnesium light was £185 14s. 10d., and the expenditure in connection therewith as follows :—Purchase of magnesium wire, £132 10s. ; repairs to lamps, £2 2s. 6d. ; total, £134 12s. 6d., leaving a profit for the year of £51 2s. 4d.

The total number of visitors who signed the visitors' books at the different caves was 4,108.

Following are particulars showing number of visitors, improvements, &c., at each of the caves for the year 1893.

*Jenolan Caves.*

Number of visitors, 1,511. On account of the shortness of funds it was found necessary in July to suspend for the time being improvement works at these and the other caves. Good progress had, however, been made in the carrying out of the more urgent and important works. At the time operations were suspended the men were engaged in opening up the new cave, and so far the work accomplished is most satisfactory. I estimate it will take two men about four months to complete necessary improvements in this cave. The ironwork for same has not yet been provided.

It having been decided to light the Lucas Cave with electricity, a new dynamo and six arc lamps and fittings were procured from the Western Electric Company, Chicago, for the purpose. The arc lamps, the first to be used at Jenolan, should, on account of its spacious chambers, produce a grand effect in this cave. The passages will be lighted with the ordinary incandescent lamps.

As the present dynamo in use for the Imperial Cave lights was driven direct from the turbine, it was found necessary in the new arrangement to remove same to a position suitable for driving from a counter-shaft, by which the new dynamo will also be driven. This portion of the work, which embraced the supply and erection of counter-shafting, pulleys, belting, &c., building of concrete foundations and erection of dynamos, was performed by Mr. J. J. Patterson, contractor. The cables have also been laid to the mouth of the cave.

The other portion of the work, viz., the hanging of the lamps and the running of the wires, &c., through the cave, was to have been carried out by the Electric Light Department, simultaneously with the portion already done, but that Department has not yet been able to spare the services of the Chief Electrician, who has been entrusted with the work.

*Wombeyan Caves.*

Number of visitors, 240. It was intended to open up the cave discovered here in 1892, but, for the reasons already given, the work was not proceeded with. It has been approved, provided the money voted will admit of it, to carry out some necessary works, principally in the Wollondilly Cave. It is also intended to plant the space in front of the Accommodation-house with trees, when the proper season arrives. The area of the horse-paddock has been increased by 25 acres.

*Yarrangobilly Caves.*

Number of visitors, 636. It was found necessary, owing to the increased number of visitors to these caves, to allow the keeper temporary assistance during the summer season.

*Wellington Caves.*

Number of visitors, 987. An additional area of 35½ acres has been dedicated for the preservation of caves.

*Bungonia Caves.*

Number of visitors, 57. This number does not include those to the "Look-down," a favourite resort for sightseers on the caves reserve. The road to the caves, in respect to which there have been a number of complaints, and a good amount of correspondence, has not yet been definitely defined. The last communication from the Lands Department in this matter is to the effect that the old road is impracticable, and that the necessary deviations are to be surveyed.

*Bendithera Caves.*

Number of visitors, 73. A number of fresh openings in the Bendithera limestone have been found, but not yet thoroughly explored.

*Abercrombie Caves.*

Number of visitors, 604. The keeper has just reported the discovery of a series of new caves, not very extensive, but he states that some of the chambers will prove of great interest to visitors.

I have, &c.,

W. S. LEIGH,

Superintendent of Caves.

The Government Geologist.

## APPENDIX 9A.

Report on the Caves in Cooleman Creek, Cooleman Plains, at the head-waters of the Goodradigbee River; with Notes on the surrounding District: By W. S. Leigh and R. Etheridge, Junr.

1. *Introduction.*

IN the present report will be found a description of the Caves, so far as known, occurring on the Cooleman Creek, or the western branch of the head-waters of the River Goodradigbee, traversing the Cooleman Plains, in the Parishes of Murray and Cooleman, County Cowley. The journey to and the investigation of the caves was made in company with Mr. R. A. Barber, of Humewood, near Yass, who most obligingly provided the horses necessary.

As the Yass-to-Kiandra road appears to be but little known we preface our report on the Caves with a general description of the route and country passed through. This is followed by miscellaneous geological notes collected at the same time.

2. *Previous knowledge.*

The only reference bearing on the physical structure and geology of the head-waters of the Goodradigbee known to us are a few pages in the Rev. W. B. Clarke's "Southern Gold-fields of New South Wales\*," and a paragraph in the same author's early "Report on the existence of Gold along the Rivers and Creeks flowing from the Muniung Range, &c., and on some auriferous Localities."† In the former he briefly describes the Counties of Cowley, Buccleuch, and Selwyn. His remarks will be referred to later on.

3. *The Route.*

The Murrumbidgee River on the Yass-to-Kiandra Road is crossed by the Boambola Crossing at Haggetty Point—a dangerous ford when the river is at all high. The bed is occupied at this point by a dark quartz porphyry, but whether in the form of a dyke or interbedded, time did not permit us to ascertain. On both banks are heavy outcrops of Siluro-Devonian limestone, a scarp on the roadside, opposite Hazlewood, on the north bank containing *Stromatopora*. The ford is about 11 miles from Humewood—our point of departure. The beds of limestone partake of the same physical character as those lower down the Murrumbidgee, near the Taemas Bridge, examined last year by Mr. J. Mitchell and one of the Writers, and there is a repetition of the same bold scenery. After regaining the southern heights above the river, our course lay along the eastern flank of a portion of the watershed between the Goodradigbee and Murrumbidgee Rivers, here known as the Mullion, or more properly speaking, the Mulyan Range. After crossing Mullion Creek, the north-west corner of the Parish of Urayarra, County Cowley, is entered, and the head branches of Tinker's Creek crossed; then over a small dividing ridge—an offshoot of the Mullion Range, descending on Webb's Swamp Creek. These waters are all affluents of the Cotter River, itself a branch of the Murrumbidgee. Here commences the large Forest Reserve No. 725. The whole of the country between the Boambola Crossing and this point presents that nondescript sandy soil which appears to indicate underlying Silurian beds, little rock being seen in place, except in the beds of rivulets and on the ranges. After following a newly-surveyed road for some distance, an important branch of the Cotter is crossed, locally known as Condo Creek, but it appears to us to be that denoted on the official maps Mount Coree, or Pabral Mountain Creek, and forms the boundary between the Parishes Urayarra and Tidbinbilla, County Cowley. Our aneroid readings made Condo Creek 2,000 feet above sea-level. It is a fine, rocky, precipitous, glenlike rivulet, with clay-slates, shales, and grits, having a general meridional strike, standing about on edge. The shales are thin-bedded, fissile, and micaceous. The track, after following the creek for some little way, rises along the sidings, and gradually the ascent of the north-eastern slopes of Mount Brindebella commences. This hill attains a height, according to our measurement, of 4,350 feet. The same rocks continue to near the crown, which, from its somewhat rampart-like nature, is locally known as "Gibraltar." It consists of a cream-coloured granite.

At the summit of Mount Brindebella is the marked-tree broad-arrow S. 85, and between this and a similar tree, broad-arrow R. 85, lower down on the ascent, the boundary of the Parishes Tidbinbilla and Brindebella crosses. About three-quarters of the way up from Condo Creek is Lee's Springs, forming a fairly good camping-ground.

Mount Brindebella, which appears to be an offshoot from the Main Dividing Range between the rivers Goodradigbee and Cotter, known as the Bimberi or Murrumbidgee Range—Condo Creek, amongst others, cutting it off from the latter on the west side—was shown‡ by Clarke as early as 1852 to be auriferous. On looking both northward and southward a most magnificent view of the whole Murrumbidgee Range is obtained—to the north, following the course of the Goodradigbee to its junction with the Murrumbidgee at Cave Flat, denoted in the view by the Barren Jack Range—to the south, trending into the Bimberi Range proper, with the noticeable points of Long Bimberi, Bimberi, and Mount Murray succeeding one another in gradual succession, at the immediate source of the final eastern branch of the Goodradigbee, as distinguished from the western branch, or Cooleman Creek. Along the northern line, Mount Coree (or Mount Goree, or Pabral, as it is sometimes called) is the highest elevation, more lofty than Brindebella, possessing a bold scarp-like front to the south-west. It is the site of a trigonometrical station.

A good deal of scattered quartz is noticeable on the slopes of Mount Brindebella, but no well-defined reefs were seen by us. The Rev. W. B. Clarke, speaking of this hill, says,§ "The whole of Cowley in

\* 12mo. Sydney, 1860, pp. 86-90, 93-109

† Sixteenth Report, dated 20th May, 1852. Further Papers relative to the recent Discovery of Gold in Australia. Parliamentary "Blue Book," 28th February, 1853, p. 81.

‡ Southern Gold-fields of New South Wales, 1860, p. 90.

§ Southern Gold-fields of New South Wales, 1860, p. 104.

in this direction is composed of the same drab and gray shales, with interspersed quartz veins, rising in Pabral Peak (Mount Coree) into lofty eminence, the quartz chiefly brown, but on the slopes of Brindebella Mountain, descending to the Goodradigbee, the quartz becomes white." We may remark, incidentally, that the vertical shales and schists around Mount Brindebella, have, in lithological and physical appearance, the strongest possible resemblance to those cropping out along the Long Plain, between Kiandra and Yarrangobilly.

The descent on the south-eastern aspect of the mountain along the old track is far steeper than on the ascent, necessitating a dismount. The same highly-altered rocks are again seen in place with a good deal of white scattered quartz. After crossing a few subsidiary spurs, the Goodradigbee River is reached, the height being 2,200 feet above sea-level. At the river-crossing a raised alluvial beach is noticeable, consisting of coarse boulders and sand. After fording, the track runs over some beautiful alluvial flats, but the river is again crossed at a horseshoe bend in Portion 21 (Parish Brindebella), and continued over the foot-ends of spurs until the residence and mining claim of Mr. W. Reid is reached.

The old river-bed is here being worked, consisting of small boulders and heavy gravel, in places very irregularly deposited. Layers of white pipeclay and other clays of various colours occur throughout the section, and near the lowest level to which the claim has been carried, namely, 96 feet, a bed of impure lignite makes its appearance at the northern end. These clays were assayed by Mr. J. C. H. Mingaye, F.C.S., &c., and found to be non-auriferous. In places, pockets and lenticular patches of a black graphite-looking powder occur. Some peculiar pipings are visible at the south end of the workings, in which the drift, instead of lying horizontally or inclined, is deposited in vertical lines. The direction of the old river-course is, roughly, north and south, and the run of the several auriferous washes coincides. The deposition of the drift in the north-east corner is in saucer-shaped lines, and probably represents a deviation of the bed in that direction. Between the claim at its southern end, and the present course of the Goodradigbee, is a Silurian rise, which must have then represented its western bank, with shales in place, the junction of the old course with the present channel on the east being quite apparent. The road passes over this rise, and crosses the Goodradigbee for the last time, entering the Parish of Bramina, County Buccleuch, when the Goodradigbee-Cotter watershed is left, and that of the Goodradigbee-Tumut entered on.

After traversing various low spurs, the first affluent of the Goodradigbee in this parish is crossed, termed on official maps the Cooleman Creek. This, however, as pointed out by Mr. R. A. Barber, is an error, and should be known by the local name of Coleman's Creek. It takes its rise in a magnificent range of heavily-timbered hills, rising tier upon tier, and furrowed by precipitous gullies, and forming the watershed before mentioned. After pursuing the upward course of the creek for some distance, the track deviates across the sidlings at the heads of branches of Coleman's Creek, on to Diamond Hill, a prominent point of the watershed, to the height of 4,570 feet by aneroid measurement, a much steeper, altogether shorter, climb than that of Mount Brindebella. The summit of Diamond Hill is long and undulating, the rocks quartzites and porphyries. Hereabouts the Parish of Peppercorn, County Buccleuch, is entered, and the direct Kiandra track is soon left, and a path taken to the left across the so-called Peppercorn Plains, with head branches of the creek of the same name, which is itself crossed at the site of the old Peppercorn Station. Peppercorn Creek is the next most important branch of the Goodradigbee south of Coleman's Creek, and joins the river in the south part of the Parish Bramina, County Buccleuch, ultimately separating the Parishes of Murray and Peppercorn of the same County.

As Diamond Hill is descended, Peppercorn Hill, a prominent peak-like elevation, becomes visible. It is an offshoot of the Long Plain Range, as that part of the Goodradigbee-Tumut watershed is called. Behind the Long Plain Range is the Long Plain itself, between Kiandra and Yarrangobilly, with the final swampy heads of the Murrumbidgee after its great southern bend. After crossing Peppercorn Creek the Parish of Murray, County Cowley, is entered, and spurs of the Long Plain Range traversed, consisting of a hornblendic granite.\*

Soon after this the large expanse of the Cooleman Plains bursts on the view, a series of well-grassed limestone downs, trending in an east and south direction. Across the plains the Cooleman branch of the Kiandra track leads. At an out-station in Portion 12 we crossed a large patch of granitic porphyry, ultimately reaching the Cooleman Creek, or west branch of the Goodradigbee head-waters, by a short cut, when a camp was formed, opposite a small island near the Blue Waterhole, in Portion 9.

The principal peak of the Long Plain Range, overlooking the Cooleman Plains, is known as Rorke's Peak, a name not mentioned on official maps.

The Goodradigbee River, soon after leaving the parish of Bimberi, County Cowley, divides into two main heads, one coming from the south-west, rising in the western gullies of Mounts Murray and Bimberi, Parish of Cooleman, County Cowley, and the other branch from the south-east, taking its rise by one branch on the Cooleman Plains, Parish of Murray, County Buccleuch, at the eastern foot of the Long Plains Range, and by another in the Cooleman Mountains on the north. These hills are a subsidiary range of the main Murrumbidgee Range, extending along the northern boundary of the plains to the junction of the two branches.

The union of the two branches is known as "The Junction," and is denoted by a marked gum-tree, broad-arrow M 85. The west, or "Mount Murray Branch," as it is termed on the official maps, we did not follow up, our researches being confined to the eastern arm, or Cooleman Creek.

The limestone of Cooleman Plains, according to the Rev. W. B. Clarke,† "forms extensive cliffs vertically stratified and abounding in caverns. The perpendicular cliffs are 80 to 100 feet in height, sometimes perfectly smooth, sometimes fissured in every possible direction. It is through these lofty and pinnacled cliffs that the Goodradigbee (*sic*) passes, having a breadth of not more than 30 feet in places, and overhanging cliffs of at least 100 feet."

Nowhere is this more marked than from the Junction upwards for the first part of the course of the western branch or Cooleman Creek. The sides of the tortuous creek are most precipitous and straight-walled, in places chasm-like, fully 100 feet, and probably more, with several likely-looking holes and fissures on the north bank. On the south side of these cliffs, soon after leaving the Junction, is an archway called "The Murderer's Cave," the scene of a brutal murder some years ago. The archway is of no depth, leading to a small hole, possibly the entrance to a cave. So important a physical feature as this

\* Consisting of quartz, hornblende, and some biotite.

† Southern Gold-fields of New South Wales, 1860, p. 105.

this chasm is worthy of a name, and we propose, in consequence, to distinguish this portion of the Cooleman Creek as "Wilkinson's Cliffs," in memory of the late Geological Surveyor-in-Charge, Mr. C. S. Wilkinson, L.S., F.G.S., &c. From the edge of the cliffs the ground rises in a slope, with a rather high inclination, into steep wooded hills—those on the north being the terminal spurs of the Cooleman Mountains, and on the south those from the Black Ridge. The latter hill separated the two branches of the Goodradigbee on the south.

On passing through Wilkinson's Cliffs the creek opens out with long sloping banks, and its course is interrupted by a small cascade about 30 feet high, caused by a highly fossiliferous flaggy limestone, which has worn away more heavily than the thicker and more highly metamorphosed Cave Limestone. A large body of water must at times pass over this fall, and rush with terrific force between Wilkinson Cliffs. We propose to term these the "Cooleman Falls." Above the cascade the declivity of the banks gradually gives way, and opens out into a small alluvial flat, locally known as Sally Flat, from the prevalence of a stunted Eucalypt, called "Sally." Limestone here continues on the north side of the creek, but the rise above the flat on the south is occupied by a flesh-coloured granite, which apparently forms the heights of the Black Ridge above—at any rate, it was in place as far up that hill as our examination led us. On emerging from the timber at the further end of the flat the granite ceases, and precipitous gorge-like walls again commence, equally narrow with those below. For distinction sake, we propose for this chasm the name of "Clarke's Gorge," after the late Rev. W. B. Clarke, F.R.S., &c. At the eastern end of this chasm is a beautiful waterhole, known to some as the "Blue Waterhole," although by others this name is applied to another hole higher up the creek. On passing through Clarke's Gorge, a smaller flat is met with, on which we camped, with a small branch creek, also with limestone sides, coming in from the north. Near the lower outlet of Clarke's Gorge, on the south side, is a small natural archway, which can be entered for about 25 feet, but partially collapsed, and leading into an interior passage. Hereabouts must issue the underground rivulet of Barber's Cave, to be more fully noticed later on. A few hundred yards above our camp, in Portion 9, at the foot of a limestone bluff, occurs the upper "Blue Waterhole," from which it has hitherto been supposed this branch of the Goodradigbee takes its rise. This is, however, erroneous, as we hope to show in the sequel. No doubt a very strong spring or underground flow issues here, for, although the creek, except in times of flood, is dry above, and at ordinary times there is no apparent intake, yet, a few yards below the Blue Waterhole, the rush of water over the stony bed is strong and copious. The surface of the Blue Waterhole is perfectly tranquil, and the water is of a pale sea-blue. Beyond this point the course of Cooleman Creek is very circuitous, with alternating isolated bold cliffs and slopes, and occasional small flats at the bends. It soon divides into two main channels, and on following the right-hand branch the Cooleman Creek is reached on the north bank. The left-hand branch turns to the south-east in the direction of Mount Murray, and the divide between the Murrumbidgee and Goodradigbee waters on the south. We were told that at its head the water flows, passing under an arch, but the intermediate portion is perfectly dry. Possibly this is the occurrence mentioned by Clarke, when he says that the Goodradigbee issues "under a natural bridge of excavated rock, as on Coolalamine (*sic*) Plain."\*

The precipitous cliffs and bluffs of the right-hand branch, although wanting in the rugged grandeur of Clarke's Gorge and Wilkinson's Cliffs, are still fine, often rising straight for 50 or 80 feet perpendicular. Those between the two caves, the Cooleman and Murray Caves, we suggest may be known as "Nichols' Cliffs," after Mr. H. W. Nichols, who assisted† the Rev. W. B. Clarke in his researches in the southern gold-fields.

About 2 miles above the Cooleman Cave occurs the Murray Cave, on the south bank of the right-hand branch, or, as it is termed on official maps, the Cave Creek. After running for perhaps another 2 miles in a general north-east direction, and giving off sundry smaller branches, it suddenly curves back upon itself, the waters coming from an extension of the plains to the north-east. Each subdivision of the Cooleman Creek more or less possesses the same physical characters. Near the main Cave Creek, in the direction of Mount Rorke, is a small bubbling rivulet terminating in a circular basin-shaped depression, through which the water appears to get away, as there is no other apparent outlet. The bed of the creek is filled with moderate-sized boulders and pebbles, but there is no permanent water above the highest Blue Waterhole. At the same time, immense bodies must traverse it in rainy seasons, and taking into consideration the large catchment area thus opened up, it appears to us inconsistent to consider the upper Blue Waterhole simply as the source of the west branch of the Goodradigbee.

The Cooleman Plains, or, as Clarke wrote the name, Coolalamine Plains,\* lie in an amphitheatre, enclosed on the north by the Cooleman Mountains, on the east by the Goodradigbee River and the Mount Coree or Murrumbidgee Mountains, on the west by the Long Plain Range, and on the south by the Currangorambla Mountains.

The plains consist of low rises and depressions, to which the name of "downs" would be far more applicable than that of "plains." The south-east, or Mount Murray branch of the Goodradigbee is usually spoken of as the main source of that river, but bearing in mind our previous remarks, we are inclined to support the opinion of Mr. R. A. Barber, that the south-west arm, or Cooleman Creek, is just as much entitled to that distinction.

#### *The Cooleman Cave.*

This cave is situated near the south-east corner of Portion 4 of 40 acres, Parish of Murray, County Cowley, on the north bank of the main west branch of the Goodradigbee River, about  $3\frac{1}{2}$  miles above its junction with the main stream. The entrance is at the foot of a limestone bluff, which rises perpendicularly to a height of 70 or 80 feet above a grassy slope, and forms an irregular diagonal fissure or archway 20 feet wide by 15 feet in height. The fissure is divided into two openings by a central pillar of rock 3 feet in diameter, the lower opening, through which the cave is entered, being about 10 feet above the bed of the creek.

On entering the cave it is noticed that this immense fissure extends back into the limestone about 30 feet, and forms an entrance-hall 40 feet long by about 15 feet in height. It contains no stalactitic growths, the roof presenting a face of bare rock, the floor being strewn with small detached boulders.

The principal passage of the cave branches off at the western end of the entrance-hall, its general bearing being W.  $10^{\circ}$  N. It has an average width of 10 feet, and 6 feet in height, and can be traversed

on

\* Southern Gold-fields of New South Wales, 1860, p. 86.  
† Southern Gold-fields of New South Wales, 1860, p. 104.

on a perfectly level floor for a distance of about 100 yards, at which point the passage opens out, and terminates in a circular chamber 20 feet in diameter. Two or three small holes or waterways, too small to follow, branch off this chamber.

The floor surface of the passage bears abundant evidence of its being frequently wholly under water as at the time of our visit that portion not so covered was coated with a sediment of brown mud. Near the terminal chamber is a long funnel-shaped up-cast from the roof, through which a large quantity of mud and debris has found its way into the cave from the surface. A fair number of stalactites are met with at intervals along the passage, but, by reason of the frequent flooding of this portion of the cave, few stalagmites are seen.

To the right of the entrance hall is a narrow passage, which can only be negotiated in a stooping or recumbent attitude. Its general bearing and length is N. 40 feet W. 10° N. 30 feet, and S. 45 feet back to entrance hall. Thus an inspection of same can be made without retracing one's steps. The stunted roofs and broken remnants of stalactites now remaining show that this passage was once rich in the finer miniature forms of dripstone growths. In fact, both passages of the cave have been denuded of all the more delicate calcareous formations to such an extent that only a few of the more massive specimens now remain.

#### *Murray's Cave.*

This cave is situated within Reserve No. 664 for Recreation, in the same parish, and about 1¼ mile west of the Cooleman Cave, on the west terminal branch of the Goodradigbee, the general bearing of the river at this point being S. 70° W. Like the last cave described, the entrance is at the foot of a lofty limestone peak, standing back about 50 feet on the south side of the creek, and 10 feet above the level of same. The entrance much resembles a Gothic archway, 4 feet wide at the base and about 18 feet in height at apex, which spans a dry water-course, running direct from the cave to the creek, the bed of same being covered with waterworn boulders. Passing beneath the archway and along a passage 15 feet in length, a large chamber, the principal opening of the cave, is entered. It is about 70 feet long by 40 feet wide, and averages 20 feet in height, and is in most respects similar to the main chamber of the Cooleman Cave.

The floor is almost completely covered with small pieces of fractured limestone, resembling rough road metal, through which crop up here and there a few stunted stalagmites. The greater portion of the roof is bare rock, the other portion being covered with small spherical-shaped calcareous excrescences, dirty white in colour. Two passages lead off from this chamber, one immediately to the left of entrance, the general bearing of which is S. 10° E., and the other directly opposite the entrance running due south. The former is tunnel-shaped, with a circular roof, and can be traversed with comparative ease a distance of 320 yards, the width varying from 4 to 15 feet, with an average height of 15 feet.

It is evident that during wet seasons large volumes of water must pass through the cave, the floor and sides being much waterworn, and numerous pools of water, with pebbly bottoms, are met with at intervals along the passage. Heaps of fine sand are also noticed at different points. The passage terminates in a slightly enlarged chamber, to the left of which, on a level with the floor, is a cavity, apparently very deep, and completely filled with water. In this chamber is also a talus of mud, which must have entered through a crack in the limestone at the extreme end of the cave. The roof of the passage was at one time completely covered with stalactites of various designs, but now only the more massive groups and broken stumps of the lighter specimen remain.

At 120 yards from the entrance, projecting from the wall, are two large circular canopies, the lower portions of which, in the form of a fringe of delicate stalactites, have been broken off. Near the same spot are the fractured remains of a series of long, fluted stalactites, which, when intact, would, on being tapped, give off musical sounds. These formations are generally dirty white and fawn coloured. Throughout the passage there is a strong drip of lime-charged water from the roof, and the broken stalactites appear to be rapidly reforming.

The other passage, running south, opposite the cave entrance, is very narrow and tortuous, and partly blocked at intervals with stalagmo-stalactitic pillars.

Running across the floor, and intersecting each other at various angles, are small, knife-like ridges, enclosing numerous shallow pans or basins, each of which is filled with small nodular concretions of carbonate of lime.

This cave is apparently named after Sir T. A. Murray, at one time Speaker of the Legislative Assembly, and who was the first to take up country in this quarter.

#### *Barber's Cave.*

The first important gully on the south side of the creek below our camp has two arms, right and left. Near the mouth of the left-hand arm, about 20 chains distant from the creek, is a large circular depression, from the bottom of which rises a limestone peak, having a central opening or fissure, 5 or 6 feet wide, the mouth of a cave which was explored for a considerable distance. It is in the form of a long, winding passage, falling rapidly in the direction of the creek, its general bearing being north-east, and contains a fairly good assortment of dripstone specimens.

The fact of these being almost intact is evidence of the cave not being generally known. At 90 feet from the entrance, bearing N. 10° E., is an irregular-shaped chamber, 20 feet across, which is partly filled with large pieces of fallen limestone. At 144 feet beyond this, the passage running S.E. by E., and keeping its downward course, are two circular canopy-like projections from the wall, 5 or 6 feet in diameter. Being almost pure white, and standing out some distance over the passage, they present a striking contrast to the sombre-looking parent rock on which they have formed.

Immediately beyond this the floor takes a sudden drop of 15 feet, the passage becoming much more tortuous and steep. At this point a rumbling sound of running water strikes the ear, the first sight of which is obtained 70 feet further on. Here a rapidly-flowing subterranean creek runs parallel with the track for a short distance, and disappearing beneath the limestone, reappears 34 feet lower down, when it finally disappears beneath the main passage and takes its downward course to join the waters of the Goodradigbee River. At 160 feet beyond this, the passage, bearing N.E. by E., still rough and tortuous, opens into a chamber about 20 feet wide and 30 feet in height, at which spot a glimpse of daylight is obtained through a second entrance or outlet. This opening corresponds with one noticed outside, not many feet above the level of the river, the distance between the two openings, through the cave, being close on 600 feet. At 39 feet beyond this the passage terminates in two small crevices, too small to follow in their present state.

At

At intervals throughout the cave some fine groups of stalactites of various designs are met with, which, not having been tampered with, as in the other caves beforementioned, makes this perhaps the most attractive of the Cooleman Caves yet discovered.

The gully on which this cave is situated takes its rise in spurs of the Black Ridge, and in its upper branches is water-carrying. It is probable, therefore, that the water within the cave is derived from the soakage of this, as the lower portions of the gully are quite dry.

#### *Other Cave Openings.*

Almost facing Barber's Cave, on the opposite side of the gully, at the southern end of the right arm before referred to, is another circular depression, at the bottom of which is an outcrop of limestone.

An opening in the rock, too small to explore very far in its present state, serves as an inlet for any surface-water which may accumulate at this end of the gully, and if properly explored, would probably be found to lead to large cavities.

In a limestone scarp, above and opposite to this, is another opening or immense vertical fissure, which apparently splits the whole of the exposed bluff. With the aid of proper appliances it might be possible to traverse the fissure a considerable distance.

Below the junction of the two head branches of the Goodradigbee, a comparatively short distance down the main stream, on the eastern bank, is a small orifice, into which a stone can be thrown and heard falling for a considerable time.

Again, a little further down, an underground creek issues from beneath a large limestone bluff on the west bank, forming at its point of issue a fine pool. On account of the quantity of water, the creek could not be followed very far inwards.

A few hundred yards still lower down the stream, on the same side, another subterranean creek issues from an opening partly choked with fallen blocks and undergrowth, and after forming a small stream of its own, joins the main Goodradigbee River.

Two such instances are recorded by Clarke on this very river—one that the Goodradigbee issues “after the first collection of waters through a cavernous underground channel”;\* and again, “the other branch of the Goodradigbee also issues from the bottom of a limestone cliff, passing into a pool.”†

Considering the large extent of Cooleman Limestone, and the numerous openings in it, it is evident that the best caves there are yet undiscovered, and fortunately being thus locked up, cannot be subjected to such acts of vandalism as have been so freely perpetrated in the present known caves.

We therefore think it would not be advisable to undertake a systematic exploration of same until such time as ample funds are available for carrying out necessary works for their improvement and protection, and the prospect of a sufficient number of visitors to warrant the appointment of a caretaker.

We would, however, point out that the present reserve does not take in the whole of the best limestone, and would recommend an extension to same, particulars of which with plan will be furnished on a separate paper.

#### *Geological Notes.*

In investigations similar to those we were engaged on, so much remains to be done in a given space of time that it is impossible to follow out in detail the geological structure of the country traversed, and without this detail actual accuracy is impossible. The following notes must, therefore, be regarded simply as an outline for future amplification.

As early as 1852, the late Rev. W. B. Clarke wrote, on the Murrumbidgee, as follows:—‡ “The country along the Murrumbidgee, about 149° E., and between 36° and 35° S. is chiefly composed of granite and granitic rocks which pass into the slate system. This, similar to the construction of the same formation as described in my twelfth report, embraces, although in a much more extended degree, various beds of limestone and calcareous grits, which are charged with innumerable fossils, among which corals of Silurian genera, pentameri, and various trilobites are most prominent. Hills of porphyry and bands of porphyritic compounds also occur in the midst of the slate system, and, owing to the former, the latter has at various points been transmitted and disturbed.”

In briefly describing the Counties Cowley and Buccleuch, Clarke recognised the probable age of the schists as Silurian, for he says:§ “I would not hesitate, even without fossiliferous evidence, to class the Murrumbidgee schists as Silurian—a conclusion justified by their positive passage through sandstone into fossiliferous limestone, containing undoubted corals described by Sir R. I. Murchison.”

The extent of these limestones is also referred to thus||:—“There is a band of cavernous fossiliferous limestone striking for fully 200 miles at intervals along the meridian of the head of the Goodradigbee.” The whole of this southern part of the County Cowley from the junction of the Cotter with the Murrumbidgee¶ “is composed of the same drab shales and grey slates, with interspersed quartz veins,” a fact which came prominently under our notice in that portion traversed by us. “The same formation continues,” adds Clarke, “with slight interruptions of granite and quartziferous porphyry—the former connected doubtless with the Bogong Mountain—to the Coolalaine Plain.”\*\*

The limestone area of the Cooleman, Clarke computes, at from 30 to 40 square miles. The portion generally travelled by us amounted to about 25½ square miles, but there is no reason to doubt that Clarke's estimate may be correct were the whole of the outlying patches taken into consideration, many of which we did not see. Along the edges of the scarp-like cliffs the limestone here and there, and particularly in the neighbourhood of the Cooleman and Murray Caves, rises into pinnacle-like heights, separated by grassy slopes. Away from the creeks the only indication of its presence is a few scattered bumpy projections through the soil. Its appearance as a rock is similar to other massive cave limestones in New South Wales, such as Yarrangobilly, Goodradigbee, &c., and weathers, when not seen in cliff faces, into rounded masses, with a fluted or grooved surface.

The limestone *en masse* has unquestionably undergone much metamorphism. This has been dwelt upon by Clarke, who says††:—“The crystallising character and arrangement of the limestone on the east side of the plain, and its nearly total want of fossils. . . . points to metamorphic agency, the origin

†† Southern Gold-fields of New South Wales, 1860, p. 105.

origin of which may be found in the porphyritic rocks with which the marble is in contact." It is a white slightly yellow, or flesh-coloured rock, weathering, as a rule, of a light leaden blue, and is highly crystalline. Clarke's expression is that it varies from a compact grey limestone to a sub-crystalline marble. The latter appearance is very marked in places. We did not trace the extent of the cave limestone up the course to the south-east, or Mount Murray branch, of the Goodradigbee; but the Rev. W. B. Clarke's description,\* so far as we can follow it, states that "the rock along this arm of the river is highly crystalline white marble, a connected mass of crystals of carbonate of lime, many of them extremely well developed and striated on their planes. The crystals are white, and their external surfaces worn, so as to exhibit the striation on the rock. Originally these were due perhaps to fossils. This kind of rock continues for about 2 miles."

At the Goodradigbee Falls is an excellent section of a highly fossiliferous calcareous shale, rather than a limestone, overlain by a thick mass of the cliff or cave limestone. It is a very marked bed of some considerable thickness, and crops out on the south bank as a series of irregularly weathered and iron-stained reefs. It is probably owing to the more readily yielding nature of these strata that the falls owe their nature. The calcareous shale is crammed with fossils, but, on the weathered surfaces, all in the form of casts or impressions. Some excellent examples of *Favosites* and *Heliolites* may be gathered. The strike appears to be about N. 10° W., and the angle of westerly dip low—not more than 5°. The dip throughout the Cooleman area does not exceed 40° westerly, the highest observed by us being 25°, but Clarke gives it from 20° to 40° to the west.† The bed of fossiliferous shale is overlain by a thick deposit of the Cave Limestone, highly jointed, and if our reading of the section is correct, exhibiting faint lines of bedding, corresponding with that by the shale below, but almost obliterated by metamorphic action.

In all the creek sections outcrops of a light chocolate coloured limestone are met with, in some cases accompanied by reefs of decomposed iron ore, apparently limonite. This limestone is also highly altered, but in a few instances where less so, has proved fossiliferous. Good examples may be seen on the south bank of Cave Creek, immediately to the west of the Murray Cave entrance, and on the bluff at the west end of Wilkinson's Cliffs. One of the reefs of iron-ore is visible on the downs to the north of the Murray Cave.

When casually examined the long and more or less vertical plane lines visible in the cliff and bluff exposures may be taken as planes of bedding, as they were by us, and an on-edge position assigned to the bulk of the limestone. From the observations made, however, in connection with the strata of the Goodradigbee Falls, we have come to the conclusion that these are simply joints—an opinion supported by an occasional irregularity and sudden stoppage of the lines, the occurrence of the fractures at right-angles to them, and their variability of direction.

The granite of Sally Flat, below Clarke's Gorge, is flesh-coloured to light pink in colour; and, according to Mr. G. W. Card, the Curator, who kindly determined it, consists of quartz, white and pink felspar, some of the crystals showing simple twinning, and a little biotite. We suspect that this granite is intrusive, and it is to this that a good deal of the local metamorphism is due. The Sally Flat granite is an extension of the rock forming the Black Ridge; at any rate, it is traceable as far up the slopes of this spur as time would permit us to climb. Another exposure takes place on the western bank of the main Goodradigbee below the "Junction," coming down to the river's edge, and is much jumbled up with limestone blows. How far the limestone continues up the slopes of the terminal spurs of the Cooleman Mountains we are not in a position to say; but if the higher portions of the Black Ridge are composed of this flesh-coloured granite, then, in all probability, those of this portion of the Cooleman Mountains, at least, are composed of the same rock.

On the river, hereabouts, the granite is seen abutting against the limestone bluff with the large pool below it, and from the side of which an underground flow of water takes place. At the eastern boundary of the Sally Flat granite is a terribly hard dyke rock containing cubical crystals of iron pyrites. Between this dyke and the granite is one of the chocolate bands of limestone already referred to.

A lode of silver-lead ore has been opened on the down to the south of the Murray Cave (M.L. 20, Parish Murray), but does not appear to have been a great success.

The decomposed ironstone reef to the north of the Murray Cave, on assay by Mr. J. C. H. Mingaye, was found to be neither gold nor silver bearing.

With time at one's disposal no doubt an excellent collection of fossils could be made at the Cooleman Downs. So far, we believe, the only specimens gathered formed a part of the Rev. W. B. Clarke's collection, and were described by Professor de Koninck. We were fortunate enough to rediscover *Pentamerus Knightii*, J. Sby., one of the species previously recorded by Clarke. Large sections of this shell are visible on weathered surfaces, and on boulders in the creek bed, accompanied by numerous *Stromatoporids*. The occurrence of *P. Knightii*, at Cooleman, will go far towards placing this limestone on the same horizon as the beds at the numerous localities detailed in a recent paper by one of us.‡ Immediately to the east of the Murray Cave entrance the sloping cliff face has been worn quite smooth, the surface showing innumerable sections of crinoid stems, *Favosites*, *Pentamerus*, and others not determined. The unequal distribution of the organic remains throughout the Cooleman limestone is due, no doubt, to the unequal effects of metamorphism, and possibly to an insufficient examination of the area. Clarke also mentions the occurrence of a large bivalve, a *Calymene*, near *C. Blumenbachii*, Brong., and an *Encrinurus*.§

The fossils described|| by the late Professor L. G. de Koninck, from Calalamine (which, we believe, to be identical with Cooleman), are the following, all European species be it observed:—

*Favosites aspera*, D'Orb.  
*Pentamerus Knightii*, J. Sby.  
*Retzia Salteri*, Dav.  
*Cyathophyllum vermiculare*, Goldf.  
*Favosites basaltica*, "  
 " *alveolaris*, "

The three first are placed in the Silurian section of his work, the three last in the Devonian. The application of Professor de Koninck's determinations to the stratigraphy of our New South Welsh rocks is

\* Southern Gold-fields of New South Wales, 1860, p. 105.

† Southern Gold-fields of New South Wales, 1860, p. 106.

‡ R. Etheridge, Junr.: The Pentameridae of New South Wales.—*Records Geological Survey New South Wales*, 1892, III, Pt. 2, p. 49.

§ Southern Gold-fields of New South Wales, 1860, p. 106. In the paper on the Pentameridae, previously quoted, an omission was made as to the first record of *Pentamerus Knightii* in Australia, which is due to the late Sir R. I. Murchison, from information supplied by the Rev. W. B. Clarke. (See *Quarterly Journal Geological Society*, VIII., p. 135.)

|| Recherches sur les Fossiles paléozoïques de la Nouvelle-Galles du Sud. 3 parts and atlas. (4to, Bruxelles, 1876-77).

is exceedingly difficult. We think it may be safely assumed, from his context, that the fossils transmitted by the late Rev. W. B. Clarke, instead of being forwarded in parcels representing a formation from a certain locality, as they should have been, were simply sent as so many individual specimens. De Koninck, in absolute ignorance of the geography of New South Wales, and in a great measure its geology also, simply determined his species from their geological alliances elsewhere, and then grouped them in wide horizons, absolutely irrespective of locality.

Space does not permit us to go into this subject thoroughly now, but a careful perusal of those portions of his work devoted to the Silurian and Devonian will convince an unbiassed reader of the soundness of this reasoning. By the light of the species quoted above, the Cooleman limestone may be either Silurian or Devonian, but at present we do not think that sufficient *published* evidence exists for a satisfactory solution of the subject. This and the other allied limestones throughout the country may be *either the one or the other*, but with a very strong bias in favour of the Upper Silurian. Facts are being daily gathered, which we hope will soon lead to a solution. Allowing for the extraordinary mixture of forms of more than one formation known to exist in some of our rocks, we do not think that for the present we can do better than continue the use of the compound term so wisely adopted by the late Mr. C. S. Wilkinson—that of Siluro-Devonian.

#### APPENDIX 9B.

##### Report on New Cave, Jenolan Caves.

Sir, Department of Mines and Agriculture, Geological Survey Branch, 24 March, 1893.

I have the honour to report, as requested, on the new cave, Jenolan Caves, discovered by Mr. J. Wilson, keeper, on the 20th February, 1893.

Although entered from the Imperial Cave, it may, from its size and position, being almost as large as that cave, and on a higher level, be considered a distinct cave. Also, in my opinion, it excels the "Imperial" in beauty and variety of formation, and the discovery may rank as one of the most important yet made at Jenolan.

The entrance is at the end of a passage running N. 20° W., 70 feet from a point about 12 feet north of the "Gem of the West" in the Imperial Cave, Right Branch. The opening was originally very small, but having been enlarged, it now measures 6 feet by 18 inches. Immediately inside, two high sloping rocks have to be scaled, and at 80 feet from the entrance is a chamber, about 70 feet long, and 40 feet wide, and 15 feet high, at which point the cave branches into two main leads, right and left, each of which has a number of offshoots or sub-branches. One of the best of the latter is situated on the right of passage between the entrance and the chamber referred to, and must have been originally a large, clear cavity, but an enormous quantity of material having fallen in from the roof, it is now necessary in making an inspection, to follow a circuitous and spiral-like course over large water-worn limestone boulders embedded in red clay and drift. These are piled on each other to a height of 70 or 80 feet, the top tier being within 10 feet of the roof, and forms the floor of a chamber about 50 feet long by 40 feet wide, which contains a grand collection of differently-formed stalactites. Projecting from the rugged walls and overlapping each other are snowy-white and salmon-coloured "canopies," and from lines of fracture in the roof, intersecting each other at various angles, depend rows of long tapering stalactites. The exposed surfaces of most of the detached limestone blocks have a crystalline stalagmitic coating, which sparkles brilliantly under the light of the magnesium lamp.

*Left branch.*—Returning to the junction chamber before-mentioned, where the cave divides into two branches, the main left branch is entered through an opening to the left, running S. 60° W. The first portion is in the form of a very irregular-shaped winding passage, averaging 10 feet wide by 8 feet in height, the bare rocks projecting, which are much water-worn. Most of the floor for a distance of 70 or 80 feet is composed of a stalagmitic coating over red muddy clay. The black and fawn-coloured walls are relieved at intervals with groups of pure white and reddish-brown stalactitic growths of various designs.

*Sub-branch to left.*—At 90 feet the cave bearing N. 20° E. becomes larger and more lofty, at which point a comparatively small passage branches to the left, the general bearing of which is S. 60° E. Following this branch a distance of 22 feet, a large chamber is entered, being about 50 feet long by 30 feet wide, the floor of which, forming a steep gradient, is ripple-marked and crystallised. It contains a good collection of differently coloured dripstone-growths. Running S. 30° E. from this chamber is a passage which can be traversed 90 feet along the centre of the floor of which, for a distance of 40 feet, is a channel 5 feet deep. The side of this natural cutting reveals a section of the floor-bed, which is composed of rounded water-worn boulders and gravel. Beyond the end of the channel the river-drift is crusted with a stalagmitic deposit, which forms the floor of the cave, in which occur at intervals a number of depressions resembling miniature lakes, whose beds are thickly covered with calcite crystals, salmon-coloured, and bunched together like small shrubs. These, and numberless slender stalactites of different shades of the same colour and pure white, depending from the roof, only 2 feet overhead, combine to make one of the prettiest sites of the cave.

Returning to the main cave the left branch, here tunnel-like in shape, bearing generally north-west, is followed a further distance of about 100 feet. Recesses in the walls and conical-shaped openings in the roof are occasionally met with, the floor for the most part being coated with guano, the upper surface of which has generally a thin stalagmitic crust, which is very brittle in places. In the next 90 feet a series of small chambers is passed through, in which are noticed some large deposits of carbonate of lime, in the form of buttresses against the walls. A peculiarly constructed stalagmite is also seen. It is about 9 inches high, by 2 inches in diameter, and sends out from its base a lateral shoot quarter-inch wide, which, running horizontally for about 7 inches, shoots up again at right angles, and again turns inwards and down again at right angles until it almost touches the lower horizontal-bar, thus forming an almost complete rectangle. This specimen has grown on the muddy floor.

*Branch tunnel like passage.*—Near this point a small branch-tunnel, about 3 feet wide by 1 foot high, running west 30 feet, is passed. It contains a centre line of stalactites, and the whole can be viewed without

without leaving the main passage. It is necessary to crawl over the next 30 feet, after which the passage enlarges considerably, forming a comparatively large chamber, one side of which is covered with a large talus heap, the broken boulders and debris composing same having fallen in from the roof. The walls of passage are still much water-worn.

*Circular depression in floor.*—Sixty feet further on is a large hole in the floor, about 20 feet wide and 15 feet deep, separated from which, by a treacherous bank of loose gravel and clay, is a circular depression, about 15 feet wide at the top, and at least 90 feet deep. In this instance almost the whole width of floor has sunk in, and as the only available track for passing same is a narrow ledge of loose gravel, it is, in its present state, a very dangerous spot. This hole is supposed to connect with a cavity on a lower level, referred to hereafter, which leads to the underground river, near the "Lily of the Valley" in the Imperial Cave.

*Hole leading to underground river.*—In close proximity, and dipping in the same direction, is another hole, which was descended to a depth of about 50 feet on to the floor of a lower level branch. From this point a roomy passage runs west 25 feet, on emerging from which a long weird-looking chamber is entered, whose damp sombre walls contrast strangely with those of the main branches immediately overhead. As if to make the change still more complete, the usual stillness is broken by the sound of fast dripping and running water.

This cavity is close on 400 feet in length, by about 15 feet wide, and from 30 to 40 feet in height, and differs in general appearance from any other cave at Jenolan. It resembles a long-rugged Gothic-shaped archway, in which small fissures and niche-like cavities occur at various places in the walls, the whole being coated with a brown muddy sediment. The floor is also thickly covered with guano and brown mud, and a number of fine stalactites and other calcareous growths have been coloured by the agency of the same material. The whole place is very moist, and pools of water are met with at intervals along the floor, the largest of which apparently running to a great depth under a shelving rock, blocks further progress at the northern end of chamber. At two or three places on the walls are noticed semi-circular cup-like excrescences, containing small nodular concretions of carbonate of lime, the whole formation being about the size of, and resembling very much a bird's nest with eggs. By descending a narrow fissure-like hole in the floor of this chamber, the underground river can be reached at a depth of over 100 feet. At one point on the descent, which is made over large rugged boulders, similar to the descent to the river in the Mammoth Cave, Jenolan, a glimpse is obtained through a small opening in the rocks of the "Lily of the Valley," in the Imperial Cave.

Continuing from the depression in the main passage by which we descended to the branch just described, at 50 feet further on a lofty conical-shaped cavity, 20 feet in diameter, is entered. A large portion of the roof having fallen in, comparatively speaking very recently, only fresh black rock and clay meets the eye. Beyond this for a distance of about 30 feet, progress is made by wriggling oneself along in a prostrate attitude, the passage not being more than 18 inches high, and closely packed, as also a small branch opening to the left, with fine white stalactitic growths, through which it is difficult to force one's way without breaking some of the specimens.

On emerging from this, a small chamber with sloping floor is entered, which, together with a small branch grotto, is profusely adorned with pure white and sparkling dripstone growths. From this portion a south-easterly course is taken over a steep talus heap for about 20 feet, when the "Alabaster Hall," the terminal and perhaps the most attractive chamber of the left branch is entered. It is a conical-shaped cavity about 18 feet in diameter by 40 feet in height, the whole wall surface of which is coated with a snowy white calcareous excrescence. Round the wall run terraced ledges of carbonate of lime, resembling a series of frozen cascades, supported here and there by miniature buttresses of the same material.

Depending from beneath the projecting portions are clusters of fine long stalactites, covered in most instances with splendid specimens of the "Mystery" type of formation, a growth very general throughout the cave. Near the centre of chamber stands a fine translucent stalagmite, 3 feet high, and 6 inches in diameter, which, though not quite so large, closely resembles in shape "Lot's Wife" of the Imperial Cave. On the left of chamber is a small ante-room or grotto, which is an almost perfect reproduction of the larger cavity on a smaller scale. This contains some very pretty shawl-like hangings and innumerable "Mysteries," and other varieties of dripstone formation. The stalagmitic floor of this chamber is ripple-marked and glossy, the crystallised surface of which presents a view under the light of the magnesium lamp similar to the "Diamond-walls" in the Imperial Caves.

*Right branch.*—The general bearing of the main passage of the right branch is north and north-west, branching from the first or junction chamber, almost directly opposite the mouth of the left branch. For the first 140 feet the winding passage, having an average width of 10 feet by 8 or 10 feet in height, is similar in most respects to the first portion of the left branch, the floor having been formed by a deposit of carbonate of lime on a bed of red clay, gravel, and guano. At 30 feet is a pretty little grotto resembling "Josephine's Grotto" in the right Imperial Cave, also a round opening in the roof something like a belfry. Portions of the floor and sides are ripple-marked and crystallized, and the grey angular projections of water-worn rock forming the other portion are spotted here and there with snowy-white patches of dripstone, the long, tapering stalactites comprising which reaching occasionally to within a few inches of the floor. At one spot is a very interesting collection of "Mysteries," which sprout up from the floor like a bed of thin twigs, twisted and curled in most unusual shapes.

*Sub-branch to left of passage.*—At 135 feet is a branch passage to the left, formed by a very lofty and narrow fissure in the limestone. With the exception of a cavity 15 feet wide by 25 feet high, and adjoining the main passage, which contains some canopy-like projections and other stalactitic growths, this branch, which can be traversed for a distance of 123 feet, is devoid of all forms of calcareous growths.

*Sub-branch to right of passage.*—Returning to the main lead, 16 feet further on two passages branch off to the right, running almost parallel in a north-east direction. The first can be traversed for about 50 feet, being a passage about 8 feet wide and 10 feet in height, rich in different forms of dripstone formations, including innumerable "Mysteries."

The first portion of the second branch is a lofty, narrow passage, opening at 36 feet into a chamber 50 feet long by 20 feet wide, partly filled with large rugged boulders embedded in red clay and river wash. The main feature of this chamber is a large patch of the "Mystery" type of formation before referred to. These growths completely cover a projecting portion of the wall 20 feet in extent, the majority of which are not more than 3 inches in length and not thicker than a very fine needle, and are twisted and curled

curled into as many different shapes as would be possible in the manipulation of a piece of pliable wire. Nothing but sombre-looking bare rock is presented to the eye in the other parts of the chamber.

From this chamber a descent of 30 feet is made through a water-worn vertical fissure, at the bottom of which is a horizontal cavity about 10 feet wide by 18 inches high, which runs back a considerable distance. The roof of this cavity is thickly studded with pipe-like stalactites, on the right of which is a small grotto, containing a good collection of calcite crystals, rivalling in beauty the "Queen's Diamonds" of the Imperial Cave.

From the junction of the sub-branches just described, the right branch, running generally north-east and north-west over a sinuous course, opening out at intervals into small chambers, can be traversed a further distance of 200 feet to present terminus. The richness, multiplicity of form, and diversity of colour of the calcareous adornments of this portion of cave, combine to make it one of the most interesting and pleasing of the cave sights of Jenolan. Depressions occur along the floor, in which, solutions of carbonate of lime having been evaporated, are now found clusters of salmon-coloured calcite crystals, about 3 inches high, and most evenly distributed over the whole surface. Near the end of the branch one has to pick one's way through miniature forests of delicately-formed stalactites and stalagmites, some of which are thickly studded with fine lateral shoots on "Mysteries."

At three places the passage converges to such an extent that it was found necessary to chip away a good portion of the rock to enable one to squeeze through and proceed further.

There is abundant evidence throughout the cave of its having been formerly a subterranean water-course. Where not covered with the calcareous deposition, the limestone walls are generally much water-worn, and the floors are mostly composed of layers of water-worn boulders, river-drift, and clay. On this account, the opening up and cutting of tracks through the floor-bed, in places now very low, should not prove a very laborious undertaking, the only drawback being the disposal of the material from the cuttings. Most of the steep descents and rises are so arranged that it will be possible in almost every instance, in providing means of access, to build concrete staircases in lieu of manufacturing iron ones.

The total length of passages discovered to date is close on 40 chains, and there are several likely-looking openings in both branches, not accessible in their present state, which may lead to other chambers and branches, it being my firm opinion that such exist.

I have, &c.,  
W. S. LEIGH,  
Superintendent of Caves.

---

APPENDIX 9c.

Report on recently-discovered branches of the New Cave at Jenolan.

Sir, Geological Survey Branch, Department of Mines, Sydney, 13 October, 1893.

I have the honour to report that during my visit to Jenolan in connection with the electric light work of the Lucas Cave, I inspected two recently-discovered branches of the new cave.

They are situated about 50 yards from the entrance, and are not more than 40 feet apart, the track to same taking an upward circuitous course between and over large masses of detached rock, and an ascent of 70 or 80 feet being attained on reaching the second branch. The cavities are about equal in size, each having a floor space of about 900 square feet, and like that portion of the main cave off which they branch, are very rugged and irregular; in fact, on account of the small and tortuous nature of the passage leading to the second branch, a person of more than average proportions could not in its present state gain an entrance.

The calcareous growths in both branches are very similar to those of the main cave, which, in point of beauty, variety, and richness, cannot be excelled at Jenolan.

The ceilings are covered with a white excrescence of carbonate of lime, from which depend long tapering stalactites of various shades of colour ranging from a snowy white to deep terra-cotta. The greater portion of the floors and sides is coated with a sparkling ripple-marked and crystallised stalagmitic layer.

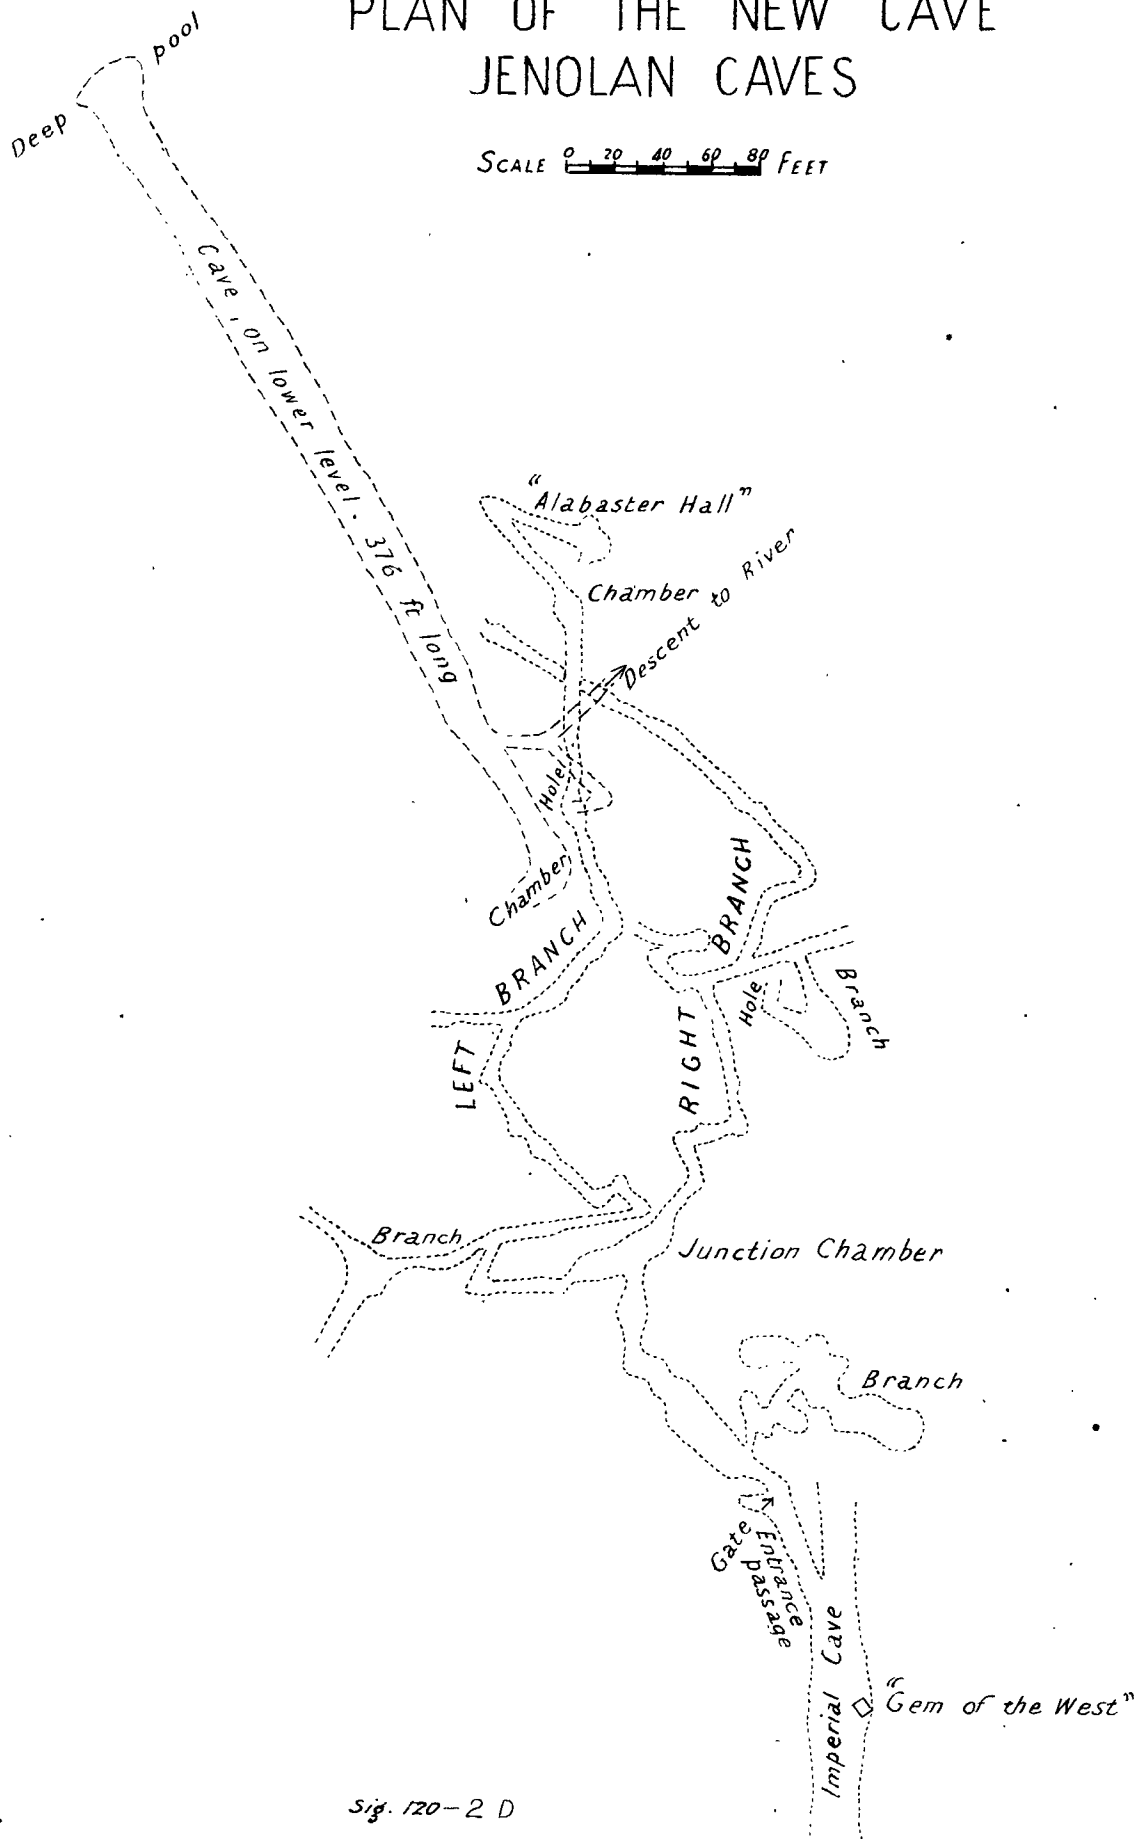

On the whole, I consider the new discoveries exceptionally good, and will add greatly to the importance of the new cave. They were discovered by Mr. J. Wilson, keeper.

I have, &c.,  
W. S. LEIGH,  
Superintendent of Caves.

**PROSPECTING VOTE.**  
(INFORMATION RESPECTING.)

*Ordered by the Legislative Assembly to be printed, 15 March, 1894.*

[Laid upon the Table of the House in answer to Question No. 2, of 7 February, 1894.]

Question.

2. PROSPECTING VOTE:—MR. ALFRED ALLEN (for MR. NEWMAN) asked THE SECRETARY FOR MINES,—Will he lay upon the Table of this House the following information respecting the Prospecting Vote:—
- (1.) The amount voted by this House for prospecting purposes in the years 1887, 1888, 1889, 1890, 1891, 1892, 1893, and 1894?
  - (2.) The various amounts actually paid away for prospecting during the years before mentioned?
  - (3.) What became of the residue from each of the above votes (if any)?
  - (4.) The proportion of the seven Votes in question devoted each to gold, silver, copper, tin, lead, coal, and other minerals?

Answer.

- (1.) 1887—£15,000; 1888—£20,000; 1889—£20,000; 1890—£20,000; 1891—£20,000; 1892—£40,000; 1893—£20,000; 1894—Not yet voted.
- (2.) 1887—£8,944 5s.; 1888—£5,601 13s. 5d.; 1889—£13,465 18s. 10d.; 1890—£17,727 4s. 11d.; 1891—£19,585 9s. 4d.; 1892—£40,000; 1893—£23,000 already paid.
- (3.) They are treated as savings.
- (4.) 1887—Gold, £8,944 5s. 1888—Gold, £5,338 8s. 5d.; silver and lead, £145; copper, £91; other minerals, £27 5s. £5,601 13s. 5d. 1889—Gold, £12,050 8s. 3d.; silver and lead, £740 16s. 3d.; copper, £46 15s.; tin, £33 15s.; coal, £337 15s. 7d.; other minerals, £256 8s. 9d. £13,465 18s. 10d. 1890—Gold, £14,465 12s. 7d.; silver and lead, £1,305 13s. 1d.; copper, £37 10s.; coal, £561 13s. 4d.; other minerals, £1,356 15s. 11d. £17,727 4s. 11d. 1891—Gold, £15,695 2s. 3d.; silver and lead, £2,175 12s. 6d.; copper, £94 10s.; tin, £462 18s.; coal, £569 10s. 7d.; other minerals, £587 16s. £19,585 9s. 4d. 1892—Gold, £34,881 8s. 11d.; silver and lead, £1,820 10s.; copper, £550 1s. 3d.; tin, £198 15s.; coal, £1,588 3s.; other minerals, £961 1s. 10d. £40,000. 1893—Gold, £20,810 11s. 4d.; silver and lead, £717 14s. 9d.; copper, £135 11s. 6d.; tin, £78 15s.; coal, £1,010 3s. 11d.; other minerals, £247 3s. 6d. £23,000. 1894—Gold, £506 12s. 9d.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

## NEWCASTLE PASTURAGE RESERVE ACT.

(SUBSTITUTION OF CERTAIN REGULATIONS FOR THOSE AT PRESENT IN FORCE RELATING TO PERMITS TO REMOVE MINERALS, &c.)

*Ordered by the Legislative Assembly to be printed, 17 January, 1894.*

Department of Mines and Agriculture, Sydney, 12 January, 1894.

### NEWCASTLE PASTURAGE RESERVE ACT, 53 VICTORIA No. 1.

REGULATIONS relating to permits to remove minerals, &c., from land alienated under the provisions of the Act 53 Victoria No. 1, and payment of Royalty therefor, in lieu of similar Regulations published in the *Government Gazette* of the 2nd August, 1893.

It is hereby notified, for public information, that His Excellency the Governor, with the advice of the Executive Council, has been pleased to approve of the cancellation of the Regulations made in terms of section 8 of the Newcastle Pasturage Reserve Act, 53 Victoria No. 1, and published in the *Government Gazette* of the 2nd August, 1893, and of the adoption (in lieu thereof) of the following Regulations relating to permits to remove minerals, &c., from land alienated under the provisions of the said Act, and to the payment of Royalty therefor.

[94-200]

T. M. SLATTERY.

If any person shall desire to dig, search for, or remove minerals from land alienated under the said Act, he shall make application to the Minister for Mines in the Form A hereto annexed for a permit to do so; and shall at the same time lodge with the Minister for Mines an abstract of his title to the land in respect of which the application is made; and if after inquiry the Minister for Mines shall consider that such application should be granted, either as made or in a modified form, the Minister for Mines may grant a permit in Form B, subject to the following conditions and to such other conditions as shall according to the circumstances of each case appear to the Minister for Mines proper:—

1. No permits to dig, search for, and remove minerals under land alienated under the Newcastle Pasturage Reserve Act will be granted to any person other than the owner of the land in respect of which the application is made, or some person or persons nominated by such owner.
2. The person named in the permit hereinafter called the "licensee" shall keep a book in which shall be forthwith entered the quantity and value of the mineral raised from the land; and such book shall at all times during each working day be open to the inspection of the Inspector of Collieries or any other Officer duly authorised by the Minister for Mines; and the licensee shall render such Inspector or Officer every assistance in making such inspection.
3. Within the first seven days of the months of January, April, July, and October of each year, the licensee, or his duly authorised agent or manager, shall forward to the Minister for Mines a return setting out the quantity and value of the minerals raised during the preceding quarter, together with a statutory declaration verifying such return, and declaring that the quantity and value of all the mineral raised from the land during the preceding quarter has been correctly entered in the said book under the proper dates, and has been included in such return.
4. With each such return the licensee shall pay or cause to be paid royalty upon the mineral raised computed at the following rates:—For coal, six pence per ton; for other minerals, five pounds per centum of the market value thereof at the pit-mouth; and such value may be ascertained and determined as the Minister for Mines shall in each case direct.
5. All surface and underground works shall at all times during each working day be open to inspection, survey, or measurement by the Inspector of Collieries or any other Officer of the Department of Mines duly authorised by the Minister for Mines; and such Inspector or Officer may use all apparatus or appliances ordinarily used at the mine for the purpose of descending or ascending any pit or other excavation; and the licensee or person in charge of the mine shall render every such Inspector or Officer all necessary assistance to enable him to make a complete inspection, survey, or measurement of such mine.
6. The Minister for Mines may cause to be made at any time an inspection of the book aforesaid, or an inspection, survey, or measurement of the mine, for the purpose of checking any such statement as aforesaid, or any entry in the book, or for any other purpose.
7. The licensee shall not assign, sublet, or otherwise deal with the permit granted under these Regulations without the consent in writing of the Minister for Mines.
8. If the licensee shall make a false return of the mineral or minerals raised from the land, or shall fail, neglect, or refuse to pay royalty upon the mineral raised, according to the foregoing scale, or shall obstruct or refuse to assist any Inspector or other Officer in making an inspection of the books or of the mine, or shall make default in the observance and performance of these conditions or any special conditions, the Minister for Mines may, by notice in writing left or affixed on any part of the land referred to in the permit, suspend for a time or absolutely cancel the permit granted to such licensee, and the right of such licensee to remove mineral from such land shall cease during such suspension, or after such cancellation, as the case may be.
9. The Regulations under the Newcastle Pasturage Reserve Act, published in the *Government Gazette* of 2nd August, 1893, are hereby repealed.

VOTES No. 24. TUESDAY, 13 MARCH, 1894.

12. APPLICATION OF MR. J. F. CONNELLY TO MINE IN THE PARISH OF CURRAJONG:—*Mr. McCourt*, for Mr. Neild, moved, pursuant to Notice,—
- (1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the application of Mr. J. F. Connelly to mine in the parish of Currajong.
- (2.) That such Committee consist of Mr. Slattery, Mr. McCourt, Mr. Morgan, Mr. Lee, Mr. Wall, Mr. Gardiner, Mr. O'Sullivan, Mr. Jones, Mr. Waddell, and the Mover.
- Mr. Frank Farnell moved, That the Question be amended by the addition of the words,—
- (3.) That the Minutes of Proceedings of, and Evidence taken before the Select Committee of "Session 1893, be referred to such Committee."
- Question,—That the words proposed to be added be so added.
- Debate ensued.
- Question,—That the words proposed to be added be so added,—put and passed.
- Question as amended,—
- (1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the application of Mr. J. F. Connelly to mine in the parish of Currajong.
- (2.) That such Committee consist of Mr. Slattery, Mr. McCourt, Mr. Morgan, Mr. Lee, Mr. Wall, Mr. Gardiner, Mr. O'Sullivan, Mr. Jones, Mr. Waddell, and the Mover.
- (3.) That the Minutes of Proceedings of, and Evidence taken before the Select Committee of Session 1893, be referred to such Committee,—put and passed.

VOTES No. 43. TUESDAY, 1 MAY, 1894.

10. APPLICATION OF MR. J. F. CONNELLY TO MINE IN THE PARISH OF CURRAJONG:—Mr. Neild, as Chairman, brought up the Report from, and laid upon the Table the Minutes of Proceedings of, and Evidence taken before the Select Committee for whose consideration and report this subject was referred on 13th March, 1894, together with Appendix.
- Ordered to be printed.

1894.

APPLICATION OF MR. J. F. CONNELLY TO MINE IN THE PARISH OF  
CURRAJONG.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, appointed on 13th March, 1894, "*with power to send for persons and papers, to inquire into and report upon the application of Mr. J. F. Connelly to mine in the Parish of Currajong,*" and to whom was referred on the same date "*the Minutes of Proceedings of, and Evidence taken before the Select Committee of Session 1893,*"—have agreed to the following Report:—

Your Committee having examined the witnesses named in the List\* \*See list, p. 6. (whose evidence, together with the evidence of Session 1893, will be found appended hereto), find as follows:—

1. That in August, 1884, Connelly first made application under the 45th section of the Crown Lands Act of 1884, for permission to mine in and upon 2 acres of land, being Improvement Purchase No. 423, township of Parkes, parish of Currajong. Connelly continued to apply for such permit from August, 1884, to November, 1886, when one was granted him.
2. That subsequent to the date of Connelly's first application, and during the time he was continuing to apply, the Government, ignoring his repeated applications, granted a permit to one Hazelhurst to mine upon the said 2 acres.
3. That when Connelly obtained the required permit in November, 1886, he started working at once, employing six men, and sank two shafts, 170 and 84 feet respectively, and also drove 150 feet; work which involved an outlay of £400.
4. That after working for about four months, Connelly broke into the workings of Quaile and party, who had trespassed into the ground held by Connelly, who sought the intervention of the Warden, but that officer declined to interfere.
5. That shortly afterwards, on receiving instructions from the Under Secretary for Mines to "order both parties to withdraw at once from the private land on which they have been working, until the Minister for Lands has decided what is to be done in regard to Connelly's permit," the Warden, Sharp, threatened the removal of Connelly and his men by the police, whereupon Connelly and men left the ground.
6. That, according to the evidence of the Under Secretary for Mines, such a threat of police intervention was, under the circumstances, wholly unusual and without precedent or repetition.
7. That prior to this event, viz., in January, 1887, the Minister for Lands assumed to cancel Connelly's permit on the ground that there had been a suppression of facts when the application was made.

8. That there was no such suppression; on the contrary, the existence of gold-mining on the adjoining land was more than once disclosed by Connelly in his applications for a permit.
9. That the power to cancel such permits existed in Regulation 171, but such regulation conferred no authority upon the Minister to cancel a permit for the reason advanced by him, and his action was, therefore, contrary to law. According to the evidence of the Under Secretary for Mines (Qs. 315 to 322), no similar cancellation has occurred. In this connection your Committee draw special attention to the minutes of the Under Secretary for Mines, dated the 8th March and 5th May, 1887, attached to this Report.
10. That after the alleged cancellation of Connelly's permit, Quaile and party obtained possession of the ground, and, as shown by documentary [Appendix A2] evidence, the Australian Joint Stock Bank at Parkes advanced £6,305 8s. 5d. to them on gold obtained from the said ground.
11. That the mine was afterwards sold by them to the Quaile Proprietary Gold-mining Company.
12. That Connelly suffered serious loss by the alleged cancellation of the said permit.

Your Committee recommend his claim to the favourable consideration of the Government and Parliament.

JNO. C. NEILD,  
Chairman.

*No. 2 Committee Room,  
Sydney, 17 April, 1894.*

1893.

## PROCEEDINGS OF THE COMMITTEE.

TUESDAY, 5 DECEMBER, 1893.

MEMBERS PRESENT:—

|              |  |               |
|--------------|--|---------------|
| Mr. McCourt, |  | Mr. Morgan,   |
| Mr. Neild,   |  | Mr. Slattery. |

Mr. Neild called to the Chair.

Entry from Votes and Proceedings appointing the Committee *read* by the Clerk.

John Francis Connelly called in, sworn, and examined.

Witness *handed in* Rough sketch of the land and workings [*Appendix A1*]; Copy of return showing advances on gold made by the Australian Joint Stock Bank, Parkes, to Quaile and Party, from December, 1886. [*Appendix A2*.]

Witness withdrew.

[Adjourned till Friday next, at *Eleven* o'clock.]

FRIDAY, 8 DECEMBER, 1893.

MEMBERS PRESENT:—

Mr. Neild in the Chair.

|               |  |              |
|---------------|--|--------------|
| Mr. Gardiner, |  | Mr. McCourt, |
| Mr. Morgan,   |  | Mr. Wall.    |

Entry from Votes and Proceedings, referring the Return to Order "Application of Mr. J. F. Connelly to mine in the Parish of Currajong," laid upon the Table during the Session of 1887-8, to the Committee, read by the Clerk.

Copies of the Return to Order *referred*, before the Committee.

John Francis Connelly called in and further examined.

Witness withdrew.

Edmund Charles Connelly called in, sworn, and examined.

Witness withdrew.

Harrie Wood (*Under Secretary for Mines*) called in, sworn, and examined.

Witness withdrew.

John Francis Connelly recalled, and further examined.

Witness withdrew.

Harrie Wood recalled, and further examined.

Witness withdrew.

[Adjourned till Tuesday next, at *Half-past Eleven* o'clock.]

1894.

## PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 15 MARCH, 1894.

MEMBERS PRESENT:—

|          |  |              |
|----------|--|--------------|
| Mr. Lee, |  | Mr. McCourt, |
|          |  | Mr. Neild.   |

Mr. Neild called to the Chair.

Entry from Votes and Proceedings appointing the Committee, and referring the Minutes of Proceedings of, and Evidence taken before the Select Committee of Session 1893, *read* by the Clerk.

Minutes of Proceedings, and Evidence referred, before the Committee.

Motion made (*Mr. Lee*) and Question,—That the Minutes of Proceedings of, and Evidence taken before the Select Committee of Session 1893, be adopted by this Committee,—put and passed.

Committee deliberated.

[Adjourned till Thursday next, at *Half-past Ten* o'clock.]

THURSDAY, 22 MARCH, 1894.

The meeting ordered for to-day postponed, by order of the Chairman.

THURSDAY,

THURSDAY, 29 MARCH, 1894.

MEMBERS PRESENT:—

None.

[In the absence of a quorum the meeting called for this day lapsed.]

THURSDAY, 5 APRIL, 1894.

MEMBER PRESENT:—

Mr. Neild.

[In the absence of a quorum the meeting called for this day lapsed.]

TUESDAY, 10 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Neild in the Chair.

Mr. McCourt, | Mr. Waddell.

Angus Graham Robertson (*Manager of Quail's Proprietary Gold-mining Company, Limited*) called in, sworn, and examined.

Witness withdrew.

John Francis Connelly called in, sworn, and examined.

Witness withdrew.

[Adjourned till Tuesday next, at *Twelve* o'clock.]

TUESDAY, 17 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Neild in the Chair.

Mr. Jones, | Mr. McCourt.

John Francis Connelly called in and further examined.

Room cleared.

The Chairman presented Draft Report.

Same read, amended, and agreed to.

Chairman to report to the House.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

APPLICATION OF MR. J. F. CONNELLY TO MINE IN  
THE PARISH OF CURRAJONG.

TUESDAY, 5 DECEMBER, 1893.

Present:—

|             |  |               |
|-------------|--|---------------|
| MR. NEILD,  |  | MR. McCOURT,  |
| MR. MORGAN, |  | MR. SLATTERY. |

J. C. NEILD, Esq., IN THE CHAIR.

Mr. John Francis Connelly called in, sworn, and examined:—

1. *Chairman.*] What is your occupation? I am a mining speculator.
2. How long have you been engaged in mining operations? Thirty-nine years, and in other business combined.
3. Your knowledge of mining extends over thirty-nine years? Yes.
4. In what class of mining have you been chiefly engaged? Gold-mining—alluvial and quartz.
5. You have been so engaged for thirty-nine years off and on? Yes.
6. I believe you made an application to mine under certain land in the township of Parkes? Yes.
7. When did you make that application? In August, 1884.
8. Whose land was this at the time? Mr. M'Gee's.
9. How did he obtain the land—by purchase? Yes.
10. By virtue of improvements, was it not? The land was applied for by John M'Connel while it was in possession by the miners.
11. *Mr. Morgan.*] But how did M'Connel obtain possession of it—under a mineral conditional purchase? No, conditional purchase.
12. He could not obtain 2 acres of land under conditional purchase? The papers will show how he obtained it. I believe it was in the ordinary way—by virtue of improvements,—there being an old hut there at the time.
13. *Chairman.*] I asked you whether M'Gee did not obtain the land by virtue of improvements? John M'Connel got the land first and sold to M'Gee.
14. M'Gee was holding it as a freehold? Yes.
15. The area was about 2 acres? Yes.
16. Where was it situated? Alongside the gold reserve at Parkes—Dalton-street.
17. Did you receive any reply from the Government to your application to mine? Yes, several.
18. What was the nature of those replies? That they could not identify the land from my description.
19. Do you consider that your description was sufficient to enable the ground to be identified? Yes; it was as clear as the sun.
20. You applied under the 45th section of the Crown Lands Act of 1884, did you not? Yes.
21. Do you remember when this locality was proclaimed as a gold-field? About thirty years ago.
22. Then you applied also, I suppose, by virtue of the regulations of the 2nd January, 1885? I could not say as to that. I know that I continued to apply from August, 1884, up to November, 1886.

Mr. J. F.  
Connelly.  
5 Dec., 1893.

- Mr. J. F. Connelly.  
5 Dec., 1893.
23. *Mr. Morgan.*] You applied for a permit under the usual conditions? Yes.
24. *Chairman.*] You obtained a permit in 1886? I did.
25. Did any mining go on on the ground between the date of the application and the date of its being granted? Yes.
26. Who was mining there? Mr. Hazelhurst.
27. Did he mine by reason of any authority obtained? Yes.
28. Do you know the date upon which he obtained this permission? June, 1886, I think.
29. Have you any personal knowledge of the date when he made his application? Yes.
30. Was his application made before or after your first application? Long after my first application—years afterwards. My application was in 1884, and his was in 1886.
31. Did he take any gold out of the ground? No.
32. After you obtained permission to enter into possession how many men did you employ on the ground? Six.
33. Was that the number required by law? The land comprised six men's ground, and it could have been worked with three, but I employed six.
34. You employed more than were required by law? Yes.
35. What work did you carry out? I sunk two shafts of about 170 and 84 feet respectively, also 150 feet of driving.
36. How far were they apart? One shaft was about 25 feet from the north fence and the east fence.
37. That is, in the corner? Yes.
38. How far was the other shaft away? Somewhere about the same distance, but 100 feet away.
39. Did you strike any gold? No.
40. Did you put in any drives from the bottoms of the shafts? Yes.
41. How far did you carry those drives? My memory does not serve me, but I think a long distance.
42. Can you give us some idea—was it 100 feet or 50 feet? More than that. We must have driven one 50 feet, another 25 feet, and another about 70 feet. I think there were about 150 feet of driving altogether.
43. Can you give the Committee any idea of the cost of the work you did on the ground? About £400.
44. Did you come across any gold? None.
45. Were you satisfied to continue; were the prospects good enough? Oh, yes. I intended to sink these two shafts to a depth of from 200 to 250 feet.
46. To sink the shafts deeper than the level at which you were driving? Yes.
47. How long were you carrying on this work? About five months.
48. What happened at the end of that time? At the expiration of about three months the Warden interfered in consequence of my breaking through into the workings of Quaile and party.
49. Where were they working? They had a claim adjoining, on Crown land.
50. Have you a plan showing the locality? Yes. [*Appendix A1.*]
51. On this plan there are certain shafts marked;—what shafts are those marked Nos. 3, 4, and 5? Those are my work.
52. And the piece of land marked "I. P., No. 423" is the land in respect of which the present dispute arose? Yes.
53. Here are some shafts marked No. 1 and No. 2;—what are those? I was looking for the reef in No. 2; Quaile's is No. 1 claim, and mine is No. 2 claim; Quaile had two claims which are represented on the plan; mine are outside.
54. What are these shafts marked 1 and 2? The shafts I sunk when I was looking for the reef during the time my application was in for a permit.
55. You were working there with the view of testing the value of that ground? No, I was working with a view of testing the line of reef which was supposed to continue on in that direction.
56. Then shafts Nos. 1 and 2 on the plan have nothing to do with the matter in dispute? No.
57. But shafts 4 and 5 have? Yes.
58. And what is shaft No. 3? I drove as far as I possibly could, with the permission of the owner, but owing to bad air I could not get any further.
59. Do the dotted lines on the plan represent your drives? Yes.
60. What did the Warden do when he visited you? I called on the Warden two or three times and asked him to interfere in this matter, but he said he had no jurisdiction and could do nothing.
61. With reference to Quaile's complaint? Yes.
62. But the dotted lines on this plan do not show you as driving near Quaile's land? I knew then, and I know still, of gold that is just close up to that fence, supposed to be running through that ground.
63. But the dotted marks on the plan do not show you as driving in the direction of Quaile's land? No.
64. Did you drive in the direction of Quaile's ground? No, we did not. In sinking my No. 5 shaft I broke into certain workings that Quaile and party had made into M'Gee's ground.
65. Your statement is that it was Quaile who was the trespasser and not you? Yes.
66. Quaile trespassed on your ground? Yes.
67. Then Quaile made a complaint? Yes.
68. And you applied to the Warden for his intervention? Yes.
69. And the Warden declined to have anything to do with the matter because the land being private property it was out of his jurisdiction? Yes.
70. Is it not a fact that the Warden at some time or other ordered you off M'Gee's ground? He did.
71. When was that? About three or four months after I went into possession of the ground.
72. Did he give any reason for ordering you away? No; I declined to go at first.
73. Did he order you off on his own authority or did he produce any document—had you received any document? No I had not. The Warden had received instructions from the Mines Department in Sydney.
74. Was that the statement he made to you? Yes.
75. Did he show you any document? No.
76. Have you during your 39 years of mining had any experience of a similar character? No.
77. Or ever hear of a similar case? No.
78. You never heard a man in possession of ground being ordered off verbally? No.

Mr. J. F.  
Connelly.  
5 Dec., 1893.

79. What did you do when he ordered you off—did you go? I declined to go.
80. Did anything happen after you refused to go? No; the Warden said if I did not go he would put me off by the police, and I said that in that case I would have to leave.
81. What happened after that;—did you go? I did for the time being. I ceased working but I kept my men on the ground.
82. How long did that continue? I think for a fortnight.
83. At the end of the fortnight what took place? I went to work again.
84. How long did you work? Speaking from memory, I think about a month.
85. During that period of a month did you get any notification from the Warden? My memory does not serve me, but I think I did.
86. Did he give you any written notice to quit? My memory does not serve me.
87. Did you get any written notice from anyone during that month? I do not think so.
88. At the end of the month what happened;—did anybody order you to quit then? No, I don't think so.
89. Then how did you come to leave—you did leave, did you not? I did leave in the end. Finding that I could not go on doing a lot of work on spec I reduced the number of my men. I think I stopped on an extra fortnight.
90. After the end of the month? Yes.
91. Then that makes a period of about six weeks or two months from the time when the Warden first ordered you to leave? As far as my memory serves me I think it was about a month altogether.
92. What did you do finally. Did you discharge all your men and leave the ground, or did you get any fresh communication from the Warden? I discharged my men and left the ground. I had to leave, of course, having been threatened with the police.
93. But were you threatened with removal during that month? No; only the once that I remember.
94. Then are we to understand this, that on a certain day the Warden came and ordered you off the ground; you remained there, notwithstanding that warning, for about a month afterwards, and finally you walked off and left the ground? My memory does not serve me as to that. It is just possible that the Warden ordered me off at the last of my working. I am not sure; it is so long ago.
95. *Mr. Morgan.*] The Warden, Mr. Sharpe, ordered you off? Yes.
96. Under instructions from whom? The Mines Department in Sydney.
97. In a Parliamentary Return, laid on the Table of the Assembly some years ago, there is a copy of a letter from the Under Secretary for Mines, instructing Mr. Warden Sharpe to order both parties to withdraw from the ground. I presume that at that time you and Drummond were both working on one piece of ground? Yes.
98. That was on the 25th March, 1887? That was about the time. But I think the Warden came to me some time after this—after we commenced work again—and ordered me off, and threatened me if I did not leave he would put me off by the police.
99. At that time you were working under a permit, and Drummond and party had no permit to go in on that piece of ground? Yes.
100. *Chairman.*] After you were first ordered off the ground by Warden Sharpe you remained in possession doing certain work, and eventually you received another communication from the Warden, either personally or by letter, directing you to leave finally, and stating that if you did not go the police would remove you, and then you went? Yes, that is so.
101. Certain communications passed between you and the Government with reference to this ground, and with reference to your being ordered off? Yes.
102. You never got permission to go back again? No.
103. Of your knowledge, was anything done with the ground after that;—did any mining take place on the same ground? Yes; Quaile and party got possession.
104. They got possession of M'Gee's piece? Yes.
105. In addition to their own ground? Yes.
106. Did they get permission from the Government? They did.
107. Then your statement is that Quaile having broken through the ground on which you were mining, you made a complaint to the Warden, and the outcome of that complaint was that you were removed from the ground and Quaile and party got a right to it all? Yes.
108. Did they ever get any gold out of this ground? Yes, any amount.
109. Could you give the Committee any statement of the value of the gold that was got out of this ground? The only statement I can give is as to what they got out of the ground after I obtained my permit. They got a considerable amount out of the same ground before my permit was granted.
110. What did they get out of the ground after you got your permit? I got a note from the bank stating the amount of gold they got up to the time they sold their claim to a company.
111. Have you got that letter from the bank? Yes.
112. Can you hand it in as an appendix? Yes. [*Appendix A2.*]
113. *Mr. Morgan.*] Of course you cannot of your own knowledge swear what amount of gold they got? I can show what they got from particulars furnished by the bank.
114. *Chairman.*] Do you hand in a document headed "The Australian Joint Stock Bank, Parkes. Advances on gold to Quaile and party from December, 1886"? Yes.
115. This purports to be a copy; did you have the original, or is this the document the bank handed to you? That is the document the bank handed to me.
116. And it shows that the bank advanced £6,305 8s. 5d. to Quaile and party from December, 1886, to November, 1890? Yes.
117. Are you in a position to say that that gold came wholly from M'Gee's ground? I am.
118. Did none of it come from Quaile's reef claim? No; that was worked out.
119. Then you swear that the whole of the gold represented in the return now handed in came from the ground you were working? Yes, I do.
120. And of which you were dispossessed? Yes.
121. *Mr. McCourt.*] Can you actually swear that of your own knowledge? Perhaps I should say, to the best of my belief.
122. *Chairman.*] Then your complaint amounts to this: That you were in lawful possession of this piece of ground known as McGee's; that you expended money upon it; that you were wrongfully dispossessed of it;

- Mr. J. F. Connelly.  
5 Dec., 1893.
- it; and that other persons, Quaile and party to wit, obtained large returns from this piece of ground which returns you would have obtained had you not been put off the land by the action of the Warden? Yes.
123. That is your complaint? Yes, it is.
124. Have you any other statement you would like to make? I should like to say that at the time I made application for a permit I was mining in No. 2 shaft, on the line of reef from Hazelhurst's claim. The reason why I applied for the permit to mine under M'Gee's land was because I knew of the existence of gold outside the fence in an old shaft. I had broken it out myself and seen it with my own eyes, and knew it was there; and this caused me to apply for a permit to mine under this land. That gold still remains, and has never been touched since.
125. There is gold in the ground still? I would not say in M'Gee's ground, but I know it to be just outside.
126. Where Quaile and party got the gold from M'Gee's ground—was it from your No. 5 shaft or No. 4 shaft? From under No. 5 shaft.
127. Did they sink much deeper than you had been sinking? Yes, about 40 feet.
128. They sunk about 40 feet and got the gold? They got the gold all the time; they followed the gold to wherever it went.
129. But you told us that in sinking those shafts you did not sink deep enough to strike the gold? No, I could not get at it; they had taken it away from me.
130. At the same time you told also that in sinking No. 5 shaft you cut through the reef? No.
131. You cut through Quaile's workings? Yes.
132. Then they continued to sink after you left No. 5 shaft and struck the gold? No, they continued their workings from their shafts on Crown land.
133. They continued a shaft on their own ground, and then drove in under your No. 5 shaft? Yes, and continued to work that from Crown land.
134. *Mr. Morgan.*] You applied for the permit when no other person had possession of the ground? Yes.
135. That is M'Gee's 2 acres? Yes.
136. Then you put on the number of men required under the Regulations or Act of Parliament? Yes, I had six men working.
137. It was no more than six men's ground? No.
138. And you continued working there until you were ordered off by the Warden? Yes.
139. Do you know under what conditions a mining permit is issued? Yes.
140. You have to fulfil certain conditions—you have to put four pegs, or the required number of pegs, in the ground, and you have to keep a certain number of men on the ground? Yes.
141. Did you fulfil those conditions up to the time you were ordered to leave the ground? Yes.
142. What was the reason given by the Minister for your removal? A suppression of the facts of the case.
143. You have a fair knowledge of the mining laws and regulations? I have.
144. Is there any such ground for the withdrawal of the permit, as far as you know, as the suppression of facts? No.
145. As a matter of fact, did you suppress any facts in applying for the permit;—did you suppress anything that came to your knowledge in a way to mislead the Department and the Minister? No, I did not; on the contrary, I gave them all the knowledge that I myself possessed.
146. Did you apply for a prospecting protection area? No, I did not.
147. What did you apply for? I applied for a permit to mine on this land of M'Gee's.
148. And the area of land you held was according to the Act or the regulations? Yes.

FRIDAY, 8 DECEMBER, 1893.

Present:—

MR. GARDINER,  
MR. MORGAN,

MR. MCCOURT,  
MR. WALL.

J. C. NEILD, Esq., IN THE CHAIR.

Mr. John Francis Connelly recalled and further examined:—

- Mr. J. F. Connelly.  
8 Dec., 1893.
149. *Chairman.*] I believe you desire to make one or two corrections in your previous evidence? Yes.
150. Question and answer No. 88 are as follow:—  
At the end of the month what happened—did anybody order you to quit then? No; I do not think so.
- Do you wish to correct that answer? Yes; and to say that the Warden ordered me to remove from the ground, informing me that if I did not do so he would put me off with the aid of the police.
151. The next question and answer are as follow:—  
Then how did you come to leave—you did leave, did you not? I did leave in the end. Finding that I could not go on doing a lot of work on spec I reduced the number of my men. I think I stopped on an extra fortnight.
- Do you wish to correct that answer? Yes. The statement that I think I stopped on an extra fortnight is incorrect. I left at once.
152. Is there any other evidence you desire to give? I wish to explain that at the end of the term, when the disturbance arose between the two opposite parties, we left by mutual consent.
153. When you speak of the opposite parties, to whom do you refer? Quaile and party, and myself.
154. When the disturbance arose between yourself and Quaile you both left by mutual consent? We left by mutual consent on the advice of the Warden.
155. That was the first intervention of the Warden in the matter? Yes.
156. That was the matter to which you referred in your evidence when you said that upon breaking into Quaile's working you sought the intervention of the Warden, and on seeking the intervention of the Warden you mutually agreed to suspend operations? Yes; and we did so for about a fortnight.
157. *Mr. Gardiner.*] When operations were suspended by mutual consent was not a court of inquiry held by the Warden? It was.
158. At which full evidence was taken? Yes.

## APPLICATION OF MR. J. F. CONNELLY TO MINE IN THE PARISH OF CURRAJONG.

159. Was not your permit cancelled by the Mines Department after that evidence had been forwarded to them? No; it was not then finally cancelled.
160. When was it cancelled? It was cancelled some time in May, by Mr. Francis Abigail, then Secretary 8 *Mr. J. F. Connelly.*  
Dec., 1893.
161. That was a considerable time after operations had been suspended by the order of the Warden—were not operations suspended in March? Operations were suspended in March, but only temporarily, because when Quaile and party started to work we started to work also.
162. *Mr. Morgan.*] You were under considerable expense in sinking shafts and cutting drives? I was.
163. And your object in this inquiry is to get compensation for loss which you consider you sustained;—what loss have you sustained by the cancellation of your permit and through being prevented from carrying on mining operations? If I could go into the matter the loss would be somewhere about £40,000.
164. Upon what do you base that estimate? It is given roughly speaking, and is not to be taken as absolutely correct.
165. I want a correct statement of the actual expenses incurred, and the loss sustained by you in consequence of the cancellation of your permit? My expenditure has been somewhere about £400. The loss I sustained through gold being taken from this piece of land, which I call my piece, by Quaile and party, while I held the permit, was somewhere about £7,000. In addition to this, there is a sum of £12,000, for which the mine was afterwards sold, and for which it could have been sold by me.
166. You say you actually expended £400? About £400.
167. What was that money expended upon? Upon work and labour done, and upon the preliminary arrangements in connection with the mine—timbering, and everything else connected with it.
168. You had six men employed? Yes.
169. For how long? I had six men employed for about three months. Four men a fortnight. I then had two men employed, not including myself. Finally, four men one month; and I was always there looking after my interests. I kept two men there for about a fortnight, during the inquiry by the Department in Sydney.
170. Do you swear you expended about £400 in connection with the mine before you were ordered off the ground? Yes.
171. You spoke of a loss of £7,000;—of what did that consist? That was the amount of gold obtained by Quaile and party from the piece of land in dispute during the time my permit was in existence, and afterwards while it was in abeyance.
172. How long was that? From December, 1886, to November, 1890. A return as to the amount of gold was furnished by the A. J. S. Bank at Parkes.
173. Then you say there was a further loss of £12,000;—what was that? That is the amount for which the mine was sold, and which could have come to me as it did to Quaile and party. They were paid £12,000 by the Quaile Proprietary Company for what was really my claim.
174. That would be about £19,400, which you say you have lost by the action of the Government in withdrawing your permit? Yes—roughly speaking, £20,000.
175. Before you applied for the permit, Quaile and party were working close by? They were working on Crown land outside their own claim.
176. You were in the habit of going down their claim before you started, were you not? No, I was not; I think I did on one occasion.
177. Before you started any work of your own, were you in the habit of going down Quaile and party's shaft? Certainly not.
178. Did you gain any information from visits there as to the existence of gold on this piece of ground, in respect of which you applied for a permit? No; during the time the permit was pending I often heard that these men were working on this private land, and from inquiries made from the men, I found out how far they had gone in under the ground.
179. That fact was stated by you in one of your applications, was it not? I think so.
180. In applying to the Minister for Lands for a permit, did you state that gold was being found around or close by this property which you desired the permit to enter upon? Yes; I think I stated that the land was being mined on three sides of this private land, or in fact on four sides, because at that time I occupied one side of it by claim No. 2. Quaile's claim was No. 1, and my claim was No. 2, outside of Quaile's. It was during the time that I was prospecting in No. 2 claim that I took a notion that there must be parallel reefs running in this land of M'Gee's, because I knew, and know still, of a gold-bearing vein immediately outside of his fence, and this caused me to apply for a permit.
181. *Mr. Gardiner.*] When you received your permit, did you immediately start No. 5 shaft, with the view of striking Quaile and party's drive? Yes.

Mr. Edmund Charles Connelly called in, sworn, and examined:—

182. *Chairman.*] Are you a son of the preceding witness? Yes.
183. Have you had any experience in gold-mining? Yes.
184. How many years? From the time I was about 15 or 16 years of age until the present time—that is about eleven years.
185. Do you know the piece of ground known as M'Gee's land, in Parkes, which forms the subject of this inquiry? I do.
186. Did you work on that ground? Yes.
187. For how long? For about four or five months.
188. Have you any knowledge of your father, and the men he employed, being ordered off the ground by the Warden? Yes.
189. Were you present when the order was given? No; I do not know what occurred of my own personal knowledge, but I know from hearsay.
190. Were you present at any time when the Warden came on to the ground? No.
191. Had you been working up to the time when work was stopped? Yes.
192. Were you informed by your father of the reason for stopping work? I cannot say that I was definitely informed by my father, but I knew from my dealings with my father, and from ordinary conversation at the table, what was going on, and I was thoroughly well acquainted with the stoppage of the works, and the reasons for such stoppage. 193.
- 8 *Mr. E. C. Connelly.*  
Dec., 1893.

- Mr. E. C. Connelly.  
8 Dec., 1893.
193. You heard the evidence which your father gave this morning with reference to the stoppage of the works by the Warden? I heard it, but it was not explicit.
194. Had you struck gold in the workings up to the time when the work was stopped? No.
195. How many men were working with you? The number varied from time to time.
196. What was the greatest number at any one time? Six.
197. Including yourself? Yes.
198. And your father? No; not my father.
199. What was the rate of wages for gold-mining in Parkes at that time? From £2 5s. to £2 10s. per week. I got £2 10s.
200. Did the work in which you were engaged require timbering? Some of it did.
201. In the shaft or in the drives? In the shaft.
202. What timber did you use? Stull pieces. It was not in my shift that stulls were used.
203. How much timber did you use altogether? To the best of my knowledge, four or five loads of timber came on to the ground.
204. Dressed timber? No; undressed.
205. Was it pine, or other timber? It was box.
206. What would it be worth a load? I should say about £3 or £4.
207. Then the amount of timber which was placed in these workings reached a value of how much? I should say about £14, including stull timber and logs.
208. Have you any knowledge of the working of the ground since you left it? No.

Harrie Wood, Esq., called in, sworn, and examined:—

- H. Wood, Esq.  
8 Dec., 1893.
- 209 *Chairman.*] I believe you are Under Secretary for Mines and Agriculture? Yes.
210. You have had some personal knowledge of a claim arising in connection with Mr. Connelly's occupancy for mining purposes of a piece of land in the town of Parkes? Yes.
211. That matter came to your Department, I think, after it had been dealt with to some extent by the Lands Department? It is a long time ago, and the matter is perhaps not quite so fresh in my memory as it should be, but the impression on my mind is that the permit had been granted by the Minister for Lands and also cancelled by him.
212. Has there been any alteration in the practice of the Lands and Mines Departments in dealing with these applications to mine, or is the practice the same now as it was in 1884? The law has been altered to some extent in regard to the matter of permits to search; because that is what I understand it to be—a permit to search for gold on purchased land.
213. Under what section of the Act? At that time it was under the 45th section of the Land Act of 1884. Now, we have also the Mining Act of 1889, under which we deal with applications of this kind.
214. Would an application of this kind come direct to your Department now? Yes.
215. It would not be dealt with by the Lands Department at all? No.
216. And your recollection of the matter is that prior to the Mines Department dealing with the case the Lands Department had granted a permit and had subsequently assumed to cancel it? Yes.
217. And then, that original cancellation came to your Department for confirmation—is that so? I think there was some question which arose between Mr. Connelly and Mr. Baxtrom or Quaile and party. As far as I recollect Baxtrom and party had acquired permission from the owner of the land to mine upon it, and I think I pointed out that the owner of the land had no power to give permission, because he had not himself obtained a permit under which he would acquire the right to mine. I do not know whether I am correct in saying that I pointed out also that these permits to search give the person to whom they are granted no right to the gold.
218. The right to search did not imply the right to the gold discovered? No. Upon a discovery being made, the fact is supposed to be reported, and it then rests with the Crown to decide whether or not it will cancel the purchase. If the Crown should decide to cancel the purchase, then the land becomes Crown land, and the man who holds the permit has the first right to make a title to that land which would give him the right to the gold.
219. Referring to this disputation between Connelly and Quaile and party or Drummond and party, whichever it is, do you recollect writing this letter to Mr. Warden Sharpe:—

Sir,

Department of Mines, Sydney, 25 March, 1887.

I have the honor to acknowledge the receipt of your letter of the 19th instant, with your report on the complaint of Drummond and party, that one Connelly had broken into their mining tenement No. 231, in the parish of Currajong, which lies adjacent to portion 423, on which Connelly was working under a permit from the Secretary for Lands; and I am directed by the Secretary for Mines to request that you will order both parties to withdraw at once from the private land on which they have been working, until the Minister for Lands has decided what is to be done in regard to Connelly's permit.

I have some recollection of that.

220. Then it was probably in pursuance of that letter that Mr. Warden Sharpe requested the cessation of work? No doubt.
221. Would that letter be any warrant, according to the practice of your Department, for the Warden to threaten the removal of Connelly with the aid of the police? If I recollect aright the facts as they presented themselves to us then—whether or not they were absolutely the facts I cannot say—were something to this effect, that Baxtrom and party were working on a certain piece of land which they said they were working under the authority of the owner, and Connelly and party drove into this land. There having been no permit granted by the Crown to the owner of that piece of land, any person, no matter whether it was Baxtrom or Connelly, taking gold from that piece of land would be practically stealing gold the property of the Queen.
222. What I want to know is whether this letter of yours, in which you request the Warden to order both parties to withdraw at once, would be a sufficient authority to the Warden to threaten the removal of either or both of the parties with the aid of the police? If the parties had refused to remove, and if they were taking gold under the conditions which I thought they were, we should then no doubt have appealed to the Attorney-General to take the necessary proceedings to prevent people from stealing this gold, the property of the Queen.

223. That is not an answer to my question, I will put it in this form. Is it the practice in your Department for Wardens to threaten the intervention of the police for the removal of persons mining on ground under the circumstances disclosed in your letter to Mr. Warden Sharpe? I am inclined to think that the Warden would, if necessary, call in the assistance of the police to prevent people from taking gold from private property for the removal of which no permit had been granted.

H. Wood,  
Esq.  
8 Dec., 1893.

224. I would draw your attention to the last line of your letter, in which you do not give any reason about gold. The evidence before the Committee is that Mr. Connelly had not struck gold, and there appears to be abundance of evidence that there was no gold in the workings upon which Connelly was engaged. Your letter to Mr. Warden Sharpe makes no reference to gold but requires the removal of the parties? Would you allow me to refer you to the Warden's letter of the 19th of March. My letter would have to be read in conjunction with that, because it is a reply to it.

225. You do not refer in your letter to the discovery of gold but to some action of the Minister for Mines in dealing with Connelly's permit—that is made the ground of withdrawal? My letter says "I have to acknowledge the receipt of your letter of the 19th instant *re* the report of Drummond and party, that one Connelly had broken into their mining tenement." I was thinking that Drummond and party were the people who were holding some adjoining private lands under the authority of the owner. This evidently is not the case. I supposed at the time that Drummond and party were the same as Baxtrom and party.

226. What I want to know is whether such a letter as that, requesting the cessation of operations pending the decision of the Minister for Lands, would be a warrant according to the practice of your Department for the intervention of the police for the removal of the parties? It would be a sufficient authority for the Warden to order these people to stop working; as to what would be the consequence of disobedience of his order, if they did disobey, that would be quite another question.

227. That is the very thing I want to know—whether it is the custom of Wardens to threaten the intervention of the police on the authority of such a request from you? I do not suppose such a case ever arose.

228. It is sworn in this case that the Warden threatened the removal of Connelly and his men by the Police Force;—is it customary for the Warden to make such a threat as that without preliminary action by the Crown Law Officers? I never heard of a similar case.

229. Then it is not the practice of your Department for such an event to transpire? Seeing that such a thing never happened it could not be the practice.

230. Will you look at this plan which has been put in evidence;—do you recognise the section of land marked "I.P., No. 423" as the piece of ground for working which Connelly had a permit? Yes.

231. Would you look at the workings at shafts No. 4 and No. 5? Yes.

232. If this plan is correct it must be evident that Connelly in sinking those shafts could not have committed a trespass on Quaile's ground or anyone else's? That is not absolutely evident; because shafts are not always perpendicular.

233. But suppose these were perpendicular? If they were it would be so; but, as a rule, shafts if they are sunk upon a quartz vein, follow the underlay.

Mr. John Francis Connelly further examined:—

234. *Chairman.*] Were the shafts shown on the plan as No. 4 and No. 5 sunk by you, perpendicular shafts or underlay shafts? They were perpendicular shafts, and were sunk a certain distance from the fence.

Mr. J. F.  
Connelly.

8 Dec., 1893.

235. How far from the fence? One is about 25 feet each way, and the other 100 feet.

236. And in sinking those shafts you broke into a drive or tunnel? No. I broke into their main workings.

237. What is the nature of their main workings—underlay shafts? The underlay of the reef. They had underlaid some distance—even beyond the plumb of my shaft.

238. And in sinking a perpendicular shaft you broke into Quaile's workings, Quaile did not break into yours? Yes; I broke into Quaile's workings.

Harrie Wood, Esq., further examined:—

239. *Chairman.*] I think after the Minister for Lands had assumed to cancel Mr. Connelly's permit, the cancellation came on to your Department for confirmation, and you wrote a minute in respect to it? I think I do recollect writing a minute on the subject.

H. Wood,  
Esq.

8 Dec., 1893.

240. If you look at page 10 of the printed papers you will find a minute by you dated 8th March, 1887, as follows:—

8 March, 1887.

In view of the decision of the late Minister for Lands (Mr. Copeland), dated 15th January last, in regard to the permit granted to Mr. J. F. Connelly, I venture, with great diffidence, to submit that the decision appears to be based on a misconception concerning the Regulations relating to such permits. The Regulation (169) provides that the person named in the permit shall mark out the land in such position as shall interfere as little as possible with any permanent improvements on such land.

This is the only provision in the Regulation concerning the position of the "area." The words in the Regulation quoted, which may have misled the late Minister for Lands, are:—"Such area shall be of the dimensions, and subject to the conditions, and shall be marked out in the manner [*e.g.*, with posts and trenches at each angle] prescribed by the Mining Board Regulations."

The power to cancel such a permit is contained in Regulation 171, and the grounds of cancellation are failure to "maintain the boundary marks of such area, and prosecute the search for gold in accordance with the provisions of the Regulations aforesaid."

If the facts are as set out by Mr. Connelly, that he has expended a sum of money in sinking a shaft while holding his permit, he will probably lose the money so spent unless the permit can be revived.

H. W.

Would you like to offer any explanation or make any statement with reference to that minute, which I understand respectfully suggests that the then Minister for Lands had made a mistake in assuming to cancel Mr. Connelly's permit—that is what it comes to, is it not? Yes, possibly it bears that construction. I think the idea in my mind at the time I wrote the minute was, that probably the Minister for Lands had taken a different view of the law in regard to the granting of these permits to the view that

I

H. Wood,  
Esq.  
8 Dec., 1893.

I held. Of course he may have been right, and I may have been wrong. But the decision of the Minister for Lands in regard to the cancellation of the permit appeared to me to be that he cancelled it because it had been probably improperly granted, the land being in close contiguity to gold workings.

241. Is it not a fact that the permit to Mr. Connelly was cancelled on the ground that he had suppressed some information that he ought to have given. Yes; that is what I mean. I think the Minister for Lands when granting the permit was under the impression, not only that the land was not near gold workings, but also that if he had known it was near to gold workings he would not have granted the permit.

242. Is it not a fact that this assumed cancellation was based upon the statement that Mr. Connelly had suppressed certain information—namely, that at the time the permit was granted to him certain persons were in occupation of the ground;—is not that shown by the documents? It may be, but my memory does not serve me to that extent.

243. That the permit had been granted in error, Connelly having suppressed certain information? Yes; I think that is so.

244. Does it not appear so from the following minute by Mr. Copeland on page 8 of the printed papers:—

The permit to Connelly has been issued in error, and was obtained by what appears a suppression of the facts of the case. Under the Mining Board Regulations a prospecting protection area can only be held when gold is not being worked within half a mile of the land applied for, whereas it appears that Quaile and party have a claim immediately adjoining this land, and are obtaining gold from the very ground applied for by Connelly, and this with the permission of the owner of the land. Connelly's permit must, therefore, be cancelled as contrary to the Mining Board Regulations, and I think additional regulations should be provided before any more such permits be granted.—H.C., 15/1/87.

Yes; it is evident that that was his impression.

245. Does that minute set out grounds for cancellation that are legal in accordance with regulations? It appears to me that it is not cancellation in the same sense that cancellation would take place in regard to an ordinary permit. It is, that the permit had been granted in error, and therefore should be cancelled because it ought never to have been granted. That is what I take to be the meaning.

246. *Mr. Wall.*] Would it be an absolute cancellation of the whole of the rights accruing under the permit? It would in that case.

247. *Mr. Morgan.*] The Minister states that the permit was obtained contrary to the Mining Regulations? Of course, that is a matter of opinion.

248. *Mr. Wall.*] Can you state whether it is the practice of the Department that those permits should come under the operation of the Mining Act before or after cancellation—that is to say, whether the land embraced in those permits, the conditional purchases, would come under the general mining regulations before or after cancellation;—what I want to arrive at is this: would a conditional purchase be excluded from applications under the 45th section if it was within less than half a mile from payable gold? We do not so administer the law.

249. But under this administration of Mr. Copeland's, under this cancellation, it would appear that being within half a mile of payable gold the land would not be open to a permit; and I understand that the persons obtaining a permit are in all cases entitled to a prospecting area? Yes; a prospecting protection area.

250. Then if Mr. Copeland's interpretation of the law be correct, any conditional purchase, or any land taken up under the 45th section, being within half a mile of payable gold, would be entirely excluded from the operation of that section? Yes; that is apparently what he means.

251. What I wanted to discover was, whether there was any other recognised form—I know of none in the Land Act—in connection with the administration of the Mines Department in granting permits besides the granting of a prospecting area, which Mr. Copeland contends must be governed by the mining regulations in force? There is no other practice in regard to permits under the 45th section of the Land Act of 1884. Under the Mining Act of 1889 it is different.

252. *Chairman.*] This matter was eventually sent to the Attorney-General for his opinion? Yes.

253. In his memo., page 16, of the printed papers, Mr. Attorney-General Foster declines to enter upon the consideration of the matter submitted for his opinion, because the statement of facts submitted to him is not sufficiently clear? Yes. But he says, "I can conceive that there may be cases not within 171 of the regulations of the Land Act"—

254. But take one thing at a time. In the last portion of his memo. the Attorney-General says:—

Unless a clear statement of facts and acts, and the authority under which they purport to be done, is sent, I must decline to enter upon the consideration of matters submitted for my opinion.

Is not that a distinct refusal to give an opinion on the facts submitted to him? Yes.

255. If Mr. Secretary Copeland cancelled this permit on the ground that there was a suppression of facts on the part of Mr. Connelly, how is it that in your Minute No. 54 you set out these propositions;—

The papers in this case disclose the following facts:—J. F. Connelly's application for a permit (not on the printed form) is dated 6th August, 1884. In this he sets out that the land in question is bounded on three sides by quartz-mining in full operation. On the 16th August, 1884, he states, when urging his application, "the land is in the centre of quartz-mining operations." On the 29th September, 1884, he states the land is being mined on three sides, and quartz reefs are known to run through it.

Mr. Hazelhurst's first application for a permit is dated 3rd November, 1885; his second application is dated 10th May, 1886. Permits were granted to Hazelhurst, one dated June, 1886, the other 13th July, 1886. On the 1st October, 1886, Hazelhurst notified the Lands Department that he had tested the ground and abandoned the permit. The Warden reported on the 20th October, 1886, that Hazelhurst had abandoned his permit a month since. Permit to Hazelhurst cancelled by the Minister for Lands on the 7th December, 1886. Permits returned by Hazelhurst to the Lands Department on the 22nd December, 1886.

Baxtrom and party made application for permit on the printed form, dated 24th August, 1886. On the same date as Hazelhurst's permit was cancelled, namely, 7th December, 1886, the Minister for Lands decided that a permit be granted to J. F. Connelly, and a permit dated 11th December, 1886, was granted to him.

On the 15th January, 1887, the Minister for Lands decided that the permit had been issued to Connelly in error, "and was obtained by what appears a suppression of the facts of the case" \* \* \* "whereas it appears Quaile and party (Baxtrom and party) have a claim immediately adjoining this land" \* \* \* "Connelly's permit must therefore be cancelled." From the above facts it will be seen that Connelly was the first applicant, and that he not only set out in his first application, but reiterated the statement, that mining was being actively carried on upon three sides of the land, that the land was in the centre of quartz-mining, and that quartz reefs were known to run through it. His application was not on the printed form, because the printed form (Form L.A.M.) was not then in use.

From the papers it appears that, relying upon the permit, Connelly has sunk two shafts and constructed drives, the cost of which will be lost to him if he be deprived of his permit.

Baxtrom

Baxtrom and party rely upon a permission granted by the owner of the land to mine upon and remove gold from the land. The owner of the land never had any right to the gold, and has never obtained a permit in terms of the Crown Lands Act of 1884, section 7, to remove the gold from such land. It appears that a large quantity of gold has been wrongfully removed from the land without the sanction of the Crown and without paying any royalty thereon.

H. Wood,  
Esq.  
8 Dec., 1893.

Baxtrom and party, it is stated, had no intention to evade the law, and are now prepared to pay any royalty due. I do not know whether the royalty can now be received, or whether, in view of the 7th section of the Act aforesaid, the Attorney-General will consider that the parties should be punished; but if the royalty can be received it is not clear how the amount due is to be ascertained. As it appears to me, the questions to be decided are: 1. Should Connelly's permit be cancelled? 2. If so, should he receive compensation; and if so, by whom should it be paid? 3. Should Baxtrom and party be prosecuted for removing gold without permission, and if not, should they pay the royalty due?

H.W., 5/5/87.

In view of your memo. quoting three of Mr. Connelly's communications, there could be no possible suppression of facts by Connelly with reference to the existence of gold-bearing land in the immediate vicinity of the piece of ground upon which he sought authority to work—there could be no possible suppression? So it appears to have struck me at the time in going through the papers.

256. In your own minute that is set out? Yes.

257. In supposing that there had been some suppression of information on the part of Mr. Connelly, it is quite possible that Mr. Secretary Copeland was under a misapprehension? Yes; it appears like that.

258. Having assumed to cancel Mr. Connelly's permit, how is it that Mr. Secretary Copeland sent the matter on to your Department? I am inclined to think that Mr. Copeland did not send the case on to our Department in the sense in which it would be generally understood from your question. The whole work in connection with the granting of permits to search under the Land Act was transferred to the Mines Department.

259. At the date when Mr. Copeland assumed to cancel the permit, was it within his competency to cancel it, or was it practically a recommendation from Mr. Copeland to your Department that you, under the new regulations, should cancel it? My impression is that the cancellation took place before the transfer from the Lands Department to the Mines Department, and if my memory serves me aright, the matter came before the Mines Department in the shape of an application from Connelly to be reinstated.

260. *Mr. Wall.*] Looking back in the printed papers to Mr. Copeland's minute, page 8, it would appear that the permit was cancelled in consequence of the suppression of facts? Cancelled because Mr. Copeland thought there had been a suppression of facts. In his minute, Mr. Copeland says:—

Under the Mining Board Regulations, a prospecting protection area can only be held when gold is not being worked within half a mile of the land applied for, whereas it appears that Quaile and party have a claim immediately adjoining this land, and are obtaining gold from the very ground applied for by Connelly, and this with the permission of the owner of the land.

Do you know of any legal right by which the owner can grant permission to mine on land? I think if the owner first gets a permit from the Crown under section 7 of the Land Act of 1884, he can allow anyone to mine.

261. But is it not a fact in law, and according to the departmental practice, that the owner had the right of allowing persons to mine on his land prior to 1884, when those permits were issued? Until the Act of 1884 was passed the Crown, so far as I know, never interfered with the removal of gold by the owners.

262. Having abolished the custom of appropriating half the rentals from the owners, did not the Crown concede to the owners at that time the absolute right of granting permission to mine on their land? I do not quite follow you there.

263. You are aware that under the old mining regulations—under the 30s. a month regulation—the custom was that on private lands the Crown took half the license fee? No; that was before my time. I do not know anything of it.

264. During your administration of the Department has the case of the *Queen v. Wilson* been brought under your notice? No; I think not.

265. You are not aware that there is a decision of the Full Court to the effect that the owner has the right to grant permits—that the owners of freehold land had the right to grant permits to mine on that land prior to the passing of the Act of 1884? I was not aware of that fact.

266. However, that appears to have been the cause of the cancellation of Mr. Connelly's permit? Yes. Mr. Copeland appears to have thought there had been a suppression of facts.

267. Had the owner possessed at that time the legal right to grant permits, and had he granted a permit to Quaile and party, and had they been legally in possession of the land, Mr. Copeland would have been justified in the course he adopted? Yes, no doubt; because he would probably have granted the permit to Connelly in ignorance of the fact that Quaile had got a permit from the owner.

268. Although this may have been the law prior to 1884, are you aware that in the Act of 1884 that right was taken away from the owner? Yes; by the 7th section. I do not know that it was taken away as a right, but there was a declaration of the rights of the Crown.

269. Has it been the custom of the Department to interfere with titles granted by the owner since the passage of the Act of 1884? Yes; in any case where we have found mining carried on on private land.

270. I am speaking now of land in respect of which the Department had no right to issue permits, not land taken up under the 45th section. In cases where the Department had no right to issue permits to search, have they interfered with the rights of any persons who obtained permission without obtaining it under the 7th section? We have interfered in all cases where we knew that mining was being carried on upon private land, either by the owner or any other people with the consent of the owner, and we have required the owner to apply for a permit and to pay the royalty.

271. Then Quaile and party having obtained permission from the owner to mine upon this land, that permission would not be valid, seeing that the owner had not applied under the 7th section for the right to appropriate the minerals? Yes.

272. Therefore, in any case Mr. Copeland's contention would have been bad in law? Yes, of course, on certain assumptions. I do not want to say baldly that Mr. Copeland's decision was wrong.

273. *Chairman.*] At page 13 of the printed papers, in a letter addressed to yourself by Mr. Warden Sharpe, these words occur:—

It seems to me that neither party has, at present, any right to mine under portion 423, as they do not possess any legal permit, and I would urge that the necessary steps be taken at once to determine who has a right to mine on it, as a great deal of ill-feeling exists between the parties.

H. Wood,  
Esq.  
8 Dec., 1893.

What are we to understand from that statement—that neither party possesses any legal permit? I should understand it to mean that Mr. Copeland having cancelled the permit that Connelly held, he, Connelly, held no legal permit, and that Quaile and party having merely got a permission from the owner of the land, that owner not having any permit, they had no legal right.

274. Then how is it if Mr. Secretary Copeland cancelled Connelly's permit, Mr. Secretary Abigail professes to cancel the same permit on the 6th May, 1887, as appearing on page 17 of the printed papers. Mr. Abigail there says:—

After going through these papers I do not feel justified in altering the decision of the late Minister for Lands, Mr. Copeland.

That is practically a cancellation, is it not? The permit had been cancelled, and Mr. Abigail simply decided that he would not interfere with that cancellation.

275. Then the matter had been already decided by Mr. Secretary Copeland? Yes.

276. How was it then that Mr. Secretary Abigail was called upon to redecide a matter that had already been decided? On account of the appeal by Connelly to the Mines Department. This branch of the business having been transferred in the meantime to the Mines Department, Mr. Connelly appeals to the Mines Department to redress what he considers is wrong.

277. But would you look at Mr. Abigail's decision No. 1—"I decide that Connelly's permit should be cancelled." If it had already been cancelled by Mr. Copeland, how can Mr. Abigail cancel it? You will see that in my minute I submit certain questions, and Mr. Abigail says:—"Replying to the questions submitted by the Under Secretary in their order: 1. I decide that Connelly's permit should be cancelled."

278. If it had already been decided by Mr. Copeland, how could Mr. Abigail cancel it? I put the question, should Connelly's permit be cancelled?

279. There is a distinct decision on the part of the Minister, who says, "I decide that Connelly's permit should be cancelled"? That should be taken, I should say, in the sense that it ought to be cancelled; that is to say, that he would not interfere. He agrees with Mr. Copeland, I presume, that the cancellation was proper. That is how I should understand it.

280. Turning to page 14 of the printed papers, there is a letter dated 23rd March, 1887, addressed to you by Mr. Freeman, writing for the Under Secretary for Lands, to the following effect:—

In reply to your letters of the 18th instant, I have the honor to inform you that the cancellation of the permit, granted to one Connelly to mine on portion 423, I.P. 80-4, of Parkes, has not been revoked, but that the case is now under the consideration of the Minister.

Are we to understand from that that there had been an effort on Mr. Connelly's part to secure a revocation of the cancellation? Yes; I should think so.

281. Then the matter came on to your Department in consequence of the change in the administration of these affairs to which you have referred? Yes.

282. Then it resolves itself into this: That judging by your own minutes Mr. Connelly's permit was originally cancelled, or assumed to be cancelled, by the Minister for Lands under a probable misapprehension that Mr. Connelly had failed to communicate certain facts that were necessary to be known? Yes.

283. And those facts do appear to have been communicated;—it appears to have been a misapprehension on the Minister's part? It may be that the facts were not brought under the Minister's notice, or he overlooked them, or something of that kind. But it is evident from my minute that, according to the papers, Mr. Connelly stated the facts.

284. In no part of your minutes do you adjudge Connelly guilty of suppression? No; as far as I know, I do not recollect ever coming across anything to justify me in supposing that Connelly had suppressed any facts.

285. *Mr. Wall.*] How long have you been in the Department? From the time when it was started in 1874, when the Mining Act was first brought into operation.

286. Section 9 of the Act 20 Victoria No. 29, called the Gold-fields Management Act, 1857, reads as follows:—

Any person who shall mine, or shall employ any person to mine for gold in any land belonging to a private individual, without the consent of the owner thereof, or his duly authorised agent, shall, upon conviction before any Justice of the Peace, be subject to the like penalties as are mentioned in the last preceding clause.

That provision was in operation at the time of the passing of the Act in 1874? It may have been; I do not know. I never had anything to do with that Act.

287. I want to know if there is any Mining Act showing where the provision I have quoted ceases to exist;—in dealing with a case before the Full Court in 1874, Chief Justice Martin said:

At the time of the taking of the present case, the 20 Vic. No. 29 was in force so far as it related to mining on private lands, and it cannot therefore be said that such taking was as against the Queen a taking *in vivo aomino*.

If the provision in 20 Vic. No. 29 was in force at that time, in 1874, can you tell the Committee when it was repealed, or by what Act it was repealed? It must have been repealed by the Mining Act of 1874. A portion of the Act had already been repealed, and the remaining portion was repealed by the Mining Act of 1874.

288. Then the whole of that Act, 20 Vic. No. 29, was repealed? Yes; a portion had been repealed before, and the other portion was repealed by the Act of 1874.

289. *Mr. McCourt.*] If any applicant for a permit or a mining lease considers that the Minister, in deciding against him, has not done so in accordance with law, are not the Law Courts of the Colony open to him, in which to appeal, to have his wrongs set right? I am inclined to think he would have no standing in Court as regards the refusal of a Minister to grant either a permit or a lease, or as to cancellation, except for damages.

290. If he considers that the Minister has decided against him, contrary to law, can he not appeal to the Courts of the Colony for damages? Yes; I suppose he could go for damages. But I thought you meant to alter the decision of the Minister.

291. He could go for damages if that decision was against the law? No doubt.

292. Have there been any cases of that kind against your Department at any time? No; I do not think there has been any case where parties have gone for damages in a Court of law. They have appealed to Select Committees occasionally, and in one case the matter went to arbitration; that was the Milburn Creek case.

H. Wood,  
Esq.  
8 Dec., 1893.

293. *Mr. Morgan.*] You say that a permit gives no right to the gold? Yes.
294. What would give a right to the gold? The title would be made after the discovery of the gold had been reported, and the purchase had been cancelled.
295. There was no application by Connelly, so far as you are aware, for anything more than a permit? Merely a permit to search.
296. And at no time had he any right to take the gold from the land? No; he could only search for it, and upon discovery it would be his duty to report the fact, and then it would be for the Government to decide whether they would cancel the purchase, and give Mr. Connelly a right under the Mining Act.
297. Then the action of the Minister in withdrawing the permit, and stopping Mr. Connelly from working, prevented him from making any application of that kind? No doubt the effect would be so. But the permit neither gives the right to the gold nor the right to sell or transfer. The holder of a permit has merely a personal right in himself.
298. Mr. Connelly states that, by the action of the Minister, he has lost about £19,400, being £19,000 the value of the gold and £400 expended in working—had he any right to that gold at that time? No, certainly not; nor would he have a right to sell to anybody else.
299. But there is a fairly legitimate claim for expenses incurred, and work done at the mine, during the time he was employed there? There may be that; but he could have had no right to the gold, and no right to sell his permit to anybody else.
300. *Mr. McCourt.*] But practically he would have the right to the gold if he found it? He would have a right to the gold if he reported that gold was found on the claim. On the discovery he is supposed to stop working at once until the Crown has decided whether or not it will cancel.
301. But usually when gold is proved to exist the Crown resumes the land and gives the prospector a lease—is not that the usual practice? Yes; he will get a title then. As soon as the purchase has been cancelled the law provides that he is to be deemed the first applicant for the land, included in his permit.
302. For all practical purposes the gold would have been his under the permit, although he would have had to go through other stages? No, not necessarily so; because it does not follow as a matter of course that the Government will resume. They might say “No, the cost of resuming this piece of land will be so great and the profit to the State so small, that in preference to resuming we will give the owner of the land a permit under the 7th section.”
303. Has such a refusal ever been made? We have refused in numerous cases.
304. *Mr. Wall.*] There is a *quasi* obligation on the part of the Department to grant the permit on the discovery of the gold? In any case where the cost of resumption is proved to be too great we refuse to cancel.
305. But in this case having recognised another applicant? I do not know that we did recognise another applicant.
306. Was there any other application made to mine on this land after Connelly's permit was cancelled? Yes; I think there was in the case of Baxtrom.
307. How was that dealt with by the Department? I am not quite clear now, but I think the owner of the land had to take out a permit under the 7th section.
308. Therefore the permit was granted? I am inclined to think it was. I am not very clear about it, but I think that was so.
309. It appears that Quaile was the party in possession at the time when it was alleged that Connelly suppressed some facts in relation to the matter? I do not know whether Baxtrom and party and Quaile and party are the same, but I think they set up a title under some permission that they said had been granted to them by the owner of the land.
310. However, the Department did not go into the question of the cost of resumption, but dealt with Connelly's application before that question cropped up? Yes; because, as far as we knew, there was no gold on the land at that time.
311. Are there any other cases in which the Department has refused to resume other than those where the compensation was considered too high? No; I do not think so. I do not recollect any.
312. *Chairman.*] Have any circumstances come to your knowledge that would give legal ground for the cancellation of Connelly's permit? I do not think I could say any more than I have said in that minute of mine about it, and I said there that I spoke with diffidence because it was merely an opinion of mine as against the opinion of the Minister.
313. That minute of yours discloses so far as you know all the facts that are necessary to be known for coming to a decision in this matter? Yes.
314. Have there been cases where permits have been withdrawn or revoked in this manner? Yes; we cancel them frequently.
315. Where misrepresentation has been made? Oh, no.
316. On what other ground? For non-work chiefly.
317. But supposing there has been no misrepresentation and the work has been carried on in accordance with law and regulations, is it customary then to cancel? No; we do not cancel. I do not know any other ground of cancellation except abandonment or non-work.
318. Is there any legal right to cancel or revoke a permit on the ground of misrepresentation;—is there anything in the regulations or the law which permits of such a course? There is nothing that I know of expressly in the regulations. But if a lease, for example, were granted by the Crown under a misrepresentation of facts, which would practically be fraud, the Governor would probably exercise the right of cancellation.
319. That would be the Governor in Council? That is in the case of leases.
320. But what about permits;—you know of no other ground for the cancellation of a permit than non-compliance with statutory provisions or regulations? Just so. I have had to deal with no case except where it has been either for non-work or for abandonment.
321. You know of no case of the cancellation of a permit except for abandonment or suspension of labour? Abandonment by the person to whom the permit is given, or his failure to work.
322. You do not know then another case in which a permit has been cancelled on the ground that the applicant failed to communicate some fact? No.
323. *Mr. Wall.*] What was the custom of the Department from 1874 to 1884 with regard to the granting of permits. I find by the Act 20 Vic. No. 29, which you have stated was repealed in 1874, private owners were

H. Wood,  
Esq.  
3 Dec., 1893.

were allowed to authorise persons to mine. From that time up to 1884, when the 7th section of the Act of 1884 came into operation, what means were there for obtaining permission to go on to private lands not taken up under the 45th or 14th sections? There were permits to search before the Act of 1884, under the 14th section of the Crown Lands Act of 1861.

324. With regard to all private lands not alienated under the 14th section of the Act of 1861, what was the custom of the Department from 1874 to 1884. The Act of 1857 having been repealed, you say the owners had no right to give permission; then how were those private lands dealt with;—did the Department step in? I do not think we interfered in any case. We simply did not act for the reason that probably we could not have acted except in one direction, which would have been perhaps undesirable.

325. There was no law regulating the granting of permits by private owners from the time of the repeal of Act 20 Vic. No. 29 until 1884? No.

326. Except as regards the land embraced the land under the 14th section of the Act of 1861? Exactly.

327. Is there anything in the papers to show that prior to lodging the application for a permit Connelly had a knowledge of the existence of gold in this particular land? No. As far as I recollect the papers go to show that he had a strong suspicion that gold would be found there because gold was being worked on contiguous land.

328. There was nothing to show that Connelly had a knowledge that Quaile and party had a permit from the owner of the land, and were mining on it at the time he lodged his application for a permit? No; nothing to my knowledge.

329. If Quaile and party had obtained permission from the owners, and had commenced mining operations on that land, and were winning gold from it, and Connelly lodged his application with a knowledge of those facts, do you think the Minister would have been justified in refusing the permit? He would have been justified in not granting the permit until he had cleared away this adverse title.

330. But you had no knowledge of any such permission being in existence? No.

331. It is not disclosed by the papers? Not as far as I know.

332. *Mr. Gardiner.*] In the event of your Department granting a permit, and afterwards discovering that a mistake has been made, has the Minister power to cancel such permit, the mistake made being through no fault of the applicant for the permit? That is a very difficult question to answer right out. For example, suppose we granted a permit to search on land in respect of which we had no right of search, we should cancel that.

333. *Mr. Morgan.*] I suppose Connelly was quite within his rights in holding 2 acres of ground under the permit? My impression is that the prospecting protection area would cover more than 2 acres.

334. *Mr. McCourt.*] Afterwards, in case the land was resumed, what would his area be? As I read the law he would be entitled to make a title to all the land within his permit. But it does not necessarily follow that he will do so. He only has the right to do it. If he did not exercise that right then somebody else might.

1894.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

APPLICATION OF MR. J. F. CONNELLY TO MINE IN  
THE PARISH OF CURRAJONG.

TUESDAY, 10 APRIL, 1894.

Present:—

MR. McCOURT, | MR. WADDELL.  
J. C. NEILD, ESQ., IN THE CHAIR.

Mr. Angus Grahame Robertson called in, sworn, and examined:—

1. *Chairman.*] You are the Manager of Quaile's Proprietary Gold Mine? Yes.
2. How long have you held the position? Over three years.
3. Was the Company formed during your time or previously? Previously.
4. It was formed to work a piece of mineral land in the township of Parkes? Yes.
5. What is the area of the land? Roughly speaking, it would be about 4 acres; that includes the whole of the mine.
6. Referring to the rough sketch that is lying upon the table, will you indicate the area which is worked by the Company? It comprises the angular piece with two acute and two obtuse angles marked as "Quaile's reef claim," and the block marked "I. P.—J. M'Connell," consisting of 2 acres.
7. Do those two blocks constitute the property of the Company? Yes, as far as I know.
8. This Committee is appointed to inquire into the loss that is alleged to have been sustained by Mr. Connelly, who at one time had a permit to mine upon that angular piece of ground marked as "Quaile's reef claim," and we desire to know the date upon which your Company purchased that block, and the price which was paid for it? To the best of my belief and knowledge we paid £8,500—that is, £6,500 in cash, and they got £2,000 fully paid-up shares, or thereabouts.
9. In what year? It was in August, 1890.
10. That payment had reference to this angular piece of ground only? £6,500 was paid in cash for the angular block, but I cannot associate the number of paid-up shares which were given in respect of each property without looking into the matter.
11. Probably it would be in the proportion of about half to half? I should not like to say without looking up the share register. I forget at this moment the number of shares which were divided between the two properties.
12. How much did you pay for the piece of ground marked "I. P. No. 423—J. McConnell"? £1,500 in cash.
13. Anything in shares? Yes, but I cannot tell you how many were given for that particular property. For the properties we gave £8,000 and 2,000 fully paid-up shares, being equal to £10,000 in all.\*
14. *Mr. McCourt.*] In his examination before the former Committee, Mr. Connelly handed in a document which showed that the Australian Joint Stock Bank, Parkes, had advanced £6,305 8s. 5d. to Quaile and party

Mr. A. G.  
Robertson.  
10 April, 1894.

\* NOTE (on revision):—On looking into the matter of shares, I find none of the 2,000 shares, although given by the Company for the property, went to the original vendors of either block.

- Mr. A. G. Robertson.  
10 April, 1894.
- party from December, 1886, to November, 1890, and he stated that he was in a position to say that that gold came from M'Gee's ground. Do you think it is possible that that amount of gold was ever taken from M'Gee's ground? It may have been, but I should not like to swear that it has been.
15. To the best of your belief, having seen the ground, do you think it is likely that that amount of gold was taken from the ground? Yes; I should not be at all surprised to hear that it has been.
16. *Chairman.*] How much money have you sunk in the property? £12,000.
17. Has that money been sunk in working the property? In purchasing and working the property.
18. Are you including the value of the 2,000 paid-up shares in that amount? No.
19. What returns have you had? I could not tell you the quantity of gold we have had without referring to my books. All I know is that our average crushing right away has been about 9 dwt. per ton, and we have taken out some hundreds of tons.
20. Do I understand you to say that you have sunk that money in addition to the value of the gold you have obtained? Yes; we have sunk the value of the gold obtained, and the money we have spent out of capital.
21. Do I understand you to say that the property stands with a debit of £12,000 against it? That is so.
22. The gold which was referred to by Mr. Connelly in his evidence as having been advanced upon by the A.J.S. Bank was obtained from McConnel's ground prior to the formation of the "Quaile Proprietary Company"? Yes.

John Francis Connelly called in, sworn, and examined:—

- Mr. J. F. Connelly.  
10 April, 1894.
23. *Chairman.*] You have heard the evidence which has been given by Mr. Robertson, Manager of the Quaile Proprietary Company? Yes.
24. When you were examined on the 8th December last you stated that that Company paid £12,000 for your claim? Yes.
25. Have you any explanation to offer as to the difference between the statement which you made on the 8th December and the statement which has just been made by Mr. Robertson? The explanation I have to offer is that the party who was working in that claim told me that it was sold for £12,000, and that their claim—that is the angular block marked Quaile's Reef Claim on the plan—was worked out long before the Company bought it.
26. That is what caused you to make the statement which you made on the 8th December? Yes.
27. Do you desire to offer any further evidence? No.
28. Have you any further witness to call? No.

TUESDAY, 17 APRIL, 1894.

Present:—

MR. JONES, | MR. McCOURT.  
J. C. NEILD, ESQ., IN THE CHAIR.

John Francis Connelly recalled and further examined:—

- Mr. J. F. Connelly.  
17 April, 1894.
29. *Chairman.*] You desire to offer some explanatory evidence? Yes; I desire to offer an explanation. Subsequent to the alleged cancellation of my permit Quaile and party applied for and obtained a right to mine on the strip of land a chain wide on the north side of purchase 423, and adjoining Quaile's claim. This strip of land was the only portion of the improvement purchase in which gold was obtained. It was in consequence of obtaining this strip of land that so large a price was paid by Quaile's Proprietary Company for Quaile's ground.
30. Is there anything further which you wish to say upon that point? I might remark that at that time Quaile's claim was wholly worked out.
31. You refer, of course, to the diagonally-shaped piece of ground shown in the plan, and marked "Quaile's reefed claim"? Yes.
32. You hand in a memorandum about the gold taken from your claim before the permit was granted? Yes—that is, of the gold taken out of my claim.
33. Before whose permit was granted;—before the permit for this chain-wide strip was granted? Yes.
34. Who took out the gold? Quaile and party. That is the lowest estimate of the gold that is supposed to have come out of my claim, the amount being £27,000.
35. This is based on an output of 25 tons a week for six men, being 100 tons a month at 3 oz. per ton? Yes; some went 5 oz.
36. The total is 300 oz. at £3 15s., monthly? Yes.
37. *Mr. McCourt.*] Can you swear to that? That is a rough estimate.
38. *Chairman.*] That is £1,125 a month for gold? Yes.
39. And for two years at that rate it amounts to £27,000? Yes.
40. What would come off that for working expenses? Six men at 50s. a week; 1 horse at 10s. a week; powder, fuse, and candles, at £1 a week; battery, 10s. a ton; carting, 1s. a load.
41. How much does that total per week outlay? £30 5s. a week.
42. How much is that for two years? £3,140.
43. Would there not be something for rent of the ground? No.
44. Is there not a royalty? According to the return they did not get a royalty. I have never known any royalty to be paid.
45. You consider that this £27,000 of the estimated gettings are liable to a deduction of only £3,140, or thereabouts, for outgoings? That is all.
46. *Mr. McCourt.*] You made an estimate of the amount of gold quartz taken from this mine? Yes.
47. You made a rough estimate of the gold taken from this claim before the permit was granted? Yes.
48. Before it was granted to you? Before my permit was granted, my application being the first.
49. But this gold was taken out before the permit was issued to you by the Minister? Yes; that gold was taken out of my claim before the Minister issued to me a permit to mine on it.

50. Then what claim have you to the gold? The right I have is this, that I made the first application.
51. You will see by the minutes of the Attorney-General and the Under Secretary for Mines that they wanted to prosecute the men for stealing gold? I know that.
52. But would not your claim commence from the date of your permit? I do not know. I leave that to yourselves.
53. I ask that question? I should think not.
54. But this gold was taken out before you had a legal claim, and before you had a permit to work this ground? It was taken out illegally.
55. Never mind how it was taken out;—was it taken out of the ground before you had a permit to work the land from the Minister? It was, and upon that I wish to remark that if these men had not stolen that gold from my claim I should have got it.
56. You were not in possession until a permit was granted to you? No, I was not; but these people took the gold out whilst my application was pending in the Department. It was illegally taken out.
57. When you made application for the land, was it not the private property of Mr. M'Gee? Yes.
58. And the deeds were issued for it? Yes.
59. At the time of the application it was private property? It was. I should like to mention that that piece of land, portion 423, was upon a gold reserve.
60. How came this man to get it? By stratagem; it belonged to me.
61. It was by arrangement with Mr. M'Gee, was it not, that the gold was taken out by Quaile and party? I am told that M'Gee gave these men permission to mine. He also gave me permission to mine under the land as long as we did not break the surface.
62. Is it not a fact that the Minister for Lands refused to prosecute these people for taking the gold? No; the Minister for Lands found that he had made a mistake, and he turned the matter over to the Mines Department.
63. Did he not refuse to prosecute? No; it was then advised that the Attorney-General should prosecute for the stealing of the gold.
64. Did the Minister refuse to prosecute the people for taking the gold? I could not tell. It appeared to me that neither the Lands nor the Mining Department knew what to do with this claim, because of its being the first case of the kind that had happened in New South Wales. That caused the Lands Department to put it in the hands of the Mines Department, and I am the sufferer.
65. According to his minute dated the 6/3/87, Mr. Abigail decided that Connelly's permit should be cancelled? Yes; it seems that he re-decided it, according to the Under Secretary for Mines.
66. He decided that it should be cancelled? Yes.
67. He also decided that there should be no compensation, and that Baxton and party should not be prosecuted for getting gold without permission, but should be called upon to pay a royalty;—is not that the minute? Yes.

Mr. J. F.  
Connelly.  
17 April, 1894.

---

MINING ON PRIVATE LANDS BILL.

(MESSAGE No. 3.)

---

*Ordered by the Legislative Assembly to be printed, 18 January, 1894.*

---

R. W. DUFF,  
*Governor.*

*Message No. 3.*

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to legalise Mining on Private Lands; to provide for charging Rents and Royalties in connection therewith; to validate certain Crown grants; to provide for the resumption of land for certain purposes; to make better provision for and in connection with Mining on Crown lands in certain particulars; to effect such amendments in the Statutes as may be necessary to give this Act full force and effect; and for purposes consequent upon, connected with, or incidental to the aforementioned objects.

**MINING ON PRIVATE LANDS BILL.**

(PETITION FROM MORETON H. FITZHARDINGE, CHAIRMAN OF A PUBLIC MEETING OF RESIDENTS OF GLEN INNES, AGAINST THE EXCISION OF TIN AND ANTIMONY FROM.)

---

*Received by the Legislative Assembly, 28 February, 1894.*

---

To the Honorable the Speaker and the Members of the Legislative Assembly of New South Wales, in Parliament assembled.

The Petition of Moreton Hyde Fitzhardinge, Mayor of the Municipal District of Glen Innes,—

SHOWETH :—

1. That your Petitioner was chairman of a Public Meeting of the residents of Glen Innes, held on Wednesday, the 21st day of February, 1894, at which said meeting there was a very large attendance of citizens of Glen Innes.

2. That the following resolution was unanimously passed at such meeting, viz. :—“ That this Public Meeting of the citizens of Glen Innes, strongly protests against the excision of ‘ tin and antimony ’ from the Mining on Private Lands Bill, in view of the fact that these metals are known to exist throughout the New England district, and respectfully request the Legislative Assembly, in the public interest, to insist on the retention of the said metals in the aforesaid Bill.”

3. Your Petitioner, therefore, humbly prays that the request contained in such resolution be complied with.

And your Petitioner, as in duty bound, will ever pray.

MORETON H. FITZHARDINGE,  
Chairman.

---

THE SELECT COMMITTEE of the Legislative Assembly, duly appointed on 13th March, 1894, "*with power to send for persons and papers, to inquire into and report upon the working of Collieries,*" and to whom was granted, on 11th April, 1894, "*power to report the Minutes of the Evidence taken before them, from time to time,*"—beg to report the Minutes of the Evidence taken before them up to the present date.

JOHN L. FEGAN,  
Chairman.

No. 3 Committee Room,  
Sydney, 12th April, 1894.

---

## PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 14 MARCH, 1894.

MEMBERS PRESENT:—

|            |            |              |
|------------|------------|--------------|
| Mr. Cann,  |            | Mr. Cook,    |
| Mr. Fegan, |            | Mr. Grahame, |
|            | Mr. Scott. |              |

Mr. Fegan called to the Chair.

Entry from Votes and Proceedings appointing the Committee *read* by the Clerk.

Committee deliberated.

*Ordered*,—That James R. M. Robertson be summoned under the “Parliamentary Evidence Act” to give evidence next meeting.

[Adjourned till Tuesday next, at *Two* o'clock.]

TUESDAY, 20 MARCH, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|                |  |              |
|----------------|--|--------------|
| Mr. Edden,     |  | Mr. Grahame, |
| Mr. Nicholson, |  | Mr. Scott.   |

The Clerk, by direction of the Chairman, *read* a letter from James R. M. Robertson, who had been summoned to give evidence, asking that his examination might be postponed on account of an important engagement.

Jonathan May (*Mining Engineer*) called in, sworn, and examined.

Witness withdrew.

*Ordered*,—That Robert Jury and George H. Green be summoned under the “Parliamentary Evidence Act” to give evidence on Thursday next.

[Adjourned till To-morrow, at *Eleven* o'clock.]

WEDNESDAY, 21 MARCH, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|              |  |                |
|--------------|--|----------------|
| Mr. Cann,    |  | Mr. Cook,      |
| Mr. Edden,   |  | Mr. Grahame,   |
| Mr. McCourt, |  | Mr. Nicholson. |

Jonathan May called in and further examined.

Witness withdrew.

Chairman submitted claim from Jonathan May for £4 13s., witnesses expenses.

Claim considered and passed.

*Ordered*,—That James R. M. Robertson be summoned under the “Parliamentary Evidence Act” to give evidence on Wednesday next, and G. H. Green and Robert Jury on Thursday next.

[Adjourned till Wednesday next, at *Eleven* o'clock.]

WEDNESDAY, 28 MARCH, 1894.

MEMBER PRESENT:—

Mr. Fegan.

[In the absence of a Quorum the meeting called for this day lapsed.]

THURSDAY, 29 MARCH, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|            |                |              |
|------------|----------------|--------------|
| Mr. Cann,  |                | Mr. Cook,    |
| Mr. Edden, |                | Mr. McCourt, |
|            | Mr. Nicholson. |              |

George Henry Green (*Mining Engineer*) called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claims from G. H. Green for £3 12s., and Robert Jury (who had attended in obedience to a summons, but was not examined) for £2 19s., witnesses expenses.

Claims considered and passed.

*Ordered*,—That Robert Jury be summoned under the “Parliamentary Evidence Act” to give evidence next meeting.

[Adjourned till Tuesday next, at *Eleven* o'clock.]

TUESDAY,

TUESDAY, 3 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|              |  |                |
|--------------|--|----------------|
| Mr. Cann,    |  | Mr. Edden,     |
| Mr. McCourt, |  | Mr. Nicholson. |

Robert James Jury called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claim from Robert James Jury for £2 19s., witness's expenses.

Claim considered and passed.

[Adjourned till To-morrow, at *Eleven* o'clock.]

WEDNESDAY, 4 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|            |  |                |
|------------|--|----------------|
| Mr. Cann,  |  | Mr. Cook,      |
| Mr. Edden, |  | Mr. Nicholson, |
|            |  | Mr. Scott.     |

James Robert Miller Robertson (*Mining Engineer*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow, at *Eleven* o'clock.]

THURSDAY, 5 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|           |  |                |
|-----------|--|----------------|
| Mr. Cook, |  | Mr. Edden,     |
|           |  | Mr. Nicholson. |

Adam Cook (*President of the Hunter River Miners Association*) called in, sworn, and examined.

Witness withdrew.

John McFadyen (*Treasurer of the Hunter River Miners Association*) called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claims from Adam Cook for £3 3s. and John McFadyen for £3 2s., witnesses expenses.

Claims considered and passed.

*Ordered*,—That the following be summoned to give evidence under the "Parliamentary Evidence Act":—Daniel McAuliffe, on Tuesday next; William Humble, on Wednesday next; and Alfred George Hamilton, on Thursday next.

[Adjourned till Tuesday next, at *Two* o'clock sharp.]

TUESDAY, 10 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|                |  |            |
|----------------|--|------------|
| Mr. Nicholson, |  | Mr. Scott. |
|----------------|--|------------|

Daniel McAuliffe (*Manager of the Stockton Colliery*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow, at *Two* o'clock.]

WEDNESDAY, 11 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|                |  |            |
|----------------|--|------------|
| Mr. Cann,      |  | Mr. Edden, |
| Mr. Nicholson, |  | Mr. Scott. |

William Humble (*Inspector of Mines for the Northern Districts*) called in, sworn, and examined.

Witness withdrew.

*Resolved*,—That the Chairman obtain leave of the House for the Committee to report the Minutes of the Evidence taken before them, from time to time.

[Adjourned till To-morrow, at *Eleven* o'clock.]

THURSDAY, 12 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

|              |  |                |
|--------------|--|----------------|
| Mr. Cook,    |  | Mr. Edden,     |
| Mr. Grahame, |  | Mr. McCourt,   |
|              |  | Mr. Nicholson. |

Entry from Votes and Proceedings, granting power to the Committee to report the evidence taken before them from time to time, *read* by the Clerk.

William Humble called in and further examined.

Witness withdrew.

Alfred

Alfred George Hamilton called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claims from D. McAuliffe for £2 19s.; William Humble, £4 13s.; and A. G. Hamilton, £1 7s. 6d.—witnesses expenses.

Claims considered and passed.

*Resolved*,—That the Chairman (in accordance with the power granted to the Committee on 11th April, 1894) report the evidence up to this date to the House.

*Ordered*,—That the following be summoned to give evidence under the "Parliamentary Evidence Act":—H. O. MacCabe, Tuesday next; John Owens, Wednesday next; and Joseph Campbell, Thursday next.

[Adjourned till Tuesday next, at *Two* o'clock.]

---

LIST OF WITNESSES.

|                          | PAGE.  |

1894.

LEGISLATIVE ASSEMBLY.  
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

APPOINTED TO INQUIRE INTO THE

WORKING OF COLLIERIES.

TUESDAY, 20 MARCH, 1894.

Present:—

|              |  |                |
|--------------|--|----------------|
| MR. FEGAN,   |  | MR. NICHOLSON, |
| MR. SCOTT,   |  | MR. EDDEN,     |
| MR. GRAHAME. |  |                |

J. L. FEGAN, Esq., IN THE CHAIR.

Mr. Jonathan May called in, sworn and examined:—

1. *Chairman.*] What is your occupation or profession? I am a mining engineer; I am at present Mr. J. May.  
lecturer on coal-mining to the Technical Education Department.
2. How long have you occupied that position? A little over two years. 20 Mar., 1894.
3. Have you ever worked in a mine? I have been connected with mining for over a quarter of a century.
4. What position have you filled? From the time when I was 9 years old until I was 17, I discharged the usual duties of boys employed in mines, and from the age of 17 until I was 21, I studied the principles of mining under a gentleman who was mining engineer to the Duke of Cleveland.
5. What is his name? Mr. Cowley. From that time up to the present I have had the personal control of mining operations in all official capacities, having been deputy, overman, undermanager, and manager.
6. Then you have a certificate of competency, I presume? I hold a first-class certificate under the Imperial Act of 1872.
7. Then your certificate gives you a standing equal to that of any mining engineer, and you can take charge of any colliery in England? Yes; it is the highest diploma.
8. According to the English Act of 1887, before a person can receive a certificate of either the 1st or the 2nd grade, I suppose he must have had five years' experience in mining? I think that is the 2nd grade.
9. There are two descriptions of certificates of competency given under the Act—one being a certificate of fitness to be a manager, and a 2nd class certificate, which is a certificate of fitness to be an undermanager, but a person cannot obtain a certificate unless he has had practical experience in a mine for at least five years? No.
10. Do you believe in that provision? Yes.
11. Is it not a fact that some persons have obtained managers' certificates who have not had practical experience in mining? Yes; sometimes young men, of good education, have gone to districts where they were not known, and have passed.
12. You will find young men with certificates who have never held any official position, whatever, in a mine, and in some instances have never got a livelihood in a mine? Yes, you find instances of that kind, but they are rare.

- Mr. J. May. 13. Have you known any of these men to be successful colliery managers without having competent men under them? I should not like to speak disparagingly of any man. I have a very strong opinion that no man should have the control of mining operations unless he has had practical experience, and has a certificate.
- 20 Mar., 1894. 14. And you have not known anyone to make a successful manager who has not had practical experience, unless he could lean upon someone under him who has had practical experience? They must necessarily lean upon them.
15. I suppose you have made yourself acquainted with the Coal Mines Act of this country, as well as with the English Act? Yes.
16. Have you a good knowledge of the Coal Mines Act of 1876? Yes, I have worked under it.
17. You know that provision is made to allow the mines to work ten hours a day five days a week, and on every alternate Saturday, six and eight hours respectively? Yes.
18. The Act says: "That no male person between the ages of 13 and 18 years shall be employed more than ten hours a day"? Yes.
19. Do you not think that if provision can be made to prevent boys from working more than a certain number of hours a day, a similar provision can be made with regard to men of any age? There is a growing feeling in that direction.
20. Do you think that if the Legislature can enact such a law for boys under 18, that it can enact a similar law for adults? I have not the slightest doubt that legislation providing for eight hours a day will take place in Great Britain. The principle has been affirmed by a majority in the House of Commons.
21. Is it not a fact that the majority of colliers in the Newcastle district work only eight hours a day? Yes.
22. I know that some objection has been taken to the Legislature fixing a day's work at eight hours, on the ground that it would make it more expensive to work the mines? I never could see that that was an argument of any consequence.
23. I suppose you have given the matter a good deal of consideration? Yes. No doubt the fixing of eight hours as the period for a day's work would involve a little more expense; but I remember that when the hours for the boys were shortened at first it caused a little inconvenience, but we found no difficulty about getting the coal out.
24. What do you think would be the extra cost per ton? It would not be a penny.
25. Do you know that a mining expert of repute in this Colony says that the extra cost will be 10d. per ton? That is ridiculous.
26. Have you heard of it? The statement was made to me when I was giving evidence before a Committee of the Upper House and I thought it was a remarkable statement.
27. Then, from your experience you know that it would not be so? I am satisfied that if the eight hours were adopted the extra cost of the coal would not be more than 1d. per ton.
28. In what part of England were you working? In Durham.
29. Do you remember the northern miners of England taking a ballot upon the eight-hours question? Yes.
30. Do you remember that that ballot went against the eight hours? Yes.
31. Could you assign any reason for it? Yes, the reason is given by Sir Joseph Pease, an extensive colliery proprietor, who says: "The miners' hours as now worked are not unreasonable; for the average over all the United Kingdom are only seven hours and twenty minutes per day; the longest hours are in Nottingham—eight hours and thirty-three minutes; the shortest in Durham—five hours and thirty-seven minutes." The objection that the miners had to the eight hours was that if others were such fools as to work for more than eight hours they could not help them. In the mines which I had charge of the day's work averaged barely fourteen hours for the two shifts.
32. Mr. Scott.] Was there not a strong feeling amongst the miners of the north of England that if they recorded their votes in favour of the eight hours there was a possibility of their being compelled to work eight hours? That was the objection.
33. Chairman.] You think that if their hours of labour had been more than eight like other people's, they would have been only too glad to vote for the eight hours? Yes.
34. Did Mr. Burt, M.P., express himself to that effect? Yes, and also Mr. Charles Fenwick, M.P.
35. Do the colliery owners and the men work more harmoniously in the counties to which you refer than they do elsewhere? I cannot say that there is any great trouble about working with the colliers. If any dispute arose we settled it by a delegate board which met the colliery owners.
36. What would you consider the reason for the harmonious feeling there. Is it not because of their strong organisation? Their unions are very strong and are always recognised. If there is trouble the delegates wait upon the managers who take the matter in hand, and if they do not agree, the matter is referred to a general committee selected by both parties. They have a sort of arbitration board.
37. Are not the average wages in that part of England higher than in any other part of England? The highest wages and the shortest hours are in Northumberland and Durham.
38. And is it not a fact that the collieries there pay as well as the collieries in any other part of England? They do.
39. Has not the average tonnage per man increased since the adoption of a shorter working day in England? Yes; but better machinery might have something to do with that, and there is no question that since the Mines Act came into force the class of managers employed has considerably improved. They are better educated and it is compulsory that they should make a study of their work.
40. Do you not think that on account of the shorter hours the men can go to work in better form? They go to work in good form, but it is a hewing match whilst they are at it.
41. They could not work so hard if they had to work longer hours? No.
42. Since the adoption of the shorter hours have not the manners and morals of the miners become very much improved? They have got more leisure, the mine-owners take an interest in their workmen and provide them with libraries, and the miners are utilising their leisure now much better than they did thirty years ago.
43. Then you attribute the improvement to their leisure being spent in study? Yes.
44. Do you think that if Parliament enacts that a day's work for miners shall not be more than eight hours that will be a means of preventing strife between employers and employees concerning the hours of labour?

I have long held the opinion that it would be much better if the Legislature were to settle the matter because if you have ten mines in a district most of them working eight hours, and there is one that wants to sneak a bit longer time the effect of that will be that the others will have to follow suit.

Mr. J. May.  
20 Mar., 1894.

45. Do you think that the majority of the miners in this country are in favour of the eight hours? The most intelligent of the miners, fully 80 per cent. of the miners, are distinctly in favour of the eight hours.

46. Have you an opportunity of coming into contact with men who are preparing for examination. What are their views? In England there was a distinct feeling in favour of shorter hours, and I am convinced that the feeling is just as strong here.

47. There has been a great deal of objection to it, and some think it should be left to the judgment of each man as to the number of hours he should work. Do you think so? Certainly not. It would be better if the eight-hour system were established as a principle.

48. Will you look at clause 2 of the Mines Bill now before Parliament, it has reference to the eight hours? Yes; it says: "No person shall, except in case of emergency or when life or property are in danger, work below ground in any mine for more than eight hours (inclusive of one break of twenty minutes for the purpose of obtaining food) on Monday, Tuesday, Wednesday, Thursday, and Friday, and for more than six hours on each alternate Saturday."

49. Do you believe that that clause is workable? Yes, up to that point.

50. You do not see any harshness in it? I do not.

51. What objection have you to that clause? The clause goes on to say, "And no person so employed below ground shall draw or hew coal on the pay-Saturday." All my life I have made it a rule that if the pit had to lay idle it should be on a pay-Saturday. I have seen cases in which I was very glad to work on pay-Saturday. Any colliery manager, if his pit has to lay idle one day in a fortnight will desire it to be on a pay-Saturday.

52. *Mr. Edden.*] I understood you to say that you had been glad to get to work on a pay-Saturday;—I suppose you mean to do some special work? If something occurred on Monday or Tuesday, or any other day to stop the mine, it would seem strange to me if the men could not work on pay-Saturday. They always worked a shorter shift on that day. That part of the clause is a weakness. I am satisfied that no manager will work on a pay-Saturday if he can avoid it.

53. *Chairman.*] But apart from that the clause is workable? Yes.

54. According to the old Act the age up to which children must not be employed in mines is 13 years; it is now proposed to make it 14 years;—what is your opinion of that? I cannot see that it would be any hardship to the community. It means that the boy will get more schooling. I think it is a very wise provision.

55. Can you say whether there has been any increase in the average output per man since the eight hours was introduced in England? Yes. According to the statistics of the Home Government, in 1873 the average was 250 tons per man, in 1887 the average was 308 tons per man.

56. That dispenses at once with the argument that granting the eight hours would materially raise the price of the coal, and cause a loss to the colliery-owners? There is no force in that objection whatever.

57. *Mr. Scott.*] Would you attribute the whole of that increase to the eight hours? I say that to a great extent improved methods, and improved machinery, and better education of the managers has a great deal to do with it.

58. *Chairman.*] And the men being in better form when they go to work? Yes; all these things.

59. *Mr. Edden.*] I think I am right in saying that you have been examined before a Committee before? Yes; before a Committee of the Upper House.

60. What were the chief points upon which you were examined? I could scarcely give you an outline.

61. I suppose you have gone through the Bill? Yes.

62. I suppose you are acquainted to a large extent with the condition of the mines in the Colony? Yes. I know the condition of the mines all over Australia.

63. Both sanitary and otherwise? Yes.

64. Supposing that a mining expert was to tell you that the miners of New South Wales worked under the most favourable conditions of any miners in the world, what would you think? I should think that he had never been in the north of England.

65. You say that you are acquainted with the Bill that has been passed by the Legislative Assembly? Yes.

66. As a mining expert, have you any strong objection to anything in it, beyond what you have mentioned in connection with clause 2? I have not.

67. Do you think that the amendments that were made in it while it was going through Committee are detrimental to the working of the coal mines in the Colony? Certainly not. There are one or two of the amendments that I have been in favour of for many years.

68. I suppose you are aware that there are places in the Colony where the men are paid by a standard weight system? Yes.

69. Where they are working on the standard weight system, 12 cwt., being the standard; and two men send out ten skips in the day, and out of the ten two skips are weighed—and one weighs 13 cwt. and the other 11 cwt.; and all the others are averaged by those two, what should be the weight paid for? Under our system three skips were sent up weighing 12 cwt., 13 cwt., and 14 cwt., respectively; the average would be the average of those three, but from what you say they will not pay for more than 12 cwt.

70. Are you aware that there are mines in New South Wales where men are paid on the system known as the standard weight system, and if two men send up ten skips in a day, and one of those skips weighs 13 cwt., and another 11 cwt., the average of those ten skips should be 12 cwt.;—are you aware that instead of being paid for as being 12 cwt., they are paid for as being 11½ cwt.? Yes, I have noticed that.

71. Are you aware that there are collieries in the Northern Districts which have been on the verge of strikes several times in connection with this matter? Yes; but could not a better system be established. Does the owner say that his cage is not large enough to admit of bigger skips?

72. That is the plea set up? It is not a difficult matter for the miner to fill very nearly the average, but it is not very good mining practice to deduct the surplus. The owner might say "I do not want the excess; but I will not pay for more than 12 cwt." What should be paid for the rest will go into the miners' fund. That would soon stop it.

73. What would you think if you were a colliery manager, and you heard an expert state to a body of intelligent gentlemen that if there were no restrictions as to the loading of skips, the men would heap them up and destroy the main roads? It seems ridiculous.

- Mr. J. May. 74. You would not believe him? No.
- 20 Mar., 1894. 75. You know that the men have more common sense than to fill skips to such a height when they know they are not going to be paid for the coal? That is got over at the Borehole nicely. If a man fills a skip more than 10 inches above the wood he loses it.
76. But he gets the weight that is in the skip? Yes; but anything over that goes to the general accident fund, which proves that the owners do not want to take advantage of the men, but want them to fill the skips properly.
77. Do you not, as a mining expert, think that this system of standard weight should be abolished, so that the men should be paid for what they send out, as long as the skip was not filled too high, and caused no damage to the machinery? Distinctly a standard is wanted. At the Borehole it is 10 inches. A man filling his skip more than 10 inches above the top loses the skip.
78. But you do not think it is a fair system, do you, this standard weight? No.
79. And there is no necessity for its being an exceptional skip or two? It really wants an established system like that at the Borehole.
80. I suppose you are acquainted with the part of the Bill referring to the divisions of mines into splits? Yes; that is the best mining practice. You never saw a competent mining manager who did not split his air straight off.
81. You think it tends to efficiency in the management of the mine? It is the very essence of good management.
82. I suppose you are also acquainted with the bord and pillar system? Yes.
83. I suppose you know the distance they have to drive before the cut-through is put through. The distance is 35 yards, and with 2 yards for the cut-through, that makes it 37 yards in all? Yes; but is there not some dispute as to whether the cut-through is included in it? Suppose the cut-through is 10 yards, that makes it 47 yards.
84. Do you think it is possible, when they have got 25 yards at the bord, for a man to get sufficient air to work by? Most certainly; the sanitary conditions will not be very nice.
85. Especially where powder is used? Where powder is used it will be worse. If you make black-damp it will be very bad indeed.
86. I suppose you are aware that in the Newcastle district the miners work nearly nude? Oh, yes; under the usual mining conditions.
87. Are you in a position to say what is the cause of that? All miners work with little more on than a shirt.
88. They work in the Newcastle district nearly nude. What would remedy that. I suppose you have seen mines at home where the men work with their clothes on? No; with a small body flannel on; that is all.
89. What would remedy that state of things? You might brattice up the bords.
90. Is it possible to get air to the men after they have worked for from 20 to 25 yards up a bord, especially where the sides are choked up with dirt, unless it is taken to them by some means? It is simply a question of bratticing.
91. Are you in favour of bratticing? Yes.
92. You think it is a practical way of working? Yes.
93. You have been used to bratticing? Yes.
94. Where a mine is worked upon the bord and pillar system, do you not think it impossible to get air unless bratticing or some other mode is adopted to turn it into the bord? They cannot get it by diffusion. It will not go by itself.
95. If there is nothing to take it up the men cannot get it? No; they have to get on as well as they can.
96. There has been great exception taken to an amendment that was put into the Bill when it was in the Assembly in reference to bratticing, and one of the great objections taken to it was that it would cause friction, and consequently diminish the ventilation. What is your opinion upon that? Anyone making an objection like that would raise the same objection to putting stoping in to carry out air along the main road. They would say that every stoping put in would increase the friction. Having been accustomed to bratticing every bord and every cut-through, it seems to me ridiculous that anyone should make that an objection.
97. You think that the talk about friction is mere nonsense? There is more friction, but we must provide more pressure.
98. There was an amendment made in the Bill to the effect that the air should be carried to within 15 yards of the working face where gas did not exist, and it has been stated that that would increase the cost of getting the coal by 3d. or 4d. per ton? They must have included the hewing price in that.
99. What do you think it would cost? With us in the North of England it used to cost barely a halfpenny per ton for labour and material and we bratticed every bord and every cut-through, but out here of course wages and material may be a little higher in cost. It would increase the cost from 3 farthings to a penny per ton.
100. And it would be the means of giving the men better air, they would be in better condition, and they would be able to do more work? I should be quite satisfied that that three farthings per ton would not be loss. It would be gain in the greater amount of work that the men could do.
101. In the Northern District a great deal of powder is used, do you not think from your experience that when a bord gets from 25 to 30 yards in advance of the air, and there is no brattice to bring the smoke out after shots are fired the place would be continually full of smoke? Yes, it will not be good for health. This trouble about bratticing has no doubt arisen because the men have felt that the want of it was injuring their health.
102. Will it not also be detrimental to the men cleaning the coal? The men will not be able to see so well when there is so much smoke.
103. If the bord is continually full of smoke will not that be detrimental to the health of the miners sending out clean coal? Yes.
104. And if clean coal is not sent out it has a tendency to cause a loss of trade? Yes.
105. Therefore, it is necessary that the managers should give them good ventilation for other things as well as for health? Yes.

Mr. J. May.  
20 Mar., 1894.

106. What quantity of air do you think is sufficient for ventilating purposes per man per minute under the present system of working? It does not vary a great deal under any system. It varies most in proportion to what gases there may be. I might give the opinions of some of the most eminent authorities on the subject in England. Mr. Herbert Mackworth said "a minimum of 100 cubic feet per man for each man and boy for sanitary purposes alone where there is no escape of fire-damp and little of any other mineral gas." Mr. Hedley says, "From 100 to 500 cubic feet per minute for each collier." Mr. T. J. Taylor says, "In a mine yielding no fire-damp, with 120 to 130 persons employed, a current of from 20,000 to 30,000 cubic feet per minute properly conveyed up to the face of the working and made to sweep the district in which the people are employed; in fiery mines a much greater quantity than this." Professor Phillips, another competent authority said:—"In most of the fiery mines an average of 600 cubic feet per minute per collier." My own experience was obtained in a mine where there was an average of 500 cubic feet per man.

107. Reverting to what we have said about being twenty-five or thirty yards ahead of the air in a narrow bord with nothing to force the air into it, how much air do you think they would get per man per minute? I should not like to hazard any statement on the subject. I should not care to work at the face myself.

108. Did you ever know the men make a demand for the eight-hour system? Yes; in Great Britain.

109. In this Colony? Yes; I know that the most intelligent miners are distinctly in favour of it.

110. I should like to ask you something about Inspectors. There has been great exception taken to the powers given by the Bill to Inspectors. Do you not think that the Inspector ought to have power to call out the men if he goes into a mine and finds it dangerous? Yes; if he is satisfied that the place is dangerous. If there is anything which the Inspector comes across suddenly which satisfies him that the mine is not safe he would naturally take upon himself the responsibility of stopping the mine. But it would be a very difficult matter. Supposing an Inspector goes to a mine and finds that the manager is permitting blasting in the longwall, and on looking into the gob he thinks there is gas there, there might be a difference of opinion about it.

111. But if they had a dispute about gas being there it could be settled with a safety-lamp? Yes.

112. If there was gas, do you think the Inspector would be justified in preventing a shot from being fired? Yes.

113. I think that under our present Coal Mines Regulation Act, if an Inspector goes into a mine, no matter how dangerous it may be, he has not power to withdraw the men? No.

114. If he had gone into the Borehole Mine on that fatal Saturday morning when it fell, and had realised what was coming on, he could not even then have withdrawn the men? No; he has not the power.

115. But do you not think he ought to have it? It is only fair in a case of that sort that he should have the power. Under the English Act, if there are any conditions which indicate that a mine is not safe, the Inspector draws the attention of the manager to the matter; but if the manager says, "I consider it safe, and I shall continue," there is only one remedy. He must send his objection to the Department of Mines, and then it is settled by arbitration.

116. Suppose the Inspector went into a mine and sees serious danger to life and property, and if the men are withdrawn, do you think he ought to say whether the place is safe before the men go into it again? I have a great opinion for a manager being distinctly responsible for every detail. If anything goes wrong the blame should be fastened upon him. You should make the manager responsible. Never attempt to make an Inspector responsible for the management of a mine. Provide that the Inspector shall have power to stop a mine in a case of serious emergency, but do not remove responsibility from the manager.

117. What do you think is a fair registration for a thermometer to make of heat in a mine for men to work in? In Pemberton's mine, in Sunderland, they mine under similar conditions, and have the temperature which we shall have here in the proposed mine under this harbour. You would not have the same temperature in the Newcastle mines as you would have in this proposed new mine.

118. Suppose that a mine is 250 yards deep, what would be a fair temperature? The temperature of that mine would be increased by 1 degree to every 60 feet. By splitting you can keep the districts cool; and if you carry pipes along your main roads, and have small sprays, that will cool the temperature very much, and a certain species of salts are used to cool the atmosphere. You cannot have any fixed statement as to the temperature.

119. If you have a mine 100 yards deep, and 250 men employed upon it, and the thermometer registers about 85 degrees, would not that be a pretty warm place? Yes; you might think there were some steam-pipes warming it.

120. *Mr. Scott.*] As regards the ventilation of the mines of New South Wales, do you not consider that they are, on the whole, as well ventilated as the majority of mines in Great Britain? I should not like to say that much.

121. I presume that you have been down a good many of them? I have not been down many of them.

122. The minimum supply of air at present is 100 cubic feet of air per minute? Yes.

123. And the distance of the drive is generally 35 yards before the cut-through is put through? I think there is some dispute about that. Suppose the cut-through is 6, 8, or 10 yards, that in some cases must be added to it.

124. Do you think it is necessary to have the proposed minimum of 150 feet, seeing that we are reducing the distance before a cut-through is to be made by fully 10 yards? I am distinctly against the 25 yards. I am strongly in favour of ventilating the face, and as long as that is done the miner is satisfied.

125. You would not make it a rule that the cut-through should be over 25 yards? No; let the face be ventilated. In longwall there is no cut-through.

126. What about the 150 feet minimum? I am distinctly in favour of it.

127. You would not interfere with the distance of the drive? No.

128. You would leave that to the manager of the colliery? Yes.

129. *Mr. Grahame.*] You want air, and nothing else? Yes.

130. *Mr. Scott.*] You approve of the 150 feet minimum? Yes; there is a distinct tendency to increase the quantity of the air in the mine, and the quantity will be increased.

131. Do you think it a fair increase from 100 to 200 feet for each horse? It is a trivial matter.

132. The men are considerably reduced in number, are they not, under the Bill, as compared with the Act—the number per split? With reference to the 60 men in the split, two men will average 5 tons a day

Mr. J. May. day. That will be 150 tons a day for 60 men. Seven districts would give 1,050 tons. Seven districts in a mine drawing 1,000 tons a day is very small. You will find mines doing that with 11, 12, and upwards of 14 splits.

20 Mar., 1894.

133. As regards the age of drivers and the qualifications of engine-men;—do you think 21 a fair age? The English Act says, “In any mine which is usually entered by means of machinery, a competent male person, not less than 22 years of age, shall be appointed for the purpose of working the machinery which is used.”

134. Do you think that 21 is a reasonable age? Yes.

135. There appears to be an impression that there are plenty of youths competent at 18 years of age, but I question that? You find some boys of 18 who are more manly than men of 23.

136. Do you think they have the thought and the care of older men? I think that 21 is a fair age.

137. There is a matter as regards the drum. Rule 34 says:—

There shall be on the drum of every machine used for lowering or raising persons, such flanges or horns, and also, if the drum is conical, such other appliances as may be sufficient to prevent the rope from slipping.

How would you decide the depth and thickness of the flanges of those drums? It would depend upon whether the drums were conical.

138. Would you not regulate the width of the drum? The width would be regulated by the distance of the cages apart.

139. Is it necessary to have the boilers inspected every six months? It would be much better to have them inspected every three months.

140. Would not that depend on the kind of water used? Yes; but I have often wondered that they have not here a branch of the Steam-users Association, because no matter how competent are the men you have to look after the boilers, the agents of the Association are experts, and the fact of their coming to give advice is worth double the money.

141. The Newcastle Coal-mining Company are erecting new boilers, and they have good water;—why insist upon the new boilers being blown down to be inspected with the old ones? There might be some limit as to the age of the boilers.

142. Do you not think it would be wise to leave it to the Government Inspectors? Yes, if the Government Inspectors have sufficient power.

143. *Mr. Nicholson.*] I suppose you are aware of the general system of ventilating coal-mines practised in the Colony? Yes.

144. Do you think that the system that now obtains could be improved by bratticing every working place? Yes.

145. You do not think that the system of bratticing would entail so much cost as the colliery owners have stated? The system would not cost 1d. per ton, and that would be returned by the increased amount of work that would be got, so that really it would cost nothing.

146. *Chairman.*] And there would be the preservation of timber, and the preservation of animals? Yes.

147. *Mr. Nicholson.*] You are aware that that is the only system by which air can be carried to the face? Yes.

148. Under the present system without bratticing the air takes the easiest outlet, and none goes to where the miner is working? Exactly so.

149. You think also that the use of the brattice would be to the interest of mine-owners as well as of miners? Yes.

150. With regard to the eight hours, do you consider that a sufficient time for a man who gives a fair day's work for his money? Yes; a good miner will tire himself in less than eight hours.

151. Is there any method of getting at the eight hours otherwise than by compulsory legislation? The best way to get at it is by compulsory legislation.

152. Would you be in favour of making it a penal offence for a man to work in a mine for more than eight hours a day? Unless you enforce an Act by penalties it will be of no use.

153. In reply to a question put by the Chairman, you said that in the north of England disputes were settled by a joint committee of masters and miners;—do you approve of that? Most distinctly.

154. Do you think that that system prevents strikes? Yes.

155. With regard to wages and other matters? Nothing could better illustrate it than the case in which Lord Rosebery intervened.

156. Do you think that a similar system could be adopted here? Certainly.

157. Would it be better than our present Arbitration and Conciliation Board? Very much better.

158. As regards the weighing of coal, do you not think that every miner has a right to have all his coal weighed? Yes; but I have always failed to see the necessity for that, so long as a man had a fair average weight. It is a custom that I have never been used to.

159. Is it not provided in the English Act that a man can demand to have every pound of coal that he gets weighed? The Act says, “where the amount of wages paid to any of the persons employed in a mine depends upon the amount of minerals gotten by them, those persons shall be paid according to the actual weight gotten by them of the minerals contracted to be gotten, and the minerals gotten by them shall be truly weighed at a place as near to the pit mouth as is reasonably practicable.”

160. Do you know that the Lord Chief Justice of England has decided that a miner has a right to have every pound weighed? I can quite see that such an interpretation can be placed upon the Act.

161. Are you aware that there are collieries in New South Wales where they do not weigh anything like a fair proportion of the skips? I can understand that that may be so.

162. And that the miners suffer great injustice? I can quite understand that.

163. Suppose that two men sent up 15 cwt. in a skip and they do not get weight allowed in the averaging, is that fair? I have had trouble in that direction. In the counties of Durham and Northumberland, the practice is to weigh the first skip and the last. In Lancashire they even weigh the whole lot.

164. Is there any other honest way to pay the men than by weighing? You can only do it by weight.

165. Every man sells his produce by weight, not by average? Yes.

166. With regard to what is provided for in the Bill, the appointment of a check-weigher, do you think that the men have a right to have a check-weigher to see that they get justice? Yes.

167. Have they a right to employ any man other than a person employed in that particular colliery? They have a right to make their own selection.

168. Seeing that they pay the man, have they not the right to employ whom they please? Yes. Mr. J. May.
169. In your opinion, whether the cut-throughs should be put through 25 or 35 yards apart is a matter of indifference as long as a great quantity of air is conveyed to the working face? Yes; it does not matter if the distance is 40 yards as long as the face is ventilated. 20 Mar., 1894.
170. Do you think bratticing would cause much loss to the owners? No.
171. Would they not be actual gainers instead of losers? Yes.
172. Do you think it necessary that every manager and every over-manager should have a certificate? Yes; the manager should have a first-class and the underground manager a second-class certificate.
173. *Chairman.*] Do you think it necessary to sink a second shaft? Yes; you must have two drifts or two shafts.
174. What is the nearest distance you would advocate for a shaft? In the English Act it is 15 yards.
175. But what would you say? I should say that they should be anywhere about a chain apart.
176. Ten feet would be out of all reason? Yes; too short a distance.
177. What special advantages are got by splitting the air? You increase the area, and the consequence is that you get a very much larger quantity of air for the pressure you have. Another advantage is that it makes the district cool, and a third advantage is that in the event of an explosion only one district may be affected, and there are many other advantages.
178. Have you ever been at the scene of an explosion? I have not.
179. Is it not a fact that where explosions have taken place under the longwall system the great majority of the men have lost their lives? It naturally follows under the longwall system, but there is nothing to prevent splits from being used in the longwall system.
180. The bord and pillar system has not always been worked with the splitting system? No; under the old idea they would take the intake air and carry it round to every man in the pit, and the last dozen men would get all the impurities from the others.
181. Has it not been found that other splits have remained safe when an explosion has occurred in one? Yes; it is a very common occurrence.
182. After an explosion is not the ventilation more readily restored under the split system? Yes.
183. Under the British Act the law gives a certificate for service;—are you in favour of that in this Colony? Where you have practical miners I consider that it is fair that they should receive certificates. In England, Mr. Peter Dickinson knew more than all the lads in the offices who might pass examinations. He was an old man of great experience, and it would have been ridiculous to have asked him to undergo an examination.
184. Is it not a fact that men and horses give off a certain amount of carbonic acid gas? Yes.
185. Is it not a fact that from 8 to 10 per cent. of that is poisonous? Ten per cent. would extinguish life and lights straight off.
186. So that it is even more dangerous than inflammable gas? Yes.
187. For what reason? Because it will not sustain life. In connection with this there is a great anomaly. Suppose you have two bords, one of which makes gas, the manager runs that out straight off, and another bord makes carbonic acid gas, in that case as long as the men can get along nothing is done.
188. Do you consider that an Inspector having a first-class manager's certificate under the English Act should pass in this Colony? The English certificate is the highest in the world.
189. Are you in favour of a system similar to the English system of appointing inspectors, or would you have the system provided for in the Bill? The best system with regard to inspectors is the one that is being gradually introduced into Great Britain. It is very good for smart young men in offices to apply for the appointments, but men of thoroughly practical training in the mines are preferred. A man who is an overman or a deputy, and who has passed an examination as a colliery manager, is a man whom they would take because he is conversant with all the details of colliery management and will not want a man to show him round.
190. What is your opinion respecting the appointing of an inspector by a Board of examiners? Under the English system the Board is composed of men like the Chairman of the Miners' Association—men representing the interests of the miners—three persons practising as mining engineers or managers of mines, and the Inspector for the district is on the Board.

WEDNESDAY, 21 MARCH, 1894.

Present:—

|              |                |
|--------------|----------------|
| MR. EDDEN,   | MR. COOK,      |
| MR. McCOURT, | MR. NICHOLSON, |
| MR. CANN,    | MR. GRAHAME.   |

J. L. FEGAN, Esq., IN THE CHAIR.

Jonathan May called in and further examined:—

191. *Chairman.*] In your opinion should the examination of a working-place take place prior to the man entering to work? In well regulated mines there is a distinct system in connection with the examination of places. The rule is, that the deputy or fireman shall examine every working-place in his district before the men enter it, but there should be some stated limit as to the time which should elapse before the man goes into it. A deputy might examine a place four hours before the men went to work in it, but he could not tell what would be the condition of the place four hours after. Our rule was that the deputy who had fifteen or twenty places to examine should have an hour's start of the men. Mr. J. May  
21 Mar., 1894
192. Is it not a fact that there is no provision in the Act of 1876 to that effect? I do not think there is any rule to that effect.
193. But you believe there ought to be? Yes; certainly.
194. Should any new Bill be passed, provision to that effect ought to be made? Yes, and a stipulated time should be given which should elapse between the man examining the place and the workmen entering it.
195. What is your opinion as to the powers which should be conferred upon inspectors? The powers which should be conferred upon inspectors should be clearly defined. The inspectors should have power, if

Mr. J. May. if necessary, to withdraw the men in case of danger, but we ought to distinctly hold the manager responsible. Do not let an inspector manage the mine, but give him some clear and simple rule in the event of any serious danger necessitating the calling out of the men. By all means keep the responsibility fastened upon the manager. If an accident happened it might be said "Oh, an inspector was round here twenty-four hours ago." The responsibility should not be moved from the shoulders of the manager in that way.

21 Mar., 1894.

196. In airing the workings with one current—having no split, but just one current—is there not a great risk of having your air cut off by a fall of roof or some impediment than if you were working your mine in districts or splits, each district or split being supplied with a current of fresh air? It would be a barbarous system. Splitting the air is the essence of good mining practice.

197. Is there not a danger in not splitting? Yes. It is one of the advantages of the splits that all the districts are ventilated separately, and if there is a fall in one air-way it does not affect the other splits.

198. Is it not a fact that in mines where gas exists the stoppage of the air-course may result in a loss of life? Yes.

199. Did not such an accident happen in the Blantyre mine in Scotland, and were not lives sacrificed? I forget the details of that accident. I believe that in one of the Royal Commission's reports there is a reference to some of the matters to which you are referring.

200. Did not Mr. Read, the manager of one of the great mines in Scotland, give evidence to the effect that there was only one air-course? One current of air. I think you will find an account of it in the Royal Commission's Preliminary Report.

201. In that instance there were something like 209 lives lost, were there not? There was a serious loss of life.

202. In splitting the air, is it your opinion that stopping should be used instead of doors? The better way is to avoid using doors.

203. With what material would you build your stopping? In the best collieries it is either brick or stone.

204. Is it not a fact that where an explosion has taken place, and stopping was used instead of doors, the air-ways have been easily repaired, and that other parts of the mine have been saved from the force of the explosion? Yes; but there is a practice being now established which dispenses with the use of stoppings.

205. What is that? You will understand that there are about 500 yards between the districts where you have stoppings to carry your air, and the modern practice is to dispense with the stopping by leaving a rib of coal from the shaft to the principal districts, and that is only pierced at the point where the main districts go through.

206. What is the length? That is according to the cover.

207. What is the minimum thickness? Fourteen or 15 yards. It has been a standing reproach to the mining engineers of Great Britain by their continental brethren. They say you get plenty of air, but you do not get it round the face. In Belgium and Germany they have had these stoppings out for a long time. You may build a stopping with brick, but it may not be air-tight. But if you leave a rib of coal between your intake and your return it dispenses with the stopping.

208. Where doors are used, is there not a danger of its being blown open, which would cause a loss of life? The practice is to have as few doors as possible. Doors are avoided by having over-casks or air-crossings. You may recollect that at the Lund Hill mine, in Yorkshire, where there was a terrible explosion, there were fifty-two doors. The place was ventilated on the old system. You can always take doors out by an over-cast.

209. Is it not a fact that often outbursts of gas take place where they are least expected? Yes; but in new mines it is usual to drive two or three winning-places for gas drainage. Where there is high pressure there are mines, as in Wales, where they put bore-holes in front of the main headings—similar to those bored in approaching drowned masts.

210. I suppose the only way to guard against danger of that description is to have a mine well ventilated? It is simply a question of properly laying out the mine and of ventilation. One thing you must not lose sight of, and that is that there is many a good man who has taken charge of a mine which has been so ruined previous to his taking charge that he could not without tremendous outlay get the mine into anything like form.

211. Where gas exists, would it be safe to work it with only 100 feet of air per minute for each man, boy, and horse? It would be disgraceful to pretend to ventilate a fiery mine with that quantity.

212. Then it is only right to have more than that in a mine, seeing that we cannot provide against sudden outbursts of gas? Most certainly. There are mines with 600 and 800 cubic feet.

213. Does the present Act hamper or impede the managers who wish to ventilate their mines properly? Certainly not.

214. Will you look at rule 3? Rule 3 says that an adequate amount of ventilation shall mean not less than 100 cubic feet of pure air. But there has been an absurd idea that that minimum of 100 feet would prevent them from getting 1,000 feet. It is a most ridiculous objection. They are limited only in one direction.

215. If you were a manager, would it prevent you? I never had so little as 100 feet in my life.

216. You would think that that would not hamper you in any way? Most certainly not; but to prevent further quibbling there should be an addition to this provision. We ought to say that the quantity of air shall not be less than the minimum, but should ten times that quantity be required to dilute and render harmless noxious gases, the manager must be responsible for its supply.

217. You admit that that clause as it stands would not prevent the manager from giving 600 feet of air? It would be absurd to say that it did.

218. If it said 150 feet instead of 100 feet it would not hamper the manager? No; the manager should be compelled to provide a sufficient quantity of air.

219. Do you not think that the words "adequate amount" cover all that ground? Yes; it might mean 500 feet or 1,000 feet.

220. You think, as a practical manager, that the words "not less than" ought to be inserted before the words "150 feet"? Yes. I might quote you the opinion of Mr. Forster, an inspector in England, and a great authority, who said that they had trouble about the "adequate amount." He said, "Suppose we

go to a mine and find the ventilation not good. We take the offenders before the magistrates, and the manager says, 'A candle would burn upright.' The magistrate would not understand the case, and how could we show that the man had not sufficient ventilation?" Mr. Forster says: "We might be certain from the very disagreeable smel—from the 'smell of humanity'—we might be positive that ventilation was not good, but how could we prove it to that magistrate?" If you say that there must be a minimum of 150 feet, and that the supply of air must be adequate, that will be a great improvement.

Mr. J. May.  
21 Mar., 1894.

221. Suppose that a mine is ventilated by one current round by the face, what is the result of that to the last section of men in that sweep as a rule? They are simply poisoned with smoke and bad air.

222. Since the passing of the Coal Mines Act, I suppose there has been a great improvement in the science of mining? Yes; and the better education demanded of the manager is having a beneficial effect.

223. Do you think any improvement can be made in the present Act of this Colony? Yes; the best thing would be to get the English Act substituted for it as quickly as possible, with whatever additions might be thought necessary. I think that a minimum of 150 feet is an improvement on the English Act, and I think that the provision for some method of getting the air to the face would be a distinct improvement on the English Act. Furthermore, I hold that the splitting of the air and limiting the number of men in the split are distinct and necessary improvements.

224. In the English Act there is provision for a barometer to be kept on the surface;—what is your opinion of that? Opinions differ about that. I am in favour of the barometer. Its actuating principle is mercury. Gas is more sensitive than mercury, and the gas will give off three or four hours before the mercury will show you the alteration in the pressure. Suppose that the pit knocks off at 6, and there has been an increase of barometrical pressure during the night, you have from ten to twelve hours during which that could take effect upon the barometer.

225. The outlay is comparatively small compared with the benefit to be derived from the barometer? I should always keep one in the mine, even at my own expense, if I had the management of a colliery which made dangerous gases.

226. What is your opinion as to the safety of catches;—do you believe that they serve a good purpose? You might make a distinction between safety catches and detaching hooks. A safety catch is simply some means of preventing a cage from slipping back. There is rather a feeling against them. Mining engineers consider that the machinery in connection with them is so complicated that they would prefer to have strong ropes and strong links, but when the cage comes to the surface I think we ought to have a catch there. There is a distinct feeling growing in favour of detaching hooks to detach the rope in case of over-winding, and also of automatic steam brakes like those adopted by Mr. Turnbull and Mr. Croudace.

227. Of course you believe in detaching hooks and safety catches;—do you believe that they make the engineman careless? Certainly not.

228. There have been many lives saved through safety catches and detaching hooks? Yes; and cases where lives would have been saved if detaching hooks had been used. There is something I should like to explain. If you have a cage coming up at a certain speed, the moment the ropes is detached the cage will not stop, it continues to travel to a certain height, proportioned to its kinetic energy, then it comes jerking back upon the links. What is wanted is something to catch the cage as well as to detach the rope.

229. *Mr. Edden.*] Have there been appliances invented for that? Yes; Mr. Croudace is having them put on at the Durham mine, and Mr. Turnbull has had them at the Borehole for some years, and speaks highly of them.

230. *Chairman.*] You are acquainted with the British Act of 1887? Yes.

231. Is there not some provision in that Act with regard to the use of safety hooks? Rule 26 says:

If in any mine the winding apparatus is not provided with some automatic contrivance to prevent over-winding, then the cage when men are being raised shall not be wound up at a speed exceeding 3 miles an hour after the cage has reached a point in the shaft to be fixed by the special rules.

232. Do you not think that the British Parliament in passing that recognised that it was necessary to have detaching hooks? Yes; there is a distinct feeling in favour of them.

233. Do you consider that the engine-winders should pass an examination? I have a very favourable opinion of examinations for enginemen, because it compels younger men to get a knowledge of the theory of their work, but in Great Britain there is a large number of enginemen, and the manager is responsible for the engineman, as he responsible for every detail of the mine.

234. Do you not know that it is a fact that in the event of overwinding, or anything of that description, causing a fatal accident, the engine-driver is brought before a jury? Yes; he has to prove that he took every reasonable precaution. Then that must prove that the manager had a proper signal, and every other necessary contrivance. If the engineman could say that the manager had not provided him with so-and-so the manager would be responsible.

235. Is it not a fact that where disputes have taken place incompetent men have been employed at the engines? In cases of that sort they are naturally glad to get anybody.

236. Is it right that they should get incompetent men to do this work? It would not be right to entrust men's lives in the hands of incompetent men. If a clause was inserted in the Bill providing that the enginemen must pass an examination that would do away with incompetent men, unless they had certificates of service which would be granted to the old men.

237. You admit that on that ground we should dispense with incompetent men? Yes; you would have some guarantee.

238. Have you ever, in your capacity of manager, had to cope with sudden outbursts of gas? No; they are very rare. There are certain districts where they are frequent. At the Boldon Colliery, Mr. May, the manager, had a bore-hole inserted in the Bensham seam, which registered a pressure of 461 lb. to the square inch, yet I do not remember there ever being a sudden outburst of gas. As a rule, gas is discharged from seams gradually.

239. Are you aware that the coal trade is depressed at the present time? Yes.

240. As a business man, and as an expert in mining, could you give us any reason for the depression in the coal trade? Yes; I have often thought about that. I gave some evidence in that direction before a Committee of the Upper House. It was with regard to the addition of a schedule at the end of the proposed Mining Bill. In the English Act, and in the proposed Bill, there is a schedule in the form of a table, in which a return can be given of the number of days in each month on which coal

**Mr. J. May:** or shalo has been got. It would be better if it provided for the average number of days in each week being given on which coal or shale has been drawn. There is certainly a number of collieries in the Newcastle district which have been established without any warrant from a commercial point of view. If we take these ten collieries—the A. A. Company, the Newcastle-Wallsend, the Lambton, the Co-operative, the Newcastle Coal Company, the Waratah, the Minmi, the Stockton, the Bullock Island, and the Hetton;—those mines could supply the whole of the trade in the Newcastle district by working not quite four days a week, and yet there are nearly twenty more mines that have been established there. There are the Greta, the Burwood, the New Lambton, the Great Northern, the Taralba, the West Wallsend, the Monk Wearmouth, the South Burwood, the Burwood Extended, and the Redhead. There has been over £1,000,000 sterling spent on these last ten mines, the first ten of which could supply the whole of the trade. I think it would be quite fair to say that one-third of the mines in the Newcastle district could supply the whole of the trade. That being the case, in the interests of legitimate mining, it would be only fair that some means should be adopted to give the commercial public some idea of what is going on. There are two mines idle out of every three. That means that the capital spent on them is simply wasted. I suppose there has been £200,000 spent over the Greta Mine,\* and it is in the Bankruptcy Court now. There being two mines idle out of every three, means that there are two miners idle out of every three, and as soon as ever those people—the syndicate mongers—have destroyed the legitimate capital of the mines they want to make an attack upon the rate of wages, and the two miners that are not required out of the three are pitted against the third miner. In the interests of legitimate mining something should be done. I think that the Mines Department should see the utility of having a statement in the form of Schedule 3, giving the names of the mines and the number of days which they have worked each week. Then, if any of these syndicate people were going into further speculation in mines, honest people, by looking at the schedule, could see whether the mines were working only two days a week. What is the use of starting more mines? The West Wallsend Mine changed hands the other day for £36,000, and it cost £140,000. Who suffers?

241. Who do you think suffers? Not only the legitimate miner, but others. Everybody suffers connected with the trade.

242. *Mr. Edden.*] With regard to the West Wallsend Mine, do you know whether the land is not cut up into blocks? I do not know how they got the land.

243. It is the custom to get the mines sunk, and to cut up the land in the vicinity into small allotments miles away from civilisation, and the mines being boomed up, it booms up the land, and the miners who work at the colliery pay large sums for small allotments of the land, then as soon as the mine stops the miner is on his beam ends, and the land is no good to him. Is not that the case? Yes.

244. *Chairman.*] Will you proceed with your explanation? In the interests of legitimate coal-mining a new schedule might be introduced, showing the average number of days each mine is worked per week. That would be a protection for respectable people who go into this sort of thing, because I presume that the only people who made any money out of these concerns are those who floated them.

245. *Mr. Cook.*] You spoke just now of the method of examining places. Is that carried out to any great extent in this Colony? I could not say what the practice is in the Colony, but in good mining practice every place should be examined. Our system was this, that the man who examined a place put his initials on the roof close to the face and burnt his mark with the naked light to show that he had been there previous to the men going there with naked lights. Where lamps were used the initials were chalked on the roof only.

246. And he makes a record of his visit? Yes.

247. In all mines, gaseous and non-gaseous, you would insist on an inspection and report? Yes.

248. For other reasons than merely to detect the presence of gas? Yes; to see that the place is in a safe working condition.

249. Has the inspector under our present Act sufficient powers given to him in your opinion? It is very little different from the English Act. Rule 5 of the present Act says:—

If at any time it is found by the person in charge of a mine or any part thereof, or by the examiner or inspector, that by reason of noxious gases prevailing in such mine or such part thereof, or of any cause whatever, the mine or the said part is dangerous, every workman shall be withdrawn therefrom, and the examiner or inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp), and in every case shall make a true report of the condition of such mine or part thereof, and no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or such part thereof as was so found dangerous, until the same is stated by the examiner or inspector to be safe.

Rule 25 says:—

25. If in any respect (which is not provided against by any express provision of this Act, or by any special rule) any inspector find any mine or any part thereof, or any matter, thing, or practice in or connected with any such mine to be dangerous or defective, so as in his opinion to threaten or tend to the bodily injury of any person, such inspector may give notice in writing thereof to the owner or agent of the mine, and shall state in such notice the particulars in which he considers such mine or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied, and unless the same be forthwith remedied, the inspector shall also report the same to the Minister. If the owner or agent of the mine objects to remedy the matter complained of in the notice he may within seven days after the receipt of such notice send his objection in writing, stating the grounds thereof to the Minister, and thereupon the matter shall be determined by arbitration in manner provided by this Act.

250. In your opinion would these rules apply to a case in which an inspector discovered the mine to be dangerous? Yes.

251. Is it a wise provision to apply to such cases. Suppose you went into a mine and discovered that the place was practically coming down, would the provisions of that Act be of any use? Yes; the inspector would call the attention of the manager to it.

252. But there might be a difference of opinion between the manager and the inspector? Then they are to arbitrate.

253. To arbitrate whilst the place is coming down? That is a matter which requires a good deal of judgment. The inspector having been a practical miner will soon see whether a mine is safe or not; he can insist upon the men being withdrawn, but if the manager objects the manager must take the responsibility.

254.

\* NOTE (on revision) :—I have heard this mine was originally purchased for £27,000, sold to a syndicate for £52,000, then floated for £200,000.

254. He has no right to insist upon it; his functions cease when he has merely called the attention of the manager to the danger. The English Act says:—

Mr. J. May.  
21 Mar., 1894.

An inspector under this Act shall have power to do all or any of the following things, namely:—

1. To make such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine.
2. To enter, inspect, and examine any mine and every part thereof at all reasonable times by day and night, but so as not to impede or obstruct the working of any mine.
3. To examine into and make any inquiry respecting the state and condition of any mine or any part thereof, and the ventilation of the mine, and the sufficiency of the special rules for the time being in force in the mine, and all matters and things connected with or relating to the safety of the persons employed in or about the mine or any mine contiguous thereto, or the care and treatment of the horses and animals used in the mine.
4. To exercise such other powers as may be necessary for carrying this Act into effect.

Every person who wilfully obstructs any inspector in the execution of his duty under this Act, and every owner, agent, and manager of a mine who refuses or neglects to furnish to the inspector the means necessary for making any entry, inspection, examination, or inquiry under this Act in relation to the mine, shall be guilty of an offence against this Act.

Section 42 says:—

1. If in any respect (which is not provided against by any express provision of this Act or by any special rule) any inspector finds any mine or any part thereof, or any matter, thing, or practice in or connected with any such mine, or with the control, management, or direction thereof by the manager to be dangerous or defective, so as, in his opinion, to threaten, or tend to the bodily injury of any person, he may give notice in writing thereof to the owner, agent, or manager of the mine, and shall state in the notice the particulars in which he considers the mine or any part thereof, or any matter, thing, or practice to be dangerous or defective, and require the same to be remedied. And unless the same be forthwith remedied, shall also report the same to a Secretary of State.

2. If the owner, agent, or manager of the mine objects to remedy the matter complained of in the notice, he may, within ten days after receipt of the notice, send his objection in writing, stating the grounds thereof to the Secretary of State, and thereupon the matter shall be determined by arbitration in manner provided by this Act, and the date of the receipt of the objection shall be deemed to be the date of the reference.

255. If the inspector is not satisfied with the way in which the arbitration went, could he not summon the manager, or get the Home Secretary to do it, to show cause why his certificate should not be cancelled? Yes.

256. That is a power which they have not here;—in certain extreme cases to appeal from the arbitration? It would be a wise provision if the Minister for Mines had some power of dealing with cases of that sort stepping in and having it investigated.

257. If you were in a mine as an inspector, and saw danger threatening, would it be a wise provision for you to have power to call the men out? It would be, but it is a matter which so rarely occurs. If an inspector saw any danger he would send for the manager, and if there was immediate danger, they would come to the conclusion that they must withdraw the men.

258. The fact that that is not done in all cases is proved by the number of police-court prosecutions for breaches of the Act;—is there not very often friction between managers and inspectors? Yes; but I have an idea that a courteous inspector, who knows his business, will have little trouble whatever with the manager of the mine. It is only bumptious men with not too much intelligence who give trouble. If an inspector went to a manager in an offensive manner there might be friction, and *vice versa*.

259. But does not your experience go to show that the old sentiment of *noblesse oblige* hardly enters into commercial transactions of this kind? Yes; and yet I can hardly remember many instances of friction between managers and inspectors.

260. But you know that such cases have occurred? If an inspector happens to be bumptious there may be trouble, or if the manager is bumptious; but if their duties are clearly defined I think that matters ought to proceed without any friction.

261. Your opinion is that under the present Act the inspector has, practically, all the power that he can have? It is similar to the English Act, and I have heard of no difficulty under that Act.

262. You have already referred to a function which the Home Office possesses which the Department here does not possess:—if a manager can show that he conforms to the letter of the law the Minister has no power over him, but, under the English Act, could he not be called upon to show cause why his certificate should not be cancelled? There should be some means of getting at the manager who is determined to do wrong for the sake of doing as he likes. I think that the present Act will almost reach that. There is almost sufficient power to get hold of a case of that sort.

263. Suppose that a body of men complain to an inspector that a certain place is not safe, and the inspector replies that he has not power to take those men out, even though the roof was falling in, would that be a desirable state of things? Not at all.

264. If that can be shown to have actually taken place, does it not show a defect in our legislation? Yes; there ought to be a clause inserted in the Bill to remedy that, but I have not heard of many cases of that sort under the English Act.

265. Is it not possible under the terms of the English Act for a manager to be arraigned on a mere opinion of an expert, as distinguished from the practical working of the Coal Mines Act? Yes; but the inquiry has to be public, and it has to be held at a certain time and place, &c. It would be difficult to convict a man of an offence of which he was not guilty.

266. I have a case of that sort in mind, in which a competent man from humane motives had done what was not strictly according to the rules when he was accused of blundering;—is it not a mere matter of opinion whether there is an offence? Experts would be called in.

267. Suppose that the experts were all against the man and the judge was for him, in this country there would not be any appeal from the action of the managers? No. Speaking of the power of the inspectors, it would be wise to remember not to expect the inspector to manage the mine, but to fasten the responsibility upon the manager.

268. Do you think eight-hours long enough to work in a mine? Yes; I think it is quite long enough. I suppose the reason is that I have been so used to short hours.

269. Would the adoption of the eight hours system throughout the Colony entail a very great increase in the cost of the output? No; I do not consider that it would be more than 1d. a ton.

270. In all cases? I am taking the average. In some cases it might be less, and in some more.

271. In your opinion is payment by weight, the system at present in vogue, such as the Act contemplated when it was passed? The system I have been accustomed to is this: If a cage contained four or eight skips, the two weighmen would take, perhaps, the second and the last, or any other two skips, according to

- Mr. J. May. to the arrangement. The whole of the coal might be weighed, but I never could see any necessity for it. In Durham and Northumberland the two weighmen make their arrangements, and no one interferes.
- 21 Mar., 1894. 272. But there is nothing impossible in the proposal to weigh all the coal? It would not be impossible, but I do not think it would be desirable.
273. There are collieries where every skip is weighed? In Lancashire.
274. Do you know of any mines raising (say) 2,000 tons a day where every skip is weighed? No; but I can understand it being done. I am aware some large mines weigh every skip.
275. Where coal is as dirty as we have it here? It will be difficult to weigh every skip of dirty coal. I never could see that there should be a great deal of trouble in the matter if there is a fair arrangement before hand.
276. What do you call a fair arrangement? Suppose you had a mine drawing 1,000 tons a day, and the weighmen said, "We will take the first and the last skip." You can give the selection of the skip to anyone.
277. Ought the matter of the weighing of the coal be left to the mere caprice of the management? No.
278. Ought the men who are vitally concerned in the matter to have the right to make an arrangement which would be equitable? Certainly.
279. Ought there to be a provision in the Act to give them that right? Yes.
280. And you think that if such a provision were in the Act giving the men power to make a reasonable arrangement there would be no need for all the coal to be weighed? Yes.
281. Do you think the managers, as a rule, have sufficient powers for all the purposes of the Act, and for the purposes of safe working? Yes; I am of opinion that the manager should have distinct control of the mine, and that he should be held responsible.
282. Is he not so now, in your opinion? Yes.
283. Except where consulting viewers come in? I should not include viewers in the management.
284. Do you know cases where the management is unnecessarily hampered by the men? Certainly not.
285. As to ventilation and as to anything that tends to the safe working of the mine? Most certainly not.
286. Do you think there is any system of terrorism exercised over the manager? Certainly not.
287. If a man stated this to be the case, you would certainly think he was drawing upon his imagination for his facts? Yes.
288. Have you found that there is a disposition on the part of Parliament to favour the miners as against the managers? No; all the attempts at legislation have evidently been based on the English Act, and I consider that the English Act is the best Mining Act in the world.
289. All the concessions that have been made in the direction of greater safety have been made irrespective of any pressure brought to bear upon the Legislature by the men? Yes.
290. Would you think it absurd to suppose that the miners influenced the Legislature unduly? Certainly. The miners have a right to have their opinions expressed, and there is no doubt that owing to defective ventilation they have taken considerable pains to enforce their views about the split question.
291. Have the managers, in your opinion, sufficient power to enforce discipline? Certainly; a competent manager never has any trouble about that.
292. I suppose you agree that a manager has a right to say to what height his skips will be loaded? Most certainly.
293. But how far has he a right under the system of payment by average to say what the weight of his skips shall be? He cannot limit the weight very well; but he can say, "We want a standard gauge." For this reason, that if the pit happens to be going badly there is perhaps a tendency to fill the skips unduly. The manager might have a means of ascertaining the standard at the bottom of the shaft, and he might say, "If the skip is filled over a certain height we shall deduct so much from that skip." The practice of the Borehole is that a skip shall not be filled more than 12 inches above the top. If it is more than that the attention of the check inspector is called to it, but the money deducted does not go to the company, it goes to a general miners' fund, which shows that the manager only wants to do what is right.
294. The standard height is distinct from the standard weight? As long as the standard height is kept, it will be better to take the average as to the weight.
295. You have known miners to fill two skips to the same height, but one would have a couple of cwt. more than the other? Yes; that is possible.
296. It is the way they pack it? It would be rather difficult to get a difference of 2 cwt. between two skips.
297. *Mr. Cann.*] In a case of that kind it would not be fair that a man should loose the skip because it exceeded the standard weight? By no means.
298. *Mr. Cook.*] Then the system is unfair and inequitable, in view of the system of averaging which obtains? Yes.
299. Do you think the men would object to a standard weight if every skip were weighed? No.
300. Then in that case the men would just as soon fill them level as not. It is only by means of the system of averaging and weighing that they are induced to fill the skips in such a manner? Just so.
301. Would you regard two shafts 10 feet apart as being as safe as two shafts that were half a mile apart? I think about 20 yards is a fair distance.
302. You would not regard two shafts 10 feet apart as being possibly safe? I should prefer that they should be further apart.
303. As to the connection between the two shafts;—the English Act, I understand, provides that the connection should be 4 feet by 4 feet? Yes; I always regarded that as being rather small.
304. In your opinion, is 6 feet by 6 feet too much? No; it is a very reasonable height.
305. Would it be any great expense to make it 6 feet high? Certainly not, in most cases.
306. And that, in your opinion, is enough? It is a nice travelling height.
307. As to the winding traction, do you regard all these contrivances for safety as being senseless? Certainly not; there is a distinct feeling, and a growing feeling in favour of some method of detaching the cage in case of overwinding.
308. Suppose a mining expert were to say that they were senseless arrangements, what would be your opinion of a statement of that kind? I have a high esteem for detaching arrangements and other methods for preventing overwinding.

309. Who invented this automatic apparatus? There are several persons, Mr. Walker, in the county of Durham, and Mr. King. I think that Mr. Turnbull, of the Borehole, was one of the first to use them. Mr. J. May.  
21 Mar., 1894.
310. It is the opinion of some men of considerable repute that it is much better to rely upon the attention of the engine-man than upon any of these mechanical contrivances;—are you of that opinion? It would not affect the engine-men. The engine-man would do his best under any circumstances, because if he overwound, he would lose his position, or, at any rate, his reputation.
311. Suppose the engineer went to the engine-driver, and told him that if he dared to use the contrivance he would fine him £10;—what is your opinion of a proceeding of that kind? I think it is a little bumptiousness, which would be very offensive to a man of spirit.
312. You have already said that you are not aware of any system of terrorism obtaining in any of our mines, that no system of terrorism has been exercised over the management by the men? Certainly not.
313. Now as to the splits—in your opinion, they are absolutely necessary? They are the very essence of the best mining practice.
314. I understand there is no compulsion as to the splits in the English Act? No; I consider this an improvement on the English Act. It is more economical to the mine-owner. The sanitary condition and effectiveness of the miner's labour are very largely increased. It is always practised in properly-managed mines.
315. Is it a fact that splits are always resorted to? Yes, in good-mining practice, where the manager understands the laws governing the circulation of air in mines; splitting the air is the rule.
316. For what reason? It reduces the friction; and we get very much more air with the same ventilating power.
317. If an expert told you that it would increase the friction, you would have a different opinion? I cannot understand any expert saying that splitting air increases the friction. It reduces the friction because it reduces the speed. If you double the speed you get four times the friction. The shaft-friction is increased only because a much larger quantity of air passes through them with the same ventilating-power.
318. If an expert stated deliberately on his oath, two or three times over, that the splitting of a mine into splits increased the friction, you think he made a mistake? There must be a mistake. I cannot understand how a mining engineer could say that. It would be an astonishing exhibition of ignorance in any mining engineer or colliery manager.
319. Is it not absolutely necessary where gas exists in mines to have these splits? Yes. It could be done without, but at the expense of not getting anything near so large a quantity of air, and at the expense of mining under very dangerous or unhealthy conditions.
320. In your opinion, if there were no splits in a mine, and an explosion took place, the whole mine would be liable to be wrecked? Yes.
321. And the lives of the miners would be liable to be lost? Yes.
322. But if there were splits, how would that affect the explosion? One of the great advantages of splitting is that you can keep your districts separate from one another. In some cases your places are actually like separate mines, and in the event of an explosion in one the men in others may take no harm whatever. I am speaking of bord and pillar.
323. Then the best mines in England are so divided into sections as to make the different parts practically independent of each other? Any competent manager lays out his mine into separate districts.
324. It minimises the danger from explosions? It minimises the danger from explosions, increases the quantity of air, reduces the temperature, and altogether is the very essence of the best mining science and practice.
325. You would not call splitting an unscientific process? No; it is the most scientific process.
326. Is the proposal in the Bill to split up a column of air a very dangerous one? It is a very wise provision.
327. It in no way defeats the purpose of good ventilation? No; it makes good ventilation compulsory, that is all.\*
328. That being so, you would not regard the advisers of the Government in respect to your present Bill being ignorant? I think the advisers of the Government have shown that they are very anxious to have a thoroughly effective measure.
329. I am speaking of the splitting clause? The splitting clause has shown that the advisers of the Government understand most thoroughly the laws governing the circulation of air in mines, and the benefits of splitting the air, and only want to go in the direction of modern mining, both practical and scientific.
330. That they understand the conditions which they are trying to meet? Yes; most certainly. Splitting the air can only be opposed by persons ignorant of the practice and science of ventilation.
331. That they are trying to meet them in a sensible and scientific way? Yes.
332. *Mr. Edden.*] I suppose you are acquainted with the skips used in the mines of the Colony? Yes.
333. Are they not all of one average strength as to axles, wheels, and so forth? They are all about the same.
334. What would the weakest be calculated to be capable of carrying? The manager always has a skip to carry the weight that he wants to have carried. Most of them will carry 14 cwt.
335. I suppose you are aware that in the Northern District there are skips that will carry 15 cwt., and they are no larger than the skips used at some other mines where the standard weight is only 12 cwt., so that that argument of loading up skips to smash things down is absurd? At the Borehole there are now skips which will carry 1 cwt. more, but the manager arranges that any man who builds his skip more than 12 inches above the wood shall lose the skip.
336. In this Colony for some years we have not known what gaseous mines were, but is it not a fact that we are getting gaseous mines? Yes.
337. Will it not be necessary to have greater protection in the future than there has been in the past? Yes; but a little gas is always a God-send to a miner. If he has a little gas he is sure to get ventilation.
- 338.

NOTE (on revision) :—To illustrate its benefits, suppose an air-way of 100 square feet area has 100,000 cubic feet passing through it; the velocity is 1,000 feet per minute. Divide this into five equal splits of 100 feet area each; the velocity is reduced to one-fifth, and the resistance to one-twenty-fifth.

- Mr. J. May. 338. Do you think there is anything derogatory in stating in the Coal-mines Bill that return air-ways shall not be used as travelling roads? No. There is one point about travelling roads which the Commissioners recommended strongly. They said, whatever you do make two in-takes, and keep one for a travelling way.
- 21 Mar., 1894. 339. We cannot have fresh air in the return air-ways? No; it is unpleasant. If you travel by a return air-way, you sometimes have to exchange your naked light for a safety-lamp.
340. Mr. Cook.] A safety-lamp would not be sufficient in a return air-way, would it—an old Davey-lamp? That is being abolished; they must be improved lamps.
341. It would be impossible to carry them in a gaseous air-way? Oh, yes; the lamp is so altered that you can carry it against a very high velocity. The only addition to the Stephenson and Davey, or old type of lamp, is a bonnet which enables you to carry the lamp against a high velocity.
342. To which lamp are you referring more particularly? I am referring to the Evan-Thomas, the Marsaut, the Hepplewhite-Grey, the Clanny lamp, and the Muesler. The modern idea of a safety-lamp is that it shall prevent the velocity of the air from driving the flame through the gauge, thus protecting the miner from the danger of rapid currents of explosive air.
343. In reference to automatic appliances, I suppose you remember the South Burwood accident, when they were sinking the shaft; four men were pulled up in the bucket, and all of them lost their lives through over-winding;—if there had been any automatic appliance to check the over-winding, do you think the accident would have occurred? The probabilities are that the rope would have been disconnected, and the men's lives would have been saved.
344. Do you not think it necessary that these appliances should be used in the sinking of shafts? It should be compulsory in the sinking of shafts.
345. As regards the size of the pillars, what is your opinion of that? The size of the pillars is always regulated by competent managers, in proportion to the depth from the surface.
346. You do not think that any hard and fast rule could be laid down? I have worked pillars 4 yards by 20, and 30 yards by 25, and the 4 yards by 20 pillars were the stronger of the two—that is, compared with what they had to do.
347. Do you think that a minimum size for the pillars should be fixed in the Bill? It would probably be wise to have a minimum, but the only scientific rule is that the size of the pillar should be in proportion to the depth of the surface. You can get a good idea if you assume that 1 square inch of average coal measures gives 1 lb. weight in pressure. If you have 1,000 feet in depth, you will have 1,000 lb. pressure per square inch; if you have 100 feet in depth you will have 100 lb. pressure per square inch on your seam.
348. You think it ought to be left to a competent colliery manager? A competent manager will regulate the size of the pillars.
349. Do you think the inspector should have any say in it? It would be, perhaps, wise to give him some power in the matter, because when a mine is being opened up, say, for a syndicate, the manager may be inclined, unless there is some one who has influence over him, to make the pillars too weak. He may be pushed to send coal out by his directors, and just to please them a large portion of the shaft pillars are sometimes sent.
350. I understand you to say that there should be a minimum? Yes.
351. Especially under tidal waters? In that case it would be wise to have a distinct arrangement by which the system of mining could be approved by the inspector.
352. I suppose you are aware that reports are taken by the inspectors, and by what are called check inspectors appointed by the men? Yes.
353. And recorded in a book at the office? Yes.
354. Can you see any reason why those reports should not be open to the inspection of the miners? I do not see why they should not. I think it is in the English Act.
355. You see no objection to it? I do not.
356. Did you ever know, in any dispute between the miners and their employers, the miners ever to refuse to submit their case to arbitration? I do not remember any case.
357. You know that many cases have been submitted to arbitration? A very large number, and there is a distinctly growing feeling in favour of arbitration. Nothing could show the good influence of arbitration better than the last strike in Great Britain, where, through Mr. Gladstone, Lord Rosebery intervened.
358. Did you ever know a case where they went to arbitration and the men refused to accept the verdict if it went against them? They generally accept the verdict.
359. Did you ever know of the masters ever refusing to accept the verdict? There was some talk of some award being given in the Northern District against the proprietors to which they refused to submit. I do not remember the particulars.
360. Do you not think that if disputes could be at once submitted to arbitration before any stoppage took place, it would be in the interests of both masters and men? I have always had an idea that arbitration should be made compulsory.
361. Chairman.] Is it not a fact that a manager can prosecute any miner for a breach of the Act? Yes.
362. I suppose you are aware that a miner cannot prosecute a manager or a company without the sanction of the Minister? That is the case.
363. Mr. Cann.] I think you said it is necessary that the mines should be examined before the men go to work, and that a stipulated time should elapse between such examination and the men going to work? Yes.
364. What would you consider to be a fiery mine? Where any traces of gas were discovered.
365. Is it not a fact that a mine often turns out to be fiery, although gas has never been seen there before? That is not very frequent. You may find gas in some of the winning-places, 20 or 30 yards in advance of the air, or where a shot has been fired.
366. You get a blower? You get gas in small quantities before you get a big pressure. A blower means a big pressure.
367. Do you not think it would be a safer line to keep up a system of examination, even if the mine is not gaseous? The places are examined in the morning whether they are gaseous or not. Every place is examined to see if the mine is in a safe working order.
368. Do you consider that of such importance that it ought not to be left to the discretion of the manager?

manager? It ought to be compulsory, and some stipulated time given to expire between examination and workmen going in. Mr. J. May.

369. There is one question which was touched by Mr. Edden; do you think the size of the pillars of such importance that it ought to be provided for in the Act? The size of the pillar is regulated by the depth from the surface. 21 Mar., 1894.

370. I presume that you would not think it wise to allow pillars to run one into another—one holding into another? That is simply an evidence of grossly bad management.

371. I suppose you would be surprised to learn that in some collieries that has occurred? No; I am not surprised to hear it.

372. Do you think the matter of sufficient importance for legislative provision? The legislature should provide against it under tidal waters. If mining is properly conducted, they drive by the lines in every case, both bord and cut through, and also gateways in long-wall.

373. I suppose that where you are working in tender ground, there would be greater danger from the existence of thin pillars? Yes; but if you drive by lines, you will keep your pillars straight.

374. Do you think the size of the return air-ways ought to be stipulated in well-regulated mines? There are regulations in Germany that the areas of the in-take and the return shall be stipulated, but I do not know that it is necessary. I do not think it would be well to introduce that.

375. I suppose it would be better to stipulate the dimensions for the return than to trust to chance, whether there is any return at all? That is a good idea. Whatever is the area of your return, that governs the amount of the air that you get. A competent manager knows the area of his return is as important as his in-take area.

376. I suppose that by increasing the size of your return, you get a greater current of air? If you stipulate the size of the return, you necessarily stipulate the area of the in-take. The return is usually largest, owing to the increased volume of the return air.

377. Do you not think it would be a wise provision that the returns should be examined to see whether they are open or not? The rule is that in properly-conducted mines the returns are as carefully attended to as the in-take. In the fiery mines in Great Britain there is a waste man who has charge of all the return air-ways, from the place where they leave the districts to where they get to the furnace or upcast shaft. The deputy has the control of the ventilation in his district, and he is responsible for that.

378. There are no such men as "waste" men in this Colony? You will get what you are insisting on in the Bill if you provide, as in the English Act, that only men holding first-class certificates shall be managers of mines.

379. I suppose when you are working long-walls, your returns are crushed and sometimes collapse? Yes; if the return is closed there can be no in-take.

380. Would it not be possible for the air to find its way round from old workings in the locality—sometimes it takes a circuitous route? It should be distinctly understood that the return air-way should always be in such a condition that persons can travel in it and inspect it.

381. Then it would be a wise provision that the air-way should be travelled for purposes of inspection? Yes.

382. I suppose that if we had legislation on the lines of the evidence which has been taken this morning, it would be legislation which would place all mining companies under the same conditions? Under the same conditions as to discipline. The mining conditions all over the world are practically the same. There can be no great difference where mining is conducted on scientific principles.

383. A piece of good mining legislation would save the mine-owners from themselves sometimes, would it not? No doubt it would save them many thousands of pounds in some cases.

384. It would prevent greedy proprietors from risking life and limb in order to make greater profits? Yes.

385. Therefore, legislation is absolutely necessary? There is one thing I may mention with regard to mining legislation, and that is that the large number of explosions that have occurred, the number of men's lives that were lost, and the way that men's health was ruined by defective legislation brought about the Mines Act in England. I think the fact ought not to be lost sight of that it was owing to the efforts of intelligent miners and mining engineers that the present Act was passed—to the efforts of men of the stamp of the late Nicholas Wood, Mr. McDonald, Mr. Crawford, and J. J. Atkinson.

386. I suppose you are aware that the mine-owners resist that kind of interference? It depends upon their advisers. If I were a colliery proprietor, I should be very glad if the State would lay down certain rules that would prevent my property from being destroyed. If I were a commercial man and had a factory, I should be only too glad to join the Steam Users' Association, like that at Manchester, who send competent men to examine boilers. You may have a first-class engineer, but you get the benefit of the inspection, and it is well known that there are much fewer explosions now than there were before the Association came into existence.

387. The same argument would apply to the mining industry? Certainly; and with very much greater force, considering the enormously larger capital invested.

388. *Chairman.*] Mr. Edden asked you a question in reference to books and reports;—are you acquainted with rule 37 of the English Coal Mines Act? Yes; that rule says: "The books mentioned in these rules shall be provided by the owner, agent, or manager, and the books, or a correct copy thereof, shall be kept at the office of the mine, and any inspector under this Act, and any person employed in the mine, or anyone having the written authority of any inspector or person so employed, may at all reasonable times inspect and take copies of and extracts from any such book; but nothing in these rules shall be construed to impose the obligation of keeping any such book or a copy thereof for more than twelve months after the book has ceased to be used for entries therein under this Act." The deputy makes an inspection in the morning, and makes a written report whether the mine is fiery or otherwise, saying that he has found the mine in a certain condition. Then there is the manager's report, and the engineer's, and overman's report.

389. You are perfectly satisfied, I suppose, that the employees in a colliery may look at the reports? Yes; any one employed in a mine may have access to the written reports.

390. You have examined both systems of working collieries—what is known as wide work, and the bord and pillar system? Yes.

391. Is it not a fact that when an explosion occurs in wide work, there is greater devastation and loss of life,

- Mr. J. May. life than there would be under the other system? Naturally; the men are grouped together all along the face.
- 21 Mar., 1894. 392. Is it not a fact that in wide work under the longwall system tremendous falls take place when an explosion occurs? Yes.
393. Is it not a fact that in the longwall system some of the old goafs are charged with gas? Under circumstances of that sort it would not be fair to work the mine.
394. Is it not a fact that these goafs cannot be properly examined under the longwall system? It is a very difficult matter to examine them; and for this reason: the roof gradually settles down, and the space between the roof and the floor becomes too small for anyone to get into it.
395. Is it not a fact that under the longwall system, to make the mine secure behind them, the men have to blow the roof down to make pillars? Yes; in some cases there is not sufficient stone, and when they have drawn the timber out they had to build pack-walls from the old waste or gob.
396. Naturally when the props are drawn from the waste a fall takes place, and that gives them material to block their goafs with? Yes; one of the dangers of the longwall system is that the gas occasionally is driven out of those places, and it is necessary to have lamps that will stand a very high velocity of air.
397. Taking all things into consideration the longwall or wide work system is the most expensive? I should not like to say that. It is a very good system. I am very fond of it.
398. But is it not a fact that in the longwall system your roads have to be kept open right to the boundary? Yes; but there is no yard work, and the hewing price is much less.
399. That up to your last ton of coal your main roads have to be kept in working order? Quite so.
400. Is it not a fact that in some mines in England almost as many shift-men are employed in the long-wall system as miners? That is true; but apart from that, long-wall mining for seams about 4 feet thick is distinctly the cheapest.
401. The great object of mining legislation is the security of life and limb? Yes.
402. From that standpoint you could not recommend the long-wall system? The long-wall system is distinctly the favourite system for a thin seam. It has its dangers, but it has also its advantages. One advantage is that it has no back bords to ventilate; you sweep the air along the face.
403. You admit that they have no trouble with the air that comes round the face? Yes.
404. That being so, it does not trouble the manager if the old goafs never get ventilated? A competent manager will attend to that.
405. You say there is no trouble in ventilating a mine under the long-wall system, because the air goes right to the face? Yes; but do not forget that the weakness in long-wall mining is the cavity formed between the two gateways. The roof gradually settles in some cases, and before the roof and the floor have met a large fall may take place, and any gas accumulated at that point—a point which it would be very difficult to examine—would be forced out on to the face, and any prudent manager would be careful to provide his men with a lamp calculated to stand a great velocity of air, and take other precautions, such as building occasional square packs, check-board fashion.
406. You said this morning that sudden outbursts of gas take place when least expected—sometimes? Yes.
407. Then, would it not be necessary always to have such lamps? If outbursts of gas are frequent in a mine, the rule is to be very careful to provide the best kind of lamp, and to be careful to keep your mining places ahead for gas-drainage purposes. In Wales they actually put bore-holes forward against gas pressure, just like the boring in approaching old workings likely to contain water.
408. That being so, still you admit that that is a great weakness in long-wall mining? Yes, that is an admitted weakness; but the return air gate-way is usually kept a little ahead of the in-take gate-ways—and, as a rule, long-wall advances to the rise—any gas made will naturally creep to the highest point, and thus be readily detected and dealt with.
409. Under the bord and pillar system, when an explosion takes place the amount of property destroyed is not so great as under the long-wall system? Not nearly so great; but the long-wall system is distinctly the favourite in a large number of cases. It is the most economical for seams about 4 feet thick.
410. *Mr. Cann.*] Is it not also considered the most secure in working? I do not think that that follows. It is cheaper and simpler than the other, and more economical for thin seams.
411. But you have seen the long-wall system worked where the air has been divided into splits, just the same as under the bord and pillar system? You can split air in long-wall in exactly the same way, but you cannot isolate one district from another.
412. What distance apart would you have your man-holes made in your incline? The stipulated distance is 22 yards in the English Act, but a prudent manager would not be ruled by that stipulation. If his haulage was carried on at a great speed he would naturally make his refuge holes very much nearer.
413. I suppose you know that some fatal accidents have taken place in the northern district through these man-holes either being filled or so far apart? I do not recollect hearing of any.
414. Did you hear of one in the Lambton Colliery where one of these man-holes was so full that a young man could not get in? No.
415. There is a case mentioned in the newspaper to-day, and the Lambton Company have been fined £10 and costs;—do you believe in making these man-holes conspicuous? They are generally whitewashed.
416. That would not be expensive? No; and it makes things look better. If you have a load travelling at a great speed, the manager is not limited by the 22 yards—the rule is to put in intermediate man-holes.

THURSDAY, 29 MARCH, 1894.

Present:—

|              |           |                |

| MR. EDDEN,   |           | MR. NICHOLSON, |
| MR. McCOURT, |           | MR. CANN,      |
|              | MR. COOK. |                |

J. F. FEGAN, ESQ., IN THE CHAIR.

Mr. George Henry Green called in, sworn, and examined:—

417. *Chairman.*] Where are you working now? At the Glebe Colliery.
418. Have you had many years experience in collieries or coal-mines? I have been engaged in colliery works for the last eighteen years. I have done all kinds of work in connection with mining. I was a mining apprentice, and I have been back overman, under manager, and manager. Mr.  
G. H. Green.  
29 Mar., 1894.
419. Are you a certificated colliery manager? Yes.
420. Under the Coal-mines Act of 1872? Yes; I have a certificate of competency.
421. The highest certificate that the British Board gives? Yes.
422. You say that you have been engaged in all kinds of work in connection with collieries? Yes; in every operation except that of wheeling coal.
423. You have hewn coal then? Yes; for a few weeks.
424. And your certificate of competency indicates that you understand colliery management? Yes; it is supposed to certify that the holder of it is competent to take charge of any mine in Great Britain, and there are as many dangers and difficulties there as there are in any mines in any part of the world.
425. Then you will be able to tell us from your practical knowledge what is the best method of ventilating mines? That has a bearing more upon the splitting clause contained in the Bill.
426. What system of ventilation do you believe in? It depends upon the system of working. There is one main principle, and that is the principle of splitting. That is accepted by all authorities as necessary for the ventilation of any mine.
427. You are acquainted with the English Act of 1887? Yes.
428. Under the English Act of 1872 it was not necessary to have had any experience in mining to obtain a certificate? No; it was left to the Boards of Examiners.
429. Since the passing of the Act of 1887 has it become necessary to obtain a certificate of five years' experience? Yes; that prevails throughout England.
430. Do you believe in that alteration of the law? I do. The Act states that a man must have had practical experience.
431. You do not believe that that is any hardship? Not at all.
432. For the better management of collieries; and for the protection of life and property, it is almost a necessity? Yes; quite a necessity. Without that provision you would find men managing mines without any knowledge whatever of the difficulties with which they have to deal.
433. In the Act of 1872 was there a clause under which certificates of service were given to colliery managers? Yes.
434. Do you believe in that? Yes. If a man has shown by past management that he is capable of managing a mine, and you are taking a new departure, which means an advance in the qualifications of managers, it would not be fair to a man capable of managing mines to demand that he should submit to an examination.
435. Such a provision was not inserted in the Act of 1887? I think not.
436. And the reason, I suppose, was that from the passing of the Act of 1872 to the passing of the Act of 1887 a sufficient time was allowed for men to prepare themselves, and they would think that in about fifteen years most of the old hands would be gone? I suppose that would be the reason. I do not think they would desire to pick out the old managers, because if they had been managing mines from 1872 to 1887 they would naturally be qualified by experience.
437. In the English Act of 1887 there is a stipulation that boys of a certain age shall not work more than a certain number of hours per day? Yes—ten hours a day if employed only three days a week, or six hours a day if employed six days a week. That applies to boys under 13 years of age.
438. But does it not stipulate in the Act of 1887 that women shall be employed only a certain number of hours? Yes.
439. Will you read the clause? Sub-section 3, of section 7, says:—  
No boy or girl of or above the age of 13 years and no woman shall be so employed for more than fifty-four hours in any one week, or more than ten hours in any one day.
440. The English Act tries to regulate the hours of labour for adults? Yes.
441. Do they find any difficulty in regulating the hours of labour for women? Not to my knowledge.
442. And you have a fair knowledge of the working of mines? Yes.
443. That being so, do you not think they could legislate for adult men as well as for adult women? Of course they could legislate for men if they could legislate for women.
444. Then you have to admit at once that the same objections could be made with regard to women which could be made with regard to men? Yes; from a logical standpoint.
445. And those objections have not been made? No.
446. What is the difference between legislating that adults shall work ten hours, and legislating that they shall work eight hours? I think it is a matter of opinion.
447. Have you a knowledge of the working of collieries in this Colony? Yes.
448. Are the collieries better ventilated in this Colony than in England? Not to my knowledge. They are not nearly so well ventilated in these colonies. My experience of collieries at home is that their ventilation is much better than the ventilation of the collieries of this country.
449. Do you not think that with such ventilation as we have here eight hours is a sufficient period for a man to work in a mine in one day? My opinion is, that a man with eight hours labour below ground in a mine has done a fair and reasonable day's work if he has employed his time to the best of his ability. I consider that a man can in eight hours do as much work as he would do in a larger number of hours, and keep his health.

Mr.  
G. H. Green.  
29 Mar., 1894.

450. It has been proved beyond doubt by statistics, has it not, that men who work eight hours send as much mineral to the surface as they would if they worked nine hours? The experience in the county of Durham is, that they get a larger output per man than they have ever had before, and there the hewers work seven hours. That is seven hours from bank to bank. It is a fact acknowledged by experts that the men individually produce a larger output per day now that the hours are reduced than they ever did before.

451. Was there not a proposal made in England to legalise the eight hours system? Yes. It is well known that a large number of men in the coal trade in England are in favour of the eight hours, and for a particular reason many of the men are not in favour of it.

452. Do you remember a vote being given some time since in the North of England against the eight hours system? Yes.

453. Could you tell us the reason why? I think the reason is very clear. The men in that district had obtained seven hours as their shift by their own efforts.

454. What do you mean when you say "by their own efforts"? By the efforts of the Union. By the strength of their Union the men have been enabled to exact that a shift of work in the coal-mines shall be not more than seven hours. Their reason for not wishing to have the eight hours fixed by law as a period of a day's work was that they thought that there was a possibility of longer hours being forced upon them.

455. Do I understand you to say that it was by their own organisation that they have been able to get shorter hours? I have not the least doubt of it.

456. Has that worked detrimentally to the interests of the owners? Considering that it is acknowledged that the output per man has increased, I think it must have been favourable to the interests of the owners. I would not undertake to say the increase of the output has been caused by the reduction of the hours, but no doubt the reduction of the hours has been beneficial. Improved means of getting the coal have also been adopted.

457. The fact remains that such improvement has taken place? Yes.

458. Is it not a fact that since the shortening of the hours of labour the condition of the men has improved morally and otherwise? Yes; but not simply in consequence of that. It is part of a progressive movement which has been going on for years.

459. I suppose from your experience you find that the shortening of the hours of labour has given the miners more time to study? Yes.

460. Even in your case it has been so? The seven hours did not affect me. It does not affect managers.

461. But you have not always been a manager? No.

462. Then owing to the shortening of the hours you had better opportunities for study? In the old country I was an official. I never worked more than a certain number of hours.

463. Has your experience shown that the shortening of the hours of labour has had the effect of giving greater facilities for the men to educate themselves? Yes; I am decidedly of opinion that the shortening of the hours has had that effect. The reduction of the hours of labour to a reasonable limit must mean that the men are in a better position to improve themselves mentally. That has been the case throughout the north of England.

464. Is it not a fact that the Mechanics Institutes and Schools of Art and other educational institutions in the north of England are better appreciated there than in any other part of England? In the north of England generally those institutions are highly appreciated, and technical education has made more progress in that district than in almost any other.

465. You say that the combination of the workmen has given the men shorter hours? Yes. I do not think that any unprejudiced man would deny that that is the case.

466. That being so, have those organisations worked to the detriment of the owners? I do not think they have.

467. Is it not a fact that there are fewer strikes in the north of England than in Manchester and Yorkshire? It is a fact that since the unions have become a strong organisation strikes have become less frequent.

468. What system have you in the north of England of arranging difficulties? They have a board of arbitration, consisting of men representing the owners and men representing the working-men, and they agree upon the choice of an umpire. The umpire is generally chosen from the leading men in the coal trade.

469. *Mr. Edden.*] I suppose you are acquainted with the Act under which our coal-mines are worked in New South Wales? Yes.

470. Do you think it necessary that any improvements should be made? That is a very broad question, and it is open to a very wide answer. In my opinion eight hours is sufficient for a day's work in a mine, but whether it should be enacted that eight hours shall be the period of the day's work is a matter for consideration. If such an enactment were passed, it would affect a very large number of men who are employed as day men. They generally work nine hours a day, and the consequence of such an enactment would be that those men would have a reduction of one hour a day in their working hours, and there would be a proportionate reduction in their wages. Recent events have already punished them rather severely in the same direction. I do not know if the question were put to the men in that way that they would be inclined to accept the reduction of hours.

471. If eight hours were made the period of a day's work by law, how much would that increase the cost of the output per ton? That is a wide question. The conditions of the mines differ so much. If my assumption is correct, that there would be a reduction in the rate of wages, I think it possible that in some mines there would be a reduction in the cost of the coal, but if the wages were maintained at the present rate the cost of getting the coal might be slightly increased. I think that, in the majority of cases, if the eight hours were enacted the output ought not to be reduced.

472. What would you think if a mining expert were to tell you that to pass an eight-hours clause in the Coal-mines Regulation Bill would increase the cost of getting the coal by 10d. per ton? I should not like to be responsible for that statement myself.

473. What, in your opinion, would be the increase in the cost of getting the coal if the hours were shortened as proposed? That would depend upon the different districts. If you assume that a less quantity of coal is going to be raised, it may be possible to estimate the approximate cost. Supposing

you

Mr.  
G. H. Green.  
29 Mar., 1894.

you are putting coal out at a cost of 4s. 6d. per ton, and your output of 1,000 tons a day is reduced to 800 tons, you can get at the approximate cost by calculation.

474. Do you think that the extra cost would be 1d. per ton? I think it would be a very high estimate to go up to 3d. a ton. The increased cost could only be 3d. per ton in an extreme case, which I cannot imagine. I think there would be very few cases in which the increased cost would be more than 1d. per ton.

475. If a mining expert were to tell you that the miners in this country work under the most favourable conditions of any miners in the world as regards ventilation, what would you think of that statement? I could imagine that the person who made the statement must have had some particular mines of his own to work in. From what I learn from the published reports, I think that that gentleman must have a very wrong conception of what the ventilation is in the mines in England.

476. I suppose you are well acquainted with the bord and pillar system of working, and also with the long-wall system? Yes.

477. Where the mines are worked on the bord and pillar system do you think that it is necessary that some alteration should be made in the mode of ventilation? I think that the ventilation requires improvement in this Colony.

478. What would you suggest as an improvement? There are two methods of improving the ventilation in mines, and I consider that both of them ought to be adopted. The present state of things is that a cut-through may advance 35 yards from the air-currents, but there may be 2 or 3 yards for the cut-through, and your cut-through may be any distance. It is not intended to be so, but as a matter of fact, it is so. It means literally that there is no limit. I would suggest a considerable shortening of the distance. I am not prepared to say what I would call a maximum distance, that a place ought to go before it is holed, but there ought decidedly to be an alteration. If the distance is 35 yards, and there is 8 yards for the cut-through, there is no reason why they should not take 100 yards as far as the Act is concerned. The new Bill says that "no place shall be driven more than 25 yards, exclusive of the cut-through away from the air-current, &c;" but here again you have no provision made from holing to holing. That is a point that requires attention. The new Bill says that the distance you may go before a current of air may be 25 yards, but it says nothing about the cut-through. You might have a pillar 100 yards wide, or you might desire to make it 30 yards by 40, or 50 yards square. To make the rule intelligible, you must provide that a place may be driven from holing to holing at certain distances, or that it must be ventilated, by bratticing. In my opinion these two alternatives must be free to be chosen from, because if we are going to work deep mines—and it looks as if we should in the near future—you will want larger pillars than any you have been accustomed to. If you insist upon cut-throughs at any short distance, you cannot work them economically. It is absolutely necessary in deep mines, if you are going to work by bord and pillar to have large pillars. If you make them small, they will be liable to creep at a great depth, and you are practically saying, "you are not going to work your mine by bord and pillar, you must work it by longwall." The cut-throughs should not be obligatory. That is not to the interest of either the masters or the men, because you limit the mode of working to one method, which may or may not be desirable. Therefore I say that the best way to deal with the matter is to provide for the alternative of bratticing, or providing a cut-through at a minimum distance. It must be put in a general way. We must say, "No places shall be driven from mouth to holing at a distance of more than 30 yards from the air-current."

479. How far from the working face may the air be carried to maintain an atmosphere fit for men to work in where blasting is carried on; what would you consider the minimum distance? I think that a question like that can be more satisfactorily answered by men who are carrying on blasting daily. I have visited those places continually; but it was in Great Britain where they have large quantities of air carried into the face.

480. How do you carry the air? By bratticing. As to the minimum distance, that depends upon circumstances. You may have a dip place or a rise place. In a dip place you may go to a considerable distance and the place will ventilate itself. You cannot say that a place will not ventilate itself until you get 100 yards away. If your question refers to a level place, 30 yards from your air-current is as long a distance as I should like to go, and less than that is desirable.

481. In a Bill that was before the Legislative Assembly an amendment was inserted that the air should be carried to within 15 yards of the working-face where gas did not exist;—what is your opinion on that? I think that once air has to be carried into a place it is a very reasonable provision. As regards the brattice, I am of opinion that it does not matter to a yard or two if the canvas is actually getting the air turned into the bord.

482. I understand you to say that you have worked in mines where bratticing was used? Yes.

483. What would be the extra cost per ton of the coal if bratticing is used? I can give you a close approximation of the cost that bratticing ought to come to, labour and everything included. I have been employed in putting up bratticing in this Colony in the Northern District. There were fifty working-places and nearly every place was bratticed. The cost of the labour for the bratticing in that mine was 4 of 1d., or two-fifths of 1d. per ton.

484. Do you form that estimate on the supposition that the bratticing is to be within 15 yards of the face, or is it carried up to the face? I form it on the supposition that the canvas is carried as far as is necessary, and that means nearer than 15 yards from the face.

485. Suppose a mining expert told you that the bratticing would increase the cost of the output by 3d. or 4d. a ton, what would you think of that? I should not like to be responsible for that statement.

486. You consider it an exaggerated statement? I can imagine conditions under which such a thing might take place, but they would be nothing like normal conditions. Suppose you canvased your working places and the pit works only one day a week or one day a month, that canvas would be rotting whilst it was hanging there, probably more than it would rot if the mine was at work, because if the mine was at work there would be a circulation of fresh air. But the statement that bratticing would increase the cost 3d. or 4d. a ton, generally speaking, is absurd.

487. I suppose bratticing is a practical way of ventilating a mine? Undoubtedly.

488. Especially under the bord and pillar system? It is not wanted under the longwall system, but it is the usual way under the bord and pillar system with which I am acquainted, though in some mines wooden brattice is used.

Mr.  
G. H. Green.  
29 Mar., 1894.

489. What quantity of air per minute do you consider sufficient or necessary, the minimum per minute per man? Where there is no gas and no horses it makes a great difference. I believe that if you have much powder-blasting the ordinary minimum of 100 cubic feet per head is rather a small quantity. I have always maintained that 100 feet was sufficient where there is no gas, but if you have much blasting with powder it makes a considerable difference. If you make special allowance for horses I consider that there should be three times the quantity for a horse that there is for a man. I have been considering what the effect of a great increase in the quantity of air per man would be in the Northern Districts. I believe that 125 cubic feet of air per man per minute, if the air is carried into the working places, would be a fair ventilation.

490. *Mr. Cook.*] What do you mean by its being carried into the working places? The places must not be more than 15 or 20 yards from the air-current.

491. It is an impossibility, is it not, for air to strike up a bord unless it is turned into it? I cannot see that it can strike up a bord more than a very few yards unless it is guided.

492. Are you in favour, as a practical way of working coal-mines, of splitting them up into districts? Undoubtedly. You cannot ventilate a large mine worked on the bord and pillar system without splitting the air to a very great extent.

493. There is another matter that I wish to have your opinion upon;—are you acquainted with the system which is in vogue in the north, known as the standard weight system? I am acquainted with it by hearsay.

494. Have you ever heard the men complain about it? I have heard some men complain about it, and I have heard some speak in favour of it.

495. Do you know that there was a law case between the Hetton Company and some of their men over this system? I do not recollect it.

496. I suppose you understand the system? I do.

497. Do you work at the Glebe Colliery? Yes.

498. Are you aware that that colliery has been on the verge of stopping two or three times in reference to this question? No. I have only been there about eighteen months.

499. What is your opinion about that? My opinion is that there should be a standard weight system. It is not an unjust scheme.

500. I suppose you are not confusing it with the standard height to which the skips are filled? That is what I mean. I have had no experience in regard to coal weighing here.

501. Do you believe that if the manager of the colliery says to the men you shall fill the skips not more than 10 inches above the side they ought not to be filled any more than that? Yes.

502. But if the men comply with the order of the manager in filling the skips they ought to have a payment for the coal that comes up in the skips? Yes.

503. And any system that prevents the men from getting that ought to be abolished? Yes. I consider it impossible for a man to know exactly how much coal he is putting into a skip, but the standard height would fix within a reasonable limit the maximum weight.

504. Did you ever find a miner who had to fill a skip a certain height deliberately load the skip 20 inches higher? No; the coal would have to be thrown off before it could get up the shaft. I never knew a man to fill up coal that he did not think he was going to get the benefit of.

505. You think it absurd to say that a man should deliberately go and do it? I cannot think for a moment that any reasonable man would do it.

506. *Mr. Cann.*] If it was the rule of the colliery that a standard height should be filled, would not a man be dismissed for exceeding it? There is generally some custom in regard to such matters. Perhaps the first time he would be cautioned, and the second time fined. If he did it a third time, perhaps he might be dismissed. A standard bar is used, and the cages themselves often form a sort of standard bar. A skip will not come through if it is above a certain height. There is generally provision made by passing a skip under the bar to ascertain if it is loaded to the proper height.

507. I suppose it is the duty of the manager to see that the rule is not violated? Yes.

508. *Mr. Edden.*] Do you see any hardship in the men employing what is known as a check-weighman, selecting for that duty a man outside the colliery? No; I cannot see but what it is a fair thing that they should be allowed to do so. I am of opinion that, generally speaking, it will be to the advantage of the men and the owners that the men should employ some one selected from amongst themselves. I think they should have a right to employ any man whom they choose. If they are reasonable men they would employ a man who would do the work efficiently.

509. You do not think that they would try to find the most obstructive man it is possible to get? I have known such a thing to occur, but I do not think that that is likely to be the rule, or that there will be even such an occurrence at all.

510. There are some mines in the north under tidal waters? Yes.

511. Are you acquainted with those mines? I have been down one that was working nearly under tidal waters, but not down one that was actually working under tidal waters.

512. Should there not be greater protection as to the working of mines under tidal waters? Yes; they are making provision with regard to the pillars, and I think they are much more careful from what I have heard than in ordinary mines.

513. With reference to pillars on main roads from the shaft bottom where there is a return air-way, and an engine bank, what do you consider should be the thickness of the pillars? That would depend on the depth of the mine, and, to some extent, the nature of the coal and the thickness of the seam.

514. Do you think it is advisable or practicable to stipulate in the Bill the maximum size of the pillars as well as the minimum? No; I think the best provision that can be made is that "sufficiently large pillars shall be left to maintain the shaft bottom and the main roads," because you can only provide in the Bill for the shallowest depth.

515. Who should say what shall be sufficient? I cannot suggest any better man than the Government Inspector. I do not know of any one else to whom such authority could be given, subject, in case of dispute, to arbitration.

516. *Mr. McCourt.*] Do you believe in mining managers having first-class certificates? Undoubtedly.

517. Does that include underground managers? Underground managers should have second-class certificates the same as in the old country.

518. How would you suggest that the board of examiners should be appointed? I think that the provision made in the English Act is a fair one. They should be selected from representatives of the owners and representatives of the workmen, with the option of the Government inspector taking part.

Mr.  
G. H. Green.  
29 Mar., 1894.

519. You have passed an examination, have you not? Yes.

520. Are the questions put from a book? The questions are written out.

521. I suppose they are taken from a book? I cannot say where the questions are taken from.

522. Would it be possible for a man to pass as a mining manager who had no practical knowledge of mining? Not if the examinations are conducted properly. If the examination is simply a written examination it is possible for a man who has had very little experience in mining to pass well.

523. Whom would you suggest should be the examiner? Representatives of the workmen and representatives of the owners.

524. Why should the owners be represented? They have an interest in the working of their property.

525. They might appoint a non-professional man who had no knowledge of mining? They might, and the men might do the same.

526. But they would not be likely to do that? Neither would the owners. They have an interest in their property, and they would try and get efficient men.

527. Should the Government make any nomination? Yes; they should have the option to do so.

528. *Mr. Cook.*] Is it not the custom to conduct both written and oral examinations? Yes; in Great Britain questions are put in the examinations which it would be awkward to put on paper—questions of a practical nature.

529. *Mr. McCourt.*] Which makes the best manager, a man of practical knowledge of mining right through, or a man who has passed an examination, but who has very little practical knowledge? If there is to be a deficiency I would rather see a deficiency in theory than in practice. But give me a man who has good theoretical knowledge and good practical knowledge.

530. Do you think there ought to be a stipulation that anyone who has passed an examination before he takes charge of a mine shall go through the various grades in a mine? That means that you would make a monopoly of mining management for the miners.

531. You say that you began as a miner? I have done a little manual mining—about three years. The English Act says that before a man can be a manager he shall have had five years practical experience of mining. I consider that that is a necessary provision.

532. You also think that an underground manager should have a second-class certificate? Yes; and that is on the supposition that he will have to undertake the duties of manager when the manager is absent.

533. Do you look upon the work of the ordinary miner as, in any sense, skilled industry? Undoubtedly, there is a certain amount of skill attached to it. No man can go into a coal-mine, and work there with safety, or profit to himself or anyone else, unless he has had some experience at it, except some classes of shift-work.

534. Do you not think that every miner should be required to produce a certificate before he is employed to show that he is a practical miner? I think it is provided in the English Act that an inexperienced man shall be employed with a companion, or not by himself at any dangerous work.

535. But there is nothing to certify that a man is a practical miner? Under the English Act he must have had two years' experience before he can be employed at any dangerous work by himself.

536. Is that the law in this country? No.

537. Do you think it ought to be? I think that some similar provision ought to be in force.

538. Do you think it is a proper thing that a mine should be filled with men who have never worked in a mine before? If the men are properly looked after. In any case a man must have a beginning.

539. But can a master look after fifty new men? No.

540. What I want to get at is this: In case of a strike, say you send two inexperienced men into a bord, who is to look after them? An experienced man would have to be standing by them.

541. Would there be danger if the experienced man was not there? I do not consider it safe for a man to work in a bord who has not been accustomed to be employed underground at some similar work.

542. You do not consider it right that a man should go into a mine except with an experienced miner? Not to do any dangerous work.

543. But it has been the practice when opening new mines, and at the time of a strike, to put in men who have never worked in a coal-mine before? I have heard that such has been the case.

544. Do you think it could be stopped? I do think it is a fair thing that men should be put to a risky employment like coal-getting without some knowledge of the business.

545. *Mr. Cann.*] Does it not endanger the lives of the other miners? In some cases it would. Take the case of a gaseous mine. I should not think it safe to let a man handle a safety lamp in such a mine, unless he had had some previous experience.

546. *Mr. Edden.*] In such a mine as the Metropolitan mine? I do not consider that a man should be left to carry on work in a mine without a certain amount of training.

547. *Mr. McCourt.*] How long does it take a man to become a competent miner? I think twelve months is a fair period for a man to learn the ordinary elements of safe mining, but it will all depend very much on circumstances. A man may have worked in the northern district for ten years without ever having to use a safety lamp, but if he goes into a mine where safety lamps are used he will require to understand the safety lamp.

548. The safety of the mine depends upon every man in it being a competent miner? Yes, in gaseous mines.

549. Then do you not think there ought to be some means of providing a competent miner with a certificate;—should not a miner have something to show that he is competent? I think if he can produce evidence that he has been employed for a certain time in a mine that ought to be sufficient.

550. But there would be no hardship in his having to obtain a certificate from the manager to say that he was competent? I do not think that a mine manager would like to undertake the responsibility of saying that a man was competent.

551. Could he not say that he has worked twelve months under him? Yes.

552. Do you think that a certificate of that kind should be required before a man is allowed to work in a mine? I consider that something of that kind should be required before a man is allowed to work in a mine by himself at dangerous work.

- Mr. G. H. Green.  
29 Mar., 1894.
553. I am speaking of men who are put to work in a mine at the time of a strike, and in new mines? I consider that some increased provision should be made.
554. You are aware that sailors have to have a certificate of some kind before they can go to sea? Yes.
555. That is because the lives of people depend upon their being competent men;—does not the same apply to miners? Yes; I have expressed my opinion that twelve months experience ought to qualify a man.
556. You think that the miner should have a certificate to show that he is qualified? Yes.
557. You do not think that a man who has not had any experience of mining should be allowed to work in a mine by himself? Not at any dangerous occupation.
558. At getting coal? Getting coal is a dangerous occupation. But a man might be employed shovelling dirt from one place to another.
559. I am speaking of coal-miners, the men who hew the coal? If a man was to work at the coal by himself he should have had previous experience, or he should have some proper supervision. When I say working on the coal I mean a man who has been mining underground. 'A man who has been working at stone or ore below ground ought not to be shut out.
560. You think he should be allowed to work without a certificate? He would be qualified to receive a certificate.
561. Do you think any man should be employed at getting coal by himself who had not previously worked for twelve months in a coal-mine? Yes; I think that any men who have worked at any subterranean mine twelve months should be allowed to work in a coal-mine.
562. The miner should have a certificate? Yes; he should have a certificate; but a man who has been working shale would be practically a coal-miner. You cannot shut out a man on the ground of incapacity who has been working underground at any mining.
563. It is unsafe to let persons who have had no experience work in mines? It is unsafe to themselves, and dangerous to others. It might be dangerous as regards blasting. I have known this occur. A man who had had no previous experience of mining charged a hole with blasting powder; he fired the shot, and there were three distinct reports. I asked the reason of it, and the man could not tell me. He had been ramming down the cartridges, but could not get them "home." That was a source of danger to anyone who might have had to go into that place.
564. You do not think that it would impose any hardship if we put a clause in the Bill to the effect that before a man was allowed to work in a mine by himself at any dangerous employment he should have a certificate showing that he had had twelve months' experience? Yes; a man should have been employed in a mine for twelve months before he is allowed to work by himself in any dangerous occupation.
565. *Mr. Cook.*] With reference to the eight hours legislation, you expressed the opinion that in the majority of cases it would involve a reduction of wages of the shift men? Yes.
566. On what ground do you base that opinion? On the simple fact that a man will be working a shorter period of time, and the industrial conditions are such to allow the master to make that reduction.
567. Do not you think that the only effect of the reduction of the hours of labour to eight will be that the men will have to put on an extra spurt? I do not think so.
568. Would there as a general rule be any less work done? I have already expressed the opinion in regard to coal-work, and I believe it applies to shift-work that the same amount of work can be done by the men.
569. And practically would be? I should not like to vouch for that. That would depend upon the conditions under which they worked. I think that if men suffer a reduction in their wages, they cannot be expected to do the same amount of work when their fellow workmen are working at the original rate.
570. Then that is practically an admission that it would not be to the interest of the mine-owners to make this reduction of wage in consequence of the reduction in hours? I think not. I think that the men will do the same amount of work in the eight hours as they do now, if paid at the same rate of wages.
571. Then whilst the opportunity of reducing the hours may be taken advantage of by some managers to reduce the wages, in the majority of cases such a thing would not occur? My opinion is that in the majority of cases such a thing would occur.
572. But you said that it would not be to the interest of the management to do this? The management have not expressed that opinion to me. It is my opinion. I do not think it would be any gain to them to reduce the wages.
573. Do you think it is a fair assumption that the management would do a thing which would produce irritation on the one hand, and do no practical good on the other? It is simply my opinion that it would do no practical good. I think they would, in the majority of cases, go for a reduction of wages.
574. In your opinion there need not necessarily be a reduction in the wages, consequent on the reduction of the hours? In my opinion there need not be.
575. Suppose that the eight hours was made compulsory in the mines, would you insist on a reduction in the wages? If I had a mine of my own I should not. I do not think it would be to the advantage of the mine-owners to reduce the wages. The same amount of work could be done in eight hours by the shiftmen that they do now, but I think that the wages would be reduced nevertheless.
576. Do you think that their keen business instincts would lead them to seize an opportunity of that kind even though it should be thought unfair? I think their business instincts would lead them to seize this opportunity.
577. But as a matter of fact, you think there would be really no need for it? I think not.
578. A man can tire himself in eight hours? A man can do as big a day's work in eight hours as he can in a longer time with a due regard to his health.
579. So that even from a commercial point of view the management of the mine would suffer nothing by the introduction of the eight hours system? Generally speaking they would suffer nothing by it. Of course, there would sometimes be a drawback. For instance, if there is a breakage in the mine, and you want an extra hour to rush things, you have a better chance with longer hours to make up for lost time.
580. These are exceptional circumstances? Yes, there would be a little more rushing to get the coal out, and that means a small amount of increased risk.
581. As to ventilation you said just now that in your opinion local circumstances should decide to a large extent what plans should be put in operation for the purpose of securing ventilation? Yes; there is one instance which I wish to mention. There are mines in the northern district in which so much rubbish is made that there is very little room left to carry air up to the working place if they were canvassed. That is one of the reasons why I suggest the alternative of limiting the distance from holing to holing, not that the cut-through should be compulsory in any case.
- 582.

582. A mine takes less quantity of ventilation to the dip than to the rise? Yes; a place will ventilate itself fairly well to the dip. I know a case in which I was using bratticing. The men were not inconvenienced, to a serious extent at 35 yards in the dip places, there being perhaps 3 inches of dip to the yard. They could carry their places 35 yards, although gas was making in that seam.
583. If the dip were sufficiently steep it would practically need no ventilation? You would, after a time, even in sinking a shaft. In sinking a large shaft we were compelled, when we got down 75 yards, to ventilate even a vertical place. Of course, the blasting was heavy in this case.
584. If local circumstances affect ventilation so materially, does it not argue the necessity for a minimum quantity of air being stated? Yes; a minimum quantity is required under any conditions.
585. Suppose a manager were employed in a mine which it was not difficult to ventilate, and he was transferred to another mine which was difficult to ventilate, would he not be likely to take his ideas as to an adequate amount of ventilation from the non-difficult mine to the one that was difficult? Probably he would consider it adequate to give the same ventilation that he had given in the previous mine.
586. Whereas, as a matter of fact, the local circumstances would completely upset his calculation? Bad habits become second nature.
587. As regards these bad habits, should there not be some enactment? I consider that provision by enactment for a minimum quantity of air is a fair thing. But the question as to the amount is open to discussion. I would point out one little difficulty in connection with the increasing of the amount of air. It has been suggested that 150 cubic feet of air should be the minimum. If a mine is working with 100 feet of air per man, and you desire that the minimum shall be 150 feet per man, that means that the ventilating power must be increased more than three-fold. That is a very big leap to take in altering the ventilating power of a mine. We know that very few mines have only 100 feet of air per man, and there is no doubt that when proper arrangements were made the amount could be considerably increased without any alteration of the ventilating power, but if there is a mine which has only 100 cubic feet of air per minute per man, and they are compelled to provide 150 cubic feet, that means a pretty stiff task. At the same time it means the burning of more coal, though that is not a very expensive matter.
588. Suppose you were putting down a mine on your own account, and you had to fix it up in good going order with modern appliances, what provision would you make with regard to the quantity of air;—would you consider that providing 125 cubic feet per man would be sufficient;—would you think that you were on the safe side if you put down as much power as would give you 125 cubic feet per man? Certainly not, nothing like it. I should want a margin of at least double that quantity.
589. But if you did not get that margin would you not consider that you were putting down a good modern plant? No.
590. *Mr. Cook.*] What are the advantages of splitting the current of air and dividing the mine into districts? It gives an increased quantity of air and circulates it in the mine. Every additional split means an increase in the quantity.
591. *Mr. Cann.*] It means less friction and less resistance? Yes.
592. What are the benefits of splitting the air? Dividing a mine into splits has this effect in the case of gaseous mines. If an explosion takes place in one part of the mine the effects may be entirely isolated. Then, instead of all the impurities of the air being collected into one current, and carried round to all the men, you have in each district a quantity of fresh air. The temperature is generally not so high at the end of an air-current.
593. It gives the most efficient ventilation, and greater safety? Yes; of course there is such a thing as carrying it too far, though I never knew of a case where it was carried too far.
594. If you knew a man to say that in his opinion the splitting of the air had a tendency to produce less ventilation, and to defeat the purposes of good ventilation, what would you think of it? If he said that splitting the air generally was calculated to injure ventilation, I should be inclined to think that he knew very little about it.
595. Is it unscientific? No; if carried to excess it would become unscientific. Generally speaking, splitting the air is the scientific question in ventilation. The question is how to split it so as to get the best results.
596. If a man told you that a general system of dividing a district into splits, and dividing the volume of air, was a menace to good management, what would you think of his opinion? I say that if he objects to the splitting of the air as unscientific as a general principle, I should consider that his opinion was very much behind the times, and that one of the technical mining classes would be the proper place for him.
597. The first thing a man would do who wanted to dispose his mine properly would be to arrange for splitting? In laying out a mine a good manager will plan a system of ventilation, and will have it in his mind if not on paper.
598. As to payment by weight, would you call the present system of payment by weight a satisfactory system? It is not a system of payment by weight, it is payment by averages. I know that a good many men do not object to it, and others do. As far as payment by weight is concerned, I think that if it is demanded, payment by weight is only a fair thing. Every man has a right to have his coal weighed. I do not see any great difficulty in the weighing as a general thing. I believe that there would be a difficulty in some mines, because the arrangements in those mines are different from what they are in England. Some weigh the coal on the screen; but the coal has to be cleaned on the screen, consequently the weighing is very slow.
599. There would be no difficulty about weighing the whole of the coal if necessary? There is no mechanical difficulty if proper arrangements are made. In some mines in New South Wales no doubt it would mean expense.
600. It might be expensive, but it could be done? Yes; it is done in England at mines turning out 2,000 or 3,000 tons a day.
601. Every skip is weighed? Yes. At the Silksworth colliery, in the county of Durham, the output is about 2,000 tons a day, and every skip is weighed. In the coal-mines in England every skip is weighed, but at some mines getting 3,000 tons of coal a day they draw the coal up two shafts, and they have two weighing machines, but at the mine mentioned above, it is all one heapstead.
602. Then, if a man told you that it was impossible to weigh a couple of thousand tons a day at one mine, you would not regard that as an expert opinion? I should consider that he was deficient in knowledge on the subject.

Mr.  
G. H. Green.  
29 Mar., 1894.

- Mr. G. H. Green.  
29 Mar., 1894.
604. What is the motive that would induce a man to fill his skip over the usual height; what gives all the trouble in regard to the standard weight system; why is it imposed; and why is it so strenuously objected to by the men? It is imposed, in the first instance, to prevent the overloading of skips.
605. What is the motive for that? In the first instance, a skip is constructed to carry a certain maximum load, and some people object that by overloading you allow the loose coal to fall on the roads. Another reason is, that the machinery about the pit will only admit of a certain height of coal in the skips. Where a standard weight has been required they have a certain limit in the height.
606. But why is it that a miner should trouble to pack his skips in this way? The only reason that I can give is that he wants to grab a little more, to get as much weight as he can into the skip, and to get as much payment as possible.
607. Why should they want to get so much weight into the skip? They get a better average weight on the skips.
608. It arises primarily then upon the system of averaging which has been adopted instead of weighing every skip? I consider that that is the primary motive.
609. But if all the coal were weighed here as it is in some parts of England, it would obviate the trouble with regard to the standard weight, and be more satisfactory to all parties? It would get rid of the trouble with regard to the standard weight, whether it was more satisfactory or not.
610. You regard the standard weight system as most unfair? I think it is a matter which ought to be optional between the owners and the employees. I believe there are many miners who are satisfied with the averaging system.
611. I am speaking of the standard weight that is imposed by the management? It is a question with which I have had very little to do. I consider that every skip ought to be weighed and paid for.
612. Is it a fact that two men filling skips, equal in size, will differ very materially in the weight which they get into them? Yes; it depends upon the class of coal that they put into them. One may put in large and the other may put in small coal.
613. Is it not a fact that one man will put  $1\frac{1}{2}$  cwt. more into a skip than another? That is so.
614. It is the result of good careful filling on the one hand, and careless filling on the other? Yes.
615. So that the standard weight system must operate prejudicially to the man who fills his skip carefully, and makes the best use of the advantages that he has? Yes.
616. It puts him on a level with the man who has not taken so much trouble? Yes.
617. You would have no objection to the standard height? No; I think they ought to have power to fix a maximum height.
618. And that would serve the purpose which is ostensibly served, but not really served by the standard weight? Yes. At the same time I think it should be optional with the workmen. They might accept the standard weight if they choose. I do not think there should be any compulsion in the matter as far as the men are concerned.
619. Have the men any say now as to the quantity of coal which should be weighed? I am not quite sure on that point. At Minmi, I think, every tenth or fifteenth skip is weighed, so that neither side has any reason to complain as to the choice of skips.
620. Do you know any other place besides Minmi where they do it? I do not.
621. What is the rule? The general thing is, as far as my knowledge goes, that the weigher calls for a skip.
622. Who says what quantity of coal shall be weighed, and whether it shall be weighed every day or only once in three or six months? I take it that the manager determines that generally.
623. Therefore, it is entirely in the hands of the manager how much coal shall be weighed? As far as my knowledge of the subject goes, that is the case; but I cannot speak with any authority on the matter, as I have not inquired into it.
624. Assuming that the manager has sole power in the matter, is that fair in your opinion? It will depend upon the manner in which he exercises the power.
625. Ought the manager to have the sole power to say whether the skip shall be weighed or not? No; I say I consider that the men have a right to have every skip weighed if they desire it.
626. And that a system which permits the management to refuse to weigh for (say) a month at a stretch is unfair? I consider that it is not fair, unless the men have the option.
627. You think the men should have some say as to the weighing of the skips? Yes.
628. In your opinion, would any system which made provision for a mutual arrangement of the matter be generally satisfactory? I think it should be.
629. You think the men would not demand that the whole of the coal should be weighed if they had some say as to the quantity which should be weighed? I do not think they would want the whole of the coal to be weighed. Where they see it would be a matter of difficulty, they would satisfy themselves with less than that.
630. Suppose a mine to be intersected with bands, brass, dirt, and refuse, is it a fair thing to discharge a man because he sends up 3 or 4 lb. of dirt in his skip? It is rather a small quantity. The question should hinge more upon the question of sending up larger quantities, which proves negligence; 3 or 4 lb. of dirt is too small a quantity to speak of.
631. Can a man send up dirt without its being possible to detect it? You can occasionally send up small quantities without its detection, and it might be possible to send up a large quantity, but not generally.
632. Would not some of the bands of a brown colour, and in a wet place, be difficult to distinguish from the coal? Undoubtedly, there is a difficulty in regard to bands in many instances; still, a careful workman will generally work his coal off in such a way as to try and keep his eye on the bands.
633. That would be where the band is thick. But suppose it was a seam where it all came away together, and you had a thick piece of brass? A man who is filling coal must be absent-minded if he does not feel a difference in the weight of that piece.
634. Suppose it was sufficiently thick? If it is a piece of brass of any dimensions you could detect it in a piece of coal by the weight.
635. Where the band is very thin it is much more difficult? There is a difference in the weight, but it is not so marked.
636. Suppose you were the manager of a mine, and you saw 3 or 4 lb. of dirt in the skip, and you knew

knew the man to be a good average miner, and a fairly careful man, would you be inclined to discharge him? Not for a first offence. At collieries that I have been in in the old country the practice was, to caution them for a first offence, to fine them for a second offence, and it was in the option of the manager to discharge him for a third offence. I do not think that a manager would be inclined to discharge a man for an offence of that sort committed once only.

Mr.  
G. H. Green.  
29 Mar., 1894.

637. If he did would you regard it as a tyrannical proceeding? I should regard it as pretty arbitrary.

638. You would be inclined to think that there was some ulterior motive in such a case? I do not think that a fair-minded manager would discharge a man for a first offence, unless the rubbish really showed shameful neglect. I have heard of a skip coming up half-full of dirt. In such a case as that the man ought to be discharged forthwith.

639. If a manager sent a man home because he had 3 or 4 lb. of penny band in the skip, would you think that arbitrary? Yes, severe treatment. I think the best method would be to have a graduated scale of deductions for dirt up to a certain amount.

640. *Mr. Edden.*] That would be a matter for agreement between the men and their employer, not a matter to be put in an Act of Parliament? No, not to be put in an Act.

641. *Mr. Cann.*] What hours do they work in coal-mines now? The coal-getters in the Northern District work eight hours from bank to bank. The shift-men work longer than that.

642. The hewers work in two shifts? Yes.

643. And how many hours does the pit run? It runs from 7 o'clock in the morning till 4 o'clock in the afternoon.

644. Is there any break in that time? There is half an hour in the night-shift.

645. Do they run a night-shift too? The pit is not working at night raising coal.

646. Then any alteration in the hours of the men would not interfere with the output? It would interfere with it in this way. If they are only eight hours down in the mine they will still require their meals. As it is at present the men are either walking or working at least eight hours.

647. But these men working at night would not stop the mine from drawing its usual quantity of coal? No.

648. They could raise their usual output as far as the night-men are concerned? Yes. The night-men are generally repairing.

649. Can you state how long the break is during the day? I think it is about one hour. I suppose there are two breaks one of half an hour in the morning and another at midday.

650. I suppose that two breaks would be a fair thing considering that the men are working ten hours? Yes.

651. Commencing at 7 o'clock in the morning the men would require their breakfast and afterwards their dinner—two breaks would be a fair thing? It would be sufficient.

652. I suppose about an hour would be the time occupied in these breaks? Yes.

653. Therefore, the pit would be running eight hours? Yes.

654. I suppose that the eight hours provision, with twenty minutes break, would only make that number of minutes difference in running a mine supposing, all the hands stopped for that twenty minutes? It would be eight hours, less twenty minutes.

655. I suppose it is not absolutely necessary to stop the output of coal in that place? No; it is not necessary. They could arrange for a certain number of men to get their coal at one time, and some at another.

656. They could keep the mine running eight hours? Yes.

657. That would be practically doing what they are doing now so far as the output of the mine is concerned? I do not see why an arrangement could not be made to keep the mine running all the eight hours.

658. I suppose that in working an adit they could go in and out at any time, and keep the mine running the full eight hours? I do not see how they could do that in the case of shafts. Suppose we have shift men who have to be down eight hours. Some must go in before the commencement of the shift, and if a man goes in at a quarter to 8, his time would be up at a quarter to 4, and then the miners have to be wound up and down.

659. But that would not be so in the case of an adit? What you want to get is that they should be able to wind the coal for eight hours. There are many ways for arranging that. There is no reason why you should not have men going in a little earlier to get the coal ready. That is the method in the North of England. In that way they could carry on the winding and hauling of the coal for the full ten hours, including the time occupied in raising and lowering men, and no one was obliged to stay longer than the statutory time.

660. You very often have to arrange the hours so that the men can conduct their various portions of work? Under the present arrangement two shifts of men are intended, but if men come in one shift at 6 and another at 8, that enables them to get coal ready for winding at 7 o'clock. And when one shift comes out at 2 o'clock there are men still getting coal, so that the pit can wind coal until 4 o'clock.

661. Does it make any difference to the cost to the owner what number of hours the hewers work? They are paid by the ton. The only difference which it makes to the hewers is as to the quantity of coal which they get out. The more coal they get out in a given time the less money it will cost the owner.

662. I suppose they would not be paid any more money? Neither more nor less. But if you have men attending to the engines and winding, and those men haul 50 or 100 tons a day more, they are doing more work for their money. The more you get from each hewer the cheaper the coal would be got. It is to the advantage of the owners to get as large quantity per man as possible.

663. I suppose the manager fixes the number of hours that the men should stop at the face? It is generally understood, I believe, that a man shall work eight hours from bank to bank. In many cases a man comes out long before the shift is finished. That is where he has an easy place and sufficient coal is got to keep the wheelers going. I have heard it stated that a good man will come home early, but I think the man who has a good working place is the man who will come home early. He soon gets enough coal to keep hauling arrangements going for the day.

664. You would not think that a man leaving his place at 9 o'clock in the morning had done a days work under ordinary conditions? No; he has had a favourable place to work in.

Mr.  
G. H. Green.  
29 Mar., 1894.

665. In reference to cut-throughs, do you consider the subject of ventilation of sufficient importance to have the minimum distance of the cut-throughs from the airways stipulated in the Act? Yes; I consider that the minimum distance should be stated either in the clause or in the special rules, as an alternative to bratticing.

666. Of course, if a minimum distance was provided, that would leave the discretionary power to use any other means that they liked? If you use one you do not always require the other.

667. You count the distance from the brattice to the face as the distance that you are in advance of the air-current? Yes.

668. Do you know whether there is any provision in the present Mining Act to stipulate the size of the returns? There is no size stipulated except the communication between the two main shafts.

669. That, as a rule, would not be used for the return airway? In some cases it would—it depends upon the distance which the shafts are apart. I have known them to be used in several cases.

670. I suppose that a definite return is a very important matter in the ventilation of a mine? It is a very important matter—both the size of the return and the size of the intake.

671. You would not think it a well regulated mine where they had a sort of chance return, the air going through old bords and walls? No; the return airway ought to be properly secured; but there is no objection to making use of old bords too. I should always see that one portion of these old bords was in a fairly safe condition. I would not stop off the old bords to prevent the air from travelling through them. I would let the air go through them if it would after leaving the working faces. It means reducing friction and increasing the quantity of air.

672. *Mr. Edden.*] What benefit would accrue from that? If you have three bords it would make your return airway three times as large as if you had only one bord.

673. Suppose you had an airway 100 yards long, and it was 10 feet all the way with the exception of about 6 feet in the centre, what would be the benefit of having 10 feet at each end? Having it 6 feet means increased resistance, but only at that point.

674. Suppose you have an airway 10 feet square and a yard long, and one 6 feet square and a yard long, what difference will that mean? The 6-foot portion will exercise increased resistance for 1 yard only. Every yard of additional area which you have means reducing the friction.\*

675. *Mr. Cann.*] Then, the return is a sufficiently important matter to have some provision for a certain dimension of return? I think it would be wise to provide a minimum, but that applies equally to the intake.

676. But you think it is necessary to stipulate a minimum quantity of air per man? If you stipulate that, the main point afterwards is that you shall have such a road that a man can travel through it in the ordinary way—that it shall not be left a creeping road.

677. Do you think it necessary that the return should be inspected from time to time, to see that it is kept in good condition? Yes; the main roads and airways should be subject to periodical inspection. That would be provided for in the special rules.

678. I suppose you think it is necessary to inspect the working faces, as to whether they are secure before the men are allowed to go to work in them? Yes; the main travelling roads in the working faces should be inspected every day.

679. And a record kept? Yes.

680. Would you be favourable to inserting provisions stipulating that some time prior to the men commencing work, that that inspection should take place? Yes; I think that the inspection should be carried out within a reasonable time before the beginning of the shift; and in my opinion a reasonable time would mean not more than four hours before the beginning of the shift.

681. *Mr. Nicholson.*] About cut-throughs. Have you read the Coal Mines Regulation Act of 1876? Yes.

682. What is your opinion as to the stipulated distance in that Act—35 yards? I have always said that I considered 35 yards was a distance I should not like to work in, to use powder for blasting.

683. Are you of opinion that the literal reading of the Act is that it shall be 35 yards,—it says that no working place shall be more than 35 yards without a cut-through being put through? I should say that the literal reading of that is that you cannot drive more than 35 yards without driving a cut-through.

684. Do you not think it means, as it reads, that a cut-through shall be put through, and that you should make your hole through at 35 yards from where you commence to drive? I can quite understand that that may be the meaning; but it is not put so in the Act.

685. There can be only one interpretation, namely, that it should be only 35 yards from the previous cut-through? I should take it to mean that the hole should be put through at 35 yards from the mouth.

686. Do you think that it is a matter of importance as to what distance the cut-through is provided that bratticing is used to bring air to the working face? No; if brattice is used I am of opinion that there should be no compulsion in the matter of driving cut-throughs.

687. Is it not a well-known fact that the fewer cut-throughs there are the better air-course you can maintain? The less leakage there is.

688. There is no stopping or blocking up to conduct the air so secure as the coal pillars? No.

689. You are quite aware that the system of bratticing is carried on in almost every mine of importance in the old country? Yes.

690. And it does not add materially to the cost of producing the coal? Not materially.

691. Do you not think it safeguards the interests of owners as much as it does the health of miners? Yes; it is a necessity in a great majority of mines in England.

692. And also in this country? In this country with the present practice I consider it a necessity as a matter of health.

693. Under the existing Act the air cannot be conducted up to the working face without brattice? I am aware of that. For a long distance you cannot get your air on to the working face without brattice.

694. I think you said that you considered 125 cubic feet of air per man per minute as a fair allowance? If it is conducted within a reasonable distance of the working face.

695. Do you consider the system of using canvas for bratticing as good as using timber? The main thing is to conduct a fair amount of air into the working face. Canvas will answer that purpose perfectly well, and

\* NOTE (on revision).—The friction in the first case is to the friction in the second as  $\frac{1}{25000}$  is to  $\frac{1}{1000}$  or as 1 is to 13 approximately.

and the expense is not great. In this country I consider that 4 of a penny would cover the cost of labour. As regards material with the pit working a fair number of days, four or five days a week, I consider that the cost of material should not exceed  $\frac{1}{4}$ d. per ton on the coal got, including labour and material  $\frac{3}{4}$ d. is a liberal allowance.

Mr.  
G. H. Green.  
29 Mar., 1894.

696. Do you think that bratticing to conduct air to the face is a safeguard in the interests of the owners? Where gas is produced it is to the interests of the owners to make use of bratticing of some sort.

697. You said you were satisfied that eight hours was long enough for a man to work underground? I am satisfied that he can do enough work in that time.

698. In the old country I believe the miner does not take twenty minutes or half an hour for meals, but he works on the whole day? In Durham some of the men go on to work without tucker for seven hours from bank to bank, and others take a certain amount of food which they find time to eat at odd intervals.

699. So that the coal-hewer in the majority of cases would lose no time if the skips were going fast enough to keep him at work? He would practically lose no time.

700. Have you known any difficulty between the owners and the men with regard to that? I have not.

701. Have you heard any strike arising owing to the want of eight hours? I cannot say that I have.

702. Is it your opinion that a shiftman would do a fair day's work if he had the eight hours? I think he could do a fair day's work in eight hours.

703. With regard to the weighing of the coal, you said that the averaging system was a fair system? No; I did not say that. What I said was that the men in many cases are satisfied with it. A perfectly fair system is that every skip of coal should be weighed. If the men are content to have so many weighed out of the number, I see no reason why they should not be allowed to have that system.

704. Do you know the system they have in England? The system there is that every skip shall be weighed of the mineral gotten and that it shall be paid for by weight.

705. Is that in your opinion the only way by which men can get strict justice, and the owners pay for nothing but what they are really getting? It is the only method by which strict justice can be done to the masters and to the men.

706. Do you not think it is quite practicable at any mine in the Southern District to make arrangements to weigh every ton of coal that comes out of the mine? I think I could mention mines elsewhere at which it would be rather a difficult matter. It would require, undoubtedly, new arrangements altogether. The weighing-machines now used are not so good for weighing large outputs. In England they weigh the skip and the coal together, but when you have to clean the coal on the weigh-screen the machine can only be used after the coal has been screened.

707. But it would not be difficult to put up a scale at the mouth of every tunnel or shaft? In the case referred to you would not have room for two skips coming out of the cage—you would have two skips on one deck, and in such a case you must have a weigh-screen or weighing-table to the right and one to the left. You would want the skips to go both ways. It would be difficult to arrange for the weighing of all the skips without having two weighing-machines. There would be considerable difficulty in putting in the weighing-machines. You have not enough room for two skips to come out together, and if you are weighing in front, you will have to keep one skip in the cage whilst the other is being weighed, and that means stopping the pit from winding. You would want three weighing-tables, or would have to do away with the straight out screen.

708. That is only an isolated case? I do not know of any like that, but that is one.

709. In the majority of cases there would be no difficulty? There would be no difficulty where there is room between the shaft and the screen for the erection of a turn-table. I think that the erection of a weighing-machine to weigh the whole of the coal is simply a question of expense.

710. Do you not think that if that system were provided for it would prevent a lot of friction between employers and employees? I think it would, if the alternative of weighing or taking the average weight were introduced, but I should not be inclined to make it compulsory on both the masters and the men, I would give the men the option. The English Act does not give you that option.

711. With regard to the second shaft of a mine what, in your opinion, should be the distance between the shafts? I consider that the provision made in the English Act is quite sufficient, namely, 15 yards.

712. Do you think the provision made in the Bill recently before the Assembly, namely provision for 50 yards is too much? I do not see where the necessity for it comes in. Only two reasons have occurred to me for it, one is the possibility of having what is called a creep upsetting the roads, and the other is a collapse of the tubbing in the shafts, where both shafts are sunk through quicksand. I do not think 50 yards is any better than 15 yards, because in the case of a creep you may take it for granted that the manager, who is going to work out the coal from the bottom of his down-cast shaft, will also work out the coal from the bottom of his up-cast shaft, if it is no further away than 50 yards. I consider also, as far as that point is concerned that ample pillars should be left at the bottom of the shaft and adjoining the main roads. In the case of the tubbing in the shafts giving way, if a shaft collapses I take it that that relates to the pressure, and the nearer that shaft is to the other, the more the pressure will be relieved. I do not see that a shaft is more liable to collapse 15 yards away than it would be 50 yards away. I do not think it is to the advantage of the miners to make it more expensive to work the coal; and in starting mines in England, it is customary to make the shafts 15 or 20 yards apart, the object being to have all their work concentrated, their boilers, their screen arrangements, and their workshops, by having the two shafts within a reasonable distance. Suppose we take the case of this Cremorne undertaking. They are going to put a shaft down there 1,000 yards deep, and they want to make all their arrangements as economical as possible; they want to raise as much coal as possible in one day to pay the interest on their large capital, and all their arrangements will have to be as concentrated as possible. They will wind in both shafts, and they will want the screening and other operations of the surface to be conveniently placed together. It is generally considered that a distance of 15 yards is ample, even in a mine like that.

713. Taking it as a means of ingress and egress in the case of danger from explosion, do you not think it really necessary that the shafts should be further apart? I do not think that 50 yards is a provision that would meet such a case.

714. Still, it is better than 15 yards? I must admit that it is better, but if you want to make provision of that sort you must put the shafts a mile apart. The only way to meet the difficulty is to provide that there shall be sufficient coal left at the pit bottom, and adjacent to the main roads. Fifteen yards is ample

- Mr. ample to prevent rotten ground from breaking through from one shaft to the other. As to saving a road by having a shaft 50 yards away, I think it is in very few cases, if any, that 50 yards would do it.
- G. H. Green. 715. Do you think that in mines working under tidal waters there should not be a minimum size of pillar provided for in the Act? There is no doubt in my mind that some provision ought to be made; but my opinion is that it ought to be made in the special rules of the colliery.
- 29 Mar., 1894. 716. You think that they should draft rules and submit them to the Minister for Mines? When rules are drafted, the inspector has the option of saying whether they are satisfactory or not. The rules are sent to the inspector for approval, and he always has power to make suggestions. If his suggestions are not agreed to, then it becomes a question for arbitration, and the matter would be settled by calling for expert evidence.
717. Do you not think it better, in the interests of the mine-owners, that good, substantial pillars should be left in every case? There is no doubt in my mind that large pillars, generally speaking, are an advantage, both as regards safety and economy in the working of mines.
718. *Chairman.*] Have you ever had to deal with sudden outbursts of gas during your experience of the colliery management? I have.
719. Did it take place at a time when you least expected it? Yes.
720. That being so, what is a sufficient quantity of air to dilute the gases to make them harmless? To be harmless, as indicated by contact with the naked flame, we consider that there should be at least thirty parts of air to one of gas; but I should not consider, if gas was diluted to that extent in a mine, that the men would be justified in using naked lights.
721. You say that the quantity of air to dilute the gas should be as 30 to 1. How many hundred cubic feet of air per man per minute would it take to make the gas harmless in a mine? Your question gives me no positive data to go upon. You must have a specific quantity of gas before I can say what quantity of air will be requisite to dilute it.
722. It is stated that a man gives off 40,000 cubic inches of carbonic acid gas in twenty-four hours, and a sudden outburst of from 8 to 10 per cent. of carbonic acid gas is poison? Yes; it is fatal.
723. You say that the quantity of air to dilute the gas should be as 30 to 1? That is for fire-damp, and when there is that quantity of air in it you cannot detect it by a flame.
724. Suppose it is 100 to 1, what current of air would you need then to render the gas harmless? I should consider that if you had the air in the proportion of 100 to 1 the mine would be a safe mine.
725. I understand that at times and places when you least expect it outbursts of gas occur? I have known them to occur.
726. Suppose you had three parts of gas to thirty parts of air, how would that do? You would want to increase your quantity of air then until you made it about 100 to 3. If you increase it to that amount the gas would no longer show on the safety-lamp.
727. I suppose you have read Mr. Upton's book? Yes; some years ago.
728. Do you think his writings are worthy of notice? I think it is a very good book for ordinary miners.
729. Do you know what stipulation he makes in that book? I cannot say. He quotes other authorities.
730. Does he not say that there shall be 100 feet per man where no gases exist—100 feet per candle and 600 feet per horse? I do not know about the 100 feet per candle, but he says that there shall be 100 feet per man, and, I think, 600 feet per horse.
731. Other writers, amongst them Farley, Blackwood and, Henry, have dealt with the subject, and you, as a mining teacher, I suppose, have laid down certain rules, and what rule would you insist upon with regard to the supply of air where gas exists? I should say that the gas must be diluted to such an extent that it could not be detected in the return by the safety-lamp.
732. What formula would you lay down by which they could calculate? You cannot make a rule beyond this, that you must reduce it to such a point according to the flame of the lamp that you will be unable to detect the presence of fire-damp. Rules are given by some authorities that for every ton of coal worked, for every square yard of face exposed, so much air shall be provided; but these rules are dependent altogether upon the nature of the seam you are working, and what the inspectors state generally in their reports is that a mine may require from 200 up to 400 and even 600 feet per man, in order to render harmless the fire-damp found in them.
733. Has not a standard been laid down by Percy, a mining engineer, who is an authority on the subject? I do not know that he is very strong on that question; he is a great mechanical engineer.
734. Is he not also a mining engineer? He is more particularly a mechanical engineer. I do not think he is a certificated colliery manager.
735. Is there not a rule laid down to the effect that where a mine has gas 100 feet per minute per foot of seam is required in that mine? I have seen it laid down that 100 cubic feet per minute per cubic yard of coal worked per shift is required, or 100 cubic feet when a ton of coal has been extracted.\*
736. This afternoon you refused to stipulate what amount of air you would require to render harmless sudden outbursts of noxious gases? I refused to state definitely what amount would be necessary. It would depend altogether upon the quantity of gas given off.
737. You have given a great deal of evidence upon supposition, could you not do the same in regard to this? I could do it in this way: I can say that it would require a great deal more air, if there is a fire-damp, than it would if there was not fire-damp.
738. In your opinion is 125 cubic feet of air per minute per man sufficient to render harmless other gases than what a man and horse cause? Not beyond what is ordinarily given off by the man, with his light and his powder.
739. Then 125 feet would not be necessary if an outburst of gas took place? It would not be adequate.
740. It would not be adequate? No; in the case of an outburst of gas, whether black-damp or fire-damp, there would have to be more air provided. That would be only a minimum for sanitary purposes in the mine.
- 741.

\* NOTE (on revision):—Take a mine raising 1,000 tons a day. This would require 100,000 cubic feet per minute on account of gas. Add 100 cubic feet per minute for sanitary purposes, and the total is 150,000 cubic feet of air per minute. The eminent mining authority, André, if my memory serves me rightly, gives a considerably less quantity than this. The difference between gaseous seams in degree makes a hard and fast line undesirable, and the general rule of 200 cubic feet per man per minute and upwards, with the practice of keeping the return air diluted so as not to show a cap on the ordinary safety-lamp, is probably as good as can be specified at the present time.

741. That being so, would it not be better to stipulate for a larger quantity than 125 feet continually travelling to the face;—you say that you have known sudden outbursts of gas take place? Yes, I have known that to be the case; but it was where gas was ordinarily given off, and those sudden outbursts were abnormal. In such cases provision is always made for air in excess of the ordinary requirements of the mine. Of course where fire-damp is given off, it is always desirable to have a larger amount of air than what is called the minimum. But in ordinary mines, where no fire-damp is given off, and no noxious gases are met with in a general way, I cannot see that they would be liable to an outburst of gas.
742. You are acquainted with some of the collieries in the Newcastle district? Yes.
743. There is not much difference in the composition of the coal in those mines, is there? I suppose that a chemical analysis would give pretty much the same results in most cases.
744. Is it not a fact that in some of those mines explosions have taken place, and caused loss of life? Yes, I know from reports that such accidents have taken place; but I am also satisfied that in those cases it was evident to those who were working the mines that the seam was giving off gas. The accident did not occur through their being ignorant of the presence of gas in the seams.
745. Do you remember an accident happening a year ago in the Young Wallsend Company's Mine? I do not; but I remember an accident happening in the Monk Wearmouth Mine.
746. In your opinion, what was the cause of it? It was apparently, from the evidence, that the opening of a door by a surveyor for the purpose of making a survey prevented the current of air from passing round the brattice in certain places. The door was closed afterwards, and shortly after that an explosion took place. That indicated that gas had accumulated in a working place where the brattice was on, but into which the air did not pass. As soon as the door was closed the gas was carried on by the current of air as it resumed its former course, and was taken to where men were working with naked lights.
747. Being acquainted with the strata of the Northern District, you are aware that there is not much trouble in making good air-ways there? I should consider that the Northern District is very favourably placed for good ventilation, both as regards the size of the seam and the quality of the floor and the roof.
748. It can be done without much extra expense? Yes.
749. You will admit that good ventilation is one of the best things in connection with coal-mining? It is a very important factor in connection with it.
750. Is not good ventilation to the interests of the owner as well as to the miner? I think it is advantageous to all concerned. It means that the horses will live longer, and that they will do better work, and the men also would do better work.
751. Is it not a fact that it keeps the timber and the roof in better preservation? Yes.
752. And if the timber gets rotten, necessarily the roof will come down? That follows.
753. You consider 150 cubic feet of air too much to ask for in the new Bill? You cannot have too much of a good thing; but, with due consideration of expense, and the fact that an extra 50 feet of air really means, in some cases, a great increase in the cost of machinery for supplying it, I think it necessary to make my minimum as low as I can.
754. That is the lowest figure that you would give? Yes.
755. I understood you to say that it is only fair for present managers to have certificates of service if the new Bill becomes law? I consider that if a man has been a manager for twelve months or more he should be considered fit to continue in that position.
756. With regard to inspectors, if a man had been an inspector for a number of years, would you demand a certificate from him? I should give him a certificate of service.
757. You would give him a certificate of competency? It would be equivalent to that.
758. If you were a manager would you object to the inspection of your book of reports if the men were under the impression that things were not safe in the colliery? Certainly not; that is a provision that has been in the English Act for a long time.
759. You believe in that? It is a thing which no reasonable man would object to. I have always found, as a matter of experience that if the men were discontented or alarmed, or suspicious that anything was wrong in a mine, the easiest way to allay their suspicions was to allow them to inspect the book of reports.
760. You believe in that? Yes; but I do not know why anyone should have to get authority from the inspector.
761. That is the only objection you have in regard to the matter? I believe in the workmen having access to the book of reports.
762. The English Act provides for the check-weigher being selected by the men wherever they think fit;—do you believe in that? Yes.
763. Seeing that the men pay him, they have a right to choose whom they please? Yes. I am aware that the objection has been raised that the men would choose an individual who would try to interfere with the business of the company, but I do not think that in general practice the men would do any such thing. What they will require will be a man capable of doing the work. An instance occurred lately in which it would be unfair not to allow the men to select a man outside of those employed in the colliery. A colliery was started in the north, and many of the old men have not been re-employed. If the men wish to select one of those who have been employed in the mine for years past they cannot do it under the old Act. It is unfair that men who have been deprived of their work in the colliery should not have the option of being selected to this post, which should be open to them.
764. Do you think that a certificate of competency ought to be issued to engine-men? For some time past I have been of opinion that they ought to pass an examination, seeing that they have charge of engines, the proper management of which affects the lives of a number of people.
765. Are you satisfied with the age for engine-men prescribed in the English Act, namely, 22 years? I should be satisfied if it were 21 years.
766. *Mr. Edden.*] What is your opinion about the use of automatic appliances for the prevention of over-winding—the use of safety hooks, for instance? Safety hooks prevent over-winding at the top of the pit, but not at the bottom. Scientific opinion in mining circles is in favour of these appliances. The fact that they have been employed in thousands of mines in Great Britain proves that they are generally accepted as a necessary thing. One firm who manufacture these safety hooks have 3,500 of them in use, mainly in Great Britain. I am acquainted with two other firms who manufacture safety hooks of different kinds on a very large scale. The hook I am speaking of is King and Humble's. When you consider the number

Mr.  
G. H. Green.  
29 Mar., 1894.

Mr.  
G. H. Green.  
29 Mar., 1894.

number that the other two firms have supplied, you must come to the conclusion that very nearly all the mines in Great Britain are supplied with safety hooks. This fact is a sufficiently clear index as to mining opinion in regard to their necessity. There has been no compulsion in the matter, yet these hooks have been adopted almost universally. Therefore, I say that safety hooks are a necessary precaution against the raising of the cage to the pulleys. I know that a large number of accidents, which would probably have been fatal, have resulted simply in the cage being detached and left hanging to the pulley frame.

767. An accident happened some time ago in which four men were dashed to pieces, when the Extended Burwood Mine was being sunk? Yes; there was no safety hook there.

768. Had there been safety hooks, in all probability there would have been no loss of life? Probably there would not. These safety hooks have been tested by accidental over-winds, and they have answered the purposes for which they were intended. I only remember one instance in which the hooks did not answer their purpose, and that was a case in which the engine was winding at such a terrific rate that it carried away the wooden framework.

769. These hooks are not very costly? No; they may amount to from £10 to £20 each.

770. You said something to Mr. Cook about skips, that if they were filled above a certain height they had a tendency to break down. Are you aware that at your colliery they cannot fill the skip above 10 inches higher than the side? Yes.

771. And you never heard of it breaking anything down yet? No.

772. And if these skips were filled with stone there would be a ton on them? Yes.

773. So that to talk about a skip being piled up 3 or 4 inches above what was authorised, in order to smash the skip, is a little exaggeration? I never heard of them filling the skips 10 or 12 inches above the side with stone.

774. No; but there would be a ton in the skip if it was full of rock? There would be a very heavy weight in it.

TUESDAY, 3 APRIL, 1894.

Present:—

MR. McCOURT,  
MR. NICHOLSON,

MR. CANN,  
MR. EDDEN.

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. Robert James Jury called in, sworn, and examined:—

Mr. R. J. Jury. 775. *Chairman.*] What are you? A miner.  
776. Where are you working at present? I am out of employment. I was last working at the Burwood Colliery.

3 April, 1894. 777. What experience have you had in mining? I have been twenty-four years working in the mines; twelve years in the North of England and twelve years in the Newcastle District.

778. In what part of the North of England? I have been in several collieries in the county of Durham.

779. And you have worked twelve years in this Colony? Yes; in the Newcastle District.

780. Then you are fairly well acquainted with mining operations in that district? Yes.

781. Have you ever worked in the Southern District? No, nor in the Western District.

782. In your twelve years experience in the Northern District you have seen the working of the various seams of coal to be found there? Yes; I have worked in three or four collieries in the Northern District.

783. At present I believe you are preparing for an examination in mining? Yes; I have been attending a course of lectures on mining for fifteen months.

784. Have you received any certificate as a student? Yes; I passed with honours for the first year.

785. You are acquainted I suppose with the Act of 1876? Yes; I am fairly well acquainted with the Act at present in operation in this Colony.

786. I suppose you have seen mines ventilated in different ways—ventilation by splits, and also ventilation in one current? Yes; but I do not consider it would be practicable to ventilate a mine of any extent with one current. That can be done advantageously only in a mine employing a small number of men.

787. You mean safely? Yes; and economically.

788. You think that a mine cannot be well ventilated where there is bord and pillar with the current going right round? Not economically. It might be done at an enormous cost.

789. I suppose you know that it was done before the system of splitting was invented. I have learnt from reading that formerly it was the custom to conduct the ventilation in that way, but the system of dividing the air into splits has now become general.

790. Sub-clause 3 provides that there shall be a minimum quantity of 100 cubic feet of air. Do you think that is sufficient for sanitary purposes? I should be strongly in favour of striking out the 100 cubic feet and substituting 150 cubic feet.

791. Do you think that 100 cubic feet is not sufficient to maintain the health of a man? No; I should prefer to see 150 inserted in its place.

792. I suppose that being a student of mining you know that there are other quantities put down as sufficient for sanitary purposes? All the highest authorities which I have read on mining ventilation state that upwards of 100 cubic feet per minute per man is required to keep a mine in good sanitary condition.

793. Have you read William Hopton's Work? Yes; Mr. Hopton states that he would allow 100 cubic feet per man, and 1,000 cubic feet per horse per minute.

794. I suppose you know that a lighted candle or lamp—any artificial light—consumes a certain quantity of oxygen? Yes, and produces carbonic acid gas.

795. What is your estimate of Mr. Hopton? There are works on mining which I have studied much more closely than Mr. Hopton's. Although he is considered a pretty high authority, I believe there are others who stand higher in regard to ventilation.

796. Do you think that Mr. Hopton is a competent authority as to the quantity of air required to ventilate a place? I should be prepared to take his statement on that, because it is borne out by so many high authorities.

797. Does he say that any ventilation should be allowed for lights? Mr. Hopton states that a candle requires about the same amount of air as a man. He was asked this question: "How much air per minute does

does a man require? He requires 100 cubic feet, a candle requires about the same quantity, and a horse 1,000 feet, or ten times that of a man." I should consider that the kind of lights that we use in this country will consume much more oxygen than an ordinary candle.

Mr.  
R. J. Jury.  
3 April, 1894.

798. I suppose Mr. Hopton is a certificated colliery manager? Yes.
799. For the services he has rendered the mining community, did he not receive a pension from Her Majesty? Yes; and his services have also been recognised by the working men of the district in which he lives, those men having made presentations to him.
800. What did he receive the pension for? For his distinguished services.
801. He has received that pension for distinguished services rendered in connection with that branch which he has written about? Yes; he has made a speciality of that particular branch.
802. Do you think that without some artificial means air can be propelled up to the face? I do not think it can.
803. What would you do to get the air to the face? There is only one practical way, that is to conduct it by means of brattice.
804. Canvas cloth? Yes.
805. You say that the best way to conduct the air to the face is to take it by brattice? That is the only effectual way that I am aware has ever been put into practice. When it is known that the face of a working place is gaseous, the manager will generally see that the air is conducted thither by means of the brattice. The current goes up one side of the brattice and returns on the other.
806. It appears then by that that you make the intake and the return by brattice? Yes; it would be necessary to do so in order to obtain a current.
807. But would not that be very expensive? I should not consider the expense worth mentioning.
808. What do you think the expense would be? For a new brattice cloth for every bord, I should consider that it would come within one penny per ton.
809. Have you ever seen this brattice? Yes, and put it up many times.
810. Does it rot very quickly? I should say in an ordinary pit the life of a brattice would be from two to three years. Of course much would depend upon the usage it would get—the care taken in its manipulation.
811. I suppose also on the ventilation given to the mine? Yes. All material will last longer in a well ventilated mine than in an ill ventilated mine.
812. Are we to understand from that that the workmen would last longer in a well ventilated mine? Yes, decidedly so.
813. And horses? Yes.
814. And the timber? Yes.
815. All perishable material will last longer with good ventilation? I think so.
816. *Mr. Cann.*] The canvas or brattice is shifted over and over again, is it not? Yes. With ordinary care brattice cloth should serve two or three bords successfully. There is nothing to stop the same brattice which serves for ventilating a bord from being used for ventilating a pillar when it is being extracted.
817. How long does it take, under ordinary operations, that is, provided the mine is working regularly, to drive a bord? A great deal would depend upon the height of the seam and the width of the bord.
818. I suppose the average is about 5 feet? From 5 to 6 feet might be taken as a fair average.
819. Where the height is 5 feet, how long would it take to drive a bord? Roughly, I should say from three to five months, assuming the distance to be 35 yards.
820. That canvas then would last two or three years, that is to say, the same piece of canvas would do for about half a dozen bords? Yes; about that.
821. *Chairman.*] Did you ever buy any of this brattice? Yes; I have bought it for use, and I have priced it to get information.
822. Then you have priced it in this Colony? Yes.
823. Have you got a sample with you? Yes; I produce a sample. It is a piece of ordinary brattice cloth.
824. This is what is used for taking the air up to the face? Yes.
825. What is the price of that brattice? I can get that delivered at 7½d. per square yard by taking a roll containing about 100 yards.
826. What would you get a single yard for? I could not say. No one would want such a small quantity as that.
827. If an expert were to say that it would cost 3d. or 3½d. per ton of coal to brattice to carry the air up to the face, what would you say to that assertion? I should consider that he was drawing the long bow—exaggerating.
828. You would think he would be buying it in single yards to cost that? Yes.
829. You say that by the roll of 100 yards the price is 7½d. per square yard? Yes; but anyone buying a large quantity would get it about 6d. per square yard, I have no doubt.
830. Taking it at its highest rate it would not cost more than 1d. per ton on the coal to brattice a mine? No; that would include the labour in fixing as well.
831. You are well acquainted with the Coal Mines Act of 1876? Yes; I have given some time to the study of its provisions, and also to the working of mines under that Act, in the district in which I live.
832. Perhaps you could point out some of the defects in the Act? The first thing to which I should like to draw attention is somewhat outside the Act. It is the great amount of dissatisfaction there is in the Northern District in the manner in which the reports of the Government Inspectors are kept secret from the miners. The miners contend that no one can possibly have a better right to know about the state of the mines than themselves, whether in regard to safety or sanitation. For my part, I quite agree with that. I think it is unreasonable and unjust that the reports of the Government Inspectors should be withheld from the very men in whose interests the inspectors are supposed to act. There is probably nothing in the whole administration of the Act that gives more general dissatisfaction, or is looked upon with more distrust than the secrecy about the reports of the Government Inspectors. I will refer to clause 8 of the Act, which says:—

No male person under the age of 13 years and no female shall be employed in any mine. And no male person between the age of 13 years and 18 years shall be employed in or allowed to be for the purpose of employment in any mine below ground for more than ten hours on Monday, Tuesday, Wednesday, Thursday, Friday, and six hours on one Saturday and eight hours on the next Saturday.

Mr.  
R. J. Jury,  
3 April, 1894.

I think that 13 years ought to be struck out and 14 years substituted for it. I think that 14 years of age is quite young enough for a boy to commence working in a mine. We ought to give the boys the fullest opportunity to benefit by our system of public instruction, and I believe that the extra year will be a great boon to the boys who have afterwards to earn their living working in the mines. I believe that during that additional year, a boy would be likely to learn more from 13 to 14 years of age than he learned in any two years previously. I am also of opinion that ten hours is too long for a boy to be employed in a mine. I should be strongly in favour of striking out the ten hours and substituting the eight, as I consider that quite long enough for any person to work in a mine, especially a boy. I consider that it is a standing disgrace to the men of any district, or any part of the world where they have taken care to shorten their own hours of labour, to allow boys to work so many hours in the mines. I am given to understand that at one of the collieries in the Northern District they have commenced to wind coal for ten hours a day, and that in all probability will mean that the boys will be down in the pit for eleven and a half hours a day. I consider that is far too long for any boy to be in a mine, or any man either. The miners of the Newcastle District are strongly in favour of the eight-hour movement. They all take part in the annual eight-hours gathering, and they send representatives to every lodge in the district.

833. Are you sure that the miners in the Northern District have asked for the eight-hours system to be legalised? I know they are all in favour of the principle.

834. Why? Because they send their representatives to the Eight-hours Committee; they take part annually in the Eight-hours demonstration, and they have required their Parliamentary representatives to pledge themselves to support the eight-hours movement. I cannot say positively that they have ever asked for the inclusion of the principle in a Bill, but I feel tolerably certain that they have. I may say that I do not attach a great deal of importance to the shortening of the hours of adults by legislation. They ought to be in a position to shorten the hours for themselves. But the boys are powerless, and I think that their interests ought to be safeguarded.

835. *Mr. McCourt.*] If the boys left the mine after they had worked eight hours, the men would not be able to work more than eight hours, would they? The men might work after the boys had left.

836. I think you said you did not believe in eight hours for the men? I think the miners ought to be able to obtain that for themselves without legislation, although I believe that in the present pitiable state of affairs they are hardly able to obtain anything. I should not be surprised in the near future to see an attempt made to encroach upon the mutual understanding which there is to work eight hours a day in the Northern District. There are indications that that is soon going to be encroached upon.

837. *Chairman.*] Then one reason why you wish a law to be passed on the subject is to prevent this agreement from being broken when strife would commence over the attempt to lengthen the working day? I feel it to be a degradation to admit it.

838. You cannot understand men agitating for the shortening of hours of labour and yet allowing the boys to work longer? I think it is anomalous.

839. Is it not a fact that boys require to work longer than the men? It is not necessary at all.

840. Then you would have the men and the boys sent down the pit together and brought up together? There would be greater uniformity and no loss if such a system were introduced.

841. If the boys and the men knocked off together the full and empty skips would be there to start with in the morning? Yes; the pit would commence to wind coal at the hour for starting, and work would be resumed where it was left off.

842. So there would really be no loss in haulage during the day? I cannot see that there would be.

843. Have you given the subject much consideration? Yes; I have given it some thought.

844. Is it not a fact that in some collieries in the Northern District the mines work ten hours? One particular colliery has commenced that system of drawing coal for ten hours.

845. There is what is called a front and a back shift in the Northern District? What is meant by a front and back shift is this—one set of miners go in at 6 o'clock in the morning and knock off at 2 o'clock in the afternoon, that completes their eight hours; the second lot come on about 8 o'clock and work until about 4 in the afternoon. Those are what we call the front and back shifts. It really amounts to this that one-half of the miners start two hours earlier than the others, and knock off two hours earlier.

846. It appears that the hewers work eight hours? Yes.

847. What time do the boys go down? They go down a little before 7 o'clock and they do not cease work until the pit stops drawing coal.

848. What time is that? At 4 o'clock with the exception of one particular colliery, which is drawing coal until 6 o'clock.

849. What colliery is that? The Bullock Island Colliery. They have introduced the practice there lately.

850. Are you sure? Yes.

851. Are you not making a mistake? I am informed by men working at the Bullock Island Colliery that such is the system. I have not been at the colliery.

852. Therefore, the boys are down in the mine from a little before 7 in the morning until a little after 4 in the afternoon? Yes.

853. That is over nine hours a day? Yes.

854. Do they stop at any time for meals? There are generally two breaks; they have half an hour in the forenoon for breakfast and they stop again at midday. In some places there is only one break.

855. You are a working miner? Yes.

856. You are out of employment at present? Yes.

857. Have you any boys nearly able to work? No; my eldest boy is about 9 years of age.

858. Would you like him to start before he is 14 years old to work in a mine? I should not.

859. No matter how bad things were? No; I would try to put up with it.

860. You think boys should get the full benefit of the Public Instruction Act? Yes; I think it will be a disgrace if they do not.

861. *Mr. Cann.*] Do you believe in the inspection of the face before the men commence work? Yes.

862. You think it is a wise provision? I think it is a wise provision, although as a practical man I do not attach a very great deal of importance to it.

863. Is it not possible for a man to go into a face and be unaware of any danger that exists? Yes, there are many

Mr.  
R. J. Jury.  
3 April, 1894.

- many men in the mines who have not had much experience and it is necessary that there should be such an examination in their case. It is necessary that the inspection should be made by the deputy.
864. It would be the safest way to treat everybody as inexperienced? Yes.
865. I suppose that the provision would apply better in fiery mines? Yes, although it is necessary in non-fiery mines, because there are other dangers besides the danger from gas. There are those slips, gray-backs where coal is likely to fall away without any warning, dislocations of the strata.
866. Do you think a provision to that effect in the Act would be a wise one? I think it would.
867. I suppose you would also stipulate that the examination should take place within a certain time before the men commenced work? Yes, or otherwise it would be practically useless. It should be near the time when the men have to commence work.
868. How long before the men commence work? Not more than about an hour or so. If the interval between the examination of the place and the miner starting work was a long one, a different state of affairs might arise, which would render the examination useless.
869. Then, in order to be sure that that examination had taken place, you would make provision for some record to be kept of it? Yes.
870. What is the method ordinarily adopted? There is no recognised method as far as I am aware. The deputy makes a practice of putting the day of the month on the shovel or perhaps on the coal face.
871. I suppose that is for the guidance of the men going to work in the face? Yes, he knows then that the deputy has been there.
872. What proof have the owners that the face has been examined? The owner can simply question the person whose duty it was to examine it.
873. Have you ever worked in mines in the old country? Yes.
874. I suppose you know that there a set of books are kept in which the deputies have to make entries every day? Yes, they have to keep a record of the state of the mine and the number of men working in it.
875. They do not do that here? No.
876. Do you think it would be wise to make provision in the Act for it? Yes; it would be all in the direction of securing greater security.
877. You said just now that the inspectors' reports are kept secret;—do you mean by that the men are not able to find out what the reports contain? They never get to know what the reports contain. The Government Inspector goes round the mine, goes to the face, then goes away.
878. I suppose the Government Inspector would send his report to the Mines Department? Yes.
879. Not to the office at the mine? No.
880. What is the reason that these reports cannot be made available? I suppose it is the system of the Department. The Inspector considers he is directly responsible to the head of the Department and not to the miners at all.
881. Do you know of any case in which any application has been made for any of these reports and has been refused? I cannot specify any particular cases, although I believe there have been such cases.
882. I suppose that if the Government Inspector reported that a mine was dangerous, and the men did not know of his report they would be working in danger without knowing it? Yes, if such was the case; but I think that if any inspector went that far he would let the men know by some means, or the manager would.
883. All coal-mining is dangerous, more or less? Yes; it is a matter of degree.
884. I suppose the danger with ordinary precautions may be avoided, whereas with indiscretion it would be a very great danger? Yes; that holds good with regard to every calling, accidents may, in a great number of cases, be averted with an ordinary amount of care.
885. Are you aware that all these reports are published in the annual report of the Mines Department? The whole of them.
886. All the reports with regard to accidents? That is probably eighteen months after the occurrence.
887. Do you think it is necessary to have any provision in any Mines Regulation Act with regard to the size of the return? I think that the return should be kept in a good state of repair, so that in case of emergency the miners could travel out by it.
888. You do not think that the return should be left to the tender mercies of creeps or falls? No; it is absolutely essential that the return should be in a good state of repair, because the whole of the air from the mine has to return through that air-way.
889. Then, on these grounds you would stipulate for a definite return; you would not allow the air to find its way, perhaps, along a short length of return at the shaft end of the mine? I should specify that the return be kept in a good state of repair, and that the men should be conversant with it.
890. I suppose it would be necessary to have it a reasonable size for the good ventilation of the mine? Yes; a very great deal depends upon the size of the air-way.
891. What size do you think a fair size? A great deal would depend upon the extent of the colliery. What may be a reasonable size for one colliery may be small for another.
892. I suppose it would be wise to stipulate a minimum size? I think a manager who knows his business, and serves the interests of his employer, will attend to that.
893. Is it not a fact that managers sometimes do not get their own way? Yes.
894. You would leave it to the inspector to say what the size of the air-way should be? I should be in favour of including in the Bill provision to the effect that the return air-way should be kept in thorough repair, so that in case of an accident the men could return by that road.
895. I suppose that in any well-regulated mine, the return is examined at set periods? It is supposed to be.
896. I suppose you think it would be dangerous under ordinary conditions for the up-cast shaft to be the hauling-shaft and the main travelling road? I should not be in favour of making the return a travelling road under ordinary circumstances, because the return air is loaded with impurities. I should insist that in a case of emergency the return air-way should be in such a state that it could be travelled, because accidents have been averted through men being able to get out by the return.
897. I suppose that where the hauling-shaft of the main travelling road is used for both the return air-way and the up-cast shaft, it would be easy to alter that, and make it a down-cast? No; it would not be very easy; it would probably mean considerable expense. The down-cast shaft might be so situated in point of elevation, that it would very materially affect the ventilation of the colliery being turned into an up-cast.

Mr.  
R. J. Jury.  
3 April, 1894.

898. I suppose that an ordinary furnace stack would alter the current of air, would it not? Yes; but in one case you might have natural conditions operating against you, and in another you might have them in your favour.

899. That is in reference to the point of elevation? Yes.

900. I suppose that, under ordinary circumstances, the elevation could be got over by a stack? Yes; it could all be overcome; but I must confess that I scarcely see the utility of changing the ventilation of the mine.

901. I suppose that if a mine were a main travelling road, and the ordinary shaft the up-cast shaft, and that shaft were to cut a blower of gas, all that gas would have to return by the main travelling road in the up-cast shaft? Yes.

902. In that case there would be greater danger than there would be in a mine working with a definite return clear of the travelling? Yes; but I may observe that it is very seldom that an up-cast shaft is a drawing shaft.

903. I suppose you will be surprised to hear that some of our collieries in this Colony are now working under that condition? I should consider that it would be very inconvenient.

904. In fact a great risk to run? Yes; I should consider it very inconvenient; it would be much more advantageous to make the drawing shaft the down-cast.

905. *Chairman.*] Under the circumstances which Mr. Cann has just pointed out, the up-cast being the hauling shaft, what sort of ventilation will you have on the main travelling road? The ventilation will be bad. The air would be loaded with all the impurities of the mine.

906. And therefore, under such circumstances, it would be impossible to have a furnace where it was discharging gas? Where gas exists in a mine, and furnace ventilation is in operation, it can be provided against by means of a dumb drift.

907. But if, as Mr. Cann says, the up-cast shaft is a winding shaft, and the main road is a return airway to the up-cast shaft, how is it possible to put a dumb drift there? In that case you would be some distance back from the up-cast shaft. You would divert the main current, and only let a small scale of air go through. But it would be very inconvenient indeed to have a drawing shaft in an up-cast, and it would be considered very bad management.

908. It would be bad management in your opinion? Yes.

909. You do not think, then, that a man who thoroughly understands his business, and cares for the interests of the company and the lives of the miners would do such a thing? I do not think that a man who is laying out a colliery would do such a thing; but a man might take a colliery which is already laid out, and he might have to make the best of it.

910. *Mr. Cann.*] I suppose that where there is a dumb drift, it is possible to ventilate the colliery from the main shaft with fresh air? Yes, usually.

911. That is usually adopted as the method of ventilating the fire? Yes.

912. It would be insecure to let the air from the return go to the furnace? Yes.

913. In reference to the size of the pillars, do you think it would be wise to provide for a minimum dimension of the pillars? Only in cases where they are working under tidal waters.

914. You would not interfere except in cases where they are working under tidal waters? Only where they are working under tidal waters.

915. I suppose the collieries are sometimes pressed for coal? Yes.

916. And sometimes short of places for men to work in? That may occur at times; but not in a well-regulated colliery.

917. Might it not occur in the case of a new colliery being opened? Yes; it might occur there.

918. They might be fast for places? Yes.

919. Then it is possible to have the bords very close to each other? It is possible; but so many managers have seen the folly of that system, that I do not think it is likely to occur again.

920. I suppose you would consider it eminently dangerous if the bords were rolling into each other before they got the full length of their pillar? Yes.

921. Would you be surprised to hear that that has occurred? I believe it has occurred in several collieries.

922. And you understand the danger of that? Yes.

923. Do you think the danger such that we ought to provide in an Act of Parliament for the thickness of the pillars, or the distance between the bords? Probably there has already been a distance stipulated, and it has been ignored. It is simply a reflection on the management of the colliery that such a state of things should exist. No doubt perhaps 4, 6, or 8-yard pillars were supposed to be left, and the miners have been allowed to encroach, to widen out on both sides, and knock through. Such a state of affairs would be highly reprehensible from any standpoint.

924. I suppose you agree that an Act of Parliament that provides for the security of the employees should not take into consideration the dignity of the manager? I suppose not.

925. Would it not put the owners of the mine in a better position to be working under a good Act of Parliament, instead of being left to exercise their own discretion? I consider that all mining legislation so far has been in the interests of the capitalists, although they are often slow to recognise the fact. The stipulations in regard to splitting the air, and all these sort of things are actually in the interest of the mine-owner, because they ensure that the mine shall be ventilated well and economically, and more effectually than could be done under the old system.

926. And at the same time it preserves their property? Yes.

927. I suppose that what would be considered dangerous by one manager would be considered secure by another? Yes. There may be a difference of opinion, but the state of affairs which you have just mentioned often comes about by neglect. The manager deposes his authority to some one under him, the under-manager or over-man, and probably the over-man neglects his duty, and so on.

928. Then, in that case, if an Act of Parliament stipulated a minimum size it would be the duty of the Mining Inspector to see that the provisions of the Act were complied with? Yes.

929. Thus affording greater security to the employees of the mine? Yes; it would ensure greater security to both employees and employer.

930. I suppose that a mine generally works ten hours, although the coal-hewers only work eight? It is pretty well an established custom that the shaft draws coal for eight hours only, with only one exception in

in the northern district. Of course the miners go into the pit and commence the work of getting the coal ready before the pit commences to draw coal. In that sense the miners are working longer than the pit.

Mr.  
R. J. Jury.  
3 April, 1894.

931. They commence earlier and knock off when the pit knocks off? Just about the same time.
932. I suppose they go in to get coal ready for when the mine starts hauling? I think it is to allow for the two shifts. One man works by himself two hours, then his mate comes in, then the man who comes in first leaves two hours before the second man. I do not think that there would be any loss entailed if the two men were to go in together.
933. You say you have not worked in the other districts? I have not been to the southern or western districts.
934. *Mr. Nicholson.*] Have you worked in mines in the Old Country where brattice was generally used for conducting the air to the working face? At one large colliery the air was kept up to the face, but it did not necessitate brattice, because it was being worked upon the long-wall system; but where it did require brattice, the brattice was kept right up to the places.
935. You have never worked in a mine on the bord and pillar system where brattice has been used for conducting air up to the face? No; I have never seen brattice in any case right up to the face.
- 935½. Do you know that it is the general custom to have mines in the Old Country so ventilated? I believe there are mines where that system obtains.
936. Do you think it possible to get the air round the face without provision for sufficient brattice to turn the air from the cross-cut up to the bords? I do not think we shall ever have the working places ventilated until we adopt some means to convey the air into the working face. The air at present goes past instead of going into it.
937. And the means that you suggest is bratticing? Yes; bratticing. A better system could be brought about by shortening the distance between the cut-throughs, or by conveying the air in by brattice.
938. *Mr. Nicholson.*] Which system do you consider best in the interests of the mine-owner, and also in the interests of the miner—to shorten the distance between the cut-throughs, or convey the air to the face by means of brattice? That is a question requiring a great deal of thought. I should be in favour of adopting both these means. I should be in favour of shortening the cut-throughs and conveying the air to some extent up the bords. Of course as a miner, I should say as long as the air is brought to me, I do not care what means you adopt. I want it to go into the working face.
939. Have you ever thought the matter out as to what the increase in the cost of production would be if the bratticing system was carried up to within 15 feet of the working face? I do not think it would entail a cost of more than about 1d. per ton.
940. Do you think that such a system would preserve the interests of the mine-owners as well as of the miners, and would it not in many instances save a large increase in cost to the mine owners; in such cases as the accident at Lithgow, the accident at Newcastle, and another at Bulli;—suppose all these could have been prevented by the system of ventilation, do you not think that by making such provision the mine-owners are safeguarding their own interests? Yes; I consider that if the mine is kept in a better sanitary state it is to the interests equally of the miners and mine-owners.
941. You have already stated that under the present system of ventilation, the air is simply conducted by the in-take, and makes the circuit round to workings without ever touching the working face? Yes.
942. And this is where the air is wanted for the miners? Yes.
943. And it is necessary where there is gas in a mine? Yes; I can remember firing shots in a bord and the smoke of the powder would remain there for hours. Such a state of things could not exist if the air was conducted into the working face. The air would sweep out that smoke in a few minutes.
944. Referring to the question of Mr. Cann with regard to using the return air-course as a travelling way, I wish to ask whether in the mine where gas is generating, you consider it safe for a travelling way with naked lights? I should not consider it safe for naked lights to be used at all where there was gas.
945. Have you known them to work with naked lights where gas is generating from day to day, and felt perfectly secure from the fact that the fireman or deputy being round there while gas was generating but not sufficient to do you any harm? I should consider that if a mine were giving off inflammable gas lamps ought to be used.
946. In every case? Yes.
947. Do you not think it is a serious detriment to the miners to have to work with a safety lamp? Yes; but if gas is known to be given off, it is a necessary precaution.
948. Where it is necessary to ensure the safety of the miner, do you think the miner deserves to be better paid when he is working with a safety lamp than when he is working with the naked light? Yes; it is certainly a great disadvantage having less light.
949. Have you ever been working in a mine where a certain allowance was made as compensation for working with a safety lamp? No.
950. Do you know that any such custom exists in the northern district? I do not know of any such custom in the northern district; but I understand that such a custom does obtain in collieries in the southern district.
951. What amount would you consider a fair compensation for using the different lights—how much per ton extra? I should scarcely be prepared to answer that question. I should want some thought, and probably should have to ask for some advice in the subject.
952. With regard to the eight hours' system, do you think it is necessary at all, under any circumstances, that a man should be asked to work more than eight hours a day? I do not consider that it is necessary. There is an abundance of surplus labour in the Colony.
953. If the eight hours' system would be favourable to the absorption of a certain amount of this surplus labour, would it not be still better if we adopted six hours? Yes, from a socialist's standpoint; but I suppose that the Parliament of this country does not look at things from that standpoint.
954. Looking at it from the economical standpoint, do you not consider that owing to the labour-saving machinery, the increase of population, and the almost abnormally-depressed state of the labour market, such a state of things will have to be brought about? I think it is a disgrace to our civilisation that we have any unemployed; but to talk to a body of capitalists in this way would be useless.
955. When you were working in the old country, was a joint committee of miners and mine-owners in existence to settle disputes? Yes; there was such a system in the county of Durham. I know that there was

was

Mr.  
R. J. Jury.  
3 April, 1894.

was a committee composed of miners and mine-owners to adjust disputes between employers and employees I have only a somewhat obscure recollection of it.

956. *Mr. McCourt.*] You are in favour of the eight hours' system in mines? Yes.

957. Are you in favour of it being forty-eight hours a week, or eight hours for each day? I should be in favour of its being eight hours per day.

958-9. Take a case of this kind: At an Illawarra colliery they have often a steamer waiting for loading from a certain mine; perhaps she may want 100 tons to fill her up, so that she may get away that evening; but if the miners only work eight hours, that steamer may have to stay an extra day there;—would you let her waste another day? We have a system which is a great boon to the worker, and I do not think we ought to set aside that system because of the difficulty with regard to a steamship.

960. Would not forty-eight hours a week be practically the same? It would be nothing one day and twelve hours another day. That would be inserting the thin end of the wedge, and we should soon lose the system altogether.

961. You said that one of the principal things that the miners complain of is that they do not see the inspector's reports? Yes.

962. What do they want to see those reports for? The miners have an idea that the mines are examined for the sake of the health of the men who work in them, but the reports are not made known to them, and that causes them to look upon them with suspicion and distrust. It appears as if the mines were inspected for some other purpose.

963. How often does the inspector inspect the mine? Usually about once in six or eight weeks.

964. I suppose there is quite sufficient time between one examination and another for the mine to be in proper working order, and that it may get considerably out of order before the inspector comes back? Yes.

965. It is sometimes so? I have a suspicion that the proprietors know when the inspector is coming round, and that they are prepared for the occasion.

966. Do you not know, as well as an inspector, when a mine is not in a proper state? Yes, nearly so.

967. Is there any means whereby a miner can make complaint under the present law? The miners possess a power by virtue of the Act to appoint check inspectors of their own—two men to inspect the mine on their behalf, at least once a month. Those men can go round and are entitled to inspect the mine, and enter their report in the book kept at the colliery for that purpose.

968. Would they not be marked men if they did that? That is just where the trouble comes in.

969. Is there no provision in the present Act whereby the miners could make a report to the mining-inspector without the owners knowing anything about it? I would rather have the reports open and above board.

970. If a miner complains that the mine is not in proper working order, is he not a marked man? Yes; but if the Government inspector reports, and if his report is truthful, his report will bear out the report of the miner.

971. What I want to get at is this: would you feel disposed to make a report if you were working in the mine, that the mine was not in proper working order? I have done so when such has been the case.

972. Were you a marked man for it? I rather suspect that I am.

973. I suggest that the miner should be allowed to make a confidential report to the Government inspector without the mine-owners knowing anything about it? I rather prefer the straight course.

974. Of being a marked man? No, not of being a marked man; but I prefer the course of letting everything come to light.

975. *Mr. Nicholson.*] With regard to the English system of settling disputes;—in your opinion should a similar system be better than our present Conciliation and Arbitration Court? I should have good hope of such a system if it is introduced.

976. Do you think that such a system would be a means, if brought into use and made compulsory, of preventing many strikes? Yes; I think that everything is tending in that direction. I think we shall see fewer strikes in the future.

977. With regard to the weighing of coal, do you think the present system of averaging is satisfactory to the men? I should prefer to see every skip weighed.

978. Would it be a serious cost to the mine-owners to provide for the weighing of every skip? There are mines in England where they draw more coal than any of the mines here, and they weigh every skip.

979. Also in America? Yes.

980. Do you think it is really the only fair way by which miners can get the value of their work? I think it is the most just and equitable way of dealing with them.

981. In regard to the miners appointing a check-weighman, according to the old Act they have to employ a man who is working at the colliery;—don't you think they should have the right of employing whom they think fit? Yes; it is unreasonable and unjust that any body of employers should veto the free choice of the men, or have the power to say whom they shall or shall not employ. If the check-weigher misconducts himself, or impedes the working of the mine, the employers can obtain redress, and that ought to be all they should expect. I think there ought to be no limit to the choice of the men. They have to pay, and they should have a free choice in selecting their men.

982. With regard to the standard-weight system, do you not think it is wrong that there should be such a thing as a standard weight; that if it is necessary to limit the size of the tubs, it should be in the height of the skip, rather than in the weight of the coal? There are two systems in vogue; one is the standard height, and the other is the standard weight. Of the two, I think the standard height is the more just and the more equitable.

983. And the least objectionable? Yes, because a man can with reasonable precision tell exactly how high he is filling his skip; but it is not possible for any man to tell how heavily he is loading his skip. The standard height is fixed by a bar over the top of the skip, and where that is adopted, a miner who fills his skip too high, and where the money for the skip, although lost, goes to the sick or accident fund, I do not see that any great hardship is entailed. But it has a semblance of meanness if, when a skip is lost to the miner, the company get the value. If the company allow the money to go to a local fund, it shows that they are acting *bona fide*, and that all they want is to insist on strict discipline.

984. Mr. Cann asked you a question about the pillars; do you not think it is necessary that the minimum size of the pillars should be fixed by legislation? It is necessary that there should be a minimum size; but

but whether the legislature is the proper authority to fix that, I am not prepared to say. I think that with more scientific management we shall probably have not so much complaint on that score in future as we have had in the past.

Mr.  
R. J. Jury.

3 April, 1894.

985. Then you believe it is in the interest of the mine-owner to leave good strong pillars between the working places? Most certainly. It is in the interest of the mine-owner because it safeguards his property; and it is in the interests of the miner because it safeguards his life.

986. Do you not think it is necessary to have still thicker pillars under tidal waters? Yes; increased vigilance will be required to be exercised in collieries working under tidal waters.

987. With regard to the appointment of mining managers, do you think it is necessary that they should hold a first-class certificate before being allowed to take charge of the mine? I do think so.

988. What class of certificate should the underground manager have? There ought to be one class of certificate for the manager, and another for the under-manager.

989. I suppose you are well acquainted with the standard weight system? Yes.

990. I believe you were manager of a colliery for a time? For a short time. I only held the appointment temporarily.

991. You understand the working of the standard weight system? Yes. It means that the manager of the colliery says, "I will not pay for more than 12 cwt. for each skip, and if you fill above that you will lose it."

992. You believe in the standard height? It appears to me that it is reasonable that a manager should have a right to say how high the skip should be loaded.

993. But after the manager has said that, you believe that the men should be paid for what they send out? Yes; but I think the men ought to see that they do not overload the skips.

994. I suppose your experience in mining teaches you that in the same bord one facing of coal may be much lighter than another. If a skip were filled 10 inches above the side with soft coal it would be lighter than one filled 10 inches above the side with another kind of coal? No man can depend upon filling regularly. He may fill approximately, but not within (say)  $\frac{1}{2}$  cwt. of the fixed amount.

995. To put the thing in a nut-shell, you believe that the manager should have the power to say how high the skip should be filled, and that the standard weight should be abolished as long as they have the standard height? Yes; I think it would be less objectionable for it to take the form of a standard height. A man can tell the height that he is filling a skip, but he cannot tell the weight with any degree of precision.

996. I suppose you have worked at mines even in the north, where there has been a standard height? No; I have not, but I understand that the system obtains.

997. There are places where, if a man filled his skip 8 inches above the side, the coal would be thrown off? I have it on good authority that there are several collieries in the Newcastle district where the men are only allowed to fill to a certain height, and if they fill above that and the coal strikes the bar, the man loses that skip. They have that system at Stockton, Wallsend, and at the A.A. Company's mine. But the money does not go to the benefit of the company, but to the benefit of the general body of men, and under the circumstances I do not think it is any hardship.

998. Did you ever know men to be so foolish, that if they could fill the skips as they liked, they would load them up to such an extent that they would tear the main roads to pieces, and destroy the machinery, and they would lose the coal? I do not think the men overload the skips with that object. It is circumstances which induce them to overload. They want to get up to a certain weight, and, in their anxiety, they go beyond what is allowed.

999. In reference to the size of the pillars, you said you thought there could be a minimum, but you did not think it should be left in the hands of the legislature to say what it should be? I think the legislature should not exercise that power.

1000. Who do you think should? I think that experienced men on both sides should have a voice in it.

1001. What do you mean by both sides? I mean on the side of the proprietors and on the side of the miners.

1002. Do you think it ought to be left in the hands of the Government inspector and the managers? I should like experienced men from amongst the miners to be consulted on these points, and I hope that that will be done in the future.

1003. Some men appointed by the miners? Yes; and the manager and owners certainly should have a voice in it.

1004. You are aware that under the present Act, if an inspector went into a mine and saw a place that was dangerous, he would have no power to withdraw the men? I think he notifies to the manager that there is danger, and I believe he can demand the withdrawal of the men.

1005. Do you think he ought to have the power to withdraw the men if he goes into a place and finds that it is dangerous? I think he ought to have that power, and if an inspector has not that experience that would justify that power being reposed in him, he is not fit for his position.

1006. Objection is taken by some to the automatic appliances to prevent over-winding, what is your opinion on that point? I consider that they are a great safeguard, and a very necessary appliance. They are coming into greater use every day.

1007. And you think they ought to be used? I do.

1008. And that they could be used without being in any way detrimental? Yes.

1009. And the cost is not much? It is very trivial.

1010. How far in the bord and pillar system, away from the working face, may a current of air pass, in your opinion, and maintain a safe atmosphere to work in, where blasting is going on; how far is a bord capable of going before air should be turned into it? A great deal depends upon the current going into the heading. If there is a powerful current going into the heading, a certain proportion of that will find its way into the bord; but if there is only a weak current circulating, little or none of it will go in. I am in favour of the air being conducted into the bords. It is not safe for it to go past the bords, because, as I have stated, I have known cases in which shots have been fired in the bords, and the powder smoke has hung about for hours. That could not exist if the air was circulating in the working place.

1011. You do not think it is possible for the air to strike 20 yards up a bord, even if there is a good current, considering that the bord entrance, as a rule, is choked up with dirt? It would only be a very weak circulation that would circulate 20 yards under the condition you name.

1012. Not enough to work in? I do not consider it would be.

1013. How would you remedy that? I would have the air conducted in by brattice.

1014.

- Mr. R. J. Jury.  
3 April, 1894.
1014. It has been stated that that would put an extra charge of 4d. per ton on the output? I consider that a misstatement.
1015. What, in your opinion, would it cost? I think it would be less than 1d. a ton.
1016. There was an amendment inserted in the Coal-mines Regulation Bill in the Assembly, to the effect that the air should be conveyed within 15 yards of the face by brattice or otherwise—do you think that an arbitrary provision? I think it a very reasonable provision. If the miners' representatives were satisfied with that, I think it is very reasonable indeed.
1017. Do you think the ventilation, as carried out in these collieries, is injurious to the health of the miners, and that it needs improvement? It is certainly detrimental to the health of the miners, when they have to work in a foul atmosphere.
1018. With regard to the power of inspectors to withdraw men in case of danger—if an inspector had gone into the A. A. Co.'s mine before the accident happened, and he had had the power to withdraw the men, and he had done so, those lives would not have been lost? No.
1019. You agree that the inspector ought to have that power? Yes. I was under the impression that he had it.
1020. Is there anything else you would like to mention in connection with the better management of mines? As regards the appointment of check inspectors, I think there ought to be no restriction of the choice of the men of individuals to carry out this work.
1021. You mean to look after the condition of the mine? Yes. If Parliament is in earnest that this work should be carried out it ought to put no unjust or senseless restriction on the choice of the miners. If the Government introduce any restriction at all in regard to this matter it ought to be in the direction of insisting that the miners should only appoint fearless and fully qualified men to discharge the duties.
1022. You think the men should be qualified to do the work? Yes.
1023. And how would you ascertain whether they were qualified? By some form of examination. The miners ought to see to that, and if they do not, in the interests of the miners, the Government should see to it. Hitherto the miners have not seen fit to make provision to ensure fit men being chosen, and the consequence is that the office is fast falling into contempt. If the miners of the district thought fit to appoint two men to do all the check inspection in the district they ought to have that power.
1024. I suppose you know that under the Act of 1876, there is no provision for certificated colliery managers? Yes; I am aware of that.
1025. Have you read the English Act? Part of it. I am aware that under the English Act it is necessary for a manager to have a certificate.
1026. Is there any other stipulation in reference to certificates under the English Act? Yes; with regard to under-managers.
1027. And according to your evidence there ought to be provision for check inspectors? Yes; I think it is merely an expensive farce unless the check inspectors possess the necessary qualifications to discharge the duties.
1028. Are we to infer from what you say that the appointment of check inspectors up to the present time has been a farce? I do not go that length, but in many cases I believe it is a farce.
1029. How is that? Because in many cases incompetent men are appointed, and furthermore, there is a reign of terror at present in the northern district—men are afraid to state the truth.
1030. *Mr. Edden.*] Why? Because they are afraid they would be singled out, and that they would be unable to get work if they dared to speak the truth.
1031. *Chairman.*] Do you think that a large number of check inspectors in the district in which you have had experience have been incompetent? Many of them.
1032. If a Bill was introduced into the legislature you think that provision ought to be made for a manager to have a first-class certificate, an under-ground manager a second-class certificate, and for check inspectors to have certificates? I should prefer to see the matter of competency on the part of check inspectors looked into by the miners themselves, but failing that, I think it is the duty of the legislature to see to it.
1033. Do you not think then, that men who are responsible to a certain extent for the safety of the mine—the deputies or firemen—should also pass an examination? Yes; I was about to observe that deputies and firemen should possess certain qualifications because they are the representatives of the manager or over-man in his absence.
1034. They should thoroughly understand the gases and so forth of a mine, and be able to master them? Yes; I think they ought to pass some examination as to fitness.
1035. I suppose you consider that an inspector should have a certificate of competency? Yes.
1036. With regard to management, I suppose you are not acquainted with the British Act of 1872? No.
1037. I suppose you know from experience that when that Act passed, a number of men received what they called service certificates as managers? I know that such is the practice.
1038. You would not be against the introduction of such a provision in any new Bill to give managers who have had experience certificates of service? It would depend upon the length of service. I do not think a very short service should entitle a man to a certificate. But if a man had charge of a mine for two or three years, and had discharged his duty efficiently, I think that that ought to entitle him to a certificate of service.
1039. And that would be equal to a certificate of competency? It would scarcely be regarded as valuable as a certificate of competency; but it would entitle the men to hold the position.
1040. I suppose you are not aware that these certificates of service were looked upon as being as good as certificates of competency in England? I cannot say that I am aware of it.
1041. Do you believe that an inspector who has been some years an inspector, should also have a certificate of service? I can hardly conceive of a man discharging the important duties of an inspector for a number of years, and not being able to take a certificate of competency.
1042. I suppose you are well acquainted with the northern district? Fairly well.
1043. You expect all miners, I presume, to be able to say whether a mine is safe or dangerous? I am afraid that that could not be said of all the miners; but even though a miner knows that a mine is dangerous, he is so anxious to push on with his work that he neglects certain precautions and accidents happen.
1044. If there was a certain outburst of gas in one of the mines in the northern district, you would not like to leave your life in their hands? I should not.

1045. I suppose it is a fact that some miners have never met with gas? I quite believe that there are some who have not been out of the Newcastle district, and comparatively speaking, we do not know what gas is there.

Mr.  
R. J. Jury.

3 April, 1894.

1046. But there has been an explosion or two in that district? Yes.

1047. Which occasioned a loss of life? Yes.

1048. That being so, I understand you to say that all miners are not proficient, though they may be very good hewers of coal? The same may be said of any body of men, and it holds good, of course, as regards the miners.

1049. You would like a competent man to be appointed, not a man merely from his knowledge of hewing coal? I should like to see every man thoroughly competent to discharge the duties which he undertakes, no matter what those duties are.

1050. Then you will admit that some miners are really not competent judges as to whether a mine is safe? Of course I must admit that there are many miners who would not be competent.

1051. *Mr. Edden.*] How could he be a competent miner if he could not tell whether the mine was safe? We understand by a miner a man who gets coal.

1052. You do not know many competent miners who are not able to tell whether a mine is safe or not? The question asked was not whether a competent miner could tell.

1053. *Chairman.*] I suppose that since you became a student you know a great deal more than you ever knew before about mines? I hope so.

1054. Before you commenced the study of the theory of mining, you thought you were efficient? No matter how much a man knows of the theory of mining, we must not underrate the practical part.

1055. Before commencing the study of mining you were under the impression that you knew a great deal about mining? I could not answer that question.

1056. You have found out since you commenced the study of mining what a great deal there is to learn about mining? Yes.

1057. Which you did not know before? No.

1058. From your knowledge as a student, you would not like to allow a large number of men who were hewers to cope with a sudden outburst of gas? No, I would not.

1059. So that really there are some men working in mines who are incompetent, though they are good practical miners, to judge as to the dangers of mining? Yes; they have never had an opportunity to acquire the experience.

1060. You say that you came from Durham? Yes.

1061. What system have they there in connection with the weighing of coal? Where I worked they weigh every skip.

1062. Were there large collieries there? There were some very large ones. I worked at the Monk Wearmouth, a very large colliery.

1063. And there was no difficulty in weighing the coal? No.

1064. Then if the miners of any colliery where you worked demanded that every skip should be weighed, you would not think it unfair? No; I should think it perfectly just.

1065. If every skip was to be weighed, do you think that the men would not be so anxious about piling up their skips? The reason that the skips are overloaded is, probably, that there are few skips going, and the miner wants to put on as much weight as possible in order to make a day's wage.

1066. Is it not a fact that the men try to fill these skips so as to get a big average? Yes; they will fill the skips as high as possible so as to get a big wage.

1067. Then you admit that the anxiety of the man would be less if every skip were weighed? Yes; I think the anxiety would be less, because if a man filled a big skip he would get paid, for a big skip, or for whatever he filled.

1068. I understand you to say that the appointment of a check-weighman should be left in the miners' own hands as they have to pay the check-weighman? Yes; that is my opinion. The men should have free choice in the selection of a check-weigher.

1069. Did the reason ever strike you why this provision is in the Act of 1876? I think the idea is to keep out good men, whom the proprietors would like to crush out of the district.

1070. Do you know of any who have been treated like that? No; I cannot say that I do.

1071. But it is so? Yes.

1072. You say that you cannot find positive proof, but you know that that has occurred? It is my firm belief that that is the reason for retaining that clause.

1073. Do you not think that this clause as it stands, prevents the men from having their choice as they otherwise would have? It restricts them in their choice.

1074. I suppose you have worked with explosives? Yes.

1075. Blowing coal? Yes.

1076. And stone? Not much stone.

1077. What would you recommend to fire shots—a fuse or a straw? I should prefer the fuse; it is safer.

1078. When the shot has missed fire, what time would you give before returning to work at that place? I would go home for that day.

1079. You think that is necessary? I do.

1080. Have you heard of shots going off two or three hours after the fuse was lighted? I have heard of such cases, and I would not on any consideration go back on that day.

1081. *Mr. Cann.*] Would you prick the hole out again if it misfired? I would not.

1082. You would bore a fresh hole? Yes.

1083. Would you consider it dangerous to prick the hole? Yes.

1084. How long does it take you to bore a hole? It is a matter of about twenty minutes work, or so, depending on the length.

1085. Of course, a hole in stone, would take you much longer? Yes.

1086. In the case of stone, you would not attempt to prick it out? No; I should think it dangerous.

1087. You would think it would at all times be more secure to make a fresh hole than to prick it out? Yes.

1088. *Mr. Edden.*] I heard you say you preferred the fuse to the straw? Yes.

1089. Why? Because of its greater safety.

1090. You think the fuse is more safe than the straws? Yes.

1091.

Mr.  
R. J. Jury.  
3 April, 1894.

1091. Is it not a fact that if a shot misses fire when the straw is used the danger is over, and a man can go back to his work at once? The danger is in lighting up the straw.
1092. Do you mean there is danger in an unpractical man attempting it? Yes; even a practical man may be shot when using a straw.
1093. If a shot misfires with a fuse in it you say you would go home for the day? Yes.
1094. You think there is quite as much danger three hours after as one hour after? Yes; only quite recently a shot went off which had been standing for two hours, at West Wallsend, I think.
1095. When you came back next morning you would not attempt to drill that hole out again; you would drill a fresh one? I should consider that if I attempted to drill out a hole in which there was an unexploded charge I should be in danger of igniting the powder.
1096. *Mr. Cann.*] Can you assign any reason for the shot hanging fire so long? It may be owing to a flaw in the fuse.
1097. I suppose that damp powder in the fuse would make it burn very slowly? I should think it would.
1098. *Chairman.*] As to the sinking of shafts;—what distance do you think there ought to be between the up-cast and the down-cast shaft? A good distance.
1099. What should be the minimum distance? For purposes of safety I should consider that they ought not to be nearer than 45 or 50 yards.
1100. That ought to be the minimum? Yes; that would be quite near enough.
1101. With regard to the different automatic appliances for preventing over-winding, do you believe that every cage ought to be bonneted or covered? Yes.
1102. Do you consider we ought to have competent engine-winders at the shafts? Yes.
1103. Do you think the engine-men should undergo an examination? I think they ought, although we have no Board at present to examine them.
1104. But do you not think that there ought to be provision in any new legislation for the examination of the engine-winders? I think that a person who takes a position of such responsibility ought to undergo an examination.
1105. Is it not a fact that some of these men have from 500 to 600 people to let down and draw up every morning and evening? Yes.
1106. And it is your firm belief that it is necessary that the most competent persons should be got to fill those places? Yes; I think that the engine-driver holds the most important position in the colliery so far as responsibility goes.
1107. Do you know anything about the safety-hook or safety-catches for the winding-gear? I have seen them in use, and read a good deal about them.
1108. If you were a manager would you have your winding-gear fitted with them? I would certainly have them in use. I have never heard of a case in which they have failed; but I have heard of several cases in which they have been instrumental in saving life. At a certain colliery in the Northern District some few months ago, the engine-driver did not reverse his engines soon enough, and the consequence was that the cage was drawn up to the pulleys; but as the cage and rope were fitted with the detaching hook nothing serious occurred. When the cage reached a certain height the safety-hook came into operation and released the rope, allowing it to go over the pulleys and wind itself round the drum. The hook held the cage suspended over the shaft.
1109. And there was no smash, and the owners' property was not destroyed in any way? Not in any way.
1110. Do you think having these contrivances in use will make the engine-men more careless? I do not think it will make the engine-drivers at all careless, but it would imbue the miner with a greater sense of security. An engine-driver would believe that if he put these things into operation it would tell tremendously against him though no lives were lost.
1111. Why do you say that you would prefer to have the air in the mines split? The great object in splitting the air is to ensure that every separate district shall be supplied with a current of fresh air, so that the men working in that district shall not be compelled to breathe impure air which has already ventilated some other district. There is the great object of splitting the air from the miner's standpoint; from the manager's standpoint it is the most economical way of conducting the ventilation of the mine.
1112. Is there any other reason? There is another reason, and it is that in the case of an explosion, in all probability the explosion would not go beyond that particular split; in that case there would be a very much smaller loss of life than there would be if the explosion extended all over the mine. There is very great economy in splitting the air.
1113. *Mr. Edden.*] Does the splitting of the air cause more or less friction? Decidedly less friction.
1114. Have you anything further that you would like to mention? I should like to be permitted to say that if a colliery is not supplied with automatic appliances to prevent accidents from over-winding, some limit ought to be placed on the speed at which they draw the men up the shaft.
1115. *Mr. Cann.*] You do not think they should wind the men at the same rate as they wind the coal? No.
1116. *Mr. Edden.*] Do you remember an accident occurring at the sinking of the South Burwood Mine where four men were dashed to pieces? Yes.
1117. I suppose that if one of these automatic appliances had been in use there that accident would not have happened? When a cage is coming up at full speed it is difficult to say what the result would be. Cases have occurred where a driver tries to stop his engine, but he is not able to stop it in time; in a case of that kind it is morally certain that the detaching-hook would prevent the sacrifice of life. It is very difficult, however, to say what would be the result, even with the safety-hook, if a cage is coming up at a very great speed, but the hook could not make things worse.
1118. *Mr. Cann.*] I suppose your safety-hook would not operate in the shaft itself? No.
1119. I suppose there is no actual security in the shaft if the rope breaks? No.
1120. Have you seen the safety-cages in operation? I have heard and read about those safety catches, but I have not seen them in operation. They do not seem to be looked upon with very great favour.
1121. Providing that they could be operated satisfactorily, do you think it of sufficient importance to put a provision in an Act that safety-cages shall be used? If in the mining world those who understand mining in all its various branches were satisfied that the safety-cages were the means of insuring greater security you would be justified in providing for them in an Act.
1122. I suppose experiment would be the only means of finding that out? Yes.

1123. If a cage contained a ton weight, and the rope was cut in two, and the catches caught the cage, and did not allow it to fall you would think that good enough? I should think that a very fair experiment.

Mr.  
R. J. Jury

3 April, 1894.

1124. Do you think it would be wise to put such a provision in the Coal-mines Regulation Bill? Seeing the general distrust that there is in regard to these safety catches, I would want to be quite sure that that was not a special case. I should want to be quite sure that any cage fitted with these appliances would act in the same manner. I have already said that I have had no experience of these things. I know that by mining authorities they are looked upon with distrust, and it is always feared that they will act when not required to act.

1125. *Mr. Edden.*] How many mines have you worked in in this country? Five.

1126. Did you ever see any water in any of them? Yes.

1127. They are not free from water? No.

1128. Have you seen places where men had to work in water—to sit down in it? I have seen places where the men have not had the water taken away, and they had to put up with the inconvenience of it.

1129. No doubt there are places where the management do their best where the men have to work in water? I suppose there are places where, if they kept a man the whole of his time at it the men would have to work in water.

1130. Many of the seams in the Northern District are difficult to clean, are they not? Yes.

1131. When water is in the bord does it make any difference? It makes cleaning a far more difficult operation.

1132. So if a man sent up 15 lb. or 20 lb. of dirt in his skip there would be some excuse for it? Yes.

1133. Whether it is wet or dry a man can easily do that without being careless? In such seams as we have in the Northern District a careful man may send up 10 lb. or 20 lb. of dirt or more.

1134. And the bad ventilation of a mine is a detriment? It is a great injustice and a great hardship to punish a man for sending up a bit of dirt where the ventilation of the place is such that he cannot see to pick the dirt out.

1135. Are there such places in this country? Yes; there are any number.

1136. I suppose you were connected with some of the mines in England? Yes; I worked in mines in England about twelve years.

1137. Do they seem to ventilate the mines in England in a more scientific manner than they do here? Yes; I consider that the mines in England are better ventilated than the mines here.

1138. Then if a mining expert were to tell you that there were no mines in the world worked under such favourable sanitary conditions as those of New South Wales, and if he were also to assert on oath that there was no water in the mines, what would you think about it? I should think he was putting his hearers down very low for intelligence.

1139. You would consider that he was not telling the truth? I should consider that he was exaggerating.

1140. *Chairman.*] Is there anything else you would like to say? I wish to say a word in regard to return air-ways. I think it is highly necessary that the return air-ways should be kept in a fit state for the men to be able to travel in them in case of accidents. I am not in favour of return air-ways being made travelling roads, but they should be in a fit state to be used in case of emergency. Several accidents have taken place in different parts of the world which have proved the necessity of keeping the return in such a state that in case of accident the men would be able to avail themselves of it, and by that means save their lives.

1141. *Mr. Edden.*] If it was stipulated in the Bill that the return air-ways should not be used as travelling roads, would that necessitate the driving of another road specially for travelling, or cannot the men travel on the hauling road as long as there are proper refuge holes made? Certainly, the Act provides that refuge holes shall be put in at certain intervals.

1142. Did you ever work in any mines in England where travelling in the return air-way was forbidden? I cannot remember that I did.

1143. If it meant the making of another road exclusively for the miners to travel in, I suppose there would be no necessity for a clause in the Bill with regard to refuge holes? No; the only reason why I would insist upon the return being kept in a fit state for travelling is that it might be necessary to use it in case of accident when the men could not get out by the main intake.

1144. Have you travelled in a return air-way that was not fit for a man to travel in? I have travelled in a return air-way where I should not like to see a number of men attempting to get out to save their lives.

1145. Do you think it would be well to make a stipulation in an Act that the return air-way should not be used as a travelling road? I scarcely see the necessity for including such a proviso in an Act of Parliament. I am not aware of any place where the men are compelled to travel in the return air-way.

1146. But there would be no hardship about it if the men agreed to travel that way if they should happen to be in a mine which had a good return air-way which the men had no objection to;—there would be no harm in a stipulation to the effect that it would be optional to the men whether they would travel in that air-way or not? If there is a mutual understanding between the masters and the men I could not see any great hardship in it; but I can scarcely conceive circumstances which would necessitate such an arrangement.

1147. *Mr. Cann.*] Would you pass an Act of Parliament which either the masters or the men could set aside according to their convenience? It is necessary in many cases to make Acts of Parliament which should be binding on both masters and men, so that neither can set them aside, because if things are left to a mutual arrangement the weakest get all the worst of it. It is a very one-sided arrangement which exists between the colliery proprietors and the men at the present time.

1148. *Mr. Nicholson.*] Suppose that the men knock off at (say) 4 o'clock, and from half-past 3 to 4 every miner is firing his shots, what is the condition of the return for travelling in? It is totally unfit to be travelled in. The only circumstances under which it would be justifiable to travel in the return air-way would be in case of accident.

1149. *Mr. Cann.*] To meet your objection it would be necessary to stipulate at least the minimum dimensions of that return air-way? The objection to that is that what may be a good area for one colliery might be very inadequate for another.

1150. I suppose in the smallest colliery the height of the return air-way is the same? Yes, for men to travel in them with comfort.

Mr.  
R. J. Jury.  
3 April, 1894.

1151. You would not think they could travel with comfort while the airway was 3 feet in height and 6 feet in width? I think a return airway of those dimensions would be equally against manager and men.
1152. *Mr. Nicholson.*] Do you not think an airway 3 feet high and 6 feet wide is as good as a place 6 feet high and 3 feet wide for ventilation purposes? It would be practically the same.
1153. *Mr. Cann.*] Would you get practically as good ventilation from the one as from the other? Yes.
1154. *Mr. Nicholson.*] In making the airway in a 3-foot seam of coal you would get the dimensions in the width of the airway rather than in the height? It would be a considerable saving to the owner to have the area made up in the width rather than in the height; but it would be very inconvenient for men who have to travel in it.
1155. Have you ever travelled in a 3-foot seam of coal? Yes.
1156. *Mr. Cann.*] You would not consider it a convenient travelling-way? No; but seeing that the returns are so seldom travelled, I should have to consider before saying that I would compel the manager to make it higher.
1157. Do you not think that a low return airway would impede the egress of the men in case of danger? Yes.
1158. Then in that case there would not be the security that there would be in the case of a more spacious airway? The men could not get out so fast, but to men working in a low seam it would not be such an obstacle as it would be to men accustomed to a higher seam.
1159. Does it not frequently occur that the cross-cut is driven into the far end of the territory before they open up at all? It is usual to open up the coal by driving in two places—one to serve for an intake, and the other to serve for a return.
1160. Nearly all the developing work takes place after what we call the back heading? Yes; the return will be sealed off as speedily as possible, but in the opening up of a new colliery there is very little inconvenience from foul air.
1161. You would not like to make a stipulation that would debar you from either working pillar work or opening up new faces or for back heading serving as a return airway? That would be practically working in the return.
1162. Are there not frequently men working in the return? I think not frequently.
1163. But they do sometimes? They do at times.
1164. You would not care to interfere with the developing and working of the mine by working in the return? I would not impose any unjust restriction on the opening up of a mine.

WEDNESDAY, 4 APRIL, 1894.

Present:—

|            |  |                |
|------------|--|----------------|
| MR. CANN,  |  | MR. EDDEN,     |
| MR. SCOTT, |  | MR. NICHOLSON, |
| MR. COOK.  |  |                |

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. James Robert Miller Robertson, M.E., called in, sworn, and examined:—

Mr. J. R. M.  
Robertson,  
M.E.  
4 April, 1894.

1165. *Chairman.*] You are a mining engineer? Yes.
1166. What experience have you had as an engineer? Over twenty years' experience.
1167. I suppose you have a certificate under the English Act of 1872? Yes; a first-class certificate.
1168. Have you had personal charge of a mine as a manager? Yes; of several in the old country.
1169. Have you had charge of the underground working? Yes; of all operations in and about mines.
1170. You have had considerable experience in this Colony, I presume, as well? Yes; thirteen years' experience.
1171. Seven years' experience in England, and thirteen years here? Yes; rather more than that. It is twenty-six years since I served my apprenticeship.
1172. Then you will be thoroughly conversant with the English Acts of 1872 and 1887? I was. The English Act of 1887 was passed after I left England.
1173. In any law that has been passed has any stipulation been made as to the hours of adult labour? In the English Act they limit the number of hours for adults and young persons, and they define what "young person" means in the English Act.
1174. I believe you have been Chairman of three Commissions in this country? Yes.
1175. What Commissions were those? The Lithgow inquiry, the inquiry concerning the collieries adjacent to Newcastle Harbour, and the Bulli Explosion Commission.
1176. Whilst President of those Commissions, I suppose you received a great amount of evidence as to the working of collieries? Yes; you may say that the evidence was exhaustive. After advertising for evidence, after all the voluntary evidence was completed, I wrote to a number of persons recommended by the members, asking them to give evidence, and in every case they did so.
1177. In the report, I believe you, as the President, made some suggestions as to the working of coal under tidal waters? I did.
1178. Can you remember what those suggestions were? There were a considerable number; I could only give at present the substance of them. One of them was, that it would be dangerous, in view of the conditions adjacent to Newcastle Harbour, to work the coal extensively under the sea, until absolute data was obtained as to the depths of the water, the depth of the coal, and the thickness and character of the coal and strata under particular points. Then there was a recommendation that the pillars should be increased in size and, as a consequence, that the bords should not be above a certain width, and that instead of driving them off, as is common in the Newcastle district, opposite one another, they ought to be reversed, *i.e.*, the entrance to one bord should be blinded by the end of the opposite pillar, and that it would be advisable to work in the shallow collieries the coal to the dip first, so that in case of a serious percolation of the water there would be a reservoir to fill up before it endangered the colliers; but the main suggestion was the ascertaining of the conditions. Everything hung upon the conditions of obtaining the coal under the sea, and under the delta of the Hunter. There are some collieries there on the old course of the river, and the natural strata seems to have been more or less eroded by the ancient currents
- down

down to, or near the top of the coal. It is very necessary where there are sand deposits that you should have absolute data.

Mr. J. R. M.  
Robertson,  
M.E.

1179. Your recommendation, as President of that Commission, was that under tidal waters 6-yard bords was quite wide enough? Yes; I have always held that the great error of colonial mining was the abnormally wide bords. However suitable they may have been to the conditions that existed in Newcastle in the early days of coal-mining, they are quite unsuitable to present conditions. In respect of depth there was no margin of safety. A large amount, if not all, of the unnatural waste of national property, namely, coal, has resulted from the neglect of good mining regulations.

4 April, 1894.

1180. Neglect on the part of whom? On the part of the management. I do not want to inculpate any one, but to say generally that it has been owing to the neglect of good sound mining regulations.

1181. Then your opinion on that ground is that the regulations are not sufficient under the present Act? I do not go exactly that length. You will never make good mining conditions by Act of Parliament. I hold that it is the absence of good mining knowledge on the part of those connected with collieries—it might be the management, it might be the directors or the owners, it might be partly owing to the men. From whatever cause it is I hold there has been, from the ignoring of good sound mining regulations and knowledge, a large amount of damage done at Newcastle.

1182. You admit that there has been neglect on the part of somebody? Yes; but I do not place a great deal of reliance on Acts of Parliament for the eradication of bad conditions. I would very much rather depend upon the good sense of those engaged in the trade than upon an Act of Parliament which cannot anticipate unknown conditions.

1183. But, as a general system, you believe in legislation? Yes; up to a point I do. I am not talking about any particular Bill, but, as a rule I believe in legislation as long as it confines itself to general principles.

1184. You are acquainted with the Act of 1876? Yes.

1185. As far as that Act is concerned do you believe there is any weakness in it? There are weaknesses in all Acts—you can improve all Acts. I think there are certain things that it would have been much better had they not been introduced into the measure.

1186. I suppose you know that there is a difference of opinion on that? Yes; I am quite aware of that.

1187. I believe you gave evidence before a Committee of the Upper House on a Bill which was recently before the Assembly? Yes.

1188. In that Bill it was proposed to making the working day eight hours? It was. I had an objection to that.

1189. What is your objection to it? I gave it pretty fully before a Select Committee.

1190. We have not got that before us? You ask the question without giving me time for consideration. When I gave evidence before the Select Committee of the Upper House I had plenty of notice of the points on which I was to speak. My objections were principally these—that I considered it was an interference with the liberty of the subject to state in an Act of Parliament that eight hours should be the period of a day's labour, and that I did not know that it was required by the men. I knew that it would increase the cost of producing the coal without giving any corresponding benefit to the men. I said also that it was calculated to harass an industry which is almost at the expiring point at the present moment, and I thought it was very undesirable and injudicious to increase in an irritating way the troubles of people who are almost troubled to death. I could not see that under the conditions that exist here legislating for the eight hours would really amount to any substantial benefit to the men.

1191. It appears that one ground of objection advanced by you was that the men have not asked for legislation on the eight hours? They have not to my knowledge.

1192. Do you know that there are associations in the three coal districts who are asking for the eight hours? No; I am not aware of that. I am aware that a large body of people in the three large coal districts are in connection with the association,

1193. Is it not a fact that there exists in those three coal districts what they call the eight hours' committee? I never heard of that committee.

1194. Did you ever hear of an eight hours' demonstration? Yes; in Sydney.

1195. Nowhere else? I see from the newspapers that they have held an eight hours' demonstration in Newcastle.

1196. I suppose it would surprise you if you were told that eight hours committees exist? No; If you say that they do, I can believe you.

1197. As a large employer have you not been approached with respect to the eight-hour movement? No; I am very easily approached by workmen. I always make it a rule to have a talk with workmen when I go round the collieries and not one has ever complained to me about the hours of labour because as a rule the men in the south do not work eight hours. We have settled that to our mutual satisfaction, and there is no complaint about it on either side. I would far rather employ a man who I knew could get out his work in six hours than a man who would require eight hours. He is a much more valuable man to an employer.

1198. *Mr. Edden.*] Especially if a reduction is wanted? I do not object to the men making the very best of their bargain. I have always recognised that the men are doing as I do myself. If they cannot convince me they may strike, but I will give way if I am convinced, but the battle being over I do not think any worse of the men.

1199. *Chairman.*] I believe you had something to do with the agreement which existed between the mine-owners in the northern district and the men? Not at all. I never sat in the Mine-owners' Conference in the north.

1200. Is it not a fact that your opinion has been asked prior to the Conference? No doubt it was; but as an association I did not know them.

1201. Is it not a fact that you, as the representative of several companies up there, were asked for your opinion? No, not in a formal way. Of course, I know all the representatives, and although they agree about as well as cats and dogs, I can approach them individually.

1202. You do not think they are a very happy family? No. I think they did things in a very stupid and short-sighted way. I think things would have been very much better if they had taken my advice at first. Some are certain of that themselves now. But when people are dealing with what they consider to be their own concerns, they do not care much for gratuitous advice. I have spoken to them all for the last ten years in the way a man would speak who has had a very large experience of these associations. I

Mr. J. R. M.  
Robertson,  
M. E.

4 April, 1894.

do not believe in these associations. I do not believe in any association which has a belligerent tendency. If I am a member of an association, and anybody proves to me that that association has a tendency to throttle liberty of opinion, I am always the very first to say that that rule at all events ought to be modified.

1203. You believe in liberty? I do. I do not believe in anyone interfering with my liberty, and I try to give every one else the liberty which a man is entitled to.

1204. Then you have never been approached on the subject of the eight hours? No.

1205. Do you think it is impracticable to make eight hours a legal day's work? I think that the eight hours as proposed in the Bill before the Assembly was impracticable. At all events it was a very inopportune time to introduce any of these changes. The trade was in a transition state. It had been established probably upon a wrong financial basis, and it was just rectifying itself. I can excuse people who want reformers to be enthusiastic. It is necessary for them to be enthusiastic or they would not carry conviction. But a certain amount of prudence and discretion ought to regulate their proceedings.

1206. When the trade was flourishing as it was five or six years since, that would be the time to obtain reform? Yes; but I could see the cancer in the heart of it years ago. Things were then in favour of the Colony, but we have now got a little reverse, such as occurs at intervals in the history of all countries, and we have to use extra discretion and prudence. We have not been prepared for this reverse, and it is because we have never known anything like it that we take so badly to it. It is no new thing to me, I came from a country where these reverses were periodical, where indeed they were rather chronic.

1207. Where they occur every ten or twelve years? Yes; every six or seven years.

1208. If things were more promising so much objection could not be raised to what the men are asking for? There are at present many people connected with the coal trade who are directors and owners in name, who are not at liberty to give an answer to the men. The trade is in a very critical state at the present moment. I explained to the other Committee that I did not think that in the collieries that I am connected with there would be any great trouble about the eight hours, because we have arranged the hours in a perfectly friendly way. I would wink, and the managers would do the same, when the miners did not work the full number of hours if they only kept the wheelers going.

1209. In the English Act there is provision for certificated managers? Yes.

1210. Do you approve of that? I am perfectly in accord with that, subject to the opinion that I expressed in one of the reports of this Commission. The Minister for the time being, had asked whether we would embody in that report, our views as to certificated managers, and we did so. Our views were pretty much to this effect, that we thought that examinations were necessary, but that under the conditions of the Colony it would be unfair not to make those examinations to a large extent oral, insofar as some very hard-headed men who probably in their youth had not the opportunity to get the education that is thrust upon young people now, were acting as mine managers—men whose genius would have been better developed by a liberal primary education, that it would have been unfair for them to be deprived of their positions which they were well qualified to hold. I had in my mind's eye the Minister for Mines himself, Mr. Fletcher, a man fitted by nature for the business, whose failings were referable to the want of a primary education and training.

1211. You remember that in the Act of 1872 there was provision made for certificates of service? Yes, of course. You would require to introduce the same thing here for a time, to allow the existing managers to retain their positions.

1212. There is no such provision in the English Act of 1887? No; fifteen years had elapsed, and it was naturally supposed that the rising generation would have received the benefits of the Education Act.

1213. But in the event of such legislation, you would put such provision in the Bill? Yes; in justice to the very level-headed men that we meet with in this Colony, because we have a number of very intelligent men here who know every point connected with mining, but who have not had a primary education, men admirably adapted for conducting the work of a mine under proper advice. I think it would be only fair in passing a Bill in this Colony to make the same provision for men of that class as that which is made in the English Act of 1872.

1214. You think it would be wrong to make these men pass an examination? I think it should only be an oral examination of an entirely practical character.

1215. You have found from your experience of a number of managers that some men who could not pass the examination are equal to those who could? Better men. I do not hesitate to say that. I have some men under me as over-men who would adorn any class of society, men of the greatest intelligence and ingenuity, yet men who cannot express themselves. I have the greatest respect for them. I know some of the working miners, and I have probably done more than many in a position similar to my own, to raise the working miner to a position of trust, and I know working miners who, if they could get the managers to take a little greater interest in them would make admirable managers.

1216. I suppose you would make it compulsory that inspectors should have certificates of competency? I may be thought to have very extreme views when I say that the Bill proposes to give plenary powers such as no inspector, I believe, in this sublunary sphere was ever entrusted with. I said I considered it highly necessary that managers in positions of trust should pass almost any examination that you please—I do not care how stiff the examination is for first-class certificates.

1217. But in the event of no legislation being introduced, would you make those inspectors who are here at present pass an examination? That would depend altogether on the powers which you propose to give them. Of course, I did not give an opinion without giving a reason for it. In Great Britain, with its enormous coal production, there are a number of inspectors of the very highest class, but those people would never expect to take half the powers that were attempted to be given to the inspectors here under the proposed Bill. I think it the most absurd proposal that I ever heard.

1218. You believe that the English Act is a very good Act? Taking it as a whole, I think the English Act is about as carefully worded an Act as you could possibly conceive. I have not the slightest doubt that some of the provisions of that Act could be altered to advantage to suit the conditions of the Colony.

1219. As one largely interested in coal-mines, would you be willing to accept the English Act? Yes; I think I should. At the same time it would be under the condition that a committee of Parliament and of those interested in mining matters should alter some of the clauses to suit the conditions of the Colony. As a whole I would accept the English Act.

1220. You would not object to the inspectors having a certificate of service? I would never appoint a single man who had not a certificate of competency. If you limit the powers of inspectors probably a certificate

certificate of service may be suitable. I would put them all under examination, with the condition that if they passed a certain standard they should receive a certificate of competency, and if they did not pass they should have a certificate of service.

Mr. J. R. M.  
Robertson,  
M.E.

1221. You believe in giving them a certificate of service? I do. I do not want to be in the least unfair. 4 April, 1894.

1222. Have you ever had to object to any inspectors? No.

1223. You have never had to find fault with them? I found fault once to the late Mr. Fletcher, who advised me to say nothing about it.

1224. How many years ago? A good many years now.

1225. Since then you have had no cause? No; I have a great respect for them.

1226. You think they are fair? I have always found men fair to me. I am in the position of getting a great many complaints, and when I investigate them I generally find that there are faults on both sides. But when I have come into contact with Government officers, I have always found in them a disposition to be fair. But I did find fault at the instance of two managers, with the manner in which an inspection was carried out by the Government Inspector.

1227. The matter never came under your personal observation? No. I spoke to one of the inspectors, and said that I was astonished that he should give himself away, but he did not say much. I think he had a conviction that a wrong had been done. But he led me to suppose that it was owing to orders from head-quarters.

1228. What case was that? I will not mention names. I objected to the inspector going through a mine with the manager or over-man, and when he came to a certain place, asking whether a man's name was so-and-so; whether that man had anything to complain of. The answer was, "No." "Quite sure of that?" "Yes." "Nothing to complain of?" "No." "What about the props; plenty of props?" "Yes." "What about the props two days ago?" "Then you have nothing to complain of?" "No." This is putting suggestions into a man's mouth. If a man is competent to inspect a colliery he can see into these things for himself.

1229. Are you not aware that the inspectors get word at times as to the condition of the mine? I do not know anything about it. Any word that they get in that way ought to be communicated to the manager, to give him an opportunity to defend himself. If you make suggestions to a man in the way that that inspector did, you can get some men to say anything you please. The inspector is not there to raise dissension and strife between miners and over-men. The effect of the proceeding was that that over-man knew, without a word being said, that that man had been writing anonymous letters to the inspector, and he had his eyes upon him. I spoke to the man, and I said, "If you have any fault to find with anything, I am always accessible to you; but I do not want to put you in such an invidious position. The chances are that you will be discharged if you do not have care. If you are short of props, why not tell the manager; why go to the trouble to write to the inspector?" The man said he did not do it; but I said, "The inference was that he did." I said, "You are putting yourself in a very invidious position. I will protect you so far, but do not do it again."

1230. Then it appears that the inspector was written to? I only inferred that he was, but I object to the way in which the inspection was carried out. The inspector ought to have been perfectly frank about it, or he ought not to have let the over-man go into the place with him.

1231. Did the inspector ever find in one of the mines a pillar a foot less than was stipulated? Yes; it was with very great difficulty that the manager was saved from prosecution over that.

1232. Who was the inspector? The inspector was Mr. Rowan. It was in the south. I suppose he was acting up to the letter of the law, but inspection is a farce if administered in this way, you must act according to the spirit. But I have no fault to find with the inspector for doing that.

1233. You think that he was overstepping the bounds? I do; and I explained it to the Minister. The over-man was a particularly careful man, and he went into a place where they were driving and marked it off, and put a stamp on with a pick and said, "When you have driven other 2 feet you turn off to make the cut-through." The coal was working well and there were a pair of good men in the place; but when they got through the other 2 feet they came to a stone rising out of the floor. They went on, being still within the 35 yards, and the manager being away they took it upon themselves to go beyond the 35 yards, and they cut their end where the coal was high. The inspector came through on the following Tuesday, and the first words of the over-man were, "Did you hear my orders about going 2 feet beyond that stamp?" The answer was, "Yes; but we saw the stone was about to run out, and we broke away to the end." Although the men admitted they were in fault, and although the stamp and check were on the wall the inspector was bound to report it, and there was a great deal of trouble to prevent the manager from being prosecuted. This is acting according to the letter of the law. They will never get things done right if they do not show a more becoming spirit in the exercise of their duty.

1234. You think that the managers and inspectors should show a conciliatory spirit? Certainly. Here was a case in which the men admitted that they were in fault, and there was proof of it on the wall, yet the inspector was obliged to report that they had gone 18 inches over the 35 yards. That is one of the unfortunate provisions of the existing Act. I hold that these provisions should not be in the Act at all. If you take the English Act, there is no such provision out of which a prosecution could arise.

1235. You said you believed in giving freedom? Yes.

1236. Are you well acquainted with the check-weighing clause? Yes.

1237. Is there much freedom given to men to select their check weigh-men? Yes. They have freedom to select them from the whole pit. I think that is absolute freedom.

1238. Do you know what are the provisions of the English Act in respect to the appointment of check-weighers? I do.

1239. You do not approve of that? No, I do not.

1240. Yet you will take the English Act as a whole? In these matters you have to take many things which you do not like.

1241. Have you had any contention with the men? Never, except once in regard to the check-weighman, but the men admitted that they were wrong.

1242. That is the only case in your large experience? I pay no attention to that case because the men admitted they were wrong.

1243. *Mr. Cann.*] Where was that? On the South Coast.

1244. Is it not a fact that the company appointed the man? No, the company never appointed the man.

- Mr. J. R. M. Robertson, M.E.  
 4 April, 1894.
1245. Is it not a fact that the company recommended that the men should take a man? Never. The company never interfered. I am practically the company, holding powers for the company, and I never interfere with the men.
1246. Is it possible that the management would recommend a man without the knowledge of the company? No, I do not think it is at all likely. There were a great many complaints about the man.
1247. How long had he been there? I cannot tell you; some considerable time.
1248. I suppose you are well up in the ventilation of mines? I suppose so.
1249. Do you think the best method of ventilation is by splitting the air? Yes; up to a point.
1250. That being so, what are the advantages to be gained by splitting the air? Why ask these abstract questions. It is only putting us through school.
1251. What are the advantages? You get more ventilation if you judiciously split the air, but you get no advantage but detriment if you injudiciously split it.
1252. Is greater friction caused by splitting the air? No, it reduces friction.
1253. The Act fixes a minimum quantity of air? I think that is wrong.
1254. What is your reason? The first clause of the Act is perfect as far as it goes. It says "that an adequate amount of ventilation shall at all times be available", but if you limit the air to anything at all, the chances are that you will not get an adequate amount of ventilation at all times. I know a colliery where the quantity of air in circulation is nearly one hundred times more than the minimum stipulated by the Act. The colliery would be unsafe if they provided no more than that minimum quantity of air, but if you provide that there should be an adequate supply of air, you ought to strike out the minimum and say that an adequate amount of air shall at all times be in circulation.
1255. Are we to understand you to say that by putting in this minimum of 100 feet we interfere with the liberties of the manager? No; I do not think it is interfering with the liberty of the manager, but I think it is interfering with good ventilation.
1256. Do you think it hampers good ventilation? I do.
1257. In what way? Unless, in these days of progress, you always keep the manager interested in the good government of his mine, if you give him a loophole to escape the consequences of carelessness, you will interfere with good management and good ventilation. It is a poor mine in which you cannot get the minimum amount of air stipulated in the Act. It is a very stupid thing that the framers of the existing Bill should have considered it expedient or necessary to define the meaning of the word "adequate," the word used in the English Act. Under that Act, if you want 100 cubic feet you get it, if you want 1,000 cubic feet of air you get it; if it is necessary to have 3,000 cubic feet it must be provided. Under the present Act in this Colony, if a manager provides 100 cubic feet per man per minute, he is practically exempt from responsibility. Under the English Act he would not be exempt at all. The English Act is a more exacting Act than ours in that respect, and to that extent it is more conducive to good management and good ventilation. I know that the owners whom I represent are perfectly willing that the minimum of 100 cubic feet should be provided for in the Act, but I am speaking now in the interests of good mining.
1258. Mr. Edden.] What quantity of air per man per minute would you consider necessary to go round the working face? There is no particular quantity. It depends upon particular conditions which a man can never foresee. According to the English Act you must have an adequate amount, and if you depart from the English Act you go very far wrong.
1259. Then, in your opinion, scientific men who have stipulated a certain amount of air as being absolutely necessary are wrong? No; what I say is quite in accordance with that. An adequate amount of air covers everything. I would say that the present Act provides a very fair minimum, but in my opinion it is wrong to have any minimum at all or a maximum either.
1260. You think there should not be a minimum against all the evidence of the experts who have written and spoken on the subject? I do not think there is an experienced scientific manager who ever spoke in favour of altering the words of the English Act.
1261. I believe you have given a lot of evidence on the question of new legislation? Yes. I was asked to give evidence, not on subjects of which I had no notice, as in the present instance, but upon particular clauses in a Bill that was submitted to me.
1262. I suppose you were questioned in regard to the eight hours? Yes.
1263. Were you questioned as to the extra cost of the output that would be caused by the adoption of the eight hours? Yes.
1264. What would the extra cost be? I took a particular instance at the time and I worked it out.
1265. Did you give the figures? Yes.
1266. Could you state what the extra cost per ton would be? Something like 8d. per ton in the particular instance which I gave. That is with the Bill worded as it was. Our men really work only eight hours, but under such conditions that there is no objection to it, but according to the Bill the men would only work eight hours and the pit would be drawing coal about two hours less than at present.
1267. You are well acquainted with the mines in England as well as with the mines in this Colony? Yes; with the mines all over the world.
1268. In which part of the world do you think the mines are best ventilated? In England, by a long way.
1269. Are the mines in England better ventilated than the mines of New South Wales? In England they have very much worse conditions than we have in New South Wales. The mines in New South Wales do not require the enormous volume of ventilation that the English mines require; but where the mines in New South Wales do require much ventilation they are doubtless just as well ventilated as the mines in England. We have very favourable conditions here for ventilation, we have no faults, comparatively few drifts, and no need to reduce the size of the roadways and airways. We have not many changes of gradient and comparatively little explosive gas. Altogether we have very favourable conditions for ventilating and for mining.
1270. You do not think in any case 100 cubic feet of air per minute is too much for a man? I do not. I say, as an interested party, that I have no objection to that minimum. I am giving my opinion as a mining engineer. But the 100 feet minimum is distinctly in the interest of those who employ me. My own judgment tells me that it is dangerous to have such a minimum. The conditions of mining in New South Wales are changing so rapidly that, as sure as you lay down any particular requirements in an Act of Parliament,

Parliament, before that Act is printed the conditions may be altered and the Act may be unworkable and the provisions worthless.

1271. Do you believe the manager should be left free to find an adequate amount of air? Yes; that is everybody's safeguard.

1272. How do you suppose the manager would arrive at the quantity? I can only answer your question by a supposititious case. If gas is given off at the face that must be cleared away by a direct current, and that probably would necessitate the increase of the ventilation by fifty or sixty times.

1273. You said that the mines in England were better ventilated than the mines here;—how do you account for that? I did not say that the mines in England were better ventilated than the mines in this Colony. I say that the mines are as well ventilated in this Colony as they are in England where the necessity arises, but the necessity for large ventilating columns does not so often arise here as in England.

1274. I suppose you believe in a man getting sufficient ventilation? Yes; I think it is the cheapest thing that a manager can give the men. The more air you can give them the better; but by going into details in an Act of Parliament you frustrate the main object you have in view. I have precisely the same object in view as the framers of the Bill, but I look upon the subject with different eyes, and with a different experience, and I know that I am right and that they are wrong.

1275. When the last Bill was before the House there was a provision in it to the effect that the air should be taken up to the working-face? That is not always necessary here. In the great majority of cases we should be wrong to insist upon it. By so doing you would close the mines.

1276. Do you object to the clause with regard to bratticing? No; but I say that the word "adequate" covers it.

1277. We have here a plan of the Wallsend Colliery, which is worked on the bord and pillar system;—how far do you think it is reasonable for a man to work in advance of the air? That depends upon the force with which it goes in.

1278. Is it possible for the air to go in unless it is forced? There is a stupid provision in the present Act. All along I have been protesting against these details being put into the Act. You will never have a satisfactory state of mining or ventilation as long as you make stipulations in the Act as to details. The present Act provides for only one system of ventilation. It does not say a word about "Longwall." Longwall, a system which gives a free and sweeping ventilation, is really contrary to the intentions of the present Act.

1279. But there is nothing in the Act to prevent them from working Longwall? There is nothing to give them liberty to do it.

1280. But they do it? That is not a satisfactory state of matters. We have arrived at a state of things now when mining will require to be carried on under conditions similar to those of the English mines.

1281. Is it possible for the air to get into a bord that is 25 or 30 yards in advance unless it is forced up? It is forced.

1282. By what means—by the skip? Not at all; the air is forced in probably by the length of the bratticing.

1283. But there is no forcing? You are satisfied with 100 cubic feet of air.

1284. I ask you how the air can get into a bord that is 25 yards from the heading? If there is a short length of bratticing it will go into the bord especially if it is a dip bord.

1285. Do you think it would go in unless it was forced in? Very often it percolates far more than 100 cubic feet going through the bord.

1286. Provided there is a hole at the top to draw it? Often the anemometer would not register it. It takes a certain force of ventilation to set the anemometer going. The present Act is all wrong about ventilation.

1287. Let us suppose a case where there is not enough air; supposing there is just enough going along the heading to supply each man with the bare 100 feet;—how can it get into the bords? In the case that you are putting, if there is only a bare supply going along the heading, then if it is subjected to additional leakage and friction from bratticing you will not attain your end that way.

1288. I suppose you are aware that there is nothing in the Act to compel a manager to put bratticing up? Yes.

1289. Suppose a case where there is not enough air on the face, and the manager refuses to take it in? The inspector would fine him for not having 100 cubic feet per man.

1290. But under the present law it is not in the face where they register the air, it is at the heading? You could not register 500 feet a minute on the face. Your bords are so abnormally wide that you could not register it with an anemometer. The whole thing shows the absurdity of the present provisions for "cut-throughs" and ventilation. If you, in an impartial spirit, consider what I have said about the meaning of the word "adequate" you will understand and solve the whole difficulty.

1291. *Mr. Cook.*] You want a standard to represent the word "adequate"? To confine the minimum to 100 cubic feet is most absurd. The question was thrashed out in the elaborate evidence that was taken for about four years in England. The English Act is the result, not of a spasmodic attempt at legislation, but of the examination of hundreds of witnesses of all grades.

1292. *Mr. Edden.*] How far do you think it is reasonable, according to your knowledge and experience, for a man to be working in front of the air? It depends altogether upon the conditions of the mine and the ventilating current.

1293. We will say in the northern district? I could not answer that question, because I look upon the present Act as the greatest piece of absurdity that was ever printed.

1294. We want to get a better? If you will cut out the provisions as to cut-throughs and ventilation, and allow managers to use their own judgment, it would bring a more competent class of managers into existence.

1295. Practically speaking, would you do away with the Act? Do not go beyond the English Act. The English Act allows the managers to work the coal according to the conditions; our Act does not. It limits you to 35 yards. In England if there is not an adequate amount of ventilation they would require perhaps to alter the shape of their pillars, or if they wanted to make bigger pillars they would probably take bratticing up to the face. What I object to in the present Act is that it is dealing with details and providing for conditions that have passed away or that cannot be anticipated.

Mr. J. B. M.  
Robertson,  
M.E.  
4 April, 1894.

- Mr. J. R. M. Robertson, M. E.  
 4 April, 1894.
1296. But is not bratticing a scientific plan of ventilating? No doubt; but if you require, say, 10,000 feet in No. 1 district to give 150 cubic feet per man it does not follow that if you put bratticing up to the face each man will get 150 feet. The last man will probably get none at all.
1297. Why? Because the additional friction without an increase in the power is so great that unless you increase the ventilating power, and that is not always possible, you cannot get the ventilation. You are increasing the rubbing surface, and if the ventilating column must increase you must increase the power.
1298. You do not mean that the 10,000 feet would have to go into every corner;—would not a strip of canvas let sufficient air in, and once in must it not go round? It may be so. I know of conditions where you have to turn in a great deal more than 150 feet. In the deep collieries in the steam-coal district, where you go very much below the sea level, the mine produces a unique form of gas absolutely unknown in any other part of the world. That gas is not light. Explosive gases generally rise to the roof, but this flows along the floor, like water, and it is the most explosive gas that I know. It is absolutely unique. If you mentioned the chemical composition of that gas to a professor of chemistry in the old country he would put an incredulous smile on his face. And yet it is found to be a most explosive agent. I object to any provision in any Bill, on account of the rapid advances that we have been making in scientific investigations, that would limit you to a hard and fast rule which you may find it expedient to alter to-morrow. The conditions of coal-mining in this country have so altered that the present Act in respect to ventilation is entirely obsolete and utterly unworthy of the mining community.
1299. As long as there are mines worked on the bord and pillar system, what distance ought the bord to be driven without air being taken in by a brattice or otherwise? You know as well as I do that there are mines that would probably require the brattice as near again as other mines where you do not require such care or regularity in putting up the brattice. There are plenty of mines where the force is so great along the main heading that a sheet of brattice would give an adequate ventilation of the face, but I object to the limitation of the pillars. I object to anything being put in the Act about "cut-throughs." I object to anything that compels you, *nolens volens*, to work under a given system.
1300. You think the manager should be a czar over the men? No; as a rule, the managers never are czars. A coal-mine should be worked according to its particular conditions.
1301. Then, if the manager should not have the sole say as to how this should be done, who should? I do not think there is the slightest difference between you and me on this subject. I want the best system of mining and the best system of ventilation.
1302. *Mr. Nicholson.*] I presume you spoke about the Metropolitan Mine when you referred to that explosive gas;—would any amount of air remove that gas from places working with a dip? I think by bratticing to the face the air would mix with the gas as it exudes from the coal and carry it away by the simple law of the diffusion of gases, but it is a difficult thing to do.
1303. Is it not a gas which lies on the floor? Yes.
1304. Would it not require artificial means to lift the gas up? There is 380,000 cubic feet of air per minute going through that mine. I can hardly conceive of a greater ventilating column than that being required.
1305. Do they not use brattice? Yes. I never grudge it when I see it is judiciously used. Probably in our mines in the south we use more brattice than is used by all the other mines put together. That is dealing with a perfectly new and unique condition. I know that the people connected with the colliery are anxious to do all they can to cope with this condition.
1306. Probably that manager might not always be there, and supposing a manager not so competent were to come there? He might neither be as competent nor so particular.
1307. Do you not think it would be wise to have some provision in the Bill to deal with the matter;—what could you have? I shall be glad to assist anyone in such an investigation, but I do not see anything more efficient than the law of the diffusion of gases. Going to the dip is the danger. If you take a brattice close up to the face, and make a large and adequate volume of air continually impinge on the face, that is the only practicable means of dissolving and carrying away this gas. It is a very difficult thing indeed to deal with, and to legislate upon; it would be to legislate for a unique case. I am not sure that other coal-mines when they get to an equal depth, may not develop the same gas. I have seen it, to a small extent, in two other mines. If you put a naked lamp on the pavement where this gas is it would explode. These are conditions which are quite novel to us. I have no doubt that, by-and-bye, we shall see a way of dealing with them. It is desirable that people should put their heads together, and try to make the working of the mines as safe as possible. Anything that you do in the way of ventilation must be simple to be effective. If you make your machinery too elaborate it will break down by its own weight.
1308. *Mr. Edden.*] I want to ask one question about weighing coal;—I suppose you believe that a manager should have the right to say to what height a skip may be filled? I do.
1309. If he says it should be filled 10 inches above the side, it ought not to be more? No.
1310. Do you not think that after the men have complied with that condition, they should be paid for the coal that comes up? Yes. I think the men are paid for the coal that comes up at present. I have never heard anyone object to the present system of averaging. In the three collieries that I have to do with in the south the weight we get paid for is slightly less than we pay the men for. In respect to the height of the skip there may be a limit. I have had stormy controversies with people who said they would fill the skips as high as they pleased, but I dubbed them fools. If you allow a man to build his skip  $3\frac{1}{2}$  feet above the side I do not think he should complain. I have seen a skip come out loaded  $3\frac{1}{2}$  feet above the side. I do not allow any standard. If a skip weighs a ton the men will be paid for that ton.
1311. Suppose two men sent out ten skips in a day, and two of these were weighed, one weighing 13 cwt. and the other 11 cwt., seeing that the other eight are paid for on the average of those two, what should be the average of the ten? The balance between 11 and 13 cwt. In the south I think we take the total weight of the skips that have been weighed and divide it by the number.
1312. *Mr. Cook.*] You said that you had the weights? I am showing how to arrive at the same result in regard to a fortnight's work as you would in regard to a day's work. Supposing the same pair of men had their skips weighed six times during the fortnight—two skips each time—that would be twelve skips. We should, I think, add up the weight of the twelve skips, and divide the answer by twelve, and that would give the average.

1313. *Mr. Edden.*] If the manager tells the men to fill the skips no more than 12 inches above the side, and they comply, ought they to be paid for what coal is in the skip after that? Yes.
1314. Are you aware that in the north there is what is known as the standard weight—that is to say, if 12 cwt. is to be the weight of the skip, and 13 cwt. is sent up, the men get paid for only 12 cwt.? That is not the rule in any of my collieries.
1315. You are too just? I do not think a man can be too just. At one of the collieries in the south, on reflection, they have a standard weight of 16 cwt., but it is very seldom reached. I know that what you say is true, and I do not altogether approve of it. At Greta, I think we had no standard weight, but a standard measure. Whatever went under that measure, which was supposed to be equal to the power of the engines, the man got paid for.
1316. You do not believe in a standard weight? You cannot have both.
1317. *Mr. Cook.*] You believe in a standard measure, but not in a standard weight? I think that the manager should have the right to fix the standard height, and having done so, he should pay for the full amount in the skip.
1318. *Mr. Nicholson.*] It appears from your evidence that you do not believe in fixing by legislation hard and fast rules with regard to ventilation. Would you be in favour of putting the responsibility for the condition of the mine upon the manager? Yes. It was proposed under the Bill, practically, to make the Government inspector the manager, but I object to that.
1319. Would it not be necessary if your view was carried out to make a radical change of managers? I have not the slightest doubt about that.
1320. During the time you have been connected with Mount Kembla and other associated collieries in the south, have you heard any complaints as to the want of ventilation? Yes; numbers of complaints, but there is 78,000 feet of air circulating for 130 men in Mount Kembla mine.
1321. But it was not always in that happy condition? No; prior to Mr. Evans going there it was in a very bad condition. When I went to Mount Kembla I wanted to know how the ventilation was carried on.
1322. Taking your experience in the southern districts for the last ten years, do you not think some of the companies would have been very materially benefited had they used brattice to take air up to the working faces? I could mention a colliery which is now in a transition state from a state of chaos to one of regularity. The South Bulli mine was worked like a rabbit warren. It is two years since we took it over, and while maintaining the output, the former workings have so crushed that a rabbit could scarcely force its way. Now I am insisting upon 10, 12, and 14 yard pillars.
1323. Can you conceive of a mine having every working place bratticed up to within 9 feet of the face? I know many mines in the old country where every place is bratticed, but they have made provision accordingly. The conditions are totally different in those collieries as a rule; there they work sixteen and seventeen hours a day drawing coal; here we draw coal eight and nine hours a day.
1324. *Mr. Edden.*] Where is that? At nearly every colliery. The collieries are working sixteen hours a day in Durham at the present moment. They do not do so much in an hour as we do; we have to crush an abnormal amount of work into an hour. A good many things proposed in the Bill would be practicable if we had the same conditions as they have in the old country. I should have no objection to weighing every skip, but under present conditions it is not practicable.
1325. *Mr. Nicholson.*] Would it be a serious item of cost to put up scales at the South Bulli colliery to weigh every skip? I do not think it would be possible. I have been devoting my time to the subject of screening and handling coal because competition is so keen and it is such a race for life at present that unless you take great care you will be left behind. I do everything with one tippler and one screen at South Bulli colliery. About ten skips a minute can go over that tippler, and I do not see how it is possible for any combination of machines to weigh ten skips a minute. I am going to alter all the collieries to this system.
1326. Do you not know larger collieries in England where they weigh every skip? Yes; I know them, but the conditions are different to the conditions under which we work. We draw more per hour per opening.
1327. The men are supposed to fill clean coal, and if a man puts in too much dirt or slack he is docked;—the coal is weighed on the grass? Do you not see you will have to alter the whole of our conditions to do that. If we had six or seven screens we might do it, but we use only one screen; it is an impossibility.
1328. *Mr. Cook.*] What is to prevent you from getting the screens? The cost would be too great, and the natural features prevent it. We should have to close the pit; we could not carry it on.
1329. *Mr. Nicholson.*] Yet you acknowledge it is the only just way for the miners? I say that the miners are getting all the justice; we pay the men more in the course of the year than we get.
1330. That is not so at all the collieries? I know a colliery where it is not so.
1331. *Mr. Cann.*] Do you refuse to put men on who have been on strike? No; I have refused to put men on who ought never to have been on.
1332. *Mr. Nicholson.*] I was going to ask you a question with regard to Canada and British Columbia;—did you visit the mines of Vancouver Island? Yes.
1333. What do you think of the system of working there? I do not think there is very much to learn there.
1334. I presume you know that their Mining Act compels them to brattice up the places to within 3 yards of the working face? Do they do it?
1335. Seventeen years ago when I worked in the old Wellington Pit, Vancouver, it was done in every instance? If you give us 16s. a ton for coal which they were getting at Vancouver when I was there, I will brattice up the places three times over.
1336. During your experience as a mining engineer on the south coast, have you met with gas in many mines down there? Not in many.
1337. You have heard that there was some? I have heard that there is some, but practically they are not gaseous mines.
1338. Do you not remember a man getting burnt at Mount Kembla? Yes; that was where they were driving through on some old workings.
1339. Did you have boreholes ahead? Yes; but we knew that there would be no water, the gas issued from the bore-hole.
1340. You remember about the Bulli accident? Yes.

Mr. J. R. M.  
Robertson,  
M.E.  
4 April, 1894.

- Mr. J. R. M. Robertson, M.E.  
4 April, 1894.
1341. Do you not think that by a proper system of ventilation that could have been prevented? No; I do not think it was a matter of ventilation at all. It was carelessness as well as ignoring the power of coal-dust, of which at that time little was known.
1342. You do not think that coal-dust was the real cause of that accident? I think that there was very little gas, and that the real damage was done by coal-dust.
1343. Are you aware that in one heading the gas was back to the face? There was very little gas.
1344. Allowing that there was a quantity of gas, do you not think it would have been taking due precaution to have had the mine bratticed up? That was our finding. If they knew that gas was in the heading it was inexcusable that a precaution such as you indicate should not have been taken.
1345. I have heard a great deal in the House with regard to certain statements made by managers of the northern collieries, and referred to by Mr. Brunker, that if they were compelled to use brattice it would be the means of closing three or four of the biggest mines? I have no doubt about that.
1346. Why should it? Because of the expense alone. In some mines brattice does not last many weeks. Then they have not the power to circulate the amount of air. The remedy would be much worse than the disease, and there is no margin of profit. I have no doubt Mr. Brunker referred to the question of profits.
1347. If we have to judge by the amount of the dividends paid by certain mining companies, there is a very large profit? I do not know any mine that is at present paying these dividends. This state of matters has come upon us within a year. Some of the conditions sought now to be imposed might not be objected to if the large profits formerly made could be made now. Those conditions might have a very deterrent effect upon the industry in a time of depression, and this is such a depression as we have never known before.
1348. Mr. Brunker was referring to bratticing? I do not think it would be wise to insist upon it unless it was absolutely necessary. I have heard some of the northern managers say that because they were obliged to brattice they would take good care that everybody else should do the same. There is nothing to be gained by that.
1349. How much per ton additional cost would be incurred by using the ordinary brattice cloth? No man could answer the question in that form. It would depend on the thickness of the seam—it would have a relative proportion to the width. It would add some pence per ton, probably 3d. You have not only the expense of brattice, but the material to fix it and the labour. Brattice cloth is one of the most insecure things I know on which to depend. I should much prefer a more stable way of ventilation than brattice. Of course, altering the style of working would effect the same object.
1350. But in every case you cannot do it? In some cases you can. A large proportion of the seams that are being worked in some of the collieries could be worked better under a different system, which would provide for sweeping ventilation.
1351. You are aware that in some collieries they have tried to work a different system. At Mount Keira they tried the American or Welsh bord system? Not to my knowledge. I have been through the Mount Keira colliery pretty often. They have wide enough bords. At Mount Kembla we have tried Welsh bords with success. Where there is any stone comes down that is all in favour of the Welsh bords, because you get the stone to make the central pack. These are favourable conditions. But the south is really not very favourable to any modification of longwall—and Welsh bords are a modification of longwall. It is a state between bord and pillar and longwall. A great portion of the south coast district is favourable to longwall, but not to Welsh bord. A great portion of the northern district is admirably adapted for Welsh bords, because they have so much stone to turn over.
1352. Where the mine is not adapted for the longwall system, do you not think the bord and pillar system is the best? I have had so much experience of longwall that I have come to the conclusion that a mine which you could not work out on the bord and pillar system by reason of a weak roof is adapted to longwall. There is this to be considered, that the condition of the sales of coal is against the introduction of longwall in this Colony, because sales in this Colony are intermittent. You will have far too much to do one week and nothing to do the next. One of the prime factors to the success of the longwall system is constant work to keep the same amount of weight always on the face and packs. But we have found it very successful in some places in the south. With open wickets and longwall you get rid of all trouble about brattice, and send the air to the face, because you get a full sweep of ventilation.
1353. Are you in favour of conferring power on the Government inspector to call out the men in case of danger? Certainly not—make the manager responsible.
- 1354-55. *Mr. Cann.*] Do you think it is necessary to have a definite return air-way in coal-mines? I think there is as much reason for a "return" as for an "in-take;" in fact, probably more. That is one of the great objections that I have to the colonial system of mining, that proper attention is not paid to the "returns." You generally find the bords broken directly off the return—that is wrong. There is as much reason for a clear return as for a clear in-take.
1356. I understand that you would not leave the return to promiscuously find its way to the surface? No; I should have a regular return.
1357. Do you think it of sufficient importance to have it stipulated in an Act of Parliament? No; I do not think that would be desirable. It should only be provided that the return should be adequate.
1358. I understand that with regard to ventilation you would adopt the phraseology of the English Act, "an adequate amount"? I would.
1359. You would not stipulate the amount? No.
1360. You would leave it to the discretion of someone? Yes.
1361. Of whom? The Government inspector. The inspectors hold in all cases of accident that the manager is guilty.
1362. I suppose it is purely a matter of discretion? Yes. I do not care what Act you make, it will be a matter of discretion on the part of someone.
1363. Seeing that it is a matter of discretion, you will admit that all men do not think the same? Yes.
1364. One man may think a thing dangerous, whilst another thinks it safe? Yes; but in the cases I have mentioned the question of danger does not come in. In case of accidents the inspectors at Home always hold the manager guilty. The managers in England are all emulating with each other as to who shall conduct their place the best. When you encourage a spirit of emulation you have made a great advance towards perfection.

1365. You do not think the question one of sufficient importance to stipulate a minimum quantity of air? The question is all-important, but you would defeat the end in view by stipulating a minimum quantity.
1366. I suppose that in fiery mines the life of each workman depends upon the good conduct of every other workman? To a large extent.
1367. Seeing that that is the case, do you think it would be wise to provide some stipulation as to the qualifications of the men? I think that that is a very large question indeed. I am afraid that if you introduce a subject like that, which really has no practical bearing upon the colliery, you will do more harm than good, because you will be excluding a large body of men from honestly earning their living. A great many of our workmen do not know what fire is; but if you introduced examinations as to qualifications you would exclude three-fourths of them. There is no need for that, as the majority of mines are non-gaseous. In the south the miners are often the sons of selectors round about, and they have had no experience of fire in mines, but they are as intelligent as any other men.
1368. I suppose you can see that it is the first duty of the State to preserve life and limb? It is the first duty of the State, but I do not think it is the duty of a small Colony like this, with industries just struggling into existence, to hamper those industries with conditions which older communities, with infinitely larger resources of the same sort, do not impose. The present Act goes into details which even in the short space of time since it was passed have begun to appear absolutely absurd. For instance, the proposed Bill attempts to make it compulsory to use water cartridges, but at the time that was proposed I pointed out to the Committee of the Upper House that we should pause before passing that clause, because there was a mixed commission of continental savants sitting on the question of explosives. When I was again called upon to give evidence, the first preliminary report of that commission had been put into my hands, and I saw, what I had all along expected, that amongst the long list of explosives that had not been proved dangerous, the water cartridges were not to be found. They stood at the top of the list of dangerous ones that would fire gas. Thus we were in the ridiculous position of attempting to compel men to use an explosive that was the most dangerous of all, instead of others which have been proved to be safe. That illustrates the danger of going into details in an Act of Parliament. We are making such rapid advances in knowledge that if you propose anything to-day, specific details put you out of court in another month.
1369. I understand that any Coal-mines Bill to satisfy you would give entire power to the mining inspector for the security of the workmen? No; I do not see that the mining inspector should do more than see that the mine is safe. The whole responsibility should be thrown upon the manager. Do not throw it upon the inspector—he cannot manage the mine. Let him confine himself to his duty, and he will have plenty to do. I think on the whole that as far as the provision with regard to ventilation is concerned, I could scarcely imagine a better word than that used in the English Act. It has been found sufficient in England, the greatest coal-mining country in the whole world.
1370. Would it not be possible to obtain powers in the Act to make regulations if they are required? An Act of Parliament can do anything, but my impression is that if you go into spasmodic acts of legislation you are keeping your eyes open to one set of facts and shutting your eyes to all others. I have a great abhorrence of hasty and of special legislation.
1371. You said you thought that about 8d. or 10d. per ton on the output would be the increased cost of production under the eight-hours' system? Eight hours is a very different thing from what was proposed in the Bill. I do not suppose that our miners work on an average eight hours a day. But by the Bill the whole mine would only work eight hours, that is quite a different thing.
1372. Do you not pay so much a ton for the getting of the coal? Yes.
1373. The miners only get paid for the number of tons that they produce? Yes.
1374. Then where would it interfere with the cost? If you limit a colliery that works ten hours a day to eight hours a day, the output will be reduced in proportion, but the same number of men will have to be kept on at the old rate, and the reduced production will increase the cost per ton.
1375. That would be in reference to the day men? All the men except the miners. You have your machinery, your capital, and everything ready for a certain output, and if you reduce that by arithmetical proportion you increase the cost.
1376. I suppose you could tell what hours you run the colliery? Yes. The mines as a rule work ten hours a day in the south, but there is about an hour for meals, so that they are actually drawing nine hours or so a day. The men are there from seven until 5 o'clock. The hewers probably work seven hours, nominally they should work eight hours. They work a front and back shift.
1377. I suppose you could work the mine without any break at all—without stopping the drawing of coal? There is always a lot of things to do, and it is convenient to stop for half an hour. The machinery wants oiling, you get short of steam, horses' shoes have to be put on, and it is better for the men to have a little interval. There are very few men who would wish to alter the present state of matters.
1378. *Chairman.*] I suppose you desire that the most competent men should take charge of your machinery as engine-winder? Yes; I am very particular about engine-drivers.
1379. You believe that they ought to thoroughly understand their work? Yes.
1380. Do you think it is sufficient for a man to know that he has enough steam, or is it better that he should thoroughly understand all about the pressure and so forth? He would be no worse for that knowledge, but an ordinary engine-driver has nothing to do with that. You can get boilers guaranteed for a certain amount of pressure, and you work with about half of that. Everybody who has expensive machinery would desire to put it under the charge of the most competent man?
1381. You have said that you were in favour of managers having certificates? Yes.
1382. Do you think that the underground managers ought to have certificates? Yes; but as a rule underground managers are taken from the coal face, and you must not expect in them the same amount of education that would be possessed by a trained manager.
1383. Do you know that such is not required even under the English Act? When I left England underground managers had not certificates; but underground managers do get certificates under the present Act.
1384. There is a clause which stipulates that underground managers shall have second-class certificates? Yes; I should be the first to agree to that, if you could prove that no injustice would be done to a deserving class of men. You take underground managers from the best men in the mine, and you must give them time for education, and see that no injustice is done to them. In that respect I have very little to add to the recommendation which I made in one of those reports of the Commission of which I was President, namely, that the examination to a large extent should be oral. 1385.

Mr. J. R. M.  
Robertson,  
M.E.

4 April, 1894.

- Mr. J. R. M. Robertson, M.E.  
4 April, 1894.
1385. Do you believe that an examination ought to be passed by a deputy? Yes; but all the examinations should be made as practical and as fair as possible.
- 1385½. You believe that a man who takes charge of £10,000 or £12,000 worth of machinery ought to be a competent man? Yes.
1386. And that he ought to pass an examination? Yes; to a certain extent only.
1387. You said you were in favour of the English Act as a whole? As a whole, I am.
1388. You say that it might be amended to make it accord with the circumstances of the Colony? Yes.
1389. Could you point out any clause in the English Act which, if altered, would meet with your approbation? I could by looking over it.
1390. Could you tell us of any clauses of the English Act that could be improved? I should not like to say without having the Act before me. I know there are a few clauses in the English Act which could be altered to suit the conditions of this Colony.
1391. You would take the English Act as a whole, but there are a number of clauses which you would like to alter? There are a number of clauses which, I think, if submitted to a committee of managers, owners, and miners, or members of Parliament, or some fair tribunal, could very likely be altered to suit the natural conditions of the Colony.
1392. Is it not a fact that the latest improvements are taken hold of now by the greatest authorities—safety-catches, and so forth? I thought so when I introduced them here, but I find on going through the world that the best mining engineers have very grave doubts about them, and they do not universally provide them. The reason is that safety-catches and safety-hooks to be of any avail must be continually looked to. You must have spare hooks, and they are very apt to supply a dangerous element in the winding of coal, because an engine-man relying upon the existence of these appliances may be a little careless, and he may over-wind. An over-wind of twenty years ago would be a comparatively small affair; but to over-wind with the present engines would be a very serious affair, and no hooks or catches could prevent a terrible accident from occurring. Nothing in the case of an over-wind could withstand the force of a cage containing 4 or 5 tons coming up at a velocity of (say) 20 miles an hour.
1393. Is it not a fact that the English Act recognises the necessity for these hooks and catches? They do not enforce it, and I cannot see that they recognise it.
1394. Is it not a fact that there is a disability attached where there is not a hook or catch;—does not the Act say that they must not wind under those circumstances at a rate of more than 3 miles an hour? It may be so, but I know that you would never get your coal drawn up at 3 miles an hour.
1395. What would you stipulate as the minimum age for engine-winders? You need not be particular here—they are all of mature age. At Home the age is 18.
1396. Do you know that the Act fixes the age at 22? I did not know that. In the former Act it was 18 years. I do not think you need bother much about that.
1397. I suppose you could give many reasons why we are going through the present depression? Yes. I do not think it is referable to any one cause. It may have been accentuated by something, but it is attributable to a combination of many causes.
1398. Do you think it is attributable to the dishonest way in which shares and mines are bought and sold? I do not think that that has anything to do with the depression. I do not know anything about dishonesty in shares; I never owned one in my life.
1399. You know the Greta colliery well? I do.
1400. Do you know the original cost of that colliery? I do not.
1401. Was it not something like £150,000? I cannot tell you. I daresay, from what I have heard, that it cost a great deal more than it is worth. The capital which it used to be worked under in my time was about £40,000, and it had to pay dividends on about that amount.
1402. I thought that Mr. Vickery bought it for £29,000? I do not know.
1403. Do you know to whom he sold the colliery;—did he sell it to Mr. Harper? No; he sold it to a Melbourne firm, of which Dr. le Febvre and Mr. Roberts were members.
1404. The reason why I am asking this is to point out that this sort of thing may be partly the cause of the depression? I do not think it has anything to do with the depression. The depression is referable to a great many causes, some of them probably within our own comprehension and rectification, and others perfectly beyond our control. No doubt one cause has been outside competition. Yesterday I received a letter from some of our agents in Singapore notifying the sale of two or three cargoes, and stating that, whilst in 1892, 89,000 tons of Australian coal went to Singapore, and only 43,000 tons of Japanese coal, in 1893 they received 149,000 tons of Japanese coal, and only 40,000 tons of Australian coal. The silver currency is at the bottom of a great deal of our depression, and at the bottom of our decreased export to the east. The decrease in the price of silver is an advantage to the locally produced article, and a disadvantage to the Australian, and you know we have no control over the silver currency.
1405. Do you know what the Greta colliery has been sold for recently—£225,000? It was much beyond its value.
1406. Mr. Harper, on behalf of the syndicate, gave £57,000? No, he did not give that.
1407. And he went to London and floated it for £225,000? He is a clever man.
1408. Do you think that such transactions as that are to the benefit of the mining community? That is a question upon which I have a very strong opinion. I do not think it is conducive to the credit of the Colony. Some people think that the more money you extract from the British capitalist the better. I have a different opinion. I do not think it is conducive to the ultimate prosperity of the Colony.
1409. I asked a question with regard to the use of automatic safety appliances. I was referring to rule 26 of clause 49 of the English Act which says:—
- If in any mine the winding-up apparatus is not provided with some automatic contrivance to prevent over-winding, then the cage, when men are being raised, shall not be wound up at a speed exceeding 3 miles an hour after the cage has reached a point in the shaft to be fixed by the special rules?
- That means nothing at all.
1410. You will admit that it imposes a disability? I must repeat that I believe I was the first in the Colony to introduce these automatic appliances. I will always do it; but I really do not know that you can place reliance upon them. When I did it at first, I told the manager, in the presence of both engineers, what I thought about it. I said, "Now you are provided with every appliance which I can think of to secure safety. But I tell you this, that if I were the manager, and if an engine-man of mine put the automatic safety appliance into operation I should fine him £10."
- 1411.

1411. Unless he was compelled? The safety appliance being brought into operation condemns the man at once. It shows his carelessness.
1412. Is it not a fact that at times the most experienced men cannot control circumstances when there is a break? That is a very different thing; that is an accident that you cannot provide for. But what case of overwinding did you ever know to result from a break. The break would take place either at the lift or in the down-going rope. It is a strange fact, and one that we cannot explain, that a rope does not always break with a load on it, but generally when it is empty.
1413. You say that it is impossible to make a stipulation as to the minimum quantity of air that should be supplied? It is not impossible, but it would be very prejudicial; it would be very improper to do it.
1414. Has the minimum of 100 feet ever hampered the managers? I do not think it has. The point is this, that if you limit it to 100 feet or to 150 feet, the tendency will be to give no more than the Act requires, whereas it is possible that circumstances may arise—have arisen—necessitating a much larger supply. It would be far better not to go into details. Do not suppose that I object to a minimum of 150 feet, I am only giving an opinion as a mining engineer who has studied ventilation, and I have simply pointed out where the Committee are going wrong. It is with the object of improving the management of mines that I do it. It is against the immediate interests of those who employ me to object to the minimum, but I say again that adequate ventilation is the cheapest thing for the master and the most necessary thing that he could supply the men with.
1415. It is better for the property of the owner, and better for the working men? Yes; I do not object to a provision to force the manager to ventilate properly.
1416. When you have to put down two shafts, what distance would you have them apart? A few feet of solid strata is just as good as 1,000 feet, but in this Colony where they have large holdings, the tendency would be very properly to separate the shafts a considerable distance. It is always advisable to utilise a shaft for the winding of the coal in its immediate vicinity. I do not always approve of two shafts together, because it is really the same as only one shaft.
1417. Whilst you have been in the Southern district, did you ever know the Miners' Association work to the detriment of the owners or of the community? I would rather you did not put that question. I have always had the courage of my opinion, and I am not one who would condemn a man who holds opposite opinions. I do not want to charge the Miners' Association with anything whatever. I have found some most reasonable men connected with it, and I have known some who were dense and obstructive.
1418. At the head of affairs? Yes; those are the only members of the Association that you meet as a rule.
1419. You never found that those men would impede you, as a manager, in doing your duty? Well, in a certain way. I do not know that they did it willingly. The Association had not the forethought that I should have given them credit for. Several mines have been stopped, simply on account of want of consideration by the Union. I have been opposed more than anybody in the Colony to introducing new systems.
1420. Did the chief obstruction come from the miners? Very often. They opposed what I considered necessary alterations in the system of working. But I wanted alterations for their good, as well as for the good of the colliery, and although the men admitted that I was right, the executive would not meet me, and the consequence was that the collieries were stopped. I spoke to Mr. Curley about that on a recent occasion in Sydney, and he said he thought my explanation was quite reasonable, and that it required to be looked into.
1421. You understand that in the north of England there is a permanent accident fund? Yes.
1422. Do you know that in your district a fund has been in operation for some time? I have heard that there was a fund, but that it was in an insolvent state.
1423. Do you know that in the north of England, and in other places, the owners contribute to a fund? Yes; I quite approve of that under certain limitations.
1424. Do you know that the owners in your district ever contributed a penny to the fund? I do not know that they were ever asked. I do not think they know that there is such a thing. I do not think you should ask the owners to contribute to any thing that they have not a say in the management of. I have taken as much interest in the men as most people, but in the matter of co-operation, I believe I was the first in the part of Scotland, where I was principally located, to introduce co-operative stores. I made a provision that as we supplied the bulk of the money we should have a say in the management. By-and-bye they thought I was too autocratic, and took the affair out of my hands. Then they went bankrupt. I then took the undertaking out of its difficulties, and established it on a fair footing, and I believe it is going on to this day. A business man can be of great assistance to men even in their own undertakings. Promoting such affairs fosters a proper spirit amongst men. There should be no wide gulf between employers and men employed. The more they come together the better.
1425. In the north of England the owners and the miners' representatives form a committee to carry on these undertakings? That is the proper course.
1426. Are you in favour of such a scheme in this Colony? Yes; I am in favour of any fair scheme such as that.
1427. You, as a representative man, would not object to pay your quota if there was a representative board? I am sure I should not.
1428. You have seen dire distress in case of accidents? I have.
1429. It is not a desirable thing to start begging for a man who has been disabled whilst following his avocation? I am a great believer in any friendly scheme where the employers and employed come forward for mutual consultation. From my experience of these societies the men really deserve great credit for their liberality in supporting them.
1430. When a serious accident has happened you have not found the miners to be cowards? I have heard a great many stories, and if I believed one-tenth of them I should have had a very severe opinion; but when I come directly into contact with the men I find, on the whole, them reasonable.
1431. In cases of accidents where you have had to superintend their efforts, you have not found them wanting in courage? No.
1432. There is a clause in the Act making provision for the inspections of the workings prior to the men resuming work? I do not know whether it is in the present Act or not, but it is always done and recorded in the books.

Mr. J. R. M.  
Robertson,  
M.E.

4 April, 1894.

- Mr. J. R. M. Robertson, M.E.  
4 April, 1894.
1433. You would enforce it? Certainly; it is a perfectly necessary thing.
1434. In the case of a missed shot, what time would you allow to elapse? I think the provision in the Bill is perfectly nonsensical. I would allow half an hour or an hour.
1435. If the men are willing would that be sufficient? If the men express the slightest fear, no prudent man would insist on their going on with their work.
1436. You would not tell them not to come again? No; but to say that twenty-four hours shall elapse is absurd.
1437. *Mr. Nicholson.*] In regard to conciliation to prevent a strike or lock-out, is it not your opinion that the appointment of a Board of Conciliation, composed of mine-owners, managers, and workmen, would do a great deal to settle disputes? Probably it would. I think if owners were allowed to settle with their own men that would prevent a good many strikes, because if there are six or seven collieries in a district and a question arises which may not press equally upon all those collieries it is a pity that the question should be pressed for the decision of a whole group. I think that many strikes could be avoided, but I do not see my way clear for any conciliation or Board of Arbitration to enforce awards for this reason: Supposing the award went against the owners. If the owner was quite correct and consistent he would close his mine. But if the award went against the men, how could the owner enforce obedience. The men have only to give their notice and leave. I see matters are tending towards a good object, but I do not see a practicable outcome. I think that probably modern unionism has a little to answer for with regard to strikes, because they insist on the absurd standard seam payment, equal wages, and all these absurdities, which, although they may perfectly represent the case at the time, in consequence of alterations that take place they do not apply all.
1438. If every colliery regulates its own affairs, meetings between managers, owners, and working men might lead to the settlement of a good many disputes? I think so. Nothing irritates me more than to have a stranger coming to me and saying, "I have been deputed by the men to consult with you as to the state of affairs in No. 1 colliery." I ask, "Are you a worker in No. 1 colliery?" The answer is "No, I am in No. 7," and the question is "What do you know about the condition of affairs in No. 1 colliery?" One cannot feel in sympathy with the man coming on such an errand. You are on pins and needles with the man from the first, and he will say, "You have always had the name of being an unreasonable man, and I believe it."
1439. *Mr. Scott.*] You believe that local disputes ought to be settled between the men in the collieries and the manager? Yes. I have had as many disputes, probably, as any man living, and they have always been settled whenever the individual men and I came together. I am liable to make mistakes, and the best manager may gloss a thing over in his account, and when individual men have explained things to me I have often admitted that I have been wrong to a certain extent—sometimes I found that they were wrong, but the dispute would be settled.
1440. *Chairman.*] Is it not a fact that the Trades Unions demand that the men must try to settle any dispute locally first? It is as you say. But a man has come to me and said, "I have been sent by the executive," and I said, "What business had you to cause this dissension and write to the executive without apprising me?" They said, "Well, it is done, and we are sent to demand so-and-so." I said, "You will, of course, be amenable to reason. You have put your views before the executive, but I have not been able to put my views before them. I do not think you have a leg to stand upon." They said, "Well, we want so-and-so, and if you do not give it, we shall strike." I said, "Very well, if I don't give you an answer in the affirmative, strike," and, of course, there is no use attempting to reason in that case.

THURSDAY, 5 APRIL, 1894.

Present:—

MR. NICHOLSON,

MR. COOK.

MR. EDDEN,

J. L. FEGAN, ESQ., IN THE CHAIR.

Adam Cook called in, sworn, and examined:—

- Mr. A. Cook.  
5 April, 1894.
1441. *Chairman.*] I suppose you are President of the Hunter River Miners' Association? Yes.
1442. You have had a large experience as a miner? Yes, over thirty years.
- 1443-4. Would you wish to make a statement to the Committee? Yes; I think it would be the best course. The first matter that I should like to touch upon, and which I think most important as affecting the health and comfort of the men, is the question of ventilation. A majority of the miners in the district I belong to would be perfectly satisfied with the alteration provided for in the Bill recently before the Legislative Assembly. I am a thorough believer in the 150 feet per minute per man minimum. I think that is the least quantity of air that ought to be guaranteed for sanitary purposes. I believe there is considerable difference of opinion about bratticing and short pillars. I am a believer in short pillars. I think it would be a great deal better and it would be satisfactory to the majority of the miners if cut-throughs were made not more than 20 or 25 yards apart at the utmost. Some people say that that would entail extra expense to the proprietors, but I think that would be counterbalanced by other benefits. In most of the collieries they have a system of taking out the pillars. In several of the collieries in the district which I belong to it is the custom when taking out the pillars to have extra cut-throughs cut across the centre of the pillar, and take one-half of the pillar down and leave the other half of the pillar up. But I maintain that these extra cut-throughs would not be necessary if the pillars were shortened. I think it would be a great advantage both to the miners and to the proprietors. If the 150 feet of air was always confined to the headings near the working-places it follows, as a matter of course, the working-places would be kept free of powder smoke and impurities. There are great complaints in the northern district about miners filling dirty coal, and in several of our seams in the northern district there is a considerable number of bands and other refuse. There are the twopenny bands, and brass and kerosene, and other refuse in the seam, and the coal, as a general rule, is very difficult to get. In fact, you can scarcely get any coal without using a considerable amount of powder, and the place is always pretty well filled with smoke. If the air was kept sweeping along the heading nearest the working-places they would be kept free of powder smoke, dirt

and you could get clean coal. Men are sometimes punished severely for sending up small quantities of dirt in the coal. As regards the question of bratticing, it is not a question of expense altogether, though of course this has to be taken into consideration. It is not altogether what we should like, but what we can get. That is the most important consideration with me. I think it would be difficult to take the bratticing up the bord where there is a very soft roof. The roof would be coming down and interfering with the bratticing, and the air would be escaping. Some of our seams are between 8 and 9 feet high. I am most decidedly in favour of shortening the pillars. It is absolutely necessary that they should not be more than 25 yards apart, because in my experience I have seen men working at least 45 yards in front of the current of air. Under the present system the cut-throughs are supposed to be 35 yards apart. But after driving that distance, I have seen where another 2 yards had to be taken out for the width of the cut-through, and thus drive 8 or 9 yards through the pillar, making a distance of 46 yards, before a fresh current of air could be got. As regards the ventilation question, there is no matter which has been talked about more freely amongst the miners for a number of years than the miners being allowed to travel on the return air-way. That is a thing which ought to be absolutely prohibited. I believe it is the custom in some collieries for men to be allowed to travel in return air-ways, but we know that the powder smoke and other impurities go into that air-way, and it is bound to be injurious to men travelling in it after a hard day's work. I would also refer to the question of man-holes. An accident occurred about the commencement of the present year in the travelling road at Lambton colliery, a man being injured seriously whilst coming from his work. I believe the present Act says that the man-holes are to be 3 feet in width and of sufficient depth. It ought to be stated what sufficient depth means. The man-holes ought to be cut down to the floor of the seam. At that colliery that was not done in every case. The man-hole was driven about 18 inches, and there was a canch of 2 feet left, then it was driven a little further. If a man was in a hurry, and ran against the canch, it might throw him back, though that was not how the accident happened to which I have referred.

Mr. A. Cook.  
5 April, 1894.

1445. *Chairman.*] A canch is a rise? It is a piece of coal left on the floor of the seam. I believe it is customary to have the man-holes whitewashed, but it is not compulsory. That ought to be done in all cases. There has been for a number of years a strong agitation in our district in favour of legalising the eight hours. Some people say that there has not been any particular desire shown for it, and that there is no necessity for it, but to my mind there is a greater necessity for legalising it now than ever existed at any previous time.

1446. *Mr. Edden.*] Why? In consequence of the serious depression. We only hold the eight hours on sufferance, and we are at the mercy of any unscrupulous employers. If they made a determined stand and said the men must work nine hours a day, the chances are that they would be successful. The men have to be guarded against unscrupulous employers and even against themselves. Eight hours a day is quite long enough for anyone to work in a mine—it is too long. But the miners would be fairly satisfied with the eight hours if it was legalised. Very often this request has been made by the miners in the Northern district, and from a body known as the Eight-hours Committee, to their Parliamentary representatives to make a determined effort to get the eight hours legalised.

1447. *Chairman.*] Are the miners represented on the Eight-hours Committee? Yes.

1448. Every lodge in the district? Not every lodge, but the great majority.

1449. *Mr. Edden.*] But they all believe in it? Yes.

1450. You do not know any lodge that is not in favour of the eight hours in the northern district? I do not.

1451. And you are President of the Miners' Association? Yes; and I have had ample opportunity of learning the opinion of the men about it. I do not think it would be wise for me to enter into what I have heard from opposite parties about the eight hours. In the Bill last introduced into the Assembly, it is proposed that they shall be eight hours drawing, less twenty minutes for meals, and the great cry by those opposed to it is that it would increase the cost of production, and would, therefore, be very detrimental to the mine-owners. But I have not been able exactly to see it in that light. We find that the output of the various mines is greater to-day than at any previous time. There is a possibility of carrying that a little too far, because if you reduce the drawing hours to five or six, it must materially interfere with the output. But I do not think that reducing it by twenty minutes would have any great effect. I do not believe that any of the mines in the Northern district are working to their fullest capacity, as far as the output is concerned. The miners are contractors, being paid so much a ton, and the wheelers are paid so much per score, so the effect of employing a few more miners and wheelers ought not to cause much additional expense.

1452. *Mr. Edden.*] If it did it would be a trifle? Yes.

1453. *Mr. Nicholson.*] If the hauling material was powerful enough, and there was sufficient rolling stock, the adoption of the eight hours would not increase the cost at all, would it? No. I should like to refer to a matter in connection with the check-inspectors. I am inclined to think that very often the appointment of check-inspectors is a farce as far as the miners are concerned. Under the present Act they have the privilege of appointing two check-inspectors—members of each lodge—but I believe that very often incompetent persons are appointed to positions of that kind, and I believe also that, especially in times like this, the men are afraid to perform their duties as they ought to be done. I think an alteration ought to be made in this respect. I have thought it would be a good thing if each district was allowed to appoint a general check-inspector for the district. We should then be in a position to get an expert; a man who thoroughly understands his duties. Of course, he would be paid by the miners. He would visit the various collieries every month, and members of each lodge would have a right to appoint a check-inspector to go about with this general check-inspector. I think it would be a great benefit to the miners if that were done, because we could rely upon getting fair and independent reports. The duties would be a great deal better performed by having a general check-inspector, to be paid by the miners.

1454. *Chairman.*] And a man to be paid by the miners to go round with him? Yes; each lodge should have the right to appoint a man to go round with him.

1455. Do you mean appointed by men of each pit set, or by the men of each lodge? Each lodge. There is another matter in connection with the appointment of check-weighmen to which I would refer. Under the present Act a check-weighman must be an employee of the colliery. There is a strong desire in the Northern district to have an alteration made in that respect. I am very much in favour of it. Seeing that the miners have to pay the check-weighman, they ought to have the right to employ whom they like, whether

Mr. A. Cook. whether he belongs to that particular colliery or not, as long as he is qualified to perform the duties of the office. Suppose he is recognised as an employee of the colliery, in the event of his being dismissed from the position of check-weighman, there is no guarantee that he will get employment at the colliery. I contend, therefore, that it is only right that the men should have the power to appoint anyone they think fit to the position of check-weighman. I would also refer to the question as to the standard weight, in connection with which there has been a grievance in the district for a considerable number of years. I believe it only exists now at four or five collieries in the district.

5 April, 1894.

1456. Which are those collieries? The Glebe, the Duckenfield, the Lambton, the Hetton, and the New Lambton.

1457. *Mr. Edden.*] Have you ever known any trouble about this standard weight? There was trouble at the Hetton colliery some time ago. There was a case brought into Court, but through some technical point the man lost the case. At the colliery at which I have been working for a number of years they used to have the standard weight system.

1458. What colliery is that? The Co-operative colliery.

1459. Whilst you believe in the abolition of the standard weight, you believe in retaining the standard height? I believe it is absolutely necessary for the proprietors to have some protection for machinery and rolling-stock, and I believe in the standard height.

1460. After that you believe they ought to be paid for what they send up? Most decidedly.

1461. And it has been a grievance for a very long time? It has.

1462. Did you ever know a colliery to be on the verge of a stoppage over it? Yes. The colliery at which I have been working has nearly come to a strike two or three times over it.

1463. You have spoken about the dirt in the seams in the north? Yes.

1464. As a rule, there is a deal of dirt in the seams in the north? Yes.

1465. And even in the highest seams the ground where the coal is taken from is filled up again by the dirt made? Yes; partly.

1466. You stated that you believed in the cut-throughs being made short instead of bratticing being used? Yes; I have a preference for that.

1467. Which would be the cheaper—cut-throughs or bratticing? I believe the cut-throughs would be cheaper, but I have not made a calculation.

1468. I suppose you are fully convinced that it wants some alteration? Certainly.

1469. There should be either shorter cut-throughs or bratticing? Yes.

1470. You said something about seams 9 feet high in which it would entail a greater expenditure to put up bratticing, but is it not a fact that when half the space is filled up by the dirt that reduces the expense a great deal, so that there would be no need to keep a bord 9 feet high? A portion of the seam would be filled up by the refuse. But I consider that a great objection to the bratticing is that in many of our northern collieries there is soft roof, and the chances are that the roof would be coming down here and there and materially interfering with the bratticing. Therefore I do not think it would accomplish the object in view.

1471. Where there is a soft roof it has to be timbered and they have to keep the timber up; the amendment put in the Bill in reference to the brattice stipulates that it shall be within 15 yards of the face;—is it not a fact that they have the timber close up on the way? Yes.

1472. And keeping the brattice up would involve no more extra labour, and if the roof was going to keep falling would it not injure the men as well as the brattice? That does not follow. It would take a very little piece to interfere with the bratticing after the men have passed.

1473. How many places are there where there are these bad roofs? I do not think there is a colliery in the Northern district free from places of that kind. I am not opposed to bratticing altogether, but I believe the short cut-throughs would give general satisfaction, and be both cheaper and simpler than bratticing.

1474. You mean to say that you are convinced that there is an alteration wanted in the mode of ventilation; but you think it would be preferable to have a shorter distance between the cut-throughs; but if not, there must be bratticing? Most decidedly; but the simpler plan is to have shorter distance between the cut-throughs—20 or 25 yards.

1475. *Mr. Nicholson.*] You think that short cut-throughs will be cheaper? Yes.

1476. Suppose you are driving a bord down 50 yards, in that distance you will require two cut-throughs of, say, 6 yards each. These would amount to 12 yards at 3s. a yard; that would be 36s.? Yes.

1477. Then, on the other hand, we put in that distance according to the requirements of the Bill passed by the Assembly,—36 yards of brattice cloth at 9d. a yard, bringing it within the required distance of the working face. That would amount to 27s.? Yes.

1478. Is it not your opinion that they could get that current of air by the brattice system better than by short-distance cut-throughs? Certainly, if the bratticing was not liable to be interfered with by soft roof or something of that kind. The shortening of the cut-throughs, in my opinion, would be no extra expense to the proprietors. The pillars are supposed at present to be 35 yards, and it is necessary to drive an extra cut-through in order to take the pillars out. That is the custom in the Northern district. If the cut-throughs were made every 20 or 25 yards, there would be no necessity for the extra cut-through, and no additional expense entailed, because they would be able to take out more of the pillars.

1479. When the miners start to take out a pillar and put a cross-cut over, are they paid for? Wherever it is necessary to drive cut-throughs for the purpose of taking out pillars or anything else the men are entitled to be paid for it.

1480. You said with regard to the ventilation of mines, that the miners generally speaking were satisfied with the provisions in the present Bill? Yes.

1481. I understood you to mean that they were satisfied with the system of bratticing, or with shorter cut-throughs, whichever might obtain? Both these provisions were contained in the last Bill, but I do not think it is necessary to have both.

1482. You are satisfied that by that system you can get a better circulation of air on the working faces than by any other means? Most decidedly, if nothing interferes with the bratticing.

1483. You referred to man-holes. You say they are driven to a level in the seam, but on canches?—

1483½. You recognise that there is danger from having them cut out of canches? Yes.

1484. Is it not a fact that the Bill stipulates that they shall be a certain height and depth? No.

1485. You consider it necessary that they should cut a certain height and a certain depth? Yes; the width is stipulated 3 feet, but it says that there shall be a sufficient depth, that being really left to the manager. Mr. A. Cook.  
5 April, 1894.

1486. *Mr. Edden.*] It ought not to be less than 3 feet? No.

1487. *Mr. Nicholson.*] Do you think it necessary that the whole of the man-holes should be whitewashed so that the men can see them? Yes.

1488. You would be in favour of legalising the eight hours? Yes.

1489. So that both the men and the owners would be compelled to observe the strict letter of the law? Yes.

1490. Is it your opinion that the eight hours question has caused considerable friction between employers and employees in the past? No; there has been very little friction in our district about the matter.

1491. Has there been any friction at all either in your district or any where else? I have not noticed anything of the kind during my experience in the Colony. There was a considerable amount of friction in the old country over the establishment of the eight hours.

1492. You spoke about check inspectors, would you prefer to have a permanent check inspector for each Colony? For each district.

1493. The same as the Government Inspector? Yes, in each district.

1494. You think it preferable to the system that now obtains? Yes; you would get better reports.

1495. Are you in favour of having not only your own inspector's report published, but also that of the Government Inspector? Yes; all reports in connection with the inspection of collieries, whether by Government officials or check inspectors, ought to be published.

1496. Is it your opinion that the miners ought to know what the Government Inspectors reports contain? Certainly.

1497. You referred to the standard weight system;—do you consider it an unfair system? Yes; very unfair.

1498. The men would be willing for the owner to limit the height of the skip to a certain standard? Yes; it is a great deal easier for a man to fill to a certain height than to a certain weight. I can mention something that I experienced in connection with the colliery that I was working at. About two years ago the standard weight was abolished. It used to be  $13\frac{1}{2}$  cwt. I have known skips to be sent up containing 16 cwt. and 17 cwt. of coal but the miners were paid for only  $13\frac{1}{2}$  cwt. Since the standard weight has been abolished it is nothing unusual to see men with an average of 14 cwt.,  $14\frac{1}{2}$  cwt., and 15 cwt. That shows that the man was robbed to that amount before the system was abolished. This in addition to the amount of slack which the proprietors get paid for, but for which the miners get absolutely nothing. They get that over and above the coal under the standard weight system.

1499. I understand that where the standard weight system is not in force, you have what is called the average system? Yes.

1500. Are the miners satisfied with that system? Yes.

1501. Would they be better satisfied if they had every skip weighed? No doubt, but there is a lot of difficulty in the way of bringing that about.

1502. Have you ever worked at a colliery where they weighed every skip? I have.

1503. Where there is a considerable output? No; the output was not to be compared with that of the mines in the Northern District.

1504. Do you not consider that every producer has a right to have his produce weighed when he goes to market? As a matter of justice and fairness it is right enough; but I fail to see how it could be brought about, especially in the large mines of the Northern District without interfering very much with the output.

1505. *Mr. Edden.*] I suppose when you speak about the difficulty in the north you mean as to the cleaning of the coal? No; I think there would be so much time taken up in weighing every skip that it would interfere with the output and interfere with the wages of the miners. On the whole, I think the miners are pretty well satisfied with the present system of averaging.

1506. *Mr. Nicholson.*] I do not mean that they should weigh the whole output as the collieries are now arranged; is it not easy to have a scale put so that they might weigh every ton as far as the coal is run out; have you never seen it done? No.

1507. Could you imagine a situation in which it could easily be done? No; I am not in a position to say anything about that; but if it could be done without interfering with the output, I should certainly be glad to see it brought about.

1508. If it could be done fairly to both parties it is the only way by which the miners could get paid for the whole of their produce? Yes.

1509. *Chairman.*] Being President of the Miners Association, you have had to deal with a large number of disputes? Yes.

1510. Through your organisation? Yes.

1511. And your experience has been that without that organisation there would have been further trouble? Most decidedly.

1512. And the Association has been the means of settling many disputes amicably? Very many, indeed.

1513. Is it not a fact that in the Northern District before you would take up a dispute every means must have been used locally to settle it? That is according to our constitution.

1514. You do not recognise a dispute unless every attempt has been made locally to settle it? No.

1515. Should any miners have a dispute with their employers, and come to the head Association, your first question would be, "Have you tried to settle the dispute?" That would be the first question.

1516. You do not recognise any case whatever until it has been tried to be settled locally between the manager and the men? That is the custom.

1517. Is it not a fact that if the men do not try to settle their disputes locally, and that if they strike without the sanction of the district, you do not recognise them? It is; they are not entitled to be supported.

1518. Do you know the Stockton colliery? Yes.

1519. Do you remember that some time since the inspector made a report which caused action to be taken against the management of the colliery? Yes.

1520. After the inspector had reported, a number of men belonging to the pit also made an examination and reported? Yes.

- Mr. A. Cook, 1521. Did the men then decide to go to work on the workmen's report? The Stockton miners did.  
 5 April, 1894. 1522. What position did your Association take up then? They went in direct opposition to the action of the Stockton miners.  
 1523. Upholding the action of the Inspector of Collieries? Yes.  
 1524. Was the manager fined? Yes; on two occasions, in accordance with the provisions of the Mines Regulation Act.  
 1525. So the district did not approve of these men going to work of their own accord? No.  
 1526. Is it not a fact that up to that time you had a clause in your rules providing that so much was to be given to the relatives of persons who have met with fatal accidents? Yes; providing for a special levy of 6d. per member.  
 1527. And owing to the position which the Stockton miners took up that was struck out of your rules? Yes; but I am not going to say that that was the only cause of its being struck out. But I believe that the action of the Stockton miners had considerable weight in the matter. The members of the Association were dissatisfied with that rule before the dispute at the Stockton mine took place; but that dispute had the effect of bringing things to a crisis.  
 1528. Is not a great deal of time and expense saved to the management by having the men in the Association? Yes.  
 1529. No dispute can be recognised by the district until it has been properly investigated? Not until it has been properly investigated.

Mr. John McFadyen called in, sworn, and examined:—

- Mr. J. McFadyen, 1530-1. *Chairman.*] You are treasurer of the Hunter River District Miner's Association? Yes.  
 5 April, 1894. 1532. You have had large experience in mining? Yes; about thirty-five years.  
 1533. How many years have you been in the Northern District? During the whole of my time as a miner.  
 1534. Has there ever been any agitation in favour of legalising the eight hours? Yes.  
 1535. During your time in the Northern District as a representative of the miners, has there been an agreement come to between the employers and the employees as to the eight hours? There was not exactly an agreement, but there was an understanding come to between the miners and the proprietors many years ago that the pits should only work eight hours.  
 1536. And later on, after the 1888 strike, there was an agreement entered into to that effect? I am not aware that there was an agreement, but there was that understanding. Through that understanding it was embodied in the late Bill.  
 1537. Is it not a fact that the miners of that district demanded from their parliamentary representatives the legalising the eight hours? Yes; it has been agitated for for years.  
 1538. *Mr. Edden.*] I suppose that you are aware that there has been a Mining Bill before the House? Yes.  
 1539. There were several things tried to be included in the Bill to which exception seems to be taken;—does your experience teach you that it is necessary in the north or in any mines in this country that some alteration should be made in the mode of ventilation? Yes; I consider that we should have better ventilation than we have at present.  
 1540. It is not satisfactory? No.  
 1541. There is a deal of powder used in the northern mines? Yes.  
 1542. The seams are dirty and difficult for the men to clean? Yes, portions of them.  
 1543. So that, besides being injurious to the health of the men, if the place is not kept clear of powder smoke it prevents the men from cleaning their coal? They cannot see to keep the coal clean.  
 1544. And dirty coal is detrimental to the trade of the port? Yes.  
 1545. Can you give us any idea as to how the ventilation might be improved? The ventilation could be improved by having a shorter distance between the cut-throughs, and perhaps in some cases by bratticing. By either one or the other, and by keeping the furnaces going to clear the mine when the men are not there during the night, so that the gases will not have time to accumulate. If pure air was coming all the time there would not be so much difficulty.  
 1546. Then you are quite convinced that it is necessary that some alterations should be made in the mode of ventilation? I am convinced of that.  
 1547. In the north they have what is called the standard-weight system at some of the collieries? Yes; we have it where I am working now.  
 1548. *Chairman.*] Where is that? At Lambton.  
 1549. *Mr. Edden.*] Has there ever been any bother over that in the district? There has been an agitation many times in the district over it, and there was likely to be a complication, but we did not go to extremes.  
 1550. I suppose you consider that the manager should have the power to say from what height the skips should be filled? Yes.  
 1551. But after that he ought to pay for what comes up? Yes.  
 1552. Do not the men lose money by the standard-weight system? Yes; I am satisfied that the proprietors are getting over-weight by the standard-weight system.  
 1553. And it ought to be abolished as long as the master has the power to say to what height the skip shall be filled? Yes.  
 1554. *Mr. Nicholson.*] Are you in favour of the eight hours' system? Undoubtedly.  
 1555. Do you think if it was passed into law it would be satisfactory to the miners generally? I do.  
 1556. You think that there is a necessity for an improvement in the ventilation in the mines? Yes; I have said so.  
 1557. Which do you think would be better—to shorten the distance between the cut-throughs, or put up brattice to carry the air up to the working face? Brattice is very good if sufficient care is exercised, but unless care is taken to keep the brattice up there is a probability of the air escaping.  
 1558. It is like everything else, it is of no use unless it is put up properly and kept there? Just so.  
 1559. Could you give any idea as to how much per ton the cost of producing coal would be increased if brattice were put up in every working place? I could not.  
 1560. You have not figured it out? No.  
 1561. Do you think it would be more than 1d. per ton? No; I do not think it would be 1d. per ton, but that is only my opinion.

1562. *Chairman.*] You were one of the original starters of the Miners' Union in the Northern District? Yes.

Mr.  
J. McFadyen.

1563. You worked in the district before there was a Miners' Union? Yes.

1564. Do you know that it has been a benefit to both the employers and employees as a trade organisation? Yes, I believe it has, and to the public generally.

5 April, 1894.

1565. Before the Trades' Union started any set of men could have a strike when they had a mind? Yes.

1566. Since your organisation has got into working order, that cannot take place without the sanction of the district? Not constitutionally.

1567. If it does take place they are not recognised? The strikers are not recognised as part of the Association.

1568. You look upon them as being outside your ranks if they take steps without the sanction of the Association? Yes.

1569. I suppose that you and your fellow officers have been the means of settling many disputes which would otherwise have ended in strikes? I believe so.

1570. Is it not a fact that in connection with the Miners' Union you require, in the first instance, that disputes must, if possible, be settled locally? Yes; after the local committee the lodge takes it up, and in the event of their failing the district takes it up, and investigates the whole matter.

1571. If there is a dispute at a colliery, the matter first goes before a committee, and if the committee do not consider it of sufficient importance for the case to go to the lodge, they throw it out? Yes.

1572. If they think it of sufficient importance, then it has to go to the local lodge? Yes.

1573. And if they think the case of sufficient importance, they first appoint a deputation to wait upon the manager? They do.

1574. And in the event of the miners failing locally, that is the only time the district will recognise it? That is so.

1575. In reference to the working place being examined before the men resume work in the morning, is there any provision in the Act to enforce that? I do not think there is.

1576. But you are in favour of provision being made in any new legislation that such a precaution shall be taken? It is much safer.

1577. And you are in favour of the reports of the deputy, and the report of the check inspector, and of the over-men, and of the Government Inspector, being kept in the office in a book provided by the owners? Yes.

1578. And you think that at all reasonable times the miners who have any doubt as to the security of the colliery ought to have access to those reports? Yes.

1579. Do you know the Stockton Colliery? I do.

1580. Some time since the manager was brought before the court for a breach of the law in working his colliery after the inspector had reported against it? Yes; I have seen it mentioned in the papers.

1581. Soon after that the men had an examination made of the colliery? Yes.

1582. They reported to their lodge, and on that report the men resumed work, although by so doing they were going against the inspector's report? That is a fact.

1583. How was that dealt with by the Association? It was not done with the consent of the Association, but contrary to their wishes, and the head official explained to the lodge that they would acknowledge no liability whatever in connection with what was being done. At that time we used to have a death levy of 6d., for every financial member throughout the district for the benefit of the relatives of any person who lost his life by accident. The men were given to understand in the Stockton case that no such claim could be made by them on the Association if they went to work without the sanction of the Association.

1584. Are you in favour of increasing the number of cubic feet of air per minute? Yes. Wherever there is a deficiency it ought to be increased.

1585. Are you in favour of increasing the minimum from 100 to 150 feet? I am in favour of increasing it to 150 feet. I wish to ask whether something could not be embodied in the bill as a protection to the miners to prevent all classes of persons from entering the mine whether they are miners or not. This is highly dangerous to all concerned when a man is not able to take care of himself. I consider that in a mine a young man should work himself up and acquire experience the same as they have to do in any other calling so as to be able to take care of himself.

1586. Are you in favour of Rule 39 in the English Act in reference to persons not being employed unless they have a knowledge of mining? Yes.

1587. What does the rule say? Rule 39 is as follows:—

No person not now employed as a coal or ironstone getter shall be allowed to work alone as a coal or ironstone getter in the face of the workings until he has had two year's experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face or workings of a mine. I am quite in favour of that.

TUESDAY, 10 APRIL, 1894.

Present:—

MR. SCOTT,

MR. NICHOLSON.

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. Daniel McAuliffe called in, sworn, and examined:—

1588. *Chairman.*] You are manager of the Stockton Colliery? Yes.

1589. How long have you been manager? I have been four years manager next June, four years under-ground manager, and three months deputy.

1590. Altogether you have been over eight years in those positions? Yes.

1591. I suppose you know that this Committee has been appointed to inquire into the working of collieries? Yes.

1592. Whilst you have been at the Stockton Colliery I suppose you have often heard demands for new legislation? Yes.

1593. Have you heard the representatives of the miners speak in favour of new legislation as to the management of coal mines? Yes.

Mr.  
D. McAuliffe.

10 April, 1894.

1594.

Mr.  
D. McAuliffe.  
10 April, 1894.

1594. Have you, as a colliery manager, got any suggestions to make? I have had rather a short notice, as I only received my summons yesterday afternoon.
1595. Do you think in any Coal-mines Regulation Bill that is introduced provision should be made for the settlement of disputes between employers and employees? It would be well, no doubt, if such a thing could be done, but I think there would be great difficulty about it.
1596. How many years experience in mining have you had? Between thirty-three and thirty-four years.
1597. What is the length of your mining experience in the Colony? The whole of that time.
1598. Then you have not had experience in other countries? No.
1599. There has been a dispute at your colliery recently, has there not? Yes.
1600. Do you think that if some provision were made in a Bill for conciliation it would be a means of assisting the settlement of disputes? It would be a benefit to everyone concerned if there was some machinery by which, in case of a dispute, employers and employees could be brought together.
1601. During your experience you have found that it is much easier to settle a dispute before than after a strike? Certainly.
1602. Then do you not think that if some provision were made by law to bring employers and employees together, it would be a benefit to the mining community at large? To force them together without having the power to decide the question at issue I think would leave them exactly in the same position as they are in now.
1603. Then you do not think public opinion would assist the side which had the weight of evidence in its favour? I can only refer you to the provision which has been made for the employment of Arbitration and Conciliation Boards. Notwithstanding the agreement as to that they still break away from the understanding. I am not going to say which is right or which is wrong, but such is a fact. I think you will hardly get a law that will operate better than getting both parties to agree to something mutually; but even that is not always successful. In my opinion it would be very difficult to enforce a law to compel the men to agree.
1604. Until recently you had an agreement between the owners and the men in the northern districts? Yes.
1605. In that agreement was there not embodied a provision to send disputes to a Referee's Court? Yes.
1606. Did you ever know of the men breaking away from the decision? Our agreement is bristling with clauses with regard to arbitration. The Delegate Board, in dealing with our case, passed a resolution to the effect that the Stockton dispute should not be referred to arbitration.
1607. Perhaps you would furnish us with the reasons? As to what their reasons were I have my opinion.
1608. It is your reason that we want? When I met the district officers and a deputation from our lodge I put this challenge to them: Why were our company called upon to pay 4d. a ton more than the collieries that were not as good for the workmen? Mr. Curley challenged my statement. I then told him I could prove it by his own evidence, his own pleading, and the pleading of his witnesses. I pointed out that Wallsend and Lambton had cases before the Referee's Court, and that the evidence of the witnesses given on oath and also his own pleading before the referee went to show that the best class of men in the best places could only hew from 4 to 5 tons of coal per day, and that I could prove from our books that the best class of men in the Stockton mine could hew one-third more coal than that. Mr. Curley answered that of course the masters at all times tried to make their cases high. I said from his standpoint he wished to make them lower, but he would remember that it was not a case of lower but a case of best against best. He proved before the Referee's Court that the best men could only hew 4 or 5 tons a day, but we could prove that the best men in the Stockton mine could hew one-third more than that, and in the face of that I wanted to know why we were called upon to pay heavier tonnage rates than the others. I also wanted to know why we should be called upon to pay heavier yardage rates. Mr. Curley disputed the point. I challenged him to prove that one colliery was as favourable as the Stockton colliery for the men. He mentioned the Newcastle colliery. I asked him and the district officers whether they considered it fair to compare that mine with the Stockton colliery, but said although it was not fair I would accept his challenge. I pointed out that in the Newcastle mine from 6 feet to 8 feet wide for heading work in the worst part paid 9s. a yard; Stockton, 8s. 8d.; for four men in the same place, 9s. 6d. per yard; Stockton, 9s. 8d.; Newcastle, six men, 9s. 6d. a yard, they advance no further; Stockton, 10s. 2d. a yard; Newcastle, six men on the heading in the crosscuts, 9s. 6d. a yard; Stockton, 11s. 2d. a yard. Then I tried to show him where our company considered it an injustice, and asked him further how about the selling price of coal. The Newcastle colliery, when they are selling at 11s. a ton, pay 4s. 2d., and at the same colliery they pay 3d. per ton extra for four men working in a place; Stockton the same six men—still the 3d.; Stockton, 4½d. Then I proceeded to prove to Mr. Curley that we were called upon to pay heavier yardage and tonnage rates than any of the others. In my opinion, that is why Mr. Curley got a motion passed by the Delegate Board that we be not granted arbitration.
1609. You say Mr. Curley—of course you mean the Delegate Board? Exactly.
1610. So that arbitration did not take place, and a strike ensued? Yes.
1611. You say you have an agreement? Yes.
1612. It did not apply generally to the district, but to the Stockton colliery? Yes.
1613. Under that agreement if coal were selling at 11s. a ton you paid 4s. 2d.? Exactly.
1614. Up to the time the strike commenced the owners of the Stockton mine were getting 11s. for their coal? Yes.
1615. And the men looked upon it as their right to get 4s. 2d. according to their agreement? No.
1616. Is it not a fact that your coal was selling at 11s.? Yes.
1617. And is it not a fact that a stipulation was made that if the company got 11s. for the coal the miners were to get 4s. 2d. for the hewing rate? No. There is a clause in the agreement which specifies that they shall be paid port rate, to be adjusted from time to time by the associated masters.
1618. *Mr. Scott.*] No matter what contract you entered into, you must pay port rates? They said that they had nothing to do with what coal sold at, but they demanded port rates. We did pay at the rate of 14s. a ton when we were selling at 11s. a ton.
1619. Is it the same agreement as you had in existence when the strike took place? Exactly.
1620. I understand from that that the exact wording of the agreement was "district rates" or "port rates"? Yes. The hewing price to be regulated by the port rates, and to be adjusted from time to time by the associated masters.

Mr.  
D. McAuliffe.  
10 April, 1894.

1621. It did not matter to the miners what you sold the coal for? We told them in 1888 that if we sold any coal besides that for the gas-works, we would pay proportionately higher rates, but they said they did not recognise what we sold at, we must pay the port rate only.
1622. Did you pay more than 4s. 2d. as the hewing rate while coal was selling at 11s.? Yes.
1623. When coal rose from 11s. to 14s., that was the port price, and they were compelled to pay the 14s. hewing rates, namely, 5s. 2d. on the 11s. selling rate? Yes. I asked Mr. Curley and the members of the Delegate Board, if we were successful in getting our contract again, and the port rates went above our contract price, which would they follow—the port rate or our contract, and they told me plainly the port rates. They then wanted to make it out that ours were port rates. I wanted to know why they did not consider ours port rates when we were selling at 11s., and they were making us pay at the 14s. rate.
1624. *Mr. Nicholson.*] With regard to the Court of Arbitration and Conciliation, I understood you to say that you did not think they would be effective? As far as my own feeling is concerned I should like to see anything that will bring about a better understanding between employers and employees.
1625. Are you aware that they have been very successful in England, especially in Durham and Northumberland? I should like to see anything that would bring about a better understanding.
1626. Of course you know that the present Act is really inoperative;—I suppose you know that disputes which have occurred would not be brought before the Court of Arbitration, because the mine-owners refused to submit to arbitration? Perhaps if mine-owners think they have the worst end of the stick, they will refuse arbitration, just as we believe the Delegate Board at Newcastle refused, because they thought they had the worst side.
1627. To get over the difficulty, do you not think it would be wise to have a compulsory enactment to compel the parties to submit their case to the Board of Conciliation? Would you compel them to accept the award.
1628. No, I would not go so far as that? Then I am afraid very little good would result from it.
1629. Do you not think the effect of getting the parties to reason the matter over would be to secure a settlement of the dispute in a majority of cases? If you can get the two sides to agree that their interests are identical and it is wiser to settle the matter themselves, that is far better than forcing them to come together. I do not think that any compulsory Act would bring about better feeling. You may force them to come together, but after that will the parties come to an agreement?
1630. You have cited a case in which you say that Stockton owners had the best of it; I know of two or three cases in which it is the reverse, therefore I say that if we had a law to compel the parties to a dispute to come together it would really be effective in many cases? It may in this way—it would expose the weak side.
1631. Public opinion might then have some effect on the action of the parties supposed to be in the wrong? No doubt; but if the other side are stubborn and say "We will not budge," you can get no further.
1632. Could you suggest any other method of dealing with disputes? I have a method of my own. Of course, I do not say that it would be the best method. I have an idea that nothing but extensive co-operation will bring these difficulties to an end. I think it is the only means of cementing the two sides together.
1633. You mean participation in the profits? Yes, in the profit and loss; bringing the two parties to see that their interests are identical. I think it is a method which could be carried out easily.
1634. In connection with the recent dispute at the Stockton colliery I understand that you have been compelled to employ non-practical men, is that so? What do you mean by non-practical men?
1635. Men who have not been working at coal-getting before? A great many of the men have been gold-miners, ironstone and shale-miners.
1636. And some neither the one nor the other? They in all cases fitted themselves up.
1637. Do you think it is right to employ men to work at the coal-face who have had no previous experience at coal-getting unless they are employed along with practical men? They engage with us as miners and we cannot say whether they are or are not until we see how they shape.
1638. I do not wish to attribute blame to you, but I would ask whether you would consider it right that a non-practical miner should be set to work at the coal-face except with practical men? In all cases and at all times there are non-practical men who come and state they have been mining here and mining there. They say they have been at one time on coal, and at one time on shale, and they turn out good miners.
1639. Of course, if you go to the coal-face and see a man working with a pick, you know whether he is a practical man? Yes.
1640. I will ask this question, and I should like to have a direct reply, with a view to future legislation: Do you not think it right that a man should have a certain practical experience before he is allowed to go to the coal-face to get coal? Do you mean that he must be a coal-miner?
1641. I mean that he should have been employed as a driver in a pit or as a wheeler—that he should have seen men at work, and have practical knowledge? A man may be an ironstone miner, a sinker, a gold-miner, or a shale-miner, and he will do for a coal-miner.
1642. If a man comes to you direct and misrepresents his case, cannot you tell whether he has been a miner or not. I hold that you are not accountable for anything that has happened supposing he has had no experience, but if you are getting a lot of men to work in a mine on account of a strike you have a shrewd idea that many of them have not been miners before? As a coal-miner, I can find fault with men who profess to be competent miners, but who I should say would never make miners. My experience in mines is that practical men, as a rule, meet with the most accidents, for the reason that they trust too much to their judgment.
1643. They are over-confident? Yes.
1644. *Chairman.*] As the manager of a colliery, would you like to have men working for you who were never in a mine before? I always wish to have the best men I can get.
1645. Would you like to have men who are not used to mining to work for you? Do you mean as a whole?
1646. As a whole? Men who have not been used to mining would give me a deal of trouble to shape them up and get them into mining.
1647. They would not be miners if they had no experience in mining? Certainly not.
1648. Are you acquainted with the English Mines Regulation Act? No.

Mr.  
D. McAuliffe.  
10 April, 1894.

1649. The English Act contains the following provision:—"No person not now employed as a coal or ironstone getter shall be allowed to work alone as a coal or ironstone getter in the face of the workings until he has had two years' experience of such work under the supervision of skilled workmen, unless he shall have been previously employed for two years in or about the face of the workings of a mine." Would you be in favour of a provision to that effect being inserted in a Mining Bill in this Colony? Does that make special provision for gaseous mines, and where a man is likely to bring injury on another by his want of knowledge? I think that a law which prevents a man from making a living where his mental or physical ability will allow him is a wrong law, providing the party does not cause risk to other persons' lives.
1650. Would you be in favour of a provision such as I have read to 'apply to gaseous mines? Anything where another person's life would be in danger of being lost through want of experience by an employee.
1651. You will admit that there ought to be some such provision to apply to mines where there is inflammable gas? It would prevent men who did not understand what they were doing from risking the lives of other people.
1652. You would be in favour of a provision similar to the one which I have read being inserted in any legislation in this Colony for the regulation of mining? Yes; to prevent life from being endangered.
1653. Do you not think that an inexperienced man using a light in a gaseous mine would cause danger? Yes; just the same as a careless man. A careless man will do just as much harm, whether he is experienced or not.
1654. Do you think it is safe for an inexperienced man to be employed where gas is? It is safer to send a man who knows what he is doing than a man who does not know what he is doing.
1655. Do you think an experienced man would be the proper person to work without supervision in a mine where gas exists? Certainly.
1656. *Mr. Scott.*] The present Act provides that there should be 100 cubic feet of air per man per minute;—do you think that is a sufficient quantity of air for the working of your mine? I think so.
1657. What number of men have you working in each split at present? The law allows seventy, but it is seldom that we have that number.
1658. Has there ever been any complaint in regard to the quantity of air supplied to each individual miner? There has been at times, but not as a rule. We have a difficult mine to work, and it is difficult at times to keep up the supply until you have your proper air courses driven.
1659. How far do you work ahead of the air? The distance to go is 35 yards, according to law.
1660. That is the recognised rule in your mine? Yes.
1661. Do you think it would be of any great advantage to the miner to reduce the distance of the cut-through to 25 yards? It would certainly keep the air closer up to the face.
1662. Do you approve of bratticing to the face? No.
1663. Do you approve of bratticing at all? Not where it can be possibly done without.
1664. Where would you recommend bratticing? There are times when you cannot help but use bratticing, but I do not believe in it where it can be avoided.
1665. You do not believe in making a hard and fast rule? No; I do not believe in confining the air. The more you brattice the air the more check you put on it.
1666. *Mr. Nicholson.*] You cannot get air up to the working-face to a bord 25 yards from the entrance or from the last cross-cut to that brattice? If you have gas to deal with you must brattice and attend to that particular point which is giving off gas, but to brattice each bord is a drag on the air, and would not give the result you would get by keeping the air free.
1667. If a bord is 25 or 30 yards from the cut-through, and the men are working there can they get fresh air;—is it not possible for it to circulate without some force behind it—is there any better system of getting air on to the face than by using brattice? If you attempt to brattice places like that you will bring about worse results; you pen your air up and there is too much friction, and the result is not nearly so good to the miners or mine as it would be if you kept your air free. There are times when you must brattice, but except at those times the less you have to do with brattice the better.
1668. *Chairman.*] Is not the Stockton Colliery working under tidal waters? Yes.
1669. What size are your bords there? Six yards.
1670. I suppose they are made that size on the recommendation of the Commission of inquiry into the Newcastle and adjacent collieries? I cannot say.
1671. How many splits have you in your mine? Three.
1672. How many men do you employ? About 110 at the present; about 140 with the men in the drifts. We have three drifts.
1673. How many did you employ before the strike? Until we stopped at the barrier question we employed about 220.
1674. What do you mean by the barrier question? The barrier between the high and low water mark of the ocean and land taking.
1675. Considering the number of men you have working now, and the number you had prior to that unfortunate dispute, is the average per man per day as much as it was then? Yes.
1676. I understand that you have 140 men now, but that prior to the barrier question you had 220? Yes. Owing to the barrier question we cavilled out ninety men. We have three drives, and we are employing thirty of our old miners in the drifts.
1677. Considering the men that you have on the coal, and the number you had employed before is the average as good? It is quite as good at present. You must admit this, that even amongst miners there is a great number who are not good hands at getting coal. You may have 100 very good men in a colliery, and 150 men in an adjacent colliery, and the 100 men may pick out as much as the 150 men.
1678. Do you think the men you now employ are equal to the men you formerly employed? The answer to that is when I find men whom I am not satisfied with it does not take me long to shift them.
1679. Are we to understand that you can remove men without breaking any rules? The rule is that when they apply at our colliery they must be practical miners, and if they are not I will not be long in shifting them.
1680. Then I understand from that that when a manager thinks fit, he can discharge any man? If a man states that he is one thing, and it is proved that he is not, there is only one course to take.
1681. What is that "one thing"? The one thing is to be a practical miner.
1682. If he is not a practical miner, you soon discharge him? That is what I have done in a lot of cases.
1683. What system have you in reference to weighing coal at your colliery? A weigh-bridge at the foot of one of our screens.

1684. Have you the standard weight at your colliery? No; we have a standard height of 12 inches.  
 1685. A bar? No; we do not use a bar, but when men will insist upon filling the skips too high, we stop the skip, and the money goes to the miners' accident fund.  
 1686. I understand that it is not the weight you judge by but the height. A man can have a ton on his skip, as long as it is not above the proper height? Exactly.  
 1687. And he will get paid for that? Yes.  
 1688. You believe in a standard height but not in a standard weight? The men require some check to prevent them from filling the skips too high to break down on the roadways.  
 1689. You think the way you have mentioned is the best, the standard height being practically the same as the standard weight? That is my opinion.  
 1690. Have you brought with you the measurement of the bore in your mine, and the measurement of the strata? No.  
 1691. I suppose you know what the measurements are? I cannot say from memory.  
 1692. Will you tell me whether the following are the correct measurements? The measurements of strata of our winding shaft as shown in the following slip are correct depth to bottom of sump.

|                                    | ft. in. |                        | ft. in. |
|------------------------------------|---------|------------------------|---------|
| Sand.....                          | 60 0    | Freestone.....         | 130 0   |
| Sand and clay.....                 | 2 0     | Blue shale.....        | 17 0    |
| Blue sand.....                     | 4 0     | Coal.....              | 2 6     |
| Red conglomerate.....              | 24 0    | Band.....              | 0 1     |
| Grey conglomerate.....             | 28 0    | Coal.....              | 12 6    |
| Fireclay and blue shale mixed..... | 10 9    | Blue shale.....        | 6 0     |
| Coal.....                          | 2 3     | Coal with parting..... | 9 6     |
| Band.....                          | 0 3     | Hard freestone.....    | 28 0    |
| Coal.....                          | 2 3     |                        |         |
| Sandstone and blue freestone.....  | 49 0    | To bottom of sump..... | 390 1   |
| Coal.....                          | 2 0     |                        |         |

1693. Can you tell whether those are the depths of the different strata in the winding-shaft? They look very much like it.  
 1694. Twelve months ago you had a big fall, either through a creep or a crush? You mean when the water broke in; that was not a creep, but a fall.  
 1695. Did the inspectors report upon it? They did.  
 1696. Who were the inspectors? Mr. Dickson and Mr. Humble. Mr. MacKenzie, the Examiner of Coal-fields, also reported.  
 1697. I suppose you have not got the reports with you? No.  
 1698. After those reports, was your mine stopped for a short time? Yes, stopped for repairs.  
 1699. *Mr. Scott.*] Who stopped the mine? I stopped it myself to bring materials to rectify the trouble.  
 1700. *Chairman.*] I suppose you secured the place in the mine where the fall took place to your satisfaction? Yes.  
 1701. And yet the inspector would not report that it was safe? No.  
 1702. Is it a fact that the miners' lodge at Stockton selected a number of men to visit and inspect the mine? Yes.  
 1703. Did you allow the men to see the report which the inspector left in your book? Yes. I furnished them with all the information, also with the Blue Book, showing the bores. After the place had been made secure and timbered up, the men came to me and wanted to know when I was going to start the pit again. I told them that I would start the pit as soon as I had made it secure, and that I wanted to get permission from the inspector to start, then when I asked Mr. MacKenzie if he was prepared to allow us to go to work next day he told me that I could do as I liked, that he would not order me, and he would not sign that the pit was safe.  
 1704. Do I understand you to say that the men did not understand the strata or the bore of the mine they were working in? I am telling you what transpired as nearly as I can, and what I did. Mr. MacKenzie said he would not sign. I asked him why, and he told me that he would not answer that question. I said to Mr. MacKenzie, "You have a right to answer that question."  
 1705. Were there any witnesses there who heard him say that? We were in a room washing ourselves. The inspectors were about, and my overman and the surveyor.  
 1706. But none of them were paying attention? I could not be positive on that point. I pointed out that before that difficulty he and his inspectors considered the mine safe; that a certain thing had happened which we had secured, and that now he considered that part of the mine was not safely secured. I was prepared to do anything he advised or ordered to be done, but all the answer I could get was that the mine was not safe. I said, "Will you state any part of the mine which you consider not safe," but he simply replied that he had no right to answer any such question. He asked me if I would say that water would not break in at any other point. I said, "No; I would not say that it would not"; but I asked, would he undertake to say what point of the mine would break away. I asked, if it did so, was there not still the same remedy that had been resorted to then, and whether he would say that if a volume of water fifty times as strong as that which had broken in did break through there would not be sufficient time for the lives of all in the pit to be saved. He said again that he would not answer any such questions.  
 1707. And you think that he really ought to have answered you? I do. I think, when he vetoed the place, as a practical man he ought to have said where the danger was, and I should have been able to see that it was made secure.  
 1708. I suppose a summons was issued against you after that? Yes.  
 1709. And you were fined the amount stipulated in the Act? Yes.  
 1710. After which six men went and inspected the fall which you made secure and inspected the whole pit? Yes.  
 1711. And their report was that it was safe? Yes.  
 1712. And the men afterwards went to work? They did.  
 1713. Has anybody been burned in connection with your mine? The overman, whilst climbing over the fall that had just occurred was burnt.  
 1714. At that place you put in a pipe? Yes.  
 1715. Is that pipe there now? Yes.  
 1716. You have never removed it? No.

- Mr. D. McAuliffe. 1717. But I believe that there were two prosecutions following each other closely, and the same fine was imposed? There were two prosecutions—one was for a breach of the Act and the other the day penalty. Mr. Mackenzie said he was not the maker of the Act, and if the Act was at fault he was not to blame for that; but he was there to see the Act carried out.
- 10 April 1894. 1718. Do you remember a return Mr. Scott asked to be laid upon the Table of the Assembly? I do.
1719. Is that return a verbatim copy of the report given in your book? Yes.
1720. Since that time has there been a cave-in of the surface at Stockton? So I believe.
1721. I suppose you have seen it? Yes.
1722. You would not venture to say what was the meaning of that cave-in? The pavement is dislodged slightly.
1723. Since that time, after the cave-in, the inspectors have been round, have they not? Yes.
1724. Did they again make a report in your book? Yes.
1725. Is that entry similar to the one that was made before? It says something to this effect: "We see no reason to alter the opinion expressed by us on a certain date."
1726. Are you a certificated manager? No.
1727. The English Act of 1872 provides that a manager who had held the position prior to the passing of the Act should be entitled to a certificate of service. Do you believe any such provision should be embodied in any new legislation here? Yes.
1728. Do you think the same provision ought to be made in any new legislation for managers who are managing mines at the present time? I think that is an ugly question, as I am interested. The other managers may be able to pass an examination easier than I could, because I have not had much education, I would be interested in having such a clause.
1729. Seeing that the managers of large mines in England hold certificates of service the same thing ought to apply to this Colony? Possibly.
1730. It would not be fair to you as a manager of long service to be compelled to retire from the management because you could not pass an examination? If my Company fully considered that I was able to take charge of their mine it would be a hardship.
1731. You had not the privileges with regard to education that young men have now? I had not, considering that I was in the pit before I was 10 years old.
1732. You are in favour of competent men being managers of collieries? What do you mean by competent men?
1733. You are in favour of some provision for managers to obtain certificates of competency? I think that every manager should hold a certain qualification not only theoretical but practical.
1734. Do you know that the English Act stipulates that a man shall have had five years experience before he can become a manager? A man may be five years in the office.
1735. It is five years in the mine. Do you think that a fair stipulation? Yes.
1736. You say you are not in favour of brattice? I like to have as little of it as possible.
1737. You would only use it where gas exists? I told you before that there are occasions where you cannot help but use it.
1738. What are those occasions? In places where you cannot get room for a return airway.
- 1738½. There you would be compelled to use brattice? Yes.
1739. There are two systems suggested—one is to make short cut-throughs, and the other is to use brattice; which would you prefer? From the men's standpoint I should certainly say short cut-throughs.
1740. You said you thought 100 cubic feet per minute per man was a sufficient minimum of fresh air? Yes. But managers will not confine themselves to 100 cubic feet, because they want to keep their mines as well ventilated as possible.
1741. Does it pay an owner to keep his mine well ventilated? Yes.
1742. It is better for both man and beast? Yes.
1743. And better for property? Better for everything.
1744. I believe you have read Mr. Hopton's work? I have.
1745. I suppose you could recommend it to the miners to read? I think it is a very useful book.
1746. What stipulation does it make with regard to a supply of air;—is it not 100 feet per man, 100 feet per candle, and 1,000 feet per horse? Yes.
1747. What is the height of the coal in your mine? It varies.
1748. Does it average 6 feet? Yes; from 6 feet to 8 feet.
1749. Then it is not very expensive to make a good return airway? Not in coal. Our mine is expensive because we have so many difficulties; so much cinder and stone to drive.
1750. What do you ventilate your mine with? A furnace.
1751. It has been suggested that engine-drivers should undergo an examination and receive certificates;—are you in favour of that? Yes; but I consider engine-drivers holding such positions should get certificates of service.
1752. I suppose you have not either the safety catch or the hook at your colliery? No.
1753. And you have never had an overwind yet? No.
1754. Do you think that using the safety catch or safety hook would have the effect of making your men careless? Possibly; but I must say we are blessed with exceptionally careful men.
1755. You do not think if these contrivances were used it would make the men careless? I do not think it will make a man careless who is naturally careful. If I thought a man was careless I would not allow him to wind men up the mine at all.
1756. I asked you a question as to managers obtaining certificates of service—I would now ask whether the same thing should apply to inspectors—suppose an inspector has been employed in a district for a number of years, would you give him a certificate of service? If he has proved himself capable of holding such a position I think he will be entitled to it.
1757. You agree that the inspectors should have it just the same as the managers? Yes.
1758. You have been in the Northern District a considerable time? I have.
1759. Is it not a fact that an agitation has been going on there from time to time in favour of the eight-hour system? Yes.
1760. No one could be in the Northern District long without knowing the opinion of the workmen with regard to eight hours? Men have various opinions upon the subject, but there is no doubt that the majority are in favour of the eight-hour system.

WEDNESDAY, 11 APRIL, 1894.

Present:—

MR. NICHOLSON,  
MR. SCOTT,MR. CANN,  
MR. EDDEN.

J. L. FEGAN, Esq., IN THE CHAIR.

William Humble called in, sworn, and examined:—

1761. *Chairman.*] You are an Inspector of Mines? Yes; for the Northern District.
1762. You obtained that appointment by examination? Yes; there were twenty or thirty competitors.
1763. And from amongst those you were chosen Inspector of Mines? Yes.
1764. I believe you have a colliery manager's certificate? Yes; a first-class certificate under the English Mines Act of 1872.
1765. What experience have you had in mining? I have had twenty-four years' experience, having worked my way up from the position of trapper boy to that of manager.
1766. Then you have held the positions of trapper boy, deputy, overman, underground manager, and manager? Yes; I became deputy when I was 20 years of age, and I held that position for eight or nine years. Since then I have been overman and manager.
1767. That was in England? Yes; in the county of Durham.
1768. For some time you were a teacher in the Technical School of Mines in England? Yes; under the Science and Art Department.
1769. When you came out here you were appointed teacher? Yes; I was appointed the first mining teacher at Newcastle.
1770. Have you had any experience in mining out here? Yes; I was deputy at the Wickham and Bullock Island Colliery for six or seven months.
1771. Your certificate is sufficient to enable you to take charge of any mine in the United Kingdom? Yes; any in the world. I believe that the English certificate is recognised wherever mining is carried on.
1772. I suppose that you have heard of the Bill brought in to provide for the regulation of coal-mines? Yes.
1773. Would you be surprised if I told you that that subject has been under consideration for six years? I should not.
1774. Are you well acquainted with the Act of 1876? Yes.
1775. Do you believe that that Act could be amended? I do.
1776. Do you think it is necessary? I think it is necessary, because we are opening out deep ground which is giving off a little gas.
1777. I suppose you think it is necessary in many respects besides that? There could be many new general rules introduced with advantage. The general rules under the present Act are very meagre.
1778. As an inspector, do you find a great difficulty in working up to the Act? Some of the sections seem to be very ambiguous. We scarcely know how to interpret them unless we are 'informed now and then as to the meaning of particular sections.
1779. You have noticed how ambiguous the Act is in regard to inspectors? Yes.
1780. Is it not a fact that there is in the Act a clause stipulating that should a mine be unsafe there must be arbitration on the matter, and the inspector cannot take steps to stop the mine? The 25th section provides for arbitration, but it does not say anything about unsafety. It says that "if the inspector at any time finds any matter, thing, or practice that tends to bodily injury," then the manager must be served with notice, and if he refuses to remedy it the case goes to arbitration.
1781. Do you notice by your inspection cases of danger not provided for by the rule? Those dangers may be only threatening.
1782. Is it not a fact that if danger is threatening according to the Act it is decided by arbitration without the inspector being given power to deal with it? Yes. Under that section we have no power to withdraw the men from the mine in case of danger.
1783. And you really think that the inspectors ought to be endowed with authority to withdraw the men in case of danger? Under the 5th general rule we have that power.
1784. Will you read it? The 5th rule says:—

If at any time it is found by the person in charge of a mine or any part thereof or by the examiner or inspector that by reason of noxious gases prevailing in such mine or such part thereof or of any cause whatever the mine or the said part is dangerous every workman shall be withdrawn therefrom and the examiner or inspector shall inspect the same (and if the danger arises from inflammable gas shall make such inspection with a locked safety-lamp) and in every case shall make a true report of the condition of such mine or part thereof and no workman shall except in so far as is necessary for inquiry into the cause of danger or for the removal thereof or for exploration be readmitted into the mine or such part thereof as was so found dangerous until the same is stated by the examiner or inspector to be safe. Every such report shall be recorded in a book which shall be kept at the mine for the purpose and shall be signed by the person reporting.

1785. Then your interpretation is not, I presume, that the inspector has power to withdraw the men? No; my interpretation is that if we find any conditions similar to those mentioned we can request the manager to withdraw the men and he must do so.
1786. *Mr. Nicholson.*] Do you think there is room for some amendment of the present Act? Certainly.
1787. Have you ever had any difficulty with managers when requesting them to withdraw men from mines on account of danger? As a matter of fact I have never had even to request the withdrawal of any men except one man in a particular working-place—not any large group of men. I have always got on very well with the managers in regard to my requests, both written and otherwise.
1788. Are you in favour of full power being given to the Government inspectors to call the men out of a mine in case of danger, or would you put the responsibility on the manager? Speaking generally, I should say that we ought to leave the full responsibility on the manager; but there may be extreme cases in which we should have no hesitation in withdrawing the men ourselves.
1789. Where you thought you were justified? Yes; if I saw imminent danger I should call the men out in spite of any one.
1790. Still you would be in favour of allowing the manager to have the sole responsibility of the management of the colliery? Yes; that tends to the better management of the colliery.

Mr.  
W. Humble.  
11 April, 1894.

1791. Do you consider the system of ventilation adopted in this Colony satisfactory? The general system is not what I might call excellent, but in the Northern District we have some excellently-ventilated mines.
1792. I refer more particularly to mines that give off a certain quantity of gas. The Act of 1876 says that the bord must go 35 yards before a cut-through is turned off. Do you not consider that too far to drive ahead of the Act? It is much too far where gas is being given off.
- 1792½. Would the system of bratticing be of material advantage in a case of that kind? Bratticing is absolutely necessary in such a case where you are working bord and pillar. Wherever I have found gas in the Northern District it is there where I found the best ventilation. The bords are bratticed to within a few yards of the face in every case.
1793. Then they do use bratticing in the Northern District? Yes; I can mention five or six instances—the Seaham, the West Wallsend, the Durham, the Burwood Extended, the Dudley, and in part of J. and A. Brown's collieries at Minmi.
1794. Do you think it is a hardship that the coal-owner should have to use brattice in cases of this kind? It may be a little more expense, but it ought not to be a hardship, because it is necessary.
1795. Do you really think, taking everything into consideration, that it is any extra expense? Yes; you must take into account the expense of the brattice.
1796. Do you not think that bratticing, as it protects the interests of the mine-owners, may be the means of saving much more than it costs? Undoubtedly, if we take it from a fire-damp point of view, because if you neglect to use brattice where there is fire-damp you may have an explosion which will put the company to an expense of thousands of pounds, and of course the cost of brattice would be nothing compared with that.
1797. Have you ever gone into a calculation as to what would be the extra expense per ton where it is necessary to brattice up the whole of your districts? Yes; taking a standard seam 6 feet in height, bord and pillar working, I think the cost per ton for bratticing and fixing it up would not be more than 1¼d. or 1½d.
1798. Do you think it is best to ventilate places like that by brattice or by having shorter distances between the cut-throughs? Yes; always bearing in mind that we are looking at it as a gas question.
1799. It is safer to brattice, on the whole? Yes.
1800. Thirty-five yards is the distance stipulated in the Act before a cut-through is made;—do you not think that is too far to have to drive ahead of the air? It all depends upon whether your working-faces are going to the dip. It is too far if you are going to the rise.
1801. Do you not think that, according to its literal reading, that general rule means that a cross-cut shall be holed at 35 yards? It says no working-place shall be driven more than 35 yards without a cut-through being put through or bratticed up to within 3 yards of the face;—does that mean that the 35 yards should include the length of the bord and the cut-through? No; I do not think so. In the Act a cut-through is not spoken of as a working-place. It says that no working-face shall be driven more than 35 yards before the current of air without a cut-through being put through. That allows you to go 35 yards; then you must make your cut-through. A cut-through is not defined as a working-place under the Act.
1802. Have you ever worked in a mine where special men were kept to put through cut-throughs and nothing else? I have found that to be done where a district has been overcrowded with men, but not as a general rule.
1803. With regard to the eight hours, do you think that if we had that provided for by legislation it would prevent a certain amount of friction between the employers and their workmen? I do not think it would prevent much friction. Practically, in the Northern District they have the eight hours.
1804. But now and then trouble crops up, the mining managers are continually asking men to stay longer than eight hours, and if the men refuse they are liable to suffer? I suppose the men are not asked to stop without getting paid for it.
1805. They only get their usual pay? They are making money.
1806. Do you know that in the Northern and Southern Districts we have more men than can get regular employment? I know very little about the Southern District.
1807. Is it so in the Northern District? Yes.
1808. In order to give a fair amount of employment to every working man, would it not be better to stipulate in the Act the number of hours which the men shall work underground? That may be the means of employing a few more men and distributing wages over a greater area, but the amount paid in wages in the district is determined by the amount of coal sold in the district. If you have to divide that amount of money amongst 1,000 men, each man will only get half as much as he would receive if there were only 500 men.
1809. But if you had 1,000 men depending on the work for their existence would not that be better? It must be better.
1810. Looking at the increase in population and the improved machinery in use, do you not think it will become necessary that the working hours should be reduced? I believe that the general tendency of the times is to shorten the hours of all kinds of work. I consider that eight hours as one shift is quite sufficient for any one to work in a mine.
1811. *Mr. Scott.*] Do you think provision ought to be made in the Act that the men or the manager should ask for a joint inspection when danger is supposed to exist? No, I do not think so. I am not opposed to it, provided that those who make the inspection take their share of responsibility. If any of the workmen have the power to go with me to make a joint inspection, I should expect them to have as much responsibility on their shoulders as I had.
1812. What I mean is, where the workmen and the manager conjointly ask that there should be an inspection, that they should be allowed to nominate three competent men to make the inspection in conjunction with the Government inspector; it was asked for in your district, but there was no provision for it;—do you not think that that would be a wise provision? Providing you are tumbling across such cases every six months it might be, but the case you have instanced might never occur again.
1813. It is an exception to the rule, I admit? Generally speaking these things are dealt with under the 25th section. In the case referred to the manager withdrew the men, and they could not be readmitted until the inspector had stated that the mine was safe. That is a straightforward statement to have to write in the book that the mine is safe. I, as an officer of the Mines Department, who have that responsibility, declined

declined to state that that mine was safe. If I had had power to state that the mine was safe at that particular time, or that it might be safe in a month, that would have been a different thing; but I had simply to declare, if I said anything at all, that that mine was safe.

1814. If there is a doubt at all the Mining Inspector would take the benefit of the doubt? I believe that the miners in that particular case were prepared to take any amount of risk to get back to their work.

1815. If they asked for an inspection by three competent men in conjunction with the Government inspectors, do you not think that would be a reasonable request? Personally I should not have the least objection to it, provided that the parties all have equal power and equal responsibility.

1816. As regards to declaring a mine safe or unsafe, would you call him an expert? Yes; but when the expert gave his decision upon whom would the responsibility rest? I have not the least objection to that, but I am afraid it would complicate matters.

1817. As to the hours of labour, I see that some time ago in the old country the workmen recorded their votes against the eight hours? That is simply because the miners in the county of Durham work no more than six hours a day from bank to bank. In the colliery that I left when I came here the back shift miners were working only three and a half hours.

1818. Do you believe in making a hard and fast rule as regards the hours of labour? I do not.

1819. You would leave it an open question? Yes; I think the clause in Mr. Slattery's Bill would do. No workmen should be compelled.

1820. Is there any reference in the English Act to the hours of labour? Not adult labour.

1821. Then you think it would not be a wise thing to make a hard and fast rule in regard to the eight hours? Personally I believe eight hours are quite enough for anyone to work in a mine, but I cannot see how you could make a hard and fast rule. There are always questions of emergency cropping up.

1822. Who would define what was a question of emergency? Take a large mine with five or six pillar working districts; two or three working places are finished just at night time, and the deputy thinks it his duty to draw that timber out of those pillars, and is stopping four nights out of six in each week, an hour or two, to draw the timber. If that goes on from week to week you will scarcely call that a case of emergency; but if you prohibit that deputy from doing that work you cause unnecessary loss to the owner, and very often you will endanger the lives of the men. Only last week I read an account of a miner being killed, in the county of Durham, through the next working-place being drawn at the time he was working. The roof broke down and covered him.

1823. As regards engine-drivers, do you think it would be right to allow a youth of eighteen to take charge of engines where men are hauled up? No; I consider that too young. The age ought to be not less than 21 years.

1824. Do you think it is necessary to have an inspection of the machinery and boilers every six months? It is quite necessary to have the boilers inspected. In the Northern district I believe the colliery boilers are all inspected three times every six months. I believe that the inspection is carried out very well by those who clean the boilers out.

1825. Do you think that every precaution is taken under the present system? That I am not prepared to state.

1826. The engineer of the colliery should see that the work is properly done? Yes.

1827. Take the case of the explosion at Lambton; there must have been some gross neglect in connection with that boiler explosion? I remember the case well, but I scarcely know what you mean by gross neglect.

1828. Had there been a competent man appointed, who would be responsible, I believe that accident would not have happened. The boiler must have been in a bad state for a considerable time before the accident? I saw the boiler a few hours after the accident. It had undoubtedly done a great deal of work, and was the worse for wear; but I do not think that the general working pressure ought to have torn it to pieces as it did. My own opinion is that the water was allowed to get very low, and the boiler exploded when the feed water was being put into it.

1829. Would you suggest a remedy for such cases? The best system of inspecting boilers is carried out in the county of Durham, England, where all the boilers at the collieries are insured.

1830. By the Steam Users Association? Yes. They insure them and take the responsibility of risk, and they appoint an inspector to inspect them.

1831. Do you not think it is necessary that some effort should be made to establish a similar Association here? Yes.

1832. Do you think that if this provision should be made in the Coal-mining Act, and severe penalties are provided for neglect, it would hasten the formation of such an institution? I have no doubt it would.

1833. Do you think it would be a wise thing to make provision for that in the Bill? I think it would be a wise thing to make provision for the periodical inspection of the boilers.

1834. *Chairman.*] According to your interpretation of the 12th section (Rule 5) of the Act of 1876, inspectors have power to take men out of the mine? No; according to my interpretation the inspector has power to request the management to do it.

1835. The inspector has not power to withdraw the men? No.

1836. I understood you to say that the only reason why you were against this joint inspection is that there is no provision to make the other inspectors equally responsible with yourself? No provision is made for joint responsibility. If you have joint inspectors you must have joint responsibility.

1837. If a third party is called in by the Government as an umpire or referee, what sort of a man must he be? He should be a man equal in capabilities to any manager or inspector in the country.

1838. Do you think it would be right to get an equal or inferior man to the inspector to do this work? I do not see what good it would do, because the man could come to a decision upon no more observation than we ourselves have been able to make.

1839. Do you think it would be for the benefit of the mining community that such a person should be called in? I do not think so.

1840. You think then the inspectors should bear the responsibility of reporting to the Government? Yes.

1841. I understand you to say, whilst giving greater powers than the present Act gives to inspectors, you would not relieve the manager of any responsibility? I would not relieve him of one iota of responsibility.

1842. So if you discovered that there was danger in the mine, you would tell the manager, and give him an

Mr.  
W. Humble  
11 April, 1894.

Mr  
W. Humble.  
11 April, 1894.

an opportunity to withdraw the men, and if he does not withdraw them, you say that the Inspector of Mines should take that responsibility? Certainly.

1843. *Mr. Scott.*] Do you not think that that is too great a power to give the inspector? I am afraid that if you did not do something the management would work on and on during a period of danger, simply waiting for the inspector to request him to do a certain thing. But if the manager knew that if an accident occurred he would have to bear the sole responsibility, I think he would take steps himself to have the men withdrawn in time.

1844. Do you not think it would be wise to be able to call in a third party to make a joint inspection if he is a person who has extra qualifications? You are proposing to set up an outside tribunal to which to appeal from the Mines Department. If this party is to take the responsibility altogether there is not much objection to it; but if satisfaction has not been given, why not dismiss the present inspectors and get men you consider qualified to do this kind of work without having to call in another person?

1845. *Chairman.*] Is it not a fact that there is no higher qualification for a mining expert than what you have? There is no higher legal qualification.

1846. I understand you to say that the English Act does not make any provision with regard to the hours of labour for adults? It does not prohibit adults from working beyond a certain period.

1847. Will you look at section 7 of the English Act, and say whether you see anything about adults there? That applies to boys, girls, and women.

1848. Do you look upon women as adults? Yes, if you are going to quibble about the word "adult." Women are not working in our mines, and I left them out of the question. I hope they never will work in the mines.

1849. You will admit that there has been some legislation as to the hours of labour for adults? Yes; adult females.

1850. Will you look at subsection 3 of section 7 of the English Act? Yes. It says:—

No boy or girl of or above the age of thirteen years and no woman shall be employed for more than fifty-four hours in any one week, or more than ten hours in any one day.

1851. If they legislate in England for women, what is the difference between men and women as far as the hours of labour are concerned? There is no difference. Eight hours' work would fatigue a woman as much as it would fatigue a man.

1852. During your long experience, and the various positions you have held, have you ever heard that this provision in the English Act operated harshly as regards either the women or the owners? Certainly not.

1853. Did you say that a man ought to be able to please himself as to how long he works? That is my opinion.

1854. You think that it is wrong to interfere with his liberty? I think you can interfere too far in that direction. If I was a man working an ordinary shift in a mine, and I was requested to stop a quarter to do some work, which I could see was necessary, I consider that I ought to have a right to stop and do it.

1855. You consider that if the owner requested you to remain ten hours you ought to do so? Yes; and I ought to have the right to refuse.

1856. Are there not many things in the Act that the owner and the employee might come together and reason upon? Yes.

1857. Do you think there is anything as regards that clause which they could reason upon? I believe they could; they do it now.

1858. Do you not think it is interfering with the liberty of the subject when you stop people from drinking as much as they like? Undoubtedly that is an interference with the liberty of the subject.

1859. Yet the law does that? Yes; it interferes with people who are not able to take care of themselves, and are liable to become a public nuisance.

1860. If these long hours were permitted to be worked in collieries would it not shorten people's lives? Yes; if a man was to work twelve hours every day instead of eight, and do it year after year.

1861. And you do not think it right that a man's life should be shortened? I think everything ought to be done that is possible to lengthen man's life, and to extend his pleasures and comforts.

1862. It is owing to your energy and perseverance that you have got your present position? Yes.

1863. Do you think you could have got that position if you had had to work ten or twelve hours a day in England? As a matter of fact, at the first job I got I worked thirteen hours a day.

1864. Do you think that conducive to the well-being of a young man? Certainly not.

1865. How many hours did you work after the term you have just mentioned? On my first advance, the working hours were twelve, then they were reduced to ten.

1866. What was the medium by which the hours were reduced? I think it was trades union effort.

1867. Are you acquainted with that organisation? I have an acquaintance with its general working.

1868. Is it not a fact that that trades organisation clashes less with the employers than any other of a like character? I believe that that organisation works splendidly with the employers.

1869. And they have reduced the actual working hours to six or seven hours a day? Yes.

1870. Is it not a fact that the arts and science classes flourish more there than in any other part of England? I believe so.

1871. And do you not think there has been a decided improvement on the part of the miners, moral and physical, in that district? During the last twenty years there have been very great strides.

1872. There has been a decided improvement? Yes.

1873. Cannot that be attributed to the shorter hours of labour allowing time for study? I believe the shorter hours of labour have been the chief means of bringing that about.

1874. Is it not a fact that at any moment the owners might make the men work longer hours in this Colony? They might try to do it.

1875. To your knowledge, has not the agreement been broken in the Northern district? It has been.

1876. So there are really no stipulated hours for work at the present time? I do not think that any breach of agreement has brought about longer hours.

1877. There are no stipulated hours as far as the agreement is concerned? If a manager intimated tomorrow that the mine would start at a certain time and knock off at a certain time, would that be the means of causing a strike in the Northern district? Yes; I believe it would, badly off as the men are.

1878. And that would be the means of crippling a trade which is now showing signs of improvement? Yes; but because of that probability of a strike I believe the owners would not do it.

1879.

Mr.  
W. Humble.  
11 April, 1894.

1879. Nevertheless, the fact remains that it rests with the owner to do such a thing if he wishes? Yes.
1880. Do you not think that the law should step in to stop strikes and lock-outs? I do not think you can legislate for strikes.
1881. Then you have really no suggestion to make as to arbitration in case of a dispute between employers and employees? It is a difficult matter. I believe in arbitration and conciliation; but if a case is given against the employers would you imprison them or penalise them if they did not comply? Or if the workmen refused to comply with the decision, would you imprison them all?
1882. Seeing that the eight-hour system has come by custom, do you not think we ought to legalise it? If suitable provision could be made for cases of emergency the legalisation of the eight hours would be no hardship to anyone.
1883. Will you tell me whether this list [*produced*] is a copy of the measurements of the strata in the Stockton colliery? Yes; the shaft is 360 feet deep, but it seems to have gone a little below the seam.
1884. Did you make a report in reference to the Stockton colliery some time since which caused the men to be withdrawn? No.
1885. Did the manager take upon himself the responsibility of withdrawing the men? Yes. I was one of three who reported to the Mines Department on that mine.
1886. Who were the other two? The Examiner of Coal-fields and my colleague, Mr. Dixon.
1887. What were you called upon to examine? The whole of the mine, but one particular section in detail.
1888. Why were you called upon to examine that in detail any more than the other part? Because, about a fortnight before, a fall took place, letting in several hundred tons of sand and clay, and water came in at the rate of from 150 to 170 gallons a minute.
1889. And you reported upon what you saw? Yes.
1890. Was the document which Mr. Scott asked for in the House a true copy of your report? I believe it was.
1891. You sued the company in the courts under the Coal-mines Regulation Act? Yes; we sued the manager, because he readmitted the miners before "the examiner or inspector had stated that the mine was safe."
1892. And you have refused to state that it is safe? We have refused from that time up to the present.
1893. Is it a fact that a number of men were selected to go and examine that mine? Yes; I believe that a body of miners were chosen, and with the consent of the management they made an inspection of that portion of the mine, and they placed a report in the book to the effect that they considered that the mine was safe.
1894. Did you ever hear of such a thing taking place before? Never.
1895. You issued a second summons against the company, I believe? Yes; a penalty of £1 a day can be recovered for every day that that breach of the law is continued.
1896. You do not think that fine sufficient to prevent a manager from breaking the law? It proved to be insufficient.
1897. Did you make an inspection afterwards? Yes; in company with Mr. Dixon in December last.
1898. Did it come to your ears at any time that an explosion occurred there? Yes; in February there was an explosion of gas, and the overman was burnt.
1899. You made that second report in December? Yes.
1900. Did that report vary from the first? No; there was no variation.
1901. Your report was that the mine was unsafe? We never said that the mine was unsafe. We said that we were unable to certify that the mine was safe.
1902. Has your attention ever been drawn to the cave-in on the surface at Stockton? Yes; there have been several.
1903. Did you visit that cave-in where the curbstones were split? Yes.
1904. What was your opinion of that? It was caused by a collapse of the pillars.
1905. I understand you to say that since then you made another report? Mr. Dixon and I made another report last week.
1906. To what effect? To the same effect as the previous report, only we stated that one of the points that influenced our opinion in February, 1893, seems to be coming more prominently before everybody's attention now. The great point that influenced us was the probable early decay of the timber on which the roof rests. In one district in the mine the roof is resting on timber which is rotting very fast. Judging from the dimensions of the fall that admitted the sand and water, I believe that there is not more than 20 or 25 feet of strata between the seam and the sand-beds. The whole of one district is water logged sand, not more than 25 feet above the seam.
1907. *Mr. Edden.*] What will be the consequence if that gives away? A flood.
1908. *Chairman.*] Would you like to be in the mine then? I should like to be able to get out very quickly. If you will allow me I will state something in justification of our action. One of our points was that the whole of those working-places in that particular weak spot were 100 feet above the bottom of the shaft, and any water breaking in would have a descent of 100 feet to the only outlets.
1909. That makes it more dangerous of course? Certainly. Had the working been to the dip, and a large feeder of water had come in, the men might not have been placed in jeopardy; but in this case a large body of water might rush down the 100 feet descent and block the only roads by which the men could get out.
1910. There is something like a pack wall to support the place? Yes, made of some hundreds of bags of sand. I believe that upwards of 1,000 bags were filled with sand which came out of the cavity.
1911. Do you say that the sand came down? Yes, several hundred tons of sand. There were bords for two pillar lengths filled knee-deep with sand. The sand was put into bags which were built one upon another as you would build a wall. There were two bords and a cut-through with these sand bags built in for 15 or 20 yards.
1912. Would you care to work in that mine? I would not work in it.
1913. You have read the English Act? Yes, several times.
1914. *Mr. Edden.*] You say that in your report in December, 1893 you said, "We are not in a position to say that the mine is safe"? Yes.
1915. You did not say that it was not safe? We never declared that it was not safe.
1916. Do you not think that men in the position of inspectors who are supposed to examine mines to see whether

Mr.  
W. Humble.  
11 April, 1894.

whether they are safe, should not give a definite opinion as to whether a mine is safe or not? Yes, provided that you make it compulsory by law. But there is nothing in the Act which says that we are to declare a mine dangerous.

1917. Then because the Act does not say that you are to do it, are we to understand that the inspectors deem it their duty not to give a definite opinion upon a mine of that description which you have said you would not like to work in—You visit this mine and then say “We are not in a position to say that the mine is safe”? We have been told more than once that we are not allowed to anticipate dangers. If we find any imminent danger we can take action at once; but we are not allowed to take action about a danger that is threatening, but which might not mature in six or twelve months.

1918. It appears from what you have just said, that in your opinion the inspectors have not sufficient power under the Act? In a case of that kind I do not think they have.

1919. What powers do you think an inspector ought to have? If the inspector requests a manager to withdraw the men, the manager ought to be prevented from sending the men back into the mine until the inspector is satisfied.

1920. That is not in the Act? It is not.

1921. As regards the sand-bags—do you really think that a place being packed up with sand-bags it would prevent a crush? If you packed 20 yards of a bord with sand-bags it is impossible for that portion to come down, but it would not prevent a crush from reaching over an entire district.

1922. And if the water broke in it might wash the sand away, because the bags would rot? Yes; but there happens to be in front of the tier of sand-bags a brick-dam 9 feet thick built in each bord.

1923. *Chairman.*] There is a pipe in that dam? There is a pipe in each dam—three pipes altogether.

1924. Are those pipes there now? They were there last week.

1925. How often are those dams inspected? They are inspected by Mr. Dixon and myself every two months. We have gone together since the inundation took place.

1926. You say you are conversant with the English Act;—will you look at rule 39 and read it? General rule 39 says:—“No person not now employed as a stone or ironstone getter shall be allowed to work alone as a coal or ironstone getter in the face of the workings until he has had two years experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face of the workings of a mine.”

1927. Do you not think that that rule is necessary, and that it should be embodied in any new legislation in this Colony? Yes.

1928. There is a provision in the present Act for 100 cubic feet of air per minute per man? Yes; that is the minimum.

1929. Have you read William Hopton's book? I have.

1930. Would you recommend that to students as a rule? For general reading, certainly.

1931. I suppose that by studying Hopton's book men have prepared themselves for positions as managers? Hundreds.

1932. What stipulation does he make as to the quantity of air to be provided in a mine? He says that a man requires 100 cubic feet of air per minute, a candle about the same quantity, and a horse 1,000 cubic feet.

1933. Do you think that is accurate? I think it is incorrect to say that a horse requires ten times as much as a man.

1934. Would you allow a horse three times as much as a man? I should be prepared to give them an adequate amount of ventilation.

1935. Have you ever worked where there have been sudden outbursts of gas? Not where there have been large outbursts, but I have met with outbursts of gas several times.

1936. Should a sudden outburst take place, would 100 feet of air be enough to prevent an explosion? I do not think that any large volume of air would be able directly to dilute a large outburst of gas.

1937. But you will admit that with a good current of air it would be safer than with a poor current? Undoubtedly.

1938. Do you know that the men in the Northern District have asked for a minimum of 150 feet of air? I heard some time ago that the miners were agreed upon that.

1939. Considering all things you would not think that that was an unreasonable request? No, I cannot get away from the fact that the ventilation of mines could be improved considerably. Of course increasing the minimum by 50 cubic feet means an improvement.

1940. If the minimum was 150 cubic feet, it would not prevent a manager from providing 1,000 feet if he wished? Certainly not. Whilst this minimum quantity is in the present Act, and has been worked up to for some time, I do not look upon it as being any protection to the manager against any charge of having insufficient ventilation. In one case I found that the manager was supplying 129 cubic feet per man and horse, and I served him with a notice that he was not adequately ventilating that district, and he had to supply a greater quantity of air. I considered that 129 feet was not sufficient to dilute the gases coming off the coal in that district.

1941. *Mr. Edden.*] Where was that? That was at the Seaham mine.

1942. In the British Act of 1872 there was provision to grant managers a certificate of service, those who had been managers prior to the passing of the Act. Are you in favour of that? Yes.

1943. Is it not a fact that a certificate of service under the Act of 1872 was looked upon as equal to a certificate won by an examination? Yes, I believe some of the leading mining engineers in the north of England are men who never sat for an examination. They got certificates of service.

1944. *Mr. Edden.*] Could you suggest any better way than the present for working the bord and pillar system for the safety of the miners? I consider that the pillars in the Northern District are, generally speaking, far too small.

1945. What is the effect of it? The effect is to lose a large portion of those pillars, and to produce a crush or creep which ultimately overwhelms a large area of coal which is lost, and there is danger to the men employed.

1946. I suppose that if the pillars were larger they could be taken out? Yes. In the Northern District I have seen very few pillars large enough for successful extraction.

1947. What size should they be? To decide that you must look at a lot of points, the thickness of the seam being one. A thin seam is capable of resisting a greater pressure than a high or a thick seam, the texture and character of coal being the same.

1948. Do you think the Government Inspector should have the power to say what the size of the pillars should be, or should it be left solely to the management? We have that power now. The 25th section says "any matter, thing, or practice." If we raised the question as to the safety of the pillars under that section, it would go to arbitration. Apart from that section, I do not consider that there ought to be anything to enable us to object to the pillars. I believe it is a thing which will right itself. I think it is slowly righting itself now.

Mr.  
W. Humble.  
11 April, 1894.

1949. How long have you been an inspector in the Northern District? A little over four years.

1950. Has any improvement taken place in that respect? Yes.

1951. They are beginning to see the necessity for it? We have one mine opened up splendidly.

1952. Which is that? The A.A. Co., New Winning.

1953. *Mr. Edden.*] What about pillars under tidal waters—would you remove them under any circumstances? If we were sinking at Cremorne I should remove them. Where you have a 6-foot seam I believe that 500 feet of cover would be quite sufficient to allow you to take out the pillars. I do not think that, with 500 feet of strata, and 6 feet to settle down in, it would show anything on the surface. I do not mean strata broken up with faults or dykes.

1954. What is your opinion in reference to check-inspectors; do you think that efficient men are appointed? Generally speaking, they appoint the best men they can get.

1955. Do you think that check inspection has produced any good results? I believe that check inspection carried out regularly and properly is conducive to the good management of a mine.

1956. A gentleman, in giving evidence, has expressed the opinion that a practical man should be appointed to visit all the collieries periodically, and that one should be appointed from the mine that he visits to go round with him. What do you think of that? I would not have that at all. Who would pay him? I believe in two of the men employed in the mine making their own inspection. They would know more about the mine than a stranger, and they will have the welfare of the mine more at heart.

1957. I suppose you are well acquainted with the Act under which you are working? Fairly well, though I do not profess to look at it from a lawyer's point of view.

1958. Do you think there is anything in it that wants altering? I think there could be many general rules inserted with advantage.

1959. Were they in the Bill that went through the Assembly? Yes, some.

1960. Did you notice the amendments that were made in that Bill? Yes.

1961. Did you think they were very arbitrary? I can agree with some of them. I agree with the minimum of 150 cubic feet of air per man, and the proposal with regard to bratticing. But if you were to leave the latter out altogether, I believe it is coming round. Wherever bratticing is necessary it is now used.

1962. Where is it applied? It is applied at the Seaham Colliery, the West Wallsend, the Durham, the Burwood Extended, the Dudley, Brown's Collieries at Minmi, and, I believe, at Lambton. In five of those places bratticing is used for almost every bord.

1963. *Mr. Nicholson.*] Seeing that every now and then we have accidents occurring through the want of bratticing, is it not best to have it provided for by law? I do not think that one great catastrophe has happened owing to the want of brattice.

1964. Were you in the country when the Bulli accident happened? I am but little acquainted with that. One or two accidents have come under my notice which could have been prevented by the use of bratticing. In the mine which I left when I came to this Colony, every place was bratticed, but we were getting a little fire-damp.

1965. *Mr. Edden.*] Do you believe that the mode of ventilation in this Colony is satisfactory? I cannot say that it is altogether satisfactory, but I believe that we have some excellently ventilated mines in the Northern District.

1966. That is outside the bords? No; I mean every working-place.

1967. How does the air get into the bords after they get 20 yards in advance? By brattice.

1968. How does it get in if there is no brattice? It is easy for it to get in if they are working to the dip, but going 35 yards to the rise before the cut-through is made must be warm.

1969. There is a good deal of powder used in some of the mines, and the seams are dirty? Yes.

1970. Is it not detrimental both to master and man as regards the cleaning of coal? Undoubtedly; the men cannot see to clean the coal if they have not a clear atmosphere.

1971. I suppose you have been in a mine when it looked as if there was a fog? I have.

1972. Is it possible for a man to work in such an atmosphere without injury to his health? I think a man would soon have his general health injured if he worked long in such an atmosphere.

1973. I suppose that on the heading there would be plenty of air? There would be a satisfactory current going.

1974. Such a state of things could not exist if the air could get in to fetch out the powder, smoke, and gases? No. I admit that brattice ought to be used where you are working bord and pillar, particularly where there is fire-damp, and the workings are rising. But if you make bratticing compulsory, I do not see how you are going to use it in regard to extracting the pillars. If you take the pillars out you will in all probability get a lot of gas, and if a man is working in one of the pillars 30 yards from the heading in which the air current is flowing, how are you going to get the brattice to the place when you have broken roof on all sides? If you made brattice compulsory, I do not see how you could apply it in that particular case.

THURSDAY, 12 APRIL, 1894.

Present:—

|              |                |
|--------------|----------------|
| MR. EDDEN,   | MR. NICHOLSON, |
| MR. McCOURT, | MR. COOK,      |
| MR. GRAHAME. |                |

J. L. FEGAN, Esq., IN THE CHAIR.

Mr. William Humble recalled and further examined:—

1975. *Mr. Edden.*] What distance would you consider that a man ought to be working in front of the air-ways to get a sufficient quantity to dilute the gas? My idea of adequate ventilation is that the working-faces should be ventilated.

Mr.  
W. Humble.  
12 April, 1894.

1976. That is the working-face? Yes. It is of no use having a large current flowing 30 or 40 yards away from a man when he may be almost stifling where he is working.

1977.

Mr.  
W. Humble.  
12 April, 1894.

1977. On the bord and pillar system, especially where it goes to the rise, is it not an impossibility for the air to strike up the bord unless it is taken in? It does not go in unless it is taken in either by brattice or some other arrangement.

1978. In reference to the pillars under tidal waters, should there be any difference in the size of pillars under tidal waters? Considering the depth that we are working at, I think that we ought to have at least 8-yard pillars and 6-yard bords under the ocean.

1979. Is that what they have in the new Winning Mine of the A. A. Company? No, they are 12-yard pillars there.

1980. Where the workings are under tidal waters, is it necessary that bore-holes should be kept in advance of the leading headings? Yes.

1981. Do you think it necessary that the bore-holes should be in the side as well as the front? Not where you are driving into solid ground. Flank bore-holes are only necessary where you are driving to meet old workings or some old goaf.

1982. Do you think that safety-hooks should be used to prevent over-winding? Yes; wherever men are wound in cages or in deep shafts this apparatus or some other automatic contrivance ought to be used.

1983. Have you ever known cases of accidents occurring where they have not these appliances in use? Yes; I have read of several cases in which men have been thrown down the shaft.

1984. And those accidents might have been averted had these appliances been used? Yes; I remember one case particularly well in which eight deputies who were about to descend a mine between 2 and 3 o'clock in the morning, owing to some defect in the machinery, or some mistake of the engine-man, were drawn up to the pulleys. The detaching-hook acted, and the men were strung up at the pulley and their lives were saved. That shaft was 1,000 feet deep, and but for the hook those men would probably have been thrown to the bottom.

1985. Consequently they would travel at a pretty fair speed in coming up? Yes.

1986. Is the use of these appliances any impediment to the winding of coal? None whatever.

1987. You think they ought to be used? Yes. In some cases men are not carried up, and in those cases these appliances would not be necessary.

1988. *Chairman.*] Did I understand you to say yesterday that a pit to a depth of 500 feet would enable you to take the pillars out? Yes. I assume the seam to be not more than 6 feet in thickness, and to be in untroubled ground, not where there are faults or dykes. With a cover of 500 feet, I believe you could take out as much of the pillars as you could possibly get without any danger.

1989. Under tidal waters? Yes.

1990. *Mr. Cook.*] How do you mean? I mean 500 feet of solid strata. If there happened to be 300 feet of strata, and 200 feet depth of water, I should say, "Don't take out the pillars."

1991. *Chairman.*] The Stockton bore is 599 feet deep; would you think that you could take the pillars out there? Taking the physical state of the Stockton strata, I should say no.

1992. Why? Because the strata on the eastern side of the peninsula is intersected with dykes and faults, and as far as we have proved it yet, it is rotten and troubled ground. The present depth of the workings in the Stockton colliery is not over 300 feet. That 599-foot bore has evidently been put down below the seam. There is no coal on the Stockton peninsula of which I am aware that we can work below the present seam.

1993. What distance would you make your shafts apart? That depends to a very great extent upon the dip of the seam, and other surface conditions, but I should never have them less than 15 yards apart. I believe in their being a much greater distance than that even.

1994. Are you well acquainted with the Act of 1876? Yes.

1995. There is no provision, I presume, in this Act to enforce inspection in the mines prior to the men going to work? There is not.

1996. What is your opinion of that? In my opinion, an inspection ought to be made every morning, or before every shift commences. It is done in many of our mines at the present time.

1997. I suppose the British Coal-mines Regulation Act makes provision for that? Yes; it insists that every working-place shall be examined before the men are admitted into those working-places.

1998-9. Have the provisions of the English Act worked satisfactorily? I believe they have. I was overman and under manager under the English Act, and we never had trouble.

2000. What is the system there; does the deputy on going round leave a mark to show where he has been? The deputy descends the mine some two hours before the men go down, inspects every working-place in his district, and leaves some indication that he has been there. He afterwards meets the men at an appointed station. No man is allowed to go beyond that station until he has had verbal or other intimation from the deputy that all is right.

2001. In any proposed legislation to amend that Act would you have that provision inserted? Certainly.

2002. How long would you keep a man from going to a place where a shot has missed fire? I should prohibit him going back within eight hours if fuse was being used.

2003. You would not allow him to go back the same day? If it was two o'clock in the morning he might go back in the afternoon. In an eight hours shift, if a man has a missed shot with fuse he ought to leave it alone for that shift. About a fortnight ago I came across a report which had been entered in a book by an overman to the effect that about six weeks ago two men left a missed shot and went home, and it exploded two hours afterwards.

2004. Will you read Rule 37 of the British Act? Rule 37 says:—"The books mentioned in these rules shall be provided by the owner, agent, or manager; and the books, or a correct copy thereof, shall be kept at the office of the mine; and any inspector under this Act, and any person employed in the mine, or anyone having the written authority of any inspector or person so employed, may at all reasonable times inspect and take copies of and extracts from any such books; but nothing in these rules shall be construed to impose the obligation of keeping any such books or a copy thereof for more than twelve months after the book has ceased to be used for entries therein under this Act."

2005. Do you know that the reports have been asked for time after time, and those asking for them have been refused when they thought there was a necessity for looking at them? Refused to whom?

2006. To the person who asked for them? I know nothing of that beyond a newspaper report.

2007. You have seen it in the public press? Yes.

2008. Do you think that a provision like the one you have read could be introduced into our legislation?

This

Mr.  
W. Humble.  
12 April, 1894.

This is my idea: I consider that an inspector should make an annual report of his proceedings, and all his important reports ought to be included in that annual report, and be laid before Parliament—made public in the same way as the inspectors' reports under the British Act.

2009. Would you keep the public in the dark for twelve months as to the state of a mine, or would you give them facilities for ascertaining the condition it was in? I do not think so. There are things in the report which are, at the time, confidential. It might injure a coal company if information was given at the time of the report, but it might be of little consequence when the reports were published at the end of the twelve months.

2010. The report would be of little consequence then should a serious catastrophe take place? The reports issued in this way would contain useful information for future guidance.

2011. What is your opinion of the clause in the English Act? I do not agree with some of the words in it. I do not approve of these words "Anyone having the written authority of any inspector or person so employed." I object to those words.

2012. Is that your only objection? Yes.

2013. If those words were omitted you would be entirely in favour of this rule? Yes.

2014. Then you believe that the books should be open to those who are working in the colliery? Yes; I believe that every employee ought to have an opportunity of seeing the reports or copies of the reports that are made in the colliery books. I should not be in favour of even an inspector or any employee giving a note to authorise anyone to go and get a copy.

2015. Have you ever heard of this rule working harshly in England as regards employers? No; I have never even heard of its being put in operation.

2016. If anything of the kind had happened you would have heard of it? If anything of the kind had happened and created a stir in the district I should have seen it in the Press.

2017. Have you seen anything about it in the *Colliery Guardian*? No.

2018. Do you think that automatic contrivances to prevent over-winding should be in use at every colliery? Yes; in every mine in which men are drawn up the shaft.

2019. Do you think that the best men ought to be employed as enginemen? Yes; and I believe that the best men are employed in the Northern Districts. I consider that the absence of fatalities from over-winding in the Northern Districts reflects very great credit upon the enginemen.

2020. Were you an inspector when that very serious accident happened at the South Burwood Mine? No; but I read of it in the papers.

2021. Had there been these automatic contrivances in use at that mine that accident might not have occurred? It would, in all probability, have been averted.

2022. You said that in the Northern District the best men are selected for enginemen? They are presumably the best considering the results of their work.

2023. Do you think that engine winders ought to pass an examination? I am in favour of the examination of managers and under managers, consequently I cannot get away from the position that all men of responsibility ought to hold certificates after passing an examination.

2024. You do not think it sufficient that a man should know no more than what the indicator tells him as to the position of the cage. He should understand the power of steam, and know something of mechanics? I think a man would be a much better engine-driver if he had this scientific knowledge, but the practical work of the engine-drivers in the Northern District cannot be improved upon.

2025. As you allow service certificates to managers, would you allow them to men who were employed at present as engine winders? Certainly.

2026. Is it not a fact that in some of the North of England districts it is the custom, though not under the Act, for deputies to have certificates? Many have them, but it is not compulsory.

2027. Has it not become a custom? I have no doubt that hundreds of deputies in the North of England hold first or second-class manager certificates.

2028. Is not a man who holds a certificate looked upon as something more than the others? Yes; generally speaking.

2029. Would you give a certificate to an engine winder? Yes; on principle. We cannot deny certificates to these men if we say that managers must have them.

2030. Is it not a fact that the Act of 1872 made provision for certificates of service for managers? Yes.

2031. But the 1887 English Act makes no provision for certificates of service? No, not for managers; there was no necessity for it. The Act of 1872 was an Act establishing a new kind of certificate, consequently certificates of service had to be given, or a class of men then employed would have been thrown out of employment until they could pass an examination.

2032. You think that the provisions of that Act are very wise? Yes.

2033. Then Parliament considered that from 1872 to 1887 there was sufficient time for young men to get certificates? Yes.

2034. Do you know the provisions in the Act with reference to check-weighmen? Yes.

2035. Is it provided that the men shall employ a check-weigher who must be a person employed in the same mine? Yes.

2036. Are you acquainted with the provisions of the English Act? Yes; and with those of the proposed Bill.

2037. Do you think it is unfair that men should not be allowed to choose whom they think fit? They have a fairly good choice in a large colliery where there are 400 or 500 men to choose from, and they generally select a man in whom they have great confidence.

2038. Is it fair that whilst men are being called upon to pay the check-weigher they should not have a right to select whom they please? If a body of men employ a man and pay him, they are entitled to the widest choice.

2039. I suppose it has never come under your observation that efforts have been made to get rid of a man who showed backbone in the discharge of his duty? I am aware of several attempts, and of one case in which a check-weigher was removed.

2040. Did you see in the *Colliery Guardian* in 1887 how they got rid of a check-weigher by stopping the colliery and re-engaging all the hands with the exception of the check-weighman? No; but I know of a similar case.

2041. This man was boycotted? It was a round-about way of getting the man removed without having to make an application to a magistrate.

2042.

Mr.  
W. Humble.  
12 April, 1894.

2042. The provisions in the English Act at present would prevent such a thing from taking place? Yes.  
2043. Therefore you think that it is more just than the present Act in this Colony? I consider that it is just that the men should have the widest choice. They should not be bound to take one of the employees of the same colliery.

2044. Did you ever know a case in which the check-weigher was the boss of the colliery, where he was not under the authority of the manager? The manager never attempts to exercise authority over the check-weigher.

2045. Did you ever know a check-weigher to make himself so obnoxious as to interfere with the authority of the manager? I knew of one case in which a check-weigher attempted to boss the place, but he always stopped short at the extreme point.

2046. Check-weighers as a rule are not so obnoxious as some people make out? I have known excellent men from every point of view to be employed as check-weighers—men who would always adopt conciliatory measures.

2047. Is it not a fact that check-weighers have been the means of preventing strikes? I cannot say that, because I am not intimately acquainted with the miners lodges.

2048. You have never seen them causing disturbance that would lead to strikes? I have seen one particularly obnoxious man do that; he was also the secretary of a lodge, and I believe that several times he desired to create trouble.

2049. Was that in this country? No, in England.

2050. Have you seen anything of the kind in this country? No; I have no complaint to make against any check-weigher that I have known here.

2051. At present accidents take place from time to time. Do you know how many there were last year? There were three fatal accidents during the last half year.

2052. Is it not a fact that no ambulances are provided in the majority of collieries? I know collieries in which ambulances are provided.

2053. There is no provision for them in the Act? No.

2054. Is it not a fact that, owing to the want of stretchers, many a man has been maimed for life? I have no doubt many a man's recovery has been greatly retarded by his being jolted about in skips, and afterwards in a cart. It would be the means of saving a great deal of suffering, and promote the more rapid recovery of injured men if ambulances were used.

2055. Is it not a fact that if a man is injured he is doubled up in a skip? They are very often put on trollies.

2056. You never saw them in skips? Yes, many times.

2057. And a man has to be doubled up to be put into a skip? Unless it is a large skip. No man can be stretched out in a skip as he would be in an ambulance.

2058. Do you think that it is humane treatment? I do not think so.

2059. And you think that provision with regard to this should be made in any proposed legislation as it is in England? Such provision should be made in any future legislation.

2060. Will you look at rule 34 of the English Act? Rule 34 says: "Where persons are employed underground ambulances or stretchers with splints and bandages shall be kept at the mine ready for immediate use in case of accident."

2061. Do you think that a provision like that should be inserted in any Act that is passed here? Yes; but to my knowledge many collieries have these ambulances already.

2062. *Mr. Edden.*] When you were appointed an inspector in New South Wales, did you enter into a bond to see that the Mines Regulation Act was carried out? I had nothing to sign; I did not enter into a bond.

2063. I suppose you see that this Act is carried out in its entirety? Yes.

2064. If you saw any violation of the Act, you would deem it your duty to see that it was carried out? Yes.

2065. Do you know that no private arrangement can be made between master and man to over-ride the Act unless it is so stipulated in the Act? Yes.

2066. Has your attention been drawn to what is known as the standard weight? Yes, indirectly.

2067. I suppose you are aware that there are collieries which pay on the standard weight system? Yes.

2068. Do you thoroughly understand that system? Broadly speaking, it means that the owner says that you must put a certain quantity of coal into the skip, but if you put in more than that he will not pay you for it.

2069. Is it possible for a man to tell to half a hundredweight how much he puts in a skip? No.

2070. I suppose you consider that the manager has a right to say to what height the skips shall be filled? Yes, it is right enough that he should say that.

2071. If he says that the skip is to be filled not more than 10 inches above the side the men should adhere to that? Yes; I think they generally do.

2072. After that, do you not think it is requisite and just that the men should be paid for what comes up out of the mine? Yes.

2073. Do you think there ought to be the standard weight system in vogue? No. I think it is a most iniquitous system to pay a man by the standard weight; to say, "I will pay for no more than 12 cwt. in a skip," and a man to lose 1 cwt. if he sends up 13 cwt. It is possible for a man to fill a skip according to the standard height, but it depends upon the way of filling and upon the quality of the coal whether 14 or 15 cwt. is got into a skip.

2074. Do you think it would be safe for a man to go back in half-an-hour to a spot where a fuse had missed fire? If a shot is to be exploded by a fuse and it has missed fire, it is not safe to go back within eight hours.

2075. I suppose that where blasting operations are carried on you would be willing to leave it to the miners to say whether they will use fuses or squibs? Yes. They ought to have every choice where the mine is going on regularly, and is worked without safety-lamps. If safety-lamps are used, the management fire the shots, and it is only right that the manager should say how they should be fired.

2076. Complaints have been made about men travelling in return air-ways;—what is your opinion about that? Complaints have been made to me about men travelling in return air-ways, but I have come to the conclusion that they were more or less sentimental complaints, as far as mines worked with naked lights are concerned. I do not think that it is right that men should travel in return air-ways if the mine

Mr.  
W. Humble.  
12 April, 1894.

be gaseous. If a mine is giving off fire-damp, no man should be permitted to travel regularly in the return air-way. It might be that a large volume of gas was being carried along the air-way, and it might be dangerous to travel against that current even with a safety-lamp.

2077. I suppose that in making inspections you travel the return air-ways? Yes; they are not travelled at every inspection, but I do not think there is a mine under my inspection in which I have not travelled the return air-ways.

2078. Have you ever travelled in one when the air was impregnated with powder-smoke and was not fit for a man to walk in? Yes; I have many a time found them smoky, but the men are not travelling for any length of time in it; and even if they were, they are not in a much worse position as regards ventilation than the furnace man.

2079. Do you think that if provision was made in the Bill to prevent return air-ways from being used as travelling roads it would necessitate the making of a new road? In some cases it would; in other cases it would mean the making of refuge holes on the engine planes.

2080. But if refuge holes were made on the engine plane there would be no necessity for it? No; but it is always better to have a separate road as a travelling road. I should not be in favour of any return air-way in a gassy mine being made a travelling road. No main return air-way should be travelled by men except in cases of emergency.

2081. How often do you make your inspection? As nearly once in eight weeks as possible. Sometimes it is a week or so within the time, sometimes a little over.

2082. Do you think that is sufficient? Yes.

2083. There is a stipulation in the Bill to make it six weeks? I think in the proposed legislation the time is four weeks. Clause 34 says:—"An inspector under this Act shall have power to do all or any of the following things, namely—(1) To make at least once in each month such examination and inquiry as may be necessary to ascertain whether the provisions of this Act relating to matters above ground or below ground are complied with in the case of any mine."

2084. What is your opinion about it? I think it would be much better if it was left as it was—eight weeks.

2085. Unless your attention is called to a case of emergency? Yes, or accident. In such a case I visit a mine three or four times in eight weeks.

2086. I suppose you are aware that the conditions of mining in the Northern Districts are changing rapidly now the mines are beginning to give off gas pretty freely? Yes.

2087. And more care will have to be taken as to the regulation and management of the mines? Yes. Wherever fire-damp is found the greatest amount of care is taken.

2088. You are pretty well acquainted with the mines at home I suppose? I was pretty well acquainted with all the mines within a good radius of my place. I was employed at Messrs. Pease and Partner's collieries, in one of which we had a large amount of fire-damp.

2089. Have you ever found water in the mines where the men worked? Yes, I have often come across wet places.

2090. That is disagreeable for the men to work in? It must be.

2091. If you have wet bands does it not make it difficult to clean the coal? Yes, much more difficult than when it is dry; some bands when wet look like a piece of good coal.

2092. And if a man sends up 10 or 20 lb. of dirt in a skip there is some excuse for it? Yes, where he is working in water.

2093. And where smoke is hanging about that makes it more difficult to clean the coal? A man cannot see what he is doing if he is working in powder-smoke.

2094. And if coal goes up dirty that has a tendency to cause a loss of trade? Yes.

2095. So that good ventilation at the face is in the interests of the proprietors? It would enable the men to clean the coal better if they had a clear atmosphere.

2096. Is there anything else that you would wish to say? General rule 44 in the Bill, after providing that the men shall make an inspection of the mine at least once a month, says, "and if the report states the existence or apprehended existence of any danger, the owner, agent, or manager, shall forthwith cause a true copy of the report to be sent to the inspector of the district." It is rather hard to ask the owner, agent, or manager to send this copy. Why not provide that the miners' inspector should send it. I, as an inspector, do not object to receive these complaints, but it is rather hard to ask the manager of a mine to send them.

2097. You think the inspector appointed by the men would be the proper person to send a report of this description? Yes. Any report that discloses anything tending to danger or any complaint. It is too much to put that upon the manager who may not agree with the men on the subject. He may say "There is nothing in your complaint," yet he is still to send a copy of it to the inspector.

2098. *Chairman.*] Have you heard of any objection to that rule in the English Act? No.

2099. Is this not a copy of rule 38 in the English Act? It is.

2100. Is it not a fact that if the mining inspector does such a thing he may be black-balled for it? I do not see that he would be black-balled any more for that than he would be for making the report. The manager knows that the inspector notified the complaint in the book.

2101. Is it not a fact that there is no provision in our present Act or in the English Act, giving power to mining inspectors to report to the Government Inspector? There is no provision against it. The inspector is bound to entertain any complaint that is sent to him.

2102. You have never heard of any case arising in which anything wrong has been done by the management in England? No; but the mines I was engaged in were seldom visited by the miners' inspectors. I remember that in one or two cases we offered to pay their day's wages if they would inspect the mine, so that we could get their report.

2103. *Mr. McCourt.*] Do you look upon the English Mining Act as the model Mining Act of the world? I do.

2104. As a perfect Act? I do not know where I could put my finger on any part of the English Act and say that it could be much improved.

2105. Ought we to follow it strictly in this Colony? I believe if we were to adopt the English Act in its entirety we could work it very well.

2106. Do you believe in the inspectors of collieries of all grades, being practical men as well as inspectors in theory? Yes.

- Mr. W. Humble. 12 April, 1894.
2107. They should commence as miners and go through all the grades? I should be in favour of his having been a working miner.
2108. I do not mean to work for long, but to go through the grades? Yes, I believe in that.
2109. You believe they should have plenty of practical experience? They ought to have had a long period of practical experience. Presumably they have the theory when they are able to pass an examination and get a certificate.
2110. Do you think that the colliery-owners should contribute towards the remuneration of the inspectors, instead of their being paid out of the general revenue? I consider that they do contribute by being taxpayers.
2111. What does coal contribute towards the expense of Government? That is going beyond the range of my knowledge. I know that all the mines that are working Crown coal are paying a tax in the shape of a royalty.
2112. Do you know that the owners of vineyards have to contribute towards the costs of the inspectors under the Vine Diseases Board? Yes; but I presume that their work benefits the vine-owners principally.
2113. Does not the inspection of collieries benefit the mine-owners? Yes, in a general way, but very often the duties of the inspector seem to clash with the interests of the owners.
2114. You think that the owners of vineyards should contribute towards the cost of inspectors, but the owners of collieries should not? I consider that they ought not to pay by direct taxation the salaries of the inspectors.
2115. *Mr. Grahame.*] Are not the colliery inspectors employed to protect men's lives? Yes.
2116. *Mr. McCourt.*] Do you think that unskilled men ought to be allowed to work in collieries? I do not—not alone.
2117. Is it not a practice when a strike takes place for the proprietors to fill the mines with ragamuffins of all kinds? Yes.
2118. Is it right to allow that? I do not think it is right to allow it for the sake of the men themselves.
2119. What would you suggest to prevent it? I think there is a provision in the proposed legislation taken from the English Act that would prevent it.
2120. *Mr. Edden.*] When a fatal accident occurs in a mine the Government Inspector attends the inquest? Yes.
2121. And miners who were working near the place where the accident occurred are called to give evidence? Yes.
2122. And they have to lose their time and their wages. Do you not think it is right that they should be paid? If they have to lose their time and work they ought to be paid for it.
2123. Have you known such cases? Yes, I know that in one case the coroner was asked to see if he could not get the witnesses some fees, but he said that he could do nothing. Provision had been made to pay jurymen, but no provision had been made for witnesses.
2124. Is not that a hardship? It is. If jurymen are paid, I do not see how they can avoid paying witnesses.
2125. *Chairman.*] Is it not a fact that it is hard to get the men to appear as witnesses? I do not know what trouble the police may have, but if a man is called as a witness he is bound to go.
2126. Do you not think that if the men were remunerated they would go more speedily? I believe that if they were paid for the time which they lose they would not object.
2127. Is it not a fact that there is no provision in the Act to allow the representatives of a deceased miner to appear at the coroner's inquest? I think there is no provision made for it.
2128. It entirely depends upon the Minister? At some inquests which I attended as inspector, the miners' representative was present.
2129. But you could object to him? I do not think so.
2130. There is nothing in the Act making provision for such a thing? No, these things are left to the coroner.
2131. Is there any provision made with regard to this in the English Act? Yes, clause 48 says:—  
Any relative of any person whose death may have been caused by the explosion or accident with respect to which the inquest is being held shall be at liberty to attend and examine any witness either in person or by his counsel, solicitor, or agent, subject nevertheless to the order of the coroner.
2132. Do you think that is a wise provision? Yes.
2133. Do you think it would be well to provide in the Act for one uniform code of signals? Yes. I believe that if the example of the New Zealand Mining Department were followed where they have established one code of signals, it would be better than the present system. Every colliery now has a code of signals of its own, and the code of one colliery differs from that of another, perhaps adjoining it, and for a certain period engine-drivers, onsetters, and so forth, on changing their work, have to learn a new code.
2134. If an engine-driver has worked for ten or twenty years at one mine, and then goes to another mine, he has to learn a new code of signals? Certainly; and an accident might take place before he has become thoroughly acquainted with the new code.
2135. Do you think 6 feet by 6 feet would be too much for the man-holes? In thin seams it would not be advisable to have the height of the refuge hole more than the height of the seam. Where there is upwards of 6 feet of coal the refuge holes are generally 6 feet in height.
2136. Provision is made in the English Act for a thermometer and a barometer to be kept on the surface at the colliery? Yes.
2137. Do you place any reliance upon the barometer? Not the least. I do not object to its being at the mine, but the warning which the barometer gives comes too late.
2138. If the men go down into a mine, say, at 6 o'clock in the morning, and a change in the atmospheric pressure has taken place at 3 or 4 o'clock in the morning, do you not think that the barometer then would be a means of assistance? It would be a general warning similar to a signal post; but any increase in the volume of gas in the mine takes place before the barometer tells us.
2139. If the increase of gas took place at 4 o'clock in the morning, there would be a fall in the barometer before 6 o'clock? If you use these things to point out what to do on a particular morning you are placing too much reliance on the instrument and neglecting general caution.

2140. If a barometer on the surface read to your satisfaction, would you be perfectly satisfied? I should not.
2141. It would not make you less vigilant? Certainly not. If these instruments are to be read regularly, and relied upon, we shall probably neglect something of far more importance, and our vigilance will be relaxed. It will be something like a railway signal being put up to stop a train after the train has gone past. The barometer tells us that a change has taken place, not that it is about to take place.
2142. Then you say this is a blot in the English Act? Yes; but it is one of those things which, if it does no good, will do no harm.
2143. A barometer is not a very costly thing? No; they are very cheap.
2144. The barometer is some use? Undoubtedly, as giving a general warning to seafaring people and others.
2145. Do you know that the use of the barometer was one of the things recommended by a Royal Commission in England? I do.
2146. And before that Commission expert witnesses were examined? Yes.
2147. Do you not think the barometer would be an assistance? Possibly it might be of some advantage at times. I will tell you, briefly, my objection to it. I have known in several cases, whilst I was deputy and overman that there had been a great change in the volume of gas issuing from old workings. I have noticed at a particular time this change, owing to the volume of gas issuing from a goaf, and I was almost able to predict that when I reached the surface I should find that the barometer had fallen. I was able to determine, however, that the increased volume of gas had come from the goaf before the barometer had given any indication of it.
2148. Is it not a fact that the managers are very often on the surface? Yes.
2149. You would like to be on the scene if danger is threatened? Yes.
2150. If you were on the surface, and there was no barometer, you would not know that there was danger? No.
2151. The barometer would warn you? Yes.
2152. And as a vigilant man you would go where you thought there was danger? Yes.
2153. So it would be a good thing in that case? Yes; but before the manager got there the danger would be apparent.
2154. If you were on the surface, and there was danger, you would observe the fall in the mercury? Yes. It may act as a general warning; it is a finger-post.
2155. Therefore, as the cost is small, it would be well to have it? Yes.
2156. What percentage of air and gas would be explosive? The most explosive point is when there are  $9\frac{1}{2}$  parts of air to 1 of fire-damp.
2157. What safety-lamp would you recommend for gaseous mines? A bonneted lamp should be used,—one with a covering to the gauze, to prevent high velocities from igniting the gaseous mixture by blowing the flame through the gauze.
2158. Do you know that in Great Britain they have twelve inspectors' districts? Yes.
2159. If legislation takes place here under present circumstances, would you have districts formed? No.
2160. You would have one general examination Board? Yes.
2161. You would not form districts? No; not until the population has greatly increased. We might have one Board to sit in Sydney.
2162. *Mr. McCourt.*] In mines that are worked under the ocean, is there any minimum depth of strata over the coal fixed? No; nothing is mentioned about tidal waters in the present Act.
2163. Do you think there ought to be a minimum depth? These things can best be regulated by the leases. These coal-mines are leased from the Crown, and the Crown provides sensible restrictions as to the covering and the boreholes to be kept in advance, and the quantity of coal to be extracted.
2164. What should be the minimum depth of the mines under the ocean, having regard to safety? I should say that nothing ought to be driven under the ocean where the cover is less than 100 feet.
2165. *Mr. Edden.*] You stated yesterday that some improvement was necessary in the ventilation of mines worked on the bord and pillar system. Suppose that bratticing was objected to, don't you think that to drive 35 yards, and to have in addition to that the width of the cut-through is too far to go from the air? Yes, I said so; where places are rising.
2166. I believe you read a paper before the Mining Students' Institute in Newcastle in January? Yes.
2167. Will you forward us a copy? I will.

Mr.  
W. Humble.  
12 April, 1894.

Mr. Alfred George Hamilton called in, sworn, and examined:—

2168. *Chairman.*] I believe you have been a miner for a considerable time? Yes.
2169. How many years' experience have you had in the Northern District? Seventeen years.
2170. Have you had any experience in the Southern District? Not as a miner, but I have been there about three years.
2171. What position do you occupy now? Paymaster.
2172. *Mr. Edden.*] At what colliery? The North Illawarra Colliery.
2173. *Chairman.*] You have been in the Northern District when there was an agitation on for the eight hours? Yes; the agitation has been going on ever since I came to the country in 1874.
2174. The miners and others have held large public demonstrations in favour of the legalising of the eight hours? Yes.
2175. Were the Parliamentary representatives in the district in which you live asked whether they are in favour of the eight hours? Yes; that has always been a standard question with the miners.
2176. Were you working in the north when they were allowed to work any hours they liked? Yes; at the Co-operative Colliery, under Mr. Fletcher.
2177. And the men were allowed to go in and out whenever they thought fit? Yes. The front shift used to go in at midnight, and come out sometimes at 3 o'clock the following afternoon.
2178. Do you think that is a desirable state of things? I do not.
2179. Were you in the district when arrangements were come to as to the adoption of the eight hours? Yes.

Mr. A. G.  
Hamilton.  
12 April, 1894.

Mr. A. G.  
Hamilton,  
12 April, 1894.

2180. Since that time, has there been any friction on the subject—have the owners ever said that it caused a loss to them? No. They have expressed the opinion that it is an advantage, their output having really increased.
2181. Is it not a fact that an owner could compel his men to work more than eight hours? Yes, he could—the shift-men.
2182. And the miners? The miner is a contractor, and I should imagine that it would be at his discretion as to what hours he worked. If the men were not in the mine to keep the output going for the period that the manager chose to work his top-men, it would make the output so much more expensive, and I imagine that he would get rid of men who would not stay in the pit working as long as he wanted to keep the mine going.
2183. Do they acknowledge the eight hours up there? Not directly.
2184. But the men work eight hours? Yes.
2185. And the manager could extend the hours if he thought fit? Yes; but the hours of the miners are recognised as eight hours.
2186. If the masters wished to lengthen the hours from nine to ten, they would be masters of the situation at present? Certainly.
2187. And that would cause a strike? Yes.
2188. Do you think that legislation, providing for cases of emergency, would prevent strikes as regards the eight hours? Yes.
2189. Have you heard, during your long experience in the Northern District, of any manager trying to break away from the eight hours? No.
2190. What collieries have you worked in? The old New Lambton, the Lambton, New Lambton Tunnel, the Wallsend, and the Co-operative.
2191. For a long time you held a prominent position in the Northern District? Yes.
2192. You were secretary of the miners' lodge there? Of two lodges—the Lambton and the Wallsend.
2193. Is it not a fact that before any grievance goes to the District Officers or the Delegate Board, every means must be used to settle the dispute locally? It is. If a complaint gets as far as the Delegate Board, the probabilities are in favour of its being a serious one, because it is fairly well threshed out before it gets to the district.
2194. Then it is not true if it has been stated that strangers deal with these disputes? I never heard of such a thing; most decidedly it is not a fact.
2195. From your knowledge as secretary of two of the largest lodges in the Northern District, you can say that everything is done locally to settle disputes? Yes; sending a dispute to the district has always been the last resort.
2196. So that the charge against miners of trying to create disputes and calling in strangers to settle them is untrue? There is no foundation whatever for it.
2197. I believe you have been the means of approaching the manager on various occasions to settle these disputes? Yes; necessarily as a lodge officer I should be.
2198. You have always understood that the men have been as anxious for fair play as the managers? Certainly the miners evince that by the fact that when the awards have been given against them in the arbitration courts they have always abided by the decision; but that cannot be said of the employers.
2199. Do you mean that when a decision has been given by the referee it has not been accepted by the owners? They have evaded the decisions.
2200. Did you ever see the men evade them? No; I never knew one instance of the men evading the referee's award.
2201. I believe you have prepared cases for the referee? Yes.
2202. And the men have accepted the decision, though in some instances they did not believe it was right? Yes. Notably when the penny a ton was given against them in the Wallsend case.
2203. Do you think some provision should be made in any proposed legislation to settle disputes? I do.
2204. I suppose that you do not look upon the miners' calling as being like any other trade? No; the miners are peculiarly situated. The conditions of their calling change so frequently that there will necessarily be a large number of points as to payment arising. It is peculiarly necessary that a Mines Regulation Bill should provide for the settlement of disputes by arbitration.
2205. Would not their employment, being in the bowels of the earth, prevent the public from obtaining any good insight into it? Certainly, it would be impossible for the public to become acquainted with the miners' calling.
2206. A man may be well versed in the technicalities of mining, yet ignorant even of the routine of disputes? Certainly. My experience has been that mining experts have shown themselves ignorant of the practical conditions surrounding the miners.
2207. So that something should be done in the way of legislation to bring the owners and their men together in cases of dispute? Yes.
2208. What sort of ventilation have they in the mines in the Northern District? Since the split system has been introduced, the ventilation in the Northern District has been decidedly improved.
2209. Were you living in the district when the miners asked that 150 cubic feet of air should be fixed as the minimum? Yes; I was secretary of the Wallsend Lodge.
2210. And every member had an opportunity to express his opinion? Yes. The Bill was placed before them, and a number of amendments that emanated from the Wallsend Lodge have been embodied in it.
2211. What is your opinion as to the minimum? My opinion is that 150 feet is little enough.
2212. Have you ever read "Hopton on Mines"? Yes.
2213. Could you recommend that book to a student? Certainly.
2214. You know what he says about ventilation? Yes; he says the amount required is 100 cubic feet per man, for a candle about the same quantity, and for a horse 1,000 cubic feet. We only provide 100 cubic feet each for man, horse, and boys.
2215. You think that is not sufficient? I do.
2216. Do you think that 150 feet minimum would hamper the manager if he wished to supply 400 or 500 feet? No.
2217. You think that the man who said that it would not be speaking the truth? He certainly would not be speaking the truth.

Mr. A. G.  
Hamilton.

12 April, 1894.

2218. What is the length of the bord which they generally drive? Thirty-five yards, exclusive of the thickness and breadth of the cut-through.
2219. What distance would you propose? I should propose less than that.
2220. If you were bratticing, you would not care about the distance? No.
2221. But if there was no brattice? It would make a material difference.
2222. What distance would you recommend between the cut-throughs? Twenty-five yards. That would mean that the air would have to be forced by expansion 29 yards in ordinary working, because there is the 4 yards through the pillar which you have to drive before you get any relief.
2223. You know the provisions in connection with the choice of weighmen? Yes.
2224. Do you think it is right that the men should be compelled to choose a check weighman from the colliery in which they work? I think they should have free choice as to wherever they can get a suitable man, just as the company have a right to take a man from where they choose.
2225. Of course the mines of this country are getting deeper? Yes.
2226. Therefore they will need more careful supervision? Yes.
2227. Do you think it is for the benefit of the owner or of the miner that inexperienced men should be allowed to work? It is against the interest of the owners that inexperienced men should be allowed to work in mines.
2228. Are you acquainted with the English Coal Mines Act? Not particularly well.
2229. Is there a clause in the English Act with regard to that? Yes, it provides that no person who has not had two years' experience in a mine under the supervision of skilled workmen shall be so employed.
2230. And you think there ought to be such a stipulation in our Act? Yes; that was recognised by the custom in the north. At one time, if a wheeler was going on the coal he had to find a man to take him for twelve months, and that man was answerable for the wheeler's safety. He (that is, the wheeler) was not allowed to work on the front shift, nor allowed to take coal down.
2231. So there was really some agreement between the management and the men that inexperienced men should not be allowed to work on the face? There was at several of the mines.
2232. *Mr. Nicholson.*] When you were working in the Northern District was bratticing used for ventilation? Only in headings and where there was gas.
2233. Do you think that 35 yards is not too far to drive ahead of the air? Certainly.
2234. Do you think it should be necessary to have every working-place bratticed up to within a given distance of the face? That is the crux of the question of ventilation. You might have a strong current of air along your heading, and a man at the face might not get any benefit from it, simply because the air can only get to the man by expansion.
2235. Which do you consider the best system of ventilation—having a cross-cut every 12 or 25 yards, or continuous bratticing? Continuous brattice I should say.
2236. Does it cause any friction? It would cause a certain amount, but it should not make any appreciable difference.
2237. Do you think that the cost of putting in brattice is a material consideration to coal-owners? I think it would make very little difference, because there would be a reduction in the yardage to be driven.
2238. Have you ever made a calculation as to what the actual difference of cost would be? No, I have not.
2239. Suppose the heading is 25 yards ahead of the air, do you think it possible for the air to get up to it unless it is carried by brattice? It could not, except there was something to induce a current.
2240. Consequently, to ensure the safe ventilation of a mine, it is necessary to have bratticing put up? Certainly. We find fault with the Act because while it provides that there should be a certain quantity of air per man, it does not provide that the air shall be circulated at the working-face.
2241. And that is the place where the air is actually required? Certainly.
2242. Would you be in favour of providing power in the Act for the Government Inspector to withdraw men in case of serious danger? Certainly I would. The inspectors are labouring under a great difficulty owing to their powers not being sufficiently arbitrary.
2243. Do you think it necessary for an inspector to have that power independent of the manager? Certainly, because he is equal to the manager in knowledge, and he is an unbiased individual.
2244. In every other case you would be in favour of the manager being responsible for the working of the colliery? Yes, I should.
2245. Are you in favour of the inspector's reports in the colliery books being open for the inspection of workers' check-inspectors at the mine? I think that is essentially necessary.
2246. You have been a considerable time in the Southern District? Yes.
2247. What is the prevailing custom with regard to the hours of labour down there? There does not seem to be a regular custom. At our place they are working nine hours.
2248. There are two shifts? Yes; one goes in at 7 and the other at 8 o'clock.
2249. Have you known any disputes between employers and employees with regard to the hours of work? Not in the Southern Districts.
2250. Do you think, that if eight hours a day were fixed by legislation it would have a tendency to prevent friction of that character? It certainly would.
2251. Is there any possibility of its being satisfactorily worked without compulsory legislation? There is not.
2252. Are you pretty well acquainted with the output of the collieries in the Southern District? Yes.
2253. Are there any collieries there that put out 2,000 tons a day? There is only one colliery in the country that can put out 2,000 tons a day.
2254. What is nearest that you can give? The Metropolitan can put out about 1,500 tons a day.
2255. Are you acquainted with the South Bulli Colliery? Only from living in the district.
2256. What is the output there? About 750 tons a day.
2257. Could you give me any idea of the travelling speed of the sets coming out of the southern mines? They travel about 8 to 10 miles an hour.
2258. Is there any possibility of any of them going twice that speed? None whatever.
2259. *Mr. Edden.*] If the eight hours' system were adopted, what would be the extra cost on the output in the Southern District? I do not think there would be any extra cost.
2260. That is considering the present cost and the cost when we were working long hours? I believe the output now is considerably cheaper than it was during the time when we worked long hours—more coal is got out at a less cost.

- Mr. A. G. Hamilton.  
12 April, 1894.
2261. How do you account for that? Continuous effort can only be sustained for a certain period, and eight hours is about the limit.
2262. Then, if a mining expert told you that it would increase the cost by 10d. a ton you would laugh at him? Yes; it would carry its own contradiction on the face of it.
2263. The adoption of the eight hours would not interfere with the output in any way? Not at all.
2264. How long have you been in New South Wales? Twenty years.
2265. Did you ever work in the mines at Home? I did not.
2266. How long is it since you were in the Northern District? Two years and seven months.
2267. You are well acquainted with that district? Yes.
2268. Do you consider that the sanitary condition of the mines is what it ought to be? I do not, and it is objectionable to compel men to travel in the return airways.
2269. You do not think that is right? I do not. When you have worked your shift in the face you are pretty well played out, and you may have a good appetite to go home with; but when you have travelled along the return airway your appetite is gone and you are completely knocked up.
2270. What is the cause of that? Travelling through a vitiated atmosphere.
2271. You do not think that the return airway should be used as a travelling route? Only in exceptional cases, and then it should be for as short a period and distance as possible.
2272. Do you consider that the minimum of 100 feet of air should be taken to the working-face? Yes; that is where it is wanted.
2273. Is it possible under the bord and pillar system for the air to get to the face without something to carry it there? No.
2274. I suppose that is the reason why you advocate bratticing? Yes.
2275. Whilst you were in the north, holding responsible positions in connection with various societies, did you ever hear complaints about wages being paid according to the standard weight? Yes; very bitter complaints. I consider that the standard weight system should never have existed.
2276. Why? Because it is impossible for a man to tell what quantity of coal he is putting into a skip in the mine, as the density of the coal varies. You may, in one part of the mine, fill the skip to a certain weight, but in another part of the mine by filling to the same extent, you may be giving away 1 cwt. of coal without knowing it.
2277. Did you ever know a man to fill the skips high for the purpose of damaging property, and interfering with the working of the mine? No; the ruling passion amongst miners is to get as much as they can. No one would be foolish enough to fill his skip high for the purpose of damaging the mine, as it would mean that he would get a so much less number of skips, owing to the stoppage, consequent on a smash up.
2278. Do you believe that the manager should have power to say how high the skip should be filled? Yes; I believe in the standard bar—that is something that you can see.
2279. Whilst you were in the north, did you ever hear of any complaints or see any necessity for any alteration as to the size of the pillars? Yes; I have seen cases where much stricter supervision should be exercised as to the thickness of the pillars. I have been in places where I have holed through into the adjoining bord two or three times in the length of a cut-through.
2280. I suppose that would cause a certain amount of danger? It would render a pillar, to a certain extent, useless.
2281. What would you suggest as a remedy for that? A more careful method of supervision in the driving of the places.
2282. Did you ever come across places where the men had to work in water? Yes; any amount.
2283. Is there water in your mines? Yes.
2284. Then if a mining expert said there was not water in, what would you say? I should think that he was lying, or that he had not been in the mines.
2285. Does that water not make it difficult for the miners to clean the coal? Yes; I have worked in the New Lambton tunnel, where it took a Tangye pump the whole time to keep the water from me.
2286. If the air is not taken into the working-places, I suppose the powder smoke from the shots will have a tendency to remain? Yes.
2287. That is an impediment to the men cleaning coal? Yes.
2288. What is the effect if they send out dirty coal? It means the ruin of the trade, especially under the killing competition which exists now.
2289. So it is to the interest of the proprietors to give the men every opportunity to send out clean coal? Yes.
2290. The seams in the Northern District are difficult to clean? Yes; not only the bands, but also the stringy brass.
2291. *Mr. Edden.*] What bulk would there be in about 25 lb. of dirt? That would be difficult to say.
2292. Suppose it was brass? You could put 25 lb. of brass in your hat.
2293. *Chairman.*] If the men asked for every skip of coal to be weighed, should that be done? Certainly.
2294. Do you think that if the men desire it they ought to have it done? Yes.
2295. And that provision should be made for it in the Act? Yes; they should have the option of having it weighed.
2296. You would not make it compulsory? No. I believe that by using the standard bar the difficulty can be got over.
2297. Did you compete at one time in the Colony for the position of Inspector of Mines? I did.
2298. What position did you get in that competition? Only the name of the winning competitor was published.
2299. Is it not a fact that you have heard since what position you got? It is hardly right to answer that question.
2300. Did you not hear that you were next to the person who received the appointment? Yes.
2301. And that was from a person who ought to know? Yes.
2302. Do you approve of legislation providing that managers should obtain certificates? I do.
2303. And how would you treat those men who are managers at present? I should give them a certificate, subject to their passing an examination within six months of the time when the Act comes into force.
2304. You would not make the same provision in this Bill as they did in England—give certificates of service? I would give certificates of service.

2305. *Mr. Nicholson.*] Would you restrict them to persons who have been managers for a number of years? I think it would be necessary for the manager to have been at least five years employed in a colliery.
2306. *Chairman.*] There is no provision in the present Act to enforce daily inspection of the mine before the men go to work;—what is your opinion on that? I think that every working place should be inspected before the men are allowed in.
2307. And that some mark should be left to show that the place had been inspected? Yes.
2308. I believe you took a very prominent position in trying to get what was termed a “permanent relief fund” established? Yes. I collated all the statistics that were available in the Northern District. I was a member of the District Committee, and I formulated a scheme for the working of the relief fund.
2309. It took the committee some time to go through that scheme? Yes; we were some considerable time at it.
2310. Who paid you for all this? The Miners Association.
2311. Did you meet the employers at any time? Yes—Mr. Gregson, Mr. Keightley, Mr. Gammick, and one of the other officers of the A.A. Company.
2312. What was the result of that deputation? We had a series of meetings, the result of which was that the proprietors were to lay the proposition before the whole of the associated owners, and we were to receive an answer at a later date.
2313. In that scheme did you propose to give the colliery owners so much representation for a certain percentage paid in? Yes; it was *pro rata*.
2314. Did anything come of it? No.
2315. They refused to go into it? Yes.
2316. Did they not give some hope at one time? Yes.
2317. And the district went to considerable expense to get the work done? Yes.
2318. Is a miner in the Northern District, in case of accident, left totally unprovided for as far as the owners are concerned? Yes.
2319. What is the reason that there are so few cases before the Court under the Employers Liability Act? I think it is owing to the trouble and the complexity of the machinery which has to be set in motion in making a claim.
2320. And the expense? Certainly.
2321. There are two or three societies in England—the Lancashire, the Cheshire, and the South Wales? Yes.
2322. And those have not worked to the detriment of the employers? As far as I know they have not.
2323. Are you in favour of such a fund being established in this Colony? Yes.
2324. You think that some provision should be made? Yes; not only for cases of accident, but also for the aged and infirm, and the widows and orphans.
2325. *Mr. Edden.*] I suppose that the funds were established in England by mutual arrangement between the masters and men? I should imagine so.
2326. You do not think that that is a matter to be dealt with in a Mining Bill? I should hardly think that it would come within the range of such a Bill.
2327. *Chairman.*] But you think it is within the range of some expression from this Committee, seeing that it has been appointed to inquire into the working of collieries? Yes; this Committee should obtain some information on the subject, because it is a matter which requires to be looked into.
2328. Men work their whole life time, and then go to the poor-house at the last? Yes; but there is no poor-house here. I do not want to see one in Australia.
2329. What is your opinion with regard to underground managers holding certificates? It is as important that an underground manager should hold a certificate as it is that a manager should, because the working of the mine is under his immediate personal supervision all the day.
2330. Then you would provide in the Act for him to have a second-class certificate? Yes.
2331. Would you require engine-winders to have certificates? Yes.
2332. You think they ought to pass an examination? I do.
2333. And to those engine-drivers at present employed you would give certificates of service? Yes.
2334. I suppose you have seen men go back to the place almost immediately after a shot had missed fire? Yes.
2335. Do you think that is desirable? I do not.
2336. How long would you give before a man should go back? He should not be allowed to go back again during that shift if the shot has been attempted to be fired by fuse.
2337. What would you recommend to fire with? I should always recommend them to fire by means of straws, with the exception of wet work and certain special places.
2338. You think that a fuse is not as safe as a straw? I think the fuse equally safe; but if a shot misses fire the man should not go back that shift. If he uses a straw he can go back almost at once.
2339. Do you think it is an impossibility for a shot to fire off half an hour afterwards if a straw has been used? I do not say that it is an absolute impossibility, but it is so improbable that you would be safe in going back again.
2340. Then, where a fuse is used, if the shot is fired, you would go home for that shift? Yes.
2341. You think that would be better than for a man to risk his life? Certainly.
2342. *Mr. Cook.*] Is there not increased danger in firing straws compared with fuses—for instance, in ramming the hole? Not if you are tamping with a copper-headed bar and using a copper needle.
2343. You would make this stipulation? Yes.
2344. In any case it is more trouble than the fuse? No; the fuse is more trouble, in my opinion, than the straw.
2345. *Mr. Edden.*] With regard to the cost of bratticing, do you know how much coal has come out of a 3-foot facing in an 8-yard bord 6 feet high? Sixteen tons to the yard.
2346. How much would you allow for waste? Thirty-three per cent., or about one-third.
2347. The cost of bratticing is 7d. per square yard, I believe? That is the lowest class of bratticing, but it is sufficiently good for bratticing bords.
2348. That would be 1s. 2d. for bratticing up a yard, consequently it would not come to 1d. a ton? No; it would come to considerably less than 1d. per ton in a large output. The bratticing can be used two, three, or more times over.

Mr. A. G.  
Hamilton.  
12 April, 1894.

- Mr. A. G. Hamilton.  
12 April, 1894.
2349. *Chairman.*] How many men would you have in a split? Seventy, according to the Act.
2350. Has there been a suggestion to decrease the number? I believe there was.
2351. What is your opinion? I think seventy a fair number.
2352. That should include horses and everything else? Yes.
2353. Would you be in favour of providing by legislation a uniform code of signals? I should.
2354. You think that that ought to be provided for? Yes, as different collieries have different signals.
2355. If a man works a number of years in one colliery and then goes to another he is likely to make mistakes and to cause accidents? Yes.
2356. Are you in favour of safety catches and safety hooks being used to prevent over-winding? Yes; I am strongly in favour of it.
2357. You do not think that using these contrivances would make an engine-man careless? It would not make a good engine-man careless. He is imbued with a sense of the responsibility resting upon his shoulders.
2358. Do you think that once every two or three months is sufficient for an inspector to examine a colliery? No; I am strongly in favour of a monthly inspection.
2359. You think that that ought to be provided for by law? I do.
2360. A lengthy period elapsing between inspections may allow people to get careless? Frequent inspections keep managers and everybody up to the mark.
2361. You think it would not be asking too much to have the collieries inspected monthly? They should be inspected monthly.
2362. That would lead to an increase in the number of inspectors? Yes; there should be an increase in the number of inspectors at present. They have to cover an immense area of ground, and to visit too large a number of collieries.
2363. You think that the cost would not be much compared with the security that it would give? The cost would be very trifling in comparison with the good it would do.
2364. What distance apart would you have the shafts of a mine? As far apart as you could conveniently get them.
2365. What is your reason for that? In the first place, if there was a collapse in one shaft it would have a tendency to bring the other with it. As you sink two shafts to provide an independent means of egress from the mine in the event of one collapsing, you want one removed as far from the influence of the other shaft as possible, to get the maximum of safety.
2366. You think the greater the distance the greater the security in case of accident? Yes; I do not think that the shafts should be less than 50 yards apart.
2367. What distance would you keep your manholes apart where men have to travel on engine planes and main horse roads? Ten yards.
2368. Would you make them conspicuous by any means? They should be carefully whitewashed, and kept so.
2369. What height or breadth would you have them? They should be 6 feet by 6 feet, and they should be kept free of everything.
2370. Do you think any reliance can be placed on the barometer at the surface? Yes.
2371. You think, considering their small cost, that they ought to have a barometer? Yes.
2372. Do you think that provision ought to be made in the Act that both the barometer and the thermometer should be kept on the surface? Certainly.
2373. What is the best safety-lamp for use in gaseous mines? In my opinion the Applewhite-Grey is the best.
2374. Do you know that in the present Act there is no provision for relatives to attend inquests on deceased miners? Yes.
2375. Do you think some provision ought to be made? Most decidedly—similar to that in the English Act.
2376. Is there any other statement you would like to make? The only thing I should like to emphasise is that travelling in return air-ways ought to be prohibited, and there ought to be a very stringent regulation in regard to the firing of shots, that proper notice should be given to the men in the adjacent bords, and a shot should not be allowed to be fired until the men employed in the adjacent bords are on the heading or a safe distance away from the face to be certain that no injury would be done to them if the shot should blow through.

1894.

EXTRACTS FROM THE VOTES AND PROCEEDINGS OF THE  
LEGISLATIVE ASSEMBLY.

VOTES NO. 24. TUESDAY, 13 MARCH, 1894.

14. WORKING OF COLLIERIES :—Mr. Fegan moved, pursuant to Notice (*as amended by consent*),—  
(1.) That a Select Committee be appointed, with power to send for persons and papers, to inquire into and report upon the working of collieries.  
(2.) That such Committee consist of Mr. Slattery, Mr. Cook, Mr. Edden, Mr. Nicholson, Mr. McCourt, Mr. Melville, Mr. Cann, Mr. Grahame, Mr. Scott, and the Mover.  
Debate ensued.  
Question put.  
The House divided.

Ayes, 24.

**WORKING OF COLLIERIES.**

---

---

**REPORT.**

---

THE SELECT COMMITTEE of the Legislative Assembly, appointed on the 13th March, 1894,—“with power to send for persons and papers to inquire into and report on the Working of Collieries,”—have agreed to the following Report:—

Your Committee having examined the witnesses named in the List,\* and \*See list, p. 5. carefully considered the evidence given before the Committee, find the following:—

1. That it is absolutely necessary that an amended Act regulating the working of collieries should be passed without delay, and, amongst others, containing the following provisions:—
2. That a fixed minimum quantity of air—not less than 150 cubic feet of air per man, boy, and horse per minute—should be provided, for the following reason: That in the majority of collieries working at the present time, where there is little or no inflammable gas met with, the absence of a fixed minimum quantity of air would leave the matter at the discretion of the manager, which would lead to disputes, and, perhaps, subsequently to strikes.
3. That provision should be made for conducting the air to the working-face, so that the men working there may be kept safe from the different gases with which they have to contend, and which prove so detrimental to health.
4. That a difference of opinion exists among the witnesses as to the better methods for conducting the air, viz., by lessening the distance between the cut-throughs or by brattice. But your Committee consider that the better way to conduct the air to the working-faces is by means of brattice, which is the cheapest and most approved scientific method.
5. That your Committee consider that the number of men in a split should not exceed sixty, as such provision is highly essential for the health of the workmen.
6. That the majority of witnesses were in favour of legalising eight hours per day for men working underground; and so far as hewers are concerned, the evidence goes to show that eight hours is the time worked at present in the great majority of mines. Your Committee therefore believe that it would be no great hardship to embody an “eight-hours” clause in any Bill for the better regulation of coal-mines and collieries.
7. That your Committee are of opinion that the system known as the “Standard Weight System” is unjust, and ought to be abolished, and that the miners should be paid for the total weight of coal obtained by them.
8. That your Committee consider it necessary that managers, under-managers, and engine-winders should be required to pass an examination to qualify them for “certificates of competency” before they are appointed to any of the before-mentioned positions; but provision should be made to allow those who have served as managers, under-managers, and engine-winders, respectively, “certificates of service” as provided for in the English Coal-mines Acts of 1872 and 1887.
9. That a uniform code of signals should be used at all collieries.

In conclusion, your Committee beg to recommend the adoption of the English Coal-mines Regulation Act of 1887 (50 and 51 Vic., cap. 58), with the amendments suggested in this Report, believing it to be for the better protection of the miner's health and life, the owner's property, and the welfare of the community in general.

No. 3 Committee Room,  
Sydney, 8th May, 1894.

JOHN L. FEGAN,  
Chairman.

## PROCEEDINGS OF THE COMMITTEE.

---

TUESDAY, 17 APRIL, 1894.

MEMBERS PRESENT :—

|            |                         |                |
|------------|-------------------------|----------------|
|            | Mr. Fegan in the Chair. |                |
| Mr. Edden, |                         | Mr. Nicholson, |
|            | Mr. Scott.              |                |

Henry Osborne MacCabe (*Manager of the Osborne-Wallsend Colliery*) called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow, at *Two* o'clock.]

---

WEDNESDAY, 18 APRIL, 1894.

MEMBERS PRESENT :—

|           |                         |            |
|-----------|-------------------------|------------|
|           | Mr. Fegan in the Chair. |            |
| Mr. Cook, |                         | Mr. Edden, |
|           | Mr. Nicholson.          |            |

John Owens called in, sworn, and examined.

Witness withdrew.

[Adjourned till To-morrow, at *Twelve* o'clock.]

---

THURSDAY, 19 APRIL, 1894.

MEMBERS PRESENT :—

|              |                         |                |
|--------------|-------------------------|----------------|
|              | Mr. Fegan in the Chair. |                |
| Mr. Cook,    |                         | Mr. Edden,     |
| Mr. Grahame, |                         | Mr. Nicholson. |

Harrie Wood (*Under Secretary for Mines*) called in, sworn, and examined.

Witness handed in Reports on the Stockton Colliery. [*Appendix A.*]

Witness withdrew.

Joseph Campbell (*Manager of the Lithgow and Hermitage Collieries*) called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claims from H. O. MacCabe for £2 5s., John Owens for £2 16s., and Joseph Campbell for £2 16s., witnesses' expenses.

Claims considered and passed.

[Adjourned till Tuesday next, at *Eleven* o'clock.]

---

TUESDAY, 24 APRIL, 1894.

MEMBER PRESENT :—

Mr. Fegan.

[In the absence of a Quorum, the meeting called for this day lapsed.]

---

WEDNESDAY, 25 APRIL, 1894.

MEMBERS PRESENT :—

Mr. Fegan in the Chair.

|                |  |              |
|----------------|--|--------------|
| Mr. Cann,      |  | Mr. Cook,    |
| Mr. Edden,     |  | Mr. McCourt, |
| Mr. Nicholson, |  | Mr. Scott.   |

Richard Baxter called in, sworn, and examined.

Witness withdrew.

John Thornton called in, sworn, and examined.

Witness withdrew.

The Chairman submitted claims for witnesses' expenses from Richard Baxter for £3 8s. and John Thornton for £3 7s.

Claims considered and passed.

[Adjourned till To-morrow, at *Eleven* o'clock.]

---

THURSDAY,

THURSDAY, 26 APRIL, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

Mr. Cook,  
Mr. McCourt,

Mr. Edden,  
Mr. Nicholson.

John Welford called in, sworn, and examined.

Witness withdrew.

William Thomas called in, sworn, and examined.

Witness handed in Plan for working a mine under tidal waters. [*Appendix B.*]

Witness withdrew.

The Chairman submitted claims for witnesses' expenses from John Welford £2 19s., and William Thomas £2 19s.

Claims considered and passed.

Re-assembling of the Committee to be arranged by the Chairman.

[Adjourned.]

TUESDAY, 8 MAY, 1894.

MEMBERS PRESENT:—

Mr. Fegan in the Chair.

Mr. Edden,

Mr. Nicholson.

The Chairman handed in Copies of the Special Rules and conditions of employment at the following Collieries, viz.:—Stockton; Mount Kembla Coal and Oil Company (Limited); Osborne-Wallsend, at Mount Keira; Lithgow and Hermitage; also, Copy of Agreement between the Associated Masters and the Miners' Association of the Hunter River District.

Ordered to be appended. [*Appendix C.*]

The Chairman submitted Draft Report.

Same read, amended, and agreed to.

Chairman to report to the House.

LIST OF WITNESSES.

## MINUTES OF EVIDENCE.

TUESDAY, 17 APRIL, 1894.

Present:—

MR. NICHOLSON, | MR. EDDEN,  
MR. SCOTT.

J. E. FEGAN, ESQ., IN THE CHAIR.

Henry Osborne McCabe, Esq., called in, sworn, and examined:—

H. O.  
McCabe, Esq.  
17 April, 1894.

2377. *Chairman.*] You are a colliery manager? Yes.
2378. Of what colliery are you manager? The Osborne Wallsend Colliery in the Southern District.
2379. How many men are you employing there? I have about 130 hewers, and inside and outside about another 120, about 250 altogether.
2380. According to the Act it is necessary that you should supply the Department with an annual report? Yes.
2381. In that, of course, you point out how much air is travelling round the workings? Yes.
2382. How much air have you in your mine usually? It runs at the furnace about 56,000 or about 57,000 feet, but going round the workings about 21,000 to 22,000 feet in one district, and 17,000 feet in the other.
2383. At the return it is about 56,000 feet? Usually.
2384. What system of ventilation have you? Furnace.
2385. Do you supply the air with one current, or by splits? By splits. We have two splits at present, and there will be three in a few days. It will be necessary to have three because I want to take some of the men out of one district to put them in another, and to comply with the Act I shall have to put in another split.
2386. The Act allows seventy men in a district? Seventy-five, I think.
2387. Have you any gas to contend with? No; not as you and I understand gas, that is fire-damp.
2388. It is free from fire-damp? Yes.
2389. I suppose you know there have been some suggestions made in a Bill before the House some time since? Yes.
2390. I believe you were examined before a Committee of the Upper House some time since? I was.
2391. Are you a certificated colliery manager? I am.
2392. Are you acquainted with the British Act? I knew the British Act which I worked under from 1878 to 1881, and the other Act I have read, but could not pass an examination on it.
2393. You received your certificate under the Act of 1872? Yes.
2394. Since then a new Act entitled the Coal Mines Regulation Act of 1887, has been passed? Yes; I have read that Act, but not having to work under it, I do not know it thoroughly well.
2395. How many years of mining experience have you had? I have been in the pits since the beginning of 1878.
2396. I suppose you have worked in various positions in the mines? Yes; while I was there I was back over-man, and fore over-man, master shiftsman, and master sinker.
2397. You have had a fair experience in mining? I think so.
2398. You say that you have 250 men in your charge? Yes; many are working outside.
2399. What hours do you work? From 7 in the morning until 5 in the evening, with two breaks of half an hour each—nine hours.
2400. Has it not hitherto been a rule that the miners should work eight hours? The miners in my place work about eight hours, that is eight hours from bank to bank. It is a mile and a quarter to all my faces, and it takes them a long time to get to their work.
2401. Have you ever had any agitation for the legalisation of the eight hours? Yes; I have heard a good deal about that.
2402. Do you think there would be any extra cost in getting coal if eight hours were the legal days work? Yes; I do most certainly.
2403. What is your estimate of that cost? I consider that it would add to the charges by one-eighth if not more.
2404. How much a ton do you pay the hewing rates? We are paying 2s.
2405. In what parts of England had you your experience? South Durham.
2406. They do not work very long hours there? Yes; the colliery that I was at was drawing, when I first went to it, from 7 in the morning until 5 o'clock at night. Then it was altered to from 6 till 5.
2407. That was on account of two shifts working? The pit was drawing for those hours, but the hewers were divided into two shifts, and one went in at 4 o'clock, and the back shift went in at half-past 10, to relieve the front shift miners. The boys began to ride at 5 o'clock.
2408. You did not tell us the time the 4 o'clock shift men would ride? As soon as they were relieved by the half-past 10 o'clock shift.
2409. They would be up by half-past 11? Yes; it would be getting very close on 12.
2410. They really did not work eight hours? They did not.
2411. And in the majority of the mines which you have been connected with, the miners very seldom worked more than eight hours, if they did work that? Since I have had charge of Mount Keira, they have not worked more than eight hours.

H. O.  
McCabe, Esq.  
17 April, 1894.

2412. Your only objection to the eight hours would be the extra cost of the shift men? We are keeping our plant idle for so many hours a day, which is a very serious consideration.
2413. As a rule do miners work by piece, being paid so much a ton? Yes.
2414. So the on cost would be for machinery horses and so forth? Yes.
2415. That is where the loss would be sustained? Yes. There is another thing which nobody seems to realise, that is the very intermittent way in which the mines in this country work. The weighman told me that we worked thirty-nine days for the second quarter of last year, and thirty-eight days for the quarter before that, that being only seventy-seven days for the half year. The mines are not working every day because we have not sufficient trade, there being too many mines.
2416. That being so, do you not think that there should be a schedule to any new Coal Mines Regulation Act giving the form of a return to be made showing the number of days that the mine is worked? I do not know that it matters.
2417. You have said that there are too many mines? That is a matter of political economy.
2418. Do you not think it is a matter of honesty as well. Do you not think that if a return was provided showing the number of days that the collieries work that would be taken into consideration by speculators before speculating in coal-mines? It might or it might not.
2419. *Mr. Edden.*] Do you not think it would depend more on the dividend paid by the mine? It might depend upon what they thought the mines were paying.
2420. *Chairman.*] I think you will admit that it would have a deterrent effect upon speculators if this return were supplied? I do not think it would do any harm.
2421. Would you have any strong objection to it? I do not think so.
2422. During the depressed times, I suppose, you are put to your wits end to make ends meet? Yes. We have had to reduce wages, a thing which we do not like to do, but we have had to make ends meet.
2423. If there were fewer collieries in the Colony to-day there would be more trade for those that were working? Yes.
2424. Therefore, a return such as I have suggested might have a deterrent effect upon speculators? It might; but it seems that a lot of enterprises are started by people who issue I will not say false but enthusiastic prospectuses. People are gulled by these, and we get our industry swamped. How we are going to stop that I have not been able to see.
2425. Do you not think that a provision of this kind in the shape of a schedule to any new Mining Act would prevent speculators from being taken in? I do not think it would do any harm or much good.
2426. How many years experience have you had in the Colony? I have been here since 1881.
2427. You have had experience under the Act of 1876? Yes.
2428. There is a minimum quantity of air fixed by the Act, namely 100 cubic feet? Yes.
2429. Does that minimum ever hamper you in ventilating your mine? No; I always have rather more than that, although I consider it sufficient under certain conditions. Under other conditions it is insufficient. It would not be sufficient in the Metropolitan Colliery, and they supply a great deal more.
2430. The Bill before the Assembly provided that the minimum should be 150 feet? I think 100 feet is sufficient under certain conditions.
2431. What are those conditions? I think that 100 feet would be enough in our mine, but I would rather put more in.
2432. Because it is conducive to the welfare of the men as well as conducive to the properties? Yes.
2433. The minimum quantity being fixed has not hampered you? In some districts if a higher quantity than 100 feet had been fixed I might have had to take men off. Wind will not always go as well one way as another, sometimes you cannot get the air through.
2434. You believe in a minimum quantity of air? Yes; I think 100 feet is a reasonable thing.
2435. Therefore you think it only right that the minimum should be provided for in the Bill? Yes; sometimes you may have men who do not pay a proper regard to the health of their workmen; but where you have well qualified men in charge of the mines you will always find plenty of ventilation.
2436. You are acquainted with the provision in the English Act of 1872 with regard to managers' certificates of service? Yes.
2437. In any proposed legislation in this Colony would you be in favour of such a provision being inserted? Most certainly, in justice to the men who by past service have shown that they were able to carry on their work satisfactorily. Unless some provision of that sort were made great injustice might be done.
2438. You are in favour of granting certificates of service to managers? Certainly.
2439. Would the same thing apply to inspectors? I think so.
2440. You would give them certificates of service too? Yes.
2441. Have you had any trouble with inspectors? No; I flatter myself that I have never given the inspector cause to find fault. The inspectors in our district have always been fair and reasonable men.
2442. *Mr. Edden.*] You said that the adoption of the eight hours would increase the on cost by one-third? By one-eighth.
2443. How do you arrive at that conclusion? The plant is working nine hours now, and if the working hours were reduced there would be the interest and cost of depreciation on that plant, and there would be less coal coming out of the mine.
2444. You said that your miners were not working eight hours? But the pit is working for nine hours.
2445. How many men have you engaged underground in connection with the drawing of coal? There are about 110 men and boys inside and outside, for whom there would be no labour if the mine only worked eight hours.
2446. Is it a dangerous mine? No.
2447. Have you any bottom to shoot up? No.
2448. What do all these off-handed men do? There are about eight shift men taking up stone at the bottom, and there are men securing the main waggon ways, of which we have  $1\frac{3}{4}$  miles, and we have to re-timber.
2449. Do you not consider eight hours long enough for anyone to be in a coal-mine? Not for men and boys simply hauling coal.
2450. They must be eleven or twelve hours from home, taking everything into consideration? Yes.
2451. Do you think they ought to be away all that time;—do you not think eight hours would be sufficient for you? I have been in the mine a good deal more than eight hours.

2452. Do you not think eight hours sufficient for anyone to work underground? I do not see that it is any harm to a man looking after the wheeling of the coal from 7 o'clock in the morning until 5 at night.
2453. Do you not think it is long enough? The lads who wheel the coal ride on the skips most of the time.
2454. They have nothing at all to do? I do not say that.
2455. You do not think it would injure anyone to work twelve or thirteen hours a day. What do you consider a sufficient period? I consider that ten hours for wheelers and men employed in passing coal along the road is not too long.
2456. You are convinced that there has been too much speculation in mines? No question about that.
2457. This over-speculation has caused a decrease in wages? Yes; but it is not all to be put down to that.
2458. What is the cause of the decrease in wages? I may, perhaps, give an answer that will be unpalatable. I put down the decrease in wages to three causes. First of all, to the fact that the country has not been able to borrow money as it did for a good many years, thus making general employment much scarcer, and money much less plentiful. I also put it down to strikes, which have frightened people from sending their ships here; and I put it down to the keen competition that there is for the small remaining trade which has caused a reduction in the price of coal.
2459. You say that over-speculation has caused reduced wages? Yes.
2460. You say that there are too many mines to trade? Yes.
2461. Is there a great decrease in the output compared with what there was two years ago? I can only judge by our own colliery. I am getting a fair share of the southern trade. But we have hardly four-fifths of what we had three years ago.
2462. Do you not think that the reduction in wages is owing to a great extent to the cut-throat competition between the masters? You may call it cut-throat competition. There is competition, and there is only one alternative, either to shut up your mine, or to sell at what price you can get for your coal.
2463. Because each one is trying to get the best of his neighbour? There are collieries working under financial conditions of which you and I know nothing—they may be obliged to carry on, and you cannot tell why they carry on.
2464. Do you think it fair to put coal on a vessel at 6s. 6d. a ton? I think the price is far too low.
2465. Do you not think that that state of things has been brought about by cut-throat competition between the companies in the north and in the south? Competition by the various companies for the trade has, no doubt, reduced the price.
2466. What do you consider a fair wage for a miner for eight hours work? At present they would have to be satisfied with about 8s. a day.
2467. Are they getting that? I believe so.
2468. Would you be surprised to hear that there are plenty of men only getting 4s. 6d. a day? Where?
2469. In the north? They ought to go to the gold diggings.
2470. I suppose you are acquainted with the working of the various collieries in the country? I have not been down a Newcastle colliery yet.
2471. What system are you working? Bord and pillar.
2472. What distance do you drive? I take out the coal between the stones. The coal on the top of the stones is not very good and we leave that. We do not work the pillars out, as a rule.
2473. You make them 35 yards? Yes.
2474. Is there much dirt in the coal? No, it is clean coal.
2475. To that 35 yards has there to be 2 yards added for the cut-through? No; it is included in the 35 yards.
2476. How far do you suppose the air will strike up a bord? The diffusion of the air will keep it fairly comfortable.
2477. Is there any powder used in your mine? Yes.
2478. I suppose it begins to get uncomfortable when you get 25 yards up? It is not bad.
2479. Will the air strike up and carry away powder smoke? It will diffuse. The air diffuses itself through the bord and takes the powder smoke with it.
2480. I ask you as a practical colliery manager how far a man can work away from the air in comfortable conditions where powder is used? They are not uncomfortable at 35 yards if they do not blow powder smoke all over the place. Many men use too much powder, and make a great deal more smoke than there is any necessity for.
2481. I have never seen men light it up for the fun of using it; have they not to pay for it? Yes; but some use more powder than is necessary.
2482. Do you not think that 35 yards is too far to be in front of the air? No; the practical effect of it is not to make the places uncomfortable.
2483. Do you not think it would be an improvement if a portion of the air which goes along the headings was turned into the bords by some means? You would be adding a tremendous amount of friction to the air then.
2484. How? If you turn the air in any direction you are throttling the air and adding friction.
2485. But you would not have to block the whole of the air on the headings; but for two men to turn 200 feet out of 5,000 or 10,000 feet? With that quantity with the diffusion of gases you would have the places comfortable if the men did not blow too much powder there.
2486. In a bord 25 yards up, how long would it take to get the smoke away after a shot had been fired? It would clear at the face in about a quarter of an hour or twenty minutes.
2487. If it was not I suppose they could take off their shirts and bonnet it out? They never have to bonnet it out at my place.
2488. Are you sure of that? Yes.
2489. You would not be surprised at it? I should be surprised if it had to be done at my place.
2490. Would it not be a great improvement if the air was turned into the bord? I do not think you need improve the present conditions. If you hamper the trade any more than it is hampered now you will increase the cost of producing the coal.
2491. Do your men work nearly nude? Some take off their shirts, and some do not.
2492. Do you ever see them sweating much? Yes.

- H. O. McCabe, Esq.  
17 April, 1894.
2493. Do you not think it would remedy that state of things if air was turned into the bord? A man must expect to sweat when he works. If you put too much wind on you will cause chest troubles.
2494. And if you do not, you will? I do not see any chest troubles amongst the people about me.
2495. Do you ever examine them? One sees them constantly.
2496. Is there not miners' asthma caused by bad air? I do not see any of my people suffering from it.
2497. Are your people exceptions to the rule? I do not see any people in that district suffering from it.
2498. You hold that there is no necessity to alter it? No; under present conditions the men work fairly comfortably.
2499. Have you ever worked at any collieries where there have been safety appliances for over-winding purposes? No; I have not. I may tell you that at the colliery where I served my time the safety appliances were got, but never put on.
2500. Do you not think it is necessary that they should be put on? That is a matter that is open to a good deal of discussion.
2501. Can the appliances be used without detriment to the output of coal;—I suppose you have a tunnel? Yes. The use of the safety appliances have certainly prevented accident—no one can deny that, and I believe that they have been the cause of accidents. I think I have heard of cases, but I am not sure.
2502. *Mr. Nicholson.*] Is that through carelessness? One reason why I am afraid of these appliances is this: If an engine driver has drawn up to the pulleys (say, through the night) without detaching completely he may partly shear the copper pin, and let back without informing anyone of the occurrence. Before next period of examination accident might happen through detaching gear carrying away. I do not care much about mechanical appliances or anything which might go wrong between the rope and the cage where there are big weights. But I would not say, positively, whether these appliances should or should not be used.
2503. I suppose you pay the miners by weight? Yes.
2504. How do you determine the weight? By averaging the skips—we do not weigh every skip.
2505. Suppose one skip comes out 17 cwt., and another 15 cwt.? From those the average would be taken for the day. Our arrangement is that if they get more than three weighed on any day they take only the first three.
2506. They are paid for all that comes up? Yes.
2507. Is the check weigher a man employed in the mine? Yes.
2508. Have you any objection to the miners engaging whom they please? I might object to their employing a certain person. He might be a man whom I have dismissed from the colliery, whom I would not have there at any price. Good feeling does not always exist between miners and managers, and the miners might appoint some particular man with whom one would not care to have any dealings.
2509. Do you think the men would engage an obnoxious individual who would cause trouble? It has been done.
2510. Can you name a case? No. It is possible.
2511. You said it had been done? It may be done.
2512. Do you think that the men ought to have a say in whom they should engage? I think I should have a say as to whom I shall allow to come on to my works.
2513. As long as the Act gives you power to remove any man who may impede the working of the colliery, is not that sufficient? No; there might be a certain man whom I would not allow on the place at all.
2514. Do you think that the inspectors have sufficient power under the present Act? Yes; under the 25th section they can stop the mine if they like. The 25th section says:—
- If in any respect (which is not provided against by any expressed provision of this Act or by any special rule) any inspector find any mine or any part thereof or any matter thing or practice in or connected with any such mine to be dangerous or defective so as in his opinion to threaten or tend to the bodily injury of any person such inspector may give notice in writing thereof to the owner or agent of the mine and shall state in such notice the particulars in which he considers such mine or any part thereof or any matter thing or practice to be dangerous or defective and require the same to be remedied and unless the same be forthwith remedied the inspector shall also report the same to the Minister.
- The 5th rule says:—
- If at any time it is found by the person in charge of a mine or any part thereof or by the examiner or inspector that by reason of noxious gases prevailing in such mine or such part thereof or of any cause whatever the mine or the said part is dangerous every workman shall be withdrawn therefrom.
2515. *Chairman.*] It is the manager, not the inspector who withdraws the men? No, the inspector. I think Mr. Rowan reads it that way.
2516. *Mr. Edden.*] You think that the inspector ought to have power to withdraw the men? I do.
2517. You think that if an inspector finds a place dangerous to life and limb, he ought to have the power to withdraw the men until it is remedied? I think he has that power, and he certainly ought to have it.
2518. And the manager should take the responsibility of sending the men back when the place is made safe? No. If an inspector takes the men out he ought to say when they shall be sent back; but if I, as a manager, withdraw the men, I do not think I ought to have to go to the inspector to say when the men shall go back. If I am competent to decide when a mine is unsafe I ought to be able to say when it is safe. It happens in the ordinary working of the mine that if a place is unsafe I do withdraw the men, and I send them back when the danger is removed.
2519. You say that you have no stipulated size for the pillars down your way? No. Our coal is laid on a very uneven floor. When I first went there, I tried to lay the place out in bigger pillars, but the result was that we had stone quarries, and there was nothing to be made out of it.
2520. Then it would be impossible to work your mine on the long-wall system? It would not work long-wall.
2521. What sized pillars do you think ought to be left? That depends upon the dip from the surface and the character of the roof and of the coal.
2522. Do you think that a minimum should be stipulated in a Mining Act? If you have competent men to manage your mines they will not leave the pillars too small.
2523. Do you think the inspector ought to have anything to say about that? If men of the calibre that I think they should be, are appointed inspectors, every manager will pay the utmost deference to any suggestion made by an inspector, without the thing being provided for in the Act.

2524. But do you not think he ought to have some power to say whether a mine is safe from the adequacy of the pillars or otherwise? He has the power, if he considers the mine is not safe, to withdraw the men. That will soon bring the manager to book.
2525. What distance do you consider the shafts should be apart? That depends upon the ground available round the mine. In the English Act 35 or 40 yards is provided for—that is not unreasonable.
2526. That is sufficient? I think so.
2527. You stated that you had two splits for 130 men and that you were going to have another? Yes.
2528. Do you believe in splitting the air? Yes, of course.
2529. That is a practical way of mining? You cannot get the wind round the mine unless you do split it.
2530. You served a few years in England as mining manager? No.
2531. In England they take a pride in good ventilation? Yes.
2532. I suppose that accounts for your mine being in such good condition? Most of the mines in our district are well ventilated.
2533. I suppose they always try to keep ahead of the requirements of the Act? Yes; I do not believe there is one mine in the southern district which is behind the requirements of the Act.
2534. *Mr. Nicholson.*] You are satisfied that the minimum of 100 cubic feet of air is sufficient? I supply more than 100 cubic feet.
2535. Would that be sufficient for the Metropolitan mine? No.
2536. In the Metropolitan mine would it not be necessary to force the air into the working face? Where there is gas you must do that, and to do it you must use brattice in bord-pillar work.
2537. You would be in favour of the use of brattice where there is gas? Yes. Unless you want to blow the property to pieces the gas must be got rid of.
2538. In a mine of that kind does the bratticing increase the cost of the output much? Yes; brattice is a very expensive item when provided all over the place.
2539. You can get it for 7d. a yard? Yes, per square yard.
2540. Do you use the brattice 6 feet wide? You cannot get it much wider.
2541. The friction produced by brattice has not such a great effect as to make it detrimental to the working of the collieries? You would have to add considerably to the power of the furnace to get the air round. The gas must be got out.
2542. Do you think 50 feet of air sufficient to get the gas out of the Metropolitan mine in places going to the dip? I do not. I think Mr. Robertson, the manager, told me that he supplies 500 feet of air per man.
2543. Where there is a necessity for a greater quantity of air than is provided for under the Act of 1876, do you think the law should compel the manager to put that amount of air into the mine? Yes; I think it does. It says that an adequate amount of air shall be supplied, and it fixes the minimum.
2544. Do you not think that in making provision for this supply of air in the Mining Act, we are safeguarding the interests of the owners as well as the lives of the men? My opinion is that no man who knows his business would attempt to carry on a mine in which there is gas without sufficient air to keep the face clear.
2545. You know that there have been managers in the southern mines who have not been practical men? Yes. That could be overcome by insisting on managers having certificates.
2546. You are in favour of certificates? Yes; I would require the same standard that they require in England.
2547. Are you in favour of the manager having the sole control of and responsibility for the mine? No; I think the arrangement in England is a good one. There a second-class man has a second-class certificate. The manager of a mine has a great many other duties to perform. He cannot be going round the mine day after day, but a competent overman should go round every day.
2548. You do not object to the eight hours so far as the miners are concerned? I do not very much care as long as the miners get in about eight hours, and as long as I have the face occupied for the time that I am drawing coal. I object to draw coal for shorter hours than I am drawing now.
2549. You want to be drawing for nine hours a day? Yes.
2550. Do you attribute all the strikes in the various mining districts to the miners? No. The miners are not all black, and the owners are not all white.
2551. There are faults on both sides? Yes.
2552. Could you suggest any way in which the extreme competition in the coal market could be prevented? I cannot.
2553. Do you not think it is possible to form a coal trust comprising all the coal-owners of the three districts, by which trade could be regulated, and prices also? No; that has been tried already and failed.
2554. What was the objection? Everybody thinks that his geese are very big swans.
2555. Everybody over-estimates the value of his own property? Yes.
2556. There was a strike at the old Lambton Colliery, in the northern district, which lasted three months, and the owners of the other collieries contributed a certain amount of money to that colliery to enable them to keep up their dividends. Working on that principle, suppose you were to lay up six collieries in the southern district and worked the other six, could you not indemnify the owners of the collieries that were closed? Not at present rates.
2557. If this plan were adopted, could you not increase the rates? I do not know that we could.
2558. Do you not think that you are actually selling coal at less than its real value? I admit that.
2559. Your trade is secured by giving in tenders to supply coal at a certain price? Yes; and I think nearly the whole of our contracts are for two years.
2560. Have you had much experience of the use of safety-lamps? Not since I left England.
2561. Do you not think they are a detriment to the miners? Yes.
2562. It is more difficult for them to work? Yes.
2563. Do you not think they should have more for their work when they are compelled to use safety-lamps? Yes; but I do not think that that ought to go into an Act of Parliament.
2564. I believe that the miners in the southern district are satisfied with the averaging system? I believe they are quite satisfied with it.
2565. Is there not a regulation at some of the collieries by which they are paid on the standard-weight system? Yes; the miners object to that system very strongly, and from their point of view there

H. O.  
McCabe, Esq.  
17 April, 1894.

H. O.  
McCabe, Esq.  
17 April, 1894.

is a good deal in their objection. I have a system that comes to the same thing. I have a bar under which the skips have to pass. From the miners' point of view the standard weight is a grievance; but from our point of view there is a grievance that the men are allowed to fill the skips as they like. The rolling stock is only calculated to carry a certain weight.

2566. Having a standard height you can measure the height, and the men will not fill over that? Yes; if they keep within the prescribed height there is not much possibility that they will exceed the standard weight. The specific gravity of coal varies so little that the weight on a skip of coal will not vary very much. I think it is not unreasonable to insist upon this standard weight.

2567. Do you think that a bar such as you have at your own colliery would answer every purpose? I suppose it would.

2568. *Mr. Edden.*] Do you pay the men for all the weight that comes up? Not for what is knocked off at the bar.

2569. But you pay for all that goes under the bar? Yes.

2570. *Mr. Nicholson.*] Do you not think that the provision of a standard bar is sufficient to protect your rolling stock? I do.

2571. *Mr. Edden.*] You believe that a manager should have the right to say how high the skip shall be filled? Yes; and also the weight.

2572. You say there is no difference between the standard bar and the standard weight? It seems to me that it would amount to the same thing. The object is not to have such a weight as would cause a breakage of the rolling-stock.

2573. A standard bar would meet all that? I daresay it would.

2574. It does with you? It serves our purpose.

2575. There is no standard weight with you? No.

2576. *Chairman.*] You have studied the British Coal Mines Act of 1887? I have read it.

2577. As a colliery manager, would you accept it for this Colony? Yes; it is a good Act. I can see no objection to it.

2578. I believe you spoke very strongly against the Bill introduced here in 1889? I did.

2579. If the British Act was substituted for that would it have your approval? I do not see that any one could object to working under the British Act. It is the outcome of the deliberations of some of the most scientific men in England.

2580. You have no objection to the 100 feet minimum of air? No.

2581. Is it not when there is no danger that men are liable to grow careless? They do sometimes.

2582. You say that as a manager you might object to some man coming on the premises as a check-weigher? Yes.

2583. You think you ought to have that privilege? I think so.

2584. Does the Act not stipulate that you shall make provision for check-weighmen in England? Yes.

2584½. And you think that is right? Yes; the men have a perfect right to see that the weighing is done to their satisfaction.

2585. Who pays the check-weighman? The men, of course.

2586. Then do you not think they ought to be allowed to get the most competent man to do their weighing? There is always a competent man to do that. I say plainly that I think people owning properties should have the right to say that certain persons shall not be allowed on those properties, just as a man may say that a certain person shall not enter his premises.

2587. You cannot object to an inspector going on the premises? No; but he is only there occasionally.

2588. You cannot object to a check-inspector? He must be one of the miners.

2589. Do you not give every facility to the check-weigher to perform his duties? Yes; and there is no objection to him as long as he is one of the men in my service. What I object to is the employment of any outsider who may be picked up off the street, without my having a say whether he shall come in or not.

2590. Do you contribute anything towards the pay of the check-weigher? No.

2591. Then why should you object? I may object to any individual, but I do not object to the office.

2592. I understand you to say that you would accept the British Act? Yes.

2593. Do you know the stipulation in the British Act? I do; but I do not agree with it.

2594. Is there any other provision in it that you object to? I do not see why check-inspectors too should not be men belonging to the mine.

2595. Is there any provision saying that they could come from any other colliery? Under the English Act they can come from any other colliery.

2596. *Mr. Edden.*] I suppose that if you think you have a miner that you do not agree with you have a right to stop him from coming to the colliery? Yes.

2597. To send him about his business? Yes.

2598. Then it amounts to this, that if you happened to own the whole world that man would have to go and stand in the sea? That is a state of affairs that will not arise.

2599. Do you not think that is a good argument in favour of nationalising the mines? If the Government will take them over we shall be very glad to let them have them.

2600. *Chairman.*] With the exception of the two things you have mentioned, you would be in favour of the English Act? As far as I recollect of it.

2601. You said a little while ago that some evidence you were going to give would not be palatable to the Committee? Yes.

2602. During the examination has there been any discourtesy shown to you? No.

2603. Did you come with the idea that you would not be fairly dealt with? No.

2604. I suppose you know that this Committee is to inquire into the working of collieries? I thought it was to inquire with regard to the Coal-mines Bill.

2605. May I ask again what made you say that your evidence would not be palatable to members of the Committee? I have told Mr. Edden before, in conversation, what I thought about strikes, and I thought he might not be pleased to hear it.

2606. Do you not know that the majority of the miners are against strikes? I think they are.

2607. Do you not think that some provision ought to be made in the Coal-mines Bill for arbitration and conciliation to prevent strikes? I think it ought to be left out of a Bill of that sort. If there is to be any legislation of that character it ought to be in a Bill for that special purpose—it ought not to be mixed up with regulations for the working of coal-mines.

2608. *Mr. Edden.*] But you believe it to be a good thing? I do not know, but I am very sick of strikes.
2609. *Chairman.*] You have had some experience at Durham? Yes.
2610. Is it not a fact that the miners and the employers at Durham have formed a Board of Conciliation? I think they had done that when I was there, but I was simply learning my business, and I was not paying attention to the labour question.
2611. Is it not a fact that such a Board exists? It did exist for a while.
2612. *Mr. Scott.*] It exists to-day? Yes, it does.
2613. *Chairman.*] Do you know that there are fewer strikes in that county than in any other part of England? I think so.
2614. Should there be special rules for the examining of the places in coal-mines before the men go to work? That should be provided under the special rules of the collieries.
2615. Do you know that there is a large number of special rules in the English Act? Yes.
2616. Do you not think that engine-winders ought to pass an examination? If they did it would at once relieve the managers of mines of an enormous amount of responsibility.
2617. But not of all responsibility? You would relieve the manager of enormous responsibility, because the appointment of men to the position of winders and deputies is one of the most anxious duties that one has to perform.
2618. We will take an extreme case: Suppose that an engine-winder pulleys some men, which causes a death, and before the inquest the manager dies, who would be responsible then;—do you not think it would be better to have a man who thoroughly understood his business there? Yes. No manager does appoint a man to an engine unless he does understand his business.
2619. Do you think it would make the men any worse if they passed an examination? No.
2620. I suppose you would deal with men now employed in those positions in the same way as you would deal with managers or inspectors—give them certificates of service? Yes; I would give those employed at present certificates of service.

H. O.  
McCabe, Esq.  
17 April, 1894.

WEDNESDAY, 18 APRIL, 1894.

Present:—

MR. NICHOLSON, | MR. EDDEN,  
MR. COOK.

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. John Owens called in, sworn, and examined:—

2621. *Chairman.*] What are you? A miner.
2622. Where do you live? At Lithgow.
2623. How long have you been living at Lithgow? With a slight intermission, I have been there for eighteen years.
2624. During the greater portion of that time you have been working in the mines? Yes.
2625. In what mine are you working now? Eskbank.
2626. Has all your experience in mining been in this country, or were you a miner in the old country? I was engaged in mining in South Wales.
2627. I suppose they adopt various systems for working the mines there? Yes; according to the circumstances and conditions.
2628. I believe you occupy an official position in connection with the Miners' Association at Lithgow? I am the general secretary.
2629. *Mr. Edden.*] Do the duties of that office occupy the whole of your time? No; I am working in the mine, and I attend to these other duties in my spare time.
2630. *Chairman.*] I suppose you know that this Committee has been appointed to inquire into the working of collieries? Yes.
2631. Have you an eight-hours day in your district? No; but we enjoy that privilege in the mines.
2632. Is it not a fact that you have an annual eight-hour demonstration in the western district? Yes; since the formation of the Miners' Association.
2633. And one prominent feature of the demonstration is the request that eight hours shall be legislated for? Yes; and to commemorate the obtaining of the eight-hour system.
2634. For how long have those demonstrations been held? For eight years.
2635. Once a year? Yes.
2636. Is it not a fact that your parliamentary representatives hitherto have promised to do all in their power to legislate for eight hours? Yes; they have always been in favour of that.
2637. Did your present representatives promise also? Yes.
2638. I suppose that was asked of them before going to Parliament? Yes.
2639. You say you are working at the Eskbank Colliery? Yes.
2640. Is there plenty of ventilation in that colliery? Yes; any amount.
2641. Is it supplied by means of a fan or a furnace? A furnace.
2642. I suppose you have never been check-inspector there? Not at that particular colliery—I have been at other collieries.
2643. What is the amount of air per man at that colliery? The amount of air per man, boy, and horse at the present time is, I daresay, between 400 and 500 cubic feet per minute.
2644. You consider then that the colliery you are working at is a fairly-well ventilated colliery? Oh, yes.
2645. Do you know if any proposal has been made in Parliament to give a certain amount of air per man? Yes.
2646. Are you well acquainted with the present Act? I have read it; I cannot say I am well acquainted with it.
2647. *Mr. Cook.*] Is it not a fact that the reason why there is such a quantity of ventilation in that particular mine just now is because of the smallness of the number of men employed? Yes; I intended to explain that the number of men employed at Eskbank is so small that there is no difficulty in producing a large amount of ventilation per man.
2648. *Mr. Edden.*] How many men are there? About thirty, all told.

Mr. J. Owens.  
18 April, 1894.

2649.

- Mr. J. Owens. 2649. *Chairman.*] You say you are fairly-well acquainted with the Act of 1876, under which you are working? Yes.
- 18 April, 1894 2649½. You know that the minimum amount of ventilation there fixed is 100 cubic feet per man? Yes.
2650. Do you know if there has been any proposal to increase that amount of ventilation? Yes.
2651. Up to what quantity? Up to 150 cubic feet.
2652. What is your opinion in regard to that? Well, it depends entirely upon circumstances. There are cases where 150 feet would not be enough.
2653. But I am speaking of the minimum;—do you think that for sanitary purposes alone it is necessary that the minimum should not be below 150 feet? For sanitary purposes there are, of course, various matters involved; but 150 cubic feet per minute is a fair minimum.
2654. And you think it is necessary to have that quantity for sanitary purposes alone? Unquestionably.
2655. If gas were shown, of course you would increase that quantity? Yes.
2656. You say you have had nearly eighteen years experience in this Colony;—how many years did you have in Wales? About six years.
2657. That makes twenty-four years experience in mining;—during all that time you have given considerable attention to the laws of ventilation? Yes.
2658. And I suppose you are acquainted with the various systems of ventilation? Yes.
2659. What do you think is the best system as a practical man—I suppose splitting? As I told you before, it is necessary to adopt various methods according to various circumstances. It would not be practicable, for instance, to work a colliery like the Helensburg Colliery in the same way that you would work collieries like those at Lithgow.
2660. How is that? In the first place the western collieries do not generate gas at all, whereas the Helensburg Colliery does; and in order to ensure safety you would have to work the Helensburg Colliery in a different way to that which would be necessary in the western collieries.
2661. You mean that more ventilation would be required? Yes.
2662. But not that it would be necessary to alter the system of work? In the western collieries, owing to the coal being damp and the depth shallow, 50 cubic feet of air per man would be quite sufficient at the present time. That seems remarkable, but it is nevertheless a fact.
2663. Do I understand you to say that where it is shallow and damp 50 cubic feet per man is sufficient? It would be safer in some cases to work with 50 feet of air than in other cases with 300 feet. We could do with 50 feet.
2664. I understand that you are referring to the danger of explosion;—you say that if you had only 50 cubic feet in Lithgow there would be no explosion, whilst if you had double that quantity at Helensburg or any other colliery generating gas there would be an explosion? Certainly. At Lithgow there would not be the same danger to life.
2665. At the same time you would not say that 50 cubic feet would be sufficient to keep a mine in a good sanitary condition? Certainly not.
2666. I suppose you believe that the best system is the split system? Yes.
2667. Does your knowledge of ventilation go to prove that that is the most scientific principle? Yes.
2668. Is it the principle that is pointed out to mining students as the best? Yes, it is.
2669. They can split air and work in splits under the long-wall system? Yes; just as easily as under the post and stall system.
2670. Have there been any explosions in the Lithgow collieries since you have been in the district? No.
2671. Have any men been burnt there at any time? Yes.
2672. With gas? No; the colliery took fire from the boiler under ground.
2673. Not owing to the existence of inflammable gas in the vicinity? No.
2674. The coal got heated and caught fire, I suppose? The colliery got filled with smoke and the men were smothered.
2675. How many men? I believe seven or eight.
2676. *Mr. Edden.*] Have you worked at any other mine at Lithgow besides the Eskbank? Yes; I have worked in nearly all of them.
2677. How do they work the coal there;—on the long-wall system? No; on the pillar and stall system.
2678. What width are the bords? Generally 8 yards.
2679. And what is the width of the pillars? Thirty yards, as a rule. It is 30 yards where I am now, and the late manager used to adhere to that principle very rigidly. You must bear in mind that the Eskbank Colliery is more shallow than any of the others, the depth of the shaft being only about 80 feet.
2680. And what distance up do you drive the bords before you put a cut-through over? About 30 or 40 yards.
2681. You do not go the stipulated distance as they do in some places—35 yards? They may go that distance in cases, but they do not exceed it. The distance is about 30 yards, as a general rule. Sometimes under pressure, through meeting a roll or anything of that kind, they may go a little further.
2682. You state that the mine in which you are working is well ventilated, there being only thirty men in it? Yes.
2683. According to the inspector's report how much air per minute goes into the mine for each man? I have not seen the inspector's report.
2684. You have no check-inspectors? No; we have had no check-inspectors there for a considerable time.
2685. I suppose you do not consider that there is any necessity? Not the slightest.
2686. When these bords are up do you use any powder in the mine? Very seldom.
2687. But you do use some? Not in the coal. The only time when powder is used is when we are getting through dykes or rolls.
2688. As a practical man, what do you consider is a fair distance for bords to be driven before a cut-through is put over;—I suppose that would depend upon circumstances? Precisely. I would not exceed the distance specified in the present Act, namely, 35 yards; but I consider that in order to be within the mark 30 yards would be sufficient, because there are cases even in the Lithgow district where at times it would be very difficult to drive 35 yards.
2689. I suppose in the Lithgow mines no means are adopted to take the air into the bords by the use of canvas? That has been done where there has been a necessity for it; but it is very seldom required, because there are so few men employed in the collieries. I do not think there is any colliery in Lithgow employing more than thirty men at present.
- 2690.

2690. But if they employed a greater number of men the air would be more heated? Of course it would. *Mr. J. Owens.*
2691. And; consequently, the good sanitary condition at present existing would be materially affected? Yes; they would require more ventilation. *18 April, 1894.*
2692. You say you have no means to take the air into a bord; I suppose, when you get about 30 yards up, it begins even there to get warm? Yes; it does.
2693. How far do you suppose the air would strike up a bord without some means to take it in? When the air travels up the main heading past a bord, without any appliances being employed to drive the air into the bord, it would simply pass by the bord end, merely sweeping away 2 or 3 yards, perhaps, of the stagnant air at the bord end. It would merely sweep by, and leave everything inside the bord, where the men were working, stagnant.
2694. Is it your opinion that a good current of air might be driven 20 yards up a bord? Yes.
2695. But 50 feet would be of no use? No; it would not be felt.
2696. You stated, in reply to the Chairman, that you thought 150 cubic feet of air per man would be sufficient under certain circumstances? Yes.
2697. Could you give us any authorities on an adequate amount of ventilation per man? Yes—Atkinson and Upton.
2698. What quantity do they give? They say that under favourable circumstances 100 cubic feet per minute is an adequate amount, while under other circumstances 500 cubic feet would not be nearly adequate.
2699. Have you ever read what Professor Murvale has to say on the subject? No.
2700. Are you aware that he puts the quantity down at 150 feet and higher; that W. Williamson puts it at from 150 to 250 cubic feet; Professor Phillips at 250 to 500; A. M. Hedley 100 to 500; J. T. Taylor at 120 to 150;—these are all authorities on mining? They are later authorities than the two I have just quoted.
2701. I suppose you have worked in mines even in your district where the sanitary conditions have not always been as they should be? Yes; I have worked in a mine where you could not burn a lamp.
2702. For want of air? Owing to black damp.
2703. In the main heading? Yes.
2704. If there had been brattice put up it would have cleared that out? Yes; but that very rarely occurs.
2705. Do you ever have any bother up your way in reference to weighing the coal? Yes; any amount.
2706. What is the trouble? We cannot get the manager to weigh a sufficient quantity of the miners' coal, and they do not weigh regularly enough. We are working there under the average system, and the skips are not weighed. A man may get one of his skips weighed this week, and perhaps his coal may not be again weighed for two or three months. I have known a case where a man worked there whose skips were not weighed for eighteen months—where the manager did not weigh for eighteen months. That, of course, was a serious grievance, especially if the last time the manager did weigh he got a light weight and kept the miners at that. What is complained of is, that there is no provision in the present Act whereby the manager can be compelled to weigh. At this particular time of which I am speaking we appealed to the then Minister for Mines, the late Mr. Fletcher, who referred the matter for the opinion of his colleague, the Attorney-General, Mr. Want, who said there was no provision in the Act whereby the men could compel the manager to weigh the coal, although they could compel him to provide a weigh-bridge merely to look at. We had to be satisfied with that. Time after time we have had cause to complain of the manner in which some of the managers treat this matter of weighing the coal. All the miners, I think, would be satisfied if they could get a certain per cent. of the output weighed—say 5 or 10 per cent. of the general output.
2707. What is about the average number of skips for a day's work for two men? About twelve.
2708. I suppose if they could get one weighed out of the twelve they would be satisfied? Yes; that is to say if that were made compulsory. We want something whereby we can demand that a certain percentage of the output shall be weighed. We consider that we have a right to have a certain number weighed. It does not matter whether the number is large or small so long as we can demand that a certain number shall be weighed.
2709. And there has been bother about this between the men and the managers? Yes; times out of number.
2710. It is a standing grievance with the men? Yes.
2711. What is the object of the managers not weighing the coal;—have you any idea? No.
2712. The weighbridge is there? Yes.
2713. And the man is there, I suppose? Yes.
2714. And yet you cannot get the skips weighed? No.
2715. And do you have a check weighman? Yes; in some places. Since the last strike there has been no check weighmen at some of the collieries.
2716. *Mr. Nicholson.*] Giving the Attorney-General's opinion in the case referred to, you said there was no provision in the Act providing that the miners shall be paid for the weight of coal gotten? That was the opinion of the Attorney-General.
2717. We have the same Act in existence now, and I find, that section 19 distinctly provides for that? The Act states that we shall be paid according to the weight of the mineral gotten; but it does not say that we shall have a right to compel the manager to weigh any particular number of skips, or any particular quantity of coal.
2718. Do you think there is any other possible way of ascertaining the weight of the mineral gotten except by weighing the whole of it? Certainly not.
2719. We know that in a great many cases the miners are satisfied with the average system; but in the case to which you have referred, the skips not having been weighed for eighteen months, how were the men paid? They were paid according to the weight of the skips when they were last weighed.
2720. Do you ballot for the bords in the colliery? Yes.
2721. If you do not get weighed in time during the present quarter, in regard to whatever work you are doing, are you paid on the average of last quarter, or on the average of the present quarter? I get paid according to my average weight of the previous quarter.
2722. Do you think if the mine-owners provided facilities for weighing every skip, there would be more satisfaction? There would be more satisfaction unquestionably.

- Mr. J. Owens. 2723. *Mr. Edden.*] You have entered into no agreement with the manager, I suppose, as to how the skips should be weighed? No; merely the average.
- 18 April, 1894. 2724. The miners up there are quite satisfied with the average principle, if they could get the skips weighed? Yes.
2725. But it appears that the managers just do as they like? The miners do not object to the principle of being paid on the average system, but they object to the way in which the masters refuse to weigh,—that is to say, when they get a low weight, they keep the men at that. Some of them do this; I do not say they all do.
2726. Do I understand that the average system is worked in this way: If you send twelve skips of coal out of the mine, and two of those are weighed, and if one weighs 12 cwt. and the other 14 cwt., you get paid for 13 cwt.? Yes.
2727. You have no standard weight? No; those two skips would be averaged. If one weighed 12 cwt. and the other weighed 14 cwt., my average weight would be 13 cwt.
2728. Have you ever worked at a mine where there was a standard weight? No; in a colliery in which I worked at home they weighed every skip.
2729. They would not put many out, perhaps? There were over 1,000 men working there, and every skip that came out of the pit was weighed. I refer to the Bute Colliery.
2730. *Chairman.*] You think that is the fairest system? Of course it is.
2731. *Mr. Edden.*] Did you ever work at any colliery where there were automatic appliances to prevent over-winding? I have not worked at any mine where such appliances have been used, but I have seen them in use.
2732. What is your opinion about them? I think they are great things, and that they are very beneficial. They are an improvement on the present system.
2733. And tend to prevent accidents and loss of life? Unquestionably.
2734. As a practical man, do you think that it is an impediment to the working of a mine to use these things? No; it has not been the case where I have seen them working.
2735. Reverting to the coal weighing matter, the Act specifies that the men can engage a man to act as check weighman, and I believe they are required to engage a man working in the colliery, and cannot engage a man outside the colliery? They cannot do so now.
2736. Do you think they ought to be able to do so? I think that as they have the privilege of employing the man, and as they are compelled to pay him themselves, they ought to be allowed to employ whom they like.
2737. *Mr. Nicholson.*] Have you ever been down the Helensburg Mine? I have just been down to the bottom of the shaft.
2738. Have you ever worked in gaseous mines in other places than New South Wales? I have only worked in gassy mines in the old country.
2739. Do you think that where there is gas in a mine it is necessary to brattice up to all working places in order to provide sufficient ventilation? Yes.
2740. Do you think it adds much to the cost of production to brattice up to the working-face or within a reasonable distance? It would certainly add a little, but very little.
2741. Is it not of equal or even of more advantage to the owners than to the men that precautions of that kind should be taken? Unquestionably.
2742. And quite a necessary matter to them? Yes; it is a necessary matter and cannot be avoided.
2743. Are you in favour of making the manager responsible for the safe working of the mine and everything in connection with it—making him liable in regard to calling the men up in case of danger from a bad roof, or from water, or gas, or any cause whatever? No; I am not. I think that should be vested in the inspector of collieries—the Government inspector.
2744. You are aware that in many instances it is not convenient for the Government inspector to be on the ground? But the men themselves, if they think that the mine is unsafe, have the privilege of informing the inspector, and immediately that is done he is supposed to be there.
2745. But an urgent case might arise when it would not be possible for the Government inspector to be present—then none would be so fit as the manager to take the responsibility? Unquestionably.
2746. Do you know that the Amending Act of 1876 provides specially that the manager shall have that responsibility? Yes.
2747. Do you know also that it confers the power on the Government inspector in a case of emergency to withdraw the men from the mine? Yes.
2748. Are you of opinion that the Government inspector should still retain that power as well as the manager? Yes; I would make it more distinct. At the present time the Act states that he “may” withdraw the men; but I say that if, in his opinion, the mine is dangerous he should withdraw the men.
2749. *Mr. Edden.*] And you think the word “may” should be struck out and the word “shall” inserted? Yes; if the place is dangerous the men should not be there at all.
2750. *Mr. Nicholson.*] Are you in favour of the eight-hours system being adopted for all miners and underground workers? Yes; and all on top too. I believe that eight hours are enough for any man, whether he is below or on the surface.
2751. You think a man can do a fair day’s work in that time? I think he can. I can answer that question from practical experience.
2752. Do you think the owners would suffer much loss if the collieries were only drawing coal eight hours a day instead of nine hours, as most of them do now? No; I do not see that they would.
2753. *Chairman.*] I suppose you have made yourself acquainted with the British Coal-mines Regulation Act? Yes; I have read it.
2754. Are you aware that in the Act of 1872 provision was made that certificates of service might be granted to those who were managers of collieries at the time of the passing of the Act? Yes.
2755. Are you aware that in the Act of 1887, while no such provision is made for managers, there is a provision of the kind in the case of under-ground managers? Yes.
2756. In the event of legislation being passed in this country, what is your opinion as to certificates of service;—do you think they ought to be granted? I am of opinion that no man should hold the position without a certificate of competency.

2757. Then you would not give any certificates of service, such as are given under the English system? Mr. J. Owens.  
I would not deprive a man of his position merely because he could not go through the technicalities required by the English Act. I knew of cases which came under the English Act of 1872 where men had been managing collieries very successfully nearly half their life-time; where a man had proved himself to be in every way qualified to manage a mine, though he might not be able, perhaps, to answer the technical questions put to him by the Board of Examiners. I think it would be cruel to deprive that man of his position merely because he could not answer these technical points. 18 April, 1894.
2758. Then in any new legislation in this country you would be in favour of making provision that certificates of service should be given to those who are managers of collieries at the present time? Yes; of course, if a man was competent before he would be competent now.
2759. I believe you were examined before the Committee of the Upper House on the Coal-mines Regulation Bill of 1890? Yes.
2760. I believe you said in your evidence on that occasion that managers became aware when inspectors were coming to the collieries? Yes; I did say that, and I say it now.
2761. You think they get to know somehow? Yes. I do not mean to say that the inspector tells them, but they get to know, especially in a place like Lithgow. If I remember correctly, I mentioned that district. The collieries in Lithgow are different to those in Newcastle, as I wish to explain to prevent any misconception of my meaning. In Newcastle they have the inspectors on the ground. If an inspector approaches a mine there, no notice is taken of him, but if an inspector goes to Lithgow, where there is no one stationed, they immediately jump to the conclusion, and very naturally, that he is there on an official visit, and, as all the collieries are connected by telephone, when the inspector goes down one pit a message is sent, "The inspector is in our pit. Look out. He will be at your place to-morrow," or in the afternoon, as the case may be. On receiving that telephone, the boss will come round and say, "Now, then, boys, fix up your props. The inspector is in the district." That is a thing of common occurrence.
2762. Then it appears that the managers in that district are a happy family, and look after each others' interests? I believe, as far as that is concerned, they are.
2763. Would you deal with inspectors as you would deal with managers—that is to say, if there were inspectors at the present time who had not passed an examination, and had not certificates under the English Act, would you give them the same preference? I would, especially as I know the present inspectors personally to be competent.
2764. You know that the engine-winders, in a great many instances, have the lives of a large number of men in their hands, being required to send them down the shaft and bring them up again? Yes.
2765. Do you not think these should be competent men, who thoroughly understand their work? Yes.
2766. Would you be in favour of engine-drivers being required to pass an examination? I believe the English Act provides for that. But, at any rate, it is absolutely necessary that the engine-driver, having the lives of so many men in his hands, should possess special qualifications for the work, and should pass an examination before being entrusted with it.
2767. And how would you deal with the men who are winding at the present time;—I suppose you would treat them the same as you would treat those who are managers at the present time, and give them certificates of service? If the men had proved themselves capable and qualified, I should say, yes.
2768. If men had been winding for some years you would not debar them from earning their livelihood, but you would give them a certificate of service? Yes; the same as I would the managers and inspectors.
2769. You say you are secretary of your organisation at Lithgow? Yes.
2770. Have you a Delegate Board up there? Yes.
2771. Is it a fact that no dispute comes to you without every local means possible having been devised to settle the dispute? Every local means possible is devised to settle it before it comes to the district.
2772. You, as the Chief District Officer, holding the office of secretary, would not hear of a dispute unless every attempt had been made to settle it locally? No; and if I did, the Delegate Board would not.
2773. And you, as secretary, would not have anything whatever to do with it? Certainly not. I would not dare. I would not countenance it.
2774. Then it is a fact that the members of every lodge do their best to settle their own disputes, and that the very last thing they do is to bring a matter before the District Board? That is so.
2775. I suppose you have had many local disputes at Lithgow? Yes, a good number.
2776. And your organisation has been the means of settling a good many of them? Yes.
2777. As a rule you have very few strikes up there? Very few indeed, happily.
2778. As an officer of the organisation, I suppose you do not believe in strikes? No; I do not.
2779. You think they are the last thing which should come? Yes.
2780. And that every means that could be conceived by intelligent men to settle the matter ought to be used? Yes; at all times.
2781. That is the position you take up, I suppose, in connection with these strikes? Yes; I believe that every other means should be exhausted before a resort is made to a strike.
2782. Is there any fund in your district to provide for old age or for men who have been disabled? No.
2783. Or for the support of the widows and orphans of men who have lost their lives in consequence of accidents in the mines? No; none whatever.
2784. There is no provision at all made for any of these cases? Not in connection with the miners.
2785. Not in any way as far as the miners are concerned? No.
2786. The only provision for sickness is that made in connection with the friendly societies? That is all.
2787. Was there any better provision made in South Wales? Not when I was there.
2788. Has not a permanent fund been established there since? I could not say with certainty.
2789. Do you know that an association for such a purpose exists? I know it exists in the West of England, but whether it extends to Wales I cannot say.
2790. Do you know that it exists in the North of England—Durham and Northumberland? Yes; I know it is the case in Durham.
2791. Do you know that they have a very strong fund there? Yes; I do.
2792. Do you know that they pay 5s. a week to the widow, and half a crown a week to the children where a miner loses his life? I could not answer as to the amount.
2793. If I were to tell you it was so, would you be surprised? No; I would not be a bit surprised, knowing, as I do, that they have a strong fund of that kind. 2794.

- Mr. J. Owens. 2794. And that so much money is given on the death of a member of the association where it occurs in consequence of accident in the mine? Yes; I know that that is the case, but I do not know the amount.
- 18 April, 1894. 2795. You think something of that kind should be done in this Colony? Yes; I do decidedly.
2796. Do you think it is inhuman that when men lose their lives following their daily avocation their wives and children should be left destitute and dependent upon the charity of friends? Yes.
2797. Do you think that if some such provision as that to which I have referred were made in this country it would help to make the position of the miner a great deal better? It would indeed.
2798. I suppose you have visited men injured by accident, and who have afterwards died in consequence? Yes.
2799. And I suppose you have observed that these men on their death-bed have evinced great anxiety as to what would become of their wives and children after their death? Yes. Naturally when a man is on his death-bed, knowing that he is leaving a wife and family behind him unprovided for, he would feel some anxiety as to their future welfare.
2800. And in your experience such cases have come under your notice? Yes; more than once.
2801. And you think that by contributions from miners and employers something should be done to raise a fund for such a purpose? I do.
2802. You think it would be money well spent? It would.
2803. And would give a better position to the miner and his family? Yes.
2804. Is it not a fact that time after time numbers of calls are made upon the miners to meet cases of distress out of his own very limited means? Yes; nearly every fortnight. Every pay-day there is a subscription list on behalf of somebody.
2805. And these subscription lists would be done away with if the same amount of money were paid into a fund? Yes.
2806. You say you have read the Act under which you are working, and there is no provision for the inspection of the working-places prior to the men going to work? No; there is not.
2807. You think some provision ought to be made? Certainly.
2808. Especially in gassy mines? Yes.
2809. I suppose in your time you have worked with a number of men who knew very little about gas? Yes.
2810. You would not like to work with those men if there were no provision of this kind—that is to say, if no inspection was made before the men went to work? I would not.
2811. There would be a liability to a serious accident, endangering, not only the lives of the men, but the property of the owners? That is the case.
2812. And you believe that some provision to guard against such a thing in the manner suggested should be included in any proposed legislation? Yes.
2813. What time would you give a person to go to a missed shot? I would give him from to-day until to-morrow.
2814. You would give him then the full eight hours—the time the pit worked? Yes, I would; because I have known in my experience of a shot having hung fire for twelve hours.
2815. In answer to Mr. Edden you said that, with a very good current, air would not strike more than 20 yards up a bord? I said it would strike about 20 yards.
2816. That goes to prove that if a pillar is 35 yards, not much air would go to the miner? Of course not.
2817. Therefore, the provision that brattice should be taken within 15 yards of the face is a wise provision? Yes. But I wish to make this explanation: I would not apply the same hard and fast rule to all collieries. For instance, it might be necessary in a mine like Helensburg, or in any other mine where there was gas, to bring the brattice to with 2 yards of the face.
2818. You believe that there should be a stipulation that not less than 150 cubic feet of air should be taken to every miner? Yes; I do.
2819. That where two men are working not less than 300 cubic feet should go right into the working-face? Yes.
2820. I understood you to say that you would throw the responsibility upon the inspector to call the men out? Yes; when he thinks the place is not fit for the men to work.
2821. While you would give the inspector power to do that, you would not allow the manager to shirk his responsibility? Certainly not.
2822. You would hold the manager responsible for keeping his colliery safe? Yes.
2823. A proposal has been made to raise the age at which children could work in the mine from 13 to 14—what is your opinion in regard to that? I think that 14 years of age is young enough for a boy to go into a mine.
2824. Have you any children? Yes; I have two boys. I would not like to see them go into a mine before they were that age.
2825. You desire that your children should have the full benefit of the Education Act? Yes.
2826. And you would not allow them to go into a mine under the age of 14? No.
2827. No matter how hard the times were? No.
2828. Do you think it necessary that men should be practical men before being allowed to work by themselves? Yes; I believe that that is one of the great questions which should be considered in connection with mining.
2829. Do you not know that there is a stipulation in the English Act to that effect? Yes. Rule 39 says—  
No person not now employed as a coal or ironstone getter shall be allowed to work alone as a coal or ironstone getter in the face of the workings until he has had two years' experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face of the workings of a mine.
2830. You think that in any proposed legislation in this Colony such a provision should be inserted? It would be a very wise one, and I should strongly advocate it.
2831. For the benefit alike of the employer and the miner? Yes; for the benefit of all concerned.
2832. Where there is a gassy seam a non-practical man is a great danger to the owners? Where there is gas a non-practical man should not enter the mine under any conditions by himself.
2833. He is a constant danger to the miners there? Yes.
2834. And jeopardises their lives as well as the property of the owner? Yes.
2835. Therefore, you think that this is a wise provision and should be inserted in any future Coal-mining Bill brought before Parliament? Yes.

2836. I suppose you are aware that there is also a provision in the British Act in reference to books and so forth? Yes. Mr. J. Owens.  
 2837. What is that provision? In the British Coal-mines Regulation Act of 1887, Rule 27 is as follows:— 18 April, 1894.

The books mentioned in these rules shall be provided by the owner, agent, or manager, and the books or a correct copy thereof shall be kept at the office at the mine, and any inspector under this Act, and any person employed in the mine, or anyone having the written authority of any inspector or person so employed, may at all reasonable times inspect and take copies of and extracts from any such book. But nothing in these rules shall be construed to impose the obligation of keeping any such book or a copy thereof for more than twelve months after the book has ceased to be used for entries therein under this Act.

2838. You think that is a wise provision? Yes.  
 2839. And you would be entirely in favour of such a provision being introduced into any mining legislation in this country? Yes.  
 2840. Do you know if it is a fact that the inspectors' reports are not open to inspection, except as regards the annual reports? Yes; I know that to be a fact.  
 2841. Do you think such a state of things should exist? No; I think we should have a right to know the condition of the mine according to the report of the inspector.  
 2842. Is it not a fact that under the present law a mine may not be safe, and the men may know nothing about it? Yes.  
 2843. Is it not a fact that under the special rules of the collieries, one man is not allowed to go into another man's bord or place? That is so.  
 2844. Therefore, as a rule, one man cannot be very well conversant with the condition of the whole of the mine? He cannot.  
 2845. A neighbour's bord may be very unsafe, and yet a man might be in total ignorance of the fact? That is very true.  
 2846. You are under the ban of dismissal if you go into another man's bord, if the manager chooses to enforce that penalty? Yes.  
 2847. On those grounds, you think the inspector's report should be open to the inspection of the miners? Yes; because I consider they have as much interest in the state of the mine as the mine-owner himself. They have their lives, and the mine-owner has his cash.  
 2848. And it is for the safety and benefit of all concerned? Yes.

THURSDAY, 19 APRIL, 1894.

Present:—

MR. GRAHAME,

MR. NICHOLSON,

MR. COOK.

J. L. FEGAN, Esq., IN THE CHAIR.

Harrie Wood, Esq., called in, sworn, and examined:—

2849. *Chairman.*] You are Under Secretary for Mines and Agriculture? Yes.  
 2850. You were in that position when the Bulli explosion took place? Yes.  
 2851. How long have you occupied that position? Since 1874.  
 2852. Then you were Under Secretary when the present Mines Regulation Act was passed? Yes.  
 2853. Soon after the Bulli explosion took place, were petitions sent in for a new Coal-mines Regulation Bill? I think so.  
 2854. You remember the disaster which took place in the A.A. Company's mine, in the Newcastle district? Yes—at Hamilton.  
 2855. Did you visit the scene of that catastrophe? Yes.  
 2856. There are some points made by the jury as to the size of the pillars? Yes.  
 2857. In the Bill, as to which you were chief adviser, you made provision for that? Yes.  
 2858. How many Bills have been introduced into Parliament to your knowledge? Either three or four.  
 2859. You are in favour of some better legislation than we have at present? Yes.  
 2860. I believe that the provisions of the last Bill were almost on your recommendation introduced? Yes.  
 2861. Is it not a fact that at present no one is allowed to see the reports of the managers and inspectors in the report-book of the mines? That is probably so, unless it is persons connected with the company.  
 2862. The men working in the mine cannot see the reports? I think not.  
 2863. Do you know that there has been certain action taken against the Stockton Coal Company under the present Act? In regard to what?  
 2864. Allowing men to go back to work when the mine had been reported against? Yes.  
 2865. Do you know the provisions of the 5th rule? Yes—that when the men have been withdrawn they shall not be allowed to return to work until the mine is declared by the inspector to be safe.  
 2866. How many convictions were there? Two or three.  
 2867. In the face of that the men are working? Yes.  
 2868. Was that a correct copy of the report of the inspector twelve months ago which was laid on the Table of the House? It would be a little more than twelve months since. They made a report after the men had been withdrawn.  
 2869. They have made a report since then? Yes.  
 2870. Have you got those reports in your possession? I have. I have brought one report, which I thought might be wanted.  
 2871. You have not brought the last report? No; but I can let you have it.  
 2872. Recently there have been a few accidents there? There was an accident a little while ago through a shot exploding.  
 2873. Which proved fatal to one man? Yes.  
 2874. Did the Department take action against the men? The Department intended to take action against them under the Coal-mines Regulation Act, but the Crown Solicitor advised that it was so serious a matter

H. Wood,  
Esq.  
19 April, 1894.

- H. Wood, Esq.  
19 April, 1894.
- matter the case should be sent to the Attorney-General, and that other proceedings should be taken, so we stayed our action.
2875. It was a case for a criminal prosecution? Yes.
2876. Do you know the result of it? No, not officially. The official communication would be with the Department of Justice.
2877. The Bill which you prepared was nearly in accord with the English Act? Very nearly, especially as to the withdrawal of men from a mine in which there is supposed to be danger, and allowing them to return to work.
2878. You have had a very large experience in mining matters? Yes.
2879. You think that the English Coal-mines Regulation Act of 1887 is nearly as complete a measure as you could have? Yes.
2880. You, as the Under Secretary of that great Department, could recommend a few alterations in the English Act? Yes.
2881. You think it is nearly time that some new Act was brought into force in this Colony? Certainly.
2882. You think that the Act of 1876 is behind the times? Quite.
2883. You know that for a long time eminent men were giving evidence before a Royal Commission upon the subjects dealt with in the English Act? Yes.
2884. I believe that you, as an officer of the Department, were against any alteration being made in the eight-hour clause? Yes.
2885. You were perfectly satisfied with it as it was introduced? Yes, as it was introduced by Mr. Slattery.
2886. What was your reason? I thought that it was better that the provisions of the Bill should not be penal as against the men.
2887. That is your only objection? Yes.
2888. Will you send us copies of those reports to which I have referred? Yes. [*Vide Appendix A.*]
2889. *Mr. Nicholson.*] Do you say that you are opposed to any alteration with regard to the eight-hour provisions in the Bill, because it would make it penal against the men? Yes.
2890. Do you not think it is necessary to make it penal, in order that the legislation may be effective? No; I think the Bill as introduced by Mr. Slattery was against the masters, not against the men, and it seems to me that that is how it should be.
2891. *Chairman.*] Yet you think it is a fair Bill? I do.
2892. *Mr. Nicholson.*] Is it your opinion that it should be made a penal offence to work more than eight hours? No; I think it is quite sufficient that the masters should not be able to compel the men to work ordinarily more than eight hours. It would be penal as against a master who compelled men to work ordinarily more than eight hours if the Bill stood as it was introduced.
2893. Are you in favour of putting the whole responsibility of the management upon the manager of the mine? Yes.
2894. Do you not think it is right that the reports of the Government Inspectors should be open to the inspection of anyone working in the collieries? Yes; that was provided for in the Bill as introduced by Mr. Slattery.
2895. And you are of opinion that that should be carried into effect? Yes.
2896. Do you think it proper that a return air-way in a coal-mine should be made a travelling air-way for the men? As a rule I should think not; but I could imagine circumstances in which, under certain conditions, it might be so used.
2897. But in a mine where much powder is used, would it be a fair travelling-road? It should not be used as a travelling road if it is possible to avoid it.
2898. *Chairman.*] Do you think that if the inspectors had greater power—if they had the power that you were making provision for in the Bill of 1893—that that accident at Hamilton would have occurred? I think that if the Bill that was introduced providing for the size of the pillars had been in force when that portion of the mine was being worked, in all probability that accident would not have occurred.
2899. *Mr. Nicholson.*] Do you think it is right that inexperienced men should be engaged to work at the coal-face? As a rule I should think not. That is one of the things provided for in the Bill introduced by Mr. Slattery. There is this about it, that if no young man could work at a face he would never learn to cut coal.
2900. Are you in favour of general rule 39 of the English Act being inserted in the Bill? There is something very similar to that in the Bill as introduced by Mr. Slattery? The main objection that I have to the exclusion of inexperienced men is that it would prevent young men from learning to cut coal.
2901. We allow that a young fellow who has worked for a length of time under experienced hands should be allowed to work at the coal-face, but we say that you should provide for inexperienced men working at the face? The rule in the measure introduced by Mr. Slattery was that "no person not now employed as a coal-getter shall be allowed to work alone as a coal-getter." If they are wheeling they are not coal-getters. I do not see that there is any great objection to that in the form you suggest; but if persons who have not been coal-getters are excluded from working at the face with experienced men they can never learn to get coal.
2902. *Chairman.*] Time after time complaints have been made as to the vague wording of some of the clauses of the present Act? Yes.
2903. You have had deputation after deputation asking for the Act to be amended? Yes.
2904. And from the advice you were tendered you have shown that you recognise the necessity for amendment? Just so.
2905. *Mr. Edden.*] In the interpretation clause of the Act the word "inspector" refers only to the Inspector of Collieries? Yes.
2906. Is that in the new Bill? The word "inspector" is not interpreted at all in the new Bill.
2907. Do you not think it is necessary that the word "inspector" should be interpreted to mean not only inspectors of collieries, but also Inspector of Weights and Measures? It is, unfortunately, owing to the interpretation of the word in the present Act that the difficulty arose. If we had had no interpretation of the word this difficulty would not have arisen. The clause in the present Act says that the testing of weighing-machines and weights shall be conducted under the Weights and Measures Act. Then it goes on to say that the inspector shall do so-and-so. In the interpretation clause of the Act the word "inspector" means

- means Inspector of Collieries, and that caused all the trouble. The Act cast upon the Inspector of Collieries a duty which he cannot perform. •
2908. And caused a lot of difficulty about getting the machines tested? Yes.
2909. I think you often have complaints? Yes.
2910. You believe it should be clearly defined that the Inspector of Weights and Measures should test the machines? In the present Bill it is so.
2911. There was no provision in the Bill before the House, although it was promised, requiring engine-winders to pass an examination? I think there was. General rule 28 provides, "that in any mine worked by steam or mechanical power a competent male person not less than 21 years of age, and being the holder of a certificate of competency or certificates of service, shall be appointed."
2912. You approve of that amendment being put in? Yes.

H. Wood,  
Esq.  
19 April, 1894.

Mr. Joseph Campbell called in, sworn, and examined:—

2913. *Chairman.*] You are a colliery manager? Yes.
2914. Where at? At Lithgow. I am manager of the Lithgow Valley Mine and the Hermitage Colliery.
2915. You are manager of two collieries? Yes.
2916. How many men do you employ in those collieries? About fifty at present—twenty-five in each.
2917. Have you ever employed more than that number? Yes.
2918. How many men have you employed at times? We have had from eighty-five up to 100 men in each colliery.
2919. What do you ventilate with? A furnace.
2920. How many cubic feet of air do you get into your mine at present? The average is about 20,000 cubic feet in the Lithgow Valley Mine, and about 18,000 feet in the other.
2921. Are you a certificated colliery manager? No.
2922. How many years have you been at Lithgow? Fifteen years last November.
2923. As manager? No; I have been seven years as manager.
2924. I suppose you have had other experience besides at Lithgow? Yes; I have been brought up in the mines.
2925. Where did you get your experience in England? In the north of England.
2926. What Act were they working under in England when you were there? I could not say.
2927. When did you leave there? About fifteen years ago.
2928. Then they would be working under the Act of 1872? I left in 1879.
2929. Were you employed in the mines in Durham? No; in Northumberland.
2930. What was the system of ventilation there? By furnace.
2931. Did they use the split system? Yes.
2932. The mine is divided into splits? Yes; every district had a split of its own.
2933. They had in the north of England a system different from any other? I never worked in any other district.
2934. There the deputies or shiftmen set the props for the men? Yes.
2935. Did they use brattice in the collieries which you worked in? Where it was necessary they did.
2936. What do you call "necessary?" Where gas existed.
2937. I suppose they always had a good current of air sweeping round? Yes.
2938. I suppose you have worked in other places besides Lithgow? I worked for about twelve months in the Eskbank Colliery.
2939. Then you have not seen any brattice used since you came into that district? Yes; I use it myself where it is necessary.
2940. Do you meet any gas? No.
2941. Wherever there is gas you would use brattice to shift it? Wherever I conceive it to be necessary to use brattice I would have it up.
2942. Were you ever examined by a Committee before? No; I was examined before the Lithgow Accident Commission.
2943. Was it at your colliery where the accident took place? Yes.
2944. What was the cause of it? It was an underground fire.
2945. It commenced at the boiler? Yes.
2946. You have not had any accident since then? No.
2947. Were you manager then? No.
2948. *Mr. Cook.*] You took the place of manager after the accident? I did. The manager was killed in the accident.
2949. I suppose you are acquainted with the Act under which you work? Yes; the principal points of it.
2950. I suppose you think the time has come when there should be some new legislation with regard to coal-mining? No; I have not arrived at that conclusion.
2951. Do you think the present Act is sufficient? I think a copy of the English Act would be preferable to the one that we have.
2952. You think the English Act should be introduced in place of the existing Act? Yes.
2953. Of course, with some slight amendment to suit local circumstances? I should have to know what the alterations would be before I could say that.
2954. You would be willing to accept the English Act of 1887? Yes.
2955. You have been a long time in the western district? Yes.
2956. Is there an annual demonstration there by the Miners' Association? I believe that there is, but I do not know for certain.
2957. Though you have not taken part in it, I suppose you know perfectly well that such a thing takes place? I think I can say "yes."
2958. I suppose you know that they have a gathering to commemorate the obtaining of the eight hours? I really could not say what the object is—I have never interested myself that much.
2959. Do you mean to say that you have a number of men working under you, and that you never ask them how they got on at their demonstration? Not a man in my employment can say that I ever asked him anything.

Mr.  
J. Campbell.  
19 April, 1894.

Mr.  
J. Campbell.  
19 April, 1894.

2960. Did it ever come under your notice that the men have been agitating for the legalisation of the eight hours? I have read about it, but I have not heard about it from the men.

2961. Have you ever been to any of the political meetings in the district? Never.

2962. You have not heard the question asked of candidates putting up for Parliament? No.

2963. What is the output of your colliery? It does not average more than about 50 tons a day.

2964. You have there a system that is not in general use to get your coal out? We have at one of the mines.

2965. Would you give us a description of the machine that you have there? I do not see it is relevant to the question, but it will not do me any harm or you any good. We work the endless-rope system. It is a good system where a large output is required. You can have a continual stream of coal coming out without any extra wear upon the rolling-stock. The empties travel at about 3 miles an hour. They hook themselves on, and unhook themselves at the other end.

2966. Is it your own invention? No.

2967. You have seen it elsewhere? No. I got all the information from a friend of mine in England.

2968. You erected the machinery on the information you got from him? Yes. It is not erected exactly according to his information. I put in several things myself.

2969. Do you object to the eight hours being legalised? Yes.

2970. Why? I believe in the eight hours. I believe it is a sufficient time for any man to work at the coal-face. It is a principle which has been acknowledged by both masters and men, and which has worked with the best results for a number of years, but I should not be in favour of its being legalised.

2971. Have you ever got coal? Yes; I started at the bottom.

2972. In your long experience you have known men to be asked to do things which were not very palatable, because they were the weaker vessels? I never had any such experience.

2973. In your experience, has all the work been carried on to your satisfaction as a miner? Generally so.

2974. There have been no hardships whatever? Not in my experience. I have only worked at three places in my life.

2975. If your directors gave you instructions to-morrow that your men must work another hour a day, would you not have to comply with those instructions? That is a question which I do not know whether it is right to ask me. My directors have given me instructions when I first took charge, and on several occasions since, that I am not to try to take any advantage of the men; that they want nothing but justice; they want me to do justice to the men, and to see that they get justice themselves. If they found that I was taking an unfair *part* towards the men they would dismiss me to-morrow.

2976. I suppose you would dismiss the men if you found that they tried to take an unfair advantage of you? We should have to talk matters over. If they persisted in doing it they would have to take the consequences.

2977. Is it not a fact that if the owners wished to lengthen the hours they could do so? I should have to carry out their instructions.

2978. It is really then in the employers' hands, under the present circumstances, whether the hours are lengthened or not? I do not think so. There are always two to a contract.

2979. Do you think there would be a squabble over it? There are always two to a contract, and the men will have power to say whether they will accept it or not.

2980. If the men would not accept it there would be a strike? There might be.

2981. If their employers wished to press their demands there would be a strike? If both parties are resolved, they would come to a strike.

2982. If a miner said, "We are working long enough hours," and the owner said, "You must work an hour longer," there would be a strike? I expect there would be; but the present system is acknowledged by both masters and men, and the men are able to look after themselves.

2983. Has there been a reduction of wages up your way? Yes.

2984. Did the men accept that as a God-send? I do not know what you mean by a God-send.

2985. Did the men accept it as a good thing? No; they would not accept it willingly, but they were not in a position to help themselves, and the masters could not help themselves.

2986. Do you not think they are in the same position as regards the lengthening of the hours of labour? Under certain conditions they may be, but they are quite able to look after themselves. I am certainly not in favour of legalising the eight hours—it would lead to various differences, and perhaps to prosecutions. Occasions might arise when it would be to the advantage of both parties to work more than eight hours.

2987. Then you think a man should have the privilege of working as long as he wished? A man ought to be a man, and to study his labour as he likes. I believe that under the Act emergency cases would be provided for, but who is to decide what an emergency case is.

2988. Do you think your objections would be lessened if provision were made for emergencies? I think it would be very difficult to decide what a case of emergency really is.

2989. During your term as underground manager, did you ever know the men, in case of danger, to refuse to do as the manager ordered them? I never had any such experience.

2990. You always found the men, if anything happened, willing to assist in doing what is necessary? The men have always to do anything which is reasonable.

2991. Do you think it would be any extra cost to you if the eight hours were legalised? Yes, I do.

2992. What would be the cost? The Bill says eight hours from bank to bank; that means a reduction of the hours of labour inside.

2993. And you think that would be a loss? I do not expect that it would be a loss to the Company. Then there is another point—we might have to keep emergency men about the place in case anything happened.

2994. But if the Bill stipulates that the men shall work eight hours unless in case of emergency, would that meet your objection? It would not.

2995. What are your objections? I have already stated them. I said that the eight-hour principle has been acknowledged by both masters and men, and acted upon with the best results for a number of years; but if we legalise the eight hours it will lead to various complications. The masters might think that there was a case of emergency where the men might think there was not. Then, if you wanted anything doing you would have to get other labour, and there would be a great difficulty in getting men. When the eight hours had expired, you would have to have somebody in the mine to hunt the men out.

2996.

2996. Do you not think it would be better to have the system legalised than to leave it to either of the parties to break up the arrangement if they thought fit? I do not think so. I should not like anyone to legislate as to how long I should work.

2997. I suppose it has been done? Where?

2998. By an agreement? It has come round as a recognised thing that eight hours should be a day's labour.

2999. And your opinion is that a man can tire himself in eight hours? I always could.

3000. *Mr. Elden.*] You said that when the men received the last reduction they could not help themselves and also that the masters could not help themselves? I did.

3001. I suppose that was on account of the depression in trade? Yes.

3002. If the masters said that there must be another hour a day put on, do you think that the men could resist it? I do not know. If the Legislature has the power to shorten the hours, they will also have the power to lengthen them.

3003. They work short hours in the north of England as a rule? Yes.

3004. I suppose that has been brought about by the influence of Unionism? I do not know. Ever since I can remember they have worked eight hours a day.

3005. I suppose you know that strikes, as a rule, are disastrous to everybody concerned? Yes.

3006. You do not think that the eight-hours system would mitigate the evils of strikes? No.

3007. Do you believe in a mine being split up into districts? Where it is necessary I do.

3008. Do you not consider that is a more scientific way of managing mines? I do. I have splits, but I have not districts.

3009. If you had many men you would split the mine into districts? Yes; I have splits now for the few men that I employ.

3010. How do you pay the men at your colliery? So much a ton.

3011. What system have you of ascertaining the weight of the coal that they send out? We weigh it.

3012. Do you weigh every skip? No.

3013. You pay them by the average? Yes.

3014. How many skips do you put out in a day? The skips carry  $13\frac{1}{2}$  cwt. on the average.

3015. I suppose you put out about 400 skips a day? Between eight and nine score.

3016. How many would you weigh out of that lot? Some days we weigh more than others. On some days we do not weigh at all.

3017. Have you ever been requested by the men to weigh more? Yes. Whenever I am requested, I always do so.

3018. Do you keep the weighmen on the job? No.

3019. Because so few men are employed? Yes.

3020. Have your men got a check-weighman? No.

3021. They did have one at one time? Yes.

3022. I suppose you are aware that the Act provides for it? Yes; but the men place implicit confidence in me, and I check-weigh, and do everything for them.

3023. Would you have any objection to the men, if they wanted a check-weighman, choosing whom they liked? They could choose whom they like in the mine.

3024. You do not think they should employ a man out of the mine? No.

3025. Why? It is adding more men to the works.

3026. If they took a man out of the mine, you would have to put another in his place? We ought to be allowed to say whom we would have. They have any amount of choice in the mine.

3027. You have no strong objection to a man being chosen out of the mine? No strong objection.

3028. Do you work the bord and pillar system? Yes.

3029. What size pillars do you use? Ten yards now.

3030. What width are the bords? Between 7 and 8 yards.

3031. How thick is the seam? The seam is about 10 feet thick. We work between 5 and 6 feet, and the rest is left.

3032. Do you take the pillars out? We have taken a few.

3033. I suppose your mine is a tunnel? Yes.

3034. I suppose you have a good knowledge of mines where they have shafts? Yes; I have worked in two mines where they have shafts.

3035. Have you given any thought to the question of the use of automatic appliances, such as safety-hooks, to prevent over-winding? Yes; I believe in that.

3036. You think it is necessary? I do.

3037. Have you ever had experience in districts where the mines are worked under tidal waters? No.

3038. *Mr. Cook.*] You said you believed in the eight hours, and that your proprietors told you that no conditions were to be imposed upon the men except such as were fair? They told me not to take any unfair advantage of the men. I cannot impose any conditions on the men without the sanction of the directors.

3039. I suppose in the present condition of things the proprietors would set up their own standard of what was fair? I could not say.

3040. Do they not, as a matter of fact? Under the conditions under which they are working now it would be possible for the managers to take advantage of the men; but my instructions are, not to take advantage of the men, but to give them fair play.

3041. Have you had those instructions lately? When I first started, and repeatedly since.

3042. I suppose that if the proprietors wanted to get a reduction they would not ask the men's opinion? I expect they would go about it in the usual way.

3043. As a matter of fact, at present it is pretty well in the discretion of the management as to whether or not fair conditions shall be imposed. If you liked to take advantage of the men, I suppose you could? Sometimes a man could; for instance, in skip weighing, or putting men into inferior places.

3044. You do not believe in legalising the eight hours? No.

3045. Have the hours of labour been increased in Lithgow lately? Not that I am aware of.

3046. You do not know that they have been increased at any of the mines? No.

3047. You are not aware that the men have to remain in the mines longer at any of the collieries? No; the eight-hours principle has been adopted as far as I know.

- Mr. J. Campbell.  
19 April, 1894.
3048. Do you know that the miners are compelled anywhere in Lithgow to stay down the mine longer than they did some time back? They are not compelled that I know of to work longer than eight hours.
3049. I want to know, whether, to your knowledge, the men have now to stay down the mines at Lithgow longer than they did twelve months ago? I do not know of it.
3050. You do not know that they have to stay down in the mine longer than they used to do? Not longer than eight hours.
3051. That is a different thing—they might only have stayed down the mine seven hours before? They might; I do not know.
3052. Do they stay down in your mine longer now than they did twelve months ago? No.
3053. What time did they go in in the morning twelve months ago? They went in at 6 o'clock in the morning when I first took the management. The front-shift men are supposed to go in between 4 and 5 o'clock, and to come out between 12 and 1. And the back-shift men to go in at 8 o'clock, and to have two-hour breaks for meals.
3054. It was the custom before for the men to go in at 8 o'clock, and to come out at 4 o'clock? Never at the Lithgow mines.
3055. He is not getting coal more than eight hours, as a rule? They are not working now more than eight hours.
3056. Does that include time for breakfast? Yes.
3057. What time do you ride now? They are supposed to be in at 7.
3058. And to come out at 4? No, at half-past 3.
3059. They are underground eight and a half hours? Yes.
3060. That is half an hour a day longer than when there were two shifts? It was difficult to know when they really went in in the morning. When they go down a shaft there is a certain time for them to go down. In the case of a tunnel, unless you watch them going, you cannot ascertain.
3061. You said that the front shift went in at such a time, and came out at such a time, and that that gave eight hours from the time they went in until the time they came out? It is eight hours, or a little less now.
3062. Now you say they are in the mine eight and a half hours? Yes.
3063. They are supposed to work eight hours? That is what I understand by it.
3064. But the men have no say as to this definition of the eight hours—you call it eight hours at the face? Yes; that is what we call eight hours.
3065. Do the men generally agree to that definition? I do not know.
3066. Have they not a different opinion? Yes; some think it ought to be eight hours from bank to bank, but you say it ought to be eight hours work.
3067. There is a difference of opinion between the management and the men on that point? Yes.
3068. That view has been urged pretty strongly on many occasions, has it not? Yes.
3069. There is no Union at your colliery now, is there? Not that I know of; I do not bother myself much about it.
3070. Have your proprietors ever put any kind of a ban upon Unionism up there? I do not know.
3071. Would any obstacle be interposed if the men wanted to form a Union? I could not say.
3072. As far as you are concerned there would not be? We are getting on very well as we are.
3073. You would not like another lodge to be formed? No, I should not. The men are now far happier than they were.
3074. You would not try to prevent it? I could not encourage them any how.
3075. Why would you not encourage it? I think the men are much more contented than they were before.
3076. What makes you think that? Some of them have said so.
3077. Has that been merely a few? I have not had a general meeting of them to ascertain their views.
3078. Are their earnings as much as they used to be when there was an Association? They are not so much—there have been reductions.
3079. As a matter of fact, they get 6d. a ton less now than they used to get? Yes.
3080. And stay half an hour longer in the mine? They work in the mine eight hours.
3081. But they stay at least half an hour longer in the mine than they did? Well, I think they do.
3082. And your colliery is not alone in that respect, is it? I do not know anything about any other colliery but my own.
3083. Do you know whether it is so elsewhere? I do not. I do not know when any other colliery starts, or what time they knock off. They do not all start at one time.
3084. You do not know whether, at any other colliery, the miners have to stay longer underground than they did? I do not.
3085. You said just now that you thought that if the eight-hour system were legalised you would have to hunt the men out of the mine? Yes; to get them out to the time.
3086. Have you ever known cases in which you have been disposed to hunt the men back when they have come out too soon? Sometimes we have given them a talking to, and sometimes I have given them a talking to for not coming out soon enough.
3087. It would be only in exceptional cases where a man would want hunting? One does not want to be prosecuted.
3088. You think that because one man would stay in the mine, and have to be hunted out, that should determine the conditions for all the rest? No, that is not it.
3089. Is it not a fact that a good average workman is always ready to be out of the pit by the time the eight hours is up? Yes.
3090. Is it not the opinion of the miners generally that eight hours from bank to bank is enough? They are not all first-class workmen.
3091. They believe that eight hours is quite sufficient? Yes.
3092. If the management would consent, they would be willing to adopt it? Yes; it is adopted now.
3093. I say eight hours from bank to bank? I see. A strong man can do the work in the time, but a weak man takes longer. You are legislating for the strong, not for the weak.
3094. I am speaking of the opinion of the men? The opinion of the good men is as you say.
3095. What system of weighing have you? The averaging system.

Mr.  
J. Campbell.  
19 April, 1894.

3096. You have no check-weighman? Not now.
3097. You used to have a check-weighman? Yes.
3098. And the absence of a check-weighman dates from the time when the Union was abolished? Yes, and the shortening of hands.
3099. Is it a fact that at the time of the last strike a set of conditions and rules were imposed upon the men of your colliery which they were compelled to sign? Yes.
3100. Is there anything in the rules which prohibits the formation of a Union? No.
3101. They are much more stringent than they used to be? How do you mean by stringent?
3102. Much more severe on the men? I do not think so. Had I anticipated this question, I might have brought a copy.
3103. *Mr. Edden.*] You will have no objection to send them? I do not know.
3104. *Chairman.*] I suppose you have no objection to our summoning you and asking you for them? I should not like to come again.
3105. Will you send a copy? I do not know.
3106. *Mr. Cook.*] You would not have any objection, I suppose, to send a copy of the rules and the last agreement between the Company and the men? I could not promise. There is nothing in the rules except the eight hours—when the men shall go in in the morning, when they shall knock off, and the half-hour for meals.
3107. There is nothing in the new agreement which imposes any more severe conditions upon the men than existed before? There is this in it: They must give fourteen days' notice before the agreement can be terminated on either side. Previously there was no agreement—a man could leave at any time. But even now if a man came and asked me to let him go away, and he has a chance to do anything better, I do not keep him.
3108. There was always a check-weigher before the Union was abolished? Yes.
3109. There used to be a check-weighman before the Union was abolished even when the hands were as few as they are now? No; the number of hands has never been so reduced as it is now. They were never reduced to twenty in each mine before. The Company did not bring any force to bear to abolish the check-weigher.
3110. Would the Company raise any objection now if the men wished to appoint one? I could not say. Under the Act they could not raise any objection.
3111. You think there might be some difficulty if they accepted it? I do not think there can be any objection to a check-weighman.
3112. I suppose that the general condition of your mine is satisfactory—no complaints? There are no complaints that I know of.
3113. Things generally go smoothly? Yes.
3114. The only result of the abolition of the Union there has been the doing away with the check-weighman for one thing, and the keeping of the men in the mine for half an hour longer? Yes; but that has been done not since the breaking up of the Union. The men stayed that length of time in the mine before.
3115. The only alteration since that has been this half-hour break for meals? They stopped an hour for meals previously, and commenced an hour earlier. We used to have two breaks.
3116. The miners used to stop an hour for breakfast? Yes; an hour for breakfast, and an hour for dinner.
3117. That was at the time of the front and back shifts? Yes.
3118. At that time the front and back shift-men were eight hours from bank to bank? Yes.
3119. The miners work eight hours with two breaks, having to be there ten hours? Yes.
3120. The result of the two shifts going in together is that the men have to stop in the mine half an hour longer than they used to do before? Yes.
3121. You do not know whether that system obtains generally? No.
3122. Would you be surprised to hear that it did? I should not.
3123. *Chairman.*] You said you knew that your men are contented now? I said I thought they were contented, as far as I knew.
3124. You said you had not called a general meeting, but you had spoken to some of them? Yes.
3125. That is a fact? I never asked any of them a question. It was what some of them told me in conversation.
3126. All the talk was on one side? Yes; they told me what I have stated—that they were satisfied.
3127. I understood you to say that if the men chose a check-weigher from outside that would mean an additional man in the mine? No. If a man went out, and we wanted another man, we should have to put another in.
3128. Would it not be better to have a stranger as check-weigher, so that you would not have to withdraw your men? If a man was taken out of the mine to be check-weighman we should have to put another in.
3129. You have no objection to the men having the privilege of choosing a check-weighman wherever they wish? I would not say that.
3130. Are the owners compelled to take their manager from the men working in the mine? No.
3131. They have as wide a field as they like for selection? Yes.
3132. Why should not the men be in the same position with regard to the choice of a check-weighman? I have said that I have no strong objection to it.
3133. Do you know that it is proposed that engine-men should pass an examination? Yes.
3134. I believe you are in favour of that? Yes.
3135. Do you know of any provisions that were made in the Act of 1872 as to managers having certificates? Yes.
3136. Was there any stipulation in that Act that men managing mines before the Act was passed should receive certificates of service? Yes.
3137. What is your opinion of that—do you think it is right? I do.
3138. If no provision were made for these certificates of service what would you think? I think that a lot of good men would lose their positions.
3139. What do you mean by that? I mean good practical men, who thoroughly understand their work, but who would fail to pass an examination.
3140. How is that? Because they would not be able to work out all those sums yet they might have a good practical knowledge of the working of a mine. It would be so with me. 3141.

- Mr. J. Campbell.  
19 April, 1894.
3141. I suppose you have worked in mines where they have used powder? Yes.  
3142. What time would you allow before a man went back to a missed shot? I could not say. It depends on what he is using. We used to use straws and small squibs at Home. If a shot misses fire, eight hours is long enough.  
3143. If the man was using a fuse you would not allow him to go back the same day? No; I should not like to go back myself.  
3144. What hours did you work in the North of England? Eight hours.  
3145. They have a strong organisation there, have they not? Yes.  
3146. Are you acquainted with the working of the permanent fund? they have there? No, I am not. I was in it, but I do not know much about its working.  
3147. I suppose it did a great deal of good? Yes.  
3148. Widows and orphans of men who met with fatal accidents were provided for? Yes.  
3149. Do you not think such a fund as that would do a great deal of good here? Yes.  
3150. In the majority of cases are not widows and orphans left entirely destitute? Yes.  
3151. I understand you to say that you would accept the English Act of 1887? Yes.  
3152. Just another word. This Committee has power to send for persons and papers, but we do not want to give you the trouble to come down here again. Could you not send us a copy of those rules? I could not promise. I shall have to consult the directors.  
3153. Mr. Edden.] Have you any suggestion to make as to the better working of mines? No.  
3154. Mr. Cook.] Before you leave this Committee, if there is anything you want to say about any legislation, or anything else relating to the working of mines, you are quite at liberty to say it? There is nothing that I want to say.

WEDNESDAY, 25 APRIL, 1894.

Present:—

MR. SCOTT,  
MR. COOK,

MR. NICHOLSON,  
MR. McCOURT,

MR. EDDEN.

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. Richard Baxter called in, sworn, and examined:—

- Mr. R. Baxter.  
25 April, 1894.
3155. Chairman.] What are you? A miner.  
3156. How many years experience have you had in mining? About twenty-eight years.  
3157. Where at? Both in England and in this country.  
3158. Have you filled any other position besides that of an ordinary miner? Yes, I have been colliery manager in two collieries in the Northern District—one at Anvil Creek, and the Abram Coal Company's mines near West Maitland.  
3159. Have you had experience anywhere else? Yes; I was employed for two years in Western Australia.  
3160. How long have you worked in the Northern District? Since 1875.  
3161. You say you have filled other positions besides those of mining manager? Yes; I have had charge of the sinking.  
3162. What shafts have you assisted to sink? The winding shaft at Stockton, the Globe shaft, and the Newcastle Coal Company's shaft.  
3163. I suppose you have held other positions in mines? Yes; I have done the ordinary work of miner and shiftman.  
3164. Are you acquainted with the act of 1876? Yes.  
3165. You say you were in the Northern District since 1875? Yes.  
3166. Has there been, to your knowledge, any request made in that district by the miners for the eight-hours system? Yes.  
3167. Have they got a committee or society there with regard to that? Yes.  
3168. What is it called? The Eight-hour Demonstration Committee.  
3169. Have the miners in that committee asked for the eight hours? Yes, several times.  
3170. What connection has the Miners' Association with the Eight-hours Committee? The miners recognise that they ought to work only eight hours a day. They work it in two shifts.  
3171. I suppose there is a representative from every lodge sent to the Eight-hours Committee? Yes.  
3172. Every lodge gets the report of its representative? Yes.  
3173. And it is in the power of every man to vote either for or against the eight hours? Yes.  
3174. Have you ever heard of a lodge voting against the eight hours? They have never done it in my recollection.  
3175. I suppose you have been present at meetings when Members of Parliament have been speaking? Yes.  
3176. Is legislation as to the eight hours one of the things asked for by the miners? Yes; it is the unanimous feeling, almost, among miners in the Northern District that the eight hours should be legalised.  
3177. You think it would fare badly with a Parliamentary representative who was not in favour of the eight hours system? Yes; in the Newcastle District especially.  
3178. I suppose you know that there is a suggestion made to legalise it in Parliament? Yes.  
3179. Did the men approve of that step being taken? Yes.  
3180. In the event of a new Bill passing, if it provides for managers to have certificates, I suppose you would be able to obtain one? Yes; at the present time I am attending mining classes. I think it is only right that a mining manager should be compelled to hold a certificate.  
3181. I suppose you know that there is no stipulation of that sort in the present Act? Yes.  
3182. And the employers can appoint any man as manager even if he has had no experience? Yes.  
3183. Do you think that is right? I consider it is unjust.  
3184. I suppose as we are getting deeper mines we shall have gases to contend with in the mines, which we have not at present? Yes.

3185. Do you think that an incompetent man being manager would endanger the lives of the men and the property of the owners? Certainly; a man having no knowledge would endanger the lives of the men.

3186. You think that, for the protection of life and property, the mining manager should be a thoroughly competent man? Yes.

3187. And you would provide in the new Act that he should have a certificate? Yes.

3188. I suppose you are acquainted with the English Acts of 1872 and 1887? I am.

3189. I suppose you know that the Act of 1872 provides that managers should have certificates of competency; but that a man holding the position of manager at the time of the passing of the Act should receive a certificate of service? Yes.

3190. What is your idea of that? My idea is, that a certificate of competency should be given to no one unless he passes an examination.

3191. Would you grant a certificate of service? Yes.

3192. Just as the British Act of 1872 does? Yes.

3193. I suppose you know there is no provision in the Act of 1887 for certificates of service? Yes.

3194. Is there not provision made that certificates of service shall be given to underground managers? Yes.

3195. Do you hold with that? Yes.

3196. You think that if a man has shown his competency by being an underground manager, it would be harsh to have him turned off? Yes.

3197. You think it would be to the interests of both owners and miners that certificates of service should be granted? I think that an overman requires a certificate more than a manager does, for service.

3198. Do you know whether any request has been made that the number of cubic feet of air in a mine should be increased? Yes; the impression is that the minimum quantity supplied at present is insufficient.

3199. How much is it proposed to increase it? From 150 to 250 feet per minute.

3200. Do you think it is possible to get 150 cubic feet per minute in our mines? I do, because most of our collieries that are developed at present are getting it.

3201. You do not think it would be very much expense to get an extra 50 feet of air per man? No.

3202. How much air is needed? That depends upon the quantity of gas there is in the mine. I should say from 500 to 600 cubic feet per minute, if there is much gas given off.

3203. How far do you say that the bords should be driven before a cut-through is put through? The Act says 35 yards; but there must be a loop-hole in the Act, because they drive the width of the cut-throughs as well as the 35 yards, making it 37 yards.

3204. You think that that is a wrong interpretation put upon the Act? Thirty-five yards should be the distance from holing to holing.

3205. Has any suggestion been made to decrease that length? Yes; it is considered that 30 yards is quite sufficient.

3206. Is there good air as a rule in the mines? In the mines that I have been connected with, there is.

3207. But you think it would be better if there was a little more air? Yes; far better.

3208. If there is not a good supply of air, is not that detrimental to the property of the owners? Yes.

3209. I suppose the timber rots sooner? Yes.

3210. And if it is injurious to a man not to have sufficient pure air, it will be injurious for horses too? Yes.

3211. Therefore it depreciates the property of the owner? Yes.

3212. *Mr. McCourt.*] Do you say that all the miners of the Northern District are in favour of the eight hours? Yes.

3213. Are the owners in favour of it? I think some of them are.

3214. Is there not an arrangement between the miners and the owners which makes eight hours practically a day's work? It is understood that we should work no more than eight hours a day, but at any moment the owners might give notice of their intention to discontinue that arrangement.

3215. You think that it would be a good thing to enact it? Yes.

3216. And to punish a miner if he worked half an hour longer? Yes; to punish the men as well as the owners.

3217. Do you think that under such conditions it would be possible to work a mine? Yes.

3218. It would not interfere with the working of the mine? Not at all.

3219. Do miners, as a rule, work six days a week? They work six days a week and five days a week alternately.

3220. Do you think that the manager of a mine ought to be held responsible for the proper working of the mine? Certainly.

3221. I mean penally responsible if he allows the mine to be worked when it is not in proper order? The manager ought to be the responsible person.

3222. He should be liable to a penalty or imprisonment if he allows the mine to be worked when it is not fit to be worked? Yes.

3223. *Mr. Nicholson.*] In reply to a question, with regard to the certificates of service, I think you said you were in favour of granting them? Yes.

3224. That is to men who have been managers for a number of years? Yes.

3225. Do you not think that by so doing you would be granting certificates to incompetent men in certain cases? No.

3226. The certificate of service will be equal to a certificate of competency? I should not take it be so.

3227. Do you not think that by giving certificates of service in certain cases, you would be giving certificates to men not competent to take charge of mines? I should say yes.

3228. *Mr. Edden.*] There would be a possibility of that? Yes.

3229. *Mr. Nicholson.*] Do you not know for a fact that it would be so; take all the managers that you have been acquainted with for years back in the Northern District, can you point to an individual who is acting as manager at present who is unfitted for the position, and unfit to have a certificate? There are none that I am aware of.

3230. There are none? No.

Mr.  
R. Baxter.  
25 April, 1894.

- Mr. R. Baxter.  
25 April, 1894.
3231. Referring to the cut-throughs, you are under the impression that they ought only to be driven 35 yards? Yes.
3232. Do you consider a cut-through put through when you started off 35 yards? No; it cannot be put through.
3233. Then how do you reconcile a statement that a face could only be 35 yards ahead of the air? Because in driving narrow bords the cut-throughs are turned from the narrow bords so that the bords following up holes on the 35 yards distance.
3234. But is it not usual to have a cut-through at every working place? Yes.
3235. Ahead of the place? Certainly.
3236. *Chairman.*] You have never seen a cut-through driven over before the bord has come up? Yes.
3237. *Mr. Nicholson.*] Is it not usual to drive the cut-through up to meet the bord? Yes.
3238. Then that does not alter the fact that getting the bords 35 yards before you start the cut-through, goes beyond the Mining Act? Certainly.
3239. Have you been in the habit of using brattice in the mines? Not in the Northern District; but at home, where I was brought up, we were compelled to use it.
3240. Do you think it is really necessary to use it where gas is given off? Certainly.
3241. Do you think it entails much extra expense on the owner? No; I do not think it does.
3242. Do you not think it safeguards the interest of the owner? I think it is to the interests of the owners to use it.
3243. It prevents accidents which would entail heavy loss? Yes.
3244. When the inspectors go round the mine, do you think that their report should be open for the perusal of any of the workers in the colliery? Yes.
3245. They have as much right to be open to the workers as the check inspector's report? Yes.
3246. And it is necessary, in order to provide for the safety of the men? It is.
3247. With regard to the eight hours, I think you said you were in favour of that? Yes.
3248. Do you think it can be satisfactorily arranged for the miners to work eight hours without legislation? I do not think it can. At any moment the owners might discontinue the present eight hours system. It would be far better if it were legalised.
3249. Have you ever known cases where the manager wanted miners to finish the loading of a boat, and he asked the miners to stay over the eight hours? Yes.
3250. *Mr. Edden.*] How long have you worked at the Hetton Colliery? About eighteen months.
3251. What did you do there? I was mining.
3252. Do you hold a responsible position there? No.
3253. How long have you been a miner? I have been about twenty-six years in pits.
3254. I suppose you are well acquainted with the systems of working up north? Yes.
3255. And you are well acquainted with the Mining Act? Yes.
3256. Do you think there is a necessity for any improvement in reference to mining? Yes; I think there is a great necessity for it.
3257. Could you tell us in what respect? In regard to the length of the cut-throughs driven, when a man has driven a certain distance, I think there ought to be means provided for giving him fresh air, either by bratticing or otherwise.
3258. As a miner, and one who has held a responsible position, you think the miners have to work too far in front of the air? Yes.
3259. Are you aware that in a Bill which was recently before Parliament, provision was made that air should be taken within 15 yards of the working-face by brattice? Yes.
3260. What is your opinion about that? I should certainly favour the bringing of the air within 15 yards of the face.
3261. You do not think it would be difficult to do that? No; I do not.
3262. Could you give us any idea of what would be the expense of bratticing? I could give a rough estimate. Say for mines up to 6 feet high, the brattice would only amount to 1d. a ton, taking it all through; from 6 feet up to 8 feet, would be about 1½d. per ton.
3263. That would include everything? It would.
3264. And bratticing would be a great improvement on our present system? Certainly.
3265. And you are fully convinced that there is necessity for improvement? Yes.
3266. Were the miners at the Hetton Colliery paid by the ton? Yes.
3267. How are you paid? By the standard weight; but I think it is an unfair thing to all parties concerned. It ought to be abolished.
3268. Why? Because a man might send up 13 cwt. of coal and only be paid for 12 cwt. I think that every pound of coal that a man gets ought to be paid for.
3269. Can you at your mine fill the skips as high as you like? Yes.
3270. I suppose you would be in favour of the manager saying how high the skips should be filled? Yes.
3271. But after that, you think that the miner should be paid for all that he sends up? Yes.
3272. Has there been any trouble at the Hetton Colliery? Yes; there was a case tried at the Police Court, a man demanding more weight than was allowed, but he lost his case.
3273. You have worked at Hetton about eighteen months? Yes.
3274. Were you working as a miner for that time? No.
3275. Has there been much bother in the district about the standard weight? It is only at certain collieries that it is applied. Attempts have been made to get it abolished, but they have been futile up to the present.
3276. What size are the bords and pillars at the Hetton Colliery? They are 6-yard bords and 6-yard pillars.
3277. Do they take the pillars out? No; because it is under tidal waters.
3278. What is your opinion about the size of the pillars? My opinion is that the present system of working at the Hetton Colliery is quite safe, considering the hardness of the coal. The pillars do not seem to be crushed, but in good order. I know this, because I had the privilege of going round the mine as check-inspector monthly.
3279. You see all over the pit? Yes.
3280. You think that the pillars are quite big enough? Yes; at the Hetton and Bullock Island Collieries.

Mr.  
R. Baxter.  
25 April, 1894.

3281. It depends upon the depth of the mine? Yes.
3282. Do you not think that, especially under tidal waters, there should be a minimum size of the pillar stipulated in the Act? I do.
3283. Do you think it is necessary that the inspector should have the same power as the manager to say what size the pillars should be? Most certainly I do.
3284. You think he should have a say in the matter? Yes; he should have.
3285. Under the present system, if an inspector goes into a mine and finds that it is not safe he has not the power to call the men out? No.
3286. Do you think he should have that power? Certainly he should.
3287. Coming back to the weighing matter,—the men have the privilege of employing a man, and they have to pay him? Yes.
3288. Do you think that the men ought to have the privilege of employing whom they pleased, whether the man was working in the mine or not? Certainly they should.
3289. You can see no objection to it? None at all.
3290. Did you ever work at any mines where safety appliances were used to prevent over-winding? Yes.
3291. What is your opinion about these things? I cannot give any practical experience in regard to them because I never saw them called upon to act; but I believe that they ought to be fixed up to prevent the possibility of over-winding.
3292. *Chairman.*] You say you have read the English Act of 1887? Yes.
3293. Would you be willing, if you were a manager or owner, to accept the British Act? Yes; with a few amendments.
3294. Would you point out any amendments which you would wish to make in it? Yes, certainly. There ought to be a minimum quantity of air stipulated for. There is a deal of opposition to it, but I think it is necessary to state the minimum quantity. There should be some amendment in regard to working under tidal waters.
3295. You would have either brattice or shorter cut-throughs provided for in the Act? It should be stipulated in the Act that the air should be carried a certain distance up to the face.
3296. *Mr. Edden.*] How far do you think would be a reasonable distance for a man to drive in front of the air without brattice? I should say that from 20 to 25 yards is quite far enough without brattice.
3297. *Chairman.*] You are in favour of the brattice coming within 15 feet of the face? Yes.
3298. Do you say that you would not go further than that with the cut-throughs? I would not.
3299. *Mr. Cook.*] In a place 20 yards up you would brattice? Yes.
3300. If the bords are turned off at a place after going about 20 yards, do you think it would be necessary to brattice up to the face? Yes; I should think when they get a distance of 20 yards it is time to brattice.
3301. Suppose it is a distance of 15 yards? If it had to go no further than 15 yards it would do without brattice—that is, where there is no gas; but you would be compelled to brattice where gas is given off.
3302. But where there is no gas generating you think it would be safe to go 15 yards in front of the air? Yes.
3303. That is, provided that there is a good current of air going? Yes.
3304. *Mr. Cook.*] I want to ask you whether you would prefer to shorten the cut-throughs, putting them over at a distance of 20 yards, or to have bratticing within 15 yards of the face? I would recommend bratticing in preference to shorter cut-throughs.
3305. Do you think it would be cheaper? I think it would be pretty much the same either way. There would not be much difference.
3306. *Mr. Nicholson.*] What price do you pay for cut-throughs in the Northern District? 7s. 4d. per yard at the Hetton Colliery.
3307. And each cut-through being 12 yards, that would be £4 4s. To put the brattice that distance it would take 42 yards at 9d. per yard, that would be 31s. 6d., so that the bratticing would be much cheaper than the cut-throughs? Yes.
3308. *Mr. Cook.*] What width do they drive the cut-throughs? From 6 to 12 feet.
3309. *Chairman.*] I understand you to say that the owners can either lengthen or shorten the hours of labour as they choose? Yes.
3310. But I understand that, as a practical man, you would make provision in the Bill for any emergency? Yes; but I should not require the men to stay longer than eight hours.
3311. I suppose in your experience you have met with a lot of non-practical men in coal-mines? Yes.
3312. Do you think that it is a desirable thing to have non-practical men in mines? I do not.
3313. I suppose you know that there is a stipulation in the British Act with regard to that? Yes; the British Act says:—
- No person not now employed as a coal or iron-stone getter shall be allowed to work alone as a coal or iron-stone getter in the face of the workings until he has had two years experience of such work under the supervision of skilled workmen, or unless he shall have been previously employed for two years in or about the face or workings of the mine.
- 3313½. Does that meet with your approval? Yes.
3314. I suppose you know that if engine-drivers are careless that may mean considerable loss to the company and danger to human life? Yes.
3315. Do you not think some provision should be made for engine-winders to pass an examination as to their competency? Yes; I think that a winder should obtain a certificate.
3316. To show that he thoroughly understands his work? Yes.
3317. You say you have had no practical experience with regard to automatic safety appliances? No.
3318. I suppose you are aware that accidents have been averted by the use of the appliances? I cannot say that; but I have read of successful trials of the appliances.
3319. Do you know that cages have been taken hold of by the safety hooks where there has been over-winding and kept suspended? No; but I have heard of trials taking place and the cage being suspended.
3320. Are you of opinion that it is necessary to have these appliance to prevent accidents? Yes. I think they ought to be supplied, because it has been shown that they will prevent accidents.
3321. I suppose there is no provision in the Act of 1876 for the examination of working-places before the men go to work? Not that I am aware of.
3322. Do you think it ought to be provided for? Yes.

- Mr. R. Baxter.  
25 April, 1894.
3323. Why? Because men will go rushing into the places when they go to work in the morning without ascertaining whether all is safe. A man should go round the mine before the usual hour for commencing work every morning, and ascertain whether there is any danger.
3324. Have you ever worked in mines where that is done? Yes.
3325. Who used to go round? Generally what they call the fireman. Here he would be called the deputy.
3326. Did he leave any mark? The man generally comes to the pit-bottom, and passes each man to his own district. If there was any danger he would warn them.
3327. Is it not possible if the man never went there and examined the mine? That is possible; but there were marks left with the date on the brattice prop, and the initials of the examiner.
3328. Therefore, it would be impossible for a man to deceive you—he must have been there? Yes.
3329. Have you worked where safety-lamps are used? Yes.
3330. Do you think there ought to be some stipulation in the Act with regard to safety-lamps? Yes.
3331. It has been suggested that the age at which children should enter a mine should be raised from 13 to 14 years—what do you think of that? I think that 14 years is quite young enough for a boy to go into a mine.
3332. Have you any boys? Yes.
3333. Would you like them to go into a mine to work before they are 14? No.
3334. You look upon them as children up to the age of 14? Yes.
3335. And you would not let your own children work in a mine before they are 14 years old? No.
3336. That is the opinion of a very large number of miners, is it not? Yes.
3337. I suppose there are a few exceptional persons who would send their children to work in a mine as soon as they could prattle? Yes; but they are very few.
3338. Would you give power to inspectors when there was danger threatening in a mine to take the men out? Yes.
3339. I suppose you know that, to a certain extent, that power is given them? Yes.
3340. Do you know anything about the Stockton Colliery? No; I never worked there as a miner. I was simply employed there as a sinker.
3341. Do you remember a case in which the inspector summoned the manager of that mine? Yes; he summoned the manager on two or three occasions.
3342. Did the inspector get a conviction? Yes; on each occasion.
3343. What was the conviction for? The management had not withdrawn the men when the inspector had condemned the workings as unsafe—he had gone against the Mining Act.
3344. I suppose the conviction took place under subsection (v) of section 12, which says that the men shall not return to work until the inspector certifies that the mine is safe? Yes.
3345. Has the inspector certified that yet? Not to my knowledge.
3346. What was the feeling in the Newcastle district in reference to that case? There was a very strong feeling. They do not like the men going to work in a mine which is deemed unsafe.
3347. Did the miners take any action to show their disapproval of that? Yes; at various meetings.
3348. Was their disapproval shown in any other way;—have you not a clause in your rules with regard to the relief of widows and orphans of men injured in accidents? Yes.
3349. Is that one of your rules now? No; it was erased.
3350. It was erased after those men went back into the Stockton mine? Yes.
3351. To show your condemnation of their action? Yes; the miners were afraid that there would be too many calls on them.
3352. That would be if a terrible accident took place at that mine? Yes.
3353. Do you think it is fair as regards the lives of miners that two or three men should be selected to give a report as against the inspector? I do not.
3354. You think that when an inspector gives his report in it should be final? No; in the event of the manager and the inspector disagreeing the case should go to arbitration.
3355. Then who will say that the mine is safe? That should be settled by arbitration.
3356. Would you have a non-practical man to decide the question? Certainly not.
3357. Do you look upon the inspector as a competent man? Yes; and I should look on the manager as a competent man. His word would be as good in regard to the safety of his colliery as that of the inspector.
3358. Whom does the manager serve? The owners.
3359. Whom does the inspector represent? The Government and the miners.
3360. Do you think that another person will be got to be more reliable than the Inspector of Mines? No; I do not think so for a moment.
3361. Do you know the inspectors in the Northern District personally? Yes.
3362. Do you look upon them as competent men? Yes; I should look upon two of them at least as competent men.
3363. And you would not be afraid to trust your life in their hands? Certainly not.
3364. Would you abide by their report? Yes.
3365. In case of a difference of opinion, whom would you ask to come in and give an opinion? Experts.
3366. You would call in a third party to settle the affair, to give his decision? Yes.
3367. That being so, how could you put the responsibility on the third person, when he is only an outsider? It would all depend upon the evidence. One deems the mine safe, and the other deems it unsafe. Expert evidence should be obtained on the subject.
3368. Do you think that any inspector, for a mere fad or whim, will say that a mine is not safe? I should not think that he would, but it is possible that he might do so.
3369. You do not think that he would do it? I do not think he would.
3370. If a mine is unsafe, and there is any sign of improvement, do you not think the inspector will allow the men to resume work? I think he would.
3371. You think if it is left to the inspector and the manager, they would be able to settle the dispute? They ought to be able to do it; but I cannot admit that one man should have power to close any mine in the event of the two principal parties disagreeing.
3372. Do you call taking men out of the mine, closing the mine? The mine is closed until it is deemed safe.

3373. You would be in favour of withdrawing the men from the mine until it was deemed safe? Yes.
3374. If the inspector gives in his report he knows that he is responsible to a Minister of the Crown, who is responsible to Parliament. Could you have a more responsible person than that? When a dispute takes place there are two competent persons at variance—the inspector and the manager. One says the mine is unsafe, and the other deems it safe, and I do not think that one party to the dispute ought to be able to say that the pit shall not work until he deems it safe.
3375. *Mr. Cook.*] Who would you regard as a suitable person to say whether the mine was safe or not? The inspector.
3376. You would not allow the inspector to do that? In regard to the Stockton affair the inspector deemed the mine unsafe; but the manager made certain improvements, and said that it was safe.
3377. Who would you call in to settle the point? I would have a Board appointed to take evidence of competent men to decide whether the mine was safe or not.
3378. And you would fix upon the Board the responsibility of declaring that the mine was safe? Yes.
3379. How would you constitute that Board? I could not say at the present time.
3380. *Chairman.*] Suppose that the inspector said that a mine was unsafe, and the Board that you suggest should say that it was safe, and the Board sends the men back to work, would not that be demanding the resignation of the inspector? I cannot see it as you see it.
3381. Take the case of a colliery which the inspector says is not safe, and the matter comes before the Board, the Board go against the inspector, the mine is re-opened, and a short time after a catastrophe takes place. The Board would be saddled with the responsibility? Yes; they take the responsibility off the inspector.
3382. *Mr. Cook.*] Suppose you were asked to appoint a Board to come between the manager and the inspector, whom would you choose to sit on the Board? I should pick competent men from the managers and miners. An inspector goes down a pit, he gives an honest report on that pit; but there is something which the inspector overlooked, but which the manager can see; they disagree, and I still think that in the event of their disagreeing a person should be called in to say whether the colliery ought to work.
3383. How many would you have on this independent Board? I should say from three to five.
3384. Would you have an equal number of miners and experts? I should approve of competent miners being appointed.
3385. Would you have as many miners as managers? Yes.
3386. Suppose that they enacted over again the same things that had been done by the inspectors and the managers? I would not go so far as to call in a fourth party if they came to that position. I should say, "Well, there is danger," and I should keep the mine closed.
3387. *Mr. Nicholson.*] Do you not think a course of that kind would lead to endless litigation? I do not think so.
3388. It is always in the interests of the colliery manager to say that the mine is safe, and he will oppose the inspector if possible? That would occur sometimes, but not in all cases.
3389. *Chairman.*] Do you approve of the action which the Stockton men took after the accident in that mine? I do not.
3390. Nor the district to which you belong? No.
3391. What you say is that there should be an outside party able to come to a decision, but you have no clear idea as to who that third party should be? No.
3392. What would you do with the mine at the time the litigation was going on? I should keep it closed until a decision was arrived at.
3393. Do you not think that if the mine is not safe the manager should go to work to make it safe? Yes.
3394. Do you not think it would be better to take the word of the inspector than to have all this litigation? I would take the word of the inspector.

Mr. John Thornton called in, sworn, and examined:—

3395. *Chairman.*] I suppose you are a miner? Yes; I have been a miner all my life.
3396. I suppose for about thirty years? For thirty-two years.
3397. I suppose you have had experience of mining in both England and Australia? Yes.
3398. What position have you held in the mines? In England I was deputy for four years.
3399. You went through all the grades up to the position of deputy? Yes.
3400. I believe you have held the same position here? I was deputy at the Waratah Co.'s mine for twelve months.
3401. How long have you been in the Northern District? About eleven years.
3402. During that time have you heard of any request for the adoption of the eight-hours system? Some have been for and some against it.
3403. As a rule, do the men ask for the eight hours? A good many.
3404. I suppose you know that according to evidence which we have received there is an Eight-hours Demonstration Committee established at Newcastle? Yes.
3405. Do the Miners' Association take part in that? They send representatives.
3406. Have you got any objection to the legalisation of the eight hours? I have no objection myself, but I think there is an evil connected with it in regard to the masters' side.
3407. What is that evil? A manager has a certain number of men who do a certain quantity of work, and perhaps the work may require that the men should stop half a shift, perhaps owing to unforeseen work, and by stopping and keeping the men for half shift he would get that work done; but if the eight hours was legalised he could not keep those men for the half shift—he would have to put more men on.
3408. Is that your only objection? I have no objection myself, but I think it would lessen the output of the collieries.
3409. I suppose, as a boy, you worked in the mines longer than eight hours? Yes; twelve hours a day.
3410. Would you like to see that state of affairs again? I should not.
3411. You think eight hours is a sufficient length of time to work in the mine? I do.
3412. You think you can tire yourself in that time? Yes.
3413. If provision is to be made in the Bill for emergencies, would you then object to the legalisation of the eight hours? It would have to be stated what the emergencies were.

- Mr. J. Thornton.  
25 April, 1894.
3414. You could not state that, could you? You could state some of the things.
3415. In your long experience, did you ever know a man to refuse to work more than eight hours when there was danger? No.
3416. You always found them willing to assist the management of the colliery on an occasion like that? Yes.
3417. Even the most straight-backed unionists you found ready to assist the management? Yes.
3418. If the words "in case of emergency" were inserted in the eight-hours provision, would not that meet part of your objection? I can hardly say whether it would or not. The word "emergency" would apply to so many things.
3419. If the times were better the same objection would not be raised to the eight hours that there is at present? I have not heard so many objections to the eight hours. I see from the Home papers that two counties in England object to the eight hours.
3420. What is the reason? It is because they think they can get six hours.
3421. If those men had been working eight hours, do you think they would have voted for the eight hours? I suppose they would.
3422. It is because those men are working shorter hours that they would not vote for the legalisation of the eight hours? Yes; that is my opinion.
3423. When you were a deputy you had a great deal to do with the ventilation of collieries? Yes.
3424. Do you think 100 cubic feet of air per man per minute sufficient? I think 100 cubic feet per horse is not enough.
3425. What stipulation would you make? According to different authors that I have read, a horse requires from 200 to 500 feet of air per minute.
3426. Have you read Mr. Hopton's book on mining? I have read part of it.
3427. Do you know what stipulations he makes in that book? He says there must be 100 cubic feet of air per man, 1,000 cubic feet per horse, and 100 cubic feet per candle.
3428. Would you take him to be an authority on the subject? I should.
3429. I suppose you know that he has gained some recognition at Home on account of the book he has written on mines? Yes.
3430. Do you think there is any harshness in asking the owner to supply 150 cubic feet of air per man and horse? I would strongly object to 150 feet for a horse when writers on the subject say that a horse requires ten times as much air as a man.
3431. Would you have a strong objection to giving a man 150 cubic feet of air? If we cannot get 100 cubic feet at present, how are we going to get 150 feet?
3432. We will ask you that question? I think the more air a man can get the better. My opinion is that if all the men working in the mines in the Northern District had 100 cubic feet of air per man per minute going past the bord end, there would not be so much grumbling as there is.
3433. You have heard that grumbling? Many times.
3434. Then you do not think the collieries in the Northern District are well ventilated as a whole? Not as a whole.
3435. You think the ventilation ought to be improved? Yes; there are some mines fairly well ventilated, and some that are not well ventilated.
3436. You think that the ventilation ought to be made better? Yes.
3437. Is good ventilation conducive to health? Yes.
3438. If you were a manager you think it would be beneficial to the property of the colliery owner to have good ventilation? If I were manager I should consider that if I was supplying 100 cubic feet of air per minute per man I was fulfilling the requirements of the Act.
3439. Do you know of any place where the inspector found fault, although 100 cubic feet of air was sweeping past the end of the bord? No.
3440. Do you think 100 cubic feet of air per minute would be sufficient to render noxious gases harmless? I do not think it would be enough where fire-damp existed.
3441. If there is any sign of gas you would expect more than even 150 feet? Yes.
3442. Do you think it behoves the Legislature to provide for more than 100 cubic feet of air? Where there is gas they will have to provide it.
3443. But I understood you to say that some of the mines were not giving 100 cubic feet of air? Some of the mines are not. They may be getting it at the intake and perhaps on the return, but every man on the heading is not getting the proper quantity of air past his bord end.
3444. *Mr. Edden.*] You say that there is a great deal of grumbling about not having sufficient ventilation? Yes.
3445. And you also state that if there was 100 feet of air per man going past the bord end there would not be so much grumbling? I do.
3446. You say also that there may be 100 feet of air per man at the intake, and also at the return? Yes.
3447. How could there be 100 feet at the intake and also at the return, unless 100 feet went by the bord ends to get to the return? The bord ends are along the heading, and at every bord the air is scaling away, and it is lost before it gets to all the men for want of proper means to carry it round the place.
3448. Do you think the bord ends should be stopped up? I think that 100 cubic feet of air should be made to travel past every place. I do not believe in getting 100 feet here, and going four or five bords away and finding that they only get 80 feet. If you get 100 feet on the intake that satisfies the inspector, perhaps. They do not take another measurement in the headings.
3449. According to that the bord ends should be stopped up? I think that the air should be made to go past every man's place in full quantity.
3450. Do you think it possible to do that without the bord ends being stopped up? Not without stopping being put in somewhere.
3451. How far in front of the air do you think it safe for a man to work? When you get from 20 to 25 yards in advance of it it is beginning to get pretty warm—too warm to be comfortable.
3452. How would you remedy that? By shortening the distance between the cut-throughs.
3453. Do you think 20 or 25 yards a sufficient distance to go before a cut-through is put over? I think from 20 to 25 yards is far enough for a man to be working before the air.
3454. There are mines in the north where the bord ends are partly choked up with refuse? Yes.
3455. So that there is very little room for the air to strike into the bords? Yes, that is so.

3456. There was a provision in the Mines Bill lately before the House that the air should be carried within 15 yards of the working face by brattice or otherwise;—what is your opinion about that? My opinion is that we ought to make the cut-throughs from 20 to 25 yards apart. If you put brattice in you can carry the air as far as you like.

Mr.  
J. Thornton.  
25 April, 1894.

3457. You think that if the cut-throughs are not put in at shorter distances bratticing ought to be used? I am not in favour of bratticing.

3458. But you are in favour of the cut-throughs being shortened? Yes. I am not in favour of bratticing for this reason: every 12 yards in the heading there will have to be a canvas door put up at every bord end; so if there are ten sets of men in the heading there would be ten canvas doors, and this will involve a great expense; and not only is there the expense, but the way the bords are now blocked up with dirt you could not get the canvas stopping in. You could not get the brattice into many of the bords unless the dirt was shifted.

3459. Would not the canvas door turn a portion of the air into the bord? The man in that bord would not get his quantity of air by scaling it in. A portion of the air would go past every bord, but you should give every man his quantity.

3460. If 2,000 feet of air was going past the bord, and a portion of that was turned into the bord by brattice, each man would get his 200 feet would he not? No; he would only get a portion of it. I say you cannot give any man his quantity of air unless you put the whole column into every bord. No doubt by scaling you think you force air into the bord, but you are only giving the man a portion of his quantity.

3461. *Mr. Cook.*] The assumption is that there is 2,000 feet of air passing along the bottom of the bord? Yes.

3462. And you say that by scaling it in each man only gets a portion of his quantity? Yes; a portion of the 200 feet.

3463. As the result of scaling you could not get 200 feet of air per man out of the 2,000 feet? No.

3464. In ventilating the mine by splits they have doors, which they call regulators? Yes.

3465. How do you increase or diminish the quantity of air in any one split? By either opening or shutting the doors—the regulator which is put on for the purpose.

3466. How does that coincide with the version you have given us that you must give the whole volume of air, if an aperture in the door can increase or decrease it? The regulator is generally put in at the far end of the return. If you have above 100 cubic feet of air going along you shut your regulator a little; if you have not your quantity you open the regulator. That air has passed all the men when it gets to the regulator.

3467. But you admit that opening or closing the door will regulate the air? It will.

3468. Do you not think that brattice, hung midway in the heading, would be the means of sending either more or less air up the bords? If it hangs across the heading it will. It is bound to send the air up the bord where it is hung.

3469. Then, if you have this 2,000 feet of air flowing along the heading, are we to understand from you that none of that air will go up the bord? I do not say that. I say that if you hung that canvas to scale the air into the bord, you only put a certain portion of that air into the bords, the other portion is going past. And how are you to be satisfied that that man is getting his share of that air? I have seen one heading with six sets of men in it. The air was measured at the in-take of one set of bords in the split. It went along the heading, and the same air went down to the next heading, and was measured again for another split—that was the same air.

3470. And that was wrong? It was wrong.

3471. That air before it got down to the other set of men would not be fit to breathe? When that air was measured it was 100 or 130 cubic feet per man, but it was measured over again in the same split.

3472. You will admit that by putting some obstacles in the heading, though it may not reach to the roof, it will have a tendency to send a certain quantity of air up the bord? You can send air up the bord by hanging a scale.

3473. But not the full complement? Not the full complement.

3474. *Mr. Edden.*] But they would get more than they get now? They would think so.

3475. They must? It would not send up their proper quantity of air.

3476. *Mr. Cann.*] Is it not a fact that you require a definite in-take and a definite return, before you can get ventilation at all? Yes.

3477. *Mr. Edden.*] If you have not a definite in-take and return, you can get no air at all;—there are so many men in a heading, and you have a scale at every bord, and will not some of the air go straight past to the regulator? I am not in favour of bratticing; I am in favour of shortening the distance of the cut-throughs.

3478. You are fully satisfied that some alteration is necessary? The distance of the cut-throughs at present is too far.

3479. Whilst you have been in the Northern District, have you ever heard of any bother at the collieries in reference to the mode of weighing the coal? Yes; I have heard complaints.

3480. What is your opinion of the standard weight system? It is a bad system for the miners.

3481. You think it should be abolished? I do.

3482. But you would allow the manager to say how high a skip should be filled? It is necessary that there should be a limit on account of the rolling-stock.

3483. But the man should be paid for the coal that comes up? I think there should be as much provision for men getting coal out of a pit being paid as there is for a railway carrying coal at so much per truck.

3484. *Mr. Cook.*] That is practically the standard weight? No; it is possible to fill a skip too full.

3485. If a truck is stipulated to carry 6 tons that is the standard weight? Yes; but they will not put too much weight into a railway truck so as to injure the rolling stock.

3486. You would control that by the height? Yes; a man should put in as much good coal as he can fill up to a certain height.

3487. *Mr. Cann.*] They would not carry an extra ton for nothing on a railway truck? No.

3488. But if a man fills a skip above the stipulated weight he loses it? Yes.

3489. But a railway company will be paid for the quantity they carry? I suppose they will.

- Mr. J. Thornton.  
25 April, 1894.
3490. *Chairman.*] The manager of the company should regulate his skips not by weight but by a standard height? He builds his skip to carry a certain quantity of coal. Some object to the skip being filled too high, and some do not.
3491. You are opposed to the standard weight? Yes.
3492. You think that the men lose money by it? Yes.
3493. *Mr. Edden.*] How long have you been in this country? Eleven years.
3494. Have you ever held any responsible positions? Yes; I was underground manager at the Hetton Colliery for three and a half years.
3495. Do you hold any certificate? No.
3496. You have not passed an examination? No; I am attending the mining school at present. I had charge of a small mine at Tighe's Hill for eighteen months.
3497. *Chairman.*] I suppose you are pretty well acquainted with the Act under which mines are worked in this country? Yes.
3498. There is a stipulation in the Act that the men shall appoint a check-weighman? Yes.
3499. I suppose you know that that stipulation keeps them to the pit set or the companies' mine? Yes.
3500. What is your opinion about that? I think the check-weighman should be an employee of the company.
3501. What is your reason for thinking so? I could not give any reason.
3502. If you were a colliery owner, you could get a manager wherever you pleased, you could send to America for one if you thought fit? Yes.
3503. And you think it only right that the owner should have that liberty? Yes.
3504. He claims that right because he would pay the man? Yes; I have no objection to a check-weighman being chosen from outside.
3505. You have no objection to the men choosing a check-weighman wherever they like? No; as long as he is not an obstructionist.
3506. Have you ever known a check-weighman to obstruct a mine to the detriment of the management? I cannot say that I have.
3507. Do you think there would be any harm if provision was made that the men should have power to select a check-weighman from wherever they thought fit? No; if the men saw fit to choose a better man than they have at their own colliery, I do not see why they should not choose him from outside.
3508. If they pay the check-weighman, they have a right to choose him where they like? I think so. The reason why I said he should be an employee of the colliery is because where a colliery employs from 150 to 200 men, they have a better chance of knowing a great many in their own ranks.
3509. Do you not think it should be left to their option? Yes.
3510. You would not put any obstacle in the way of their choosing a man where they like? I would not.
3511. Are you acquainted with the English Act of 1887? I have read it.
3512. With a few amendments to suit local circumstances, would you accept the English Act? Yes, on the whole. I think it is a very good measure.
3513. Under that Act, men in the position of underground managers receive certificates of service; what is your opinion of that? I think every man should have a certificate of competency. I would give him a certificate of service, if he was manager when the Act was passed. I think every man should have a certificate of competency before he takes charge of a mine.
3514. Were you acquainted with the Act of 1872? Yes.
3515. Do you recollect the stipulation made there with regard to certificates of service for managers? I do not.
3516. There was a provision in that Act that men in the position of managers at the time of its passing should receive certificates of service. Do you think such a provision should be inserted in any Bill passed here? I think that the manager should be given time to prepare himself for an examination if he has not been a manager long enough to meet the requirements of the Act before it was passed. A man should have a certificate of competency.
3517. That is for the future? Yes.
3518. Would you give a certificate of service to colliery managers who have proved themselves successful so far? I would.
3519. There is no provision in the present Act for the examination of places before the men go to work? No.
3520. Do you think provision ought to be made that the deputy, or fireman, or some other responsible person should make an examination of the mine before work is resumed in the morning? Yes; every place should be examined before the men go to work.
3521. *Mr. Cann.*] How long should that be before the men go to work? It should be done, as nearly as possible, to the time when the men go to work.
3522. In some mines it would take three or four hours to do it? Yes.
3523. By the time the examination was finished, it might not be much good? No; you could never tell what might happen in a place in four hours.
3524. Would it not be necessary to stipulate the time, to say, perhaps, that it should not exceed two hours? Yes.
3525. *Chairman.*] Do you think the inspectors have sufficient power under the existing Act with regard to withdrawing men where they see there is danger in a mine? I do not think the inspector has enough power at present.
3526. You would accept the English Act as the best that you have read? Yes; in my opinion it is.
3527. I suppose that there are some thousands of pounds worth of machinery and the lives of many men in the hands of the engine-winders? Yes.
3528. Would you be in favour of the engine-winders passing examinations? Yes.
3529. In any proposed mining legislation you would provide for that? Yes.
3530. What distance do you think the shafts of the mine should be apart? I think the English Act says 15 yards.
3531. Is that far enough? Yes; if there are sufficient pillars left to support them.
3532. If you had plenty of ground would you put them further apart? Yes; very likely I would.
3533. A great deal depends upon the nature of the ground? Yes; no doubt.

3534. There is no provision made in the Coal-mines Regulation Act for arbitration between employers and employees? No. Mr.  
J. Thornton.  
25 April, 1894.
3535. I suppose you are one of those who think that strikes should be a thing of the past? Yes; that is my opinion.
3536. Do you think that some provision should be made in a Mines Bill for bringing about conciliation? I do not think it is necessary to put that in a Mines Regulation Bill. It is a question outside the provisions of the Mining Bill.
3537. It has been suggested that the age when boys should be eligible to work in a mine should be raised from 13 to 14 years? I think that 13 years is old enough. If you want to keep your boy at home after that you can do so.
3538. You would allow a boy to work in a mine when he is 13 years of age? I would.
3539. Do you think that the education that a boy gets after that age is no good? They get tired of going to school by the time they are 13, and they are only a burden to their parents.
3540. You would stick to the provisions in the present Act? Yes.
3541. Do you not think it ought to be in the power of the employees to ask for every skip to be weighed if necessary? I do not see what difference it would make.
3542. Is it not a fact that at some collieries they are weighed just according to the whim of the manager? At the Hetton Colliery as soon as one skip was weighed and put into the waggon they called for another.
3543. Do you not think that if the men wished it they should have every skip weighed? It might be better for the men if every skip was weighed.
3544. And you think that if employers and employees cannot come to an understanding about that it ought to be provided for by law? I say I thought it might be better if every skip was weighed, but I would not say positively. A man has three, or four, or six skips weighed in a day, and has filled twelve skips for that day, and he gets the full average of those six skips. If they are full skips the better for him; if they happen to weigh six small skips the master gets the benefit of it. It is as fair for the one as it is for the other.
3545. Do you not think it is right for the men to have every skip weighed if they choose? I think that a man should have as many skips weighed as he can.
3546. There are mines in England where they weigh every skip? Yes; but not under the same circumstances as they are worked under here.
3547. What is the difference? At home most of the skips are run on to a weigh-bridge, and the weight of the empty skip is deducted. The coal is not put into a pan as it is here.
3548. Do you know that there are provisions in the English Act for the weighing of every skip? The Act says that the miner shall be paid for the mineral gotten.
3549. That would not prevent you, as manager, and your men from agreeing to do a certain thing? I quite believe in the English Act, taking it *in toto*.
3550. *Mr. Scott.*] You have worked in the Stockton Colliery? Yes.
3551. You are one of the cavilled-out men? Yes.
3552. Do you think that mine is dangerous? No, or I would not work there.
3553. Do you know where that accident was? No; I worked on Gardiner's heading after the accident.
3554. You have no fear with regard to that mine? No; I am going to start there when I get back, if I have the chance.
3555. Would you be in favour of an inspector, when he considers the mine dangerous, like the Stockton mine, calling in three competent men to inspect the mine with him? I think it would be a very good idea. They should be thoroughly practical men. I think it is a great power to put into the inspector's hands, to say that he shall be able to withdraw the men, and stop a mine for any period that he likes. It is an arbitrary power, which might be injurious to both masters and men.
3556. There may possibly be a doubt as to the safety of a mine, and if there is a semblance of a doubt the inspector will always take the benefit of the doubt? Yes; they must uphold their opinion.
3557. Suppose they called in three men to represent the managers and the miners, would it be possible to get competent men to sit as arbitrators in such a case? I do not see what good the inspector would be then; the power would be taken altogether out of his hands.
3558. Then why call in those men? They could call in three men to inspect the colliery, but not to give a decision as to whether the colliery should go on working or not. Perhaps the three men would have no more ability than the inspectors.
3559. If three men representing the miners and the management and three inspectors could not agree, what would you do then? I would call in three or five men to form a Board to take the evidence of the six experts.
3560. Would you leave the final decision with the Government Inspector? I think they would call three men in and get their opinion, but the Board should say whether the mine should go on working or not. It is an arbitrary power to give to one man; but if three men on each side sat and could not come to a conclusion the Board should decide.
3561. *Mr. Edden.*] I suppose you work in the mine for the sake of your bread and butter? Yes.
3562. *Chairman.*] I suppose you would not work in a mine if you were well off? No; if I were well to do I would not work in a mine, neither would I be a Member of Parliament.
3563. You say that you would give greater power to the inspectors than the present Act gives them? Yes.
3564. You think there is no man more competent than the inspector? I could not say that.
3565. Is it not a fact that there can be dangerous parts in a mine without your knowing it? Perhaps so.
3566. Is it not a fact that according to the rules of the colliery you are not supposed to leave your own bord? Yes.
3567. And that you can be discharged if the manager finds you in another man's place? Yes.

THURSDAY, 26 APRIL, 1894.

Present:—

MR. EDDEN, | MR. COOK,  
MR. McCOURT.

J. L. FEGAN, ESQ., IN THE CHAIR.

Mr. John Welford called in, sworn, and examined:—

Mr.  
J. Welford,  
26 April, 1894.

3568. *Chairman.*] What is your occupation? I am under manager of the Hetton Colliery.
3569. How many years' experience in mining have you had? About thirty-three.
3570. I suppose during that time you have filled almost every position in a mine? During that time I was seven years deputy overman in England.
3571. What part of England? Durham.
3572. And I suppose you have filled other positions as well from the bottom rung of the ladder to your present position? Yes; from a boy upwards.
3573. Have you made yourselves acquainted with the existing Coal-mines Regulation Act, under which the mines are working—the Act of 1876? Yes.
3574. As well as the proposed new legislation? Yes.
3575. How long have you been in the Northern District? Five years.
3576. Do you know that there has been a request for the eight-hours system from the miners of the Northern District? I know it has been agitated for a little.
3577. What is your opinion with regard to the eight hours;—do you think a man works long enough if he works for eight hours in a mine—I mean the miner? Yes; I do.
3578. You think he can tire himself in eight hours? Yes.
3579. Have you any objection to the legalisation of the eight hours? No; except that there are cases where it is impossible to do all the work of the mine in eight hours—I refer, for instance, to the on-setters sending timbers down after the pit has done hoisting.
3580. But you would not have any objection to the eight hours being legalised as applied to the hewers of the coal? No; I would have no objection to its applying to the hewers.
3581. If in any new Coal-mines Regulation Bill, provision were made for such emergencies as that to which you have referred, your objection to legalising the eight-hours system would not be very great? It would not be so great.
3582. You say you come from the county of Durham? Yes.
3583. You worked there? Yes.
3584. Do you remember a ballot being taken among the northern miners in England on the question of whether they would recognise the eight-hours system? I read about it; I was in America at the time.
3585. What reason do you assign for the fact that they did not vote in favour of the eight hours? They worked a less number of hours.
3586. That is the reason—they did not wish to work any greater number of hours than they were already working? The eight-hours system would have added more hours than they were already working. They were not working eight hours.
3587. Then you think that if they had been working nine hours those miners would have only been too glad to vote for the eight-hours system? I believe so.
3588. Is it not a fact that a large number of men in the North of England—in Durham and Northumberland—do not work more than seven hours? Yes.
3589. How have they brought that state of things about? It is because the mines only work ten hours. There are two shifts, and the shifts are divided into seven hours each. In some instances the men only work six hours.
3590. How did they get that;—was it by legislation or by their Trade Unions? By the legislation of 1872, which reduced the hours of labour for boys. Formerly the mines worked twelve hours, but the Act of 1872, when it came into force, reduced the hours of labour for boys under 16 to ten hours, and, consequently, that reduced the hours for the miners by two hours.
3591. But the Legislature did not step in and say to the miners, "You shall only work a certain number of hours"? No.
3592. Then it was owing to the action of the Trade Unions that the hours were shortened;—it was the result of a mutual agreement between the employers and the employees? Yes.
3593. You are well acquainted with the Northern District;—is it not a fact at the present time that the owners, if they wished, could put up a notice on their property to-morrow to the effect that in the future their collieries would work a longer number of hours? Yes.
3594. That would be within their rights? Yes.
3595. Do you not think it probable that a strike would be the consequence? I do.
3596. Do you not think that if it is possible to do so without injury to the interests of the owners it would be better to legislate against strikes and lock-outs? Yes; I am quite in favour of that.
3597. Then, if the Legislature proposed to make provision for such emergencies as you pointed out just now, and to legalise for eight hours for the hewers of coal, you would be in favour of it? Yes.
3598. I understood you to say you had been in America? Yes.
3599. Did you have any mining experience in America? Yes; seven years.
3600. Then you have had a fair experience, taking the countries you have been in? Yes.
3601. From the experience you have had, what do you consider is the best system of ventilating a mine? To split the air.
3602. You can recommend that? Yes.
3603. Is it not a fact that at one time the mines were not ventilated by splits? Yes.
3604. What would be the result if an explosion took place? Serious.
3605. I suppose the whole pit would be knocked to pieces almost? Yes; I suppose you remember Rudhill very well?
3606. If a mine is ventilated with only one current of air, and an explosion takes place, there is a greater loss of life than would be the case if the mine were ventilated in splits? Yes; there would be a liability to greater explosion with no splits than with splits.

3607.

Mr.  
J. Welford.  
26 April, 1894.

3607. In the case of splits the damage to property and life is minimised considerably? Yes.
3608. And there is no system of ventilation that would meet your approval except that of working the mine by splits? Yes; by splits.
3609. It has been proposed to increase the minimum quantity of air per man to 150 cubic feet;—what is your opinion in regard to that? I think that 100 cubic feet is quite sufficient for the minimum, but that in a well-ventilated colliery the quantity would never stop at 100 cubic feet.
3610. Do you think that by making the minimum 150 cubic feet it would operate harshly on the collieries? I think it would in some cases.
3611. But not in the majority of cases? No.
3612. You know collieries where they get more than that? Oh, yes.
3613. And where, if properly taken round, it would give more per man than that? Yes.
3614. For instance, if new collieries were starting, they could easily provide for even more than 100 cubic feet? Quite easily.
3615. And the hardship would only exist in the case of collieries started on a small scale? Yes.
3616. Where a mine is worked with the improved machinery of the age, a competent man will always see that he has got a great deal more than 100 cubic feet of air? I should think so.
3617. Do you think that if a minimum quantity of air were fixed a manager who wished to give more would be hampered or hindered? I do not think so; but, as I said before, in some cases it would happen.
3618. But you are in favour of a minimum quantity being fixed? Yes; I would have no objection to that.
3619. As an underground manager you would not hold the position under present circumstances, seeing that all our mines are not free from gas, if there were no minimum? No.
3620. Men would always be complaining, and the door would be left open for a certain amount of ill-feeling between the employer and the employees? Yes.
3621. If no minimum were fixed there would always be men who would say there was not sufficient air, and the manager would say there was, and in that way a dispute would be brought about? Exactly.
3622. And you think that by inserting a minimum quantity in the Act you leave both sides free from disagreeableness? Yes.
3623. In reference to cut-throughs, the 4th subsection of section 12 of the Act of 1876 says:—  
No place shall be driven more than thirty-five yards before the current of air without a cut-through put through or bratted up within three yards of the face of such working place.
- Do you interpret that to mean that you only go 35 yards before the air? I take it to mean that.
3624. Do you not think that distance should be materially reduced? I do not think so.
3625. You think the air ought to be got up to the face somewhere? Yes; I quite believe that a sweeping current would meet that case, especially if the seam were not less than 5 feet in height.
3626. How many men would you have in a split? I would not object to seventy.
3627. Seventy would be the outside; you would not have more than seventy? No; less where possible.
3628. I suppose where there are seventy men the last set of men do not get the good air that the first set do? No.
3629. Then you think that for the health of the miners a smaller number than seventy would be advisable where possible; that is, if the mine could be worked? Yes; I think that wherever it could be done forty men should be put into a split.
3630. What distance do you think the cut-throughs should be from each other? Thirty-five yards; except in a place that was rising very much.
3631. And then you would make it less? Yes.
3632. And you think it is necessary to make a provision to that effect? I think so.
3633. Is it not a fact that at the present time you are not forced to have your boilers inspected? Yes.
3634. Do you think that state of things is desirable? No; I do not think it is. Nevertheless the boilers are inspected. We have a partial inspection with ours.
3635. But there is nothing in the law requiring such inspection? No.
3636. And you think that would be desirable? Yes.
3637. Do you think it desirable that such a state of things should exist as that no provision should be made for the inspection of boilers? Well, I do not know, altogether, that provision should be made. I think there is a time coming when insurance companies will enforce inspection.
3638. Is that system carried out anywhere? Yes; in England.
3639. Where there is what is called a Steam Users Insurance Association? Yes; they send competent men to inspect all boilers. All boilers are under their supervision.
3640. Do you not think it would hasten forward a movement of that kind in this Colony, if a provision were made in our legislation that all boilers should be periodically examined? In the absence of such an association as I have mentioned, I think that ought to be done.
3641. But do you not think that if such a provision were inserted in the Act, it would hasten the formation of such a society, because the owners, as you know from experience, will make themselves secure? I do not see where it would force on such a movement.
3642. At the present time no legal provision is made for the inspection of boilers? No.
3643. I suppose you remember a boiler explosion which caused loss of life in the Northern District? Yes.
3644. If that boiler had been periodically examined, do you think the explosion would have taken place? In the case referred to, the accident was caused by a rush of cold water.
3645. Do you not think that if provision were made in the Act, compelling the owners to submit their boilers to periodical inspection, the same as is done in the case of their mines, good would accrue from it? I think it would.
3646. Do you remember a law case that occurred some time ago, in which damages were sought to be recovered from the manager of the Lambton Colliery, on account of the filling up of refuge holes in the mine? I read of the case.
3647. What distance apart would you have your man-holes on an engine plane where the coals were drawn and where the men would have to travel? Not more than 60 feet.
3648. Where there was good coal? Yes; I would make the hole the height of the seam.
3649. A stone drive is not made as wide as a coal drive, as a rule, because it is more expensive? That is so.

- Mr. J. Welford.  
26 April, 1894.
3650. In the case of a stone drive would you not have the man-holes at more frequent intervals, because there would not be the same facility for getting out of the way? In an engine-plane provision is generally made for travelling roads.
3651. But where a tunnel is driven in stone, and where they generally make the tunnel as narrow as they can to save expense, you would make the distance shorter, would you not? Yes; 15 yards.
3652. And you would make these man-holes conspicuous? Yes.
3653. What would you do? Whitewash them.
3654. That would not be expensive, would it? No.
3655. I believe you have some good machinery at the Hetton Colliery? Yes.
3656. You have intelligent men attending to the machinery, of course? Yes.
3657. How many men have you working there altogether—men who ascend and descend? Four hundred.
3658. Then an engine-driver has 400 lives in his hands night and morning? Yes.
3659. Do you think that men should pass an examination before they take the responsibility of so many lives? I do.
3660. And you would be in favour of provision being made in any future legislation to that effect? I would.
3661. What size would you make your man-holes? I would make the height not less than 6 feet—not more than the height of the seam.
3662. And what breadth would you make it? About 4 feet.
3663. What depth would you make it? About 4 feet. It would be 6 x 4 x 4.
3664. *Mr. Edden*. I understood you to say that you had been a deputy over-man in the old country for seven years? That is correct.
3665. What are the duties of a deputy over-man. The first thing in the morning he has to examine the barometer, then inspect the stoppings in the seams, and the travelling roads and all working places.
3666. Have you ever passed an examination? No; not in mining.
3667. Do you belong to any technical class at the present time? Yes.
3668. Then I would be right in assuming that, although you have not passed any technical examination, you have a certain amount of technical knowledge on mining matters? Yes; a limited knowledge.
3669. How do you ventilate the Hetton Colliery—by fan or furnace? By fan.
3670. I suppose there would be no trouble at that colliery in putting in 150 cubic feet of air per minute? We put even more than that in at the present time.
3671. I think you stated to the Chairman that you thought 100 cubic feet would be a sufficient minimum? Yes.
3672. How do you arrive at the conclusion that that would be sufficient? I think a sweeping current of 100 feet is adequate for man's requirements.
3673. What do you mean by a sweeping current—passing by the working face? Passing by the man within the limited distance I stated—35 yards at the extreme.
3674. But is it not a fact that you drive more than 35 yards at the present time? No.
3675. Do you not drive 37 yards for the width of a cut-through? No. Occasionally, perhaps, we might. I would say from 35 yards to 37 yards.
3676. Could you quote any modern mining authorities as to the quantity of air required per man per minute? I would not be positive about the names at present.
3677. Have you read *Mr. J. H. Murvale*? No.
3678. Or *Williamson*? No; I do not remember that I have.
3679. Or *Phillips*? No.
3680. *Hedley*? No.
3681. *Taylor*? No.
3682. These men are thorough mining experts, possessing not only a technical knowledge of the subject, but also, I should assume, a practical knowledge;—do you think it would be wise for a man who had not a thorough technical knowledge, as well as practical knowledge, to set his opinion against those of such men as I have quoted? Partly.
3683. But not wholly? No.
3684. You have been chiefly accustomed, I expect, to the bord and pillar system? Yes.
3685. How far do you suppose it is possible for the air to strike into a bord—that is, to the working face, where the men could work? Fifty yards.
3686. Do you think so? Yes.
3687. How will it get in? Natural current.
3688. You would not like to work in one, would you? No; I am speaking about air striking into it.
3689. I will put it in this way: How far from the working face may the air current pass and maintain an atmosphere fit to work in where blasting is carried on? Thirty-five yards.
3690. Did you ever work in a mine where they had brattice? Yes.
3691. Suppose brattice were adopted in this country, what expense would it entail to brattice the bord (say) within 15 yards of the face? Brattice is often done now in cases where it is required.
3692. Where? In Hetton, for one place.
3693. There is no gas at Hetton, is there? No.
3694. And yet you use brattice? Yes; where we think a man requires a greater amount of ventilation than we are able to give him from the distance of the drive.
3695. You never drive above the 35 yards? Well, that may be done occasionally—under circumstances.
3696. Do you ever use brattice where you do not drive above 35 yards? Yes.
3697. Then that is plain proof that you have not got sufficient air? Quite sufficient, but it is done in the rise places.
3698. Then, where places go on the rise it is necessary that there should be either shorter cut-throughs or some other means to take the air in? Yes.
3699. But suppose the place is rising, how far would you put the cut-throughs through then? According to the rise—20 or 25 or 35 yards, according to what would be reasonable ventilation.
3700. How long have you been in this country? Five and a half years.
3701. What collieries have you worked at? Hetton only.
3702. I suppose you regard the Hetton Colliery as being well ventilated? I do.

Mr.  
J. Welford.  
26 April, 1894.

3703. Yet, I expect, the men work nearly nude there? Oh, no.  
 3704. Do they wear body flannels? Some of them.  
 3705. But not as a rule? Well, no; the miners generally like to work free.  
 3706. Do they do that in England? Oh, yes.  
 3707. In all places where you have worked? Yes.  
 3708. It is the rule, I think, for the miners to work free? Yes.  
 3709. And he would be pretty warm even then at times? Yes.  
 3710. You said just now you thought the air would strike up a bord 50 yards from the main current? Yes.  
 3711. Have you ever thought about that, or did you just answer the question off hand? I am speaking from authority.  
 3712. How would you prove it? I have proved it by the instrument—the anemometer.  
 3713. How? I have actually got the current to tell on the instrument.  
 3714. Up at the face? Forty-five yards inside of the holding.  
 3715. And with nothing to turn the air in? No; the current was so great on the heading.  
 3716. How much would there be on the heading? Thirty-five thousand cubic feet per minute.  
 3717. Is not that something extraordinary? We have that quite commonly.  
 3718. Are you sure you did not blow on the anemometer? Not at all. I can give proof of my statement. The instrument registered at 45 yards in the presence of Inspector Humble.  
 3719. But, as a rule, you would not put a man to work at that? No; I would not.  
 3720. Especially where there was blasting? Yes.  
 3721. And if it were a case of emergency and the air had to go that far it would be necessary to take it into them? Yes; but you asked me how far the air would strike.  
 3722. But it was an exceptional case? Yes.  
 3723. *Chairman.*] It was a case where you got the whole current of the air on to the heading? Yes.  
 3724. Sweeping right in from your intake shaft? The intake of that main split.  
 3725. *Mr. Edden.*] Do you think that under the present Act the Government Inspectors have sufficient power? That is a matter of opinion.  
 3726. What is your opinion? My opinion is that they have.  
 3727. What powers have they? They have power to deal with the supervision of a mine so far as the safety is concerned.  
 3728. But if they go into a mine and find a place dangerous, they have no power to withdraw the men, have they? No.  
 3729. If they saw that a place was dangerous, do you not think they ought to have power to immediately withdraw the men? Yes.  
 3730. Who, do you think, should have the power to set the men to work again? The manager.  
 3731. And he would, of course, take the responsibility? Yes.  
 3732. You do not think it would be wise that the inspector should have power to withdraw the men, and that the men should not be allowed back into the mine until the inspector came again? No.  
 3733. Because, I suppose, it would cause delay? Yes.  
 3734. Have you ever known of any accidents that have happened which could have been averted if the inspectors had had more power? No; I cannot remember any.  
 3735. What is the size of the pillars that are left in your colliery? Eighteen feet.  
 3736. I suppose you have been down other collieries in the Colony? I have been down the Stockton and other collieries.  
 3737. I suppose the coal is of a similar character in all of them? It is nearly the same—of a bituminous nature.  
 3738. You say the size of the pillars is 18 feet; what is the size of the bords? The same size—18 feet.  
 3739. Do you take the pillars out? No.  
 3740. Because the workings are under tidal waters? Yes.  
 3741. I suppose the manager has the sole voice in regard to the size of the pillars? No; there is a stipulation in the lease as to what the size of the pillars shall be.  
 3742. There is nothing in the Mining Act on that subject? No.  
 3743. Do you not think a minimum should be stipulated? No; I do not think so.  
 3744. In whose hands do you think the size of the pillars should be left—solely in those of the manager? No.  
 3745. In whose hands then? A Board of Arbitration, if required.  
 3746. Do you think the Government Inspector should have any power in reference to the pillars? No; I think it ought to be left entirely to a Board of Arbitration to adjust the thing.  
 3747. And who would bring it up before the Board of Arbitration? Inspectors, if required.  
 3748. But you say you do not think inspectors should have a voice in the matter? They could bring it up before the Board of Arbitration.  
 3749. Of whom would you suggest that this Board should be composed? Of mining engineers.  
 3750. Not grocers and bakers, I suppose? No.  
 3751. *Mr. Cook.*] Mining engineers alone? No.  
 3752. How would you constitute the Board? Of skilled men. No doubt there are geologists and others who would be equally qualified with mining engineers for such a purpose.  
 3753. Who would have the nomination of the Board? As I said before, if a discrepancy occurred and the Inspector of Coal-fields thought a pillar was too small, he should call the Board together. I think it should be left in the hands of the Government to nominate the Board.  
 3754. Would not that practically be leaving it in the hands of the inspector? I should think so.  
 3755. Would it be fair that the inspector should act as prosecutor and judge too? He would not act as prosecutor and judge.  
 3756. Would he not be practically doing so if he nominated the Board and arraigned the Company before the Board? I would leave it in the hands of the Minister to constitute the Board.  
 3757. But do you not see that that would be practically leaving it in the inspector's hands, because naturally a Minister would ask his experts to suggest names for the Board? As to how the Board should be chosen and by whom it should be chosen, that would be a matter of detail as to which I am not in a position to dictate; but I am of opinion that the matter is one that should be dealt with by mining experts.

Mr.  
J. Welford  
26 April, 1894.

3758. *Mr. Edden.*] I suppose you have not considered the question as to who should nominate the Board? No.
3759. You think it would be wise for the Government to have power to nominate the Board, so long as it was composed of mining experts? Just so.
3760. Do you think that a man who takes charge of a mine as manager should hold a certificate of competency? Yes.
3761. And do you think a man in your own position should also hold a certificate of competency? Yes.
3762. By passing examinations? Yes; or a certificate of service.
3763. Would you give certificates of service? Decidedly, I would.
3764. And after you had given a certificate of service, would you propose that the holder of that certificate should after the lapse of a certain time be prepared to pass an examination? I could not see my way clear to propose that. If they were men of many years' experience I think they would be justified in holding a certificate.
3765. Do you use any automatic appliances at your colliery? No; we do not.
3766. I suppose you have seen them in use? Yes.
3767. What is your opinion with regard to them? I believe that they ought to be employed in all cases where men are hoisted in shafts.
3768. Did you ever know them to prevent accidents? Yes.
3769. Have you known any accidents that might have been averted if they had been used? Yes.
3770. They are not very expensive, are they? No.
3771. Nor do they impede the working of a mine? Not at all.
3772. And you think they ought to be used where men have to ascend? Yes.
3773. How do they pay the miners at the Hetton Colliery? By the ton.
3774. How do they ascertain the tonnage that the miner gets? By the weigh-screen.
3775. Do they weigh every skip of coal? No; they are weighed as called for by the weighman and check-weighman.
3776. The men have orders as to the height to which they can fill the skips; they cannot fill them as high as they like? No.
3777. How high above the side do you allow them to fill the skip? So as not to impede the working.
3778. About how high is that? From 8 to 10 inches above the side of the skip.
3779. Do you ever have any accidents owing to their being filled above that height? Yes.
3780. Many? Occasionally.
3781. Of what nature are the accidents chiefly? They consist of putting the set off the road.
3782. What do they catch against? Coal falling from the skip.
3783. But that I suppose is quite a natural thing that would occur under any circumstances? It would not occur if the skips were not filled so high.
3784. Is there any bar or catch? No.
3785. How high could they fill the skip? Two feet above the side.
3786. But they would never do that? No.
3787. I suppose, as a rule, they do not exceed the width to which they are restricted? Occasionally.
3788. How many sets are thrown off the road in consequence in the course of a week? Sometimes two or three in a day. At other times the skips may run a day or two without anything of the sort occurring.
3789. And it arises from the coal dropping off? Yes.
3790. How do you know that these skips from which the coal drops are filled above the stipulated height? We have to keep a man to clean the road especially for that purpose.
3791. I suppose that is done at all collieries? I could not say.
3792. You would naturally think it would be done? Yes.
3793. You believe that a man ought to fill the skip to the height at which he is ordered to fill it and no more—10 inches or a foot, as the case may be? Yes.
3794. And if the skips are filled to the height of 10 inches or a foot above the side you do not consider there will be any danger or impediment to the working of the mine? No.
3795. Roughly speaking, how many skips per day do you turn out of your pit? About 1,200 skips of round coal, wound.
3796. How many of that number would be weighed? About eighty.
3797. Is there any standard weight? Yes; a skip is not to exceed 12 cwt.
3798. It is possible for the men to ascertain when they have 12 cwt.? Oh, yes.
3799. How? By the weighbridge.
3800. But the men down the pit? Not at all.
3801. Is it impossible for them to tell within  $\frac{1}{2}$  cwt.? Yes.
3802. If I sent ten skips out of your colliery in a day, and of these one weighed 13 cwt. and another 11 cwt., I suppose the ten skips would be averaged according to the weight of those two? They would average 12 cwt. and 10 cwt.
3803. Then I should lose  $\frac{1}{2}$  cwt. on each skip? Yes.
3804. Is that fair? Yes.
3805. How do you make that out? That is the order.
3806. Is it fair to give an impossible order; you admitted just now that it was impossible for the men to tell within  $\frac{1}{2}$  cwt. the quantity of coal they put into a skip;—is it fair, then, to give an impossible order and tell the men they must only put 12 cwt. in a skip, when there are no possible means of their knowing when they have got 12 cwt.? It is not an impossible order, because, if a man fills his skip within 8 inches of the side, it is impossible to put 12 cwt. round coal in it.
3807. What is the inside measurement of the skip? It is 2 feet deep, 36 inches wide, and 40 inches long.
3808. And do you mean to tell me that a skip being of those dimensions, a man filling it with coal to a height of 8 inches above the side could not put 12 cwt. in it? Yes.
3809. If a man fills a skip more than 8 inches above the side, is it possible for it to get up the pit? Yes.
3810. Would you believe that I have seen 16 cwt., 17 cwt., and 18 cwt. go up in skips of nothing near the dimensions you have given? Yes; I believe what you say.
3811. The skips being filled to about a foot or 15 inches above the side? They must have been packed, and not filled with the shovel.

Mr.  
J. Welford.  
26 April, 1894.

3812. I suppose that at your colliery under this system you do not have much over-weight—the men do not lose much by it? For the last three months they have not averaged  $10\frac{1}{2}$  cwt.
3813. You have never had much bother with them? No.
3814. You once had a law case? Yes.
3815. To your knowledge have the men ever complained to anybody in order to get this standard-weight system abolished? I have heard it talked over, but not upon any authority.
3816. You have a thorough knowledge of the standard-weight system? Yes.
3817. Do you believe it is a just system? No; I do not.
3818. You think it ought to be abolished? Yes; I believe the standard weight ought to be abolished, but at the same time I believe the authorities ought to have the right to establish a standard height.
3819. *Chairman.*] In answer to Mr. Edden, you said just now that with 35,000 cubic feet of air per minute going into one of the splits your anemometer registered at 45 yards in the presence of Inspector Humble? Yes.
3820. How many splits have you in your mine? Five.
3821. According to the annual report of the Department of Mines you have 53,000 cubic feet of air per minute passing into your mine; at one time you had 70,000 cubic feet, and there are 400 men employed; dividing that 70,000 by five, that will give 14,000 cubic feet of air;—sending that 14,000 cubic feet of air into a split, how far up a bord will it travel, if, with a pressure of 35,000 cubic feet, you could only register at 45 yards? That would depend upon the opening.
3822. But you will admit that neither the velocity nor the pressure would be as great with 14,000 feet as it would be with 35,000 feet? That depends on the size of the air-way.
3823. That being so, you would not say that 14,000 feet would go round to the seventieth man—would go 30 yards up his bord? No; I would not. It would go up; there would be some, but not sufficient to register on the instrument.
3824. In rise workings would you be in favour of reducing the distance of a cut-through from the current of air below the present distance? Yes.
3825. How far? To 25 yards.
3826. You say you have been using brattice in your mine? Yes; occasionally, not excessively.
3827. If, as proposed in the new Bill, managers were compelled to brattice up to within 15 yards of the face, would that involve any material cost? Taking a 9-foot place the cost would run into something like from 2d. to  $2\frac{1}{2}$ d. per lineal yard.
3828. *Mr. Edden.*] Where is there a 9-foot place? At Hetton.
3829. You do not work it all at once, do you? Yes.
3830. Any dirt in it? No; only penny bands.
3831. *Chairman.*] If your seam was 5 or 6 feet, would that not reduce the cost by one-half? Not quite. The cost in that case would be about  $1\frac{1}{2}$ d. per ton.
3832. Then the only objection you have is that in your seam, on the rise, it would be expensive to brattice in order to convey the air up to the men at the face? At a distance of 35 yards, with a level seam, not lower than 5 feet, I do not see the necessity for it, except where you would have gas to contend with, when naturally it would have to be done.
3833. I suppose you know that in twenty-four hours one man gives off 40,000 cubic inches of carbonic acid gas? Yes.
3834. And that a horse gives off three times that quantity? Yes.
3835. Two men working in a bord for eight hours would each give off 13,000 cubic inches of carbonic acid gas, making altogether about 27,000 cubic inches;—under these circumstances do you not think that the air should be brought nearer to the face than 25 yards;—scientists having proved, according to the authorities quoted just now by Mr. Edden, that a minimum of 100 or 150 cubic feet of air is requisite for each man;—do you not think there should be some means of taking the air nearer to the face of the mine? But there is a natural current all this time. There is a natural current in the bord all the time the man is working which takes off the carbonic acid gas.
3836. But it is being produced again as quickly as it is being taken off, owing to the heat arising from the body and from the friction that takes place? A man has an area within which to work, 18 feet wide and 9 feet high.
3837. Your practical knowledge of mining will tell you at once that air will take the nearest course? Yes.
3838. If there is a level heading, and if there is a return, as necessarily and naturally there must be, will not the air make for that return sooner than anywhere else? Yes.
3839. Do you not think, then, that there should be some artificial means of propelling the air into the face? Yes, if necessary.
3840. What would you call necessary? If there were any noxious gases to be dealt with that could not be removed by the natural course of ventilation.
3841. But you know that noxious gases do not mean altogether inflammable gases? No.
3842. You know that the presence of from 8 to 10 per cent. of carbonic acid gas is sufficient to put your light out, and prove fatal to life? Yes.
3843. Do you not think your men would work better, your horses would be more valuable to you, and last longer, and your timber would be kept in a better state of preservation, if there was some method of giving the men a greater amount of air;—you know from your wide knowledge of mining that when a mine is heated a kind of sweating process goes on? Yes.
3844. When anything gets damp it becomes softer, and such a state of things is detrimental to the interests of the owner, as well as to the lives of the men? Yes.
3845. Do you think that the stipulation in the proposed legislation of 15 yards from the face will be beneficial to the employer taking all things into consideration? No; I do not.
3846. It would not be a hardship upon him? Well, it would be costly.
3847. Only the cost? The cost would be very great.
3848. In a 9 or 10 foot seam you think it would cost  $2\frac{1}{2}$ d.? Fully that.
3849. In a smaller seam it would cost a good deal less? Yes; the cost would be in proportion.
3850. Have you made yourself acquainted with the English Act of 1887? A little.
3851. As an underground colliery manager, would you be willing to accept that Act to be passed into law for the working of collieries in this country? Yes; generally speaking.

- Mr. J. Welford.  
26 April, 1894.
3852. Being acquainted with the provisions of the English Act, you say, generally speaking, you would have no objection to its becoming law in this Colony? No.
3853. Is there any suggestion you would like to offer to the Committee? Not at present.
3854. *Mr. Edden.*] You said you worked your bord 6 yards? Yes.
3855. And what did you say would be the cost of the bratticing? Counting a lineal yard, about from 2½d. to 2⅓d. per ton.
3856. I suppose you have gone into figures with regard to that? A little.
3857. And your calculations are based, I suppose, on the bratticing being taken within a yard or two of the face? The given face of the place that is being driven.
3858. How far off the face did you calculate the brattice would go? I said just now the lineal yard taken out—equal to a lineal yard of brattice.
3859. How many lineal yards of coal would there be in your bords? One yard.
3860. What would be the yield of a lineal yard of coal in your bords? From 11½ to 12 tons.
3861. There is a lot of waste, then? Yes; it is very soft. We have a lot of slack to deal with and a lot of brass.
3862. And you do not believe that the distance of a cut-through should be reduced below 35 yards? No.
3863. You do not believe in bratticing? Where it is necessary in rise places.
3864. There is a tremendous lot of waste in your colliery, surely? Yes.
3865. Is there anything else you desire to state? No.

Mr. William Thomas called in, sworn, and examined:—

- Mr. W. Thomas.  
26 April, 1894.
3866. *Chairman.*] What are you? A miner.
3867. How many years of experience have you had? About fourteen years.
3868. Where are you working now? At the A.A. Co.'s colliery.
3869. How long have you worked in the Northern District? All the mining that I have done I have done in the Northern District.
3870. I suppose you are acquainted with the Miners Association there? Yes.
3871. Have you ever heard them ask for the eight hours? Yes; some years ago.
3872. Until recently there was an agreement between the owners and the employees, called the General Agreement? Yes.
3873. In that agreement there is a stipulation as to the eight hours? Yes.
3874. Have you heard of any loss being sustained by the company on account of that agreement? Not through the eight hours.
3875. I suppose you know that there was a suggestion that the eight hours should be legalised? Yes; eight hours from bank to bank.
3876. The agreement says eight hours; it does not mention from bank to bank? I understand the eight hours to mean from bank to bank.
3877. Was there ever anything said against it by the miners? Not that I am aware of.
3878. The miners were satisfied? Yes.
3879. But the miners acknowledge that some provision should be made for cases of emergency? Yes.
3880. Do you attend any institute or school of mines? I attend the classes under the Technical College at Newcastle for several subjects.
3881. I suppose you have received a certificate? Yes; first and second years' certificates in coal-mining and in other subjects.
3882. Having a practical knowledge of mining, you wanted to learn the theory of mining? Yes.
3883. I suppose you are well acquainted with the Act under which the collieries are regulated at present? Pretty fairly.
3884. Under the present Act there is a minimum quantity of air stated? Yes.
3885. Are you in favour of the minimum? I am not in favour of the minimum in the present Act.
3886. What would you substitute for it? I would have 150 feet substituted for 100 feet in non-fiery mines.
3887. What should be the minimum in mines now giving out gas? I should say 250 feet of air per man per minute, and eight times that quantity for a horse.
3888. Do you wish to make any statement? William Williamson says, in his Notes on Formulæ of Mining, that the quantity of air for non-gaseous mines should be from 150 to 200 feet per man per minute; in gaseous mines, from 250 to 500 feet per man per minute, and eight times that quantity for a horse. Mr. Merrivale, in Notes and Formulæ, says the quantity required depends upon the varying conditions of the mine. In the North of England the volume seems to vary from 100 feet to 500 feet per man per minute for every person employed, and from 30 to 160 feet per minute for every ton of coal per day, and that the velocity must not be more than 4 feet per second. Professor Blackhall says the quantity should be from 250 to 500 cubic feet per minute. J. T. Taylor says from 120 to 150 feet per minute. W. Fairley, in Ventilation Made Easy says the quantity should not be less than 100 feet per man per minute, and 500 feet for a horse. There is another thing to which I should like to refer: Sir Henry Roscoe, another eminent authority, in his Elementary Chemistry, says, that where there is .1 of .002 carbonic acid gas, or carbon dioxide, it is certainly unfit for human respiration for any continued length of time. Not only on account of the deleterious effects produced by the carbon dioxide, but also on account of the volatile putrescible matters which are given off from the skin and lungs of animals, and hence the necessity for ventilation in dwellings and other places.
3889. *Mr. Edden.*] I suppose you attach great value to the opinions of those men from whose works you have quoted? They are eminent mining authorities, whose word is looked upon with respect and reliance.
3890. Would you suggest any better power of ventilation than that at present in use? The benefits derived from splitting the air are innumerable.
3891. You believe in splitting the air? Yes; near the downcast shaft.
3892. You believe in a mine being worked in splits? Yes.
3893. What is your idea for that? In the first place, the air is divided into as many splits as possible, as near the downcast shaft as possible. It may be split until the friction of the splits is equal to the friction of the downcast shaft, and the limit depends upon the speed being lowered so that the velocity will dilute and render harmless the noxious gases that exude from the coal and the superincumbent strata.

Mr.  
W. Thomas.  
26 April, 1894.

3894. Do you look upon the working of a mine in splits as a scientific mode of operation? The working of a mine in splits is decidedly a scientific operation, and is viewed very highly by mining authorities.
3895. How far from the working face may a current of air pass and keep the atmosphere fit for men to work in where blasting operations are carried on? I should say that 15 yards is quite close enough to the face.
3896. I suppose you are acquainted to some extent with the Mines Regulation Bill that was before Parliament a short time ago? Yes.
3897. There is an amendment made in that Bill to the effect that the air should be carried up to within 15 yards of the working face;—do you look upon that as an arbitrary amendment? I do not know that it was arbitrary to any extent.
3898. Have you ever studied the matter of bratticing? Yes.
3899. If that plan were adopted do you think it would be of any benefit to the men? Undoubtedly.
3900. Would it materially increase the cost of the output of coal? No; it would not increase the cost of the output more than a penny a ton. I can give you a calculation, based upon conditions which I will assume. The conditions which I assume are that the seam is 6 feet thick; the bords to be worked 8 yards wide, and the pillars 8 yards wide; the cut-through 3 yards wide, and 35 yards apart. The cost of the brattice cloth will be 7d. per square yard, and the life of it (say) six months. Well, say that the bords should be driven 35 yards. For the first 15 yards no brattice is put in, and if the pit is used ten days a fortnight, those 15 yards will be driven in about ten weeks. For this ten weeks no brattice is needed, but for driving the next 20 yards the brattice is put in. I calculate that in this bord, driven 35 yards, there will be about 608 tons of coal, and against this we have to provide 80 yards of brattice cloth. That brattice will last six months, and it can be used three times for three bords similar to those already mentioned. Therefore, in using that brattice, you will get nearly 2,000 tons of coal, which will cost  $\frac{5}{8}$ d. That equals about  $\frac{3}{4}$  of a penny per ton for the material. We will say that another  $\frac{3}{4}$ d. will be the cost of labour, and the two together will be less than 1d. per ton. Of course, this is only for the conditions that I have assumed.
3901. You are quite satisfied with the calculation that you have made? I am.
3902. If this plan was adopted would it effect any improvement in the conditions under which the men work? It would.
3903. I suppose that under present conditions there are some places that are bad to work in? With regard to the conditions under which men work in the Northern District at present, I should like to say a few words with regard to ventilation. The men, as far as I have seen, generally work nearly naked; and this condition, I maintain, is due to the air being inadequate for men to work in as hard as they think fit, and to keep the temperature of the body low enough. That is why they strip off. The quantity of air, without going into a calculation, I should say, travelling round the mine, should be such as would prevent a man from taking his shirt off. The quantity and velocity of the air travelling should keep his body so cold that he would require to have his shirt on to keep him warm.
3904. Do you think it is possible for that to be done? It is done in gaseous mines where men are forbidden to take their shirts off, lest if the gas explodes they should be burnt.
3905. Under the present Act do you think that the Government inspectors have got sufficient power? I have not studied the power that they have very closely, but I am of opinion that their power is too limited, and ought to be increased very much.
3906. Do you think they ought to have the power to call the men out if they see that the mine is dangerous? I think they ought to have the power to stop part of the mine, or the whole of the mine, until competent authorities are satisfied that the place is safe, and until then I should say the inspector ought to have authority to prevent the men from going into the mine, except men to make the place safe.
3907. In working on the system of bord and pillar, do you think there ought to be any minimum size of pillars stipulated in the Act? The minimum size of the pillars should be stipulated, but the minimum and the maximum depend greatly upon the thickness of the superincumbent strata. A pillar that would be suitable (say) for 100 feet of strata would not be suitable for 100 fathoms.
3908. In whose hands would you place the power to say what the size of the pillars should be? The chief inspector ought to have the power to say that the pillars should be enlarged if he thinks that they are not large enough.
3909. You said it was a scientific plan to work a mine by means of splits;—do you think there should be any difference in the mode of working under tidal waters? Undoubtedly there should be. The conditions under tidal waters are quite different from what they are under ground which contains no water.
3910. Have you studied the matter much? Of course. I am of opinion that there should be rigid supervision over mines under tidal waters.
3911. I suppose that the mines are laid out under tidal waters in practically the same way as they are anywhere else? They do not work any differently under tidal waters to what they do elsewhere.
3912. Could you suggest any better system? We could adopt certain plans for working under tidal waters. I have a plan here which I drew out for working a mine under tidal waters. [See Appendix B.]
3913. Who drew out this plan? I drew it out, and I have brought it to be submitted to the Committee. I would suggest that the mines should be laid out on what is known as the panel system, shown on this plan. Districts 1, 2, 3, and 4 are in blocks about 500 yards square, having no connection with any other part of the mine except the main intake and the return. If an explosion or inundation of water took place in one district, its extension beyond that district would be impossible. The intake and the return into the districts can be dammed or stopped in case of fire, or in case of water flowing into the mine. Such an occurrence would affect only one district.
3914. *Chairman.*] You have laid a plan before us, and now we want an explanation of the system on which you could work under tidal waters? The pit is laid out in four districts, with pillars of coal between the districts, making them separate and distinct from each other.
3915. *Mr. Edden.*] How does the ventilation work there? As I have laid it out on this plan, one split of air will ventilate about fifteen places—that is, about thirty men. In this plan the pillars are not to be worked out. This plan conveys what I intended, that the given number of men in a split will not have any injurious effect upon the working of the mines. On this plan a sufficient area can be worked to get out a large quantity of coal—say 1,000 or 1,500 tons a day, with thirty men in a split, and about fifteen splits.
3916. Will you send in a written explanation of that plan to be added to the evidence as an appendix? I will.

Mr.  
W. Thomas.  
26 April, 1894.

3917. Has that plan ever been submitted to any other mining expert? It was drawn for a competition.
3918. Have you ever given the question of the use of automatic appliances to prevent over-winding any consideration? I have seen where it has been applied for years in several cases in the Northern District, and the appliances worked effectually where over-winding has taken place. When the cage has been drawn up the appliances held it fast.
3919. What is your opinion about the automatic appliances;—do you think they ought to be used? I think it is absolutely indispensable that over-winding appliances should be used.
3920. Did you ever hear of any bother in the Northern District about the standard weight? Yes. I do not believe in the standard weight.
3921. You believe in giving the manager the right to say how high a skip shall be filled above the side? The conditions of the mine will regulate that, and it ought to be stipulated.
3922. Beyond that you think the men ought to be paid for what they send up? The men ought to be paid for the quantity of coal that goes over the weigh-bridge.
3923. *Chairman.*] I suppose you have given considerable attention to the Act under which we are working? I have read it many times over.
3924. Have you given any attention to the Coal-mines Act of England of 1887? I have read it two or three times, and I think it is about the best Coal Mines Regulation Act of the nineteenth century.
3925. You think there is none to equal it? None to equal it; but it could be improved.
3926. In which points? In regard to the minimum quantity of air per man per minute. The restriction of the number of men in the splits; the regulations of workings under tidal waters; and the restriction to eight hours work per day—these are the chief points.
3927. What about the bratticing? Also bratticing up to (say) 15 yards of the face.
3928. You would be willing to accept the present English Act with these amendments? Yes; but there are undoubtedly some minor details which might well be struck out.
3929. *Mr. Cann.*] Would you give latitude for amending and redrafting special rules from time to time, as conditions may alter? No; I should limit that power very considerably. I consider that the successful working of collieries depends upon rigid discipline, and the Act, in my opinion, should restrict the rules.
3930. I suppose you do not think it would be competent to legislate to meet every case? There should be a limit. I should not make a hard-and-fast rule for everything.
3931. There should be a certain amount of discretion? Yes. That power should be in the hands of the chief inspector, or the body of inspectors.
3932. Then, any supplementary regulations necessary, you would leave to the Mining Inspector? Yes.
3933. *Chairman.*] The English Coal-mines Regulation Act of 1887, provides for the appointment of check-weighmen. You are acquainted with the present Act in this Colony? Yes.
3934. I suppose you are aware of the system of appointing a check-weighman? Yes; he must be one of the men engaged as a hewer in the mine.
3935. Do you think that that is a desirable state of things? Not exactly. I should give power to the men to elect whom they think fit to be check-weigher.
3936. You think that as the men pay the check-weigher they should have as wide a choice as possible? They should choose whom they think fit—not to be tied to any particular persons.
3937. In the Coal-mines Regulation Bill of 1887, provision is made for giving second-class certificates of service to underground managers; what is your opinion of that? My opinion is as to certificates of service, that the underground manager should qualify himself, or should satisfy a board of examiners, before he is granted any certificate whatever.
3938. And you would make the same thing apply to colliery managers? I would make it apply in all instances. The man who can satisfy a board of examiners is the man who is really deserving of his certificate, in my opinion.
3939. *Mr. Cann.*] Would you make that a hard-and-fast rule? Yes; without the slightest deviation whatever.
3940. It should be a written examination? It should be a written and oral examination.
3941. *Chairman.*] I suppose you know that the engine-winders have a large number of men's lives in their hands, and that any negligence or ignorance on their part might cause loss of life and the destruction of property? Yes.
3942. Do you think that the engine-winders should have certificates of competency? Yes. In Victoria the men employed as engine-winders have to be holders of engine drivers' certificates. All men in charge of winding or any other machinery connected with mines should be required to pass an examination to satisfy a board of examiners of their theoretical knowledge of steam and applied mechanics, and of their practical experience in connection with machinery before they should be allowed to have charge of any machinery.
3943. Would you not grant a certificate of service to those men? I do not know that they are entitled to it any more than any one else.
3944. I ask whether you would or not? No; they should satisfy a board of examiners of their efficiency.
3945. In the event of a law passing putting your views in force, what would you do with the men at present employed as winding engineers? I should give them six or twelve months to prepare themselves for examination, and if they could not pass the examination other men who could should be substituted.
3946. You would only give them twelve months at the outside? Yes; twelve months at the outside.
3947. In the case of a manager what would you do? I would give him twelve months grace to pass the required examination.
3948. How long have you been attending the mining classes? Between three and four years.
3949. Do you think that the first year you could have passed and taken a manager's certificate? I do not.
3950. Do you think that you could have done it at the end of the second year? Yes.
3951. Then you think that if a Bill was passed to-day, requiring managers to obtain certificates of competency, you could pass the examination? Well, I would do my best. These men that you say have held the position of colliery managers ought already to be possessed of such knowledge that it would not take them more than twelve months to prepare for the examination.
3952. *Mr. Edden.*] I think that the mines of the north are getting more difficult to work than they used to be? Yes.
3953. They are beginning to let gas off? Yes.

3954. Then your conclusions are based on the different conditions of working, which will make it necessary to have better men as managers than we have had? I would not say better than we have had, but it will require men of theoretical and practical knowledge.

3955. Is it possible for these men to have a thorough knowledge of mining, and yet, not to be able to work out some of the formulæ that are submitted at an examination? He could be what they would call a practical man of the past decade, but not a mining engineer of the present decade. He might be very practical and nothing else, but he would not be looked upon as a mining engineer.

3956. You have been a miner for fourteen years? Yes.

3957. You have hewn coal? Yes; for half the time.

3958. Do you not think that under the examination system, a number of managers would be put off if you did not recognise them in some way—men who have given satisfaction to all concerned? They may have given satisfaction to their employers.

3959. And to the men? As long as they give satisfaction to their employers the men have not a say in it.

3960. Have you ever read the English Act of 1872? I have not.

3961. I suppose you will take the mining authorities of England as being before any others in the world? Not absolutely. I should not say English authorities, I should say European authorities. We must recognise French engineers and other Continental engineers.

3962. How long would you allow a man before he returns to a missed shot? Twelve or fourteen hours at least.

3963. That is if it is lit by an ordinary fuse? Yes.

3964. *Mr. Cann.*] You say you would allow twelve hours for a missed shot? Yes. I have known missed shots to go off seven hours after they have missed.

3965. Could you mention a case of that kind? I knew of a case that occurred ten or twelve years ago.

3966. Would you bore the hole out where you had a missed shot? No; I should bore a hole alongside of it.

3967. But if it was dynamite you would not bore too near it? If the two holes were 6 inches apart there would be no danger of an explosion.

3968. If it was loose ground, I suppose there would be some danger from concussion? Not if the hole was any depth.

3969. You would not attempt to prick the hole out? No.

Mr.  
W. Thomas.  
26 April, 1894.

## WORKING OF COLLIERIES.

## APPENDIX.

## A.

[To Evidence of Harrie Wood, Esq., Under Secretary for Mines 19 April, 1894.]

Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 15 December, 1893.

We have the honor to report inspection of the above colliery on Wednesday and Thursday, the 13th and 14th instant.

On the first day the mine was at work, and we commenced our inspection by visiting the forty-two men, four boys, and four horses at work in the Gardiner's heading district.

The quantity of air was 6,480 cubic feet per minute, which gave an average of 129 cubic feet each.

We noticed that a few bords in the south-west corner of this district, some of which are now being driven westward towards the Hunter River, have crossed a north and south fault with an upthrow of from 6 to 9 feet, going west.

The inclination of the seam adjacent to this fault is very irregular, and the roof is very soft, and in two of the bords recently abandoned very wet. All these places are well timbered with strong and substantial props and slabs.

We next visited the three brick and cement dams, which we found in apparently good condition. The feeder of water coming through the pipe in each dam is about the same as when the dams were built in February last, totalling upwards of 150 gallons per minute.

Leaving there we travelled through the remainder of this district. The bords and headings driven herein since work was resumed in March last have from 18 inches to 2 feet of the upper part of the seam left as a roof, and in spite of this a fall of sand roof (containing water) took place where one of the bords exposed one of the two dykes passed through by the main headings. This fall is now barricaded with props and slabs.

Proceeding along the main headings we found that more workings had been opened out beyond, and on the in-by side of the dykes. All are now abandoned, and thickly studded with timber.

The immediate roof here is the 18 inches or 2 feet of coal previously referred to, and it is extremely soft and wet.

The whole of the seam here has a very dirty and inferior appearance, and looks like as if nearing the outcrop.

4. On the following day we continued our inspection from this point right along the face of the eastern workings, known as Kelly's heading district. About a dozen bords nearest to the main headings and Gardiner's heading district are now abandoned, and, like the other abandoned places, very thickly timbered.

The inclination is very irregular, the roof wet, soft, and traversed by faults and dykes.

5. With regard to the workings in the company's M.P. 130, under the ocean, the method of working is the same as in other parts of the mine, viz., 6-yard bords and 6-yard pillars, which, as regards pillars, is in contravention to the conditions of the permit, which are as follows:—"The minimum width of pillars to be 8 yards," and left unwrought.

The permit also provides that "In one road of every pair of winning off or leading headings a bore shall be kept going 10 feet in advance, &c."

Of the two pairs of winning places driven under the ocean one pair had a borehole, but the other pair, which were stopped at a dyke, and very wet, had none.

The permit also provides that "the strata overlying the coal-seam shall be bored through, and proved a minimum thickness of 30 feet at the face of the leading headings or levels so soon as they have been driven 100 yards in advance of the working bords," but no hole of the kind has been put in to prove the thickness of the overlying strata.

The whole length of main engine plane and cross-cuts were in good condition, and there was a plentiful supply of timber on hand ready for use.

6. In conclusion, we beg to state that after most careful inspection and due consideration of all the conditions in connection with the underground workings of this colliery we find nothing that would justify us in altering the opinion expressed by us and recorded in the book at the company's office on the 18th February last, and before leaving the office on the 14th instant we recorded the following report in a book kept for that purpose:—

"Stockton Colliery, 14 December, 1893.

"Our inspection of the above colliery yesterday and to-day has revealed nothing that would justify us in altering the opinion expressed by us, and recorded in this book, on the 18th February, 1893.

"JOHN DIXON,  
"WM. HUMBLE,

"Inspectors of Collieries."

We have, &c.,  
JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

Stockton Colliery Inspection.

Sir,

Coal-fields Office, Newcastle, 9 January, 1893.

I have the honor to report inspection of the above colliery on the 5th and 6th instant.

The quantity of air in each split was as follows:—

No. 1 *Split* (Gardiner's heading district).—Fifty men, three boys, and three horses employed, and supplied with 6,200 cubic feet per minute, being an average of 110 cubic feet each.

No. 2 *Split* (Kelly's heading district).—Fifty-four men, four boys, and four horses employed, and supplied with 6,460 cubic feet per minute, being an average of 104 cubic feet each. This current of air was not sustained for more than about half the distance of the split, the latter half of the men being without any perceptible current. In consequence of this, I have served the manager with notice to have a remedy effected without delay. [Copy of notice annexed.]

No. 3 *Split*.—Sixty-four men, three boys, and three horses employed, and supplied with 7,140 cubic feet per minute, being an average of 102 cubic feet each.

No. 4 *Split*.—Twenty men, two boys, and two horses employed, and supplied with 3,600 cubic feet per minute, being an average of 150 cubic feet each.

3. On the first day of inspection I travelled the branch engine-plane leading up to the No. 45 top-drive district that collapsed some few months ago. I found it quite quiet, and in much the same condition as when I saw it last.

4. The district known as Gardiner's heading (No. 1 *Split*) is very wet, the roof of almost all the bords and headings "shedding" water freely. In several of the old bords a thickness of about 12 feet of roof-stone has fallen. Water is dropping heavily from the top of each cavity thus produced, but not more so than was the case when the falls took place almost a year ago.

5. On both days of inspection I noticed in the districts now at work several recently-formed pillars that were only 4 yards in width instead of at least 6 yards, and that several bords were from 6½ to 7 yards wide. This mode of working where the overlying strata is upwards of 300 feet thick does not, in my opinion, leave sufficient coal in the pillars to permanently secure the roof, and if such mode is continued it may create another crush that might be speedily followed with disastrous consequences to all persons employed in the mine. I have, therefore, forwarded a letter to the manager, drawing his attention to the matter, and urging him to take steps without delay to prevent a recurrence of the same.

6. I also forwarded notifications to him concerning the insufficient number of refuge-holes, and the dirty condition of those now in existence by the sides of the new cross-cut engine-plane, and the absence of fencing to the fly-wheel of the Priestman's oil-engine that is now pumping water from the No. 42 district, and copies of such are herewith annexed.

7. On the second day I travelled the abandoned workings of the No. 3 district near to the shaft. I found everything in fair order and condition.

8. Water to depth of about 12 inches is still on the engine-plane, about 450 yards from the shaft. A new pump is now being placed at the bottom of the upcast shaft, which is expected to be ready for work in a short time and to deal effectually with this and other waters that have been troublesome for a long time.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

John McKenzie, Esq., Examiner of Coal-fields, Sydney.

Sir,

On my inspection of the Stockton Colliery to-day I found that a portion of the engine-plane (which is also a travelling road) situated between the junction formed by the straight up and the new cross-cut main roads, and the No. 42 flat was not provided "with sufficient places of refuge at the sides of such planes at intervals of not more than 20 yards, and such places of refuge shall be at all times kept clear," in accordance with the provisions contained in section 12, subsection 2, of the Coal-mines Regulation Act, 1876.

2. In addition to the above, several places of refuge that are in existence were not "kept clear," but were partly blocked up with loose timber, stone, rubbish, &c.

3. This, you will observe, is a contravention of the above-quoted sections of the Act, to which I now draw your attention, and request you to effect a remedy without delay.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

On my inspection of the Stockton Colliery to-day, I found that the fly-wheel of the "Priestman's oil-engine," which is pumping water from the No. 42 district, was not fenced in accordance with the provisions of section 12, subsection 17, of the Coal-mines Regulation Act, 1876.

2. This, you will observe, is a contravention of the above-quoted sections of the Act, to which I now draw your attention, and request you to effect a remedy without delay.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

On my inspection of the Stockton Colliery yesterday, I found that the district known as Kelly's heading was not adequately ventilated.

2. The intake current of air measured 6,460 cubic feet per minute, for fifty-four men four boys, and four horses, but this current of air did not "sweep undiminished along the air-way past each working-place," as provided for by section 12, subsection 3, of the Coal-mines Regulation Act of 1876.

3. The current of air was fairly well sustained until about the middle of the district was reached, but from this point to the last working-place, adjacent to the return, there was no observable velocity of air-current, certainly not one that could be measured by the anemometer.

4. This, you will observe, is not in accordance with the provisions of the above-quoted sections of the Act, to which I hereby draw your attention, and request you to effect a remedy without delay.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Sir,

On my inspection of the Stockton Colliery, on the 5th and 6th instant, I found that in each of the working districts there were several recently formed pillars only 4 yards, instead of, at least, 6 yards in width, whilst many of the bords were from 6½ to 7 yards wide.

2. This irregular method of working (which leaves considerably less than 50 per cent. of coal as pillars) does not, in my opinion, provide sufficient and secure support for the roof, for you must bear in mind that during the last four years three distinct and separate parts of this same mine have collapsed from the same cause.

3. Taking into account the fact that in the districts now at work the overlying strata is upwards of 300 feet in thickness, some of which is known to be sand and other alluvial deposits saturated with the tidal waters of the ocean and the Hunter River, I consider that a continuance of this practice tends greatly to create another crush that might be followed by disastrous consequences to all persons employed in the mine.

4. Having thus drawn your attention to this very grave matter, I trust you will take immediate steps to prevent a recurrence of the same.

I have, &c.,  
WILLIAM HUMBLE,  
Inspector of Collieries.

D. McAuliffe, Esq., Manager, Stockton Colliery, Stockton.

Mr. Inspector Humble will please make another inspection of this colliery to see whether the matters complained of have been remedied.—J.D., 13/1/93. Mr. Inspector Humble, B.C.

On further inspecting this colliery to-day, I found that the matters complained of in paragraphs 2 and 6, viz.: Inadequate ventilation, an insufficient number of refuge holes on the engine-plane, and the absence of fencing to the fly-wheel of the "oil engine" had been remedied. With regard to the first, several additional stoppings and doors have been fixed, which carry the current of air along the innermost cut-through past each working-place. The volume of air passing the last pair of men on this split to-day was equal to the volume entering, and on the middle of the split. 2nd. Places of refuge are now to be found at less than 20 yards apart, several new ones having been made since the notice was served. All are now clear and in good order. 3rd. The fly-wheel of the "oil engine" is now fenced with wood framing.—W.H., 16/1/93. Mr. Inspector Dixon.

The Examiner of Coal-fields.—J.D., 17/1/93. Mr. Inspector Dixon (for Mr. Humble) to state on his next inspection whether the matter complained of in paragraph 5 has been attended to by the Manager.—J.M., B.C., 18/1/93. Mr. Inspector Humble.—J.D., 19/1/93. I have not found any more pillars or bords similar to those complained of in paragraph 5 of this report.—W.H., 20/2/93. Mr. Inspector Dixon. The Examiner of Coal-fields.—J.D., 21/2/93.

Stockton

## Stockton Colliery Inspection.

## Report on outburst of Water and Gas from the Roof of the Bottom Seam.

Sir,

Coal-fields Office, Newcastle, 21 February, 1893.

In consequence of receiving the following telegram—"Come over to Stockton Mine at once. Mr. Dixon is here.—D. McAuliffe, Stockton"—on Friday evening, the 17th instant, I at once went to Stockton Colliery office, and there met Mr. Inspector Dixon, who had also been called there by a similar telegram a couple of hours previous to my arrival.

2. Mr. D. McAuliffe, the manager, then informed me that between 6 and 8 o'clock that morning a large feeder of water was observed coming on to the main flat of Gardiner's heading district from some part of the same district.

Search being made, it was soon found that this water and a considerable quantity of sand and clay were coming off at a fall of roof in one of the abandoned bords.

The flow continuing, without any perceptible diminution, the manager, about 2 o'clock in the afternoon, withdrew all workmen from the mine, except a few needed for "inquiry into the cause of danger and the removal thereof."

3. Shortly after this was done, James Leitch, the overman, approached the fall with his naked light, and was burnt on the face and arms by explosive gas. He is not, I understand, seriously burnt, and will, I hope, be alright again in a short time.

4. About 6 o'clock in the evening Mr. Inspector Dixon and myself, accompanied by Messrs. McAuliffe and McDonald, the manager and night-shift overman, descended the shaft with locked safety-lamps, and inspected the district. We found no gas of any kind, but a large volume of water (difficult to measure, or even estimate, but certainly not less than 150 gallons per minute) was still issuing from the top of the fall, bringing with it large quantities of sand and clay, that were rapidly silting up the adjacent bords and cut-throughs.

5. The explosive gas that burnt Leitch probably came off from the same orifice as the water, and immediately after the latter had made its first outburst.

It may have had its origin in the black-shale bed overlying the seam, where it was probably stored under great pressure, which would be instantly reduced when the water commenced to flow, thus allowing the gas by its expansion to exude and enter the workings; or, what is still more probable, the gas may have been held in solution by the water whilst under great pressure, and given off when such pressure was reduced.

6. On the following morning (Saturday) we again visited the colliery, and before descending the shaft entered the following report in a book kept in the office for that purpose:—

"Stockton Colliery, 18 February, 1893.

"We hereby certify that last night, the 17th of February, we carefully inspected with locked safety-lamps a portion of the Gardiner's heading district of the Stockton Colliery.

"2. We found no explosive gas, but a large volume, together with sand and clay, was coming off at a fall of roof in one of the abandoned bords in that district.

"3. The manager (Mr. D. McAuliffe) informed us that a few hours after the issue of water was first observed yesterday, he withdrew all workmen from the mine, except a few for the purpose of exploration, one of whom, James Leitch, the overman, was burnt by explosive gas when in the immediate vicinity of the fall.

"4. We are, therefore, of opinion that, in accordance with the provisions of section 12 (subsection 5) of the Coal Mines Regulation Act, 1876, no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine, or such part thereof, until the same is stated by the Examiner or Inspector to be safe."

7. Accompanied by Mr. McAuliffe we then descended the shaft, and made another inspection of the district with locked safety-lamps. We found nine or ten men at work with safety-lamps, putting in dams, composed of slabs and sand-bags, on each side of the fall, with a view of preventing the flow of detritus, which, it was hoped by the manager, would ultimately choke the orifice, and probably stop the flow of water. Five or six more men were employed in the adjacent bords putting in extra timber to secure the roof.

We found no gas, or sign of any, and very little change in the quantity of water flowing; if anything, there was a decrease, but nothing to speak of.

The sand-bags had stopped, to some extent, the flow of sediment, but a deal was still being brought away with the water.

It is the intention of the manager to continue putting in those dams, one in front of the other, until the flow of sediment is stopped, and then build brick dams in front of all.

8. The roof of almost all the workings in this district is very wet and soft. Several falls of black shale roof, from 8 to 12 feet in thickness, are to be found in the abandoned bords. From the top of these falls water, highly charged with oxide or iron, is dropping heavily. Several of my previous reports refer to them, and the workings of this and other districts then at work formed the subject of a letter dated 7th of January, 1893, that I addressed to the manager drawing his attention to the fact that several of the recently formed pillars were only 4 yards in width, instead of at least 6, and many of the bords from 6½ to 7 yards wide.

My report on my last ordinary inspection with copies of this and three more letters sent to the manager, I herewith forward to you with the present report.

9. The point of issue of the water now flowing is situated about 86 chains north of the present downcast and up-cast shafts, and about 29 chains south-west of the sinking shaft now down about 130 feet.

The flow of water is undoubtedly coming from the thick alluvial deposits, consisting of water-bearing beds of sand and gravel, interstratified with beds of clay, which almost immediately overlie the coal-seam at this point.

10. The whole of this Gardiner's heading district is upwards of 100 feet above the level of the downcast shaft bottom, and the present feeders of water are, therefore, all flowing out-by to the lodgment some 400 or 500 yards from the shaft, where the large pump recently placed at the bottom of the upcast receives and forces it to the surface. The pumping-power appears to be capable of pumping the ordinary feeders and the extra water now coming off.

11. In conclusion, I beg to state that my opinion is that under the present condition of the mine it is not safe for work to be resumed.

John McKenzie, Esq., Examiner of Coal-fields, Sydney.

I have, &amp;c.,

WILLIAM HUMBLE,

Inspector of Collieries.

I accompanied Mr. Inspector Humble during those inspections, and fully agree with this report.—J.D. The Examiner of Coal-fields.

## Report on Stockton Colliery inrush of water on 17th February, 1893.

Sir,

Coal-fields Office, Department of Mines, Newcastle, 21 February, 1893.

I have the honor to inform you that I went to the Stockton Mine yesterday, and accompanied by Messrs. Dixon and Humble, Inspectors of Collieries, and Mr. McAuliffe, the company's colliery manager, proceeded to Gardiner's-heading district, where the inrush of water took place near the face of a 6-yard bord, on Friday last, the 17th instant, and found about twenty workmen engaged in an attempt to stop the flow of sand, pebbles, &c., which was being carried down by the current of water from the fall.

2. The means being adopted to stop it were barriers of strong slabs supported by upright timber from roof to floor, filled in behind with large bags of sand, which sand came from the fall.

3. The barriers have been erected in three different places as near the fall as it was possible to get, and were then about 15 yards in length back from the fall. The work was still being carried on by the erection of slabs and filling in behind with bags of sand with a view to giving additional strength to the first barriers.

4. We next examined several old bords adjacent to the last fall and saw four other falls [vide section of roof] 10 to

12 feet in height of soft shales, &c. The roof of these bords show signs of having been heavily watered, and some are now shedding water. The timber in some of them is giving way, and a large percentage of broken props is to be seen both on the road side and near the rib side, and consequently the roof is bending. Men are at work renewing the timber in the old bords in this district.

5. Messrs. Dixon and Humble are of opinion that the decrease in the flow of water is very slight, if any, since they saw it on the 18th instant (Saturday), viz., about 150 to 200 gallons per minute.

6. I and the Inspectors are of opinion from the shale conglomerate (10 inches in thickness) sand which we saw had been washed down into the bords and cut-through; that the water is probably coming from the large alluvial deposits on the Company's M.L. and the Hunter River adjacent thereto, which deposit (possibly thicker than what is usually supposed to overlie the Stockton coal seam) overlies the top of the 10-inch conglomerate resting on 10 to 12 feet of soft shale, &c., which is the roof of the coal seam worked.

7. In conclusion, I beg to state that I have seen Messrs. Dixon and Humble's report of 18th instant on the inrush of water, &c., which I fully agree with and forward you herewith. The men having been withdrawn by the manager, work cannot be lawfully resumed until I or an Inspector state that the mine is safe, which we cannot at present say.

I have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

The Under Secretary for Mines and Agriculture.

P.S.—Annexed tracing lettered "B" denotes the place where the fall occurred, viz., at the western boundary of mineral lease No. 38 (Crown lease), which is the Hunter River high-water mark.—J.M.

#### Stockton Colliery Inspection.

Report on the influx of Water, &c., and other matters in connection therewith.

Sir,

Wickham, Newcastle, 22 February, 1893.

I have the honor to report inspection of the above colliery yesterday and to-day.

2. Yesterday I visited the mine in the afternoon, and inspected the workings adjacent to the fall in Gardiner's heading district, from which the water is now flowing.

I found about twenty men employed putting in dams to stop or regulate the flow of water, and in putting extra timber into the adjacent bords and headings to secure the roof.

The quantity of water coming off was about the same as when I saw it on the day of the outburst, viz., about 150 gallons per minute, but the flow of sand and clay has been stopped by the sand-bag dams. I did not see the least sign of gas, but all the men employed at the dams were still working with safety-lamps.

3. To-day, in company with Mr. Dixon, I made further inspection, and found the amount of water about the same as yesterday.

About twenty-six men were engaged in connection with the timbering and dam-building, three of whom were bricklayers, who started this morning to build one of the three brick dams considered necessary by the management.

I found no sign of gas, but the men working at the dams adjacent thereto were still working with safety-lamps.

4. In the same district I found a large number of broken props in several old bords, situated about 4 chains northward of the fall from which the water is now flowing, and am of the opinion that, unless the roof is speedily secured, further falls will occur, which might liberate other large volumes of water.

I drew the attention of the manager and Mr. Scott, the company's surveyor, who had charge of the work this morning, to this grave matter, and they both stated that extra timber would be put in as soon as possible.

5. I was greatly surprised to find that, notwithstanding the withdrawal of the workmen by the manager of Friday last (17th instant), and the report entered by Mr. Inspector Dixon and myself in a book at the mine on the following day, wherein we stated that "in our opinion no workman shall, except in so far as is necessary for inquiry into the cause of danger, or for the removal thereof, or for exploration, be readmitted into the mine or such part thereof as was so found to be dangerous until the same is stated by the Examiner or Inspector to be safe," the manager had either ordered or permitted the readmission of five small-coal fillers and two wheelers into the mine, all of whom I found filling and wheeling small coal in this Gardiner's heading district to-day.

6. The manager stated that this small coal was necessary as fuel for the boilers on the surface which supply steam to the pumps and winding engine, and, therefore, in his opinion, it was part of the work necessary "for inquiry into the cause of danger and the removal thereof."

7. I am of the opinion that this small-coal filling is certainly not at present necessary work in this sense, because the Company has some hundreds of tons of small coal stored in their box on the surface in close proximity to the boilers that could have been used for steaming and furnace purposes.

8. Therefore, I think that the management has committed a breach of section 12 (subsection v) of the Coal-mines Regulation Act, 1876, by readmitting these five small-coal fillers and two wheelers into the mine that was found dangerous, and before it had been "stated by the Examiner or Inspector to be safe," but I should like to have your advice on the matter as soon as possible.

I have, &c.,

WILLIAM HUMBLE,  
Inspector of Collieries.

The Examiner of Coal-fields.

I accompanied Mr. Inspector Humble during the second day of inspection, and fully agree with this report.—J.D., 23/2/93. The Examiner of Coal-fields.

Stockton

## Stockton Colliery Inspection.

Report on the influx of water, &amp;c., in Gardiner's heading district.

Wickham, Newcastle, 25 February, 1893.

Sir,

I have the honor to report inspection of the above colliery on Thursday, Friday, and to-day the 23rd, 24th, and 25th instant.

2. On the first day, I found about thirty men employed, five of whom were bricklayers building two brick dams, the remainder being shiftmen and deputies at work putting extra timber into some adjacent old bords and building sand-bag dams near to the point of issue of the water.

3. The quantity of water flowing appeared to be slightly less than formerly. The two dams now in course of construction are provided with pipes which are built into them for the purpose of allowing the water and any gases present to issue therefrom.

It is proposed to affix taps to the water-pipes, so that the flow of water can be regulated or even stopped altogether if circumstances require it.

The dams are built with brick and cement, one in a 6-yard bord and the other in a 2-yard cut-through, the former being about 8 feet high and 10 feet thick, and the latter about 10 feet high and 4½ feet thick secured in front by a few feet of arching.

4. Safety-lamps are still being used by the men at the dams, but I found no sign of gas.

I found no small-coal fillers at work as I did on the previous day.

5. On the second day, in company with Mr. Inspector Dixon, I made further inspection.

Found water slightly diminished, and the dam building making very fair progress.

Found a gang of men stowing debris in and around several of the falls of roof in adjacent bords with the view of preventing such from further collapse.

Safety-lamps still in use, but found no sign of gas, neither did I find any small-coal fillers at work.

6. To-day, in company with Mr. Inspector Dixon, I made another inspection and found things pretty much the same as yesterday.

7. The number of men timbering the old bords has been augmented, as it has now been seen by the management that every old bord needs more or less new timber to secure the roof. The two brick dams were not quite finished this morning as some trouble had been experienced in making them tight next the roof, especially the dams in the cut-through where the closing point is about 10 feet high and very soft roof. Unless something unforeseen comes in the way both dams will be finished either to-night or to-morrow, and a start made with the third one.

8. Found no gas of any kind—safety-lamps still in use.

No small-coal fillers at work to-day. The last I saw of this kind of work being on Wednesday the 22nd instant.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

I have, &amp;c.,

WILLIAM HUMBLE,  
Inspector of Collieries.

I fully agree with this report.—J.D., 21/2/93. The Examiner of Coal-fields.

## Stockton (No. 3) Sinking Shaft Inspection.

Sir,

Coal-fields Office, Newcastle, 23 March, 1893.

I have the honor to report inspection of the above shaft on Tuesday, the 21st instant.

2. On my arrival at the shaft I found nine men employed in connection with the work, and the winding engine busy taking out the water.

3. Mr. George Bell, the chageman, informed me that up to the time of my visit they had sunk about 127 feet 4½ inches of cylindrical tubing, 10 feet in diameter, the strata passed through being 120 feet of sand, 3½ feet of clay, and 1½ feet of sand, the bottom of the tubing then being some feet into a dark blue stiff clay.

The cylinders are forced down by a top weight of from 900 to 1,000 tons composed of sand-bags and other heavy materials.

Since the cutting tool in the bottom of the cylinders entered this stratum of stiff clay two divers have been employed to cut away the clay around the bottom of the shaft, and thereby help the descent of the tubing. These two men work two hours at a time and whenever their services are required.

As the top length of cylinders is about 4 feet 5½ inches below the level of the surface the total depth sunk in this shaft is 131 feet 10 inches.

Some of the water is now being taken out of the shaft, and when it is thought that a water-tight connection is effected between the bottom of the cylinders and the bed of clay the shaft will be entirely unwatered and a borehole put down a short distance to prove the character of the deposits next to be sunk through.

4. The ropes, machinery, &c., appeared to be in good order and condition.

I have, &amp;c.,

WM. HUMBLE,  
Inspector of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

## Further Report on the condition of Stockton Colliery.

Sir,

Coal-fields Office, Newcastle, 2 March, 1893.

We have the honor to report that we, yesterday, made an inspection of that portion of the Stockton Colliery workings, of Gardiner's heading district, where a fall of roof occurred on the 17th ultimo and liberated a large quantity of water, sand, pebbles, clay, and shingle, and find that although water is still to some extent flowing from the fallen ground, the inrush of sand, &c., has been stopped by the close packing of bags of sand behind barricades of slabs and upright props, and the erection of brick dams, one of which is 13 feet in thickness, and the others 10 feet and 4 ft. 6 in. in thickness, respectively, the latter being strengthened by a few feet of arching.

These dams are built from floor to roof, and set in cement, and each is provided with a 6-inch iron pipe to allow the water to flow. Thus, in our opinion, the danger arising from this source has been removed.

But there are other circumstances in connection with this colliery, which, in our opinion, preclude us from stating that the mine is safe, which we beg to give as follows:—

1. Throughout the whole of the Gardiner's heading district, and the districts adjoining, comprising the innermost northern workings, water is freely shedding from the roof in nearly all the bords and headings, or cut-throughs.

This, to us, is an evidence that the rock cover, between the top of the coal seam and alluvial deposits, is thin, and not only thin but very much broken by the cleavage at right angles to the horizontal bedding, and by igneous dykes, which, in the main headings, have given, and are now giving off regular quantities of water.

This rock appears to us to be of a texture unable to resist any great pressure from the overlying alluvial deposits of sand, clay, gravel, &c., but would rather of itself add to the dead load over every excavation, whether bord or heading.

2. During our inspection yesterday of the old bords, in the workings above named, we noticed much of the timber, which had been set to support the roof, broken, and men were engaged renewing some of the broken timber in bords adjacent to the late fall.

In very many places the roof shows signs of weakness, and several falls of roof have already taken place, some of which have been secured.

Under such conditions further falls of roof in other bords and headings may at any time take place, which, in every instance, might be expected to liberate considerable quantities of water, &c., similar to the late fall.

3. Should any further fall of roof take place, and cause a large opening or cavity, the inrush of water might be so great as to almost at once find its way on to the main road; and seeing that at one portion of the main road, about 22 chains from the bottom of the shaft, there is a swell or depression of about 5 feet below the level of the shaft bottom, this portion of the road would in all probability be speedily blocked by the volume of water, and all egress to the shafts cut off.

4. In addition to the above, we may here point out that another source of danger arises from the fact that the bottoms of the main and upcast shafts are both about 100 feet below the level of the innermost working districts, and consequently the approaches to both shafts (as they are not far apart) could be flooded before the innermost workings would fill with water.

This, in our opinion, is a matter for serious consideration in the absence of an opening to the day or surface in the immediate vicinity of the present rise workings, whereby the persons employed in the mine could find a ready means of exit in case of a panic caused by a large flow of water into the mine.

5. We further beg to state that, according to provings by boring on the Stockton peninsular, there cannot be a doubt of the existence of thick alluvial deposits all over the present workings of the Stockton Colliery, and as in our opinion such deposits are to a great extent water-logged, we consider this to be a continual menace to the safe working of the colliery.

6. In conclusion, we have also to inform you that before leaving the colliery the manager (Mr. M'Auliffe) asked us whether the water-bailers could, on the following day, commence drawing the water out of the men's places, so that the men could commence getting coal. We replied that we could not write a report in the book at the colliery stating that the mine was safe. Also, that our report of that day's inspection would be made and forwarded to you next day.

We have, &c.,

JOHN MACKENZIE,  
Examiner of Coal-fields.

JOHN DIXON, and  
WILLIAM HUMBLE,  
Inspectors of Collieries.

The Under Secretary for Mines and Agriculture,  
Department of Mines, Sydney.

Stockton Colliery Inspection—Special Inspection to see if the Mine was at work.

Sir,

Coal-fields Office, Newcastle, 18 March, 1893.

We have the honor to report inspection of the districts known as Gardiner's and Kelly's headings yesterday. Arriving at the colliery about 11 a.m., we found the mine at work drawing coal. Accompanied by the manager, we descended the shaft about 11.30 a.m., and found that, notwithstanding the fact of no report having been entered in a book at the mine "by the Examiner or Inspector stating it to be safe," the bulk of the miners had been readmitted into the mine for the purpose of getting coal.

We counted forty-seven men and boys coming out from the workings to the shaft, and found thirty-eight miners and water-bailers at work in the Gardiner's and Kelly's heading districts, all such being engaged in their ordinary employment.

We noticed that since the miners commenced work a few days ago some of the working places situated in the north-east corner of Gardiner's heading district are now confined to the bottom coal between 5 and 6 feet thick, the top coal, of about 2 feet in thickness, being left unwrought to form a roof. This is, we understand, a precaution adopted by the management to avoid further falls of roof similar to the one that took place on the 17th ultimo, which released large volumes of water, sand, clay, pebbles, &c.

The volume of water now issuing through the pipes built into the brick dams is about the same as when last we saw it, and the dams are in good condition.

Since our last inspection, made on the 1st instant, a deal of additional timber has been put into the abandoned bords adjacent to the fall of roof from which the water is issuing, and several of the smaller falls of roof have apparently been secured by barricades of timber and sand-bags.

We have, &c.,

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Newcastle.

Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 8 February, 1894.

We have the honor to report inspection of the above colliery on Tuesday and Wednesday, the 6th and 7th instant. In the No. 22 going bord district we found eighteen men getting coal and eight deputies, shiftmen, stonemen, &c., employed on other work. These, together with two boys and two horses, making a total of thirty, were supplied with 3,360 cubic feet of air per minute. In Kelly's heading district we found thirty men getting coal, and two deputies in attendance. These, together with two boys and two horses, making a total of thirty-six, were supplied with 6,720 cubic feet of air per minute.

Each working-place was well supplied with timber, and the roadways were in fair condition.

In a cut-through off the No. 22 going bord, and about 10 chains beyond high-water mark of the ocean, there is a vertical borehole, which James Leitch, the overman, informed us was 33 feet in height, passing through, in ascending order, 17 feet of shale, 10 feet of coal, and 6 feet of coaly bands and shale. This 10 feet of coal is probably the upper of the two sections of coal usually wrought at this colliery.

About 25 yards further in the same bord another vertical hole was being bored. It was then (the first day of inspection) up 23 feet in shale, and boring still progressing.

The face of this same going bord was being driven in cinder and igneous rock. An advance borehole was in the face. 4. No place at present is being driven in the barrier adjacent to and on the west side of M.P. 130, and all the workings beyond, *i.e.*, advancing seaward, are laid out on 8-yard pillars and 6-yard bords.

5. In addition to the districts at work, we also inspected the old workings of Kelly's, Wilson's, and Gardiner's heading districts, and that portion of the latter district in which men were recently employed, but in which no work was being done on the day of inspection.

We found the old workings practically unchanged since our inspection in December last.

There appears to be about the same quantity of water flowing from the pipes through the three brick dams, and the quantity of water shedding from the roof in those districts is much the same as on prior inspections.

6. Since our previous inspection, a portion of the old workings in the No. 3 District, amounting to an area of about 7 acres, has fallen and caused a subsidence of the surface at the junction of Maitland-street and Fullerton Cove Road.

We travelled the outskirts of a considerable portion of this fallen ground, and did not hear anything indicative of further disturbance, neither did we see any sign of water coming from the fallen ground.

To-day we walked over the surface where the subsidence has taken place. The greatest depression appears to be at the junction of the two streets, many of the kerbstones being split and disjointed, and in several places the asphalt guttering was fractured. The retaining-walls, stone steps, and fences of several houses in both streets bore evidence of disarrangement, the two former being fractured, and the latter thrown from their original upright position.

7. Before leaving the colliery to-day, we entered the following report in a book at the Colliery.

"Stockton Colliery, 8 February, 1894.

"Our inspection of the above colliery on Tuesday and Wednesday the 6th and 7th instant, has revealed nothing that would justify us in altering the opinion expressed by us, and entered in this book on the 18th February, 1893, and referred to by us on the 14th December, 1893.

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries."

We have, &c.,

JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie, Esq., Examiner of Coal-fields, Sydney.

Stockton

## Stockton Colliery Inspection, Stockton.

Sir,

Coal-fields Office, Newcastle, 6 April, 1894.

We have the honor to report inspection of the above colliery on Monday and Wednesday, the 2nd and 4th instant.

The quantity of air in each split was as follows :—

No. 1 split.—Thirty-two men, three boys, and three horses employed, and supplied with 4,800 cubic feet per minute being an average of 126 cubic feet each.

No. 2 split.—Thirty-two men, two boys, and two horses employed, and supplied with 3,750 cubic feet per minute, being an average of 104 cubic feet each.

No. 3 split.—Forty men, three boys, and three horses employed, and supplied with 5,100 cubic feet per minute being an average of 110 cubic feet each.

The wheeling-roads and working-places were in fair condition, and a good supply of timber was on hand ready for use.

On the first day of inspection we travelled the working-places of the No. 2 and No. 3 splits known as Kelly's heading, and No. 22 going bord districts. About one-third of the working-places in these two districts have now crossed the high-water mark, and are being driven under the ocean in an eastward direction. The bords are 6 yards wide, and the pillars 8 yards wide. On our last inspection the No. 22 going bord was being driven in troubled and cindered ground of the lower seam.

Since then this work has been abandoned, and about 60 yards back from the face a sloping drive has been driven through about 21 feet of strata to open out the upper seam. Just as this seam was reached an igneous dyke was met with, and at the time of our inspection two headings were starting about parallel with the dyke, to prove the coal on each side of the drive. From the lower seam in these two districts the manager and overman informed us that nine vertical boreholes have been put up into the roof to heights from 30 to 44 feet. In seven of these the upper was found, but in almost every case it was more or less cindered and interfered with by igneous dykes. In the No. 43 going bord driven in the lower seam we found three men employed boring a vertical hole in the roof close to the face, which was then idle and standing at an igneous dyke. The men informed us that they had bored this hole up 30 feet through shale-rock, without, however, finding any upper seam.

The innermost 15 yards or so of this bord is very very wet, the water "raining" from the roof heavily, resembling very much a tropical shower on the surface.

The yield of water from this small area of roof is not less than 15 gallons per minute.

On the second day of inspection we visited the thirty-two men working in the south-east corner of Gardiner's heading district, and travelled the old workings of this, Kelly's, and Wilson's heading districts. The amount of water coming from the pipes inserted in the three dams is unchanged, and with the exception of several broken props in the abandoned bords of each district things are much the same as when we saw them in February last. But this exception, in our opinion, is an important one, as the roof of every bord and heading appears to be resting almost entirely on the timber, which is constantly exposed to the deteriorating influence of moisture, vitiated air corrosion, and great weight.

The probable rapid decay of this timber followed by large falls of the roof was an important element that influenced our opinion in February, 1893, because judging from the dimensions of the fall that took place at that time and admitted large volumes of sand and water we believe that all the abandoned portions of Gardiner's and Wilson's heading districts have not more than about 20 or 25 feet of soft porous shale between the roof of the seam and the overlying water-logged sand beds.

Messrs. Leitch and Scott, the overman and surveyor, accompanied us and saw this broken timber, who will no doubt take steps to renew the same.

Before leaving the colliery on the second day we entered the following report in the book kept at the colliery office.

"Stockton Colliery, 4 April, 1894.

"Our inspection of the above colliery on Monday and Wednesday the 2nd and 4th instant, has revealed nothing that would justify us in altering the opinion expressed by us and entered in this book on the 18th February 1893, and referred to by us on the 14th December 1893, and the 8th February 1894.

JOHN DIXON,  
WM. HUMBLE,  
Inspectors of Collieries."

Since our last inspection the large pump that was then being fixed at the shaft bottom has been started.

It has been supplied by Evans and Co., of Wolverhampton, and has two 28-inch steam cylinders, two 10-inch water rams and 4-foot stroke.

The suction and rising main columns of pipes are each 12 inches in diameter through which the water is brought from the lodgment in C heading district and forced to the surface. The manager expects that when it has got fairly to work it will deliver 45,000 gallons per hour or 750 gallons per minute.

We have, &c.,  
JOHN DIXON,  
WILLIAM HUMBLE,  
Inspectors of Collieries.

John Mackenzie Esq., Examiner of Coal-fields, Sydney.

[*Handed in by the Chairman before the Select Committee on "Working of Collieries," 8th May, 1894.*]

## STOCKTON COLLIERY.

SPECIAL RULES for the conduct and guidance of the persons acting in the management of Stockton Colliery, in the district of Newcastle, and persons engaged in or about the Colliery.

N.B.—One or more copies of these Rules shall be fixed up in the principal office at the Colliery; and all persons accepting employment in the Colliery shall be engaged subject to the regulations contained in them. A printed copy of the Rules shall be supplied to every person before he is employed in or about such Colliery.

*Special Rules.*

1. The Colliery Manager shall have the daily supervision and control of every shaft in the course of sinking, and every level and inclined plane in the course of being driven for commencing or opening any mine, or for searching for or proving minerals, and all shafts, levels, planes, works, machinery, tramways, and sidings, both below ground and above ground, in and adjacent to the mine, and any such shaft, level, and inclined plane belonging to the mine.

2. He shall comply with the requirements of the Coal Mines Regulation Act, 1876, and shall, to the best of his power, enforce the observations of the said Act, and of the General and Special Rules.

3. He shall appoint such competent persons as may be necessary for carrying out the provisions of the said Act, and to provide for the safety and proper discipline of the persons employed in the mine or mines under his control.

4. The overseer shall have the daily supervision and responsible charge of the mine, under the direction of the Manager, and shall give all necessary instruction to the men and boys in the pit respecting their work; and shall see that they pay due respect to the rules and regulations of the Colliery; and shall visit every working place in the pit daily, or as often as may be practicable, and see that the air-courses and stoppings are in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

5. In the event of any sudden discharge or accumulation of inflammable gas in any part of the workings, the fact shall be immediately reported by or through him to the Manager, and he shall also adopt such measures as may seem to him most advisable for the immediate removal of the gas, and work shall not be resumed in such place or places until the gas has been removed.

6. In any place where there is a dangerous appearance of fire-damp, locked safety-lamps shall be used, and no workman shall be permitted to remain where fire-damp shall be accumulated in such quantity as to burn in the inside of, or to heat the lamps dangerously.

7. The overseer, or some other person specially appointed in his place, shall personally see that the air furnaces are kept in good repair and carefully attended to, and shall examine daily, or as often as practicable, the state of the roof in the main roads and the working places, also the state of the shaft and the guides therein; and in the event of any of the above-mentioned places being found insecure, he shall cause them to be repaired at once.

8. It shall also be the duty of the overseer to see that an adequate supply of timber is sent into all the working-places, and to see that such places are properly and securely timbered.

9. If on examination by the overseer or any other person specially appointed, any working place shall be found insecure from a defect in the ventilation, or from insufficiency of timbering, he shall cause a danger signal to be placed in the middle of the road at the entrance of it, such danger signal to consist of a board with the word "Danger" printed thereon.

*On-setter or Hooker-on.*

10. The on-setter or hooker-on shall, subject to the directions of the Manager or overseer, have the sole control of the pit-bottom, and the command of the signals up the pit, and on no account shall he allow any person to interfere with the rapping of the signal-hammer. He shall at all times, when sending up waggons of coal, see that none of the coal projects beyond the side of the waggon, and shall pay the greatest attention to the signal-hammer when men are going to ride, in order that accidents may be avoided. The rapping shall be as follows:—

11. Number of raps—

- 1 for "go on."
- 2 for "lower down."
- 3 for "men coming up."
- 4 for "empty cage."
- 5 for "go slow—door open."
- 6 for "small coal for engine."

12. The on-setter shall on no account allow any person to ride in a cage with a waggon, and on no account shall any person be allowed to go across the pit-bottom while work is going on in the pit, and any violation of this rule shall be reported to the Manager immediately.

*Banksman.*

13. The banksman shall, subject to the direction of the Manager or overseer, have the control of the pit-top, and the command of the signals down the pit, and have power to prevent strangers from descending without special instructions from the Manager.

14. The banksman shall be responsible for the state of the pit-top, and shall see that the frames and the surface near the pit-mouth are kept free from coal, stones, or rubbish, and that they are cleaned at least three times a day. He shall also see that the ropes and slides are well greased, and on no account shall he allow any person to descend the shaft in a state of intoxication.

15. He shall not allow any miner or workman during work hours to descend the pit in the same cage along with his tools, but he shall send them down for him.

16. He shall examine the pit-ropes and the cage-chains frequently through the course of the day, and shall report to the Manager or overseer if they are found faulty, adopting at the earliest opportunity such means as will, to the best of his judgment, remedy the defects.

17. Wire ropes shall be run through the banksman's hands slowly, once every week, to detect broken wires.

*Engine Driver.*

18. The engine-driver shall have the sole control of the engine entrusted to his care.

19. He shall inspect daily the engine, boilers, drums, chains, cages, and all other machinery used for the purpose of raising men and coals from the mine; shall see that all winding ropes be carefully attached to the drums by clamps; that boilers be blown off every twelve hours; that the pumps are working well, and that the water is regularly pumped.

20. The engine-driver shall attend constantly to his engine during his shift, and upon no account shall he permit any person to touch any of the machinery or enter the engine-house, except such persons as may be appointed so to do by those in authority over him. He shall run the ropes once up and down before men descending in the morning in order to see that the ropes, &c., are all right.

21. The engine-driver shall at all times pay strict attention to the rapping of the signal hammer, as specified above, and to the oilings of the engine and the pulley-wheels, and should he discover any derangements of the machinery he shall stop the engine at once, and report the matter to the manager, overseer, or engineer.

22. When men are in the pit-workings the engine-driver shall not leave the handle of the engine on any account, and when men are going to ride from the bottom he shall not lift the cage until he is sure of the signal given, and when men are going down he shall see that they are all right before the cage is started, and he shall see that the men are let down or drawn up with the greatest possible care.

*Collieries and Workmen.*

23. No collier or other person shall descend contrary to the direction of the banksman, nor ascend contrary to the direction of the hooker-on, nor shall any person or persons ascend or descend upon a loaded skip, or attempt to get out of the cage when in motion.

24. Every collier shall, in all matters relating to the workings of the mines or to the safety of the men, obey strictly the orders of the Manager or the overseer, and no man or boy shall go into any part of the pit, other than where he works, without special authority from the Manager or overseer.

25. Every collier shall, upon leaving his place of work, take care that no lighted candles or lamps or other fires (except such as are used for the purpose of ventilation) be left burning in any of the workings he may pass through or by, unless it be under the care of some person, nor shall he leave any gunpowder dangerously exposed.

26. Every collier shall securely sprag or uphold the coal whilst holing, and shall securely prop up the roof of the board or heading where he may be working, so that accidents may be avoided; and if he shall not be provided with a sufficient quantity of timber he shall cease working, and report the same to the Manager or overseer.

27. Every workman employed in any pit shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being damaged or left open, immediately on its being observed by him.

28. No workman or other person shall injure any air-courses, brattice, or stopping, or leave open wholly or partly any door, or do any other act whereby the ventilation of the mine may be effected, or the lives of the men or the property of the owners may be endangered.

29. The seam of coal must be wrought strictly in accordance with the instructions of the Manager or overseer. No collier shall on any account be allowed to take the tools of another.

30. Every person employed shall obey the orders of the Manager or overseer, or other persons specially appointed to give orders in all matters connected with the safety of the miners or the working of the Colliery, and shall refrain from quarrelling, fighting, or using obscene language, or from doing anything that may cause a stoppage of the works.

31. There shall be no restrictions as to the amount of any individual's daily or weekly earnings.

32. Any miner or other person employed in or about the Colliery shall be liable to instant dismissal if he shall fully violate the foregoing rules, or if it shall appear to the Manager that the men or machinery are in any way endangered by his neglect or incapacity.

*Fireman.*

33. The fireman shall be in the pit four (4) hours before the workmen commence to draw coals, and shall examine carefully with the safety-lamp all places and sections where gas has previously been seen.

34. He shall suspend "danger crosses" in all places where gas is found to be dangerous and stopped, and on no account allow them to be removed until the place is considered safe, and started again.

35. All safety-lamps to be examined by the fireman before they are given out to the miners or anyone connected with the Colliery requiring the use of a safety-lamp.

36. All safety-lamps shall be locked by the fireman before they leave the lamp-room, which will be in charge of the fireman.

37. Any lamp receiving any injury shall be at once delivered up to the fireman or overman, and the fact reported to the Manager.

38. No smoking shall be permitted in any place where safety-lamps are used.

*Furnacemen and Horse-drivers.*

39. The furnacemen and horse-drivers shall be subject to the same Rules and Regulations as the other workmen, and when the pit is not at work shall obtain special instructions from the Manager or overseer.

40. When day and night furnacemen are required, the one shall not leave the furnace until the other arrives, except to give information of the non-attendance of the other, in which case he shall return again with all speed to the furnace, and remain there until relieved by someone appointed by the Manager or overseer for that purpose. When a day furnaceman only is employed, the furnace shall be got into vigorous operation before the time for starting work in the pit, and he shall see that a clear, brisk fire is kept up all day.

41. Gunpowder or other explosive or inflammable substance shall not be stored in the mine.

42. It shall not be taken into the mine except in a covered or closed case or canister, containing not more than 4 lb.

43. A workman shall not have in use at one time, in any one place, more than one of such cases or canisters.

44. No steel or iron rammer shall be used, and a charge of powder which has missed fire shall not be unrammed.

N.B.—It is the particular desire of the owner of the Colliery that the various officers shall at all times report to the proper authorities every individual case of neglect or wilful disobedience of the rules and cautions abovementioned, in order that the safe and proper working of the Colliery may be duly maintained.

By the 34th clause of the 39th Victoria No. 31 it is enacted, Every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provisions of this Act, or any general or special rule established hereby or hereunder for the violation or neglect of which no penalty is hereby expressly imposed, shall for every such offence be liable to a penalty not exceeding £10, recoverable summarily before two or more Justices of the Peace.

By the 33rd clause of the same Act it is enacted, Every person who pulls down, injures, or defaces any notice hung up or affixed as required by this Act, shall be liable to a penalty not exceeding 40s.

Department of Mines, Sydney, 9 December, 1887.

THE undermentioned Special Rules, to be observed at the Mount Kembla Colliery, are now published in conformity with the provisions of the Coal Mines Regulation Act, 1876, 39 Victoria No. 31.  
[87-15,389.]

FRANCIS ABIGAIL.

## MOUNT KEMBLA COAL AND OIL COMPANY (LIMITED).

SPECIAL RULES for the conduct and guidance of the persons employed and acting in the management of the Mount Kembla Coal and Oil Company's Colliery, near Wollongong, in the Colony of New South Wales.

A copy of these rules shall be fixed up in the principal office of the Company and entrance to the mine.

All persons who are at present employed or who may be employed by the Company, in or about the Colliery, shall be deemed to have entered its service subject to the following rules, and shall be entitled to receive a copy of same on application.

*Colliery Manager.*

1. The Colliery Manager shall have full and sole control over all persons employed, and of all the operations in or about or for regulating the work of the mine.

2. He shall, to the best of his ability, employ efficient officers and persons for positions of responsibility, and of such workmen as may be required for carrying on the mine in a safe and efficient manner.

3. He shall periodically ascertain or cause the ventilation of the mine to be ascertained and recorded in a book kept in the Colliery office for the purpose, and signed by the person making the same.

4. He shall comply with and be responsible for the due carrying out of the requirements of the Coal-fields Regulations Act of 1876, and shall enforce the due observance of the said Act, and of the General and Special Rules, upon all employees.

5. The Manager will order, when required, locked safety-lamps to be used, and will appoint a competent person to examine them. The overman, fireman, or deputy, or other competent person who may be appointed for the purpose, shall attend to this rule, and are hereby empowered to order safety-lamps to be temporarily used whenever he or they may consider it requisite.

*Under-manager or overman.*

6. In the absence of the Manager, the underground manager or overman shall have full control and charge of the mine, and of all persons employed in or about the Colliery. The Manager shall personally, or by his assistants, give all necessary instructions to the men and boys in the mine respecting their work, and shall be responsible for the due observance of the Rules and Regulations of the Colliery. He shall see that the air-courses and stoppings are in a good state of repair, and that an adequate quantity of ventilation is constantly supplied to the men; and upon its being ascertained that any discharge or accumulation of inflammable gas has taken place in any part of the mine to a dangerous extent, he or his subordinate officers shall see that the miners be withdrawn from such place, and he shall adopt such measures as may seem to him most advisable for the immediate removal of the gas. He shall also cause to be put up on all entrances to such place or places a danger signal, as far as practicable from the said danger, beyond which all persons are prohibited from passing, unless with the distinct sanction of the Manager, overman, or fireman, and then only with a locked safety-lamp.

7. If at any time when by reason of the presence of fire-damp in any part of the mine in sufficient quantity to show a blue cap on the flame or to heat the lamps, all miners must instantly leave that part of the mine.

8. The Manager or his overman shall see that the air-furnaces or ventilation appliances are kept in good repair and carefully attended to, and shall examine daily, or as often as practicable, the state of the roof in the main roads and working places; and in the event of such roof being found insecure, he shall cause the same to be repaired at once. He shall also see that an adequate supply of timber is sent to the appointed stations within the mine, and that such places are properly and securely timbered. If from any cause the condition of the roof in any place is found dangerous, unless the same can be immediately remedied, the men shall be withdrawn, and he shall cause a danger signal to be placed across the road. In every case where danger signals are used, the word "Danger" shall be distinctly printed or marked thereon, and beyond this no ordinary workmen must pass.

9. If at any time it is found necessary to work any "bord, stall, or heading" in the mine with locked safety-lamps, no shot-firing shall be allowed before the place shall be examined by the overman, deputy, fireman, or the person specially appointed by the Manager to act in such capacity, and he or they alone shall be the person or persons duly authorised to fire the shots; and if by reason of the place containing fire-damp in such quantities as to show a blue cap on the safety-lamp, no shots shall be allowed to be fired while the ordinary miners are within the mine, and only when the gas has been removed. In any place worked with safety-lamps, the shots shall be prepared and fired in the manner directed by the Manager or overman.

10. The night overman shall receive his instructions nightly from the Manager or day overman, and he shall, so far as practicable, observe the same Rules and Regulations as the day overman, and shall have, during his shift or in the absence of the overman, full control over all persons employed and working in the mine.

*Deputies.*

*Deputies.*

11. A deputy, where employed, shall be at all times subject to the Manager or overman, from whom he shall receive his instructions. He shall see that the men are provided with timber, and that the wheelers, trappers, and others strictly obey his instructions; and in the overman's absence he shall have full control over all persons employed in his particular district, and see that the provisions of the Act and special rules are complied with. He shall also report to the Manager or overman any danger that may from time to time arise, either from inflammable gas or insecurity of roof, and in their absence he shall take such steps as he may think most advisable for the security of the workmen and of the mine. He shall also, without fail, report any disobedience or violation of rules, and shall, subject to the instructions of the overman, have full and sole control over the men and the amount of labour to be performed by each person under his employ. Any deputy failing to perform these duties will be considered to have committed an offence, and will, in the option of the Manager, be liable to dismissal.

*Fireman.*

12. The fireman shall once in every shift, and before the men enter the mine, carefully examine with a safety-lamp the whole of the workings, faces, and travelling roads; he shall cause to be written with chalk the day of the month in every working-face so examined, and if in his opinion any danger is apparent, either from inflammable gas or insecurity of roof, he shall cause a danger signal to be put up, and no persons shall be admitted to work in such places until the said danger is reported to the overman or Manager, and removed.

13. He shall also make a true report, and enter and sign daily in a book kept at the Colliery office for the purpose, the state of the mine.

14. He shall at least once in every week examine, so far as is practicable, the state of the waste workings and main airways, and make a true report of the state thereof in a book kept at the office for the purpose, which report he shall also sign.

15. In the deputy's absence he is empowered to act on his behalf, and shall report any disobedience or violation of rules on the part of any employee to the Manager or overman.

*Surface Operatives.*

16. All workmen employed by the Company shall be under the direct supervision and control of the Manager or any foreman that may be appointed.

*Colliers and Workmen.*

17. Every collier or other person employed in or about the mine shall, in all matters relating to the working of the mine or safety of the workmen, strictly obey the orders of the Manager, overman, deputy, or fireman, or any other person for the time being in charge of the mine or part of the mine. Every collier shall, when leaving his place of work, take care that no lighted candle, lamp, or matches be left burning in his own place or any of the workings he may pass through or by, unless it be under the care of some person, nor shall he leave any gunpowder loose and unsecured, or under any pretext enter any part of the mine other than the place or district where he is immediately employed, without having first obtained distinct permission to do so by the Manager or the overman.

18. Every collier shall securely uphold the coal whilst holing, and shall prop up and secure the roof and sides of the "bord, stall, or heading" in which he may be employed, for at least a distance of 24 feet back from his working-face, and if he should not be provided with sufficient quantity of timber he shall cease working and report the deficiency to the Manager, overman, or person in charge. It shall be the duty of every workman employed in any part of the mine to inform the person in charge of the workings of the existence of any choke or fire-damp, or any insecurity of roof, shaft, or any other part of the mine, or of any air-door being damaged or left open, immediately on its being observed by him.

19. No workman shall injure any air-course, brattice, or stopping, or leave open wholly or partly any door, whereby the ventilation of the mine may be affected, or do any other act whereby the lives of the men or the property of the owners may be endangered.

20. The seam of coal or other mineral shall at all times be worked strictly in accordance with the directions issued by the Manager or his overman, and any workman disregarding this provision will be liable to dismissal.

21. In all cases involving the use of safety-lamps, every person using the same shall satisfy himself that they are securely locked, and are otherwise in good order and repair. No unauthorised person shall open any lamp; and any person having in his possession, when using safety-lamps, any lucifer matches, tobacco pipes, or any contrivance whatever by which he could open his safety-lamp, shall be instantly dismissed, and his offence reported to the Crown authorities for punishment. At any time when the safety-lamps required to be relighted, they shall be brought to the nearest lamp station provided, where a person duly appointed by the Manager shall be in attendance to re-examine, light, and relock the lamp. If at any time, through accident or otherwise, a lamp is found to be defective, he shall immediately extinguish the light by withdrawing the wick and return with it to the lamp station, where the defect shall alone be remedied, or shall receive another, and every lamp in good order.

22. All workmen using safety-lamps will be responsible for their condition, and shall be required to give to the lamp man a satisfactory explanation as to the cause of any lamp that may be found to be defective, and in default he shall be deemed guilty of negligence, and in the option of the Manager may be dismissed.

23. Where safety-lamps are used no person shall fire a shot except those specially appointed by the Manager for the purpose, who shall first satisfy himself that the operation can be conducted with safety; and all miners shall strictly obey the instructions of the Manager, overman, deputy, or the shot firer as to the method of dressing the coal before the shot shall be fired; and every precaution must be taken in order to avoid and lessen the risks of accidents caused by blown-out shots, that the same shall be assisted by holing well under the seam, and also nicking, shearing, or cutting where necessary. No shots shall be tamped with dry coal or dust, but with some other moist and non-inflammable material.

24. No shot that has missed fire shall on any account be untamped, and no person shall approach any working-place where a shot has missed fire until a period of at least 30 minutes has elapsed from the time it was lighted.

25. In other parts of the mine where shot firing shall be allowed to be carried on by the miners, it shall be subject to the regulations as to tools and preparing the coal (as in Rules 23 and 24) that may from time to time be issued by the Manager.

26. No person shall go behind a danger signal except those having special instructions from the management.

27. No person shall on any account be permitted to take the tools of another, and shall refrain from quarrelling, fighting, using obscene or profane language, inciting men or boys to disobedience, impeding work, or using any words whereby a breach of the peace may be occasioned, or entering the mine intoxicated or bringing intoxicating drinks to the work, or interfering with or disobeying the orders issued by the Manager or overman.

28. Except the Manager, no person or persons shall be permitted to place any restrictions whatever upon the amount of wages or the amount of labour performed by the different workmen at the mine; and any person violating this rule, or as aforesaid interfering in any way with the orders issued by the Manager, overman, or any other person for the time being duly in charge of the mine, shall be liable to dismissal without notice.

29. No person shall carry a greater quantity than 3 lb. of gunpowder into the mine at one time, and it shall be kept or carried in a secure tin or can.

30. Except those in charge of a train, no person shall ride in or out of the mine upon a full or empty skip or train of skips.

31. Any person employed in or about the mine who shall violate or infringe any of the foregoing rules shall, in the opinion of the Manager, be liable to be dismissed without notice.

*Wheelers.*

32. The wheelers shall diligently attend to the requirements of the colliers, and carefully attend to their horses, and see that the harness is kept in a good state of repair, and shall be answerable for any wilful damage they may cause thereto. They shall also prohibit trappers to leave their doors or to ride upon the skips, and shall immediately report any insecurity of roof or road, or any damage they may have accidentally caused, or that they may observe to have occurred, to any air-crossing, door, or brattice, to the overman or person in charge.

*Trappers.*

*Trappers.*

33. The trappers shall constantly remain at their respective doors, and see that they are carefully opened and closed as occasion requires. They shall also on no account ride upon the skips, leave their post, or follow the wheelers, and shall report immediately any defect in the doors to the overman or person in charge.

*Set-rider.*

34. He shall carefully attach the ropes to the set, and inspect the connections, &c., &c.; and if any defect is discovered he shall at once report the same to the overman or person in charge. He shall permit no person to ride on the full or empty sets, and upon any person refusing to comply with his orders in this respect, or in any other way violating this rule, he shall immediately report the circumstance to the Manager or overman.

*Furnaceman.*

35. Any person in charge of the furnace shall see that the fires are always kept in vigorous operation during working hours, and that the bars are cleaned between shifts. He shall also not allow any hot ashes to accumulate in the mine, and if any stoppage should occur in the ventilation, he shall at once report the circumstance to the Manager or overman.

*Mechanical Engineer.*

36. The mechanical engineer, or other person appointed for the purpose, shall at least once in every twenty-four hours carefully examine all machinery, hauling-ropes, drums, pulleys, boilers, &c., &c., and shall make a true report, stating the condition thereof, daily in a book, which must be signed by him, and kept in the office of the mine for that purpose.

37. He shall, if any disarrangement is discovered in any part of the machinery or ropes, &c., &c., cause the same to be immediately remedied, and shall see that the boilers are regularly blown off, cleaned, and inspected, and that all connections, pumps, safety-valves, gauges, &c., &c., are kept in good working order. He shall have control (subject to the Manager) of all men in his department, who must strictly obey his instructions.

*Enginemen.*

38. The engine-driver (subject to the mechanical engineer) shall have the sole control of the engine entrusted to his care. He shall have control of the firemen, and shall see that the steam is constantly kept up. He shall also inspect daily the engines and boilers, drums, ropes, &c., &c., under his care, and shall immediately report any defect to the Manager or mechanical engineer. He shall be in constant attendance to his engine during his shift, and on no account shall he permit any person to enter the engine-house, or to touch any part of the machinery, except such persons as may be appointed so to do by those in authority over him. He shall at all times pay strict attention to the various signals from the mine, and to the oiling of his engine and pulley wheels.

*Brakesman.*

39. It shall be the duty of the brakesman to see that the drums and all the machinery connected with the incline and lowering-gear are kept in good condition. He shall daily examine the ropes, and should he discover any broken wires or appearance of weakness in either rope or machinery, he shall immediately report the circumstance to the Manager or mechanical engineer, with a view to the defect being remedied. He shall not permit any person to ride in the waggons up or down the incline.

*Locomotive Drivers.*

40. The drivers of the locomotives shall have full control of the engine under their charge and of the respective stokers, subject to the Manager or mechanical engineer. They shall see that their engines are kept in a proper state of repair, and that the boilers are regularly cleaned and examined, and if they discover any defect they shall at once report the same to the Manager or mechanical engineer. The drivers shall on no pretext whatever leave their engines or delegate their duties to another, nor shall they allow any person (other than the officials of the Company), unless he has previously obtained special permission from the Manager, to ride upon the engines under their charge.

*General.*

41. Every person employed in connection with the mine shall give and receive, as the case may be (except for violation of Special and General Rules), fourteen days' notice before leaving the Colliery.

Department of Mines, Sydney, 26 March, 1877.

THE undermentioned Special Rules to be observed at the Osborne Wallsend Colliery, at Mount Keira, Wollongong, are now published in conformity with the provisions of the Coal mines Regulation Act, 1876, 39 Victoria No. 31.  
[77-2,073] GEO. A. LLOYD.

SPECIAL RULES for the conduct and guidance of the persons acting in the management of the Osborne Wallsend Colliery, at Mount Keira, near Wollongong, and all persons engaged in and about the Colliery.

One or more copies of these rules shall be fixed up in the principal office, and every person employed or accepting employment in or about the colliery shall be supplied with a printed copy of these rules, and shall be employed subject to them.

*Mining Manager.*

The Mining Manager, or the person acting for him, shall have full command over all other officers and persons employed in the colliery, who shall receive their orders from him, and shall apply to him for instructions as often as may be necessary; and he shall, either by his overman, or deputy, or some other person appointed for that purpose, take care that the following duties are duly performed.

The overman or deputy shall have full charge of the mine in the absence of the Manager, and shall give all necessary instructions to the men and boys in the pit respecting their work, and shall see that they pay due respect to the Rules and Regulations of the Colliery, and shall visit every working-place in the mine every alternate day, and see that the air-courses and stoppings are in a good state of repair, and that an adequate quantity of fresh air is constantly supplied to the men.

In the event of any sudden discharge, accumulation, or indication of inflammable gas in any part of the workings, the fact shall be immediately reported, and the Manager and miners shall cease working therein until the said gas be removed, and the overman or deputy in the meantime shall adopt such measures as may seem to him most advisable for the immediate removal of the gas. In any place where there is a dangerous appearance of fire damp, locked safety-lamps are to be used, and no workman shall be permitted to remain where fire-damp shall be accumulated in such quantity as to burn in the inside of, or to heat the lamps dangerously.

The overman, deputy, or some other person especially appointed, shall personally see that the air furnaces are kept in good repair and carefully attended to, and shall examine daily, or as often as practicable, the state of the roof in the main roads and the working-places; and in the event of such roof being found insecure, he shall cause it to be repaired at once.

It shall also be the duty of the overman or deputy to see that an adequate supply of timber is sent into all the working places, and to see that such places are properly and securely timbered. If, on examination thereof, the overman, deputy, or other person specially appointed, shall find any working place insecure from a defect in the ventilation or from insufficiency of timbering, he shall cause a danger-signal to be placed in the middle of the road at the entrance of it, such danger-signal to consist of a board with the word "danger" printed thereon.

*Colliers and Workmen.*

Every collier or other person employed shall, in all matters relating to the working of the mine or to the safety of the men employed, obey strictly the orders of the Manager, overman, or deputy; and no man or boy shall go into any part of the pit other than where he works, without special authority from the Manager, overman, or deputy. Every collier shall, when leaving his place of work, take care that no lighted candles, lamps, or other fire (except such as is used for the purpose of ventilation) be left burning in any of the workings he may pass through or by, unless it be under the care of some person, nor shall he leave any gunpowder dangerously exposed. Every

Every collier shall securely uphold the coal whilst holeing, and shall securely prop up the roof of the bord or heading where he may be working, so that accidents may be avoided; and if he should not be provided with a sufficient quantity of timber he shall cease working, and report the deficiency to the Manager, overman, or deputy. Every workman employed in any part of the mine shall inform the person in charge of the workings of the existence of any choke or fire-damp, of any insecurity of the roof, shaft, or any other part of the workings, or of any air-door being unsecured or left open, immediately on its being observed by him.

No workman or other person shall injure any air-courses, brattice, or stopping, or leave open, wholly or partly, any door, or do any other act whereby the ventilation of the mine may be affected, or the lives of the men or the property of the owners may be endangered. The seam of coal shall be wrought strictly in accordance with the instructions of the Manager, overman, or deputy. No collier shall on any account be allowed to take the tools of another. Every person employed shall refrain from quarrelling, fighting, or using obscene language, or from doing anything that may cause a stoppage of the works.

Any miner or other person employed in or about the colliery shall be liable to instant dismissal if he shall wilfully violate these Rules, or if it shall appear to the Manager that the safety of the men or machinery is in any way endangered by his neglect or incapacity.

No workman shall take any person into the mine without the consent of the Manager, nor shall any workman enter the mine in a state of intoxication, or take any ale or intoxicating drinks on or to the works without special permission from the Manager.

No person shall ride in or out of the pit on a full or empty skip.

#### *Firemen and Horse-drivers.*

When work is not going on in the pit, the firemen and horse-drivers shall obtain special instructions from the Manager, overman, or deputy.

When day and night firemen are required, one shall not leave the fires or furnace until the other arrives, except to give information of the non-attendance of the other, in which case he shall return again with all speed to the furnace, and remain on duty until relieved by someone appointed by the Manager, overman, or deputy for that purpose. When a day fireman only is employed, the fires shall be got into vigorous operation before the time for starting work in the pit, and he shall see that a clear brisk fire is kept up all day.

#### *Banksman.*

The banksman shall run the rope slowly through his hands once a week, to detect broken wires or other defects.

#### *Engine-driver.*

The engine-driver shall, subject to the directions of the Manager, overseer, and engineer, have the sole control of the engine entrusted to his care, and shall not allow any person to interfere with it during working-hours without the consent of the Manager, shall have control of the fireman, shall be responsible for the proper state of the boiler, and regularity with which the steam is kept up, and shall see that the steam-gauges, water-gauges, and safety-valves are kept in good working order. He shall inspect daily the engine-boilers, drums, ropes, waggons, and all machinery used in connection with drawing the waggons up the incline. He shall see that winding-ropes are carefully attached to the drum by clamps; that boilers are blown off every twelve hours; that the pumps are working well; and that the water is regularly pumped. The engine-driver shall attend constantly to his engine during his shift, and upon no account shall he permit any person to touch any of the machinery or enter the engine-house, except such persons as may be appointed so to do by those in authority over him.

The engine-driver shall at all times pay strict attention to the rapping of the signal-hammer, as hereinafter specified, and the oiling of the engine and the pulley-wheels; and should he discover any derangement of the machinery, he shall stop the engine at once and report the matter to the Manager or overman.

#### *Signals (number of raps).*

- One for "stop."
- Two for "going down."
- Three for "coming up."

Every person employed under the Osborne Wallsend Coal Company shall give or receive (as the case may be) fourteen days' notice before leaving the colliery.

It is the particular desire of the owner of the colliery that the various officers shall at all times report to the proper authorities every individual case of neglect or wilful disobedience of the Rules and cautions above mentioned, in order that the safe and proper working of the colliery may be duly maintained.

N.B.—By the 34th clause of 39th Victoria No. 31 it is enacted: Every person who shall be guilty of any offence against this Act, or who shall wilfully violate or neglect to observe any provision of this Act, or any general or special rule established hereby or hereunder for the violation or neglect of which no penalty is hereby expressly imposed, shall for every such offence be liable to a penalty not exceeding ten pounds, recoverable summarily before two or more Justices of the Peace.

By the 33rd clause of the same Act, it is enacted: Every person who pulls down, injures, or defaces any notice hung up or affixed as required by this Act shall be liable to a penalty not exceeding forty shillings.

F. P. MACCABE,  
Mining Manager.

### LITHGOW VALLEY COLLIERY COMPANY (LIMITED).

#### CONDITIONS of employment at the Lithgow and Hermitage Collieries.

1. Every miner or person engaged in or about the Company's mine shall sign these Rules and abide by the same.
2. That eight hours shall constitute the day's work, every day except Saturdays, when the day's work shall be six hours. Every miner, therefore, shall work eight hours at the face, the hours of commencing and leaving work to be decided by the Manager; and all day men and wheelers shall work eight full hours—the time of commencing and leaving work also to be decided by the Manager.
3. Both shifts of men (if required) shall go in together, and there shall be half-an-hour's break every day, except Saturdays, to allow all men to get meals and to feed the horses. It is distinctly understood that these breaks shall not be counted in the working time.
4. All miners, if called upon by the Manager, shall do shift work at 8s. per day.
5. Special Rule 8, which provides that "there shall be no restriction as to the amount of any individual's daily or weekly earnings," shall be strictly adhered to. (Note.—While the Company are anxious that every miner in their employ shall have an equal share of skips, and every endeavour will be made to secure that object, the Company will not permit any men to be "laid back," if, in the opinion of the Manager, such action will interfere with the working of the pits.)
6. It is distinctly understood that the employees of the Company are engaged individually, and fourteen days' notice shall be given by either side of a desire to terminate the engagement, except in cases of wilful disobedience of orders, when the offender shall be liable to instant dismissal.
7. Except in cases of sickness or other explanation that the Manager may accept, all persons employed at the Company's pits shall (if the trade requires it) work every day for the number of hours specified.
8. Any employee of the Company absenting himself from work without giving a satisfactory reason to the Manager will be liable to dismissal without notice.

9th June, 1893.

MEMORANDUM OF AGREEMENT made the \_\_\_\_\_ day of \_\_\_\_\_ one thousand eight hundred and eighty-eight, between the Australian Agricultural Company, the Newcastle-Wallsend Coal Company, the Scottish-Australasian Mining Company, Messrs. James and Albert Brown, of Newcastle, William Laidley, Esq., of Sydney, the Newcastle Coal-mining Company, Limited, \_\_\_\_\_ at New Lambton Colliery, the Ferndale Colliery, the Burwood Coal-mining Company, the Stockton Coal Company, \_\_\_\_\_ at Hetton Coal-mining Company, hereinafter called the Associated Masters of the one part, and the District Officers of the Miners' Association of the Hunter River District and the Delegates employed at the various Collieries whose proprietors are parties to this agreement of the other part.

WHEREAS it is considered expedient to enter into an agreement for the purpose of regulating the rate of wages to be paid at the collieries belonging to the above-named parties of the first part, for hewing coal and for other work usually done and performed by the miners, the hours of labour to be observed at the said collieries, and the mode of settling any dispute that may arise in reference thereto: Now, therefore, it is mutually agreed and declared by the Associated Masters of the one part, and the officers and delegates representing the miners working at the collieries comprised in the Associated Northern Collieries of the other part:—

1. Subject to the provisions herein contained, the wages paid at the said collieries shall be regulated by the selling price of coal, and shall rise and fall with it; provided that the selling price shall be fixed from time to time by the Associated Masters.

2. The standard hewing price shall be four shillings and twopence per ton of clean round coal when the selling price of round coal is eleven shillings per ton; and the standard price for yard work shall be that paid at the various collieries abovenamed prior to 1st August, 1888, when the selling price of round coal was eleven shillings per ton—excepting in the case of six-yard bords, the basis of payment for which is hereinafter specially provided for; and the standard price for filling small coal by the miners shall be that paid at the said various collieries prior to the said 1st August, 1888, when the selling price of small coal was five shillings and sixpence per ton.

3. Wages shall rise and fall upon the scale hereinafter mentioned—provided that the said scale shall not operate below the point at which the several rates shall stand when the selling price of round coal is nine shillings per ton, and of small coal four shillings and sixpence per ton, which rates shall be the minimum wages paid for working what is hereinafter defined to be the standard seam.

(a) Hewing by the ton—one penny for every threepence in the selling price of round coal.

(b) Yard work—one penny per yard for every threepence in the selling price of round coal, in the case of the maximum rates paid for headings, and a proportionate rate in the case of other yard work for which lower rates are paid.

(c) Filling small coal, either in places wrought by the yard or in wide places, one penny halfpenny per ton for every shilling in the selling price of small coal.

4. The standard seam to be worked for the standard hewing price hereinbefore provided in clause 2 of this agreement shall be defined as follows, viz. :—

Five feet of coal, including what are known as penny bands, shall be the minimum standard height, and in cases where the seam is less than the said minimum standard height, one penny per ton for every inch by which the seam is less than the said minimum shall be paid in addition to the said standard hewing price; provided always that when refuse, commonly known as jerry, morgan, or myrtle, shall be met with, the same shall be separated from the coal, and thrown aside by the miners; and for the additional work so entailed, payment shall be made on the following scale—that is to say :—

Where the seam (including the ordinary penny bands) is less than five feet in height, any thickness of the said refuse, up to four inches, shall be worked and thrown aside free of charge; above four inches and up to nine inches in thickness, three farthings per ton for each inch in excess of four inches shall be paid in addition to the hewing price of coal; above nine inches in thickness, one half-penny per ton for each inch in excess of nine inches shall be paid in addition to the said hewing price.

Where the seam (including the ordinary penny bands) is from five feet to six feet in height, any thickness of the said refuse up to five inches shall be worked and thrown aside free of charge; above five inches and up to nine inches in thickness, three farthings per ton for each inch in excess of five inches shall be paid in addition to the hewing price of coal; above nine inches in thickness, one half-penny per ton for each inch in excess of nine inches shall be paid in addition to the said hewing price.

Where the seam (including the ordinary penny bands) is six feet and upwards in height, any thickness of the said refuse up to six inches shall be worked and thrown aside free of charge; above six inches and up to nine inches in thickness, three farthings per ton for each inch in excess of six inches shall be paid in addition to the hewing price of coal; above nine inches and up to eighteen inches in thickness, one half-penny per ton for each inch in excess of nine inches shall be paid in addition to the said hewing price; above eighteen inches in thickness, one farthing per ton for each inch in excess of eighteen inches shall be paid in addition to the said hewing price.

5. The hewing wages, fixed and provided by any part of this agreement, shall include the cutting-up on one rib of so much of the coal-seam as lies above the morgan band, such cutting to be done after the most approved method of mining in the district; and in the case of any colliery at which such cutting has not heretofore been a practice, or has not been provided for by the special or local rules, no extra payment shall be due to the miners for cutting, but the same shall be done, notwithstanding, on its being required by the manager, overman, or deputy, unless brass occurs in the line of cutting to a total thickness (not including bands) of one inch and a half.

6. The hewing price for taking down tops shall be three pence per ton less than the current standard hewing price.

For lifting bottoms the price shall be twopence per ton less than the current standard hewing price, where the bottoms are three feet and upwards in thickness; and where the bottoms are less than three feet in thickness, the price shall be the current standard hewing price.

The hewing price for drawing pillars shall be twopence per ton less than the price payable for hewing coal in the adjacent bords.

Yardage shall be paid for driving six-yard bords, at the rate of two shillings and sixpence per lineal yard in a clean seam.

7. The daily hours to be observed at the said collieries for drawing coal, exclusive of the time required for men riding in the shaft, shall be eight.

8. All disputes which may arise between the parties hereto, whether concerning one individual colliery or more, shall be submitted for settlement to a referee, to be appointed as hereinafter provided, whose decision shall in all cases be final. It is mutually agreed that no person having direct personal interest in the coal trade shall be eligible for such appointment.

9. For the purpose of carrying out the foregoing method of settlement of disputes, a referee shall be appointed by the favour of His Honor the Chief Judge in Equity. The referee shall hold office for a period of twelve months, but shall be eligible for reappointment; and, in the event of his death, or inability, or unwillingness to discharge the duties of his office, as well as upon expiry of his term of office, a successor shall be appointed in similar manner to that above provided for the first appointment. The referee shall appoint times and places for hearing and inquiring into disputes. He shall have power to call for any evidence, whether oral or documentary, as may appear to him to be necessary, or to reject evidence which may appear to him to be immaterial or superfluous. His rule shall decide the order of procedure, and generally he shall have all powers requisite for full inquiry and prompt settlement of all disputes arising between the parties hereto, and his award in regard to the subject matter of the dispute shall be observed by both of the disputing parties. Each party shall pay his own costs. The referee's salary shall not exceed forty guineas for each day of sitting in the Referee's Court. The amount of such salary shall be fixed by the said Chief Judge in Equity, and shall be contributed by both of the parties hereto in equal proportions, to be paid in advance or not, or partly in advance or not, and in such manner and with such directions as may be required by the referee. The failure to contribute to this salary as required, or to observe the awards, orders, or directions of the referee, shall have the effect of enabling either party to thereupon put an end to this agreement. Each party to any matter of dispute brought before the referee for examination and decision shall have the right to nominate an assessor (no Member of Parliament shall be eligible for nomination) to sit with the referee at any inquiry, for the purpose of affording him assistance upon any technicalities which may require the knowledge of

of experts; but it shall be clearly understood that the assessors' duty shall be simply that of advisers to the Court. It is expressly declared that they shall take no part in, or have power to interfere in any respect with, the conduct of the business before the Court, or with the control of its proceedings hereinbefore given to the referee.

It shall be optional with each party to a dispute to be represented before the referee by not exceeding four persons as managers of their case.

All inquiries under this clause shall be made as far as practicable in conformity with the provisions of the Act to make arbitrations more effectual. (31 Vic. No. 15.)

10. Consideration shall be paid only for the following services or deficiencies in the workings :—

- (a) Stone or roof coming down extraordinary.
- (b) Crossing faults.
- (c) Taking out water, as provided by the local rules at each Colliery.
- (d) For an unusual quantity of water coming from the roof.
- (e) Cutting sumpshs, if ordered by the Manager, overman, or deputy.
- (f) Soft or tender coal in close proximity to faults, and tender coal extraordinary in other places.
- (g) For sets of timber, where slabs are used as caps, the consideration shall be one shilling per set.
- (h) For filling dirt, sixpence per skip; and for removing dirt from pillar-sides where necessary.

In the event of disputes arising as to the value of any of the services or deficiencies mentioned in the foregoing part of this clause, such dispute shall be settled by local arbitration, the arbitrators for such purpose being two persons, employees of the Colliery, respectively appointed, one each by the owner or Manager and the miners at the Colliery where such dispute may occur, and in the event of the arbitrators not agreeing they shall appoint an umpire, whose decision shall be final; but failing an appointment of an umpire by the arbitrators for seven days, he shall be appointed by the referee, whose fee for such appointment shall be one guinea.

11. All established customs of the district, except such as are inconsistent with the provisions of this agreement, shall continue to be observed until altered by mutual consent of the parties hereto. This clause shall not be construed as prohibiting, at any of the said Collieries, the establishment of the practice of cutting the coal above the morgan.

It shall not be permissible, on the grounds of custom, to lay a Colliery idle on two days' notice, on any but public holidays.

12. Local agreements shall be entered into at the various Collieries between the Manager and miners employed thereat, in accordance with the general agreement, for their mutual guidance.

13. In the event of any Colliery commencing to work the coal by the long-wall or any other system not generally adopted in the district, the rates to be paid for hewing coal, driving levels, packing, and all other work incidental to such system, in default of agreement between the Manager and miners may be fixed by local arbitration, as provided in clause 10; or, failing settlement by that method, the said rates shall be fixed by the Referee's Court provided by clauses 8 and 9.

14. One ton of fire coal shall be supplied each month to each householder amongst the miners, but no ticket for fire coal shall have currency for longer than two months.

15. This agreement shall be terminable on infraction of its conditions by fourteen days' notice from either of the parties to the other, but otherwise shall continue in force until the 31st December, 1889; and thereafter it shall continue in force from year to year, unless on or before the 30th September, 1889, or any subsequent 30th September, notice shall have been given, in writing, of its discontinuance on the 31st December then next ensuing.

As witness the hands of the parties.

Australian Agricultural Company (by their Agent and Attorney), Jesse Gregson, General Superintendent  
A. A. Co.

For the Newcastle-Wallsend Coal Company, F. W. Binney, Secretary.

For the Scottish-Australian Mining Company (Limited), A. Shannon, Manager.

James and Alexander Brown, for Duckenfield and Brown's Collieries.

For W. Laidley, James Fletcher, Co-operative Company.

Newcastle Coal-mining Company (Limited), Stewart Keightley, Manager.

New Lambton Colliery, Alexander Brown.

For Ferndale Colliery Company, George Hewison, Secretary.

For the Burwood Coal Company (Limited), Henry Stokes, Director.

For the Hetton Coal-mining Company (Limited), W. A. Steel, Managing Director.

Joseph Middleby, Co-operative Lodge.

Alfred George Hamilton, Wallsend Lodge.

Henry Hanlon, Lambton Lodge.

James Errington, Stockton Lodge.

John A. Davidson, Borehole Lodge.

Albert D. Jones, Glebe Lodge.

John Thwaites, Burwood Lodge.

William Ridings, Lambton C. Pit Lodge.

John Jack, Hetton Lodge.

David Durie, Back Creek and Duckenfield Lodge

Thomas Thomas, Ferndale Lodge.

Ralph Goundry, District Chairman.

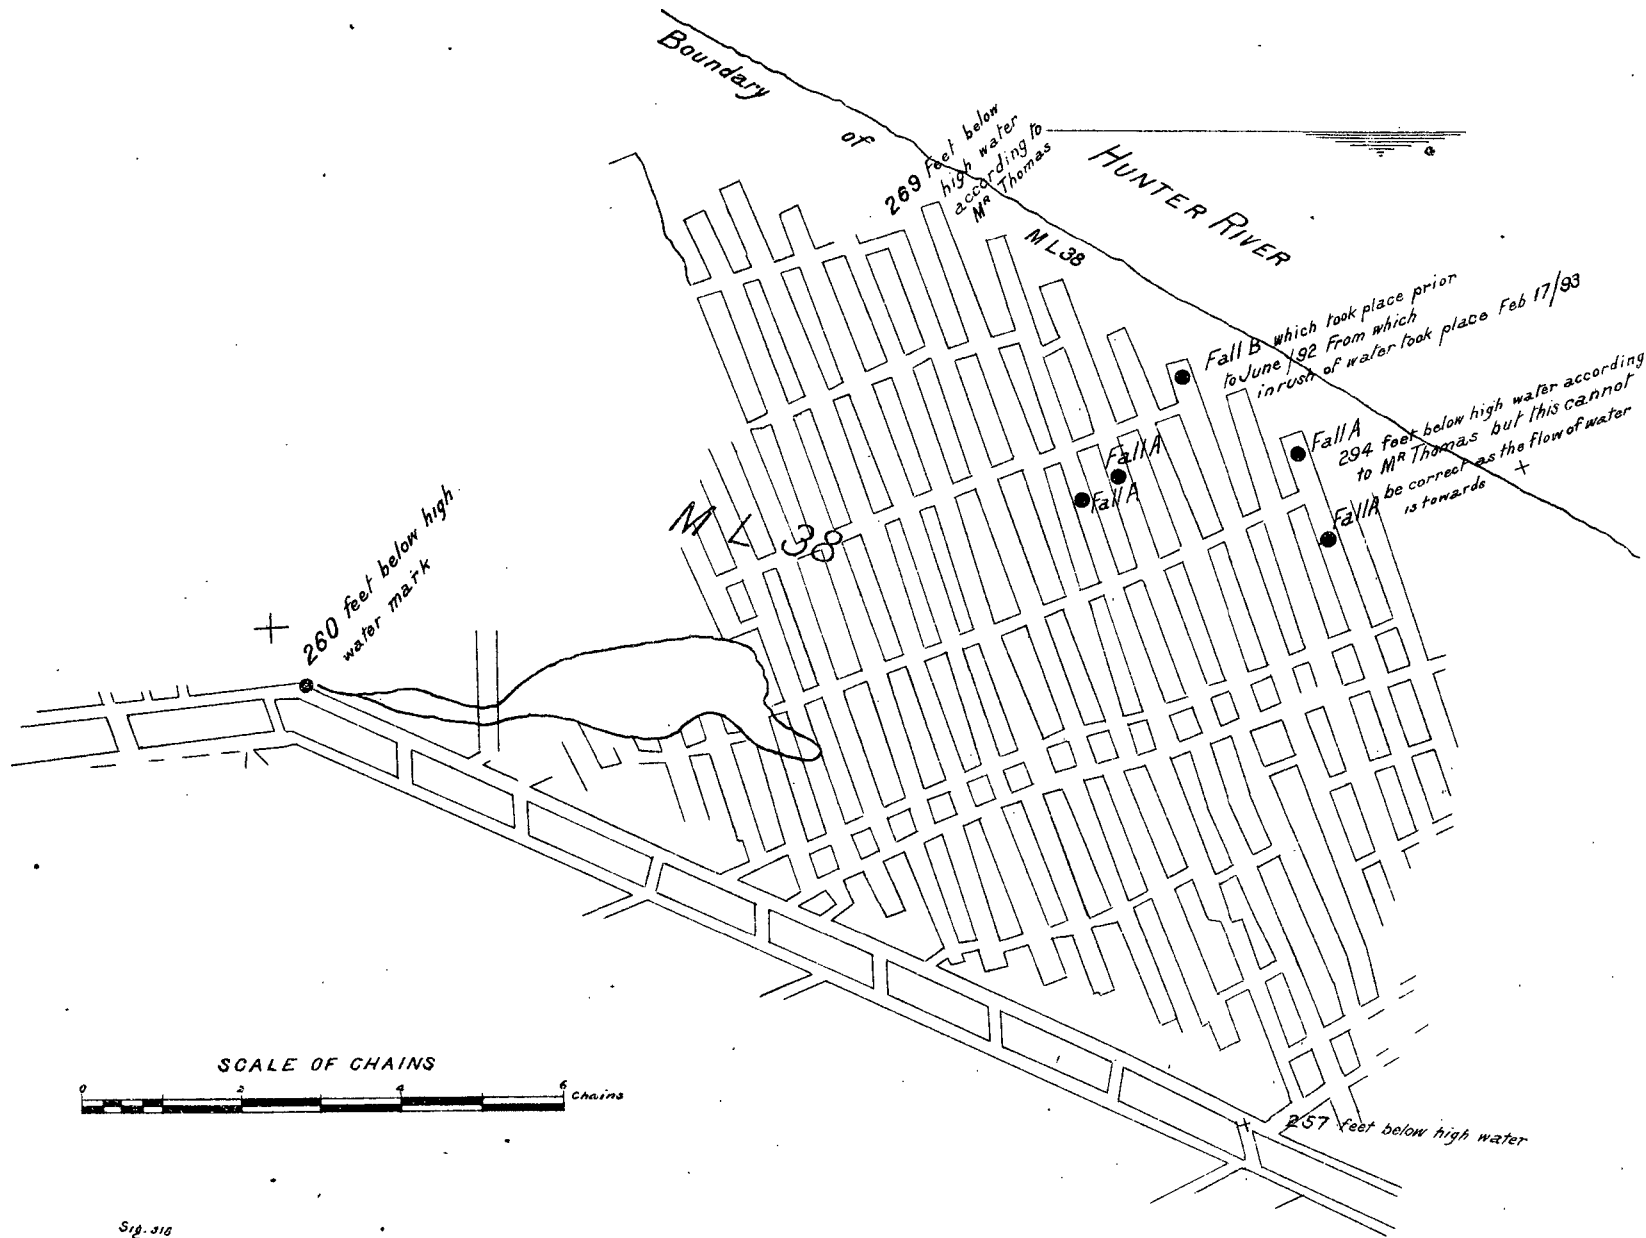

William Hunter, District Treasurer.

James Curley, General Secretary.

# PLAN OF MINE

Handed in before the Select Committee  
on 'Working of Collieries'  
W. S. M.  
26/4/94.

SCALE

EXPLANATION of Plan for Working under Tidal-waters.

This plan is drawn for the working of a seam 14 feet thick, with 400 feet of superincumbent strata for the excavation under the ocean.

The laying out of the plan is according to the lines laid down by the most eminent mining authorities. The intakes taken from each side of the shaft are two in number, with a barrier pillar between them and the returns, being four, or two returns for each intake. This is intended so as to keep the velocity of the air in the returns as low as is compatible with economy, and to have as large a quantity of air circulating through the mine which is derived from splitting.

The method of working is laying the mine out into districts of about 500 yards square, into which an one intake and one return are the only methods of ingress and egress, as the workings are surrounded by a barrier pillar (being 22 yards wide). Having arrived in one of the districts the method of working the coal is what is known as "Bord and Pillar." The headways are 9 feet wide, the bords 6 yards, cut-throughs 35 yards apart, which should be bratticed up within 15 yards of the working-face. The ventilation upon the plan is plain and simple. According to the plan this gives fifteen or sixteen working-places on each side of the entrance or intake into the district in which two men can work, and as the air is passing thirty men in one split (assuming 150 cubic feet per man), the quantity passing in one split is 4,500 cubic feet per minute. If we restrict the number of men in a split to sixty, this would mean 4,500 cubic feet  $\times$  2 = 9,000 cubic feet per minute, therefore I see no reason how sixty men in one split can be looked upon as arbitrary.

NOTE

- D.D. Double Doors.
- D. Single Doors.
- X. Air Crossings.

The great benefit to be derived from working the mine in districts, as the plan shows, is that if the mine is gasy and an explosion takes place it has not the same chance to spread if the sea or any feeder is tapped, the intake and return can be provided with locks or dams and only this part of the mine is affected; the same if it chanced to take fire.

WILLIAM THOMAS.

BARRIER PILLAR
