NEW SOUTH WALES.

REPORT

OF THE

PROCEEDINGS OF A CONFERENCE

RESPECTING THE

RABBIT PEST IN NEW SOUTH WALES,

COMMENCED AT THE DEPARTMENT OF LANDS, SYDNEY,

ON TUESDAY, APRIL 2ND, 1895,

IN RESPONSE TO INVITATIONS ISSUED AT THE DIRECTION OF THE
HON. J. H. CARRUTHERS, SECRETARY FOR LANDS.

Presented to Parliament by Command.

SYDNEY: CHARLES POTTER, GOVERNMENT PRINTER, PHILLIP STREET.

1895.

THE RABBIT CONFERENCE.

Held April 2nd, 3rd, 4th, and 5th, 1895.

REPORT of Proceedings, for Presentation to the Honorable J. H. CARRUTHERS,
Minister for Lands.

THE proceedings were opened by the Minister, who had invited, in addition to Representatives from the Country, Members of Parliament and other gentlemen, to take part in the deliberations for the purpose of securing an expression of opinion as to the best methods by which the eradication of the rabbit pest might be brought about. This, as he had explained in his opening address, was essential in the interests of the Colony; and the reason he had invited an interchange of opinion was that something practical might result which would be a guidance to him in future legislation.

The Honorable William Campbell, M.L.C., was unanimously elected Chairman of the Conference, in which the following gentlemen took part:—

W. H. Suttor, M.L.C.	William Fisher, Murrumbidgee.
J. MacIntosh, M.L.C.	S. Black, Chief Inspector under the
J. M. Creed, M.L.C.	Vermin Destruction Act, Victoria.
Philip Gidley King, M.L.C.	Robert Gibson, Hay.
T. Hassall, M.L.A.	T. Fitzpatrick, Murrumbidgee.
E. W. O'Sullivan, M.L.A.	J. A. Fotheringham, Secretary,
J. C. Watson, M.L.A.	Fresh F. & I. Co.
J. Ashton, M.L.A.	J. Lane, Corowa.
T. Waddell, M.L.A.	W. Farrell, Coonamble.
S. J. Law, M.L.A.	G. E. Traquair, Coonamble.
T. Brown, M.L.A.	Joseph Wilks, Menindie.
W. Affleck, M.L.A.	Kenneth Murchison, Girilambone.
H. Macdonald, M.L.A.	T. Irving Campbell, Mount Ida.
C. Collins, M.L.A.	D. Scott, Condoblin.
E. D. Millen, M.L.A.	D. Johns, Wyalong.
R. Sleath, M.L.A.	M. Tully, Bourke.
W. J. Ferguson, M.L.A.	D. Tully, Hillston.
Travers Jones, M.L.A.	J. M. Atkinson, Nyngan.
J. G. Carroll, M.L.A.	Harrie Wood, Under Secretary for
J. F. Barnes, M.L.A.	Mines.
G. H. Greene, Grenfell.	W. H. Walker, Tenterfield.
A. McCollough, Deniliquin.	H. A. Hough, Mount Ida.
D. A. Morgan, Wentworth.	F. W. Bacon, Brewarrina.
R. F. Roberts	P. Oakden, Cobar.
A. Anderson, Corowa.	J. B. Milne, Condobolin.
A. Macfarland, Hay.	W. Alison, Canonbar.
N. Gatenby, Forbes.	E. H. Wall, Narrabri.
R. A. Ryan, Sturt.	D. Robertson, Narandera.
Thomas Leslie, Forbes.	A. Ross, The Hume.
H. N. Cunningham, A. M. & A. Co.	H. C. Taylor, Rabbit Branch,
J. A. Gunn, Narandera.	Lands Department.
R. B. Wilkinson, Sydney.	A. T. Brooke, Bogabri.
William Devlin, Wagga Wagga.	E. Quin, Wilcannia.

After the reception of certain correspondence, the Conference proceeded to discuss the subject for which they had assembled. Mr. Millen, M.L.A., moved,—“That the rabbit pest, being a national evil, this Conference is of opinion that it should proceed to the consideration of the best means whereby the State, in co-operation with those in occupation of the land, can deal with such pest.”

Mr. Waddell, M.L.A., seconded the resolution, which was unanimously agreed to.

Several other motions were submitted, and, after discussion, Mr. Macfarland, in order to facilitate the business of the Conference, moved,—“That a sub-committee be appointed to schedule notices of motion and draw up a business paper.” The Conference agreed to the resolution, and an adjournment was made until 10 o'clock next day, when the Conference again met. The Chairman announced the receipt of a telegram from the Premier of South Australia, regretting that his Government would be unable to send a delegate, but desiring to be informed of the conclusions arrived at. This the Conference received, and the business paper as prepared by the sub-committee was proceeded with, and a series of resolutions as appended arrived at.

On Thursday morning, Mr. S. Black, Chief Inspector under the Vermin Destruction Act, Victoria, addressed the Conference, and in the course of his remarks explained the working of the Act of 1884, its repeal, and the substitution of the 1889 Act. The latter had been found to work well. Information on various matters was vouchsafed by Mr. Black, who, at the close, received the thanks of the Conference.

The result of the Conference deliberations was the adoption of the following resolutions:—

Mr. T. Leslie moved, and Mr. T. Waddell seconded,—

With a view to future legislation to more effectually deal with the rabbit-pest, this Conference is of opinion that the Rabbit Act of 1890 having failed to give the relief required, should be repealed.

Mr. J. A. Gunn moved, and Mr. McCollough seconded,—

That this Conference is of opinion that the matter of dealing with the rabbits be placed in the hands of the Pastures and Stock Boards until they are superseded by more representative bodies.

Mr. Leslie moved, and Mr. F. W. Bacon seconded,—

That the Pastures and Stock Boards be empowered to make special levies for the destruction of rabbits and the erection and maintenance of rabbit-proof barrier fences where necessary.

Mr. Gunn moved, and Mr. A. Ross seconded,—

That the local controlling authorities should have the power to make destruction compulsory in their respective districts.

Mr. D. Tully moved, and Mr. H. A. Hough seconded,—

That, with reference to the large extent of abandoned areas in the Colony, the Crown should be called upon to take such steps as shall ensure the re-occupation of the country upon any terms, provided there is a clause in the lease strictly enforcing the destruction of rabbits.

Mr. E. D. Millen, M.L.A., moved, and Mr. Murchison seconded,—

That as one means by which the State might beneficially co-operate with the landholders, this Conference recommends the free carriage of rabbits in any form on the State railways.

(This resolution was carried on the casting vote of the Chairman.)

Mr. H. Cunningham moved, and Mr. G. H. Greene seconded,—

That the duty on netting be abolished.

Mr. Cunningham moved, and Mr. G. H. Greene seconded,—

That netting be carried by rail free when cattle or sheep trucks, which would otherwise run empty, can be used.

Mr. T. Irving Campbell moved, and Mr. Murchison seconded,—

That the State should, on the Board's recommendation, supply netting to landholders, charging interest at the rate of 4 per cent. per annum.

Mr.

Mr. Hugh Macdonald, M.L.A., moved, and Mr. Scott seconded,—

That the Government is recommended to maintain the compulsory fencing clauses of the Rabbit Act, but to introduce an amendment to prevent hardships to individual owners, recognising that such cases do arise.

Mr. N. Gatenby moved, and Mr. Leslie seconded,—

That in all cases where rabbit barrier fences are constituted under the Pastures and Stock Boards they shall remain the property of those Boards, and provision be made to ensure their safety.

Mr. J. Ashton, M.L.A., moved, and Mr. Ross seconded,—

That, in order to secure the maximum of economy in the work of rabbit destruction, the controlling district authority should have power to proclaim that certain adjoining holdings shall constitute a group; to secure the fencing of such group; to enforce simultaneous and continuous destruction of the pest within the boundaries of the fenced area; and to apportion the cost of fencing and killing between the owners affected.

Mr. Alison moved, and Mr. Bacon seconded,—

That this meeting, having decided that the question of dealing with the rabbit pest should be placed in the hands of the Pastures and Stock Boards, it is further of opinion that the Government, in proportion to the unoccupied Crown lands in any district, should contribute towards providing funds for dealing with the pest in such district.

Mr. P. Oakden moved, and Mr. Alison seconded,—

That, without material assistance in the shape of subsidy or reduction in rents, the greater portion of the pastoral lands in the Western Division are unequal to bearing the weight of expenditure necessary for coping with the rabbit pest.

Mr. R. Gibson moved, and Mr. T. Irving Campbell seconded,—

That, owing to the devastations caused by the rabbits, a provision be inserted in the Rabbit Act allowing holders of infested country to have a re-classification and re-appraisal of their lands.

Mr. H. Cunningham moved, and Mr. W. H. Walker seconded,—

That all districts where rabbits are known to exist, or are in danger of becoming infested, be proclaimed infested areas.

Mr. Gatenby moved, and Mr. Leslie seconded,—

That this Conference recommends the Government to put the rabbit proof fence from Albury to Bourke in thorough repair, and take steps to ensure its effective maintenance, afterwards handing it over to the Stock Boards.

Mr. P. Oakden moved, and Mr. Hough seconded,—

That this Conference recommends the free carriage of rabbit skins on the State Railways.

Mr. D. Johns moved, and Mr. Alison seconded,—

That, as it is impossible for infested districts to combat the rabbit pest until the vacant lands are wire netted, the Government is urged to join in netting the boundaries of abandoned and unoccupied lands, reserves, and commons. To allow to any adjoining holders who may erect a wire netting fence adjoining these lands an abatement of rent which will, during term of lease, cover interest and capital on the Crown's proportion of the cost of erection.

A discussion as to the best methods for destroying the rabbit ensued and—

Mr. Oakden moved, and Mr. Macfarland seconded,—

For the destruction of rabbits this Conference recommends primarily the use of wire netting, poisoned water, and trapping at tanks, phosphorised pollard, poisoned twigs, tilt pit-traps along the lines of wire netting.

Mr.

Mr. D. Tully moved, and Mr. Ross seconded,—

That in the opinion of this Conference the maximum size of rabbit netting to be used in future shall be $1\frac{1}{2}$ in., with a minimum width of 42 in. by 17 in.

Mr. N. Gatenby moved, and Mr. Leslie seconded,—

That in any levies made under the Pastures and Stock Boards for the destruction of rabbits, and the erection and maintenance of barrier fences, such levies shall be *pro rata* on the acreage of land and not on a stock basis.

Mr. Oakden moved, and Mr. Ferguson, M.P., seconded as an amendment the insertion of the words, after the word land, "in proportion to its natural carrying capacity." The addition of these words was agreed to on division, the voting being 15 for and 13 against.

Mr. T. Leslie moved, and Mr. Hugh Macdonald, M.L.A., seconded,—

That where any boundary fence which has been or may hereafter be fenced with rabbit proof netting, whether in a proclaimed rabbit infested district or not, is used by the adjoining holder to make his holding rabbit proof, such holder shall be liable (after inquiry by the Local Land Board) to a contribution of one half the cost of making and maintaining such boundary fence rabbit proof.

Throughout the sittings members have evinced a strong desire to place before the Minister matters of urgent necessity, and this Conference desires to emphatically bring before the Minister the fact that it is its unanimous desire that the present Rabbit Act should be repealed, that the destruction of rabbits be entrusted to local control, and that the State accept its due responsibility with respect to unoccupied Crown lands, and urges the Minister to introduce speedy legislation to give effect to the reforms embodied in the foregoing resolutions.

W. R. CAMPBELL,
Chairman.
5th April, 1895.

THOS. LESLIE,
Chairman of Sub-Committee.

THE RABBIT CONFERENCE.

FIRST DAY.—April 2nd, 1895.

THE Conference met at 10.30 a.m., and the following gentlemen took part in the deliberations:—

W. H. Suttor, M.L.C.	Thomas Leslie, Forbes.
J. Macintosh, M.L.C.	H. N. Cunningham, A.M. & A. Co.
J. M. Creed, M.L.C.	J. A. Gunn, Narrandera.
Phillip Gidley King, M.L.C.,	R. B. Wilkinson.
W. Campbell, M.L.C.	William Devlin, Wagga.
T. Hassall, M.L.A.	William Fisher, Murrumbidgee.
E. W. O'Sullivan, M.L.A.	Robert Gibson, Hay.
T. Fitzpatrick, M.L.A.	J. A. Fotheringham, Secretary, Fresh Food and Ice Co.
J. C. Watson, M.L.A.	J. Lane, Corowa.
J. Ashton, M.L.A.	W. Farrell, Coonamble.
T. Waddell, M.L.A.	G. E. Traquair, Coonamble.
S. J. Law, M.L.A.	K. Murchison, Girilambone.
T. Brown, M.L.A.	Joseph Wilks, Menindie.
Travers Jones, M.L.A.	T. Irving Campbell, Mount Ida
W. Affleck, M.L.A.	D. Scott, Condobolin.
J. G. Carroll, M.L.A.	D. Johns, Wyalong.
Hugh Macdonald, M.L.A.	M. Tully, Bourke.
J. F. Barnes, M.L.A.	D. Tully, Hillston.
C. Collins, M.L.A.	Harrie Wood, Under Secretary for Mines.
E. D. Millen, M.L.A.	H. C. Taylor, Rabbit Branch, Lands Department.
A. McCollough, Deniliquin.	W. H. Walker, Tenterfield.
D. A. Morgan, Wentworth.	H. A. Hough, Gunbar.
R. F. Roberts, Wentworth.	F. W. Bacon, Brewarrina.
A. Anderson, Corowa.	P. Oakden, Cobar.
A. Macfarland, Hay.	J. B. Milne, Condobolin.
N. Gatenby, Forbes.	W. Alison, Canonbar.
R. A. Ryan, Sturt.	E. H. Wall, Narrabri.
G. H. Greene, Grenfell.	A. Ross, The Hume.
D. Robertson, Narrandera.	E. Quin, Wilcannia.
A. T. Brooke, Boggabri.	

The Minister for Lands in opening the proceedings delivered the following address:—

Gentlemen,—

I am very pleased to have the opportunity of welcoming you here to day and I feel assured that we all feel interested in conferences such as this, held periodically, on so important a subject as the rabbit question. Holding the position that I do, I do not wish to intrude on this Conference any observations of my own, with regard to any specific method of coping with the question. I have called you together as practical men, to give me the benefit of your opinion, your experience and advice in this matter, and I shall only scrutinise that advice in the light of my duty, and generally in the interests of the great body of taxpayers of this Colony. In doing this I shall have to protect the public funds, and the general public, but where you do not come into conflict largely with these two questions, you can be assured of my cordial support in any plan you may submit to me. The gentlemen forming the Conference have been called together with the object of considering the best means of dealing with the rabbit pest and of supplying the Minister with the result of their deliberations in the hope that he may, from the practical and personal experience gained by most of those present, be able to formulate some measure which will mitigate the pest complained of to such an extent as to render the occupation of lands in this Colony more profitable than it would appear to be at present, either by reducing its numbers in a cheap and wholesale manner, and, if possible, make the rabbit contribute to the cost of its own destruction by the utilisation of the skins and carcasses. Conferences to deal with this subject have been called together on previous occasions, and it cannot be questioned that they have been productive of much good. Legislation having for its sole object the destruction of the rabbit dates from the 1st May 1883, when the Bill introduced by Sir Joseph Abbott, became law. Previous efforts had of course been taken to cope with the rodent, but the machinery provided by the Pastures and Stock Protection Act was found quite insufficient for the purpose, and, in response to an almost universal outcry, the Rabbit Nuisance Act of 1883 was, as before stated, submitted to Parliament, and in due course became law. The main principle of this Act was the compulsory destruction of the rabbit by the occupants of the land, who were to be assisted in their efforts by the payment of a subsidy to be obtained from a fund raised by imposing annually a tax upon stockowners. Soon the greater portion of the Western District was in a state of activity, and large sums were spent in attempting to check the spread of this pest, which was known to be exercising such a prejudicial effect upon the pastoral interests of the Colony. It was, however, soon patent that the fund established would be quite inadequate for the purpose, and before long it became necessary to make large demands upon the Consolidated Revenue, in order that the work entered upon might be persevered with.

The

The following figures will show the sums of money paid through the medium of the Department charged with the administration of the Act solely for the purpose of attempting to get rid of the rabbit :—

or a total of £831,457 4s. 1d., of which sum £503,786 5s. 8d. was supplied by the Consolidated Revenue consequent upon the fund established by the Act being insufficient to meet demands. It must also be remembered that the enormous sum mentioned does not include the total cost incurred, as in all cases the occupant of the land had to bear at least 25 per cent. of the expenditure incurred in destroying rabbits, so that it may be safely stated that the known cost up to the date mentioned is considerably in excess of £1,000,000. From the 1st July, 1890, to the 31st December, 1894, the Government expenditure on account of the rabbit has been limited to the sum of £22,761, and almost the whole of this has been devoted to the erection of rabbit-proof fencing. During the period this expensive warfare was in progress efforts were being made to devise other means of dealing with the pest, and a Conference, with this object, met on the 1st October 1885 and the six following days, and a report was presented in due course. The succeeding year another gathering was convened, consisting of fifty-four delegates, jointly representing the whole of the landholders and pastoralists of the Colony. These gentlemen met on the 14th June, 1886, and seven following days, and a report, recommending among other things, the erection of a rabbit-proof fence from the Queensland border to the Victorian border, was submitted, and, as is known, this work was soon in progress. The experience gained in the year 1887, made it more than plain that the rabbit had come to stay. During that year the Department paid for in excess of 27,000,000 rabbit skins; but the pest was, if anything, more numerous at the end of the year than at the beginning, and the country lying to the west of a line drawn from Albury on the south to Barrington on the north, may be said to have been more or less infested. It is also known that about 3,000 men were engaged solely in the work of rabbit destruction, earning large wages, in some cases as much as £12 per week. Facts such as these had the effect of determining the Government of the day to put an end to a system found to be futile in its operation, and on the 31st July, 1888, the payment of all subsidy ceased, and from that date the Rabbit Act of 1883 may be regarded as a dead letter, and for a time the work of attempting to cope with the rabbit practically ceased; although spasmodic efforts continued to be made by owners alarmed at the devastation made on the pasturage upon which they were depending for the maintenance of large flocks of sheep. Nevertheless, fresh legislation dealing with the question did not eventuate, although a Bill with this object was submitted to Parliament in the year 1888. Prior to this time the terrible ravages caused by the rabbit had forced the Government to take some action, and on the 31st August, 1887, a reward of £25,000 was offered to any person or persons who would make known and demonstrate a process for the effectual extermination of the pest, in response to which upwards of 2,000 schemes were received from residents of various parts of the world. To investigate these proposals and report generally as to the best means of dealing with the rodent, a Royal Commission was appointed on the 16th April, 1888, consisting of representatives of Victoria, New Zealand, South Australia, Queensland, Tasmania, and this Colony, and on the 16th December, 1889, this Commission submitted its final report. The Commission reported that none of the claimants for the reward had propounded a scheme that would comply with the conditions under which it had been offered, but it went on to formulate certain definite conclusions, amongst others "That no finality in rabbit destruction would be obtained without making the erection of rabbit-proof fences compulsory." "That the system of compulsory destruction, with professional trappers and State bonuses, was radically bad" "That the responsibility for the destruction of rabbits, whether on freehold or leasehold land, should rest on the landholders." "That with regard to unoccupied country, the State should accept similar responsibility." To this report may perhaps be ascribed the existing legislation relating to the rabbit pest. This Act, assented to on the 20th December, 1890, purposes to facilitate and encourage the erection of rabbit-proof fencing, and to make the destruction of rabbits compulsory, under certain conditions. Whatever may be said in opposition to this Act, it may fairly be urged that its operations have brought about the erection of about 15,000 miles of rabbit-proof netting, which has unquestionably checked the onward march of the rabbit; but the cost has been so serious as no doubt to render the question of the continuance of this method under existing conditions a matter likely to engage the earnest attention of this Conference. Whilst on the subject of rabbit-proof fencing it may be mentioned that extensive fences have been erected at the cost of the State. A fence, starting at Barrington on the Queensland Border and following the Main Trunk Railway Line from Bourke to Corowa, a distance of 407 miles, has been completed. Another fence along the entire western boundary of the Colony, a distance of 346 miles, has also been erected at the public expense; whilst, as showing that the plague is not confined to New South Wales, the Queensland Government have found it necessary to erect a similar fence along a considerable portion of the northern boundary of this Colony. Under the existing Rabbit Act provision is made whereby, on a date to be named, the destruction of rabbits may, in areas to be specified, be made simultaneous and compulsory; but owing to agitation on the part of landowners, resort has not yet been had to this as a means for reducing the evils consequent upon the introduction of the rabbit into these colonies. Here is another point on which it is fair to assume that the time and experience of the Conference may be used to the advantage of all concerned. The extent to which the rabbit has spread in this Colony is now a matter of history, but the rapidity with which it has been done is still a source of surprise. New South Wales, it is generally believed, owes the presence of this curse to some no doubt well-meaning gentlemen residents of the Geelong District, Victoria, where the rodent is said to have been liberated some thirty years ago. However, many years elapsed before this Colony became alive to the danger likely to result. The first public announcement that the rabbit had invaded New South Wales is said to have been made in 1881 by Mr. Quin, who, in moving the address-in-reply to the Governor's speech

Speech, regretted that the Ministerial programme did not include a Bill to deal with the rabbit pest. The matter met with general ridicule, and a suggestion was made that Mr. Quin would do better by introducing a Bill to exterminate fleas. However, no great length of time elapsed before the evil became pronounced, and complaints as to the damage done began to arrive from the south-western corner of the Colony; and during 1882 the pest was to be met with in greater or less number on most of the holdings on the Murray frontage from Corowa to the South Australian Border, a distance from east to west of at least 350 miles, and then again from south to north about 200 miles. In 1883, when the first Act was brought into force, the rabbit had spread north a short distance above Silverton; thence across the Darling River, easterly, between Wilcannia and Menindie; then down the Lachlan above Hillston; then by a line almost due south to the Murray near Corowa—an area of almost one-fifth of the whole Colony. Inquiries made early in 1887 elicited the information that the infested area had at that time been at least doubled, whilst at the present time the whole of the Western Division and the bulk of the Central is more or less rabbit infested, whilst the Eastern Division is by no means free, although population in that part of the country has checked the spread of the pest. In short, the whole of the country to the west of a line drawn from Germanton on the south to Mungindi on the north, is to some extent subject to the depredations of bunny. During the period the rabbit has been a source of trouble and expense, the landowners in the Colony have tried numerous methods to grapple with the pest. In the early times the use of the old gin-trap was the most popular with the rabbit, and next to that, hunting with dogs. Bisulphide of carbon was used in many places suitable for the purpose, and with considerable success, although labourers had strong objections to the use of it. Natural enemies in the shape of the ferret and the mongoose were availed of, whilst men of experience were to be found who argued that if trapping operations were to cease, the iguana would be quite capable of putting an end to the wily rodent. The domestic cat was converted into an agent of destruction, and it is alleged that over limited and suitable areas they proved of service. To recapitulate the methods adopted in the attempt to check the rabbit invasion would doubtless be unnecessary, seeing that the gentlemen constituting the Conference have a vivid recollection of these various remedies and the cost of the same. It might, however, be mentioned that of late years the efforts have to a great extent been restricted to the use of poisons in conjunction with wire netting, and in seasons when food has been dry and water scarce, the result has been the wholesale destruction of the rabbit, and at a cost trifling in comparison with what it was a few years since. However, these efforts have no finality, and the expenditure is an annual one, and the reports received from time to time go to show that the rabbit is continuing his work of destruction and attacking new country. There can be no question that the continued activity of bunny results in the carrying capacity of pastoral holdings being reduced to a considerable extent, whilst the owners of agricultural lands are being harassed to such an extent as to seriously interfere with the profitable occupation of the land, and as a consequence the productiveness of the soil is retarded to such an extent as to be seriously felt not only by the actual occupants of the land, but by the State. At the present time the Crown has upon its hands something like 7,000,000 acres of land in the Western and Central Divisions, which may be referred to as abandoned resumed areas, and there can be no question that this due in some measure to the expense of working the country, consequent upon the prevalence of the rabbit pest. With the object of obtaining the most reliable and up-to-date information on this subject, the present gathering of practical men has been summoned in order that the State may obtain the benefit of their experience, and in the hope that some efficacious and inexpensive method of keeping the rabbit in check may be propounded. Extermination seems to be out of the question, but much may, it is thought, be done by combined action in the way of reducing the pest within manageable proportions, and at a reduced cost, the State, of course, taking its share of whatever responsibilities it may be thought necessary to impose. One feature of the rabbit question has not, it is thought, received sufficient attention at the hands of the sufferers in this Colony, and that is the commercial utilization of the animal. In the past suggestions of this character have met with condemnation, on the grounds that it would lead to the conservation of the rabbit, but it would appear that the time for such argument has disappeared. Experience in the past leads to the belief that the rabbit is a fixture, and there should be no reason why persons resident in localities suitable for the purpose should not seriously consider why the animal should not be made to contribute to the cost of its own destruction. It is, of course, apparent that operations of this character would only be possible over a limited area of the infested country, but with the easy means of reaching foreign markets, it is worthy of consideration whether the carcase of the rabbit may not be used as an article of food, either frozen or canned, and whether the skins and fur may not be profitably applied in the manufacture of gloves and felt. Industries of this kind are reported to have met with a fair amount of success in one of the other colonies, and quite recently reports were received from Narrandera indicating that similar operations are likely to be successful in that locality. Under the present Act power is given to declare districts overrun or likely to be overrun with rabbits to be rabbit infested, and upon such being done, the lands included therein are subject to the fencing provisions of the Act. A recently expressed intention of extending the area already declared infested has been received with considerable opposition, and an expression of opinion as to the advisability of persevering in this intention would be of value, and also as to whether the conditions relating to the erection of rabbit-proof fencing are unfair or harsh in their incidence, and if so, in what manner they are to be improved. As before stated, the Act in force gives power to make the destruction of the rabbit compulsory, and as some agitation is on foot to bring this power into active operation, it is thought that an expression of opinion as to the judiciousness of such a course would be desirable, without respect to the peculiar conditions existing in any particular district, but as a question of national policy. In order that you might deal with this question specifically, I have called you together, and it would be idle for me to offer you advice as to how you will conduct your business. You have the subject before you, and it is one that touches many of your breeches pockets, and I believe that men who are touched that way are likely to deal with the subject in a practical manner and come down to successful results. I ask you to elect your own Chairman, but I would suggest to you that Mr. Campbell or Mr. King, as gentlemen who are acquainted with parliamentary methods of conducting meetings, should be appointed. Mr. Taylor will be with you during the whole of the Conference, and I am glad to see Mr. Wood here, so that he may give you the benefit of his experience. We expect Mr. Black, Chief Inspector of Stock of Victoria. South Australia has been invited to send a delegate, but up to the present no reply had been received; and we hope before the Conference breaks up to have the benefit of the Queensland representative's views. Now to any person outside this Conference who desires to give information

I wish it to be made known that the Conference is willing to receive any such information from any source whatever, because if it can do no good it can do no harm. I shall not attempt to direct your efforts in any way; but this I advise you to do, to open with a general discussion on the question, and then embody the points in resolutions to be afterwards arrived at. Let a sub-committee be appointed to draw up a report, and let it be submitted to the Minister, so that it may become a State record. If the report goes too far, and does not meet with the approval of the Government, then you shall have an opportunity of amending that report so as to bring it within manageable limits. It is my wish to carry out your desires as far as possible, and I hope success will attend you in your deliberations, and I now ask you to elect your Chairman.

The Conference then proceeded to elect a Chairman, the Hon. W. Campbell, M.L.C., being unanimously chosen.

Mr. CAMPBELL thanked the representatives for the honour they had conferred upon him, and he hoped they would bear leniently with him in the discharge of his important duty. He was there to keep order, and to direct the debate as he deemed necessary. The question that they had met to deal with was one of the most important connected with the welfare of the country. They wanted to do practically what the Minister had already expressed, and to have his ideas carried out in the shape of practical legislation. He thanked them again for the honour, and hoped they would assist him as Chairman and restrict their remarks, on the different resolutions that would be submitted, as much as possible. There were several letters that had been handed to him by Mr. Taylor which he thought desirable to read. One was an application by Mr. Phil. Mowbray to give evidence as an expert witness on the subject before the Conference.

The Conference decided to acknowledge the receipt of Mr. Mowbray's communication.

The Rev. Hugh Dunlop wrote asking permission to exhibit two appliances for rabbit destruction. The communication was received.

Mr. L. Fane De Salis wrote expressing his regret at his inability to be present at the Conference, and stating that he still considered the plan which he had *ab initio* advocated in so many publications was the easiest, speediest, and cheapest (on the whole) of any plan yet proposed. The communication was received.

The CHAIRMAN thought that there should be someone prepared to make some definite motion, in order that members could speak to it.

The Hon. J. M. CREED, M.L.C., moved, "That the paper read by the Minister be printed, and circulated as soon as possible."

Mr. HUGH MACDONALD, M.L.A., drew attention to the expense that would be incurred in the publication of a document of the kind, and thought it altogether unnecessary. The Minister recommended that their first proceeding should take the form of a general discussion. We cannot improve a great deal on that. He suggested that in the discussion they should confine themselves to one particular aspect at a time. He had a resolution to move in relation to the operation of the present Act, but did not desire to submit it at that particular juncture.

Mr. MACFARLAND (Hay) seconded Dr. Creed's motion.

Mr. FISHER (Murrumbidgee) asked the mover if it was intended to have the document printed and distributed amongst the members of the Conference. If so, he considered it would occasion a great loss of time.

Mr. GREENE thought the printing of the document altogether unnecessary. He looked upon it simply as a waste of time.

Mr. HUGH MACDONALD, M.L.A., entered his protest against the incurring of such an expense.

Mr. WADDELL, M.L.A., thought it would be absurd to waste such time, as the Minister's remarks would probably appear in the morning papers.

The Hon. J. M. CREED, M.L.C., in reply, remarked that the thing was to get it through as quickly as possible. The whole matter had been considered in a general way for the last twenty years. He only wished to see some resolution come from that Conference.

The motion, on being put to the meeting, was negatived on the voices.

Mr. MILLEN, M.L.A., proposed to submit a motion which he thought would have the advantage of being sufficiently broad to permit of general discussion. It was as follows—"That the rabbit pest being a national evil, this Conference is of opinion that it should proceed to the consideration of the best means whereby the State, in co-operation with those in occupation of the land, can deal with such pest." He would ask the members to note one sentence contained in the motion, and that was "the State in co-operation with those in occupation." He thought it was well in moving the resolution that they should recognise very clearly the obligation resting upon the State. They might reasonably ask the State to do this. The fact that in this country the State was the landlord gave them a reason why they should expect assistance in this direction.

Mr. WADDELL, M.L.A., seconded the resolution.

Mr. WATSON, M.L.A., said he did not know anything about rabbits, and came there to listen. Before entering any further into the matter he thought it would be better for the members to thoroughly discuss the whole question.

Mr. GREENE thought the resolution was quite in conformity with what the Minister had suggested. He hoped it would be carried.

Mr. FISHER (Murrumbidgee) ventured to say that there would not be a dissentient voice so far as the motion, which was a good one, was concerned.

Mr. HUGH MACDONALD, M.L.A., said that the only objection he had to the motion was that it was too comprehensive.

The CHAIRMAN reminded him that he could move an amendment upon any motion before the meeting.

Mr. WADDELL, M.L.A., said that the object in the first place in having the Conference at all was to get men from all parts of the Colony, in order to obtain the general information they would be likely to get from men of such experience from different parts of the Colony. The object in moving the resolution was, he considered, to give everyone an opportunity of speaking and putting forth their views. Some members of the Conference would have an opinion of one kind as to the best means of dealing with the difficulty, whilst others would hold different views. Then they could proceed to frame different resolutions, having interchanged ideas on the subject. Some members might think it would be a good thing for the Government to take definite steps. Each one would have an opportunity if a general discussion took place of submitting definite resolutions, and the Conference would have an opportunity of considering them one by one.

Mr.

Mr. ASHTON, M.L.A., asked the members of the Conference not to put the motion to the vote until they had had an opportunity of discussing the question. He thought a general discussion on the question should take place, and the various methods for dealing with the pest thoroughly considered.

The CHAIRMAN said that members could speak on the motion. He hoped that members would explain their views to the Conference.

Mr. MACFARLAND (Hay) thought that the compulsory killing of rabbits should be the next thing taken into consideration. If this was to be under the control of the various Pastoral Boards, aided also by the police in the districts, the difficulty could be got over. These Boards should have the control of compulsory killing of rabbits. The use of poison as a means of extermination had been much facilitated, and much good had resulted therefrom, but he thought the various municipalities, which had control of commons from which revenue was derived, should be compelled to destroy the rabbit, and if it were made compulsory there would very soon be complete extermination.

Mr. GIBSON (Hay) wished to be informed whether they were going to make use of the rabbit, or whether they were going for complete extermination. They were fostering an industry, and he was of opinion that they should not recommend in any shape or form the rabbit as an article of commercial value.

Mr. GREENE rose to a point of order. They were entering now into matters of detail which he thought would be valuable later on.

Mr. GIBSON (Hay), on the point of order, considered that the resolution opened up the whole question. He was touching upon one phase of the question, while Mr. Macfarland touched upon another.

The CHAIRMAN said the point of order raised by Mr. Greene would not hold good in a case of that kind. It was just ventilating gentlemen's opinions on the subject, by means of which they could see which way the members' feelings were.

Mr. GIBSON (Hay) continuing, said: They knew that the Crown should destroy rabbits; but when it came to a question of spending the public money, was it feasible that the Crown would accept the responsibility. There was also the question of wire-netting, and whether it should be made compulsory or should the Government supply it at such a cost as to materially aid the occupiers. These were important matters that would have to be dealt with at an early stage.

Mr. MORGAN (Wentworth) said he could tell them something about what the landholders had done during the last ten years. As Mr. Macfarland had stated, poison had been most efficacious in his district up to the present time. Poison was found about the best means for destroying rabbits in his district, and it should be combined with wire netting. He suggested that wire-netting and poison should be generally adopted.

Mr. KENNETH MURCHISON (Girilambone) thought the best plan would be for the Government to supply the netting to the holders of the land. He knew the landholders were not in a position to wire-net their own land.

Mr. J. A. GUNN (Narrandera) considered it would save time if they dealt with the points that were most important. The chief points, he took it, were those relating to the question of infested areas, wire-netting, and also the commercial use of the rabbit. He thought it would be as well that these should be put before the Conference separately, and dealt with on their merits.

The CHAIRMAN said it would be easier to put it as a general motion, and let the Conference then go on with the different proposals.

The motion was then put to the meeting and carried unanimously.

Mr. J. A. GUNN moved:—"That the destruction of rabbits should be made compulsory throughout the Colony, and that the control of the operations should be placed in the hands of the Pastures and Stock Boards." For his own part, he was a believer in wire-netting and poison as a means of exterminating the rabbit, and he considered that the Boards would be able to cope with the pest in such a way as to cause it to be no longer a serious menace to the Colony.

Mr. A. McCOLLOUGH (Deniliquin) seconded the motion.

Mr. W. AFFLECK, M.L.A., desired to move an amendment. It seemed to him that, notwithstanding the fact that the Conference had been called for the purpose of considering the rabbit pest, they ought equally to take into consideration another danger, namely, the hare pest.

The CHAIRMAN said that the hare pest was not the question before the Conference.

Mr. W. AFFLECK, M.L.A., said he wished to move an amendment, which he thought would deal with the principles in a better way than the one suggested, and it would bring it more under the notice of those interested. It is a fact that we are on the eve, or expect to be on the eve, of getting Local Government.

The CHAIRMAN again drew the speaker's attention to the fact that he was not discussing the motion, and asked him to confine himself to the matter under consideration.

Mr. W. AFFLECK, M.L.A., desired to read his amendment which was—"That this meeting is of opinion that, as we are likely soon to have a Local Government Bill, the rabbit question should be delegated to those bodies, and that the Government be requested to grant assistance to the local governing bodies to destroy the pest." The reason why he proposed this was, that if they resorted to Stock Boards, they would be resorting to a body that was elected by stock owners; but if they referred the matter to local Boards, they were referring it to Boards that were elected by all sections of the community. If this Conference was going to consider the matter at all they ought to take all parties into consideration, and not only a section. The Conference was not formed for considering a single section of the community, but every section; and he thought that if the question was placed in the hands of these bodies instead of Stock Boards it would have a far greater effect.

The CHAIRMAN ruled the amendment out of order as there was no local government in existence, and he did not see what good could come of discussing questions that were not before them.

Mr. T. WADDELL, M.L.A., considered that to carry Mr. Gunn's resolution into effect, namely, "that the control of the destruction of rabbits be placed in the hands of the Pastures and Stock Boards," legislation would have to be passed. Mr. Affleck's amendment was just as pertinent to the question as the motion. He intended to oppose the motion, and support the amendment.

Mr. K. MURCHISON (Girilambone) also signified his intention of moving an amendment.

The CHAIRMAN said the question before them was that the destruction of the rabbit should be made compulsory, and that the operations should be in the charge of the Pasture and Stock Boards. He ruled Mr. Affleck's amendment out of order.

Mr.

Mr. F. W. BACON (Brewarrina) said he represented a district that was highly affected, and he thought that there were no persons better fitted to control these operations than the men who lived in the locality. The work would be done much cheaper and more efficiently. He considered rabbit-proof fencing a most efficient agency in the prevention of the spread of these pests.

Mr. T. WADDELL, M.L.A., said it appeared to him that the motion opened up a matter of great importance in connection with the destruction of the pest, and if it were carried it affirmed that the graziers and agriculturists should bear the expense. It was better for them to consider every step they took than to make any mistake which would appear hereafter. If they occupied a little more time in calmly and carefully considering what they had before them it would be time well spent. He objected to the first motion because its direct tendency would be to throw the expense of a national question upon a section of the people. It would be to the interest of the Government to take means to destroy this pest, and when he said the interest of the Government, that meant the interests of the whole of the Colony. There was another question which came in: If the Pastures and Stock Boards are to deal with this matter, fresh legislation, as he had already pointed out, would have to be passed. The Government must first pass legislation to give effect to the resolution, and invest the Boards with the power to act. They knew there was every probability of a Local Government Bill being passed very soon, and if they had that legislation passed side by side with the other, they would have two Acts giving the same powers to two sections of the people. He suggested that the Conference should carry a resolution to urge the Government to pass the Local Government Bill as soon as possible. The expense of extermination would then be borne by the whole of the Colony, and subsidised by Government funds. He thought the Conference would make a great mistake if they passed the motion as originally moved.

Mr. W. FISHER (Murrumbidgee) said he had been considering the matter very carefully, and the more he considered Mr. Gunn's motion the less he liked it.

Mr. HARRIE WOOD (Under Secretary, Mines Department) said that although the utilisation of the rabbit would only apply to certain districts, still it might be worth considering whether, within those districts where the rabbit could be utilised, they should be utilised or not. He had given the matter consideration, and had very nearly completed an arrangement by which rabbits would be placed on the English and Continental markets at sixpence each, and if they could be placed at that price they could be sold in millions. In this way they would get rid of a lot of rabbits, and would be giving a large amount of employment to men at the same time.

Mr. F. W. BACON (Brewarrina) objected, on the ground that Mr. Wood's remarks were not pertinent to the question.

The CHAIRMAN ruled the remarks in order, and said they wanted to get at what the resolution really meant. It seemed to him that it was a question that should be discussed as fully as possible.

Mr. HARRIE WOOD, continuing, moved as an amendment, the insertion of the words "or utilisation" after the word "destruction."

Mr. J. A. GUNN (Narrandera) hereupon agreed to alter his motion, with the consent of the Conference, making it to read as follows:—"That the destruction or utilisation of rabbits be made compulsory, and the control placed in the hands of the Pastures and Stock or any other local Boards that may be appointed."

Mr. J. ASHTON, M.L.A., said the wording of that would mean that while one person was engaged destroying, another would be engaged utilising. He thought that had the debate been confined to a discussion on the best methods to be employed to eradicate the pest, and every idea having found expression, they would have had a better opportunity of crystallising those ideas into motions. Then they would have made better progress than they were likely to do. The Conference might decide upon certain methods and motions which it would be more expedient to carry out under State control, and which would be better than vesting them in local bodies.

Mr. K. MURCHISON (Girilambone,) thought that they should give the power indicated to no Board, except the Government of the country. He was of opinion that the Government should help them to fence in the land as they were Crown tenants.

Mr. E. D. MILLEN, M.L.A., said, in the motion before the Conference there appeared to him two distinct principles. One was the compulsory destruction, and the other that of local control. He drew attention to the fact that they had in existence a law which permitted of compulsory destruction, and quoted certain clauses of the Rabbit Act, which showed that all occupiers of land should be compelled at once to destroy the rabbits. It had been pointed out that Ministers were not likely to do this so long as there were vacant areas, but the motion provided for it. He considered the motion, unless it was coupled with something else, a dangerous one for the Conference to accept. It appeared to him that it would be making matters worse if there was any attempt to place the control in the hands of Local Government Boards, as by such action those people who had no interest in the destruction of the rabbit would be called upon to pay towards the cost of destroying.

Mr. HUGH MACDONALD, M.L.A., remarked that the representatives seemed to imagine that any resolution passed by them was going to become the law of the land. He thought they were altogether too particular, as all they were required to do was to affirm a principle on broad lines for the destruction of the rabbit, without going into detail.

Mr. J. C. WATSON, M.L.A., suggested that the motion should be divided, for convenience sake, into two sections.

Mr. T. LESLIE (Forbes) opposed the amendment, and expressed himself as being quite at one with the original resolution, which he would support. He repudiated the remark which had been made to the effect that the Pastures and Stock Boards were not representative bodies. So far as the Board in his district was concerned, it had done good work in the destruction of noxious animals. In the Forbes district, under the Rabbit Act of 1883, £10,000 had been contributed to the fund, while they never had a rabbit near them. If the destruction of noxious animals were handed over to the control of Local Government Boards, they would have a repetition of the doings of 1883, when such a large sum of money was frittered away by a Government department. Under the Pastures and Stock Protection Board they had got the machinery to at once, with slight alterations, fetch the work under the control of the Board. The present Rabbit Act must be wiped out, as it had failed to afford the relief required, and had been opposed by all the small holders. That was the position of the Act, and the reason why a great many people had opposed
fresh

fresh areas being proclaimed rabbit infested. There was no simpler or better way as far as he could see as a matter of urgency than to place the destruction of rabbits under the Pastures and Stock Act. He thought it only waste of time going into matters of detail. What they wanted to do was to assert a broad principle, and if they did so every member of the Conference would admit that there was no better way of dealing with the destruction of the rabbit as to give the Pastures and Stock Boards the power of dealing with them as noxious animals. He thought that if the Conference would earnestly consider the matter they would see there was no better way, as he had said, as a matter of urgency, than by placing the matter in the hands of these Boards. He hoped Mr. Gunn would see his way to withdraw his consent to the amendment, as those gentlemen who were best able to judge of the matter would prefer to see the motion in its original form. In his district alone they had been working in this direction since 1892, with various promises from Ministers that legislation in the manner indicated should be introduced, and unless they struck out now, and did not shilly-shally, the districts which could be protected would be overrun with the pest. The objection that he took to the amended resolution was that it was too broad. They required to narrow it down to something as an expression of opinion from men who lived on the soil, to Ministers for legislation, and not to leave it too broad.

Mr. ASHTON, M.L.A., moved the adjournment of the debate, but the Chairman ruled that he was not in order, as he had already spoken.

Mr. MACFARLAND (Hay) moved—"That a sub-committee be appointed to receive notices of motion, and to schedule the same, in order to arrange a business paper and be prepared to proceed with the business of the Conference at 10 a.m. next day.

Mr. ASHTON, M.L.A., seconded the resolution.

Mr. E. D. MILLEN, M.L.A., said they had met to discuss certain business, and not one of them knew what they were going to discuss. If a business paper was printed and handed round in the morning they would be able to arrive at something definite. As it was it was generally considered that time had been wasted.

Mr. F. W. BACON (Brewarrina) said he did not agree with Mr. Millen as to time being wasted. He proposed as a further amendment that they should not adjourn until some definite expression of opinion had been taken in a broad way on Mr. Gunn's motion.

Mr. HUGH MACDONALD, M.L.A., thought they ought to carry the amendment.

On the motion for the adjournment of the discussion until 10 a.m. being put to the Conference, it was carried.

The following were appointed as a sub-committee to draw up a business paper:—Messrs. Gatenby, Leslie, Roberts, MacFarland, Ashton, Millen, Taylor, Gibson, Devlin, and Murchison, with power to add to their number; and five to form a quorum.

Mr. ASHTON, M.L.A., moved—"That members of the Conference be invited to send in notices of motion to the sub-committee by 4 p.m. this day, and that Mr. H. C. Taylor be appointed Secretary to the sub-committee appointed to draw up business paper."

Mr. WATSON, M.L.A., seconded the resolution, which was carried on the voices.

Mr. ASHTON, M.L.A., moved the adjournment of the Conference until 10 a.m. next day, which was agreed to.

The Conference adjourned until 10 a.m. next day.

SECOND DAY.—April 3rd, 1895.

THE Conference met at 10.30 a.m., the Hon. WM. CAMPBELL, M.L.C., in the Chair.

The minutes of the previous sitting were read and confirmed.

The Chairman read the following telegram from the Premier of South Australia:—"The Premier of South Australia regrets that his Government will be unable to send a delegate to the Conference, but desires to be informed of the conclusions arrived at." He also announced the presence of Mr. S. Black, Chief Inspector under the Vermin Destruction Act of Victoria. Communications were also received from Messrs. Baker and Cobb, drawing attention to their rabbit-trapping invention. With regard to the latter communication, he pointed out that it would be quite impossible for them to entertain and discuss such subjects, because there were doubtless thousands of matters of like nature which could be brought under the notice of the Conference. He would ask the Conference, as the first matter of business, to proceed with Mr. Gunn's motion, "That the destruction or utilisation of rabbits be made compulsory, and the control placed in the hands of the Pastures and Stock, or any other Local Boards that may be appointed."

Mr. GUNN said he wished to withdraw his motion until it came in its proper course and as placed upon the business paper by the sub-committee.

Mr. WADDELL, M.L.A., said that as Mr. Leslie had a motion which was practically the same as the one standing in his name, he desired to withdraw his motion, which was, "That in the opinion of this Conference the Rabbit Act of 1890 has failed to attain the end it was passed for and should therefore be repealed."

This was agreed to, and the motion was withdrawn.

Mr. THOMAS LESLIE (Forbes) moved—"With a view to more effectually dealing with the rabbit pest, this Conference is of opinion that the Rabbit Act of 1890 having failed to give the relief required, should be repealed." He said his object in moving the motion was because, so far as his experience went, the Rabbit Act of 1890 had failed entirely in giving any relief to those in non-infested districts, and what was more, it had the effect of creating a great amount of opposition in districts likely to be infested, for the reason that some of its provisions were looked upon by small holders as being arbitrary and unfair. In the district he represented the Government had to extend a large area below Condobolin, on the western side of Forbes, and had given notice that such would be proclaimed, and although it was two or three years since, members of the Government for fear of losing support, had refused to proclaim this area as being rabbit infested. The Government had taken no action to give the necessary thirty days' notice and proclaim these districts infested. Nothing had been done, or so little had been done under the Act, that it was practically useless; and for the purpose of enabling them to devise some effective method for dealing with

with the rabbit question this Act should be repealed, as by so doing time would be saved and fresh legislation might be enacted. He would not detain them by discussing the want of utility in the Act of 1890, which might not be the fault of the Act, but the fault of the administration, and with a view to getting more effective legislation he moved that it be repealed.

Mr. WADDELL, M.L.A., seconded the resolution.

Mr. ALISON (Canonbar) agreed with the motion, but at the same time thought it would be advisable that something should be done about the fencing clauses, and without saying how the fencing should be dealt with he would ask the mover to accept an amendment. He would like, if the Rabbit Act of 1890 was repealed, that special and more distinct regulations with regard to fencing should be introduced, in order that they might not revert to some old Act. He did not propose to discuss the details of the measure, but he thought that provision should be made, as, if the Act was repealed entirely, they would be going back to some old Act, seeing that the motion said nothing respecting fresh legislation. He suggested after the word "view" the insertion of the words "to future legislation."

Mr. LESLIE accepted the suggestion.

The CHAIRMAN asked the consent of Conference to the resolution being amended in the manner indicated.

Mr. HUGH MACDONALD, M.L.A. : I do not understand the amendment.

The CHAIRMAN read the motion as amended, which was, "With a view to future legislation to more effectually deal with the rabbit pest, this Conference is of opinion that the Rabbit Act of 1890, having failed to give the relief required, should be repealed," and explained that the purport of the motion was simply the repeal of the Act of 1890, no reference being made to future legislation. The amended motion provided for this.

Mr. HUGH MACDONALD, M.L.A. : Am I to understand that if the amendment is carried the motion, as altered, will still be open to discussion ?

Mr. GIBSON (Hay) said there was no necessity to put the amendment to the Conference at all, as the mover of the motion had already consented.

The Conference consented to the alteration.

Mr. GIBSON referred to the enforcing of contributions with regard to fencing, and said that if the principle was a right one every person who made a claim should have reasonable facility for getting that claim enforced.

Mr. HUGH MACDONALD, M.L.A., asked whether or not the carrying of the motion would interfere with other motions on the paper dealing with specific parts of the existing Act ?

The CHAIRMAN said he did not think it interfered. If the motion was carried by them that did not repeal the Act, and consequently other motions could be dealt with.

Mr. HUGH MACDONALD, M.L.A. : Exactly so. Then I would like to point out that we should be placing ourselves in a ridiculous position by, on the first vote, carrying a resolution to repeal the Rabbit Act, and subsequently discussing and agreeing to amendments on specific parts of the same Act. I hope the meeting will not pass the resolution.

Mr. SLEATH, M.L.A., said if he understood the thing aright the Conference had been called together for the purpose of making recommendations upon which future legislation was to be based. If these recommendations were adopted, and if they were different to the Rabbit Act of 1890, then such parts of the Act would necessarily be required to be repealed. They set off, first, by repealing the whole Act, and then were going to recommend that certain portions of it should be adopted for fresh legislation. If they decided that the Act should be repealed, not that it should be amended, then, if they proceeded afterwards to make certain recommendations, which would be part and parcel of the Act, in his opinion they would be holding themselves up to ridicule. He admitted that the Act of 1890 had been pretty well a failure, but there were conditions in it that it would be unwise to deal with at the present time. He was of opinion that they had started at the wrong end, and that it would have been better for them to make certain recommendations.

Mr. G. H. GREENE said that he had had some experience in the conduct of similar conferences, for he had been a member of three Rabbit Conferences, and the only effect of those bodies was to gather certain information for the guidance of the Minister, and to suggest alterations. He thought their efforts would be futile if they attempted to make a new Act ; and, in his opinion, the best thing to do was to place before the Minister the views held by the Conference. There was a good deal of common-sense in the arguments adduced by Messrs. Macdonald and Sleath, and he thought that it would be a simple matter for them to give a clear expression of opinion before any decision was arrived at. He considered that for the Conference to affirm the failure of the Act of 1890 was sufficient, without any reference to repealing. Instead of saying that the Act should be done away with, he thought it would be better to hear the views of members.

Mr. WADDELL, M.L.A., disagreed with the views expressed by Messrs. Sleath and Macdonald. He looked at the motion in this way : The whole of the provisions of this Act, with the exception of the one with respect to fencing, had been a failure, and he thought he had the unanimous assent of the Conference to that statement. The Act had been a total failure, and had been of considerable expense to the country, and should be wiped away. When they saw how it had acted, and that no good results had ensued from its passage, then would it not be a wise course to pursue in helping to sweep away such rubbish, and leave the Statute Book clear for a fresh enactment. The removing of the legislation now existing was the first thing to be considered, and as it had been proved to be a total failure, with the exception of that one small part already referred to, let the Government, in introducing new legislation, embody any recommendations which the Conference might arrive at.

Mr. K. MURCHISON (Girilambone) thought the Act had been found a failure, and the sooner they got rid of it the better.

Mr. J. ASHTON, M.L.A., said he intended to vote against the motion, one reason for his doing so being that the mover had not shown why the Act should be repealed ; that, as the mover had pointed out the failure of the Act was due to the fact that its provisions had not been enforced. The most potent argument in favour of the repeal of the Act was the statement that districts had not been proclaimed infested in accordance with the power given to the Minister under the Act. So far as he could ascertain, if that power had been exercised by the Minister, Mr. Leslie would have no fault to find with the Act as it stood to-day

to-day. He concurred with the views expressed by Mr. Greene, that the better course to pursue was not the repeal of the Act. They desired that future legislation should be passed, leaving it to the framers of such legislation to decide as to whether they should proceed to deal with the difficulty by means of an amending Act, or whether an Act should be substituted for it. If the Conference could confine itself to finding out the weak spots in the Act, it would lead to a more coherent issue to the proceedings than would be the case if they commenced their proceedings by repealing the Act and then dealing with certain clauses now contained in the Act.

Mr. GATENBY (Forbes) considered the present Act of no use, and could not see why they should not vote for its repeal.

Mr. FARRELL (Coonamble) suggested the exercise of more unanimity between the large and small owners.

Mr. F. W. BACON (Brewarrina) considered that the present Act had done much good. Mr. Waddell had pointed out that the chief aim of the Act had been in the direction of fencing, and undoubtedly without fencing they could never proceed to destroy the rabbits. Since fencing his run, upon which rabbits had been for the past seven years, they had been able to keep them in check. He thought that if they tried to amend the present Act by means of the adoption of the recommendations of the Conference, they would be doing more good. It was not wise for them to throw away the dirty water before they got cleaner.

Mr. T. BROWN, M.L.A., said he desired to move an amendment on the motion, and would base it on the resolution standing in Mr. Waddell's name.

The CHAIRMAN reminded him that Mr. Waddell's resolution had been withdrawn.

Mr. BROWN, M.L.A., said he desired to move—"That, in the opinion of this Conference, the Rabbit Act of 1890 having failed to attain the end for which it was passed, should be amended so as to embody the suggestions of this Conference." He thought that they were pretty well agreed that the Act, while it may embody some desirable features, had largely failed to meet the end for which it was intended. At the time that legislation was passed the rabbit pest was very largely confined to the Western Districts, where big areas of land were held by pastoral lessees, and the same conditions did not exist in the Central Districts. To apply the provisions of the Act of 1890 to the Central Division would entail a large amount of hardship upon settlers there, and that is the reason why the attempts of the Department to enforce the Act have been blocked and prevented. He thought it would be generally recognised that any attempt to apply the provisions of the Act of 1890 would meet with strong opposition, and it was desirable that they should consider, in their future suggestions and amendments of this Act, these conditions, and make suggestions that would meet their requirements. Under the Act the pastoral lessee could fence in, and could compel every settler within the fenced area to contribute towards the cost of the fence. The question now being discussed had been given notice of and appeared upon the business paper.

The CHAIRMAN said that Mr. Brown was perfectly in order with his amendment.

Mr. BROWN, M.L.A. continuing pointed out, that in order to protect themselves from damage by rabbits settlers were compelled to fence their holdings in, and having done this it would be a great hardship to such holders if they were compelled to contribute to the cost of erection of a barrier fence round some large area. This was the strong objection which had been successfully urged against this Act and prevented its being brought into operation in the Central Division, and to compel them to contribute to a barrier fence would be tantamount to giving them notice to quit. He would point out that whatever this Conference decided there was a power outside that would have a voice in any Act that was framed, as to whether it should operate or not. He did not think it was the desire of members of the Conference that the small holder should be harshly dealt with in any way, and he thought that by the passing of his amendment they would retain those provisions contained in the Act which were workable and at the same time leave themselves room to make such suggestions that would meet the conditions they were now attempting to legislate for.

Mr. G. H. GREENE, seconded the amendment, and in doing so said he had much sympathy with all he had heard from Mr. Brown who he considered had shown an extensive knowledge of the working of the Act. He shared with him the opinion that there was not one present that desired to inflict any hardship on that portion of the community known as selectors. The present Rabbit Act showed that the Board had power to apportion the contributions in accordance with the respective areas of the holdings of such owners in grouped lands, and the amount declared by the Board to be payable by any such owner was a charge equally distributed over and upon all lands within the holding, and a purchaser of such holding or any portion thereof was bound to inquire as to the existence of such charge. He had had considerable experience and he knew that such cases as mentioned by Mr. Brown might occur. He thought that latitude should be given to the Board so as to enable it to deal with such cases. As one who had been anxious for years to have his own district proclaimed he desired it to be understood that he was equally anxious to guard against injustice to any man. He desired that the Act should in every case be dealt with on its merits and amendments suggested so as to do away with any injustice that may be worked under its present conditions.

Mr. ALISON (Canonbar) thought that everyone present recognised that the fencing clauses should be amended. Could anything good be shown in the present Act. Then let them pass the resolution and propose what they would like to see in the next Act.

Mr. HUGH MACDONALD, M.L.A., objected to the Act being repealed. There was an amendment before the Conference and he desired to point out that both in relation to the motion and the amendment the whole matter resolved itself into a discussion on the 20th clause. He had a motion on the paper which specifically dealt with this clause, and he would ask that the members of the Conference would restrain themselves until his motion came on.

Mr. MACFARLAND (Hay) reminded the Conference that their time was precious, and although they appreciated the intention of the Minister in consenting to Members of Parliament being present to assist them with their advice, still he claimed the indulgence of the meeting to mention that if all these things could be threshed out in their own way much time would be saved.

Mr. OAKDEN, (Cobar) opposed the amendment. He came from a district where they had had unfortunate experiences. If they voted for the repeal of the Act it would show that they condemned it and deemed it unworkable, with the exception of the fencing clauses, which also required amendment.

Mr.

Mr. SLEATH, M.L.A., did not intend to deal with the amendment, but he entered his protest against the remarks made by Mr. Macfarland. He considered every member present had the same rights as each other.

The CHAIRMAN drew attention to the fact that Mr. Sleath's remarks were irrelevant.

Mr. SLEATH, M.L.A., said that certain members desired to conduct the business in their own way, and asked the Chairman in future to try and prevent such remarks as those which had been made. He thought he had a right to ask this, and also thought the Chairman had no right to allow such remarks to pass without reproof.

The CHAIRMAN said he thought members of the Conference would not allow any personal matter to upset the deliberations, and he hoped Mr. Macfarland would apologise to the meeting. He thought the meeting would stand by their Chairman. As Chairman he was there to maintain order, but he would not put up with insult.

Mr. MACFARLAND regretted that his remarks had caused any unpleasantness.

Mr. SLEATH, M.L.A., asked whether Mr. Brown's amendment would have the effect of shutting out any other amendments?

The CHAIRMAN: Certainly.

Mr. LESLIE (Forbes), in reply, said the arguments adduced against the resolution were, as far as his intelligence went, not very forcible, and he had not heard one good reason advanced why such a motion as his should not be carried by the Conference. Everyone who had spoken had admitted the fact that the Act had been a failure, some even going so far as to say that the clause in regard to fencing was the only one worth considering. Its weak points had been shown, and the general opinion seemed to be that it should be removed from the statute-book. If they intended to ask for the repeal of the Act, and replace nothing in its stead, then he could understand opposition; but they did not propose to do that. Later on they proposed to fetch in a series of resolutions, which would give those gentlemen anything they wanted in the shape of fencing, and which would deal with all in a more equitable manner than they were dealt with under the present Act. Mr. Bacon had told them that the Act of 1890 had worked well, and in the same breath said they were dead against the fencing provisions, which they could not enforce. What then, he asked, was the good of keeping an Act which did not afford relief, and enable them to recover for fencing. Mr. Brown, in moving his amendment, spoke of the injustice likely to be done to small holders. To attempt to amend an Act which was so full of faults would be a work that would occupy the Legislature for months. They wanted to administer their own affairs, and if the stockowners of the Colony were not capable of managing their own affairs then God help them. In working for this object, he thought they, the stockowners, ought to be heard, and their views should be taken before those of men who knew nothing of the Act, and who had not contributed a penny towards its administration. He hoped that the motion would be carried by a large majority, for the reason that if the Conference showed that the views of the stockowner were decidedly opposed to the continuance of the Act it would very much strengthen the Minister, and enable him to introduce to Parliament an Act which would effectually deal with the rabbit. He thought the men who lived and worked on the soil would support the motion almost to a man.

The Chairman then put the amendment.

Mr. ASHTON, M.L.A., desired to intimate that as he was not a representative for any district, it was not his intention to vote.

The amendment was negatived by 30 votes to 10.

The CHAIRMAN then put the motion, which was carried.

Mr. LESLIE suggested that before the next resolution was discussed, it being then a quarter to 12 o'clock, they should adjourn until 2 o'clock, to enable those who had notices of motion on the business-paper to have an opportunity of rearranging their motions, so as to bring them within reasonable dimensions.

The CHAIRMAN thought it would be better to let the business proceed on its ordinary course.

Mr. GUNN moved—"That this Conference is of opinion that the matter of dealing with the rabbits be placed in the hands of the Pastures and Stock Boards until they are superseded by more representative bodies." He thought the matter had been pretty well discussed on the previous day, and that everybody was convinced of the importance of the destruction of the rabbit under a system of local control. The squatters and the Government had in years gone by failed to cope with the pest, and it was about time that something should be done whereby local bodies, who understood the method of dealing with the evil, should have control of the operations. He was opposed to the control being left to a body which did not exist, such as local government control.

Mr. WILKS, on a point of order, contended that there was no room for discussion, the matter having already been dealt with.

The CHAIRMAN ruled the discussion in order.

Mr. GUNN, continuing, said the Local Government Act was an Act which did not exist, while the Pastures and Stock Boards were ready to take action in any fair share of legislation. He therefore moved the resolution.

Mr. McCOLLOUGH seconded the resolution.

Mr. MORGAN drew the attention of the Conference to several clauses in the Pastures and Stock Act. In the first place, noxious animals, such as marsupials, &c., were dealt with under the thirteenth section thereof; that embraced the rabbit pest. Under the Pastures and Stock Act they could necessarily deal with the rabbit pest; but if they saw any better method of conducting the movements in this direction, then it could be adopted afterwards. At the present time he thought their requirements were embodied in that Act. The people in his district did not want other legislation: they would rather conduct the business in their own way; and if they failed to conduct it properly, let the neighbouring boards come in and show they were not doing their duty, and do it for them. They had been dealing with the rabbit pest for ten or twelve years.

Mr. IRVING CAMPBELL desired to move an amendment upon Mr. Gunn's motion, which the Chairman thought unnecessary, and, upon the suggestion of several members, he subsequently withdrew.

Mr. MURCHISON (Girilambone) desired to move that the words "Pastures and Stock" be struck out, and "Local Land" substituted. It was a grass question they had to deal with. They knew that a considerable amount of money had been spent on this matter, and notwithstanding that such had been the case he ventured to say they had not done very much. He thought they would be able to see their way to
falling

falling in with the amendment he had proposed, and that they would be able to kill the rabbits if they gave the power to do so into the hands of Local Land Boards. As these bodies had the machinery in their hands, the Conference could not do better.

Mr. H. C. TAYLOR seconded the amendment.

Mr. OAKDEN (Cobar) was strongly in favour of the advisableness of the matter being placed under the control of the Pastures and Stock Boards.

Mr. SLEATH, M.L.A., said that in the event of the amendment being defeated he wished to give notice of an amendment to the effect:—"That the Pastures and Stock Boards be omitted, and that the control be placed in the hands of Boards." This would agree with certain resolutions that were already on the paper providing for the appointment of Boards.

The CHAIRMAN reminded Mr. Sleath that only one amendment could be moved to the resolution, and a verbal amendment could be moved on that, and as he had previously endeavoured to impress upon members of the Conference that would be the end of the question.

Mr. SLEATH, M.L.A., said he understood the Chairman to say that after one amendment had been moved that that would close the question altogether.

The CHAIRMAN stated that they could not have any more than one amendment, for the reason that if they had they would not be able to get along at all. As a matter of fact, if he were to permit such a course there would be no finality to the discussion.

Mr. KING, M.L.C.: I understand that when you have taken the vote—say, that the meeting agrees to omit the words "Pastures and Stock,"—then comes the question, what words are to be inserted in place of them? When the first part is disposed of, is it competent for the Conference to propose another amendment?

Mr. WADDELL, M.L.A., remarked that if they debated that matter they would be adopting an interminable method of procedure.

Mr. SLEATH, M.L.A., said it was contrary to the procedure of the Assembly, and not in accordance with the ordinary rules of debate. He moved the omission of the words "Pastures and Stock." This had already been moved, but there had been certain other words added, and he merely required the omission of these words. If the Chairman could point out to him how he could possibly move an amendment according to his opinion on the question then he would be satisfied, otherwise he would refuse to vote at all.

Mr. T. BROWN, M.L.A., on the point of order, pointed out that so far as he understood there was a Pastures and Stock Board, a Local Land Board, and a Special Board, and they had to decide to which body it was wise for them to hand over the power of dealing with the rabbits.

The CHAIRMAN said: The original motion they already knew, since the moving of which Mr. Murchison proposed as an amendment to strike out certain words. He proposed to put the question in the usual way, which was that the words proposed to be left out stand part of the question, and it followed that if those words were left out then there was a blank created, and it would be within the province of the Conference to deal with that blank as they pleased.

The amendment on being put was negatived, and the original motion was carried on the voices.

Mr. LESLIE (Forbes) moved:—"That a short amended Bill be added to the Pastures and Stock Protection Act, bringing the rabbit pest under the jurisdiction of the Pastures and Stock Boards, and that these Boards be empowered to make special levies for the destruction of rabbits, and the erection and maintenance of rabbit-proof barrier fences where necessary, such levy not to exceed $\frac{1}{2}$ d. per head per annum on sheep, and 3d. per head on large stock." He desired to strike out of his motion all the words after "that" down to "jurisdiction of."

Mr. BACON (Brewarrina) seconded the motion.

Mr. LESLIE thought that it was necessary that the power should be given to the Boards to raise a further fund should circumstances require it. He did not think opposition need arise on that portion of the resolution, for the reason that if they voted against it they would be increasing the burden of the stock owner. He would not detain the Conference longer, but would leave it to the members to discuss.

Mr. BACON said he had some experience of the working of the Boards in Queensland, where the system worked very well. He supported the motion.

Mr. LANE considered that it was not fair for them to have to pay. He was one of those who believed that it was only fair for all classes to bear the burden, and thought they should all be dealt with alike. He considered there was no necessity for this compulsory taxation. If he wanted to fence in his own land, well and good; but he could not see the justice of being compelled to contribute towards fencing in a large landholder as well. He did not want to say anything against the large landholders, but thought he might be permitted to say that in justice a small holder should be equally fairly dealt with.

Mr. T. BROWN, M.L.A., was strongly opposed to the motion. Which were the lands which were chiefly affected? They were the lands with little or no stock, and the resolution proposed to put the whole charge of deciding and dealing with the rabbits on the less infested areas. He agreed with the last speaker in saying that the effect of the motion would be to create great hardships to the small holders who had their lands heavily stocked. He proposed that, after the word "necessary," to insert "that such levy for rabbit destruction be a *pro rata* charge on the lands protected."

Mr. T. IRVING CAMPBELL (Mount Ida) seconded the amendment.

Mr. OAKDEN (Cobar) wished to move another amendment, whereupon—

The CHAIRMAN reminded the Conference there would be no finality if so many amendments were to be permitted.

Mr. OAKDEN said that if they accepted Mr. Leslie's motion a large area of country which was perpetuating the rabbit pest would be allowed to go "scot free." He thought the machinery for collecting funds on stock had worked well for years past, and they ought to stick to that. He thought people ought to contribute, and that a tax upon unstocked and abandoned country would meet the case. He agreed with the principle of the assessment of stock, and considered that it would be the best plan. At the same time he thought abandoned country should be made to contribute its quota.

Mr. MORGAN (Wentworth) said that it was true there was a good deal of open country in the district he represented, and the assessment was raised by a levy on stock alone. Therefore the owners of stock had to pay the whole of the expense of the working of the Act, with the exception of a small subsidy from Government. Some years ago the funds locally raised were subsidised £ for £, but it had been narrowed down until now it only amounted to 4 per cent. The Government at the present time could not see their way to increase the subsidy, so that if the Rabbit Act was thrown on their hands they would have a great deal more expense.

Mr.

Mr. HUGH MACDONALD, M.L.A., entered his protest against the motion. It was incomplete, inasmuch as it did not provide that the State should undertake to bear its share of the obligation.

Mr. ASHTON, M.L.A., thought the motion, and the amendment also, were open to grave objections. The motion provided a levy to meet the case of fencing in connection with the rabbit destruction at a half penny per head per annum on sheep, and 3d. per head on large stock. He provided, as an alternative means of taxation, a taxation of the lands according to value; but he would like to point out that the lands most heavily infested will be less in value, and secondly, in the amendment it would contribute less to the cost of carrying on the work of rabbit destruction. The principle for levying was to erect a barrier proof fence, which, he took it, was for the purpose of separating one district from another. The people on the side where the rabbits were not would benefit mostly by this arrangement, while, if there were no barrier fences, the rabbits would have a larger area to travel over, and there would probably be fewer rabbits in the infested districts. Undoubtedly the men who were protected by barrier fences from the rabbit invasion were the men who benefitted most by this, and the effect of rabbit fencing was to drive the rabbits back upon those who had not protected their holdings. Whatever way they looked at the question the objection still remained that the advantage was not to those people on the rabbit side of the fence, but to those who were on the side of which it was not rabbit infested. He did not intend to give any vote on the question before the Conference, understanding, as he did, the object of the Conference was to instruct the public and the Parliament as to what was requisite.

Mr. BACON offered a few words in explanation of the amendment. The gentleman who had spoken seemed to be under a misapprehension as to the working of the barrier proof fencing. He had a property in Queensland managed by one of these Local Rabbit Boards, and the first step the Board took in connection with the property he referred to was to make a levy to erect a barrier fence on the western boundary of the district. This fencing was paid for by the contributions of those living on the eastern side, which was the protected side, of the barrier fence.

Mr. FISHER (Murrumbidgee) thought the motion one that should receive careful consideration. Previous to this motion there was one carried on the motion of Mr. Gunn. Having carried this resolution, how could the Pastures and Stock Boards be expected to conduct operations unless supplied with the sinews of war? The amendment proposed by Mr. Brown was most indefinite, whereas with representative men on the Pastures and Stock Boards, though in many cases he thought they were not representative, he thought better work might be done, and to enable it to be done money necessary to carry on the operations must be forthcoming.

Mr. A. ROSS (The Hume) supported the motion, and said that they would be willing to pay their share in the taxation necessary for the destruction of rabbits. He suggested that if Mr. Brown would withdraw his amendment he would propose a taxation on stock in districts where the land was stocked.

At this stage the Conference adjourned until 2:15 p.m.

On resuming, Mr. WILKS (Menindie) said that he was opposed to the resolution and also to the amendment. He looked upon the matter as one of national importance, and until the State as landlords took some means to render their property of the value it should be to the tenant all he had to say was that in taxing themselves they were wrong. He was speaking now particularly for the Eastern and Central Divisions. Speaking on behalf of the Western District, which was a large division, and which was probably more affected by the rabbit pest than either the Eastern or Central Divisions, they had burdens in the way of rent, and when the rent was assessed by the Minister for Lands the destruction of rabbits was never taken into consideration. The land was assessed as if there was no such thing as a rabbit on the land. The land was owned by the nation, and therefore the nation should help to protect its property; and unless something was done to give them state aid, no burden ought to be put upon the lessee, no matter what position he was in. He represented hundreds of thousands of acres owned by small holders, and millions of acres owned by the squatters, and they were one and all opposed to anything in the shape of a burden being put upon them until the State found some way to assist them. He would ask the Conference to take this into consideration, and negative both the motion and the amendment. What was the use of giving powers to Boards that would not make use of them when they had them? He contended that there was no use, and in negating the motion they would be acting in the right direction. There could be no doubt that landholders should bear a portion of the burden; and, if the State reduced the rents, the whole of the burden might be borne by lessees, but until some means were enforced to reduce the present difficulties under which lessees and holders generally laboured he felt that they had no right to suggest the imposition of additional burdens. It had been pointed out that money collected by the Pastures and Stock Boards was subsidised by the Government, but there was no law to compel the Government to subsidise local contributions, and it seemed to him that they had to depend largely upon the whim of the Government for the time being as to what extent this subsidy should go to, or whether there should be any at all, and what they now required was a guarantee that they should be subsidised to a fair amount. A mean 4 per cent. would not help them out of their difficulties, and, as a representative of the Western Division, he had no hesitation in affirming that the burden of taxation on both large and small holders was too much at the present time, and accordingly would oppose both the motion and amendment.

Mr. LESLIE desired to ask a question. He wished, with the permission of the Conference, to withdraw his motion with a view to substituting another in its place. If the Conference permitted him to withdraw he would indicate the direction a fresh resolution would take.

The CHAIRMAN said he could do so if the Conference consented, but reminded him that there was also an amendment, and that also it would be necessary to withdraw.

Mr. MILLEN, M.L.A., thought that under the circumstances they should deal with the question at once.

Mr. GREENE asked whether it would be competent for any other amendment to be moved, provided the Conference agreed to Mr. Leslie's request.

The CHAIRMAN said that an amendment had already been moved.

Mr. BROWN, M.L.A., said that if Mr. Leslie was permitted to state the nature of the proposed alteration he might be enabled to see his way clear to withdraw his amendment.

The Conference objected to the alteration of the resolution.

Mr. LESLIE, replying to the arguments used in opposition to his motion, said that it seemed to him that a great deal of the opposition came from persons who were not sufficiently up in the working of the Pastures

Pastures and Stock Act. For instance, he would point out that where a district was not rabbit-infested there would be no necessity whatever for the Board in that district to make a special assessment for putting up rabbit-proof fencing. His resolution simply gave the Board power that where they required the money for special purposes such a levy could be made. An objection had been taken on the ground that those outside the fencing would be called upon to contribute equally with those inside. This was a mistaken notion, as under the Pastures and Stock Act there was the power of appeal, which was sufficient safeguard he thought. If any person so assessed was injured by these levies for rabbit fencing he had the power to appeal to the Board against such assessment being made, and he did not think any Board would be so unjust as to require a man to contribute towards a thing which did not benefit him. Then again it was stated that they were asked to impose additional taxation upon themselves. There had been a general expression of opinion in the district he came from that people, rather than be ruined, were actually prepared to tax themselves. The Minister had told them that he would, as far as possible, carry out the recommendations of the Conference so long as they did not ask for too much from the Consolidated Revenue, and in a matter of this sort the cost would be so trifling to each individual holder that it was hardly worth quibbling over. In his district they had land at the present time upon which it was intended 30 miles of rabbit-proof net-fencing should be erected, and it was contemplated that this would be done by contribution, and the difficulty which they had to contend with was, that where one man would contribute four or five who derived equally as much benefit would not. If they did not get power to enable them to protect themselves they would find that there would be a great many men that would shirk their responsibility. He thought it unnecessary to proceed further, for the reason that he considered the matter had been fairly and thoroughly discussed.

The CHAIRMAN then put the amendment, which was to omit all the words after the word "necessary," which was agreed to.

Mr. BROWN, M.L.A., then moved the insertion of the words "and that such levy for rabbit destruction be a *pro rata* charge upon the lands protected" in lieu of those previously struck out.

The words were not inserted.

The amended motion,—“That the Pastures and Stock Boards be empowered to make special levies for the destruction of rabbits and the erection and maintenance of rabbit-proof barrier fences where necessary”—was agreed to, 20 voting for and 13 against the resolution.

Mr. FISHER (Murrumbidgee) said that the motion seemed to him that the resolution, as carried, left it in the power of the Pastures and Stock Boards to charge what they liked. He desired to know whether they could limit the powers of the Boards in this direction.

The CHAIRMAN: No.

Mr. FISHER: Then I say the meeting has not understood what they were voting for.

The CHAIRMAN remarked that he had tried to explain the meaning of the resolution, and he was sorry if he had failed to make himself clear.

Mr. BROWN, M.L.A., said the Stock Boards were an improvement upon the present arrangements, inasmuch as they had the machinery for the destruction of rabbits at their command; but he thought the question was one that required special consideration and special dealing with, and that the better plan would be to place it under Boards so charged with the work of carrying out the destruction. He contemplated that these Boards would be limited by the land-holders within the area of the separate districts to the extent of the levy to be imposed for the proper carrying out of the duties devolving upon them. Much had been stated in favour of the Stock Boards, but they knew that these Boards generally represented large class interests, whilst the smaller holders had not been so well represented. The rabbit pest, in his opinion, was a special matter which required special attention, and instead of overloading the Stock Boards it would, in his opinion, have been better if separate Boards could be appointed to deal with the question in the manner best suited to the different localities.

Mr. MURCHISON agreed with the remarks of the last speaker, as he considered the appointment of special Boards would be a step in the right direction.

Mr. BROWN, M.L.A., moved, “That for the purpose of the more effective extermination of the rabbit plague future legislation should contain the following provisions:—

- (1) The subdivision of the Colony into suitable and conveniently sized rabbit-infested districts.
- (2) In order to ensure the more effective destruction of the pest, said districts may from time to time be further subdivided.
- (3) The land-holders of such districts shall be empowered to elect a Board annually; said Board to be charged with the work of protecting the district from outside invasion of the pest, and enforcing such provisions as may be determined upon to ensure the eradication of the pest within said district.
- (4) The Board shall be empowered to enclose the district with a rabbit-proof fence, and maintain same in good order and condition. The cost of erection and maintenance of said fence shall be raised by a *pro rata* charge upon the lands within said protected district; the Board to be armed with the necessary powers to enforce the payment of these *pro rata* charges.
- (5) Adjoining districts or private land-holders shall only be required to contribute towards the cost of the erection of rabbit-proof fences where the lands are directly benefited by said fences.
- (6) The land-holder, who has or who may hereafter enclose his holding with the prescribed rabbit-proof netting, shall be required to contribute towards the erection or maintenance of a district fence. Provided the Board may require such exempted holder to keep his fence in good order and condition whilst so exempted.
- (7) The Board shall also be charged with the eradication of the pest within such districts, and shall be empowered to enforce such regulations or methods of extermination as may from time to time be agreed upon.”

Mr. GIBSON (Hay) suggested that the subsection should be taken *seriatim*, which was agreed to.

Subsection 1 was moved by Mr. BROWN.

Mr. GATENBY (Forbes) drew attention to the fact that subsection 1 was somewhat like motion 6 on the business paper, and he moved that No. 6 be substituted for the motion.

Mr. LESLIE seconded the amendment.

Mr. ROSS did not think the amendment in order, as it partook of the nature of a fresh resolution.

Mr. ASHTON, M.L.A., on the point of order, contended that the amendment was entirely irrelevant. The resolution, so far as he could understand, referred purely to geographical districts. The amendment had nothing to do with that special section, and if an amendment of the kind was to be proposed it should be proposed when subsection 3 came on for discussion.

Mr. GATENBY withdrew the amendment.

The CHAIRMAN then put the first subsection of the resolution,—“The subdivision of the Colony into suitable and conveniently sized rabbit-infested districts.”

Mr. A. ROSS (The Hume) opposed the motion. They had already a Land Board and a Pastures and Stock Board, and by agreeing to the subsection proposed they would be affirming the desirableness of the formation of a host of other Boards to control operations in these proposed new districts. He thought that the Conference should not agree to this as, in his opinion, one Board could do the whole of the work.

The CHAIRMAN explained that the idea was to make the operations more effective.

Mr. ROSS considered that the actual meaning of the proposal was the election of a new Rabbit Board.

The CHAIRMAN: There is nothing in the subsection to do with the Rabbit Board.

Mr. MORGAN (Wentworth) said it appeared to him that in effect the resolution negatived the work already done. It had been proposed and carried by the Conference that the matter of dealing with the rabbits should be placed in the hands of the Pastures and Stock Boards.

Mr. GIBSON (Hay) thought the motion should be carried as a matter of form. Experience might show that it would be better for the Rabbit Act to be administered under Local Government. As it was, by agreeing to the resolution, they committed themselves to nothing.

Mr. ALISON (Canonbar) thought the resolution altogether unnecessary. The present Boards were already defined on the maps and they were working alright, and where was the necessity for interfering with them. Taken as a whole, the motion was practically a Bill in itself.

The subsection having been put, was negatived.

Mr. BROWN, M.L.A., desired to withdraw subsection 2, and moved subsection 3.

Mr. GIBSON (Hay) said he was one of those who was not in favour of the Pastures and Stock Board being the only body to administer the Act. They had never had an opportunity of giving a vote as to the ultimate Board which was to administer the Rabbit Act, and only until there was a more representative body they had decided that the Pastures and Stock Boards should perform the duties.

Mr. GATENBY (Forbes) again desired to move motion No. 6 on the paper as an amendment.

Mr. ALISON objected to Mr. Gatenby bringing in his motion at this stage.

Mr. CUNNINGHAM (A.M. and A. Co.) seconded the amendment.

The CHAIRMAN suggested that the resolution had better be postponed until the following day, in order that it might be put into proper form. He thought it hardly advisable to pass a resolution in this way.

Mr. WILKS (Menindie) pointed out that the word “such” after the words “land-holders of” rendered the subsection of no use. As it was, it meant nothing, and was altogether unintelligible.

Mr. BROWN, M.L.A., proposed to amend the subsection by putting in the word “stock” after the words “land-holders of” instead of “such,” so as to make it read “the land-holders of stock districts may be empowered,” &c.

Mr. MORGAN (Wentworth) said that the subsection was already provided for, as the Pastures and Stock Board was elected annually.

The CHAIRMAN thought it a pity to pass a matter of such importance in a hurry. He thought it would be better to have it postponed until they could substitute some other section that would be more in accord with the ideas of the Conference.

Mr. BROWN, M.L.A., said that if it was the will of the Conference they could thresh the matter out on Mr. Gatenby's motion, and he would, therefore, with the consent of the Conference, withdraw the whole of his motion.

Consent was given, and the motion withdrawn.

Mr. GATENBY (Forbes) moved, “That the Colony be divided into Rabbit Boards, constituted as follows:—Three or more sheep districts to each nominate one of their members, and the members so nominated to constitute an Executive Committee of the various Boards, into whose hands shall be delegated the special administration of the funds collected for the purposes of rabbit prevention and destruction.”

Mr. D. TULLY (Hillston) seconded the motion.

Mr. GATENBY (Forbes) said that in Queensland the system was working admirably, and they were able to raise money and carry out their barrier-proof fences, and it was that principle that he wanted introduced here. He mentioned that he had tried in vain in Sydney to get a copy of the Queensland Act so that he might further elaborate his motion and have it placed before the Conference. He felt sure they would consider the motion with favour, as he was confident that it would work well.

Mr. ALISON (Canonbar) scarcely thought the motion should pass. Supposing a man thoroughly understood one district, it did not follow that he would understand another, and the carrying of the motion either meant paid men to travel round and see the districts or the work devolving upon one of the members of the present Pastures and Stock Boards. With regard to the destruction of rabbits, surely it was much better to let each district deal with its own, as in that case every man would do what he considered most advantageous for his own district. He hoped that the Conference would not carry a motion which would have the effect of entailing new machinery and more expense.

Mr. T. IRVING CAMPBELL (Mount Ida) thought the members of the Boards should be elected by the land-holders of the district, and should be charged with the administration of the Act.

Mr. A. ROSS (The Hume) thought that encouragement should be given to every individual to fence his land in. He considered the Pastures and Stock Boards had the best machinery to assist in the destruction of the rabbit.

Mr. WILKS (Menindie) maintained that the Pastures and Stock Boards in the Western Division would be utterly unable to erect fences, as the attempt to raise a levy for the purpose would be opposed all round, owing to the different conditions which existed out west as compared with those of the Eastern and Central Divisions. Therefore, in his opinion, the question required to be fought out in a broader manner.

Mr. MURCHISON (Girilambone) moved the adjournment of the discussion.

Mr. FISHER (Murrumbidgee) seconded the motion for adjournment.

Mr.

Mr. GIBSON (Hay) objected to the adjournment, as he had travelled all the way from Hay, and did not want to be kept in Sydney longer than was absolutely necessary.

The motion for adjournment was negatived.

Mr. ASHTON, M.L.A., asked whether the mover of the motion under discussion intended the executive body to be one that would supersede the Pastures and Stock Board, as provided in the resolution moved by Mr. Gunn, and agreed to by the Conference. If not, it seemed to him that they appeared to conflict.

The CHAIRMAN drew attention to the fact that the mover had already spoken in reply, and put the motion, which was lost on the voices.

Mr. MURCHISON (Girilambone) again suggested an adjournment, in order that the Conference might accept an invitation to inspect some rabbit-catching contrivances at Kirribilli Point.

Mr. GREENE explained that the members of the Conference could go over and see these appliances, and then come back to the Conference and proceed with their deliberations. He would be sorry, however, to interfere with the progress of business.

Mr. CUNNINGHAM strongly objected to the Conference being made a medium for advertising.

Mr. FISHER seconded the motion for adjournment, which was negatived.

Motion No. 7 standing in Mr. Leslie's name, as follows:—"That the Government shall define the boundaries of each Rabbit Board, but not until it has had an expression of opinion as to the proposed Rabbit Board from the various sheep districts interested," was withdrawn.

Motion No. 8, standing in Mr. Campbell's name, as follows:—"That the Rabbit Bill should contain provisions for the appointment of Local Boards, elected by the landholders of each district, to whom would be entrusted the administration of the Act," was withdrawn.

Mr. GUNN (Narandera) moved: "That the local controlling authorities should have the power to make destruction compulsory in their respective districts." He thought the Local Boards should have the power of making the destruction of rabbits compulsory in districts when they considered it advisable. He thought the motion a necessary one, and expressed the wish that the Conference would adopt it.

Mr. ALISON (Canonbar) seconded the motion.

Mr. RYAN (Sturt) pointed out that on some holdings in the Western Division there was a large portion of the resumed areas cut off from the stations, which they could not make any use of at all. He hoped the Boards would try to meet these cases in some shape or form.

Mr. OAKDEN (Cobar) said that the Boards for the administration of the Act were virtually of their own creation, seeing that they were chosen by their respective districts, and should be so acquainted with its requirements as to be able to administer in accordance with the circumstances of the district.

Mr. HOUGH (Gunbar) said that to compel him to contribute his quota towards the destruction of rabbits would be inflicting a great hardship upon him in common with many others living near him. The rabbits encroached upon his place in thousands at a time, and it was only by netting in small areas that they could live. He had tried poison, and had killed them in thousands, but unless they had an army of men almost continually on the watch it was an impossibility to keep them out. Nine years ago they erected a barrier fence, and it did not keep them out, as they were as bad on one side as the other. He was anxious to keep the pest down, but was not in a position to pay additional taxation, and many others were similarly situated. If any member of the Conference could devise a scheme to keep them down he would willingly do his share. He had heard of cases near to where he lived where the fences over night were intact, and on the following morning were found to have holes in them, and rabbits in the enclosure, the holes having apparently been bitten by the rabbits. On one station he had himself seen the rabbits going, some over, some under the netting, and some through the netting, and in sandy country it was utterly impossible to do more than temporarily check their inroads. Netting had certainly proved of temporary benefit, but it was not effectual, as he had proved by the fact that when he took up his holding four years ago there was scarcely a rabbit, and now, in spite of wire netting, he himself had poisoned thousands, and was at that moment a ruined man through the pest.

Mr. WILKS (Menindie) rose to a point of order. He thought the speaker should confine himself to the question before the Conference.

The CHAIRMAN said that Mr. Hough's remarks were not strictly within the limits of the discussion, but he was sure members were not going to restrict information that was likely to assist them in arriving at satisfactory conclusions.

Mr. HOUGH, continuing, said that he had found that the people who had been out in his district seven years were unable to cope with the pest, and he could assure the Conference that in order to make a living those very holders were compelled to leave their holdings and take work elsewhere, whenever the opportunity offered itself. One man who lived near him had about 7,000 acres and he was working and toiling with his family yet, although he had lost five or six thousand pounds. There were other evils which they had to contend against, such as losses by fluke and anthrax. He had known those evils to take away nearly all his sheep, but he could always successfully cope with these, but the rabbits were too much for him. He did not wish to discourage others if they thought they could deal with the evil and keep it down.

Mr. GIBSON (Hay) considered the motion one of the most important the Conference had to deal with. They would find one man in favour of compulsory killing and another in favour of making it optional. If they made killing compulsory, and if the Crown could evade its responsibility, they would be making it a difficult matter for the unfortunate landholders whose property had been destroyed. That, in his opinion, was the difficulty they had to contend with in the matter of compulsory killing. What was the position of the man who had to kill his own and kill his neighbours as well? The Boards could exercise a certain amount of discretion in enforcing their powers, otherwise unfortunate men would be driven through the Insolvency Court, through the sole reason of their being in the neighbourhood of badly infested country.

Mr. BROWN, M.L.A., thought there was a great deal in what the last speaker had said about compulsory killing. There was no doubt on the one hand the Boards must have certain powers to compel landholders to take active measures towards the destruction of the pest. On the other hand, if compulsory killing were to be enforced immediately, it would mean that a lot of the holders would have to quit at once. He thought that under the control of Local Boards the conditions would be better understood and better dealt with than under the control of authorities such as existed at the present. In the back country, some time ago, there was considerable consternation through the working of the barrier-proof fences. They had

been

been trying phosphorized honey and other things, and they had yet to work out the problem of how to destroy the rabbit pest as cheaply and thoroughly as possible, and until they could do that it would be injudicious to enforce drastic measures with respect to the destruction of the pest.

Mr. WILKS (Menindie) said that the Pastures and Stock Boards possessed all the powers that Mr. Gunn had made out, and thought those Boards could not effect any more than they had done in the past.

Mr. GUNN, in reply, said it appeared to him that there had been some objections raised to the effect that making the destruction compulsory would create hardships. His motion made it discretionary whether they should make destruction compulsory or not, and he felt that there was not the slightest danger of any measure being enforced which would impose hardship on the holders. They were bound to carry out the work in the interests of the whole.

The motion was carried unanimously.

Motion No. 10, in Mr. Morgan's name, as follows:—"That the destruction of rabbits be compulsory, and that the compulsion be within the discretionary power of the Pastures and Stock Protection Boards throughout the Colony under the existing Pastures and Stock Protection Acts," was withdrawn.

Mr. D. TULLY (Hillston) moved, "That with reference to the large extent of abandoned areas in the Colony the Crown should be called upon to destroy the rabbits existing thereon, or take such steps as shall ensure the re-occupation of the country upon any terms, provided there is a clause in the lease strictly enforcing the destruction of rabbits." He had a list of the acreage of the abandoned areas in the Hillston district and these areas he contended were, so far as the rabbit pest was concerned, a standing menace to the whole of the holders around. These areas were simply no man's land, and were a scourge to the district, affording as they did a breeding ground for the pest. He thought that some measure should be included in any legislation on the question which would embrace what he intended in his motion.

Mr. HOUGH (Gunbar) seconded the motion.

Mr. A. ROSS (The Hume) suggested an adjournment of the debate until the following morning.

The suggestion was not accepted.

Mr. ROSS, speaking to the motion, said he was a thorough believer in rabbit-proof fencing, and did not think rabbits would ever be put down without the use of it. He thought the Government had control of such a large amount of land that in justice to holders they ought to be compelled to keep the rabbits down on it. He believed the pest could be kept down if the destruction was made compulsory and the Crown took its share of responsibility. Pressure ought to be brought to bear upon the Government to lease these areas of abandoned and unoccupied lands upon any terms.

Mr. GIBSON (Hay) supported the motion. In the Hay district they had a large area of abandoned country within 25 miles of the railway which showed that it was situated in a very central position. Farmers there had been completely eaten out by the pest, and the moment they commenced to cut their crops, it was a race as to which should have the most, the farmer or the rabbits, and the latter generally came out best. The only way out of the difficulty was for the Government to let the land which was a standing menace to the neighbourhood, and to the whole Colony.

Mr. CUNNINGHAM (A. M. and A. Co.) asked the mover to insert in his motion the words "reserves from leases and commons."

Mr. WILKS (Menindie) considered the Crown was in the same position as private owners in all matters under the Rabbit Act.

Mr. MORGAN (Wentworth) supported the resolution. In the western district they also had large areas of abandoned country. He considered that Mr. Tully had put a fair and reasonable motion before the Conference, and he had much pleasure in supporting what the mover had said. It was very necessary that the people should be assisted in this respect, and that these large areas should no longer continue as breeding grounds for rabbits.

Mr. OAKDEN (Cobar) pointed out that the amendment did not exactly embrace the whole of Mr. Tully's motion, because they were taking steps to ensure the occupation of this abandoned country. He would support the motion as his district also contained a very large area of abandoned country south and west of it which was simply breeding ground for rabbits, and wild dogs as well. It was highly essential that these abandoned areas should be occupied. In January last, three men erected a fence on the barrier line, to which they were contributing individually in order to fence off part of this abandoned country, but of course that was not final as the rabbit succeeded in getting under and over. The motion was one of the most important that had been submitted to the Conference.

Mr. ALISON (Canonbar) in speaking to the motion, referred to a motion he purposed moving on the following day. The motion he purposed moving was "That this Conference having decided that the question of dealing with the rabbit pest, be placed in the hands of the Pastures and Stock Boards, it is further of opinion that the Government should contribute towards providing funds in the pest district." He contended that the Crown should contribute towards the funds of the Pastures and Stock Boards in proportion to the areas held by the Crown, and considered that would be a more satisfactory way of dealing with the Crown, than by calling upon the Government to destroy the rabbits. By all means they must endeavour not to give the Government a loop-hole whereby they could start and do the work, as to ask the Government to send out men to destroy the rabbits would result in complete failure. Mr. Tully's motion did not meet with his approval in respect to calling upon the Government to kill the rabbits, and further, he did not think any one would take these unoccupied lands if there was a clause in the lease providing for the destruction of rabbits. He would move as an amendment that after the word "to" in the second line, the words "destroy the rabbits existing thereon or" should be omitted.

Mr. GREENE seconded the amendment which was agreed to.

Mr. BROWN, M.L.A., pointed out that one part of the clause affected not the Rabbit Act but the Land Act. He had not heard any reference to this provision as to whether it met with the ideas of the Conference or not. He thought that the land should be leased on very reasonable terms, and although anxious not to prevent discussion, thought the matter might very well be discussed with the new land Bill, and that if they had any suggestions to make they should make them for the guidance of the Minister.

Mr. FARRELL (Coonamble) did not think that the clause should be brought before the Minister for Lands at all. The Minister had asked them to furnish him with all the information they could which would be likely to assist him in regard to framing legislation for the destruction of the rabbit, and he did not see that they were going about it in the right way. To his mind the part of the resolution dealing with the occupation of the abandoned areas was no good. Who were they going to get to occupy this country.

Mr.

Mr. LANE (Corowa) did not think it right for the selectors to throw obstacles in the squatters way. Some of these gentlemen had lost hundreds of thousands of pounds in this country. They had met there for consideration of the great rabbit pest, and to endeavour mutually to arrive at some means of eradicating or lessening the evil, and they should deal with others as they would like to be dealt with themselves. Every consideration should be given to the question, and they should ask the Government to assist them. It was only fair for the Government to throw open the lands in question for, say, five or ten years, and it would not be too much to ask them to do so. He thought every delegate present should support the motion.

Mr. RYAN (Sturt) thought that the Government should get these lands reoccupied at any sacrifice. What was really required was permission for any person to rent these lands in order to keep the rabbits down, as the extermination of the pest was simply an impossibility.

Mr. MURCHISON (Girilambone) did not think the motion could be improved upon in any way. The Government should do something with the lands lying idle at the present moment.

Mr. ALISON moved as an amendment the omission of the words "provided there is a clause in the lease strictly enforcing the destruction of rabbits," which was negatived by 13 votes to 11.

The motion, as amended, and which reads as follows:—"That with reference to the large extent of abandoned areas in the Colony, the Crown should be called upon to take such steps as shall ensure the re-occupation of the country upon any terms, provided there is a clause in the lease strictly enforcing the destruction of rabbits," was agreed to.

On the motion of Mr. McFarland (Hay) the Conference adjourned until 10 o'clock next day.

THIRD DAY.—April 4th, 1895.

THE Conference met at 10-30 a.m., the Hon. W. Campbell, M.L.C., in the chair.

The minutes of the previous sitting were confirmed. Several communications having been read and received, the Chairman said that before they proceeded with the first motion on the business paper, Mr. S. Black, Chief Inspector under the "Vermin Destruction Act of Victoria," who was present, had consented to give them a slight sketch of the work in Victoria, which he thought would be of considerable advantage to them in their deliberations.

Mr. S. BLACK said that formerly in Victoria the rabbits were bad, and the north-west was infested to a very large extent. The Shire Councils agitated the Government to bring in a new Bill to make it compulsory for the destruction of the rabbits all over the colony. The Act of 1884 gave the administration of rabbit destruction into the hands of the Shire Councils. It was at that time generally agreed that the Councils were the best bodies to deal with the pest, as they were composed of local men. The Shires appointed inspectors to carry out the Act. This meant an expenditure of £13,000 to the Shires. For the first year the Act was very fairly administered, but when the inspectors found that they had to take proceedings under the penal clauses of the Act, there was a great outcry that the inspectors were doing more than their duty, and the Shire Councillors being interested, the Act soon became a dead letter. For two or three years an agitation was kept up amongst the Shires throughout the colony that the Government should administer the Act. The Government brought in a Bill, and it was passed in 1889, vesting the administration in the hands of the Chief Inspector, subject to the control of the Minister. He was appointed Chief Inspector, and he proceeded to appoint 70 inspectors; that gave about 1 inspector to each Shire. The provisions of the Act were that the inspector must visit the land of the occupier, and if he found rabbits on the land, one, two, three, or twenty, he served a notice under the Act that the owner or occupier must take steps within fourteen days to destroy the rabbits on the land. That notice was served personally or by registered letter. When the inspector visited the run again, say a week or two afterwards, and found that the holder had not taken any steps to destroy the rabbits, there were two ways open to him. The inspector could either summon the occupier at the police court, or put a man on and destroy the rabbits at the expense of the owner. Something like 970 prosecutions had taken place in three years, and they had expended £10,000 in destroying rabbits on private land. The penalty averaged for the first offence from £2 to £10, and for the second from £10 to £50; and these cases had to be tried before a stipendiary magistrate and one or more justices. As regarded the compulsory destruction of log and brush fences, they were great harbours for vermin, and so was undergrowth of any kind; and the inspector, when he discovered this, could serve a notice on the owner or occupier to have the fence destroyed in six months without any compensation. In a few years many thousands of miles of log and brush fence had been destroyed. The compulsory destruction did not rest with the inspector, but with himself. He had not yet, however, had to give instructions for the destruction of any fences; it had always been a voluntary act on the part of the owners, who could see the utility of the work. Still the power was vested in him, and he could enforce it if he wished. He had had great assistance in carrying out the Act by reason of the wire-netting clauses of it. Part 2 of the Act gave the Government power to loan out £150,000 to the Shire Councils to purchase wire netting with, and to give the owners and occupiers of infested land an opportunity of fencing in their holdings. The Shire Councils repaid to the Government one-tenth of the loan every year, whether they received it from the occupiers of the land or not. The money was loaned to the Shire Councils without interest, and the Councils lent it as a loan to the occupiers. So far the five instalments had been paid back to the Government within a few hundred pounds. All the money would be repaid in ten years. Every year, about the month of February, a day was proclaimed for simultaneous action throughout the colony for the destruction of rabbits. The day was proclaimed in the *Government Gazette*. He sent the proclamations all over the colony, and also advertised them in the weekly papers. In Victoria they had found that digging the rabbits out was the best means of destruction. In the summer they could reduce them by poison by 60 per cent.; that was mostly on poor country where it would not pay to dig them out. Under the Victorian Act they could declare any animal to be vermin—foxes and wild dogs were proclaimed under it. Last year there were 8,000 foxes destroyed, and 5s. per head was paid for them. The Government paid one-half of the subsidy, and the Shires the other half. Of wild dogs about 1,000 were destroyed. The Government paid 10s. per head, and the Shires another 10s. per head for them, making £1 for each dog.

dog. They were getting very scarce now. Generally speaking the Rabbit Act had given satisfaction. Of course there were a few objections to it. There had been three Rabbit Acts in Victoria, but it was acknowledged that this was the best they had yet had, and it gave satisfaction to the local bodies. Regarding utilising the rabbit, because of its commercial value, he was opposed to it. It only conserved the rabbits. There were three rabbit-freezing factories in Victoria, but the general opinion was that they were only doing harm.

The CHAIRMAN said they were very much obliged to Mr. Black for the valuable information he had given them. No doubt they had all been taking notes of what had been said. He noticed that in one place Mr. Black had spoken of the compulsory destruction of log and brush fences without compensation, and also that the Government had loaned the Shire Councils £150,000 without interest in order to enable those bodies to lend it again to the holders for the purpose of procuring wire-net fencing. He had noticed also that the Chief Inspector had full power to act as he pleased. He was, as it were, dictator so far as the rabbit was concerned. He was sure that the observations made by Mr. Black would be of great value to them in their deliberations.

Mr. GREENE thought that some form of recognition of Mr. Black's attendance and information should be made by the Conference. He moved a vote of thanks to that gentleman for his kindness in attending, and the assistance he had given them.

Mr. FISHER seconded the motion. He thought it extremely kind of the Victorian Government to send Mr. Black over here. That gentleman had given them a lot of valuable information which they would act upon in the future.

The motion was carried by acclamation.

Mr. HUGH MACDONALD, M.L.A., said that, speaking to the motion standing in his name, he would just like to say that when he saw that two other motions in the direction of compulsory destruction had been passed, he had almost intended to withdraw it, but since arriving there that morning he had been asked to go on with it, because included in his motion there were two points which had been overruled in the others. First, that the destruction of the rabbits in the districts referred to should be simultaneous; and secondly, that the State was called upon to recognise and accept its responsibility in the matter. So that the Government must accept the same responsibility in regard to public lands as private owners on private lands, he therefore moved—"That in the opinion of this Conference the Minister should give effect to the provisions of the 27th Clause of the Rabbit Act of 1890, by making the destruction of rabbits simultaneous and compulsory in all districts that have been proclaimed rabbit infested, upon the distinct understanding that the State accepts the same responsibility with regard to public lands as applies to the owners and occupiers of private lands." He hoped that the motion would be passed, as he did not think there was anything that could be objected to in it.

Mr. FISHER (Murrumbidgee) seconded the motion. He had a motion upon the business paper, and the carrying of the motion proposed would save him the trouble of going on with his. He thought they must admit that compulsory action was the only way of coping with the rabbit, and he would like to point out to the boards of management that the extermination of the pest might be conducted in different ways in the various districts. All districts were not alike, and the one he represented he was sure that compulsory fencing would not be good for the inhabitants. If they introduced simultaneous poisoning they might be able to cope with the rabbits without asking the Crown for assistance, or without being asked to put their hands in their pockets for fences. Where the boards found that the people were doing their best in the matter of the rabbit pest, then they ought not to compel them to go on wire netting.

Mr. LESLIE (Forbes) rose to a point of order. He thought that by passing a motion of that kind they would be going back over ground that had already been dealt with. They preferred to go on the principle that the Rabbit Act should be repealed. They had also affirmed that the destruction of the rabbit should be placed under the control of the Pastures and Stock Boards.

Mr. HUGH MACDONALD, M.L.A., on the point of order, pointed out that when the motion affirming the desirableness of repealing the Act was under discussion he had drawn the attention of members to the fact that in passing the resolution there was a danger of blocking all other resolutions specifically dealing with the amendment or enforcing of the present Act, and had told members that if the passing of the resolution was intended to do this members would be wrong in passing it. He was then told that the passing of that resolution would not interfere with any motions relating to specific clauses, and he thought that that was understood by other members of the Conference, because they were not to suppose that the Act was to be repealed simply because the Conference carried a resolution to that effect.

The CHAIRMAN ruled that it was quite within the province of the Conference to discuss the matter. There must be fresh legislation, and they wanted to embody in their report anything that would be valuable to the Minister.

Mr. ALISON (Canonbar) said he remembered once they had received in his district a notice from the Stock Board to destroy simultaneously, and it was found to be impracticable and utterly useless to attempt it. He was strongly opposed to Government destruction, as they had an illustration of the Government work in the amount of money spent before when they took over the same business. The only way that sort of thing worked out was that men were sent out far west simply to loaf on the Crown. He strongly opposed the motion.

Mr. MILLEN, M.L.A., said it appeared to him from the remarks of the last speaker that there was an objection to the State taking up the destruction of the rabbit. He considered that if the State was prepared to send out men to destroy rabbits on Crown lands, that was a State concern and not theirs. They had no right to say to the Government by what method and under whose direction the rabbits should be destroyed. Mr. Alison had also said that it was not possible to have simultaneous compulsory destruction, but he thought that difficulty might be got over by making simultaneous action apply to all districts in the Colony. If that was done, he thought it would overcome the objection urged by Mr. Alison. In Victoria the simultaneous destruction had proved rather successful, and that fact should encourage them.

Mr. MORGAN (Wentworth) said it had been remarked by one of the speakers that simultaneous action was taken with respect to the destruction of marsupials. This he knew to have been proved a failure. The destruction of wild dogs was carried out in the same manner, and men were sent round the district simultaneously, and from what he could gather he did not believe there was a single dog destroyed by the whole lot. It had also been suggested that, in order to make the destruction of rabbits effective, it should

be simultaneous throughout the whole of the districts. Now, the rabbits were about the most whimsical lot he ever had to deal with, and required to be dealt with in accordance with their whims. The districts were divided equally at the present time, and men in the districts worked well together to destroy the pest. He felt sure that if they introduced simultaneous and compulsory action with respect to this matter the attempt to destroy the rabbits would be a failure and end in nothing.

Mr. WILKS (Menindie) said that in the district he represented the conditions were different in various parts. In one part they had been able to destroy the rabbits wholesale, whereas in other parts it was hopeless to attempt to deal with them. He objected to the word simultaneous.

The CHAIRMAN thought it would expedite matters if someone was to move the omission of the word "simultaneous."

Mr. HUGH MACDONALD, M.L.A., in reply, said he would like to point out that the motion did not attempt in any way to enforce details. It was simply advocating a principle, and he was agreeable to so alter his motion as to enable simultaneous action to be confined to certain districts. He did not wish to be bound to details, but was willing to substitute the word "several," instead of "all," in the third line of the resolution. The efforts of those who were compelled to take action would be multiplied because a few refused to fall in with the arrangement. He thought there was nothing to be objected to in the motion; and although the plan had failed in regard to dogs and kangaroos, there was no reason why it should not succeed with rabbits. In certain districts the action should be as simultaneous as possible.

The resolution on being put to the Conference was lost, 5 voting in favour and 16 against.

The motion standing in Mr. Fisher's name, to the effect, "That the destruction of rabbits by the use of poison be made compulsory," was withdrawn.

Mr. WADDELL, M.L.A., moved (1) "That in the opinion of this Conference the Government should take active steps to open up markets in England and other parts of the world for Australian rabbits. (2) With a view to such, the Agent-General should be instructed to secure the services of a capable and trustworthy man (with wide experience on the London meat markets) to assist in opening up profitable markets in England, and on the continent of Europe, for Australian rabbits." He said that he recognised that some of the members of the Conference appeared to be under the impression that if the rabbits were made a commercial commodity, it would tend to increase the pest rather than diminish it. He could not help thinking that anyone coming to that conclusion had come to it rather hastily. If they made these animals a commercial commodity, then they would have men in different parts of the Colony taking up this employment, and applying to owners for permission to go on land for the purpose of killing them. It had been stated that if such a condition of things were brought about it would be a bad thing for the country, and that it would be impossible to make them a commercial commodity and a profitable export to the English market. He denied this. Others would contend that the time of the year was not suitable to get them ready for the English market; but they knew that almost at all times there would be parts of the Colony where the climatic conditions would be favourable for getting them ready. Coming to the matter of the appointment of a man in London to assist producers in the Colony, he did not think they could take a better step than this. The last consignment of rabbits sent home from Victoria realised 7d. per head. They had been down to 6d. He would mention that the Government should appoint commercial agents to help the producers to find markets for their produce, as in this way markets in France and Germany could be opened up. He thought Mr. Wood was doing good service in this connection in endeavouring to open up markets for the exportation of rabbits, and if they were successful they would be going a long way towards making a profitable industry. He would like members of the Conference who held similar views to himself when they rose to speak to point out why they thought making the rabbit a commercial commodity would help to eradicate the pest, and those who held contrary views, to explain in what way they thought action in this direction would tend to increase rather than diminish the pest. The experiment would entail very little expense, and if successful would certainly be of great advantage to the people of this country.

Mr. ALISON (Canonbar) seconded the motion.

Mr. HUGH MACDONALD, M.L.A., considered the whole matter a fad, and nothing else. Mr. Black had told them that the only rabbits that would be marketable in England must weigh $2\frac{3}{4}$ lb. That alone was enough to upset the export trade as regards New South Wales, as he did not believe there was one out of every 500 rabbits killed that would weigh that amount. Another thing that occurred to him, was that seeing that 200,000 had the effect of glutting the home market, he could not see where the market for one or two millions was to be found.

Mr. BACON (Brewarrina) thought that if Mr. Waddell had spoken in favour of freezing beef and mutton, and had suggested that the Government should look after that industry, he would have been doing a good thing for the country. They had met there to consider the best means to eradicate or diminish the rabbit pest, and in his opinion the motion did not tend to the end they sought. It had been shown that rabbits were sold in London for 6d., and the cost of sending them there amounted to 7d. He admitted that they would get rabbits in certain districts that would be fit for exportation, but the majority were not fit, therefore, he thought it a waste of time discussing the matter. They would have, in reality, to fatten the rabbits before they were fit for exportation. They would have, if they desired to benefit the country and themselves, to diminish them by poisoning. He hoped they would waste no more time over the matter of exportation, which he looked upon as one of little importance.

Mr. GUNN (Narrandera) was opposed to the Government spending public money in continuing such a pest as the rabbit, as he maintained that in spending money to utilise the rabbit the Government would only be continuing the pest, and the object for which they had met was to devise means by which the pest could be exterminated. He referred to Mr. Black's remarks with respect to the factories in Victoria, and drew attention to the fact that the general opinion in that Colony with respect to these factories was that they were only doing harm, and only that morning they had heard from the Chief Inspector of Victoria that a strong agitation was on foot to have a clause inserted in the Rabbit Act with special reference to these factories. In his opening address the Minister had informed them that in the year 1887 the Department paid for upwards of 27,000,000 rabbit skins, and still, at the end of that year, the rabbits were worse than ever, although some 3,000 men were employed at an enormous expense to the Government. At that time there was only a comparatively small portion of the country infested, yet the Government found their efforts futile. They had heard from various speakers that the placing of a few hundred thousand rabbits on the London market had brought the price down to 6d., and that the actual cost up to the time

of

of landing them was 7d., which meant a distinct loss. It had also been pointed out that employment would be found for many if the rabbit became a commercial commodity, but he maintained that employment would also be found for the pest, who would continue their work of destruction.

Mr. MILLEN, M.L.A., said it appeared to him that members were running away on the wrong scent. There was nothing in the motion which would tend to perpetuate the pest. They had got the rabbit, and would they allow it to be destroyed to rot, or would they permit of and provide means for its utilisation. He did not wish to discredit the evidence given by Mr. Black, but the last speaker had discredited that evidence when he said that the preservation of the rabbit would only tend to increase their numbers. The last speaker had also said that after spending a lot of money the rabbits were on the increase in this Colony. He felt surprised that a body of gentlemen like those assembled could understand for one moment that 200,000 rabbits were a glut. It was absurd on the face of it, and it was for that reason he intended to vote for the motion. As far as he could see, the only thing necessary was to enlarge the channels through which their trade must flow. All that was requisite was the appointment of someone in London to find markets for the produce sent home. It was contended that by making the rabbit a commercial article they would be simply perpetuating the nuisance. That argument was not used in regard to the sale of kangaroo skins, and the rabbit, he contended, was in the same position as the kangaroo, and he failed to see what possible harm could arise from selling the rabbits when they were killed.

Mr. CUNNINGHAM (A. M. and A. Co.) opposed the motion.

Mr. MORGAN (Wentworth) said that before speaking to the motion he would like to ask a question. Was it the intention of the mover to export poisoned rabbits to England? He would answer the question himself by saying—No. Well, then, how were they going to catch them? They were very hard to catch. They might be able to catch them when they are poor, but he had seen thousands run into the traps, and nine out of every ten of them were as nothing in their hands, and his experience had taught him that the only thing to do with them when caught was to knock them on the head—they were good for nothing else, exportation being out of the question. The only way they could get fat rabbits was by going through runs of five or ten miles in extent, and bringing them into some place where they might be frozen and preserved to enable them to be sent to England or any other market, and he contended that this plan could scarcely be worked, as in two hours in our climate the rabbits would be tainted. He was of opinion that they should be allowed to deal with the rabbits in their several districts as they saw best.

Mr. TRAVERS JONES, M.L.A., supported the motion. He had had some experience of the rabbit in the interior. He had known properties where thousands of pounds had been spent in the effort to exterminate them, and the efforts had resulted in failure. When these properties were cut up into small holdings they could see one nowhere. Of course, there were only certain seasons of the year in which the rabbit could be exported and made of commercial value, but during those seasons employment would be found for many. In the summer season the drought had a great hand in decreasing their numbers, and in such seasons poisoning could be resorted to. Taking a rational view of the case, he thought they could be utilised in a manner which would provide food for people instead of allowing them to rot on the ground. As regarded the Government, his experience led him to the conclusion that the more they gave for the extermination of the pest the more they would have to give. Taking all things into consideration, he would support the motion.

Mr. MURCHISON (Girilambone) could see no harm in preserving the carcasses, and would support the motion.

Mr. FISHER (Murrumbidgee) was sorry to see valuable time wasted over the discussion. The Conference had met there for the purpose of determining the best means of exterminating the rabbit, and after coming hundreds of miles the members were confronted with this resolution for making the rabbit a commercial commodity, which, if carried, would spoil all their efforts in the direction of extermination. He hoped that, considering their time was valuable, and a number of delegates were anxious to get away, members would allow the question to be put, as in his opinion enough discussion had taken place.

Mr. LANE (Corowa) said that on the banks of the Murray he had at certain times seen thousands of rabbits lying dead. He considered that those living in infested districts were the best able to judge as to how the pest should be coped with, and he thought their views should be heard.

Mr. HOUGH (Gunbar) stated that he had had forty years' experience in this Colony, and twenty-four of these years were spent amongst the rabbits, and he believed that in nine drives out of ten the rabbits they caught were too poor for export. Moreover, there was not one person in ten near enough to the railway to send them down at a profit. With regard to the utilisation of the rabbit, the matter of asking the Government to aid and assist them was quite wrong, and if they carried the motion the rabbits would increase largely. If they could get people to open up the land, then he thought the rabbits might be kept down. However, he believed in the principle of killing and getting rid of them.

Mr. ROSS (The Hume) hoped that the Conference would not endorse the motion, as he considered the object of the gathering was to devise means for getting rid of the rabbits. If people wanted to export them after they had caught them, by all means let them do so. It was within the experience of many that when the rabbits were trapped they still continued to increase, and the only effectual means of decreasing their numbers was by poisoning.

Mr. HARRIE WOOD (Under Secretary for Mines) said that so far the intention was to export rabbits from districts where there were chilling works on the railway line, and that, of course, would only affect a very limited area of country. The results of his inquiries had shown that they could put the rabbits on the London market at 6d. each. Reference had been made to the distance from chilling works, but that difficulty could be got over by sending the rabbits down alive, and killing them at the establishment. Those rabbits that did not reach a marketable weight could be tinned, instead of being sent home frozen. The information he had from London was that at such a price as 6d. the rabbits could be sold in millions, and the fact that the market may have been glutted might possibly be due to the fact that up to the present time the export trade in rabbits had been carried on with a view to securing the highest price, coupled with the fact that efforts had been made to introduce the rabbit to the wealthy consumer, whereas up to the present time no effort had been made to bring the rabbit within the reach of the working classes, and if this was done they would be sold in millions. If a scheme of this kind could be carried out, it would not interfere with the land-holders who wished to destroy the rabbits, because the area which would be affected was so small at the present time as to make very little difference to them, but if the industry increased, then

then probably their chilling works would also increase. As regarded extermination, he might say that he had been connected with the administration of the Rabbit Act from the start until it was transferred to the Lands Department, and he was sure they would never succeed in exterminating them. The only thing they could hope to do was to keep them down, and whether this was accomplished by trapping or poisoning, it seemed to him that it mattered very little to the land-holders. If the rabbits from those districts where there were chilling works could be exported, then the cost to the landholders would be nothing, because the trapper would get as much from the chilling works as would pay him for his labour. One speaker had remarked that the difference in climate was so great as to render it impossible to keep up the export of rabbits all the year round, but he did not agree with this. He thought that if the rabbits could be exported, it would be a great pity to simply destroy them when they might be utilised, seeing that it would offer employment to a large number of men, do no injury to the landholder, increase the railway traffic, and provide food for poor people.

Mr. GIBSON (Hay) saw no reason why the Conference should not pass the motion, while at the same time they should go as far as possible to exterminate the pest. Taking the Colony as a whole, the exportation of the rabbit would be a small item in connection with the rabbit question. He had shipped to London two or three thousand rabbits in October last, and he desired to inform the Conference that he just came out about square. He thought that if, as had been pointed out, a fall had taken place in connection with the price of rabbits, the Government, to make it pay, would have to subsidise the experiment to the extent of 3d. per pair. They knew that the Victorian Department had been sending rabbits home, and he understood that when they received the rabbits in Melbourne they stacked them and froze them, and put them on board the steamer at a penny a pair.

Mr. FOTHERINGHAM, Secretary, Fresh Food and Ice Company, furnished a number of details in connection with prices obtainable for rabbits, and the cost of the same until placed on the London market.

Mr. WADDELL, M.L.A., said his object in moving the motion was to obtain an expression of opinion from the Conference to the effect that it would be better for the Colony, as a whole, to make some use of the rabbits that were killed without poison than to throw them away. Mr. Macdonald mentioned that the motion was simply a fad. He could well understand Mr. Macdonald making that remark, as, so far as he could understand, that gentleman's policy had been to destroy industries, and not to foster them. Mr. Bacon had opposed the motion on the ground that it would tend to foster the rabbit rather than help to exterminate, but he had advanced no reasons in support of this contention. Then Mr. Gunn made a similar statement, and said they knew districts where bunnies had increased in spite of trapping and poisoning. (Several members, No! No!) If the argument of Mr. Gunn was correct, it came to this: Because the means used in the past had not been successful they should calmly fold their arms and let the pest go on. Another member had asked the question: "Did he intend by the motion that poisoned rabbits should be exported?" What kind of question was that to ask a man? Was it reasonable to think that any man in his senses could think of such a thing? Mr. Morgan knew that there were millions of rabbits in this country that were trapped and fit for food. Again, he understood Mr. Black to say that there was no market for more than a few hundred rabbits, but they found from Mr. Wood's statement that there was a market for millions of them, and he (Mr. Waddell) said that if the Conference came to the decision that to make rabbits a commercial commodity was not the right thing, then let the Conference be logical. The object of the Conference was to deal with the whole matter of the rabbit question, and if the majority of the delegates had arrived at the conclusion that what was being done by the Mines Department was advantageous, let them vote for the motion. The whole matter hinged upon one of two things—whether it was advisable to make the rabbit a commercial commodity or not; and if the Conference decided that it was inadvisable, then it would wisely vote against a motion of the kind submitted by himself. But he believed he spoke the feelings of the majority of the people of this country when he said that in the best interests of the country the Government, and private individuals as well, should do their best to open up markets for the rabbits. It would also give employment to a large number of men within the Colony. Having judged the feeling of the Conference on the matter, he begged leave to withdraw his motion.

The motion was then, by consent, withdrawn.

Mr. MILLEN, M.L.A., moved—"That as one means by which the State might beneficially co-operate with the landholders, this Conference recommends the free carriage of rabbits in any form on the State Railways." He said that after the debate on the previous motion, he would, with the consent of the Conference, withdraw his motion.

Objection having been taken, and the motion having been seconded by Mr. Murchison,—

Mr. MILLEN, M.L.A., said that the other motion provided for State assistance in one way, and his motion provided for it in another way.

Mr. FISHER (Murrumbidgee) announced his intention of supporting the motion, and referred to the mover's disinclination to proceed with his own motion.

Mr. BACON (Brewarrina) intimated that he would vote against the motion, following so closely as it did the proposal for utilisation made by Mr. Waddell. He did not see why the rabbit should be carried free any more than their beef or mutton. Mr. Wood had spoken with reference to the rabbit being introduced as an article of consumption for the poorer classes in England. Their mutton was sold in England at 2d. and 2½d. per pound, whilst a rabbit, weighing only a little over 2 lb., would cost, taking the price it would have to be sold at to make it a profitable investment, at the least 6d. Was it fair to expect these animals to be carried free to compete with their meat products? He did not think it wise to preserve animals which were undoubtedly a pest.

Mr. ALISON (Canonbar) supported the motion. It had nothing to do with Mr. Waddell's motion, and he thought that where it was possible to send the rabbit free to Sydney there would be no great harm in doing so. They might fairly ask the Government if rabbits were carried at all to allow them to be carried free, as it would not in any way interfere with the destruction of the rabbit.

Mr. MURCHISON (Girilambone) considered that it was only right that the rabbit should be carried free.

Mr. WADDELL, M.L.A., hoped that the Conference would agree to the motion as it would be a step in the right direction.

Mr. MILLEN, M.L.A., thought he was entitled to refer to the statement made by Mr. Fisher, who had referred to his disinclination to support his own motion. His reason for desiring to withdraw his motion was to save the time of the Conference, as he thought he understood by the tone of the remarks on the previous motion that his motion would not find favour. Mr.

Mr. LESLIE (Forbes) asked who were eligible to vote on this question. Was the voting to be left to the delegates, or were those who were present by invitation also entitled to vote?

The CHAIRMAN explained that the gentlemen present who were not delegates were present on the invitation of the Minister, and he took it were equally entitled to vote with the delegates.

The motion was then put to the Conference, and the voting being equal, 15 in favour and 15 against, it was carried on the casting vote of the Chairman.

Mr. CUNNINGHAM (A. M. & A. Co.) moved—"That the duty on netting be abolished. That netting be carried by rail free when cattle or sheep trucks, which would otherwise run empty, can be used." He said that when he sent in his motion he intended that there should be two separate motions, because he could conceive that some members might vote for one but might not wish to vote for the other part. He would therefore, with the consent of the Conference, take the first part, "That the duty on netting be abolished."

This course having been consented to,

Mr. CUNNINGHAM said that for the purpose of cheapening the work for the producer he was moving the motion, and he would ask members in speaking to it to remember that they were in attendance at a Rabbit Conference and not in their electorates. He would draw the attention of the Conference to the fact that under the high protective duties in vogue in Victoria there was no duty placed on rabbit netting.

Mr. GREENE seconded the motion, and in doing so said that there was a strong consensus of opinion in favour of the abolition of this duty, and it would require only a light pressure to be brought to bear on the Government to cause them to take steps to remove it.

Mr. HUGH MACDONALD, M.L.A., said that a lot of the speakers had referred to the Members of Parliament being present as if they had no business there. There were Members of Parliament there, not in their capacity of members of Parliament, but as representatives of Districts and Boards. For his part he desired to make it known that he was present as a delegate.

Mr. ALISON (Canonbar) was opposed to the motion. He had no doubt that the taking of the duty off would tend to cheapen the cost slightly, but he objected to the question of freetrade or protection being introduced to the Conference and hoped that the Conference would decide that it was not their business to deal with such a subject.

Mr. ROSS opposed the motion on the ground that the duty, if it affected them at all, did so in so slight a manner as to be scarcely felt; in fact, if the duty was taken off, he did not think netting would be one penny cheaper.

Mr. ASHTON, M.L.A., said that the rabbit question rose far above any consideration of freetrade and protection, and to negative the motion would be equivalent to sending it out to the world that the men living in the rabbit country did not want the netting any cheaper.

Mr. WILKS (Menindie) said the question they had to consider was, could they keep the rabbits down at a reasonable cost; and he thought, when they came to reduce the price of a mile of wire netting by 30s., it must necessarily be of great assistance in keeping the pest in check.

Mr. WADDELL, M.L.A., said that although a protectionist he had always looked upon this as a special matter, and he thought it was upon an amendment of his in the Assembly that the duty was reduced. He thought that they had good hopes of succeeding with the Government if they agreed to the motion.

The motion was then put and carried unanimously.

Mr. CUNNINGHAM (A. M. & A. Co.) moved—"That netting be carried by rail free when cattle or sheep trucks, which would otherwise run empty, can be used."

Mr. GREENE seconded the motion, which was also unanimously agreed to by the Conference.

Conference adjourned until 2.15 p.m.

On the resumption of business at 2.15 p.m.,

Mr. T. IRVING CAMPBELL (Mount Ida) moved, "That the State should, on the Board's recommendation, supply netting to landholders, charging interest at the rate of four per cent. per annum. That abandoned areas be fenced off from settled districts, the fence to be erected at the expense of the State." In speaking to the motion he drew attention to the deplorable position of the district which he represented. The Mount Ida District comprises the selected portions of the abandoned areas lying between Gunbar, Whitton, and Hillston. Mr. Tully, in his motion dealing with compulsory killing, described these abandoned areas as a continual menace to the adjoining holders. He would go further and say that the neglect of the State in dealing with these areas had resulted in the ruin of the district. They had heard his neighbour's (Mr. Hough's) statement of his position as one of the residents of the district, and he could endorse what he had said as a fair account of their position in the Mount Ida District, but he had to confess that it had not come under his notice that the rabbits were eating the netting. It would also indicate the opinion of the residents when he said that a petition to the Minister was in course of signature to this effect. By advancing netting at a sufficient rate of interest to cover cost of money to the State, together with cost of distribution, would be the cheapest and most effective way of dealing with the rabbits without cost to the State. By making it compulsory that those to whom wire netting was advanced should cultivate part of their holding in proportion of 15 acres for each mile of netting received, the State would also receive direct benefit. It had been decided by the Conference to urge on the State the necessity of taking steps to ensure the re-occupation of abandoned areas upon any terms. He trusted also that the justice of extending special assistance to selectors adjoining and surrounded by abandoned areas would also be embodied in the recommendation of the Conference. In order to illustrate the position in which they stood he would place before them the case of one of their more fortunate residents, who was in a position to wire net. Mr. Hough had also referred to the same case when he was demonstrating the inutility of netting. Mr. Hough was correct when he stated that this family had killed over 20,000 rabbits off their holding of 2,560 acres since the first day of September, but he forgot to mention that owing to a bush fire a large portion of the fence was destroyed, and in consequence of a dispute as to reinstatement the place was open for a period of twelve months to the entry of rabbits from the worst infested block in the district. However, the fence has been repaired, and he had in his possession a diary of rabbit destruction dating from the first of September, 1894, to the 29th of March, showing a total of 22,808 rabbits actually killed and counted. That diary he would be glad to submit for inspection, and as the numbers for each day are entered, it should be useful to indicate the ability of selectors to cope with the pest when they have only their own rabbits to deal with. The diary closes with the entry that they had ultimately to go to the adjoining area to provide food for the dogs

dogs and pigs. In order to show that his district was worth saving he would also submit some of the agricultural statistics. Mr. Peck, off an area of 240 acres netted in, received a return of 981 bags of wheat, or an average of 17 bushels, and Mr. D. McInnes, off an area of 10 acres enclosed, 24 bushels to the acre; whilst a list of other holdings unenclosed show areas of 600 acres returning a total of 187 bags, many only averaging about 6 bushels, and areas of 28, 30, 50, and 90 acres, totally destroyed by the rabbits. He would not presume to say what should be done with the whole of the abandoned areas of the Colony, but he submitted that the State should extend privileges and concessions to the selectors who were surrounded or joined by these areas. Should the motion be carried it would be necessary to deal with the second part of the motion, for, of course, if their holdings were fenced in the abandoned areas would be fenced out. In submitting the motion to the meeting he would like to point out that they asked the assistance of the State as their landlords; they, as tenants, were asking for reparation for damage for which they were not responsible.

Mr. MURCHISON (Girilambone), in seconding the motion, said he had heard a remark made that wire netting was of no use, and to that remark he took exception. He thought that by the Government supplying wire netting in the manner suggested in the motion much good would be done, both large and small holders being benefited. There were many people who to-day were not in a position to fence their holdings, but if the Government provided them with the netting they could then step in and compel them to kill the rabbits on their holdings.

Mr. FISHER (Murrumbidgee) supported the motion on the ground that the mover had made out a strong case, which he, from personal knowledge, could corroborate. The country that was untenanted was the sole cause of the trouble, and he felt that the Conference should sympathise with the remarks made by Mr. Campbell and support his motion. Some might consider the charge too high, but the principle was a good one, and it was the principle he was advocating.

The latter part of the motion, to the effect "that abandoned areas be fenced off from settled districts, the fence to be erected at the expense of the State," was, by consent, withdrawn; and the motion—"That the State should, on the board's recommendation, supply netting to landholders, charging interest at the rate of 4 per cent. per annum," was agreed to.

Mr. HUGH MACDONALD, M.L.A., moved—"That, in the opinion of this Conference, much injustice is done by the operation of the fencing clauses of the Rabbit Act of 1890, and that it is therefore desirable that no holder of land should be compelled to contribute to the cost of erection or maintenance of any rabbit-proof fence erected by any other person unless such landholder shall be benefited or protected by the same." The previous motion he had moved that morning was lost, he believed, because it referred to certain provisions in the Rabbit Act after the Conference had decided by resolution to ask the Minister to repeal the Act in its entirety. He would like to draw the attention of the Conference to the fact once again that it was not because they agreed to recommend the repeal of the Act that it was to be repealed, and if he was certain that the Act was going to be repealed he would not require to go on with his motion. He, in moving the resolution, desired to call attention to the fact that his motion affirmed the principle that where no benefit was conferred no expense should be incurred, as, if the landholder was not protected by the erection of a fence, then he should not be compelled to pay towards the cost of its erection or maintenance. His motion was no new affair, as when the Act was under discussion in the Assembly Mr. Waddell moved an amendment virtually the same; and the principle should receive the support of Mr. Alison, who was at that time a member of the House.

Mr. SCOTT (Condobolin), in seconding the motion, said that under the clauses of the present Rabbit Act there was much hardship occasioned, and no doubt there was room for improvement. There was certainly room for great injustice to those who were outside the boundary of wire netting and had received no benefit from it. On the west side of his boundary there were a number of men who had holdings, and he would have to compel those men to contribute towards the cost of the erection of the rabbit fence when at the same time that very rabbit fence was doing them an injury by throwing the rabbit back on to their holdings. He hoped the principle would be endorsed by the Conference.

Mr. ASHTON, M.L.A., thought that it was to the interest of everybody to have the fullest light thrown on the operation if carried into effect. The motion provided that no holder of land should be compelled to contribute to the cost of erection or maintenance of any rabbit proof fence erected by any other person unless such landholder shall be benefited or protected by the same. He considered that the question was one of great importance, and should be looked at from every point of view and in the interests of the general body of people, and their first consideration should be: Would the law work well? Suppose, for instance, a holder wire-netted his holding, and his neighbour adjoining did not do the same, the fence would not be of benefit to the latter, and he would be able to avoid payment of a contribution; but if he subsequently fenced the other sides of his holding, then the fence originally erected by his neighbour would be of benefit, forming as it did a dividing and at the same time rabbit-proof fence. Under such circumstances as these he did not think a man should be deterred from levying.

Mr. GUNN (Narrandera) said that the district he represented was infested for a great number of years, but he thought that nearly every block of holdings there was now practically fenced. Had it not been for the compulsory clause, he did not think they would have been fenced. There may be perhaps some slight cases of hardship under the present fencing clause, but in comparison with the benefit it had conferred on the people and the country at large these had been slight indeed.

Mr. WADDELL, M.L.A., said that he realised that the pastoralists and the large class of land-holders in the Colony wished to have a law passed that would be equally effective to the small holders. He believed there was a spirit of fair play amongst them, and a desire for justice to be done to the small holders. The latter were not in a position to erect a boundary fence, and a compulsory clause might simply work destruction to them; and he thought that in the interests of all classes it was better to consider every interest before they came to a decision on the matter. If they took a broad view of the whole question, and gave fair consideration as far as possible, then they would be doing what was best in the interests of all concerned. These suggestions could be incorporated in a new Bill very satisfactorily. He recognised the force of what Mr. Ashton had pointed out, and his contribution to the debate on this matter was of great advantage.

Mr. ALISON (Canonbar) was afraid that the motion was more conflicting than he had at first considered, and he was afraid of doing anything which would interfere with wire netting. It was generally recognised that wire netting was absolutely essential, and if they placed drawbacks in the way of getting fencing,

fencing, it might possibly work in this way—that the runs might not be fenced and an injustice committed towards the whole of the Colony for fear of doing some slight hardship to an individual. He had no desire to do injustice to any individual, and would be loth to injure anyone; but at the same time he was compelled to say that the whole of the pastoral districts, big and little, recognized that fencing was a good thing. Therefore they must be exceedingly careful. He was not in a position at the present time to give a definite opinion on the question, and would like to see a motion substituted, setting forth that the fencing part of the Rabbit Act should be maintained with amendment.

Mr. GATENBY (Forbes) thought the motion proposed met the case very well, although at the same time he thought it was cruel of them to force a man to pay who was not in a position to pay. He would support the motion.

Mr. BACON (Brewarrina) was opposed to the motion. The Government had recognised the principle of fencing, and he was sure that if the resolution was carried it would only tend to discourage it. There would be terms in every Act and every Bill which would, no doubt, create in some cases individual hardship but the proportion of such cases would be very small.

Mr. WALKER (Tenterfield) thought that Mr. Macdonald was hardly in order in bringing the motion before the Conference, inasmuch as it applied to the Rabbit Act, which they wished repealed. He might say this with regard to the fencing that many people who were compelled to fence thought it was a curse, and had lived to find it was a blessing. In a previous Conference it had been carried, and it was very important to have the small holdings fenced in as far as possible. He would oppose the motion.

Mr. ALISON (Canonbar) desired to move an amendment.

The CHAIRMAN ruled him out of order.

Mr. LANE (Corowa) said he represented very small selectors, and he submitted that it would be an insult to turn these men off the lands, as that was what the carrying of the motion meant.

Mr. FISHER (Murrumbidgee) considered that if the Conference rejected the motion, then he could only assume that the Conference believed in making a man pay for fencing, whether he received any benefit or not. He thought it would be better to err rather on the side of justice, and accordingly he would vote for the motion.

Mr. WILKS (Menindie) supported the resolution. He had listened attentively to what had been said, and he felt certain his district would not be in favour of compulsory fencing. If they struck a levy in the back country for this purpose the people would never be able to pay it.

Mr. OAKDEN (Cobar) said that he understood that Mr. Macdonald was prepared to substitute a modification of his motion.

Mr. HUGH MACDONALD, M.L.A., said that having heard the objections to the motion by the Conference, and realising that there was no desire on the part of any delegate to perpetrate an injustice to the small holders, and he would therefore, with the consent of the Conference, substitute the following motion in lieu of the one already moved,—“That the Government is recommended to maintain the compulsory fencing clauses in the Rabbit Act, but to introduce an amendment to prevent hardships to individual owners, recognising that such cases do arise.”

Mr. WILKS (Menindie) objected to it.

Mr. MACDONALD, M.L.A., asked the Chairman to rule whether he could move the proposed substitute motion now that it had been objected to.

The CHAIRMAN ruled that he could not; but Mr. Wilks having withdrawn his objection, the substituted motion was seconded by Mr. Scott, and carried.

Mr. N. GATENBY (Forbes) moved, “That in all cases where rabbit-barrier fences are constituted under the Pastures and Stock Boards they shall remain the property of those boards, and provision be made to ensure their safety.”

Mr. LESLIE (Forbes) seconded the motion, and in doing so said that if the fences were the property of the boards the boards should have power to go on to the land in order to ascertain if they were kept in proper repair.

The motion was carried.

Mr. ASHTON, M.L.A., moved, “That in order to secure the maximum of economy in the work of rabbit destruction, the controlling district authority should have the power to proclaim that certain adjoining holdings shall constitute a group; to secure the fencing of such group; to enforce simultaneous and continuous destruction of the pest within the boundaries of the fenced area; and to apportion the cost of fencing and killing between the owners affected.” He said he had not much to say in favour of the motion. The Conference had passed a resolution in favour of the State assisting the holders and others to fence their holdings, and that being so it seemed to him that it was only right and proper that the State should have the power to step in in certain cases, as it was of no use erecting 32 miles of rabbit netting when by a little judicious management 8 miles or 16 miles would answer the purpose just as well. The Rabbit Act provided for the grouping of holdings, but it left it quite a voluntary matter on the part of the controlling authorities to group their holdings or otherwise; but now the State had been asked to assist holders in providing fencing material, he thought in the interests of the State and for the sake of economy that holdings should be grouped, and that the State, through the controlling authorities, should declare such grouped holdings.

Mr. A. ROSS (The Hume) seconded the motion, which was carried unanimously.

The following motion, standing in Mr. ASHTON'S name, was withdrawn—“(1) That the Crown has not properly recognised its obligations in connection with the rabbit pest. (2) That in consequence of such failure this Conference desires to affirm as a principle that Crown tenants and alienees whose lands have been reduced in value by the incursions of the rabbit are entitled to a reclassification of their lands.”

Mr. ALISON (Canonbar) moved, “That this meeting, having decided that the question of dealing with the rabbit pest should be placed in the hands of the Pastures and Stock Boards, it is further of opinion that the Government, in proportion to the unoccupied Crown lands in any district, should contribute towards providing funds for dealing with the pest in such district.” The only thing that had occurred to him since placing the motion on the business paper was that the Government might possibly say that if they subscribed certain funds to the Pastures and Stock Boards it was probable the boards might devote the funds so subscribed to purposes other than the destruction of the rabbit on Crown lands. He would therefore like to add to the end of his motion, “Such funds will be spent on the Crown lands.”

Mr.

Mr. LESLIE (Forbes) objected, on the grounds that it would render the administration unworkable.

Mr. ALISON said he scarcely expected any opposition, but if there was opposition he would refrain from saying more until he replied.

Mr. BACON (Brewarrina) seconded the motion, which was carried.

Mr. GUNN (Narrandera) intimated that Messrs. Waddell and Greene had requested him to ask the Conference to permit them to postpone their resolutions until the following morning. The permission was granted.

Mr. OAKDEN (Cobar) moved, "That, without material assistance in the shape of subsidy or reduction in rents, the greater portion of the pastoral lands in the Western Division are unequal to bearing the weight of expenditure necessary for coping with the rabbit pest." He thought the resolution was self-evident, and that the necessity for some assistance to enable them to bear the weight of expenditure, largely increased owing to the rabbit pest, was so widely known and felt that it was unnecessary for him to say anything further.

Mr. ALISON (Canonbar) seconded the motion. They were nearly all aware that there were runs continually being abandoned, which clearly proved that the rabbits were too much for them. He knew of a number of leases which had been abandoned in certain districts, and undoubtedly the rabbits would continue to increase unless there was not something done in the direction of the reduction of rent.

Mr. FISHER (Murrumbidgee) supported the motion.

Mr. BACON (Brewarrina) supported the motion. He would point out, however, that the first part of the motion had, in his opinion, been dealt with by the Conference when they carried Mr. Alison's motion, which specified that the Government should provide funds for dealing with the pest, and further that the second part, which touched upon reduced rents, was provided for in the Land Bill, which had just been passed through the Council.

Mr. WILKS (Menindie), in supporting the motion, said that the holders in the western portion of the Colony were justly entitled to a reduction of rents, for the money they had been compelled to expend, owing to the pest, was enormous. The value of the lands had been appraised as though there were no rabbits in existence. They had found that the Act had not done any good, therefore they were justified in asking for a reduction or some equivalent.

Mr. MURCHISON supported the motion. The Minister had told them at the opening of the Conference that some millions of acres had been abandoned, and that was sufficient to show that something really was required to assist those who were yet sticking to their holdings.

Mr. OAKDEN said that as far as assistance by extension of tenure was concerned, extension of tenure upon many of the holdings in the west meant nothing else but ruin. He was not asking for what was unjust or unfair, but for simple justice, and he hoped they would agree to the motion unanimously.

The motion, upon being put by the CHAIRMAN, was carried.

Mr. HOUGH (Gunbar) moved, "That, in the opinion of this Conference, the interest and instalments on all C.P. and C.L. land, in all badly-infested rabbit districts, should be remitted by the Minister, and no forfeiture incurred where good cause can be shown of inability to pay; and that in such rabbit-infested country the interest on C.P. land be reduced by at least one-half, and that on C.L. land be remitted entirely until such time as the rabbits have been reduced to a minimum. All fines in such cases remitted."

Having submitted the motion, Mr. Hough asked permission to withdraw it.

Mr. GIBSON (Hay) objected to the withdrawal. It was a question forming part and parcel of the great question they had met to consider.

Mr. HOUGH thought himself that the rabbit question was largely mixed up with the land question, and that the subject of his motion was part and parcel of the question they had met to consider. He had felt inclined to withdraw because he felt that the motion was not approved of, and he did not wish to needlessly occupy the time of the Conference. An objection having been taken, he would accordingly proceed with the motion. If they agreed to the motion it would save many holders from foreclosure by the Banks. He knew of one instance where a man could not pay the interest required, and he was compelled to go through the Bankruptcy Court—the rabbits simply ruined him. Many like cases might be quoted, and he felt sure that numbers sitting at that table could endorse his remarks as to the absolute necessity of rents being reduced.

Mr. MURCHISON (Girilambone) seconded the motion.

Mr. GIBSON (Hay) moved, as an amendment, "That, owing to the devastation caused by the rabbits, a provision be inserted in the Rabbit Act allowing holders of infested country to have a re-classification and reappraisal of their lands." Owners of buildings had had to make concessions to their tenants, and holders of conditional purchases, seeing that circumstances had altered considerably, were justified in coming forward to ask the Government for re-classification. The question was this: Would it pay the Crown to lose these men? Because when men were compelled to leave the land who was to be got to take their places. By making some concessions at the present time holders would try and pull through. He thought the amendment would meet with the approval of the selecting party of the community, particularly in the Western Division, and that the Conference would be assisting the holders by asking the Government to grant these concessions.

Mr. T. IRVING CAMPBELL (Mount Ida) seconded the amendment.

Mr. HOUGH agreed to accept the amendment, and

The Conference having agreed to accept it in lieu of the motion,

Mr. WALKER (Tenterfield) said it was most important that they should keep as many people on the soil as possible, in order that the rabbits might not be permitted to increase, as the more land that was thrown back on the hands of the Government so much the greater became the scope upon which the rabbits would be unmolested, and they all knew how rapidly they increased when undisturbed, and in his opinion nothing tended so much to keep the rabbits down as settlement. He hoped the amended resolution would be agreed to.

The substituted motion by Mr. Gibson was then put to the meeting and carried.

The CHAIRMAN pointed out that before the Conference dispersed, and in order that the Minister might be immediately apprised of the result of the Conference, it would be necessary to appoint a sub-committee to prepare a draft report. The Conference would meet again in the morning, when the draft report would be submitted for adoption.

Mr

Mr. OAKDEN (Cobar) asked leave to withdraw the motion standing in his name, on the ground that the principles contained in it had been affirmed by a previous resolution (Mr. Alison's).

The withdrawal of the motion was agreed to.

Mr. CUNNINGHAM (A.M. and A. Co.) moved, "That all districts where rabbits are known to exist, or are in danger of becoming infested, be proclaimed infested areas." He asked leave to amend his motion, seeing that the Conference had carried a motion recommending the repeal of the Rabbit Act, so that it would read, "That it be a direction to the local Boards in districts where rabbits are known to exist, or are in danger of becoming infested, to proclaim them infested areas."

Mr. WALKER (Tenterfield) seconded the resolution.

The Conference would not accept the alteration, and on the motion, as printed, being put it was agreed to, 11 voting in favour and 7 against.

Mr. OAKDEN (Cobar) said that as the Conference had already agreed to the free carriage of rabbits on the railways, he thought that the same principle should be agreed to concerning rabbit skins, and he therefore moved—"That this Conference recommends the free carriage of rabbit skins on the State railways."

The motion was seconded by Mr. HOUGH and carried, 14 being in favour of it and 5 against.

Mr. D. JOHNS (Wyalong) moved, "That, as it is impossible for infested districts to combat the rabbit pest until the vacant lands are wire-netted, the Government is urged to join in netting the boundaries of abandoned and unoccupied lands, reserves, and commons; to allow to any adjoining holders who may erect a wire-netting fence adjoining these lands an abatement of rent which will, during the term of lease, cover the cost of erection."

Mr. ALISON (Canonbar) seconded the resolution, which was carried.

Mr. GATENBY (Forbes) moved, "That the Government be urged to at once put the rabbit-barrier fence from Albury to Bourke in thorough repair, and take such measures as will ensure its effective maintenance whilst under its control. Subsequently, on demand of the various Stock Boards through or along the boundaries of which it runs, shall be handed over to their care." He thought that what was asked for in the motion was only reasonable, and he had moved the motion because he considered that where fences along a certain line were in disrepair the Government might reasonably be expected to put them in repair.

Mr. SCOTT (Condobolin) seconded the motion, which was agreed to without further discussion.

The CHAIRMAN asked the Conference to appoint a sub-committee to prepare the draft report, as whatever they had done, unless put into some form for presentation, would be utterly useless.

Mr. WILKS (Menindie) moved, "That the following gentlemen be a committee to draw up a draft report embodying the motions passed at this Conference, for the purpose of presenting the same to the Honorable the Minister for Lands for his consideration:—Messrs. Gatenby, Leslie, Oakden, M'Farland, Gunn, Lane, Gibson, Murchison, Ross, and Hough, of which five should form a quorum."

Mr. GIBSON seconded the motion, which was carried.

Mr. OAKDEN (Cobar) moved, "That, for the destruction of rabbits, this Conference recommends primarily the use of poisoned water and trapping at tanks, phosphorised pollard, poisoned twigs, tilt pit-traps along the lines of wire netting." The best way, in his opinion, for dealing with the pest was by poisoning the water in tanks. He thought that when they had a long dry season there was nothing equal to poison for destruction. The skins would cover the cost of the poison. The tilt pit-traps along wire netting had also proved very successful indeed, and no barrier lines of fencing should be without them, as by the means of these thousands had been caught. Then again, in the event of the rabbits being required for market, the pit-traps were of much use in catching them. He thought that those members of the Conference who had tried these methods would agree that they were most effective.

The motion was seconded by Mr. M'FARLAND.

Mr. CUNNINGHAM said he would like to see wire netting included among the means for destruction, as unless they had it included in the recommendation they might leave the impression that it was not considered of much use, whereas throughout the Conference reference had been made to its efficacy.

Mr. SCOTT (Condobolin) said that in his district there were a great many settlers, and their belief was that they could keep down the rabbits in their holdings with the aid of wire netting and phosphorised pollard. One of his neighbours had lately used this poison with the greatest success, and he was the only man he ever heard say he could completely keep down rabbits. Of course, that was only one man's opinion. He believed in wire netting, but still phosphorised pollard could do a lot, and a bushel could be laid at very little cost, and that amount would lay a train from 12 to 14 miles, the pellets being about 4 or 5 feet apart. Judging from that, the objections of the selectors to poisoning on the score of expense fell to the ground. Pit-traps had also been found very serviceable in the work of destruction.

Mr. WILKS (Menindie) said no man could doubt that fencing could keep rabbits down, but what they wanted was a cheap means of destruction, and in the Western districts they were already paying more than they could afford to keep the pest down.

The consent of the Conference was given to the insertion of the words "wire netting" before "poisoned water," and the motion as altered was agreed to.

Mr. M'FARLAND proposed, and Mr. OAKDEN seconded, the adjournment of the Conference until 10 a.m. the following morning.

Conference adjourned accordingly at 5.30 o'clock.

FOURTH DAY—Friday, April 15th, 1895.

The Conference met at 10:30 a.m., the Hon. W. Campbell, M.L.C., presiding.

The minutes of the previous sitting having been confirmed,

Mr. OAKDEN desired it to be understood that he had withdrawn his motion (No. 18 on the previous day's paper) as he understood that the principle contained therein was met by a previous motion, agreed to by the Conference.

Mr. D. TULLY (Hillston) said that before the business was proceeded with he desired to draw attention to the fact that a resolution he had given notice of had been omitted from the business paper. He hoped that he would be permitted to discuss it.

The Chairman said that he would be in order in moving it when the other business had been disposed of.

Mr. OAKDEN's motion, upon which the discussion was adjourned on the preceding day, was then put to the Conference and carried.

Mr. WADDELL, M.L.A., said that with reference to motion 1 standing in his name to the effect "That the matter of dealing with the rabbit pest being a national question, this Conference is of opinion that the Government should supplement at the rate of pound for pound all moneys raised by local contribution," he desired to postpone it. On the previous day a motion had been agreed to which he thought would require to be rescinded before he could discuss the one in his name, and unless that motion was rescinded he would not proceed with his.

It was agreed to postpone the consideration of motion 1.

By consent Mr. Greene was permitted to withdraw his motion, which was "That in view of the increased power proposed to be conferred on the Pastures and Stock Boards, especially in regard to the expenditure of public money it is necessary that provision be made for the adequate representation of the State upon such Boards."

A motion in Mr. Morgan's name to the effect "That for the purpose of rabbit destruction in rabbit-infested districts a rebate duty be allowed on the following articles:—Wheat, pollard, phosphorous, rabbit-traps, and poisoning machines," was, on the motion of Mr. Gunn, struck off the business paper, the mover being absent.

Mr. OAKDEN said that with the consent of the meeting he would, on behalf of Mr. Hough, withdraw the motion standing in that gentleman's name. The motion was as follows:—"That in view of the widespread desolation and ruin caused by the enormous increase of rabbits, and to further their complete annihilation the Minister be asked to embody in the Bill now before the House a provision enabling anyone to occupy 640 to 1,000 acres absolutely free for ten years, in all badly infested country, conditionally on their surrounding the holding with a netting fence, to be approved by the Local Board; residing thereon continuously, and destroying all rabbits therein; and in necessitous cases to extend the same privilege to conditional purchase and conditional leaseholders, thereby putting them on the same footing, and giving them a chance to keep their holdings."

Permission was given, and the motion withdrawn.

Mr. D. TULLY (Hillston) moved, "That in the opinion of this Conference the maximum size of rabbit netting to be used in future shall be $1\frac{1}{2}$ x 42 x 17." He considered the size of the netting was a most important matter for them to consider in connection with rabbit destruction, and that they should have a proper gauge to fence in holdings with. The majority of holders knew that with the gauge under the 1890 Act the width of the mesh was utterly useless as a means for keeping out rabbits. He had much pleasure in moving that this should be the maximum gauge in any future legislation.

Mr. ROSS (The Hume) seconded the motion.

Mr. GUNN (Narrandera) agreed with the mover in thinking that the mesh should be reduced, but he would have gone further, and proposed that it be $1\frac{1}{4}$ -in. gauge. It was known that rabbits would go through an inch and a half. He would, however, support the motion, but would have had greater pleasure in doing so had the gauge been fixed at $1\frac{1}{4}$ in.

Mr. MCFARLAND (Hay) supported the motion so far as the mesh and height of the netting. He thought a $1\frac{1}{4}$ -in. mesh would be too expensive to start with. He thought that with a mesh of $2\frac{1}{2}$ in. and 2 ft. 6 in. above the ground they would do well.

Mr. OAKDEN (Cobar) proposed as an amendment the insertion of the words "with a minimum width of" in front of "42 in." What they really wanted was a maximum mesh and a minimum width.

Mr. SCOTT (Condobolin) seconded the amendment.

Mr. OAKDEN pointed out that the amendment merely drew the attention of the Conference to the maximum mesh and minimum width. He had used wire netting with traps, and fairly-strong young rabbits would go through the $1\frac{5}{8}$ -in. mesh, and that size was generally condemned by all who knew anything about it. He had used 42-in. netting, and had carried a resolution at a previous Conference to the effect that it was desirable to do so, and it was pointed out that the extra expense would affect the use of wire netting very seriously. Nevertheless, he believed that 42-in. netting would be more serviceable. He had seen rabbits jump over netting 3 ft. above the ground, and netting that high was not a complete barrier.

Mr. MORGAN (Wentworth) thought that $1\frac{1}{2}$ in. was far too big for a rabbit-proof fence, and in fact he thought that any fence less than 3 ft. high was not rabbit-proof. He would like to see the maximum mesh $1\frac{1}{4}$ in. as $1\frac{1}{2}$ in. did not meet the requirements.

Mr. GUNN said that there had recently been introduced a new kind of fence, which while adding greatly to the efficiency had largely reduced the cost. He moved, "That the maximum mesh be $1\frac{1}{4}$ -in. up to 1 ft. above the ground, and $1\frac{3}{8}$ -in. above the minimum height to be 42 in."

Mr. HOUGH said that with regard to the size of the mesh he concurred in the remarks made by Mr. Gunn. Rabbits could get through a $1\frac{1}{2}$ -in. mesh, and lived afterwards, but with a $1\frac{1}{4}$ in. they all died that succeeded in getting through. He would like to see the height fixed at 42 in., but it would make the material considerably dearer. He understood that the combination mentioned by Mr. Gunn had proved very satisfactory in Queensland.

Mr. WILKS (Menindie) said that with respect to the $1\frac{1}{2}$ -inch mesh, he was not in accord. He thought the $1\frac{1}{4}$ -inch much better. Between this Colony and South Australia, where a barrier fence had been erected, it was wise not to put up $1\frac{1}{2}$ -inch mesh netting, for where they had one side through which foreign rabbits could get in, where was the use putting $1\frac{1}{4}$ -inch on the other three sides. The

The CHAIRMAN said that, if there was no objection, he would put the motion in sections, "That in the opinion of this Conference, the maximum sized mesh shall be 1½ inch." On that Mr. Gunn had moved an amendment, "That the maximum mesh be an inch and a quarter up to a foot above the ground, and an inch and five-eighths above, the minimum height to be 42 inches."

Mr. BACON (Brewarrina) opposed Mr. Gunn's proposition. He thought they had better establish a maximum of an inch and a half instead of an inch and a quarter.

Mr. RYAN pointed out that an inch and a quarter and an inch and five-eighths might do very well in some parts of the country, but he ventured to think that anyone who had seen a border fence that netting a foot and a half from the ground would be no use at all, because if a shower or two came the fence would be completely blocked with *debris*, which formed an easy means for rabbits or anything else to get over. Netting of any larger mesh than one and a quarter right up would be of no use.

Mr. QUIN concurred in what Mr. Ryan had stated. On the South Australian border the fence there was quite covered with sand, and he saw the other day on one of the runs in the Western District a man having to remove the sand where it had completely covered the fence. What, in cases of that kind, were the men to do? As for saying that the Government would recognise their liability, that was all rubbish. The Government would do nothing of the kind. They all knew that the pastoralists who were fencing their runs would be made to do it by the Local Land Boards. What was the use of bringing a matter of that kind forward, when the Government would not recognise their responsibility.

The CHAIRMAN pointed out that the resolutions arrived at by the Conference were for the Minister's guidance, and it did not follow that because they held those opinions that he would adopt them. The whole of the proceedings would be placed before him, and he would then be able to judge for himself as to the wisdom or otherwise of making use of the resolutions arrived at by the Conference.

Mr. QUIN still urged that the size of netting as contained in the motion should not be considered to apply to the Western District.

Mr. HUGH MACDONALD, M.L.A., considered that netting more than an inch and a quarter in mesh was of no earthly good, and without doubt it was only fair that, if through anything agreed to by the Conference a compulsory fencing clause was introduced, they should so word their suggestions as to ensure that those who did have to pay received something which would benefit them in return.

Mr. Gunn's amendment, with reference to a combination fence, was negatived by 15 votes to 12, and the original motion, providing for a mesh of 1½ inch diameter, was agreed to on the casting-vote of the Chairman.

Mr. OAKDEN (Cobar) moved that instead of 42, a minimum width of 36 should be inserted.

The Conference decided that the 42 should be retained, and that as proposed the words "with a minimum width of," should precede it. A gauge of 17, as per original motion, was agreed upon, and the motion as amended, and which read, "That in the opinion of this Conference, the maximum size of rabbit netting to be used in future shall be 1½, with a minimum width of 42 by 17," was agreed to.

Mr. GATENBY (Forbes) moved, "That in any levies made under the Pastures and Stock Boards, and the erection and maintenance of barrier fences, such levies shall be *pro rata* on the acreage of land and not on a stock basis."

Mr. LESLIE (Forbes) seconded the motion.

Mr. GATENBY said that he was in favour of any assessment that might be made, or any levies made by the Pastures and Stock Boards, and no doubt it was a comparatively easy matter to make the levies on the stock, but there were serious objections to such a course being pursued, as if it were levied on a stock basis, the more a man had improved his holding, the greater would be his tax; and it was only fair that those men who had not taken advantage of their opportunities and improved their holdings, should be made to pay their share.

Mr. QUIN thought the introduction of such a system as was proposed in the motion would in many cases work great hardship.

Mr. MURCHISON (Girilambone) supported the motion, and explained that in the district where he lived there was splendid land and very little improvement. He would like to be informed why a man who by sheer hard work brought his holding to a high degree of perfection should be compelled to pay for the man who, with the same opportunities, calmly sat down and did nothing towards making improvements on his holding.

Mr. BACON (Brewarrina) did not favour the motion on the principle adduced by Mr. Quin.

Mr. OAKDEN (Cobar) moved as an amendment the insertion of the words "in proportion to its natural carrying capacity."

Mr. FERGUSSON, M.L.A., seconded the amendment.

Mr. LESLIE (Forbes) thought that the Government should pay their quota. He believed the Conference had expressed its opinion that the Government should recognise its responsibility in paying something towards the destruction of noxious animals, and that there was a large amount of land which had been abandoned by owners because it had become rabbit infested. If the words were inserted, a great quantity of land would carry nothing, and the tax would be nil.

Mr. ASHTON, M.L.A., said that there was much in what the last speaker had said. In a rabbit-infested country the natural carrying capacity amounted practically to nil. If they based the valuation on the carrying capacity of the lands, men, who had kept up that carrying capacity by improving it, would have to pay far more than the Crown would pay. The question was were those abandoned and resumed areas to escape their just portion of taxation through the fact that they had been neglected. If they could fix a value to these Crown lands, then tax it at a certain rate per acre and the lessee who had improved his land at the same rate, fixing the rate sufficiently high to raise the amount of revenue required. By this means the system would operate equitably.

The amendment was agreed to, 15 voting in favour and 14 against.

The motion as amended, "That in any levies made under the Pastures and Stock Boards for the destruction of rabbits and the erection and maintenance of barrier fences such levies shall be *pro rata* on the acreage of land in proportion to its natural carrying capacity, and not on a stock basis," was then carried.

Mr. LESLIE (Forbes) moved, "That where any boundary fence, which has been or may hereafter be fenced with rabbit-proof netting, whether in a proclaimed rabbit-infested district or not, is used by the adjoining holder to make his holding rabbit-proof, such holder shall be liable (after inquiry by the local

Land

Land Board) to a contribution of one-half the cost of making and maintaining such boundary fence rabbit-proof." In moving the resolution he said his object was to protect those who had already erected fences beside lands which were proclaimed areas. They all knew people would shirk their obligations unless some definite arrangements were decided upon. He would not detain them, as he considered the justice of the thing was so apparent as to secure their sympathy and support.

Mr. HUGH MACDONALD, M.L.A., seconded the motion, which to him appeared perfectly fair.

Mr. J. M. ATKINSON desired to point out that this provision was already in the Rabbit Act, and under the provision recovery had been made.

Mr. MORGAN said the motion was intended to apply to districts where the Rabbit Act was not in force.

Mr. FISHER said the putting in operation such a principle as that contained in the motion would be very severe. During the whole of the discussion the tendency had been not to insist on a man paying for rabbit-proof fencing unless he received some benefit. If a man took up a piece of land, two sides of which were proof fenced and the other two open, was he to pay for these two sides? He did not think he ought to be compelled to do so.

Mr. LESLIE explained that the motion did not convey this idea.

Mr. FERGUSSON, M.L.A., said there was a provision in the old Act that was somewhat similar to the one now under discussion.

Mr. QUIN presumed that the mover had submitted the motion, assuming that the Rabbit Act would be repealed.

Mr. LESLIE: Yes.

Mr. GATENBY thought the motion one which many of the delegates would support. He considered it only just and fair that if a man received a benefit he should pay for it.

Mr. LESLIE, in reply, said that so far as he had heard no argument had been advanced against the motion. The result certainly could not affect men who had already fenced, and it was only to protect those who may have fences in districts which had not been proclaimed rabbit-infested, and which might hereafter be proclaimed, and he thought the motion would commend itself to the good sense of the Conference.

The motion was agreed to.

Mr. WADDELL, M.L.A., withdrew the postponed resolution standing in his name.

Mr. GUNN suggested that as many of the members had made arrangements to leave for their respective homes, any further business not on the business paper should not be taken.

Mr. LESLIE moved the adjournment of the Conference for twenty minutes to enable the Sub-Committee to complete the Draft Report for presentation to the Minister.

On resuming, the Sub-Committee presented the Report which was read by the Secretary and adopted unanimously.

It was then arranged that the Chairman and the members of the Committee should wait on the Minister on the following Monday at 10 a.m., for the purpose of handing him the result of the deliberations as set forth in the Draft Report.

Before dispersing, votes of thanks were accorded the Chairman and the Secretary.

1894.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

PASTURES AND STOCK PROTECTION ACTS AMENDMENT BILL.

(MESSAGE No. 33.)

Ordered by the Legislative Assembly to be printed, 12 December, 1894.

R. W. DUFF,
Governor.

Message No. 33.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends, for the consideration of the Legislative Assembly, the expediency of making provision to meet the requisite expenses in connection with a Bill to amend the Pastures and Stock Protection Act and Pastures and Stock Protection Act Amendment Act of 1881.

*Government House,
Sydney, 12th December, 1894.*

1894-5.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

THE PROSPECTS OF THE FROZEN MEAT TRADE ON THE CONTINENT OF EUROPE.

(REPORT OF THE CHIEF INSPECTOR OF STOCK ON.)

Ordered by the Legislative Assembly to be printed, 19 March, 1895.

From what I learned while on the Continent, more especially in Berlin and Paris, I had doubts—in view of the extent to which protection exists in Germany and France and the great influence of the Agrarian Party in both these countries—whether a paying trade in Australian meat of any great extent could be permanently established on the Continent; and I considered it the safer course in regard to this portion of my report on the meat trade, to take time to prepare it while attending to my own special duties (which of late have occupied more than the whole of my time), and wait the result of the efforts which were being made by Messrs. W. Weddel & Co. and Messrs. Geddes, Birt, & Co. to secure a footing for our meat on the Continent, before submitting my report, lest, in view of the heavy duty and expense which must be incurred on meat taken to the Continent, and the risk and uncertainty which attaches to trade with foreign countries, and where alterations of the regulations may take place at any time, I might give rise to hopes which would not be realised.

What mainly led me to take this rather doubtful view of the prospects of the Continental trade in Australian meat was the treatment the question of its introduction into Berlin received while I was in Germany. As I explain more fully in my report on the Berlin meat trade, previous to my arrival in that city an application had been made in due form by Messrs. W. Weddel & Co., of St. Helen's-place, London, for leave to introduce Australian meat into Berlin; and, although their agent made repeated endeavours to obtain a reply to their application, and I also enlisted the assistance of the English Embassy, they only received a reply after a delay of some five or six weeks to the effect that the meat would not be admitted, while at the time the application was made there was no law or regulation forbidding its introduction, the authorities merely instructing their officers not to inspect the meat, and without inspection it could not be introduced.

Seeing what had happened I expressed a fear to some of those who were thinking of embarking in the Frozen Meat business, lest the same course might be taken in regard to the rest of Germany,—as for instance at Hamburg,—and was assured that it would not; but now we learn that an interdict has been issued against the introduction of frozen mutton into any part of Germany, and what I was afraid of has actually taken place with respect to the meat in which we are principally interested.

But while this is the case I would recommend that we continue to urge on the Governments of France and Germany the withdrawal of the restrictions which seriously interfere with its introduction into these countries (which would otherwise be by far our best customers) without, as we think, adding anything to the guarantee which we are prepared to give, that the meat is free from infection, by carrying out a careful inspection of the stock both before and after slaughter, by qualified veterinary surgeons.

THE MEAT TRADE IN GERMANY.

GERMANY, with a population of some 50,000,000, has not sufficient live stock to supply them with animal food. According to the latest available returns, she has 17,496,000 cattle and 13,775,000 sheep. Her annual average imports of live stock are, say, 251,000 cattle, 7,800 sheep, and 910,000 pigs, while her average annual exports are about 15,000 cattle, 319,000 sheep, and 12,000 pigs. This shows that she requires, say, 236,000 cattle and 898,000 pigs in addition to those which she breeds, but that she has a surplus of more than 311,000 sheep.

Germany has been receiving her outside supplies of cattle (alive and dead) principally from Denmark, Austria, Holland, Switzerland, and the United States, but the American importations have recently been stopped, on the ground that some of the cattle were affected with Texas fever. The pigs introduced into Germany have been principally from Holland, Austria, Denmark, and Belgium. Naturally Berlin and the other large cities in eastern and central Germany should draw their supplies of foreign meat from the south of Russia, where live stock are comparatively cheap; and there is no doubt she would do so were it not that Rinderpest and other infectious and contagious diseases in stock are almost continually prevalent in Russia and Germany, and the other European States are obliged to maintain a constant prohibition against the introduction of Russian cattle and sheep.

The surplus sheep of Germany are taken principally by Belgium, the United Kingdom, and France.

The consumption of meat per head of the population in Germany is low, only 64 lb. per annum. This is no doubt largely attributable to the high prices going there for meat.

The following were the wholesale and retail prices for German meat in Berlin in May last :—

<i>Wholesale.</i>			
Beef—1st quality	... 6½d. per lb.	Mutton—1st quality	... 7d. per lb.
2nd "	... 5½d. "	2nd "	... 5½d. "
3rd "	... 4¾d. "	3rd "	... 4d. "
<i>Retail.</i>			
Beef—1st quality	... 10½d. per lb.	Mutton—1st quality	... 9½d. per lb.
2nd "	... 8½d. "	2nd "	... 7½d. "
3rd "	... 6½d. "	3rd "	... 5½d. "

This, I think, shows that there is a fair prospect of doing a trade with Germany, more especially in Berlin, in Australian meat, even with the rather heavy duty of 1d. per pound, including the fee for inspection, if the restrictions at present in force to which I afterwards refer as existing in Berlin were modified or withdrawn and that they would not be again arbitrarily imposed.

It will have been noticed that Mr. W. Weddel, of Messrs. W. Weddel & Co., St. Helen's-place, London, as agents for several of the New Zealand and Australian meat export companies, has been doing his best—by visiting the Continent and forwarding direct shipments to Hamburg—to obtain a footing there for frozen meat in the face of considerable difficulty and discouragement. Mr. J. H. Geddes also, while connected with the late firm of J. H. Geddes & Co., and latterly since the formation of the new company of Messrs. Geddes, Birt, & Co., has done and is still doing excellent work in the same direction. As regards the duty with which I was charged, it is only right that I should here acknowledge that in prosecuting my inquiries in Great Britain both Mr. Geddes and Mr. Weddel afforded me every assistance in their power. Before I left for the Continent they very kindly furnished me with letters of introduction to their correspondents in the different countries I intended to visit, which enabled me to gather a great deal of information which I could not otherwise have obtained. I also, through the kindness of Sir Saul Samuel, C.B., the Agent-General for the Colony, received from the Foreign Office letters accrediting me to the Ambassadors at Brussels, Copenhagen, Berlin, Paris, and Rome, and left London on the 27th April for Cologne, where I arrived on the 28th, and there met Mr. Oebel, merchant in that city, to whom Mr. J. H. Geddes had given me a letter of introduction. Cologne is an important town on the Rhine, with some 200,000 inhabitants, and being only a short distance from the large manufacturing cities of Elberfeld, Bremen, Eachen, Essen, and Dusseldorf, Cologne is very well situated for, and should, I think, be chosen as a distributing centre for the sale of Australian meat, should the trade be established. As it is hoped it will yet be, in the south of Germany. I found Mr. Oebel was prepared to take up the business in Cologne, if regular supplies of meat could be sent him, and cold storage procured, but as these requirements could not then be met, and as the distance by rail from either Antwerp, Rotterdam, or Amsterdam, the nearest seaports to Cologne, was considerable, and no refrigerating cars procurable, it was seen that it would not be possible to do any business, except, perhaps, for a short time in mid-winter, and then only after a central cold-store had been provided at one or other of the ports mentioned, to which the meat in the first instance could be forwarded from London on its way to Cologne.

If, however, a better footing were obtained in Germany for Australian meat, and the supplies, instead of coming as they now do, through London, were to arrive direct, there is no doubt a satisfactory trade will be done at Cologne.

BREMEN.

I left Cologne next day for Bremen, a town with a population of 166,000, where I saw Mr. G. H. Specht, ship-broker, to whom I had an introduction from Messrs. W. Weddel & Co., London; but from what Mr. Specht said, the prospects of business being done in our meat there are comparatively poor. Considerable quantities of American beef, and shipments of live cattle, too, from the United States, were at that time landed at Bremen. I also saw the British Consul, who held similar views as Mr. Specht with regard to frozen meat, but thought business might be done in tinned meat if our companies were to push the business and bring samples of the meat, and perhaps of other products. I then called at the office of the German-Lloyds Steam Navigation Company, and saw the managing director as to the prospect there was of their vessels being fitted up for carrying frozen meat from Australia to (say) Antwerp, Rotterdam, Amsterdam, and Hamburg; but I found that nothing would be done, at any rate in the meantime, but that he expected the company would have another large new steamer on the Australian line, when they would consider the matter.

HAMBURG.

I left the same afternoon for Hamburg, the principal seaport town in Germany. The population of Hamburg, with Altona, which adjoins Hamburg, is about 800,000. A very large and growing trade is done in Hamburg, and from the highly advantageous position which it occupies, it is bound to continue to increase.

It was at Hamburg that the first successful attempt was made to introduce Australian frozen meat into Germany. Messrs. Hirsch Bros., general merchants of Melbourne and Hamburg, some five or six months previous to my visiting Hamburg, opened a retail shop for the sale of Australian and New Zealand beef and mutton. At first they did a large business, principally in beef, and although it had fallen off to some extent when I met Mr. Albert Hirsch, they were still doing a considerable trade. All over the Continent, except in France, and perhaps also in Belgium, the sale of beef is very much greater than that of mutton.

Messrs. Hirsch purchased their meat in London, through Mr. J. H. Geddes, and the steamer by which it was forwarded to Hamburg had a roughly insulated compartment to protect the meat on transit from the effects of the heat, but the arrangement was not by any means an absolute protection in hot weather; and very naturally Mr. Hirsch was looking anxiously for properly refrigerated chambers on board some of the steamers plying between London and Hamburg, or direct shipments from Australia, to which it must ultimately come if a trade in Australian meat is to be established on the Continent. Coming by way of London, not only is there additional expense of about ½d. per lb., but there is a certain amount of risk of taint which would not occur in the case of direct shipments.

The other firm in the frozen meat trade in Hamburg is the Austral Fleisch Import Company, managed by Von P. H. Andresen. This company has five shops, and they had a large stock of Queensland beef on hand in the cold store attached to the city meat market. This beef was the balance of a cargo sent to Hamburg by Messrs. W. Weddel & Co., who disposed of a portion of it and then stored but afterwards sold the rest to the Austral Fleisch Import Co. Both

Both Mr. Andresen and Mr. Hirsch gave me to understand that they meant to carry on the trade, even though they should have to go to London for supplies. I do not think, however, that it would have been necessary for them to do so, for I understand that more than one direct cargo of Australian meat have, since I was at Hamburg, been taken there.

The following is a statement of the retail prices at which Australian beef in May last (at that season of the year little or no mutton was selling) was being disposed of by Messrs. Hirsch Bros. and the Austral Fleisch Import Company in Hamburg :—

				<i>Hind-quarter.</i>	£	s.	d.
Knuckle-bone, say 10 lb., @ 3d.	0	2	6
Leg and buttocks, say 55 lb., @ 6 $\frac{3}{4}$ d.	1	10	11 $\frac{1}{2}$
Rump, say 35 lb., @ 6 $\frac{3}{4}$ d.	0	19	8 $\frac{1}{2}$
Rump steak, say 20 lb., @ 7 $\frac{1}{2}$ d.	0	12	6
Flank, say 16 lb., @ 4 $\frac{1}{2}$ d.	0	6	0
Tallow, say 14 lb., @ 2 $\frac{1}{2}$ d.	0	2	7 $\frac{1}{2}$
					<hr/>		
					£3 14 3		
				<i>Fore-quarter.</i>	£	s.	d.
Knuckle-bone, say 7 $\frac{1}{2}$ lb., @ 3d.	0	1	10 $\frac{1}{2}$
Flat rib, say 50 lb., @ 4 $\frac{1}{2}$ d.	0	17	8 $\frac{1}{2}$
Shoulder, say 28 lb., @ 6d.	0	14	0
First ribs, say 15 $\frac{1}{2}$ lb., @ 6 $\frac{3}{4}$ d.	0	8	8 $\frac{1}{2}$
Covered ribs, say 12 lb., at 6d.	0	6	0
Neck, say 10 lb., @ 4 $\frac{1}{2}$ d.	0	3	9
					<hr/>		
					£2 12 0 $\frac{1}{2}$		
Hind-quarter...	£3 14 3			
Fore-quarter...	2 12 0 $\frac{1}{2}$			
					<hr/>		
Total				...	£6	6	6 $\frac{1}{2}$

While in Hamburg I called also on the manager of the German-Australian Steamship Company with regard to the prospect of their fitting up some of their steamers to carry meat, and take direct cargoes from Sydney to Hamburg. He said they would require a guarantee as to the quantity of freight before they could incur the heavy expense which the fitting out of any of their boats for the frozen meat trade would entail. I suggested that for a time they might deliver a portion of the meat at London, and take on the balance to, say, Rotterdam, Amsterdam, or Hamburg, when he seemed to think that a commencement of direct shipments might be got in that way if cold storage were provided, and arrangements made for doing a fair amount of business at each of the cities mentioned.

THE MEAT TRADE IN DENMARK.

The area of Denmark is less than one-third that of Scotland, and the population in 1890 was 2,170,000. The principal industries of Denmark are farming, dairying, and fish-curing, and she carries on a considerable maritime trade. Her exports in dairy and farm produce, bacon, and fish, are large for the size of the country. In 1893 she sent butter valued at more than £5,278,000, and bacon and hams at more than £2,178,000 to England alone.

The only country from which Denmark imports any live stock is Sweden, to the extent of 20,000 cattle a year, and nearly the same amount of sheep, with, say, 2,000 or 3,000 pigs.

Her exports in live stock again are almost entirely confined to Germany and the United Kingdom, and they average, say, 90,000 cattle, 4,000 sheep, and 150,000 pigs to Germany, and 40,000 cattle, 40,000 sheep, and 1,000 pigs to the United Kingdom, showing that the exports exceed the imports, 110,000 cattle, 24,000 sheep, and 148,000 pigs.

The following are the wholesale prices obtained for meat in the Copenhagen market in October last :—

Ox beef, 1st quality, from 55s. to 60s. per cwt. (say 6 $\frac{1}{4}$ d. per lb.	
" 2nd " 32s. to 41s. " 4d. "	
Cow beef, 1st " 41s. to 47s. " 4 $\frac{3}{4}$ d. "	
" 2nd " 27s. to 30s. " 3d. "	
Veal, 1st " 25s. to 27s. 6d. " 2 $\frac{3}{4}$ d. "	
Pork, extra quality, weighing from 132 lb. to 154 lb. (say 5 $\frac{1}{2}$ d. per lb.	
" 1st " " 126 lb. to 165 lb., " 5d. "	
" 2nd " " 126 lb. to 165 lb., " 4 $\frac{3}{4}$ d. "	
" 3rd " " 126 lb. to 165 lb., " 4 $\frac{1}{2}$ d. "	

There is no duty on the importation of beef, veal, mutton, lamb, or pork, nor of sausages, hams, or tongues into Denmark. The annual consumption of meat in Denmark is rather low, only 64 lb. per head of the population, and I think that there are fair grounds for supposing that, with the introduction of good frozen meat at a less price than that at which the home-bred meat is now sold, there would be a considerable increase in the consumption per head, and a fair opening to a moderate extent for our meat, even although, as I have shown, Denmark has a surplus of live stock, because it will pay her to sell her own stock and purchase frozen beef and mutton.

Copenhagen, the capital of Denmark, is situated on the northern portion of the peninsula of Jutland, and has a population of between 380,000 and 400,000. Its position is favourable as regards facilities for trade with Prussia, Russia, Finland, and Sweden. Some 30,000 vessels pass the sound every year, and a good many of them touch at Copenhagen.

In order to maintain the footing she has obtained in the countries named, and counteract the effect which the opening of the canal which Germany has constructed from the North Sea through Holstein to the Baltic, the merchants in Copenhagen have just completed an extensive free port, the area of which is over 50 acres, surrounded by over 10,000 feet of wharves, with very commodious stores supplied with all the newest appliances for loading and discharging vessels at a cost of, it is said, about £1,000,000 sterling.

From

From this it will be gathered that there is a good prospect that the trade now being done at Copenhagen will increase, and, if so, there is every reason to believe that a fair amount of trade in Australian meat will be done when proper arrangements have been made for carrying it on, as it is believed they will be when direct shipments have been obtained to Hamburg and the business there put on a proper footing.

I reached Copenhagen on the 3rd May, and called at the British Embassy. I afterwards delivered a letter of introduction I had received from Mr. J. H. Geddes to the manager of the Den danske Landmans Bank (one of the leading banks in Copenhagen), by whom and Mr. Salomon, the secretary of the bank, I was well received. I was introduced by Mr. Salomon to Messrs. Max Levig & Co., merchants, Copenhagen, who are prepared to take charge of any consignments of meat or other produce which may be put in their charge.

On visiting the meat market I found that the butchers were divided into two classes, and occupied stalls in two different portions of the market, the one class selling only Danish meat and the other only foreign. Some of the butchers in the foreign portion expressed themselves willing to purchase Australian beef and mutton at the market price in London, and pay carriage from London to Copenhagen. I gave Messrs. Geddes, Birt, & Co., Messrs. Max Levig & Co.'s, the name and address of one of the principal butchers who offered to buy the Australian meat, and they intend to see what can be done in opening a trade in Copenhagen, but as no cold storage is as yet provided there, and as for a time the demand will be small, business can only be done by forwarding supplies by ordinary steamers from London to Copenhagen in the winter time. If, however, a beginning were made at that season, and the trade grows, as I believe it will, cold storage will be provided and a constant supply of beef and mutton kept up, and when this takes place, as there is a large population in Copenhagen and the suburbs, and the Australian beef and mutton, while it is of quite as good quality, can be sold at less money than the Danish, while that on the other hand being offered in the shape of live stock can find a market in Germany and England at considerably higher prices than what would be paid for the Australian meat.

When the trade is fairly established at Copenhagen, a good quantity of frozen meat would be sold to the shipping, and it is thought that a market would also be found for some of it in Sweden at certain seasons of the year.

THE MEAT TRADE IN BERLIN.

Berlin is now one of the largest and finest capitals in Europe. She has numerous public parks, gardens, and recreation grounds, while the streets in the new portion of the city are well laid out and wide, and the buildings, both public and private, are large and handsome. The population of Berlin, with that of Potsdam, and the other suburbs, is said to be more than 2,000,000. She has extensive manufactures in iron, porcelain, furniture, and other lines, which employ great numbers of workmen, and her trade and commerce are large and increasing.

THE MEAT SUPPLY OF BERLIN.

Live Stock.

It is estimated that there are sold weekly in the city of Berlin :—

Fat cattle	3,000
Fat calves	2,600
Sheep and lambs	5,000

Fresh Meat.

Beef	40,000 cwt.
Veal	28,000 "
Mutton and lamb	30,000 "

Berlin's supply of meat from outside comes principally from Denmark, Austria, and Sweden.

It will be gathered from this estimate that the demand for beef is much greater than for mutton in Berlin, and indeed, all over Germany; and it is only in winter that mutton is much used, while beef is eaten all the year round.

THE PRICE OF MEAT IN BERLIN.

Prices during the second week in May last for German-bred beef were :—

Beef.

Wholesale, per 112 lb.

	Marks.	s.	s.
1st quality	54 to 60	=	54 to 60
2nd "	48 to 52	=	48 to 52
3rd "	41 to 45	=	41 to 45
4th "	35 to 38	=	35 to 38

Mutton.

Per 112 lb.

	Marks.	s.	s.
1st quality	58 to 63	=	58 to 63
2nd "	41 to 51	=	41 to 51
3rd "	36 to 40	=	36 to 40

Prices of meat in Berlin in the second week of June last, for German-bred beef were :—

Beef.

Wholesale, per 112 lb.

	Marks.	s.	s.
1st quality	55 to 62	=	55 to 62
2nd "	50 to 54	=	50 to 54
3rd "	44 to 48	=	44 to 48
4th "	36 to 42	=	36 to 42

Retail, per lb.

Steaks	90 pfennige	=	11d. per lb.
Roast	80 "	=	9½d. "
Boiling	60 to 80 "	=	7½ to 9½d. per lb.
Soup	50 "	=	6d. per lb.

Veal.

<i>Veal.</i>						
Wholesale, per 112 lb.						
					Marks.	s. s.
1st quality	50 to 63	= 50 to 63
2nd "	35 to 48	= 35 to 48
Retail, per lb.						
Leg	75 pfennige	= 9d. per lb.
Chest	60 "	= 7½d. "
<i>Mutton.</i>						
Wholesale, per 112 lb.						
					Marks.	s. s.
1st quality	52 to 58	= 52 to 58
2nd "	45 to 50	= 45 to 50
Retail, per lb.						
From	60 to 75 pfennige	= 7½d. to 9d. per lb.

Cost at which Australian meat might be laid down in Berlin.

In May last Australian beef and mutton was being supplied to those in the trade in Hamburg, at (say)...	3d. per lb.
Freight from London (say)	0½d. "
Duty and inspection fee at Hamburg	1d. "
Costing in Hamburg (say)	4½d. "
Cartage from steamer to train, and from train to store, and railway freight to Berlin (say)	0½d. "
Costing there	4½d. per lb.

I reached Berlin on the 8th May, and next day I called upon Mr. Schlochauer, of Messrs. Schlochauer & Levy (Asiatische Handels Gesellschaft), general importers, of 1, Monbijou Platz, of that city, whom I met at Chicago, and who had expressed himself as anxious to take up the frozen meat trade, to the introduction of which, as well as that of other Australian produce, he said his firm had been devoting considerable attention; and since I returned I have received a letter from the firm offering to undertake any commissions with which they might be favoured from this Colony.

Mr. Schlochauer took considerable pains to assist me in my inquiries, and among others he introduced me to a produce broker doing a large business in Berlin, who is of opinion that a good trade could be done if a steady supply of meat were received. Mr. Schlochauer also took me to the meat market, where I obtained information in regard to the inspection of Australian meat. Each piece has to be marked as inspected, and a fee of 4d. per quarter for beef and 3d. per sheep is charged.

The meat market is very large and well arranged, and has an excellent cold store apportioned off in compartments with wire netting, which are let to the butchers, each butcher having a lock on his compartment. There are two more markets in other parts of the city on the same principle.

The live-stock market (which, although on the outskirts of the city, is surrounded with buildings), covers a large area of ground, is conveniently situated as regards the railways, is laid out on an excellent plan, and has substantial lofty sheds, with long rows of roomy well paved stalls, while immediately adjoining are the slaughter-houses, which are everything that could be wished for as regards arrangements, convenience, and cleanliness.

I was fortunate in seeing the annual metropolitan exhibition of fat stock, which was then being held in the market. There was a large number of fat cattle, a very large show of fat calves, a poor lot of fat sheep, and a fair show of fat pigs.

The cattle were exhibited in sections according to the part of Germany from which they came, and in each section the type of animal was different, while, as a whole, they were evidently more adapted for the dairy than for beef, but even as milkers—judging them while shown as fat—they seemed, with the exception of the Dutch, the Holstein, and the Shorthorn cross stock, inferior to the British milking breeds. There were a good many which showed the Shorthorn blood, and it was cattle of this cross which were the principal prize-takers as fat stock.

The fat sheep, with the exception of those got by rams of the English breeds, more particularly the Downs out of Merino ewes, which were of fairly good sizes and shapes, were inferior both as regards shape and quality.

The pigs shown were almost entirely of the English breeds, principally the Berkshire and large white Yorkshire, and made a very good show.

I also saw Mr. Silberg, of Messrs. Silberg and Shulter, general merchants, Berlin, to whom I had a letter of introduction from Mr. J. H. Geddes. He had seen this gentleman when he visited Berlin some six months previously, and I found that he had been giving the subject of the introduction of Australian meat a great deal of attention, and had been in constant communication with Mr. Geddes. He told me that his firm had friends in Berlin who were prepared, if a steady supply were sent at a reasonable price, to take up and push the frozen meat trade, and that he would, as soon as he was satisfied on these points, visit London, and make final arrangements with Mr. Geddes. He, however, was of opinion that a very profitable business could not be done until direct shipments to Hamburg were obtained, but he thought that might be secured, as I suggested, by arranging to taking a portion of the cargo to London, and bringing the balance on to Hamburg.

I also called on Mr. Siegfried Wiesenthal, agent for Messrs. W. Weddel & Co., London, who were endeavouring to introduce Australian and New Zealand meat into Berlin, and had requested him to ascertain from the German Government what the regulations were under which the meat could be introduced. As Mr. Wiesenthal's application for this information had been made some weeks previously without his receiving any answer—which, it will be seen, was very essential should be obtained—and as I thought I might be able to expedite the matter through my being in a position to speak to the health of the stock in Australia and the qualifications of the veterinary surgeons who might be called upon to certify to the freedom of the meat from disease, I called at the British Embassy and saw Mr. M. Gosselin, C.B., who

who kindly offered to assist me, and gave me a letter to the British Consul requesting him to put me in the way of obtaining the required information with regard to the introduction of meat into Berlin, and to help me in any other way he could. The Consul, however, was unable to do anything for me with respect to the regulations, but he introduced me to Messrs. G. Dietrich and Son, commission and forwarding agents, Berlin, from whom I received every attention and assistance during my stay in Berlin.

On letting Mr. Gosselin know that I had not succeeded in obtaining information relating to the admission of Australian meat, he kindly sent one of his staff with me to the German Foreign Office, where we were still unsuccessful, but the gentleman whom we saw promised to send copies of the regulations later in the day to the British Embassy. Instead of this, however, a letter was received by Mr. Gosselin stating that there were no regulations so far as the Imperial Government were concerned, and that as each State in the Empire made its own regulations there might be some State, or even municipal regulations affecting the question; they, however, added that they would make the necessary inquiry, and it was arranged that we should call next day and learn the result. On calling, however, we could get no definite information. I then, with Mr. G. Dietrich's assistance, made inquiry at the Police Department where we learned that the police to whom Mr. Weisenthal's application for the admission of the meat, and for information with respect to the regulations had been made in the first instance, had, on account of the large quantity of meat proposed to be introduced, referred the application to the Minister of Cultus (Education), but had up to that time received no instructions with regard to it.

The fact I believe, was, that not long before this application was made on behalf of Mr. Weisenthal, a new tariff was arranged with Russia, under which the duties on Russian produce had been very greatly reduced contrary to the wishes and interests of the Agrarian Party in Germany who bitterly resented the change, and as the admission of Australian meat would have increased the resentment of this party against the Government, they delayed for some weeks giving any answer in regard to the regulations, and at last, after I had left Germany, informed Mr. Weisenthal that the Australian meat could not be admitted at all into Berlin.

This is very unfortunate, for Berlin would be an excellent market notwithstanding the comparatively high duty, nearly 1d. per lb., for meat, as a rule, brings somewhat higher prices in Berlin than in London. I would, therefore, submit for consideration, whether a joint effort should not be made by the Agents General for the Colonies through the British Foreign Office to induce the Prussian Government (with whom I understand the matter rests) to allow the Australian meat to be introduced into Berlin; and if this suggestion be acted upon, it might be pointed out that the introduction of the Australian meat would not come into competition with the German meat, but with other imported or introduced meat for which higher prices are now given than would have to be paid for Australian meat of superior quality, duly certified if necessary by a properly qualified veterinary surgeon, to be free from disease.

I think it only right to state that in the endeavour which I have made to assist Messrs. Weddel & Co., to obtain admission for the Australian meat into Berlin, I had on several occasions to visit the British Embassy, and when I did I always received prompt attention and every assistance from Mr. M. Gosselin, C.B., and his staff; and I may add that this remark applies also to the representatives of the Imperial Government in Denmark, Holland, Belgium, France, and Italy, to whom I was accredited by the Foreign Office, London.

THE MEAT TRADE IN HOLLAND.

The area of Holland is about one-fourth that of England and Wales, and the population is upwards of 4,500,000. The principal industries are agriculture, fisheries, manufactures, and commerce. The trade with the United Kingdom is extensive, say, £18,000,000 imports and £28,000,000 exports.

The number of cattle in Holland may be put at, say, 1,528,000, the sheep at 752,200, and the pigs at 543,900, while the consumption of animal food (a large proportion of which is smoked meat), is only 57 lb. per head of the population.

Holland imports no cattle, sheep, nor pigs for food, but annually exports some 120,000 cattle, 180,000 sheep, and 270,000 pigs. Of these again, say, 55,000 cattle, 70,000 sheep, and 4,000 pigs go to Belgium; 23,000 cattle, 107,000 sheep, and 200 pigs are exported to Great Britain; and Germany receives from Holland some 3,560 cattle, a very few sheep, and say, 260,000 pigs.

Mutton, either fresh or frozen, may be imported into Holland, free of duty, provided it be accompanied by a certificate of health, and that concession for admission (which is readily granted) has been obtained from the Dutch Government. This concession refers to large packages only, as crates, barrels or loose.

In salted condition mutton may be imported without certificate of health or concession for admission, but it pays a duty of 1 florin = 10d. per cwt., say, 8d. per lb. The same applies to beef, fresh or salted, with the exception of the duty, which is 6 florins per cwt. = 5s. per cwt., say, 8d. per lb. For beef smoked or dried the duty is, say, 8d. per lb. The duty on canned mutton and beef is—

1 lb. }	25 florins per 100 Kilo = £1 0s. 10d. per cwt., or, say, 2½d. per lb.
2 lb. }	
4 lb. }	
6 lb. }	6 florins per 100 Kilo = 5s. per cwt., or, say, ½d. per lb.
14 lb. }	

The prices fat stock were bringing in the Amsterdam market in January last were the following:—

Cattle	from 11d. to 14d. per Kilogram of 2.2	= 5½d. to 6½d. per lb.
Calves	„ 17d. to 19d. „	2.2 = 8d. to 8½d. per lb.
Sheep	„ 10d. to 11d. „	2.2 = 4½d. to 5½d. per lb.
Pigs	„ 7d. to 8d. „	2.2 = 3½d. to 3¾d. per lb.

It will be gathered from what has been stated that there is no great prospect of a market for Australian meat in Holland; but while this is the case, I believe, as the duty is light on beef and nil on mutton, a fair quantity of frozen beef and mutton might be sold if regular direct shipments were obtained to the Continent from Australia and one or more centres of distribution with the necessary cold stores, established at Amsterdam, The Hague, or Rotterdam. A trade could, too, I believe, be done at either of these ports in tinned meat, and perhaps also in salt beef, as considerable quantities of these articles are required for the shipping; and salt beef is also purchased by farmers and other country residents, who retail portions of it to their employees.

THE

THE MEAT TRADE IN BELGIUM.

BELGIUM, with a population of 6,000,000, has not sufficient animal food to supply their requirements. According to the latest available returns, her cattle number 1,382,815 and the sheep 365,400. Her average annual imports are about 99,408 cattle and 284,319 sheep, and the exports (say) 12,900 cattle and 88,404 sheep. This shows that even with her present comparatively low rate of consumption of meat—only about 65 lb. per head of the population—Belgium is some 86,508 cattle and 195,915 sheep short of her requirements. This shortage in cattle is made up principally from the Netherlands, and that in sheep mainly from Germany, but a good many sheep are also received from the Netherlands.

The duty on foreign fresh beef and mutton entering Belgium is five-eighths of a penny; and while the regulations still require that the lungs shall accompany and be attached to the fore-quarter of beef, that portion of the regulation which made the lungs of sheep be also attached to and imported with the sheep has been abrogated, and frozen sheep are admitted on inspection without that needless and harassing regulation.

The wholesale prices of home-bred beef in Belgium are, as a rule, about as high as in England, and the retail price of the best portions of the carcass is, I believe, higher than in England, *i.e.*, 6d. to 7d. per lb. wholesale, and 8d. to 10d. per lb. retail. Mutton, again, sells at a less figure both wholesale and retail than it does in England—say, 5½d. to 6¼d. per lb. wholesale and 7½d. to 9d. per lb. retail.

Considering the price of meat in Holland and also in Germany, from which almost all the stock imported into Belgium come, it will, I think, be seen that if direct shipments could be obtained to Antwerp there is a good opening for Australian meat in Belgium, notwithstanding the duty of five-eighths of a penny per lb., and another one-eighth for inspection fee; that even Australian beef and mutton, purchased in London at (say) 3d. to 3¼d., and landed in Antwerp at (say) 3½d. to 3¾d., would, with (say) five-eighths duty, leave a fair margin for expenses and profit if retailed at something less than the prices now obtained for Belgian, Netherland, or German beef or mutton; and that if direct shipments are obtained, and portions of the cargo left at Antwerp, Amsterdam, and Hamburg, not only will expenses be considerably reduced, but, with the steady supply which will then be maintained at these ports, fresh distributing companies will be formed, and the trade must steadily increase, for, with the low consumption of meat per head of the population in Belgium, there is ample room for a great deal more meat to be sold than is now consumed, and the increase will come with reduced prices.

As to cold storage:—There is now at Antwerp—which would be the port in Belgium to which shipments should, in the first instance be confined—a cold store, with accommodation for 12,000 sheep; and, if the trade required it, this could easily be enlarged to hold 20,000.

In June last I was introduced, through Messrs. W. Weddel & Co., of London, to M. L. Jardine, one of the partners of Messrs. Jules Renand & Co., of that city, Brisbane, Sydney, Melbourne, and Adelaide, at Antwerp, where the International Exhibition had shortly before been opened, and I found that Mr. Jardine, who had been for some time in Australia, was acting as honorary Commissioner at the Exposition for the colonies of South Australia and Queensland, and was taking an active practical interest in the introduction into Belgium of colonial products, more particularly frozen meat. He had, in fact, gone so far as to assist in forming a syndicate, with a capital of £20,000, for the purpose of importing and selling Australian beef and mutton; and it was the intention of the syndicate to commence operations by opening a number of retail shops in Antwerp and some of the other principal towns in Belgium, and when the trade was established they meant to confine themselves to the importing and wholesale branches of the business.

I found also that Mr. Jardine had, on behalf of his firm, made an offer to the Agents-General of the Australian Colonies, to take charge of a joint exhibit of their principal products at the Exposition, but the offer was not entertained; and I think it was unfortunate that something of the kind was not done on an inexpensive scale, either through Messrs. Renand & Co., or in some other way; as this would have been an excellent mode of making our leading Australian products widely known throughout Europe; for almost every country on the Continent was represented at the Exposition. I was so impressed with this fact that I addressed a communication to Sir Saul Samuel, suggesting that a joint exhibit, so far as regards beef, mutton, butter, and colonial wine should still be made in an effective and economical manner. He kindly brought the suggestion under the notice of the Agents-General for the other colonies, but they considered it was too late to take any action in the matter, and allowed the proposal to drop.

THE MEAT TRADE IN FRANCE.

France, with a population of (say) 40,000,000 has not sufficient live stock to supply her people with the meat they require. No census of live stock in France has been published since 1889; but looking back at the returns for previous years they vary very little, and the numbers given for 1889 may be fairly accepted for 1894; they are,—cattle, 13,518,000, and sheep, 21,996,000. Taking an average of years, France imports annually (say) 70,000 cattle and about 1,200,000 sheep, while she exports about 55,000 cattle, and say, 20,000 sheep, showing that she is about 15,000 cattle and 1,189,000 sheep short of her annual requirements.

From the shortage of sheep, however, there falls to be deducted the annual importation from Algiers, which continues for about four months in the year, and amounts to about 900,000; but these Algerian sheep are very light, the best of them not weighing over 30 lb., and, so far as the calculation here attempted is concerned, the 900,000 cannot be put equal to more than (say), 550,000 Australian or New Zealand sheep. Taking, then, the Algerian sheep on that basis, the number of sheep which on an average she is annually short would be say, 580,000.

France receives her principal supply of foreign cattle from Italy, Algeria, and Holland, and her exports of cattle are principally to Switzerland, Germany, and Belgium.

Her shortage of sheep, again, is chiefly supplied by Russia, Germany, and Holland, and the Argentine Republic, and the sheep she exports are principally sent to Switzerland.

At one time a considerable quantity of frozen meat, chiefly mutton, was brought from the Argentine to France by Messrs. Sansinena & Co. and one or two other importers, but the trade has fallen off, mainly through the heavy duty and town dues payable on foreign meat and the stringent veterinary regulations to which allusion is afterwards made; and although frozen mutton is still imported from the Argentine it is so in a comparatively small way.

The annual consumption of meat in France is given at 77 lb. per head of the population. This is considerably more than that of Germany and Belgium, but much less than the consumption per head in the

the United Kingdom, which is 109 lb. There is therefore plenty of room for an increase in the rate per head of consumption, and there is no doubt, but with cheaper meat—which the importation of Australian would give—there would be a considerable increase in the rate of consumption, and a corresponding increase, of course, in the quantity required.

From what has been said, and from the fact also that the French are accustomed to and like merino mutton, it will be gathered that if the frozen mutton could be properly thawed and made more presentable when offered for sale there would be a good market in France for New Zealand and Australian mutton if it were not for the heavy duty, the excessive town dues, and the restrictive veterinary regulations, which require the lungs to be attached to the carcass. Why the lungs of sheep, which in Australia at least are notoriously free from disease, should be required is hard to understand, as is also the regulation calling for the quartering of the sheep.

The following are the duty and town dues payable on mutton imported into Paris :—

Customs duty	1½d. per lb.
Octroi, or municipal dues	½d. "
Sanitary inspection fee	⅓d. "

Say, 2d. per lb.

With the high duty, town dues, and other charges, we would naturally suppose that the price of meat would be very high in France. This is the case, as will be seen from the following statement of the wholesale and retail prices which were current in Paris in July last for first-class home-bred beef, mutton, and pork :—

Wholesale prices.

Beef	95c.	=	9½d. per lb.
Mutton	95c.	=	9½d. "
Pork	92c.	=	8½d. "

Beef—Retail prices.

Rosbif	}	Faux filet	}	4fr. per kilo	=	1s. 5¾d. per lb.	
(Roast beef).		(False filet)		5fr.	"	=	1s. 9¼d. "
Pot-au-feu	}	Gete	}	2fr. 20c.	"	=	9½d. "
(Boiling beef).		(Quarter, Kernel)		2fr.	"	=	8¼d. "
		Cotes de bœuf	}	2fr. 80c.	"	=	1s. 0¼d. "
		(Ribs of beef)		3fr. 40c.	"	=	1s. 2¼d. "
		Entre cotes	}	3fr. 60c.	"	=	1s. 3½d. "
		(Middle rib)	
		Romsteak	}	
		(Rump steak)	

Mutton—Retail prices.

Gigot	}	2fr. 80c. per kilo	=	1s. 0¼d. per lb.	
(Leg of mutton)		Selle	}	2fr. 60c.	"	=
(Saddle)	Epaule	}		2fr.	"	=
(Shoulder)	Cotes		}
	(Ribs, &c.)	70c.
		60c.

Pork—Retail price.

Average	1fr. 40c.	=	1s. 1½d. per lb.
---------	-----	-----	-----	-----	-----	-----	-----------	---	------------------

Even with the high duty, town dues, and other expenses, there would apparently be a sufficient margin of profit to lead to the opening of a trade with France in frozen mutton; but when we come to consider the way in which the trade in meat and other produce brought from places outside of France is done and the difficulties foreigners meet with in carrying on business of that nature there, it is questionable if the margin of profit be sufficiently wide to admit of a successful trade being done in Australian meat. If, however, the regulations in regard to foreign meat, to which allusion has been made, were such as would allow the best portions of first-class beef and mutton to be introduced, then perhaps a limited business might be done, and I understand that some shippers mean to make an attempt in that way if the necessary alterations in the regulations could be brought about.

I would, therefore, suggest that the Agents-General for the Colonies should, as I recommended in regard to an alteration in the regulations now in force in Germany, communicate with the French Government through the Foreign Office, London, and ascertain whether, if the stock, from which meat intended to be imported into France was to be taken, were, immediately before and after they were slaughtered, examined by a veterinary surgeon holding the diploma of the Royal College of Veterinary Surgeons, London, and certified by him to be free from disease, the French Government would dispense with the regulation which requires that the lungs of the cattle and sheep should come attached to the carcass, and allow the meat to be landed on the production of the inspecting veterinary surgeon's certificate to the above effect, if it be found by the officer examining it at the port of arrival to be sound; and failing this inspection and certificate by a British veterinary surgeon being considered sufficient, whether those of a duly qualified French veterinary surgeon employed by the Government of the Colony would be satisfactory and received in lieu of the regulation referred to. The meat would, of course, bear an indelible brand or mark to be referred to in either certificate.

ALEX. BRUCE,

Chief Inspector Stock.

Sydney, 8th March, 1895.

SPECIAL AGENT FOR THE COLONY	31

THE FROZEN MEAT TRADE, AS CONDUCTED IN THE COLONIES AND IN GREAT BRITAIN.

I.—The loss to the Colony through not breeding Cross-breds.

ALTHOUGH it may not perhaps be the order in which it was expected that the information I obtained while in Great Britain and on the Continent with regard to the meat trade would be given, I think it is best to state what I have to report in the order in which the different stages of the trade actually occur. That, after all, is the most natural course to take, for if a mistake be committed at the commencement of an undertaking, or if the grounds on which it rests are not sound, the undertaking may thereby be completely ruined, or, if the effect be not so very disastrous, it may still be very seriously crippled.

Now this is what has taken place through our not being in a position to export the right sort of mutton. If we had been so, instead of the poor prices we have as a rule been receiving, and the losses we have been sustaining by exporting merino mutton, our shippers would have been receiving good prices and making fair profits. To carry out the trade in this way successfully, two things are essentially necessary, and these are within our reach, *i.e.*, country suitable as regards the climate and soil, and first-class cross-bred sheep.

I have already, in my report of 1st February, 1893, on stock breeding and fattening in New Zealand, described the class of country suitable for that purpose as well as the crops which should be grown to supplement the pasture; and I also, in that report, indicated some of the portions of this Colony in which I considered the New Zealand system should be adopted. But as further information has been obtained with regard to the capability of some of the land in New South Wales for growing crops, which can be turned to account in the breeding and fattening sheep of the English mutton breeds and crosses of these breeds and the merino, and as I have, while in America and Great Britain, obtained additional information with respect to the different sorts of English sheep and their suitability for crossing with our merinos, I will here deal, and I will do so as shortly as possible, with these two subjects.

II.—The portions of the Colony suitable for Cross-bred Sheep.

When the report referred to was written there was no certainty that turnips could be grown, as has been demonstrated by the Department, in country where the climate was even much more temperate than that of Wagga Wagga. This has now been done by the experiment so successfully carried out by Mr. Superintendent Coleman at the Experimental Farm there, which proves that this, the most valuable of all the green crops, can be grown in a very much wider area of country than was at all supposed, thereby demonstrating to pastoralists and farmers that in at least one-fourth of the Colony they can if they choose—like the farmers in New Zealand—adopt a rotation of crops, under which they can not only breed and fatten at very early ages prime fat cross-breds and first-class lambs suitable for freezing and export, but they will be able also to keep their land in heart and save ruining it by overcropping without manuring, as the sheep in eating off the turnips will manure the land. The fact here demonstrated by the Department is of the very highest importance to our pastoralists and farmers in the eastern and more temperate portions of the Colony, and especially to those whose holdings are comparatively small, who are now keeping sheep and are combining sheep-farming with tillage. They have in most cases a good deal of land under cultivation, and they have now only to obtain the right class of English sheep and adopt the system so successfully carried out by the New Zealand farmers in breeding cross-breds for export. Like them, too, our selectors and farmers, as they are in an excellent position to supply the ewes and lambs with cultivated food, should devote their attention to breeding and fattening lambs for the London and other home markets, as this, when properly attended to, is one of the best paying branches of the business. Of course turnips may not be such a success on some holdings as at Wagga Wagga, but there are other green crops which can be grown, such as dunn oats, rape, mangolds, &c.; and as wheat, oats, and maize are now very cheap, it will pay the grower better to consume them on the farm in feeding pigs and sheep than to dispose of them in the market.

Even although none of the crops mentioned might be adapted for some holdings, there is no question but their owners, if they made up their minds to adopt the system here suggested, would be able to find some description of crop which, with grain of either of the sorts mentioned, would supplement the pasture and enable them to finish off their cross-breds in prime condition; and as there is, as I afterwards show, a difference of about 1d. per lb. between the price of cross-breds and merinos in the London and other home markets, which amounts to some 8s. per sheep, there is surely sufficient inducement for our pastoralists, selectors, and farmers, but especially for our selectors and farmers to breed and fatten cross-breds, seeing that course enables them, while obtaining high prices for their sheep, to adopt and follow a systematic rotation and maintain the fertility of their land.

III.—The best Breeds of Sheep for Export.

1. DESCRIPTION OF CROSS-BRED AND MERINO AS THEY APPEAR IN THE SMITHFIELD MARKET.

A perfect frozen sheep for the Smithfield market should weigh from 55 to 60 lb. It should be round on the shoulder, rather short and broad in the back and loin, with both fore and back ribs well sprung, and little or no hollow between the last rib and the hip.

hip. It should be short on the leg, and the jigget or hind leg should be plump and full right down nearly to the hock. Its outward appearance should be bright and full of bloom, and along the back and loin should have but a thin coating of fat, and the saddle, when cut off and turned up, should show a large share of red mutton and comparatively little fat.

The merino wether sheep again, of (say) 50 lb., an average weight, is, as compared with the cross-bred, long in the body, sharp on the shoulder, and looks narrow on the back and loin, and is not well ribbed home, and, as a consequence, falls in between the back ribs and the hip. It is long on the leg and wanting in fullness in the jigget. When over the weight mentioned, the merino has usually too much fat and too little red meat, and not unfrequently the carcass, especially on the thighs and legs, is dark in colour.

2. INSTEAD OF MERINOS NOW EXPORTED, CROSS-BREDS OUGHT TO BE BRED AND SHIPPED.

If we are to study, as we ought to do, the taste of the people in the countries to which we ship our frozen mutton, there is no question but the cross-bred sheep are much better for export than the merino. No doubt the merino mutton, when obtained in prime condition, and not wasted nor deteriorated, is very sweet and nice; but it is comparatively delicate, and its appearance and flavour are easily spoiled. This is what has, in most cases, been done through the cruel and wasteful way in which the sheep at any great distance from market have been treated, and the mutton has not sold at such good prices as it might otherwise have brought. The result has been that our merino mutton has been generally sold at about 1d. per lb. less than the New Zealand cross-breeds. Besides this its lightness and thinness, as compared with English and Scotch mutton and New Zealand cross-breeds, is much against it when put on the table, and especially when it comes up in the shape of cold mutton, and it is spoken of as anything but economical. This is very unfair, for taking into account the price paid for Australian and for English and Scotch mutton, the Australian is much more economical. But that is forgotten, and those who are continually running down our mutton take every care that any objections which may have been taken to it are not forgotten, while its cheapness is allowed to be overlooked.

Our sheep breeders, therefore, should as speedily as possible breed at least as many cross-breeds as are required for exportation. This, again, should not take very long, as the production of (say) a million and a half would—for a year or two, until more provision is made for freezing—meet our requirements, and by the end of the third year from now the whole of the four millions surplus of fat sheep which we have for export could be cross-breeds, and might be frozen and exported, while the balance of our cast of fat sheep, which would consist of merinos, could be partly consumed in this and the neighbouring colonies, where, if the merino mutton is not preferred to cross-bred, it is at least as well liked, and partly tinned and boiled down.

3. HOW FAR OWNERS OUGHT TO GO IN PRODUCING CROSS-BREDS.

While, however, it is evident that the sheep which are frozen and exported ought to be cross-breeds, it will be for our sheep breeders in the country adapted for cross-breeding to consider whether they should go beyond the number required for export, and if so, to what extent; for while it is comparatively easy to change from merinos to cross-breeds, it would be a tedious and difficult matter, unless the whole of the sheep are cleared off the run, to bring them back—after having used the English rams freely among the flocks—to the true merino type.

To arrive at a sound conclusion on this point, several important questions will have to be considered, and amongst others:—

- (1.) How far are other wool-growing countries and colonies going, and likely to go, into cross-breeding?
- (2.) What the prospects are of merino wool, more especially of the finer descriptions, advancing in price.

(1.) *What description of Sheep are the wool-growing countries which send Wool and Mutton to the British and Continental Markets breeding and likely to breed.*

While I am not in a position to say with any degree of certainty that the answers I give to this question are even approximately correct, I have been able to glean such information with regard to the countries from which it is likely that either mutton or wool of either merinos or cross-breeds will be sent to the British and Continental markets as will, I think, put our sheep breeders, whose country is at all adapted for cross-breeds, in a position to form a much better idea than they can now do on the question, and will assist them in making up their minds whether or not they will introduce rams of any of the British breeds into their merino flocks, and, if so, how far it will be safe for them to go in that direction.

In the United States of America, with some 45,000,000 sheep, the farmers and pastoralists have, as I have shown in the portion of my report which relates more particularly to that country, gone very largely into cross-breeding; and I have there estimated that, say, 40 per cent. of the entire number are either sheep of one or other of the English mutton breeds or crosses with more or less of the blood of these English sheep; and it is my opinion that in the course of a few years the English and cross-breeds will outnumber the merinos and merino grades which now form the majority of the sheep in the States.

In Canada, with 3,000,000 sheep, there are few or no merinos, and the cross-breds to be met with there are in no great numbers, and what there are have been principally bred in and brought from the United States.

In the Argentine Republic again, Mr. Herbert Gibson, in his history and present state of the sheep industry in that country, of 1893, says that it owns from 78,000,000 to 85,000,000 sheep and has room for as many more. Of the sheep now in that country he says that one-half of the whole number are crosses with the English Lincoln and Leicester breeds, and that, judging from the continued and still increasing demand for Lincoln rams, it may be presaged that in another four or five years the pure merino sheep left in the Argentine will be a very small fraction of the whole; while, he adds, the years 1888 and 1893 are witnessing the conversions of 50,000,000 sheep from the one type to another, a conversion perhaps without a parallel in the annals of sheep-breeding. According to him the Lincoln is unquestionably the most popular of all the English breeds in Argentine; and the reasons he assigns for the extraordinary conversions alluded to are (1) that the Lincoln crosses are hardier and less liable to diseases, such as foot-rot and worms, than the merino; (2) that the Lincoln crosses bring very much better prices as freezers than the merino; and that the price of fine merino wool fell heavily, while the Lincoln and cross-breds maintained their value, or very nearly did so.

In Uruguay, which adjoins Argentine and owns some 15,000,000 sheep—which are almost wholly merinos—there are few or no English sheep. There is, however, little doubt but that when the breeders in Uruguay come to know that cross-breds are doing so well in Argentine, they will also introduce the English mutton sheep.

In the Falkland Islands there are some 800,000 sheep, all, or nearly all, of which are said to be Cheviots or Cheviot crosses. Their cast, which is a comparatively large one, is frozen and exported to London. It is said that the Islands are nearly fully stocked.

In South Africa, where there are some 25,000,000 sheep, there are very few of the English mutton type, and it is not likely that cross-breeding will be followed in that Colony to any great extent.

In Western Australia, where there are some 2,000,000 sheep, few or no English sheep or their crosses are kept.

In South Australia, with say 7,000,000 sheep, the portion of which can be classed as English and sheep with English blood is comparatively small—say one-thirtieth part of the whole. Crossing is increasing, but it is not likely that for some considerable time at least there will be many cross-breds to export from that Colony.

In Victoria, where there are some 14,000,000 sheep, there are considerable numbers of the English breeds (principally the Lincoln and their crosses)—say one-third of the whole—and the number is steadily increasing.

In New South Wales, where there are say 57,000,000 sheep, the returns show that there are 2,436,429 sheep of the English mutton breeds or their crosses. Our owners are in numerous cases introducing English rams; and the latest returns show that while there was a decrease of over a million in the total number of sheep in the Colony in 1893, the English breeds and cross increased by 726,000.

In Queensland, with some 22,000,000 sheep, there are very few English sheep or their crosses, perhaps not more than one-seventieth of the whole; but it is to be expected that crossing will be adopted in that Colony wherever the country is suitable, and that the export of frozen cross-breds will, in course of time, be a considerable one.

In New Zealand, where the sheep number (say) 20,000,000, two-thirds of them at least are of some of the English breeds or crosses of these breeds; and I believe the change to cross-breds will continue, although to a less extent than heretofore.

On the understanding already stated that my estimates are to be considered as of doubtful accuracy, I will now set out in figures what I have just stated with regard to the relative numbers of the two sorts of sheep in those countries in which there have been, or likely to be, sheep of any of the English breeds or their crosses, and from which mutton or wool from such sheep is likely to be exported to London or to the Continent of Europe.

(2.) *Estimated Increase of Cross-breds in all parts of the World.*

Country.	Total No. of Sheep.	Estimated No. of English and Crosses.	Will crossing increase during next 5 years?		Estimated No. 5 years hence of Crosses, &c.
			Yes or No.	Extent of Increase.	
The United States	45,000,000	20,000,000	Yes ...	5,000,000	25,000,000
Mexico	2,000,000	Nil.	No	Nil.
Canada	3,000,000	3,000,000	Yes ...	500,000	3,500,000
Argentina	81,500,000	40,750,000	Yes ...	20,000,000	60,000,000
Uruguay	15,000,000	Nil.	Yes ...	300,000	300,000
Chili	2,500,000	Nil.	No	Nil.
Falkland Islands	800,000	800,000	Yes ...	100,000	900,000
Cape Colony, &c.	25,050,000	200,000	Yes ...	300,000	500,000
Western Australia	2,000,000	Nil.	No
South Australia	7,000,000	230,000	Yes ...	600,000	830,000
Victoria	14,000,000	4,660,000	Yes ...	2,340,000	7,100,000
New South Wales	57,000,000	2,500,000	Yes ...	5,500,000	8,000,000
Queensland	22,000,000	500,000	Yes ...	800,000	1,300,000
Tasmania	2,000,000	200,000	Yes ...	200,000	400,000
New Zealand	20,000,000	12,500,000	Yes ...	2,000,000	14,500,000
	298,800,000	85,340,000		37,640,000	122,030,000

I have had but few thoroughly reliable data to compile the foregoing statement from, but if the matter is looked into and the information available duly considered the conclusion arrived at will, I think, be that my estimate of the probable increase of cross-bred sheep which is likely to affect the British and Continental markets during the next five years is rather under than over the mark; for the difference in the return from the cross-bred compared with the merino, where the country, climate, and circumstances are suitable for the cross-bred, is simply enormous; about twice as much as from the merino—nor could it be otherwise, considering the early maturity of the cross-breds, their heavier weights, more saleable mutton, higher prices, and the telling superiority of the cross-bred lambs.

All these facts are, of course, well known to the majority of our sheep-owners. But in order that they may be still more deeply impressed with the advantages of the cross-breds, and be able also to form clear ideas with respect to the relative value of the different kinds of British sheep for breeding cross-breds—a subject which I afterwards touch upon—I give the following comparative statement of what I believe to be the present average London prices of the wool and mutton of the different cross-breds there mentioned, and of the merino.

(3.) *Statement of the average prices made in London by the wool and mutton of prime fat wethers twenty to twenty-two months old, got by English rams of the breeds mentioned and out of merino ewes, compared with those of merino wethers:—*

	lb.	d.	£	s.	d.	£	s.	d.
1. Lincoln Cross—								
Wool	9	@ 8	=	0	6	0		
Mutton	63	@ 3 $\frac{3}{4}$	=	0	19	8 $\frac{1}{2}$		
							1	5
								8 $\frac{1}{2}$
4. English Leicester Ewes—								
Wool	8	@ 8	=	0	5	4		
Mutton	58	@ 3 $\frac{3}{4}$	=	0	18	1 $\frac{1}{2}$		
							1	3
								5 $\frac{1}{2}$
5. Border Leicester Cross—								
Wool	7 $\frac{1}{2}$	@ 7 $\frac{3}{4}$	=	0	4	10		
Mutton	60	@ 4	=	1	0	0		
							1	4
								10
6. Romney Marsh Cross—								
Wool	7	@ 8	=	0	4	8		
Mutton	60	@ 3 $\frac{3}{4}$	=	0	18	9		
							1	3
								5
2. Shropshire Cross—								
Wool	7 $\frac{1}{2}$	@ 9	=	0	5	7 $\frac{1}{2}$		
Mutton	57	@ 4 $\frac{1}{4}$	=	1	0	2 $\frac{1}{4}$		
							1	5
								9 $\frac{3}{4}$
3. South Down Cross—								
Wool	5	@ 9	=	0	3	9		
Mutton	55	@ 4 $\frac{3}{4}$	=	1	0	0 $\frac{1}{2}$		
							1	3
								9 $\frac{1}{2}$
7. Merino—								
Wool	6	@ 7 $\frac{1}{2}$	=	0	3	9		
Mutton	50	@ 2 $\frac{3}{4}$	=	0	11	5 $\frac{1}{2}$		
							0	15
								2 $\frac{1}{2}$

The above tabulated estimate shows a difference in the returns from the cross-breds and merinos of more than 9s. 3 $\frac{1}{2}$ d. per sheep in favour of the cross-breds. Nor is this all. When there is anything like a heavy fall in the price of frozen mutton it is as a rule, the second class and inferior descriptions which suffer most; and we find that, while in the recent glutted state of the frozen meat market in England prime New South Wales merino mutton was selling at 2 $\frac{3}{4}$ d., ordinary Queensland was only bringing 1 $\frac{3}{4}$ d., and inferior, of course, less, neither of the latter paying the expense of preparing, sending home, and getting returns (say, 2d. per lb.), to say nothing of giving the breeder of the sheep any return.

Of course where cultivated food is required for the cross-bred sheep the additional expense has to be kept in view in comparing the returns from the two classes of sheep; but I do not think that the whole, or even the greater, of this should be debited against the cross-breds, for they consume this food principally, if not wholly, on the land on which the crops are grown, and its fertility is thus renewed, while a rotation is secured which could not otherwise have been obtained.

It would not pay to adopt the same mode of management with merinos, as they are wanting both in early maturity and outcome.

IV.—What the Prospects are of Higher Prices for Merino Wool and Mutton.

1. AS TO IMPROVED RETURNS FROM THE MERINO WOOL.

There is a prospect that the fashions will change before long, that large supplies of the better sorts of merino wool will be required in the United States now that the tariff is settled and the duty on wool removed, and that the price will rise. It is to be expected that when the woollen manufacturers in the States, who now make the finer fabrics, get their arrangements completed for dealing with an enlarged supply, and the new mills which are certain to be established there to take up that branch of the woollen trade are

are erected and at work, there will be a large increase in the demand for the finer merino wools for America, which it is hoped will lead to a substantial rise in the price of these wools; for with the sheep-breeders in so many parts of the world taking to the breeding of cross-bred sheep, there ought to be a further advance, even supposing the expected change in the fashions does not for some time take place. When, however, it does the rise in the price of the better sorts, should the fashion run as it not unfrequently does from one extreme to another, will be large. But after all the rise in wool must be a very large one to go any great length in making up the difference in the return made by the cross-bred compared with that from the merino. A rise of even 3d. per lb. in the price of the best merino wools (which is not very likely to occur) would only come to, say, 1s. 6d., while the amount by which the return of the cross-bred would exceed that of the merino would be at least 8s. 4½d., made up of 8 lb. 5 oz. more mutton at 3½d. per lb., and 1½d. per lb. more on 58 lb. of mutton, which still leaves the cross-bred 6s. 10½d. better than the merino.

2. AS TO IMPROVED RETURNS FROM THE MERINO FROZEN MUTTON.

These, I think, may fairly be expected on the following grounds:—

- (a) Now that so many of the old ewes and other inferior sheep have been boiled down, and ample room made for fattening the wethers, maiden ewes, and other marketable sheep, there will be a full supply of prime sheep, and prime sheep will, as a rule, pay if properly prepared for shipment.
- (b) The number of up country killing and chilling places is extending, and under that system both the appearance and quality of the mutton is improved, which must bring it into greater favour at home.
- (c) Now that exporters have learnt by dearly bought experience, that it is courting trouble and loss to ship anything but first quality, greater care will be taken in the selection of sheep for freezing and export.
- (d) Freight and expenses will be lowered.
- (e) It is believed that under a proper system (which I will afterwards explain at length under the heading of freezing and export) of turning each portion of the sheep (within certain limits) to the best and most profitable use, *i.e.*, freezing one portion, tinning another, boiling down another, and utilising every bit of the offal, a much better net return will be obtained for the whole sheep, and especially that the heavy expense of freezing, freight, storage, and commission, &c., at home (now amounting to 2d. per lb.) will not be incurred on portions of the sheep which do not pay even these expenses, much less give any return to the shipper.
- (f) While a steady supply of frozen mutton will be despatched, very heavy shipments will only be made at the right season of the year—(say) between October and March.
- (g) Better arrangements will be made for its distribution and sale, and the appearance of the mutton will be greatly improved by the new system of thawing, and better prices will be obtained.

I would, therefore, advise those owners whose sheep are merinos, and who are in doubt whether they should introduce British rams into their flocks, especially if there is any question as to whether their country and climate are adapted for cross-breds, to consider what has been here said in regard to the expected improvement in the returns from merino sheep before making up their minds; and if, after giving the matter full consideration, they should still have doubts on the subject, they might, as I understand some breeders intend doing, put British rams to their old ewes for the last crop of lambs, and fatten off the greater part of the "drop," ewes as well as wethers, but reserving a few of the best of the cross-bred ewes for breeding, and follow this course until they see how the introduction of the British rams answers. In this way their merino flocks would be maintained until the owners are satisfied or otherwise with the result of the experiment.

In the selection of mutton, buyers in the Smithfield and other Home markets have a good deal to say about the shapes of the sheep; and, as I have already explained, they raise great objection to the comparatively high, thin shoulder, narrow frame, and light leg of the merino; and although there has as yet been no move in that direction, I think an effort should be made, now that mutton has to be so much depended upon, as well as wool, in obtaining a paying return from sheep, to alter the shape of the sheep so that the mutton will bring better prices and be also more saleable. This can be done to a considerable extent by selecting sheep for breeding short on the leg, comparatively round on the top of the shoulder, with well-sprung ribs, broad backs and loins, and as large and robust as is compatible with their carrying good heavy fleeces of high-priced wool. With these improvements in the shape of the merino, coupled with a better mode of placing the merino mutton on the market and disposing of it, a considerable portion of the difference in price between that of the cross-bred will, it is believed, be got rid of.

V.—The best British Sheep for crossing with the Merino.

While at home I took every opportunity of making myself acquainted with the characteristics and qualities of the different breeds of British sheep and the suitability for crossing with the merino, with the view to ascertain how far the conclusions arrived at in my report of 1st March, 1893, on the New Zealand system of breeding and fattening sheep for export, was correct; and I found they were so in the main. Still, there are several cases in which I am now led, from the information I have since obtained, to alter my views as regards the relative position of some of the breeds; and I will state very briefly how I now think they stand in this respect. 1.

1. THE LINCOLN CROSS.

If the land on a holding is very good and well watered (sufficient water is an essential requisite where cross-breeds are to be kept) and the pasture rich, or where the pasture is fairly good and the owner can supplement it with cultivated food, he might begin by putting well-bred Lincoln rams with good frames and fleeces to his merino ewes. Acting in this way, his young sheep would clip fleeces of first-class wool, heavier by $1\frac{1}{2}$ lb. than any other cross-breeds; and they would at eighteen or twenty months, if well cared for, give a dressed carcass of 60 lb. to 63 lb. of good saleable mutton, though not, perhaps, of the same high quality as that of the Shropshire cross. Then, again, by using the Lincoln ram for the first cross; the ewe portion of the "drop" would, through being comparatively large and roomy, make excellent mothers for the next cross, which should, I think, be got by putting Shropshire rams to these Lincoln cross ewes, and the result would be first-class cross-breeds for export, which the owner could dispose of either as lambs or as fat sheep, according as he considered best, while the ewe, so long as she was breeding, would give a good return also in wool,—clipping, as she would a heavy, saleable fleece. In short, although in the export trade the quality of the mutton may be said to be the most important consideration, still it would be advantageous to overlook quality of mutton to some slight extent in order to have a ewe to breed from with a good paying fleece, the difficulty being to find a sheep which is very good in respect to both mutton and fleece.

If, again, the land is not of the best description, or the grass not very fattening, or if a sufficient supply of cultivated food cannot be obtained for the sheep, then the owner instead of using Lincoln rams for his merino ewes could try the Shropshire or English Leicester or even the Border Leicester, taking them as to preference in the order in which they here stand, as the crosses of either of these breeds with the merino would thrive well, not only on the best land and with cultivated food, but would do so also on second or third rate land and a moderate supply of cultivated food, which the well-bred Lincoln would not do.

2. THE SHROPSHIRE CROSS.

For the production of prime fat lambs from merino ewes there is no better ram, if there be as good, as the Shropshire, and the result is equally favourable where that ram is put to cross-bred ewes. In fact, it is hard to say which of these two sets of lambs show the better returns, for while the quality of the merino and Shropshire lambs may be rather better than the others, they again would have the advantage in weight and early maturity—the quality in both cases being excellent.

The weak point in the Shropshire as compared with the Lincoln or English Leicester, so far as our experience of the breed in the Colonies has gone, is the lightness of the fleece, which of course does not to any great extent, if at all, affect the lambs, but it does affect the mature sheep. We have, however, as yet scarcely had sufficient experience of the Shropshire sheep in crossing, and from the information I obtained while in England, and the sheep I saw there, I am led to believe that the breeders of Shropshire stud sheep have, during the last ten or fifteen years, been giving very much more attention to the weight and quality of the fleece than they formerly did; and the Shropshire sheep, which are now taking first places at the principal Agricultural Shows in England, are remarkably well clad for mutton sheep, and the wool is bright, comparatively soft, and of fair length. And while the Shropshires, which were introduced into the Colonies some twenty years back, may be largely defective as regards quantity and quality of wool, these defects do not now exist in the best flocks of the breed to anything like the same extent as they once did. We may, therefore, expect from the value the judges at the leading shows in England now set on these points, that still farther improvement will be made in the same direction.

Then as regards wethers of this cross, they may be somewhat longer than those of the other crosses, such as the Lincoln and English Leicester, in reaching the best selling weight, and if sold within the same time would be lighter, but this cross, the Shropshire, would be superior in shape and quality and would bring proportionately higher prices, while they would, notwithstanding that their wool brought less money, give quite as good a return for the food they consumed as any of the other crosses. The Shropshire and merino cross is by far the most popular in the United States, and I believe it bids fair to be so also in these Colonies where cross-breeding on good sound land is taken up.

3. THE SOUTH DOWN AND MERINO CROSS.

With respect to this cross again, from what I saw in England, and from the extreme value set on prime quality of mutton like the South Down, and the consequent great difference there is in the price of the mutton, through only a slight difference in the quality, I now think that, in my previous report on the breeding of sheep in New Zealand, I underrated the advantages of this breed to a considerable extent; for the South Down is a perfect mutton sheep, and notwithstanding the poor return it gives in the shape of wool, its qualities as a mutton producer are so very high as to make up to a very large extent for the lightness of its fleece. Although, therefore, the Shropshire, through being almost as strong in quality of mutton and much better as regards wool, is now considered the preferable breed for using with the greater part of the ewes of the first cross, I believe South Down rams would, in the case of the Lincoln and Romney Marsh first cross ewes, not unfrequently prove as successful, more particularly for the production of fat lambs for export, inasmuch as the South Down has, like the Shropshire of recent years, been greatly improved as regards weight of fleece; and owners should, before making up their minds in regard to this cross, not do so without seeing some of the recently imported South Down sheep.

4. THE ENGLISH LEICESTER AND MERINO CROSS.

Although the mutton of this cross is, perhaps, not quite equal to that of the Border Leicester and merino in appearance and quality, and is still farther from being as good in these respects as the Shropshire cross, it makes a very compact, round-shouldered, broad-backed, well-shaped carcass of saleable mutton, which, when in prime condition, commands a ready sale at a fair price, notwithstanding that it has rather too much fat and too little red meat. This cross has also the recommendation that it carries for its size a heavy fleece of very saleable wool, and the ewes of the cross, like the Lincoln for that reason, make excellent breeders for the next cross, say with a Shropshire ram. As already noticed, it is of considerable importance that the breeding ewes should be "well clad," not only on account of the good return they would in that case themselves give in the shape of wool, but also to ensure a good clip from their progeny.

5. THE BORDER LEICESTER AND MERINO CROSS.

From what I have learned while in England, I now consider that in my report (already alluded to) on the breeding of stock in New Zealand I placed this cross in a higher relative position than that to which it is entitled. It was there placed at the head of the British sheep for crossing purposes; and I would now, where the country and circumstances are favourable, put the Lincoln and Shropshire crosses ahead of the Border Leicester, as the quality of the mutton of that cross is not so good as I then thought, and the loss of weight of wool with repeated use of Border Leicester rams is greater than I calculated upon. At the same time, from what I heard of the breed, I believe that this cross will make fair saleable mutton, and that the sheep will be hardy, and are excellent foragers. Their length of leg, breadth of chest, broad loins, and general appearance confirm this; and the fact should be a good recommendation for their use where the country for which British rams are required is rough or the grass comparatively thin.

6. THE ROMNEY MARSH AND MERINO CROSS.

Notwithstanding that the Romney Marsh sheep clip good fleeces, make very fair mutton, and the ewes are excellent mothers, while the breed is noted for freedom from fluke and foot-rot, I do not now, from what I saw of it in England, hold quite such a good opinion of the breed for general use as I did when I saw these sheep in New Zealand; and I am inclined to think, after seeing them in their native county and at the Canterbury and Royal English shows, that some of the progenitors of those to which my attention was called in New Zealand had been improved by the introduction of English Leicester blood—a system of breeding which the owners of Romney Marsh stud flocks in England acknowledge was at one time not unfrequently resorted to. My reason for taking this view is that the rams which took the highest positions at the Canterbury and Royal English shows were high on the leg, very coarse in the bone, rather loosely built, and flat in the ribs. I would not, therefore, recommend the use of this breed for crossing where the country is sound and the risk of fluke or foot-rot small. But where the land is unsound, and there is such a risk, the rams of the Romney Marsh breed should be freely used, and the stronger and more robust sheep of the breed could be selected for the worst description of country.

7. THE HAMPSHIRE AND OXFORD DOWNS.

These are excellent sheep; but, like the Cotswold and Wonsleydale, they are too large to mate safely with a sheep so small as the merino; and this objection as to size applies also in regard to the comparatively poor provision we could make for their food. We could not always obtain rich succulent pasture or a full supply of cultivated food for such sheep.

THE EXPORT MEAT TRADE IN AUSTRALIA.

Having dealt with that portion of my report which relates to the most suitable country for breeding and fattening sheep for export, and the best breed of sheep for that purpose, as well as the crops which sheep-owners should grow for supplementing the natural pastures, I will now consider the steps necessary to be taken in order to prepare the meat for export and to place it in first-class condition on the markets of the world; and in doing so I believe the best course for me to take will be to set out in detail what action I think should be taken for the establishment of the meat export trade on a satisfactory basis, from the time that the first step is taken in the initiation of the trade until the meat finds its way to the consumer. To that end, therefore, I would make the following recommendations:—

I.—Joint Stock Meat Export Companies.

1. THE REASONS WHY THEY SHOULD BE FORMED.

To prepare our meat for export and place it in the best possible condition on the market, it is necessary that strong joint stock companies should be formed with ample capital, with the view to the erection of extensive and thoroughly efficient chilling, freezing, tinning, and boiling-down works, the favourable arrangement with the owners of ocean-going steamers with respect to freight, the providing of the necessary cold storage in the countries to which the meat is sent, the proper arrangements for the distribution and sale of the meat there, and the appointment of reliable and capable agents to carry out these arrangements, to keep the management in the Colonies thoroughly apprised of the state of the trade, and to find fresh markets; and I would recommend

that our graziers and farmers, as well as those who are at all closely connected in business with them, join some of the existing meat companies, or take a substantial interest in any which may be in the course of formation, for there cannot be any question, considering the circumstances in which our graziers and farmers are now placed, and the importance and urgency of the matter, but that they should at once act on this recommendation.

2. THE CAPITAL REQUIRED FOR THE BUSINESS WOULD BE LARGE.

If we are to compete successfully with the live-stock and meat trade of North and South America, but more especially with those in the trade of the United States, it is absolutely necessary that our chilling, freezing, tinning, salting, and boiling works should be amply sufficient to do the work—that they should be provided with all the most approved machinery and appliances, and that they should be conducted with the greatest efficiency and energy,—while the companies doing the trade should not only have sufficient capital to carry it on in the Colonies, but also to follow and protect the meat placed in their charge in the countries to which it is exported till it can be disposed of to best advantage.

All this will entail a large outlay, and that again calls for a large amount of capital. And it is here that the United States have had so great advantage over the Colonies. There, if an undertaking connected with stock has a fair prospect of paying, a speculative company can very quickly be formed, and the required capital subscribed. Hitherto it has been different in this Colony. Since the formation of the Sydney Meat Preserving Company,—which is allowed on all hands to have prevented our live stock sales from collapsing, and which took place some twenty-four years ago,—enterprise among our stock-owners as a class has been all but dead. Effort after effort was made by a few graziers and others connected with the pastoral interests to form meat export companies without success, until comparatively lately, when a few up-country killing and chilling places were established, and the freezing and export works of Messrs. J. H. Geddes & Co., the Pastoral Finance Association, were erected. But now things have arrived at that pitch that a change in this respect must take place; and if the present excessively low prices of stock are not to be allowed to continue proper works will have to be constructed, and an export trade established on a sufficiently large scale to give our owners full relief. To bring this about the required capital must be subscribed, and to do that again, stock-owners will have to form themselves into joint stock meat companies to raise it, and they should do so without delay, and as far as possible manage their own business themselves.

II.—The different Classes of Meat Companies.

There are at least four different principles upon which companies may be formed to conduct the meat export trade; and as it is very important that in the formation of companies for that purpose the main object should be the promotion of the interests of our stock-owners, I will shortly notice the principles on which each class of company is formed, and endeavour to show how far in each case that object would be likely to be attained, by stating as briefly as I can the arguments brought forward in favour of and against the several classes of company.

1. ARGUMENTS IN FAVOUR OF GRAZIER'S MEAT COMPANIES.

These companies are formed largely on the co-operative principle, and are intended to be worked wholly in the interests of stock-owners and those connected with them in business. They are, of course, agency companies which take charge of the owners' stock, and deal with them from the time they are placed in the yards at the company's works until they are sold in the London or other markets, the company making net returns to the owners. The following are some of the arguments which have been adduced in favour of this form of company:—

- (1.) *A steady supply of Meat will not be maintained unless Graziers' Companies are formed.*

It is argued that unless there is a constant full supply of first-class meat in the countries to which it is exported the trade in Australian meat will not be readily taken up, nor pushed with the necessary energy and success; and that such a supply can only be maintained by the formation of joint stock graziers' meat companies; because it is only through their formation that it is possible to secure that co-operation, which it is essential should exist, between meat export companies, not only in their own Colonies, but also between the companies in the several Colonies, more especially between those in New South Wales and Queensland, so that the effects of the uncertain seasons in Australia, and consequent droughts, may as far as possible be obviated, and a constant supply of first-class meat steadily maintained in the countries to which it is exported.

- (2.) *The profit on our Meat is too small to both pay Trading Companies and give Graziers fair returns.*

The advocates of this form of company say that even supposing there were no risk of trusts or monopolies being formed, it is almost, if not altogether, a matter of necessity that the chilling, freezing, and other export works should be owned and worked by the graziers themselves, for with the low prices usually realised in London for merino sheep and the doubt there is as to a constant, steady supply, any company entering on the business of purchasing stock and exporting meat must at times either buy at a price which would give little or no profit in London, or which would leave our graziers without any return for breeding, rearing, and fattening the sheep; and that there is no doubt but the loss would fall on our stock-owners. They

They say that if our sheep were cross-breeds, as they for the most part are in New Zealand, the result would be different, and the course followed there of selling to trading companies might also be adopted here; but that that was only brought about in New Zealand, and fair prices obtained, through there being a large number of graziers' companies also at work, and regularly receiving direct orders from distributing firms in England.

(3.) *It was the formation of Graziers and Farmers' Companies that established and extended the New Zealand Meat Trade.*

In support of this assertion, the advocates for graziers' companies bring forward Mr. John Cook, the manager of the Australian Loan Mortgage and Land Company, Melbourne, who was intimately connected with the meat export business in New Zealand for years, and recently had the principal hand in floating the Denilquin Freezing Company, as a leading authority on this question. He strongly recommends our graziers and farmers to take the meat export business up themselves, and very pointedly remarks that "if they allow it to fall into the hands of trading companies they will go on hobbles all the rest of their days."

They call attention, also, to the statement made by Mr. Cook that if the trade in New Zealand had not been originally designed and worked to yield the utmost possible return to breeders and graziers the enterprise would never have grown to such large dimensions, nor would the colony generally have so largely participated in the marvellous benefits which have ensued, in the shape of a vast addition to the steam tonnage, largely-extended railway traffic, and a remarkable increase of employment, together with the doubling of the number of sheep in the colony, and the cultivation of tens of thousands of additional acres of land; and all this, Mr. Cook says, has been brought about by the graziers' companies—(1) by freezing nothing but prime meat; (2) by constantly working for and giving the grazier the benefit of the reductions in all the charges for freezing, freight, insurance, storage, selling, &c.; and (3) by encouraging the breeding of early-maturing sheep. And he concludes by asserting that this can only be attained by the shareholders being virtually all producers, and that, while a fair dividend was regularly paid, the shareholders all acknowledge that the indirect advantages of reduced expenses and the consequent development of the industry make the rate of dividend a secondary matter.

(4.) *The Distribution and Sale of Australian Meat in England and elsewhere can only be satisfactorily carried out by Graziers' Meat Companies, or by Companies acting solely for Graziers.*

Those in favour of the graziers class of company point out that this is one of the most important, as it is the most difficult portion of the meat export trade,—the placing on a proper footing the distribution and sale of the meat in the countries to which it is sent; and they assert it is only to be so by the formation of companies such as they here advocate, and the united efforts of the graziers in this and to a large extent also in the neighbouring colonies; for they say that the meat companies, in the first instance, in the colonies and afterwards in London, through their agents, must act fairly to each other, and heartily co-operate in the shipping, distribution, and sale of the meat; and they argue that this co-operation will never take place except on the part of graziers' companies, or of companies working mainly in the interests of stock-owners.

To prove that such a system of co-operation is urgently required, they point to what has recently been doing in the Australian meat trade in England, where for several months past the prices of Australian beef and mutton have been exceedingly low, and very severe losses have been sustained by the shippers, arising, as they say, through a heavy over-supply at a season of the year when the demand for frozen meat is comparatively slack—through a scarcity of cold storage, and the want of the same extensive accommodation of that description which trading companies, such as Messrs. Nelson Bros., Eastman & Co., James Nelson & Sons, and the other firms engaged in the Australian and North and South American trade, possess,—and above all through the want of mutual co-operation amongst the companies which have been doing the Australian business, and which would be secured were they to form companies and carry on the business on the basis which they advocate. They further affirm that had the Australian trade, during the period alluded to, been mainly in the hands of graziers' companies they would have been working together; and as each of them would have known what the other intended to do, they would have curtailed their shipments, and the excessive glut of Australian meat which has taken place would not have occurred, especially in the face of the fact that there was not sufficient cold storage to keep the meat until the market was relieved; while they would have assisted each other in different ways; but, instead of this, they say that the companies in the colonies as well as through their representative in London have to a large extent been acting independently of each other, and thus placed themselves in the position of being dealt with in detail by those in the trade in London, who know but too well how to take advantage of producers in an over-stocked, unprotected market.

2. OBJECTIONS TO GRAZIER'S MEAT COMPANIES.

Those, again, who are against the formation of graziers' meat companies argue that they are in many cases unsuccessful, and that they are so partly because they say that the business of meat companies formed on the co-operative principle are not as a rule managed with the same economy nor with the same care or energy as trading companies, and partly because it has not infrequently happened that the interests of individual shareholders have been allowed too much sway in the management.

They

They are also doubtful how far even graziers' companies could be brought to co-operate with one another in the shipping of the meat from the colonies, and in its storage, distribution, and sale in the countries to which it is sent—a point on which the advocates for the formation of graziers' companies so strongly dwell.

3. ARGUMENTS IN FAVOUR OF AGENCY MEAT EXPORT COMPANIES.

The business carried on by these companies is a purely agency one. They have no dealings on their own account in stock either alive or dead. Their business may be confined to either chilling or freezing, or both may be done, and such a company as this may also act as agent for the transport of the meat to market in this Colony and for its disposal there, or it may undertake to see to the shipping and sale in the countries to which the meat is exported.

These companies are to a large extent identical with those formed by graziers, and so far as they are in operation they have been doing good work for our stock owners. The arguments adduced in favour of agency companies are:—

- (1.) That owners can, by placing their stock in the company's hands, get them prepared for transport, and also, if necessary, for shipment without incurring the responsibility of becoming shareholders in joint stock companies, and of paying away money which they cannot very well spare, to meet calls to raise the large capital which is required by such undertakings as graziers' export companies for the erection of extensive works and the conduct of their business.
- (2.) That as a rule agency meat export companies manage their business better than co-operative, and that the agency companies can afford on that account to do the stock owners' work at as low a rate as graziers' companies.
- (3.) That even if the charges were higher, this is more than compensated for by the absence of the risk which would follow their becoming shareholders in a graziers' company.

4. OBJECTIONS TO AGENCY MEAT EXPORT COMPANIES.

The arguments used against the formation of agency meat export companies are of course chiefly brought forward by those who prefer the graziers' companies, and they are to the following effect:—

- (1.) There would not be a sufficient number of companies on that footing, as they would not be formed unless it was quite evident that they would pay well.
- (2.) The charges made by these companies would be likely to be higher than owners could afford to pay, considering the poor price stock are bringing.
- (3.) These companies would not, so far as experience goes, be in a position to take the same trouble as graziers' companies, to tin, salt, or deal in other ways than freezing, with certain classes of stock, and the portions of the stock, so as to make the most of them for the owner.
- (4.) The bi-products would not, so far as the owner is concerned, be turned to nearly so good account.
- (5.) Supposing the meat was exported to England or elsewhere, for sale by these companies, it is doubtful if the same interest would be taken in the meat as if it were in the charge of employees of a graziers' company, of which the owner was a shareholder.
- (6.) Although the representatives of agency companies would no doubt push the sale of the meat in London, they would not be likely to take the same interest as the employees of the graziers' companies, in the extension of the business, nor would they be in the same position to work for the opening of fresh markets as the graziers' companies acting together, as it is proposed they should do, for the distribution and sale of the meat in England and elsewhere.
- (7.) The chances of co-operation to which reference has been made, and which is absolutely essential, would be much less in the case of agency than of graziers companies.

It will be gathered from what has been said that the objections raised to what are here termed agency meat export companies, are of a comparative character, and, as between them and graziers' companies, for the formation of agency meat companies, such as the Fresh Food and Ice Co., the Metropolitan Ice and Cold Storage Co., the South Coast and West Camden Co-operative Co., and Messrs. Geddes, Birt, and Co., are considered by our graziers and farmers to be of the greatest benefit to them. It is hoped therefore that the Graziers' Meat Companies and the Agency Meat companies, which are already in existence, or which may hereafter be formed, will work cordially together for the common good. There is ample scope for both classes of companies.

5. TRADING MEAT COMPANIES.

What are here termed trading meat companies are those which purchase and sell stock, both alive and dead, solely on their own account, and neither do work, such as chilling or freezing, nor act as agents for other companies or owners. Such companies have of course an established business in England, where they both sell the meat they import and, when the state of the trade suits, purchase in the home market.

These trading companies have done good service in the colonies, by erecting works and purchasing stock, more especially in New Zealand, where the effect of their operations has been—in competing with graziers companies for the sheep for freezing—to keep

keep the price of sheep at a paying figure. The same thing has also to some extent occurred in this Colony, where the firm which first began to export, and which ultimately merged into the Aberdeen Company, has done a good deal of useful work, and been of great service to our stock-owners. In fact, it is largely through the energy and enterprise of the trading meat companies that the Australian and New Zealand meat is so widely known and in such general use as it now is in England and elsewhere.

While, however, this is the case, the interests of these trading companies and our pastoralists do not run altogether in the same groove; for, of course, the cheaper the company can purchase the stock, the more profit it will make, and it will be seen that if the chilling and freezing works are wholly or even chiefly in the hands of trading companies there is very great risk—considering the extensive power the possession of such works gives—that trusts or rings would be formed, and, having thus obtained the control of the trade, they would get the stock pretty well at their own price.

This is said to be the case at Chicago, where it is broadly stated that four of the leading packing houses control the meat trade not only there, but in a large measure, throughout the United States; and it would be a matter of very great regret if anything of that kind were to occur in this or in any of the neighbouring colonies, for it would be an exceedingly hard and tedious work to bring about a change for the better.

The principal trading meat companies in England doing business on the above lines are James Nelson and Sons, 57, Charterhouse-street, London, and 41, North John-street, Liverpool; Nelson Bros., 14, Dowgate Hill, London; Eastman & Co., Charterhouse-street, London; J. C. Hammond & Co., Charterhouse-street, London; and Sansinena & Co., of Liverpool, London, and Paris.

Nelson Bros.—Besides the cold stores at their head quarters in Dowgate Hill, this firm has very extensive and conveniently arranged cold stores on the river at Lambeth, with all the newest labour-saving appliances for receiving, classing, weighing, and delivering, and lately for thawing the meat. Their stores in London are capable of keeping over a quarter of a million of sheep frozen. They have also branch depôts at Birmingham, Manchester, Liverpool, Leeds, and Newcastle, at all of which centres there is cold storage to protect the meat, capable as a whole, with the London stores, of accommodating 300,000 sheep. In conducting their business Messrs. Nelson Brothers employ a great number of hands and a large staff of travellers, who push the trade in all directions.

James Nelson and Sons.—By far the largest portion of this firm's purchasing business is done with the stock-owners in the Argentine Republic, where they have very extensive slaughtering and freezing works on the River Plate, from which they imported, in 1893, 435,000 sheep. They have also an interest in the North British and Hawkesbury Freezing Company (Limited) in New Zealand. Their wholesale distributing branches are at Bristol, Birmingham, Manchester, Sheffield, Huddersfield, and Newcastle, and their cold storage accommodation is at Liverpool, London, and Bristol, with a capacity of a quarter of a million of sheep. Their cold store in London is situated within 50 yards of the Smithfield Central Meat Market, where they have stalls for the wholesale business. Besides an extensive wholesale trade, which is energetically pushed by their travellers and agents, the company has over 400 retail shops in various parts of England.

Eastman & Co.—This company makes heavy purchases of stock, chiefly cattle, in the United States, and slaughters them there, principally at New York, where they have an extensive retail meat trade; but they are also large shippers of chilled beef to Great Britain, which is disposed of, to some extent wholesale, but mainly in the retail shops they have opened in almost all the large towns in the United Kingdom; and they state that, although they have tried the Australian and New Zealand frozen beef and offered it at a lower price than the chilled, their customers preferred the chilled, and that they do not now keep frozen beef. The company also sell in their retail shops large quantities of frozen mutton, professedly New Zealand and Australian; but from what I saw of it, and could learn, I believe a good deal more of it was South American than either New Zealand or Australian. This concealment of the true home of the mutton is practised on account of the bad name which the South American mutton at one time had; and although of late years, through the introduction of Lincoln rams, there is a great improvement in the quality of the mutton from that part of the world, its previous character still sticks to it, and interferes to such an extent with even the best they can send as to lead those who retail it to palm it off as Australian. This company disposes of about 500,000 frozen sheep a year. They also purchase and slaughter English and Scotch sheep and sell the mutton where they see that there is a margin of profit. They have over 600 retail shops.

G. H. Hammond & Co.—Like Eastman & Co. this firm are large purchasers of American cattle and shippers of chilled beef to England and Scotland, and they also, I believe, ship considerable numbers of live cattle. Their business is entirely a wholesale one, but it is not wholly confined to the meat they import from America. They are also purchasers, as I understand, on their constituent's account, of New Zealand mutton, and they informed me they were prepared to buy Australian, if the quality and price were right.

Sansinena & Co. (Ltd.), Smithfield, London, have extensive works on the River Plate, and ship considerable numbers of sheep to both Liverpool and London. They have also a house in Paris, and at one time imported and sold a considerable number of River Plate sheep there; but the restrictions, duty, and towns dues have led almost to the extinguishment of the trade.

6. TRADING AND AGENCY MEAT COMPANIES.

These again are meat companies, which, while they carry on their own business of buying and selling stock both alive and dead, also act as agents for such companies and stock owners as may entrust them with their stock.

Anything that can be said in favour of this form of company is, that as they are usually in a large way of business on their own account, they would have a thorough acquaintance with the trade, and be able to do any work which other companies or stock owners might entrust them with in a prompt and efficient manner. But against that again is the fact that they might at times have their own meat to dispose of, or they might themselves be in the same market for meat to supply their own customers, as they were disposing of that sent by their consignors from the colonies; and the impression naturally is that they would not neglect their own or their customers' interest, however that of their consignees might fare.

Besides this there is the objection that in thus acting as agent for other companies or owners, these trading and agency companies would, in the event of an effort being successful to bring about co-operation and the formation of an association in London for the management of the Colonial meat trade, be entitled to a say in its conduct, although their interest, and those of the companies and stockowners, which the association was formed to conserve, were quite divergent, seeing that these trading companies would be frequently in the meat market as purchasers.

7. THE APATHY OF OUR STOCK-OWNERS WITH RESPECT TO MEAT COMPANIES.

A very little consideration ought, I think, to lead our farmers and graziers to see that before the unfortunate state of things which now exist with respect to the meat trade of the Colony can be remedied, they must take far greater personal interest in the trade, and become shareholders in some of the existing or proposed meat companies, and thus assist in providing the necessary funds for carrying on the trade in a thoroughly efficient manner, while they should do all in their power to induce the management of the company they join to co-operate in the first instance with the directors of other companies in their own, and afterwards with those in the other colonies, in the shipment, distribution, and sale of the meat in the countries to which it is exported.

The necessity for all this has been very forcibly pointed out by Mr. Cuthbert Fetherstonhaugh, in his very able correspondence in the daily papers and in the addresses which he has delivered to owners in different parts of the Colony, while advocating the formation of "The Graziers' Meat Export Company." But I am sorry to see that his efforts have not met with the entire success which they deserved, and that there are still some 30,000 shares of that company to be allotted out of 100,000. From the latest statement made by him at a meeting which he held at Wagga Wagga, on the 18th September last, it would appear that a very large majority of our graziers and farmers who own more than 2,000 sheep, and represent in the aggregate considerably more than half of the sheep in the Colony, have not taken any shares in the proposed company, nor are they shareholders in any other meat company.

The following statement shows how this matter stands:—

	Number of Owners.	Number of Sheep they represent.
Number of sheep-owners and of sheep in the Colony	14,000	57,000,000
<i>Deduct—</i>		
Owners with fewer than 2,000	10,500	6,000,000
	3,500	51,000,000
<i>Deduct also—</i>		
Owners who have taken shares in the Graziers Meat Export	450	13,000,000
	3,050	38,000,000
<i>And deduct also—</i>		
Shareholders in other meat companies	350	7,000,000
	2,700	31,000,000

That is to say, if this statement and estimate be correct, that 2,700 owners, with more than 2,000 and representing some 31,000,000 sheep, have taken no shares in the proposed Graziers' Meat Export Company, neither are they interested in any other meat company.

When we see the markets in this and the neighbouring colonies, more especially in Queensland, over stocked, the return from cattle and sheep excessively low, and that there is no relief possible except by the establishment of an extensive export trade in meat, we are greatly astonished at the comparatively unsuccessful result of Mr. Fetherstonhaugh's arduous efforts, by word and pen, to float the graziers' company.

The apathy and short-sightedness on the part of stock-owners is simply unaccountable, and discloses a lack of interest on the part of large numbers of them, which is most disheartening to those who have taken shares and are anxiously looking for the company being started.

If the owners who are hanging back had not had the whole matter so fully explained to them and been furnished with ample particulars with respect to what has been done in New Zealand; and if the urgent necessity for the proposed Graziers Meat Export

Export Company had not been, as it really is, far greater in this Colony than in New Zealand, the conduct of these owners would not have appeared so very strange. But they have been repeatedly made acquainted with all these particulars and everybody knows that the formation of similar companies and the establishment in that way of the vast trade in frozen mutton, has been the salvation of New Zealand; while the slightest consideration must convince any unprejudiced person, that while trading companies might answer in New Zealand in which two years ago there were twenty-one freezing and export establishments all at work, except one or two,—very few companies of the trading class will ever be established in this Colony on account of the little prospect there is of dividends from the treatment and export of merino mutton, unless the company dealing in it secured a monopoly and got it at its own price. But this does not affect the question of our stock-owners forming such companies, inasmuch as it is the indirect advantage which they principally look for; and if the export trade was conducted without any loss (which there is no doubt it can certainly be) they would be quite satisfied.

I would therefore once more urge our owners, who have not yet taken shares in any meat company, to become shareholders in the Graziers, or some other meat company, and to give the undertaking their cordial support; for surely there is no grazier or farmer who would not trust himself far more readily in the hands of the directors of a company of which he is a shareholder, than in those of some trading company.

8. THE SYDNEY MEAT PRESERVING COMPANY AND THE GRAZIER'S MEAT EXPORT COMPANY SHOULD AMALGAMATE.

As I have been dwelling so much in this report on the subject of co-operation, and have, I think, conclusively shown the incalculable benefit which it would confer if generally adopted and faithfully carried out by the companies which have been formed in the interest of stock-owners,—I will here take it upon me to offer the suggestion to the Directors of the Sydney Meat Preserving Company (which they are aware I had a share in forming) and of the Graziers' Meat Export Company, that they should amalgamate on terms that would be thoroughly fair to both companies,—keeping, of course, in view, the comparatively favorable position which the Sydney Meat Preserving Company now occupies, and the excellent work it has done for stock-owners for twenty-four years, without the shareholders having received any dividends,—and that a powerful freezing plant be erected at their works at Rookwood with the Graziers' Company's funds. The fact is, the Sydney Meat Preserving Company's works are incomplete without the freezing plant, and those of the Graziers' Company, if constructed as proposed, would be incomplete without a tinning and boiling plant and appliances. Both companies have been formed with the same object,—the promotion of the interests of our stock-owners,—and I submit there is no way in which this could be so effectually done as by acting on the suggestion here made for the following among other reasons:—

- (1.) The freezing works which do not also tin and make every possible use of the bi-products and offal will not be a success; and the Sydney Meat Preserving Company has in its works and manager, Mr. Gee, a guarantee that this—which is really the most particular and difficult part of the process of turning the stock to the best possible account,—would in his hands be a decided success. The Sydney Meat Preserving Company's goods are favourably known in all parts of the world.
- (2.) If this suggestion were acted on the amalgamated company would not only freeze the sheep which would pay best to freeze, and tin or boil the others as suited best, but it would be prepared to freeze the portions of the sheep that would in that way give the best return, and tin and boil the whole or the balance or portions of the balance, as the case required. Sheep sent down from up-country chilling depôts could be either frozen whole, or portions of them could be so and portions tinned or boiled, while sheep bought in the saleyard could be dealt with in the same way; and so also perhaps might sheep sent alive to the works to be dealt with on owner's account on terms favourable alike to him and the company.
- (3.) If refrigerating cars were used, as they would be (and as they would have in any case to be even from the Darling Harbour market) the additional distance from Rookwood to the ship's side would not entail any risk to the frozen meat, and the additional expense (if any) compared with loading from any other freezing works would be exceedingly small. Of course this arrangement would not be so convenient and complete as erecting freezing works on the harbour; but under the existing circumstances it would I think be decidedly more advantageous for stock-owners.
- (4.) One of the chief essentials in the establishment of a successful meat export trade is the formation of a financially strong company, and the proposed amalgamation would secure that; for the amount of capital already raised by the Graziers' Company and that possessed by the Sydney Meat Preserving Company would form a strong company, while there is no doubt but if the amalgamation were to take place the unallotted shares of the Graziers' Company would be speedily taken up.

Should the proposed amalgamation not take place the Sydney Meat Preserving Company should I think itself erect freezing works; for the freezing companies in this and the other Colonies are adding tinning appliances to theirs, so that they can work in either way and turn the stock to best possible account; and there is no doubt but the Sydney Meat Preserving Company could at times make a better return from freezing than tinning certain portions, if not the whole, of the sheep.

III.—The Site for Freezing and Export Central Works.

SUCH a site as that proposed for the Graziers' Meat Export Freezing Works in Sydney would be a very suitable one for a company doing a purely export business, for not only would the labour of putting the frozen beef and mutton on board the ocean-going steamers from the store rooms attached to the works be reduced to a minimum both as to time and expense, and this would apply equally to the tinned and other cooked meats of which there will be very large quantities, but also to the coals, timber, machinery, and other plant which will from time to time be required for the central works and for the killing and chilling depôts affiliated with the central works. But for a general business, including slaughtering, tinning, and boiling down, it will be seen that a site such as the Sydney Meat Preserving Company's would be preferable.

IV.—Necessity for commodious and thoroughly well-built, well-planned Premises, and the best and most approved Machinery and labour-saving appliances.

IT is absolutely necessary that our works should, in the buildings themselves, their size, the plant and arrangement, and the whole of the machinery and appliances, be of the most suitable description for such a business, both as regards efficiency and durability, and that they should contain all the most modern and most effective labour-saving appliances to be met with in America or elsewhere for turning the meat, and every particle of the bi-products to the most profitable account possible. In fact the works should be so complete that not only every description of stock can be dealt with in the way that would be most profitable to the owner, but that each portion of each head of stock could be treated in that way—the carcass or any portion of it being boiled down, frozen, tinned, or salted as considered best.

V.—Up Country Killing and Chilling Depôts.

IF the sweetness and delicacy of our mutton are not to be destroyed, and the low prices now obtained in the English markets, more especially for our merino mutton, are not to continue, we must do away with the present cruel and wasteful live stock business so far at least as concerns the export trade, and establish up country killing and chilling depôts at the principal centres of the stock traffic—care being exercised to ascertain before deciding on the erection of these depôts that stock in sufficient numbers can be supplied to support them. From there the stock, when chilled, can be brought more economically as well as more safely than alive to the central works at the seaboard, to be frozen, tinned, or otherwise disposed of, as it is most to the owners interest.

1.—THE SITE OF KILLING AND CHILLING DEPÔTS.

Great care will have to be exercised in the selection of sites for killing and chilling works. There must be an ample and permanent supply of good water, a good fall for the drainage from the slaughter-houses and the "soup" from the digestors, and the works must be as close as possible to the railway line, with the necessary convenience for a siding. Then there must be no risk of the stock being obstructed in coming to the works, nor of actions being brought for nuisances on account of boiling down, or of any other of the work going on at the establishment.

2.—THE BUILDINGS, SLAUGHTER-HOUSES, YARDS FOR KILLING AND CHILLING DEPÔTS.

These should be erected on rising ground, not only for the sake of drainage, but also to admit of the stock, when killed, being carried by gravitation from one point to another, while they are being dealt with. The material used in the buildings should be of the description best adapted for the purpose, keeping in view that thorough cleanliness and disinfection is essential, and that in those portions of the works where the chilling and the freezing is done, the insulation should be as perfect as possible. There should be ample room to do the work, and utilize the bi-products; and the fittings, vessels, and appliances of every description should be of the newest and most approved description, while labour saving arrangements should be introduced wherever possible. We should take the American works as a model, and improve upon them, if we can, making certain that any alteration we may intend to make really is an improvement.

If the sites, buildings, sheds, and surroundings are not what they ought to be, and the work not conducted in thoroughly efficient and expeditious manner, we will not be able, in the face of the competition of both North and South America, to secure and keep our due share of the British and Continental meat trade.

VI.—Preparation of Meat for Export.

THERE are four modes in which meat is now prepared for export, (1) freezing, (2) tinning, or (3) salting, and (4) boiling down, and I will now, very briefly, refer to those four different modes, and the manner in and extent to which each mode of preparing the meat should be adopted.

1. FREEZING, MACHINERY, AND PLANT.

The ammonia system of freezing and chilling in some form or other is now that generally worked; for while it is highly efficient, and easily mastered and managed, it is by far the most economical. Among the ammonia freezing and chilling machines, now in use, may be mentioned, "The Linde," "The de la Vergne," and "The Hercules," all of

of which I met with in Chicago, and several others, like "The Hercules" of an American make. In some parts of New Zealand where the temperature is comparatively low Hall's patent carbonic anhydride machine is also used, and is there both effective and economical, but where the temperature of the water is over 87 these advantages cannot be claimed for it.

(1.) *Thawing Frozen Meat.*

Even frozen mutton, which is not so much affected by the moisture from the freezing as beef, does not look well when allowed to thaw in the ordinary way with the natural temperature; and the appearance of frozen beef, when thawing in this way, more especially the thicker portions which have been cut through, is very much worse. These cut portions look moist, soft, and uninviting, and begin to "weep" and drip. The juices of the meat escape with the moisture from the thawing, and care (which is not always given) is necessary in cooking meat in this state lest the greater part of the juices should run out, and the meat, when cooked, be insipid and flavourless. The same objections apply in a less degree to frozen mutton; but while mutton does not "weep" to anything like the same extent as beef, the appearance, when allowed to thaw in the ordinary way is, except in cold, dry weather, moist and dull in color compared with the home article.

Early in the present year, Mr. Litchenberg, one of the managing partners of Messrs. Wills & Co., storekeepers, Port Said, the proprietors of the refrigerating stores which supply the shipping there—with Australian and New Zealand beef and mutton—applied for a patent for thawing frozen meat, and when I met him in the month of April, he informed me that he had heard that his application had been approved, but that the official intimation would not reach him for another month. He stated also that he did not intend to put the patent into operation until he received this intimation. He was then busily engaged in making arrangements for a large refrigerating store, which his company were about to erect at Malta at a cost of £40,000, to keep meat for the supply of the British troops on that island. I have since obtained a copy of the specification of his patent, particulars of which appeared in some of the Australian agricultural papers.

When I saw Mr. Litchenberg, he informed me that he had brought the patent under the notice of Messrs. Nelson Brothers, and had shown them how his process was worked, with the view to the sale of the right of patent to them, but he gave me to understand that they did not consider it a practical one. It would now, however, seem, from accounts recently received from London, that the Messrs. Nelson Brothers had improved upon Mr. Litchenberg's process, and hit upon a thoroughly efficient system of thawing.

After seeing the state of the frozen meat in the Smithfield market, as the warm weather came round with the spring, and more especially with the summer, I was convinced that some process of artificial thawing was absolutely necessary, even if it should not, as Mr. Litchenberg and the owners of the other patents claim it will do, completely restore the frozen meat to the state it was in originally when sent to the chilling-room preparatory to freezing as regards both appearance and quality—that is to say, they claim (1) the objectionable moisture on the outside of the frozen meat, caused by the ordinary thawing, will be absorbed by this process; (2) the superabundance of moisture through the freezing in the inside of the meat will also be absorbed, and the "weeping" and "drip" of the juices will be stopped; (3) the natural colour of the meat will be retained; and (4) the juices will be thoroughly re-set, and the meat will cook and eat as well in every respect as if it had never been frozen.

By recent accounts it would seem that as regards advantages 1, 2, and 3, at least they had been actually secured, and the natural appearance of the meat restored. There are good hopes too that advantage No. 4 will also accrue, and that the thawed meat when cooked will retain all its juices and flavour. But even supposing this should not be the case as regards the last advantage, the benefits from the improvement in the appearance of the meat and the prevention of the "weeping," as well as from its being in a fit state to cut up at once, which frozen meat is not, will be immense, especially in the case of the owners of cattle.

As to the expense entailed by this process, the patentees propose to charge $\frac{1}{4}$ d. per lb. for thawing. This would be a very high rate, amounting as it would on a bullock dressing 800 lb. to 16s. 8d., and on a wether weighing 50 lb. to 1s. 0 $\frac{1}{2}$ d. each. But I believe that if a reduction cannot be obtained from the patentees, means other than those protected by the existing patents can be found to do the work. The principal expense would be in the additional space which would be required for keeping the meat till it is thawed, as the process of thawing itself would seem from the description in Mr. Litchenberg's specifications for the patent, and from what he stated to me, to be a very inexpensive one, and to be carried out by adding, according to the requirements of the case, three or more separate chambers, into which the meat is carried with little or no handling, on overhead trollies from the large Central Frozen Meat Store to each of these chambers as required, where it would remain till thawed by the introduction of warm, dry air, at a gradually rising temperature,—beef, it is said, taking five days to be properly thawed, and mutton two to three days. It is then passed on into a fourth or outer chamber, maintained at a safe temperature, in which a supply of thawed meat sufficient for the daily trade is kept, and sent away as ordered. By having the different thawing chambers, in which of course the heat can be maintained at any temperature which may be required, the quantity of meat required day by day can be put through, and not much more need be thawed than can be despatched.

2. *Establishment of a School of Refrigeration, and Experiments in Chilling, Freezing, Thawing, &c.*

Before leaving Australia there was of course a great deal of information relating to the meat export trade which I might have obtained in the Colony, and which would have been of great assistance to me in the course of my inquiry; and there were no subjects of greater importance in regard to which information was required than those set out in the heading under which I now write. I did make a recommendation before I visited New Zealand in the end of 1892 that an unofficial commission might be appointed to make inquiry with regard to the effect of freezing on the quality and flavour of the frozen meat, but the matter fell through, and while I was in England I had in a large measure to take for granted a great deal of what was told me with respect to these and other matters relating to our meat, which I believe could be definitely settled in the Colony by actual experiment, and in many cases defects in our products could be remedied and prejudices removed.

Considering, therefore, the vast importance of refrigeration to this, as well as to the other Australasian Colonies; that in point of fact very few of our products can be placed on outside or even inside markets without it, and the incalculable advantages which would accrue by our obtaining a better knowledge of how cold can be most simply and economically obtained and most efficiently applied, and the uses to which it can be turned, and the effect of its application—I would recommend the establishment of a School of Refrigeration, and the appointment of a qualified teacher who would, besides imparting the necessary instruction to his pupils, carry out such experiments as were required in the chilling, freezing, keeping, and transport of meat, poultry, game, fish, and other animal products, and in the keeping and transport of dairy produce, eggs, fruit, and vegetables, as well as of any other Colonial products to which refrigeration can be applied.

Some of the experiments which I think are most urgently called for in connection with the meat export trade are those which would go a long way to settle several very important questions, such as,—

- (1.) Is it the case that a rupture of the cells in which the juices of the meat are held takes place through its being frozen?
- (2.) If so, would this occur where the meat has been previously chilled, even if the freezing were carried out slowly and gradually, and the temperature were not taken lower than (say) 24° Fahr., *i.e.*, by beginning at freezing point, 32° Fahr., and going slowly and gradually down to and not lower than 24° Fahr.?
- (3.) If a rupture does not take place when the meat is frozen, as in No. 2, slowly and gradually, would it do so if it were subjected to hurried and hard freezing as low as (say) 10° Fahr.?
- (4.) If the meat were first frozen, as mentioned in No. 2, would it have any prejudicial effect if it were afterwards subjected to such a temperature (10° Fahr.), and frozen in the manner mentioned in No. 3?
- (5.) Supposing that no damage is done to the meat when frozen, as described in No. 2, would it be safe to send it to England at or about 24° Fahr. (say not higher than 26° and not lower than 22°), and if so, can the engineers be depended upon to keep the temperature within those limits during the voyage?

If, as is generally supposed, a mechanical operation is set up by the freezing of meat, which bursts the cells that hold the juice—in the same way as the frost breaks bottles in which there are liquids,—there are reasonable grounds for believing that this rupture—if it really takes place—may to a large extent, if not altogether, be prevented by freezing slowly and gradually, and not lowering the temperature much below freezing point; and that, on the other hand, when the temperature is allowed to drop as low as (say) 8° or 10° Fahr., and this is done hurriedly, it is believed that the tissue of the meat is needlessly injured, “weeping” is caused, and its value greatly reduced. Any one will, I think, therefore see that the questions here proposed to be settled by actual experiment and careful inquiry are most important, and they are only a very small portion of those which could be settled, if the necessary accommodation, machinery, and teacher were provided.

In support of this statement I would point to the fact that there are a great many other experiments to be carried out in connection with the freezing of meat, as also with regard to the thawing and cooking of meat, the freezing and transport of fish, fowls, and game, the keeping and carrying of dairy produce, fruit, and vegetables, and many other questions relating to refrigeration which will be certain to occur as the products of the Colony increase, and the necessity arises for conveying them in good condition to other parts of the world.

This proposal would, of course, entail the necessity for providing accommodation for the classes and experiments, and the purchase of machinery and plant.

It is calculated that some 840 square feet of floor space, to be divided as shown on the accompanying plan, would be required to carry out the proposed experiments and afford the necessary accommodation for the pupils to attend and make themselves properly acquainted with the experiments which are going on. Separate chambers will also be required in carrying out the inquiries and making the tests, as it may occur that experiments with respect to meat, fruit, and dairy produce have all to be gone on with at the same time, and this would entail the use of three separate chambers. Then a small space would have to be partitioned off as an office. In addition to this space for the engine and freezing machinery and boiler would have to be provided.

A plan and estimate of the necessary building are appended to this Report, showing the position of the different rooms and of the machinery and plant, which has
been

been kindly furnished to me unofficially by Messrs. Wildridge and Sinclair, consulting engineers, and agents for the Linde Refrigerating Company, Pitt-street. The cost of the boiler, engine, machinery, and plant they estimate at £1,112; the erection of the buildings and insulation, £475; making a total cost of £1,587.

2. TINNING.

Tinning is an essential adjunct to either boiling-down or freezing works, and, of course, to works at which both operations are carried on; and tinning machinery and plant will be still more essential if the suggestion which I afterwards made at some length be acted on, as I believe it will to a considerable extent,—that not only should our exporters refrain from freezing the lighter and less prime stock, and tin, salt, or boil them down, as the circumstances suited, but that they should also, as regards very considerable numbers of the prime stock, keep back the inferior portions of the carcass, and treat them in the same way as the second rate stock; for it is only a waste of time, freight, and money to incur an expense of (say) 2d. per lb. (the all round consolidated charge for freezing and shipping stock to London and getting net returns) on portions of the meat which do not relatively realise sufficient to pay this expense, to say nothing of giving the owner no return, or, at least, a return which is less than he would have netted for the meat by dealing with it as here suggested.

The work of tinning, or as it is termed in Chicago "canning," is brought to very great perfection in the packing houses there, especially as regards the innumerable labour-saving appliances in the making of the tins—their conveyance from one part of the establishment to another while being formed, soldered, filled, and labelled,—the cooking of the meat in the tins and the closing of them, the printing of the labels, the manufacture of the packing-boxes, the packing of the tins, and their transport from the works to Boston or New York for despatch to all parts of the world.

Any company intending to erect tinning works in the Colony should, before doing so, obtain full particulars with respect to the tinning machinery and plant now in use in such packing houses as those of Messrs. Armour & Co., Messrs. Libby, M'Neill, and Libby, and Nelson Morris, Chicago; for there is no doubt but they are the most efficient and complete to be found in any part of the world. But, while this is the case, and while the American tinned meats have a wider and more general sale than those put up in this and the other Australian Colonies, there can be no question but that the Australian tinned meat is superior in quality and nutriment to the American. This has been proved by actual analysis, and the fact is well known to ship-owners and the heads of the army and navy commissariat departments throughout Europe and other parts of the world, and, as a rule, it is acted on by them. It is different, however, in the case of grocers and other retailers who sell tinned meats to the working classes, and who purchase the American tinned meat, although the quality is low as the price is also low, but it is nicely pressed, and got up in a very taking fashion, with handsome label, and, when turned out of the tin to be retailed, as it generally is to the working people, by the pound, it cuts and looks well and has a good colour; while all the time the cattle from which the meat was taken may have been old poor cows, stags, bulls, or rough Texas steers, hundreds of thousands of which are worked up annually in Chicago for tinned meat and sausages, and the tinned meat is made to look well by having some small pieces of fat mixed with it, and little bits of cow heel to do duty for dripping.

I believe that if our meat preserving companies, who put up nothing but good meat, would lay themselves out more than they have been doing to secure the retail trade in England and on the Continent, by putting the meat up in such a way as to suit those engaged in that branch of the business—especially as regards the pressing, the size and shape of tins, and their "get up" and labelling—they would do a more extensive business.

I think, too, it would help the sale to publish a comparative analysis of the New South Wales and American tinned meat.

3. SALTING.

As I have already in that portion of my report which relates to the American trade touched upon this mode of dealing with meat, it is not necessary to say anything further than that with the increase that is now going on in the number of refrigerating depôts and cold stores we will soon be in a position to carry out the process of salting meat in the most approved manner, especially when the system here recommended of dealing with the different portions of the carcass in the way in which the best return will be made to the owner, is adopted. If sufficient care is exercised in the selection of the meat for salting and in carrying out the process, there is not the slightest reason seeing that meat in Australia is only about one half the price it is in America, why the Colonies should not, in the course of a few years, secure the greater part of the salt beef and pickled pork trade, which the United States is now doing, amounting to nearly two millions sterling a year.

4. BOILING DOWN.

The boiling-down of cattle and sheep for the tallow is not in general use anywhere except in South America and Australia, and is by no means a profitable mode of disposing of stock. But although this is the case boiling is at times the best way of utilising them when they must be got rid of, and they cannot be turned to better account. Boiling is also used more or less by Packing Companies and butchers in the course of their business, and to a very much greater extent at the tinning factories, where, it is said, as much within a pound and a half or two pounds is boiled from a sheep which is preserved as from one simply melted for the tallow.

As

As regards either the system of boiling, or the plant and appliances used, or the manner in which the work is done so far as regards the preparation of the ordinary tallow for market, I do not think we have anything to learn, for our tallow has a high position in the London and Continental markets and meets ready sale.

Recently, however, it has been found that oleo, *i.e.* edible fat, which is worth about £40 per ton, can be obtained from inside mutton tallow, as it has for some time been from beef, if it is properly prepared for melting which it is by subjecting the fat as soon as it is taken from the sheep to repeated washings in pure water, reduced to a temperature not exceeding 40° Fahr. To carry this out artificial cold will be required, and proper presses and other appliances, which can all be readily fitted up at a comparatively small cost at any of the chilling or freezing works, but the process will, of course, have to be carried out under the direction of some one who has a practical knowledge of all its details.

The oleo forms the basis of butterine, or margarine, which is principally made in Holland, the manufacturers there obtaining supplies from many parts of the world, but chiefly, as yet, from the United States. The consumption of margarine is very much greater on the continent of Europe than anywhere else. It is said that in some portions of Germany, and in Denmark and Sweden, the greater part of the butter is sent to England, and margarine used. At the same time, very large quantities of it are used in the United States, where it is regularly quoted in the agricultural papers under the heading of butter, at from 2½d. to 3½d. per lb. less than real butter, according to quality. A good deal of margarine is also used in England, and some, too, in Scotland. The best sorts of margarine are made by churning milk or butter with the oleo, and when carefully prepared in this way it takes an expert to distinguish it from real butter; and when made from perfectly sweet and clean fat, margarine is a thoroughly safe and fairly nutritious article of food.

Sheep owners will be glad to learn that the extraction of the oleo, which, as I have said, sells at very nearly double the price of ordinary tallow, instead of lowering the value of the residue, which is used for the manufacture of the better class of candles, actually adds to it to the extent of from 4s. 2d. to 5s. per 100 lb., as the extraction of the oleo largely increases the proportion of stearine, the principal ingredient in the manufacture of what are termed wax candles and matches. This process, when brought into use in the Colony, ought to make a good addition to the return per sheep over and above the expense of extracting the oleo.

It is, too, I think, worth considering whether, with such large quantities of beef and mutton fat as there are in this Colony and Queensland, we should not only prepare the oleo, but also make margarine. America, as I said, does so in large quantities; and Holland, while she imports nearly the whole of the oleo she uses in making margarine, exported in 1892 to Great Britain alone margarine to the value of more than £3,360,000, and in 1893 to the value of more than £3,650,000. There is no reason, therefore, why Australia ought not, like the United States, carry out the whole process, and supply England with a considerable portion of the quantity represented by the large sums I have quoted; and our meat companies ought to give this matter their serious consideration, for if the larger portion of the tallow which is suitable for margarine were worked up by them in that way, it would largely increase their returns and add a very considerable sum to our exports.

5. SELECTION OF CERTAIN PORTIONS OF SHEEP AND CATTLE FOR FREEZING AND EXPORT.

There are very few now who will advocate the freezing and export of inferior or third-class beef and mutton, while those whose opinion carries the greatest weight are opposed to anything but first-class meat being shipped in that way. If this is a fact, then it ought to be equally true that it is as far wrong to freeze and ship the portions of first-class meat which, taken by themselves, really rank no higher than inferior or third-class, and a good many more which can only be termed low second. Indeed we are regularly incurring—and I think I can show needlessly incurring—heavy expense in freezing large quantities of what is little else than bones let alone inferior beef and mutton.

To show that this is the case, I will here submit a comparative statement showing the portions and weights of the portions into which a merino wether of (say) 50 lb. is usually cut up for sale by the retail butchers, and give the average wholesale and retail prices, which I believe, the separate portions were bringing while I was in London. The wholesale prices are calculated on a basis of 1s. 10d. per stone, or 2¼d. per lb.; and the retail prices are taken from the tickets on the portions of the meat exposed for sale in the butchers' shops.

STATEMENT referred to.

Portions.	Wholesale average price, @ 2¼d. per lb.			Retail average price, @ 4½d. per lb.		
	Weight of portion.	Price per lb.	Amount.	Weight of portion.	Price per lb.	Amount.
	lb.	d.	s. d.	lb.	lb.	s. d.
Legs	16	3½	4 10½	16	6	8 0
Chops	12	3¼	3 0½	12	5	5 0
Shoulders	12	2½	2 5½	12	4	4 0
Breast and flanks	5	1½	0 9½	5	3	1 3
Necks	5	1½	0 9½	5	3	1 3
	50	11 11	50	19 6

Showing a profit on the sheep of 7s. 7d.

It will be seen by this statement, when the relative values of the different portions of the Merino sheep which have been sold in London are worked out that the "neck," and the "breast" and "flank" portions not only return nothing to the owner or shipper of the sheep, but actually do not pay the consolidated charge of 2d. per pound for freezing, shipping, freight, and storage and sale in London; and that all that the shoulder returns is somewhat less than ($\frac{1}{2}$ d.) one halfpenny per lb., or less than half of what is considered the lowest price (1d. per lb.) at which it will pay to ship mutton.

It is quite evident, therefore, that so far as regards the two last portions,—the breast and brisket, and the neck,—they do not pay to freeze and ship, and should either be disposed of in the Colony, or tinned or boiled down, as paid best; and with regard to the shoulders, again, which it will be seen give a return of less than $\frac{1}{2}$ d. per lb. over and above the consolidated charge of 2d. per lb. for freezing, shipping, and selling in England, it is very questionable whether a better return could not be made by selling in the Colony, or tinning or boiling them down. Should it, however, pay better to freeze and ship the shoulders, then the flanks, briskets, and neck could be cut off, and the shoulders, saddles, and hind legs in one piece, could be frozen and shipped,—the bones of the fore and hind legs being lopped off as short as is compatible with the appearance of the meat; and if the sheep were cut through at the fork, where the hind legs join, the carcass would open flat out and save space, now lost in the hollow of the sheep on board ship. If, however, it be found that more than $\frac{1}{2}$ d. per lb. can be made of the shoulders by disposing of them in the Colony, or by tinning or boiling down,—then they could be cut off as well as the flanks, brisket, and neck, and only the legs and chop pieces, or saddles, which are all paying mutton, frozen and shipped.

As those engaged in the trade in London are very conservative, I would expect that objections would at first, at least, be raised to dealing with the sheep in the way here suggested to any great extent, and I am afraid that for some time proportionately high returns will be hard to obtain for the valuable portions of the mutton thus sent by themselves; but I do not think these objections will continue. Inasmuch as we have a great deal more mutton than can be frozen and exported, there is no fear that a less quantity would be shipped through the adoption of my proposal,—for what was sent, if fairly treated, in the English markets, would pay better than it now does, and heavier shipments would be made. In this way a great deal more money would be made all round by the owner, or shipper, the salesman, and also by the retail butcher. Even now, too, some single haunches or legs—principally of over-heavy sheep—are frozen and shipped, and the mode here suggested by me of sending the hind legs and saddles in one piece ought to be much less objectionable from the retail butchers' point of view than shipping single legs, for legs cut from the portion I propose to ship by the retail butcher in England would look very much fresher and less liable to be put out of shape in transit from the freezing works to London than single legs.

Of course shippers must study the requirements of the markets to which they send their produce, and attend to the wishes of those who are in the trade, so far as they are reasonable; but it cannot be deemed reasonable that shippers should be forced to keep on sending produce which, in some cases, does not even pay the expense of preparing it for market and cost of transit. This is what is actually taking place with respect to the portions of the sheep to which allusion has been made, and as well might the exporters be called on to ship inferior sheep which do not pay to export as to ask them to keep sending the inferior portions of first-class meat which are sold at a loss, while, as a rule, these portions are not sold by the retail butchers with the best portions, but singly by themselves, and need not therefore be sent with the other portions. While, therefore, it may for some reasons suit the retail butcher better to purchase the whole sheep, there is no absolute necessity for the mutton being offered to him in that way, and there is no real reason why he should object to our shippers putting the meat on the market in such a manner as they can obtain fair prices for it.

It may again be said that if the whole sheep is not put on the market the retail butcher will be unable to supply all the joints which his customers require. That may be; but that state of things need not last, for as soon as the price of the portions now proposed to be dealt with in the Colony rises in the London and other markets to a rate that will make it pay our shippers to export these portions—and it would not require a very large advance to bring this about so far as shoulders are concerned—they will only be too glad to freeze and ship them, and as I have already said it would be very unreasonable to ask them to ship at a loss.

What I have said on this subject has reference only to sheep, in which the Colony is mainly interested, but my suggestion would, if acted on, operate to even greater advantage in the case of cattle, for the proportion of second-class and inferior meat is greater in the carcass of beef than in that of mutton; and as there is every probability of beef being eventually exported from this Colony, as well as mutton, I will here state very briefly how the suggestion should be made to apply also to cattle.

Instead of dividing the side of beef, as is usually done, into quarters, I would suggest that the hind leg should be cut off at the point where the meat will pay to freeze and ship, that the flank be stripped off until the back of the shoulder is reached, and that the side be then cut through. This would leave all the most valuable parts of the meat in one piece, which will pay well to freeze and export. The portion of the hind leg, again—consisting principally of bone—that cut off the flanks, and the portion of the fore-quarter containing the heavy bones of the shoulders and neck, while they, as a rule, would not pay to freeze, can be turned to fairly good account in tinning, salting, boiling down, and extract making.

Although I make these suggestions under the impression that they would, if acted on, tend in a very important degree to improve the prospects of the frozen meat trade in several directions. I think it would be inadvisable, even if they did meet with
general

general approval, to act upon them at once to any very great extent, and that the change from the present mode of conducting the trade to the course which I recommend of selecting certain portions of the sheep and cattle for freezing and export should be a gradual one.

By way of contrast I give here statements prepared on the same principle as that for merino mutton, for English, and New Zealand cross-bred mutton.

Best Southdown Wether, weighing (say) 70 lb.

VII.—Shipping and Freights.

As it not only costs large sums, say from £15,000 to £20,000, to fit up a steamer to carry frozen meat, but also entails considerable loss of stowage room, and consequent loss of freight when ordinary cargo has to be carried, through the space taken up by the insulation, shipowners have naturally been backward in altering their vessels for that purpose, and putting in the necessary machinery.

For some time, therefore, after the initiation of the frozen meat trade there was a great deal of trouble in obtaining freight; and at first the shipping companies insisted upon receiving a guarantee that a certain amount of meat would be provided for their vessels at stated periods before they would agree to fit them up, and send them to the ports at which it was desired to load the meat for London. This, of course, had the effect of retarding the development of the trade; and it was not until within the last few years that a change began to take place in this respect, partly through the increase of the meat export trade, partly through the depression in the shipping business and a scarcity of ordinary freight, partly through the freezing companies and ship-owners coming to a better understanding, and partly also through the development of a trade in other produce, such as butter, cheese, fruit, &c. The result of this has been that within the last three or four years considerable additions have been made to the fleet of steamers carrying frozen meat, and the cost of freight has been lowered very considerably.

The charge for freight, which, at the commencement of the trade, was as high as 2½d. per lb., is now 1d., which, it is said, pays ship-owners well even if they obtain little or no outloading; and if the vessels could only obtain a fair amount of that, it would pay shipowners very well. Recently, I believe, offers have been made of freight at ¾d. per lb. if a steady supply of meat for shipment were guaranteed; and it has been stated that that rate of freight would pay shipowners as well as ½d. per lb. does for wool. If that is the case then there are fair hopes that ¾d. will become the established rate, and, if so, that will mean a saving of more than 1s. per sheep in the expense of sending a 50 lb. merino wether to London, and 1s. 3d. in sending a 60 lb. cross-bred; and with the saving which we expect to make on this side in the preparation and conveyance of the sheep from their runs to the steamer by which they are despatched, more particularly in the cost of carriage by the railway, and also in the reduction of the charges in England, there are better prospects for our sheep breeders, especially those who cannot breed cross breeds.

VIII.—Cold Storage for the Export Trade in Australian Produce.

Situated as the Australian Colonies are as regards climate and distance from the principal markets of the world, it is absolutely necessary that there should be ample cold storage accommodation both in the Colonies and in the countries to which our meat and other produce are exported for the use of those engaged in the trade.

1. COLD STORAGE IN THE COLONIES.

There should in any case be sufficient accommodation of this nature at the ports where the steamers call to load our produce, whether it be meat, dairy produce, or fruit and where it can be kept in sufficient quantities to make it well worth the steamers while to call, and there would then be no unnecessary delay in loading. It is a question too, whether, supposing that sufficient cold storage accommodation could be provided at comparatively small expense in the Colonies, a good deal might not be done by storing in the Colonies towards preventing the ruinous glutting of the London market for our meat, which has recently occurred, without taking the extreme step of closing the meat works in Australia, to give time for the English markets to clear off the over supply.

To settle this question, however, the cost of cold storage in the Colonies and in England will have to be carefully compared, and if there is not a decided advantage in keeping the meat in the Colonies, it would be best to ship it as it is prepared, and let it be kept in England—as it can in that case be supplied as required—and provide no more cold storage accommodation on this side than the requirements and convenience of the shipping calls for.

2. COLD STORAGE IN COUNTRIES TO WHICH MEAT IS SENT.

Every year more cold storage is being provided, not only in Great Britain and Ireland, but also on the Continent, and the indications are that the demand for this description of accommodation will continue to increase, especially as the cost of cold is diminishing, while the uses to which it can be turned are multiplying and its benefits being more widely acknowledged.

The following is a list of the principal refrigerating companies in Great Britain which take in produce for cold storage (the usual charge being one-eighth of a penny for twenty-eight days, including receiving and delivering), and the capacity of their stores calculated as for keeping frozen sheep:—

(1.) *In and near London.*

The Victoria Dock Company, at the docks ...	200,000
Addition to be erected at dock, say... ..	100,000
	300,000
In course of construction near Smithfield	
Central Market, say	70,000
	370,000
Nelson Bros., at Dowgate Hill and at Lambeth, on the	
River Thames	250,000
James Nelson and Sons, at Smithfield	20,000
The Central Market Stores, Smithfield	75,000
Eastman & Co., Charter House Street	20,000
Cold Storage Company, Blackfriars... ..	60,000
Linde Company, Shadwell	50,000
Sansinena and Co. (Limited), Smithfield	50,000
Leadenhall Market	10,000
West India Docks	15,000
	920,000

(2.) *Cold storage in the towns other than London.*

Manchester Corporation	120,000
Cardiff Pure Ice and Cold Storage Co.	60,000
Leeds Ice and Refrigeration Co.	5,000
Northern Counties Cold Storage Co., Newcastle	15,000
Eastman's Cold Storage Co., Glasgow	20,000
James Nelson and Sons, Liverpool	200,000
Liverpool Cold Storage Co., Liverpool	100,000
Bristol Cold Storage Co., Bristol	10,000
James Nelson and Sons, Bristol	10,000
Linde Cold Store, Birmingham	10,000
	550,000

The practical question however, is—How are we to obtain sufficient cold storage accommodation in Great Britain, and in other parts of the world, to enable us to offer our products in such good condition as that they can compete successfully with those from other parts of the world? With that view the meat companies might adopt either of the following courses:—

1. They may obtain, as they now are generally doing so far as London is concerned, the necessary accommodation at some of the many cold stores which are offering accommodation at fixed charges for storage and freezing, and for receiving and delivery; or
2. The companies, if they could procure the funds, might build their own stores, and fit up the necessary machinery and appliances; or
3. They might rent suitable buildings, and fit up machinery and appliances, with the right of removing them at the end of the lease, or with an obligation on the part of the landlord, when the lease expired, to purchase the machinery and appliances at a valuation.

3. THE COST OF COLD STORAGE.

The cost of cold storage in London runs about one-eighth of a penny for four weeks, including receiving and delivering. When I visited Cardiff in April last, where there is a large cold store capable of accommodating 60,000 sheep, the company was offering

offering to take frozen mutton at very much less than the London charge, *i.e.*, at one-seventh of a penny for three months, receiving and delivering included. Coals are very cheap at Cardiff, which perhaps accounts for the low rate at which accommodation was offered. Still there is no doubt but with properly constructed stores, and the right sort of machinery, the necessary cold can be obtained at a very low rate, and this will be of very great advantage in the conduct of the trade, for it will allow the meat to be kept at a small cost to wait when necessary for a better market.

THE CONDUCT OF THE MEAT TRADE IN GREAT BRITAIN.

IX.—Complaints and Grievances brought by Shippers of Meat against those in the Trade in London.

There have been numerous complaints in regard to the manner in which the trade in Australian meat has been conducted in England, some of which were well founded and some not, while a good many of the wrongs, which at one time were to be met with in the wholesale trade, have been righted.

The principal complaints to which allusion has been made are:—

Full commissions have been charged both by the merchants to whom the meat was consigned and by the salesman.

An unfair advantage is given to the purchaser of the meat; 1 lb. being deducted from the weight of each sheep, and the portions of the pound, whatever they may be, even up to (say) 13 oz.

It is said that weights have been returned as short where there was no shortage.

It has been said that fraudulent rebates have been obtained.

The selling of the meat direct to the retail butcher has been greatly obstructed, the salesmen selling to middlemen, who again sell to the retail butchers.

Agents are blamed for not keeping, but selling meat, in the face of an expected rise of price.

The prices to be charged by the salesmen for the different descriptions of meat are said to be fixed arbitrarily by themselves, instead of after consultation with a properly constituted body chosen by the agents of the importers.

Some firms, while dealing in and importing meat, act also as agents for other shippers, which is not only likely to operate injuriously so far as their constituents are concerned, but may also prejudicially affect other shippers, inasmuch as that when the prices of the meat for the day or week have to be settled—as it is understood they are largely at the instance of the leading firms in the trade—those who are themselves dealing in meat might find it to their interest at times to get the prices settled below the real value, in order that they might, through some friend, purchase what was to be offered, and make a good deal more by the lowering of the price than by maintaining or raising it.

It is said that in the case against salesman "Hicks," which was brought into Court in 1892, for keeping back a large part of the proceeds of the sale of the meat, he pleaded that he had sold the meat to himself at market rates, and afterwards cut it up and sold it; and he pleaded, further, he was only doing what others did, as he said it was the custom of the trade if a salesman cut up meat that the profit made on it went to him, and not the original owner.

It is reported that in other cases salesmen have taken the mutton put into their hands for sale at their own price, but have not neglected to charge commission.

There are said to be rings and combinations formed for the purpose of cornering the Australian meat trade, and preventing the meat from bringing a fair price, like the notorious fruit and fish rings.

It is said too that some of these rings start salesmen, who, of course, sell only to their patrons.

These rings and middlemen are said to be now doing their best to crush those who act independently, or attempt to expose their methods of working.

X.—Remedies for the complaints of Australian Shippers in regard to the conduct of the London Meat Trade.

It will, I think, on consideration, be seen that if the co-operation to which allusion is here made between the Graziers and Agency Meat Export Companies in each Colony, and between these companies again and those of the same class in all the other Colonies, were to become an accomplished fact, the complaints and grievances I have mentioned as having been made by the shippers of our meat, as well as others which I may have omitted to notice, would be almost entirely removed; for then there would be ample funds for the construction of chilling, freezing, and tinning works—favourable terms would be made with the shipping companies—numerous fresh centres of distribution and sale, with the necessary cold storage, would be formed. The establishment of these centres would prevent the accumulation and glut of meat, which is now constantly occurring in London, and would prevent the formation of rings, and help to get rid of the middlemen, for it was largely through this accumulation of shipments and business in London that the opportunities occurred which has enabled those who have been concerned in the practices complained of to carry them out; and with these improvements and better supervision complaints would cease. The question, however, is whether this co-operation, which is so very essential, is or is not practicable; and I will now briefly discuss that question, and in doing so I will notice the necessity for co-operation and some of the conditions under which it would have to be carried out.

1. THE NECESSITY FOR CO-OPERATION.

The frozen meat trade in England is now in a very depressed state, and the immediate cause, of course, is over-supply, coupled with the scarcity of cold storage and the want of a better system of distribution and sale.

This being the case, the question arises how a change for the better is to be brought about, and I think the answer clearly is, by co-operation among stock-owners, not only in their respective Colonies, but in all the Australian Colonies, more particularly in this Colony and Queensland; for with the very heavy surplus of stock in the Colonies, and the constant glutting of the markets in England, it is utter folly for one company to hope to improve its position by underselling the others, or for the companies in one Colony to attempt to gain an advantage by lowering prices beyond what will pay. Such methods only bring prices permanently down, and give middlemen and speculators the opportunity they want of getting the meat at their own price, and making money out of the losses of our graziers and farmers. In ordinary times it is a hard matter for our producers to protect themselves from the middleman and the monopolist; and with glutted markets, such as there have lately been in London, and a scarcity of storage, a great deal of our meat has not only returned nothing to the stock-owner, but has in some cases not paid the expense of preparing and sending it to the London and other markets, where it was sold.

It is high time, therefore, that the representatives of the companies in the Colonies which are managing their own business, and those which are doing a purely agency work, should come together and discuss the present position and future prospects of the meat-export trade, with the view, if possible, of arriving at a mutual understanding under which they would put only sufficient quantities of meat on the English and other markets as will admit of prices being obtained which will give our stockowners returns they can live by, and under which they would also agree not to sell, unless under special circumstances to be specified in the agreement, at prices lower than those to be fixed from time to time by the representatives of the companies in London—the general conditions of the agreement being subject, of course, to the approval of the Boards of Directors in the Colonies.

It would be very satisfactory if this were really practicable (if even only in some respects), and I think the best way to ascertain that is to make an attempt to set out the conditions under which such an arrangement, if it really is a workable one, would be likely to be carried out, and see how far they could be so. With that view, therefore, I now submit the heads of an agreement, some of the principal conditions of which I consider would, in such a case, require to be accepted and acted on by the companies interested. And while these conditions may not be practicable, and not in all respects answer the purpose, they will, I venture to hope, at least serve to call attention to the urgent necessity there is for immediate co-operation on the part of those connected with the export trade in meat, and may, perhaps, also serve as a basis upon which this most important subject can be discussed; for there is no question but in some way or other co-operation between companies and colonies must take place if ever the export trade in Australian meat is to be in any degree what can be termed a success.

2. CONDITIONS OF CO-OPERATION SUGGESTED.

1. The graziers' meat-export companies in each of the Colonies should agree to co-operate in the conduct of the meat-export trade, and to that end bind themselves, as a preliminary step, to grade their meat and other animal products closely and fairly, to ask for and accept only such share of freight, cold storage, and sales as they are entitled to on the basis of the relative number of stock which their shareholders own, and to faithfully co-operate with the other companies in the shipping, storage, distribution, and sale of the meat in the countries to which it is exported.

(1.) *Boards of Advice.*

2. With these objects in view, a Board of Advice should be formed in each Colony, to consist of the managing directors of the several companies.

3. This Board should meet regularly every month, and oftener when required, to consider the reports received with respect to the state of the trade and the prospects of the markets, the supply of stock, the available freight, the quantity of meat on hand, &c.

4. In order, as far as possible, to prevent over-supplies of meat being sent to the London or other markets, the Boards of Advice should decide as to the quantity of meat which should be shipped, and also by what particular vessels it should be so. The Boards should also determine the quantity to be despatched belonging to each individual owner on the basis mentioned, and the ports at which the vessels should call and discharge; and generally the Boards would, subject to the confirmation of the Inter-colonial Council, settle the course to pursue in the conduct of the meat-export trade in the Colonies, and also in London, so far as can be done by such a body resident in the Colonies.

(2.) *The Intercolonial Council.*

5. In order again to secure intercolonial co-operation on the part of the graziers' companies in the Colonies joining in this arrangement, there should be appointed an Intercolonial Council of one member from each Colony, who would be chosen from their own number by the members of the Board of Advice in the several Colonies.

6. The business of the Boards of Advice, so far as it had an intercolonial bearing, would come before the Council for confirmation, and the decisions of the Council would be binding on the Boards of Advice and the companies they represent.

(3.) *Colonial Meat Importation Association.*

7. The agents of the several graziers' meat-export companies in London should form themselves into a Colonial meat importation association, and should at the first general meeting appoint from their own number a committee of seven, who would retain office for twelve months, and manage the affairs of the association; and this committee would, under the control of the Boards of Advice and the Intercolonial Council, carry out among others the following special duties:—

- (1) They would meet regularly every week, and oftener when necessary.
- (2) They would decide what quantity of meat of the several kinds and grades should be put on the London and other markets during the following week.
- (3) They would settle, on the basis of number of stock which the shareholders of each company owned, the share of the offerings for sale which the several companies were entitled to put on the market, unless where the market is under-supplied, when it might be offered under the same rule by those who had the meat on hand.
- (4) They would consider and decide as to the minimum prices at which the different sorts and grades of meat would be sold during the following week.
- (5) They would keep the Boards of Advice and the Intercolonial Council fully advised as to the state and prospects of the trade.
- (6) They would advise as to the ports and refrigerating stores to which the shipments should be sent.
- (7) They would, where necessary, recommend the establishment of fresh distributing centres for the sale of meat and other produce.
- (8) They would see that sufficient cold storage was provided, and where it could not be obtained recommend the leasing of the necessary buildings and the erection of machinery.
- (9) They would recommend the engagement by the Intercolonial Council of some one who had a thorough practical knowledge of the Colonial meat trade, to inspect and report to the association on the state of the trade at the different distributing centres, to recommend fresh centres where necessary, and to maintain and extend the trade in Australian produce.
- (10) They would advise also as to the best breeds of stock for shipment, the modes of preparing the meat, the seasons to ship, and in regard to all other matters which would tend to the extension of the trade in Great Britain and on the Continent, and the opening up of fresh markets.

It will of course be seen that, even if all the meat companies in the Australian Colonies were to agree to co-operate as here suggested, and entered into an arrangement to curtail their shipments on some such basis as that of the number of stock owned by their shareholders, that might not have the effect desired of reducing the supply offered in the London and other markets, for not only might advantage be taken by the Australian trading meat companies, and by the companies generally in New Zealand, to send on more mutton, but it is very probable that the shippers in South America would do so; and that although those entering into the arrangement might lessen their supplies, the shipments from the directions mentioned would be increased, and the expected improvement of prices would not take place.

There would, no doubt, be considerable risk of this taking place—so far as the countries mentioned have the additional sheep to send—but it is questionable if they have. But the matter mentioned is only one of the many means, though a very important one, which it would be advantageous to take to put the meat trade in London on a satisfactory footing; and there are so very many other ways in which co-operation would be of solid benefit to stock-owners that the doubt which exists with respect to the effect of a combined and systematic curtailment of shipments of Australian meat, ought not to prevent the realisation of the co-operation suggested. Instead of that, the fact that this doubt exists clearly shows the utter folly of meat companies, not to speak of stock-owners, attempting single-handed to put the meat-export trade on a satisfactory footing or imagining that they will get relief until this is done.

3. THE FROZEN MEAT IMPORTATION ASSOCIATION.

I believe an arrangement has more than once been made, and for a time acted upon, by at least some of those engaged in the frozen-meat trade in London for the conduct of that trade; and in the month of June last a set of rules for an association with the above designation was framed and printed with the view to putting the arrangement on a right footing and forming the association in a regular manner; but I understand that the arrangement has since fallen through, and the association will not now be formed.

It will, however, be gathered that the association here alluded to differs from that suggested by me in the foregoing conditions in two very important respects:—

- (1.) The members of the proposed association were not all members of graziers' or agency companies, some of them being actually dealers in meat, and, at times, purchasers of meat in London.
- (2.) The association was wholly a London association, and was not binding on the companies in the Colonies.

As regards the first difference, it was not to be expected, with the divergent interests of some of the members of the proposed association, that it would last. It is, however, different with respect to the association suggested by me. The interests of all the companies which the members of that association would represent would be identical, and there would be every inducement for them to pull together.

Then,

Then, under the proposal I make, the members of the association are not like those of the association which has fallen through—entirely independent—but they would be under the control of the Boards of Advice and Intercolonial Council, to the extent that although they would have the power to fix and alter prices, that would be subject to confirmation as regards subsequent markets by the Intercolonial Council.

4. THE RESULT OF CO-OPERATION IN DENMARK.

I have been the more induced to deal with the question of co-operation at the length I have gone through the remarkable success which has attended its adoption by the farmers in Denmark in the making and marketing their butter. Very little more than twenty years ago the butter made in Denmark was described in a British Consular report as execrable, and the return from it must have been exceedingly small, while for the last six or eight years at least Denmark has been supplying England with about £5,000,000 worth of butter a year, and the greater part of first quality. All this has been brought about by co-operation, in the first instance, among the dairymen in Denmark in the interchange of information in dairying and the introduction of machinery and improved appliances for the work—in the making of the butter and its preparation for market—the practical grading of the butter previous to shipment—the enforcement of a thoroughly honest trade—and afterwards in the shipment of the butter to England and its distribution and sale there; and so efficiently and honestly has the trade been conducted under this system of co-operation that numbers of the retail grocers and provision dealers in England and Scotland now send their orders direct to the dairymen in Denmark, and not only are these grocers and dealers better served, but the dairymen are considerable sums in pocket which they used to pay away in commissions; for when they began to ship butter to England, the dairymen were charged commission by the merchant in Denmark, who consigned to another merchant in England, who also charged commission; and he again put the butter into the hands of a salesman, who, too, had to be paid. Now this, through co-operation, is all changed: first, by dropping off the Danish merchant; then the English merchant was dispensed with; and lastly, the salesman. I do not say that the Australian meat trade can be conducted in this economical way; but the Danish experience goes to show what can be done when any class of producers work heartily together for the common good.

Good results would have, likewise, followed co-operation among the exporters of butter in our own Colony under the New South Wales Dairy Farmers' Association if it had been confined to farmers and dairymen; and although our meat companies might not be able to go to the same length in co-operation and its objects in several respects as the exporters of butter, still it is believed that they would, if an earnest effort were made, be able to work together to such an extent as would put the trade upon a satisfactory footing—which, I am afraid, it will never be unless practical co-operation among our meat export companies is secured.

XI.—The advantages of Direct Shipments and fresh centres for Distribution and Sale.

It has been frequently suggested that distributing centres for the sale of meat and other Australian produce, besides London, should be established in Great Britain and Ireland, and direct shipments where practicable be made to these centres; and where they cannot be so by steamer they be sent to the nearest ports to the centres, and forwarded from there direct by rail to these centres; and I cannot too strongly support such a suggestion, nor can it be too quickly acted on. But, of course, at every centre there must be sufficient cold storage. The advantages of such a system are, among others:—

1. There would in many cases be a saving of expense, as Australian meat and other produce has now to be forwarded long distances from London by rail at a considerable cost for carriage.
2. Long journeys by rail in ordinary trucks in hot or even mild weather, more or less detract from the appearance of the meat or produce, and tend to curtail the keeping margin for distribution and sale, while this deterioration and risk of loss would, with fresh centres and direct shipments, be largely, if not wholly, avoided.
3. There would then be no room for the complaints which are now frequently made—and, it is believed, with good reason—that the consignees and agents in London keep the best of the produce for disposal there, and send on the stale, the inferior, and what they cannot sell in London, to the provinces for disposal, thereby keeping in touch with their own purchasers, and making it appear that higher prices are obtained in London than elsewhere, but very seriously damaging the character of Australian produce in the other parts of the Kingdom.
4. With additional distributing centres, cold stores, and direct shipments, there would be a constant, steady supply of our produce on hand in these centres, and that would enable not only the existing trade to be well maintained, but fresh business would be secured, and the trade in Australian produce would steadily extend and increase.
5. The advantage of saving the heavy accumulation of Australian produce in London, thereby curtailing the scope of the operations of rings and monopolies, lessening the number and influence of middlemen, and, it is hoped, eventually leading to their disappearance, even, perhaps, in London.

6. Direct shipments would be a great assistance in fighting the American competition, and with proper management would lead to the displacement to a large extent of American meat and other produce by Australia.
7. The encouragement which the establishment of distributing centres would give to the formation of Retail Distributing Companies. Except, perhaps, in London, where meat is constantly coming from all parts of the world, and perhaps also Liverpool, which is so very frequently and fully supplied by both North and South America, it would not now be possible to form Retail Distributing Companies such as that at present being floated by Mr. C. R. Valentine in London. But with the establishment of these centres, which would always have a full supply of meat, these Retail Distributing Companies might confidently be formed; and if they were, it is more than probable that they would before long purchase their supplies in the Colonies, at prices free on board, and get their meat and other produce direct from the Colony where the company with which they dealt had their works.

It will be gathered from what has been said that the formation of fresh centres of distribution and direct shipments would be of the highest possible benefit to the frozen meat trade; that, in fact, these changes, if systematically adopted and properly carried out, would not only place the business in the existing centres of distribution on a satisfactory footing, especially in London, by relieving the glutted markets, but would tend very largely to the extension of the business and the displacement by Australian of American meat to a considerable extent in the larger manufacturing towns in the Midland and Northern Counties of England, and in the South of Scotland. But while this is the case, and however desirable and practicable these changes might be, it will take some time to bring them about; for in order to get steamers to carry loading to a port other than that to which they have been accustomed to trade it would, as a rule, be necessary to guarantee "out loading" from the port as well as "in," unless it is arranged, as it has been in some instances, that the owners of the vessels receive such a rate of freight for carrying the frozen meat to England as induced them to come out for the meat in ballast. Generally speaking, therefore, this question of "out loading" is one of the difficulties which will have to be settled before direct shipments can be secured to ports other than London and Liverpool, and, perhaps, Glasgow and Manchester. Even as regards Manchester, notwithstanding the great inducement there is to make the canal pay, and the fact that so many of those connected with the trade there are interested in the canal, it will take a little time before a direct trade can be established, and the full amount of business done in that way; for, while all the cotton and woollen goods and a great deal also of the iron, as well as other articles, would have considerably less railway freight to pay from the works to the port if they were shipped from Manchester than from London, almost all the larger cotton and woollen manufacturers, and in the other trades, have houses in London as well as in the towns in which their works are situated, and London, of course, is the centre of all financial transactions. Although, therefore, direct shipments are most essential, so far as we are concerned, and would be very advantageous also to manufacturers and others in England and Scotland, saving as they would considerable sums on the carriage of the raw material, as well as tending to an increase of trade, and although direct shipments are bound to come, it will take some time before they can be obtained so widely at any rate as they are required. This, however, as I have already pointed out, need not stop the establishment of fresh distributing centres, for arrangements can be made with the railways to carry our produce from the port nearest to the centre at special rates until direct shipments are obtained.

Beyond all question the greatest and most effectual alteration which can be made in the frozen meat trade as now conducted in England and Scotland is the establishment of these fresh centres and cold stores, with a constant steady supply of meat, which is really first class.

XII.—Fresh Distributing Centres Recommended.

The fresh centres for distribution which I would suggest are:—

- | | |
|----------------|----------------|
| (1) Manchester | (6) Hull |
| (2) Birmingham | (7) Liverpool |
| (3) Newcastle | (8) Glasgow |
| (4) Cardiff | (9) Nottingham |
| (5) Bradford | |

and I think they stand in order of their importance so far as the distribution of meat is concerned.

As to the order again in which they should be established, the question of how far they are now provided with cold storage has to be borne in mind; and looking at the question from that point of view, I would recommend that a commencement be made in the following order:—(1) Manchester, (2) Birmingham, (3) Cardiff, (4) Glasgow, and (5) Liverpool, at all of which towns there are cold stores at which accommodation is ordinarily to be obtained; but with the heavy shipments and slow sale of Australian meat recently sent to England, some of these stores may now be full.

With respect to the other cities mentioned, cold storage would have to be provided, and it would be in such cases as these, and where the stores already erected are full, that the possession by the companies of ample capital would be of great advantage.

XIII.—Deception practised in the Frozen Meat Trade.

1. NEW ZEALAND AND AUSTRALIAN CROSS-BREDS SOLD FOR SCOTCH AND ENGLISH.

There is no question but a vast amount of deception has been practised in the frozen meat trade, but it has been principally confined to the retail portion of it. The consignees and importers have, of course, known where the meat they had to offer came from, and so would the salesmen. This would be the case also in almost every instance with the wholesale purchasers and middlemen, and it might really be said to be so also as regards the butchers who buy and retail the meat; for they could not help knowing that the sheep had been frozen, and besides, they know their business too well not to be able to distinguish Australian and New Zealand from Scotch and English mutton. I am, therefore, justified in saying that the principal, if not the sole offenders, with respect to the deception which has been going on for years, have been the retail butchers. To give a clear idea of the profits made by retail butchers who adopt these practices, I will suppose that a butcher who professes to sell only Scotch and English mutton purchases wholesale a first-class New Zealand (Canterbury) cross-bred wether weighing 60 lb. at the present average rate of 3½d. per lb., and retails the sheep at the present price of the best Scotch or English mutton, 8½d. per lb. The case would then stand thus:—

New Zealand cross-bred prime wether, 60 lb., at 3½d.	£0 16 10½
Retailed as Scotch, 60 lb., at 8½d.	2 1 3
	<hr/>
	£1 4 4½

Thus making £1 4s. 4½d. on the sheep, or 4¾d. per lb.

Whereas, if the sheep is sold as New Zealand, the case would stand thus:—

	£	s.	d.
New Zealand cross-bred prime wether, 60 lb., at 3½d.	0	16	10½
Sold at current rates for New Zealand mutton, 60 lb. at 5¾d.	1	6	10½
	<hr/>		
	£0	10	0

Leaving a profit in this way of 10s. on the sheep, or 2d. per lb., and showing that the butcher, by the deception he practised, would make on a single sheep, over and above what may be termed a legitimate profit £0 14 4½

While, again, this statement shows how very strong the inducement is to practise the deception referred to, the fact that it has been so long and so generally practised is conclusive proof that first-class New Zealand and Australian cross-bred mutton has not been bringing anything like its real value in the wholesale market in Sydney, as compared with the best Scotch and English. The latest quotations of the two classes received were—Scotch, 4s. 8d. to 4s. 10d. per stone of 8 lb., or (say) 7½d per lb.; and best New Zealand, 2s. 6d. per stone, or (say) 3½d. per lb. The difference, therefore, in the price of the best frozen mutton and of the best home-bred, (say) 3½d. per lb., is quite an unnatural one. That this is the case is easily proven, for supposing that there was some difference in the real value of the two descriptions of mutton, it is absurd to say that it really amounts to 3½d. per lb., the difference at present existing between the two sorts, in the face of the fact that the one kind of mutton is frequently sold for the other, and so frequently is this the case that it is safe to say many hundreds of tons of New Zealand mutton have been retailed for best Scotch and English without the butchers' customers being able to detect the difference. Besides, when the question has been put to an actual table test, no such difference has been recognised, and New Zealand lamb is frequently preferred to Scotch or English, and asked for in preference at a good many of the clubs, being more tender.

I am aware that those connected with the trade attribute the enormous difference here noticed to the prejudice that exists against frozen mutton, and there is no doubt such prejudice does exist, but it is said, and there appears to be at least some grounds for the assertion, that some time after meat began to be exported from New Zealand to London a combination was formed there for the purpose of controlling the frozen meat trade in the same manner as so many of the trades in London are controlled by rings and middlemen, and that this prejudice was actually created and fostered, and is still maintained by the combination to serve their own purpose, and of course also by all the butchers who sell or pretend to sell home-bred meat, and whether there be any truth in the charge thus brought against the wholesale butchers and middlemen or not, there is no question but they have, assisted by glutted markets (which again have been caused through the exporting of a good deal of second and third class meat, and by the loose and incautious manner many of the Colonial shippers of meat have conducted their business), been enabled through this prejudice to get a very large reduction on the price the meat originally brought, and frequently to purchase it at almost their own price.

Those, again, who make these statements say that they are borne out by the fact that, notwithstanding the frozen sheep which were at first exported from New Zealand to London were over-fat and heavy weights, averaging about 80 lb., they for several years brought prices approximating to those at which the best Scotch and English were sold; and they say it was only after those in the trade had time to study the situation and make their arrangements for obtaining and keeping the control of the market that the price of New Zealand mutton began to fall. That such a fall did take place will be seen by the following statement of the prices the New Zealand mutton brought from 1883 to 1893 inclusive:—In 1883 the average price for the year was 7d.; in 1884 it was 6d.; in 1885 it was 5½d.; in 1886 it was 5¾d.; in 1887 it was 4½d.; in 1888 it was 3¾d.; in 1889 it was 4½d.; in 1890 it was 4¾d.; in 1891 it was 4½d.; in 1892 it was 4½d.; and in 1893 it

was

was 4½d. Now, although the increased supply may have been the direct cause of the fall in the price of New Zealand mutton, still, if an unfounded prejudice had not been aroused against its use, the natural result of the increased supply from New Zealand would have been that not only would the value of that mutton but also of the home-bred declined; for it is only right to suppose, as the New Zealand mutton had for three or four years at least been selling at prices approximating those brought by the best Scotch and English, and evidently taking the place of both these classes of mutton, that the price of both these sorts of mutton would have also declined. But, instead of this, the price of prime Scotch and English, according to the latest quotations, is higher than it was, at any rate, in 1888. There are, therefore, I think, grounds for the complaints which have been made that interested parties are systematically fostering and encouraging a feeling of prejudice against frozen beef and mutton; and it is only natural that those who profit by the existence of this prejudice—the wholesale butchers, middle-men, and retail butchers—should be blamed with respect to it. No wonder that the New Zealand and Australian sheep-owners who send first-class cross-bred mutton to England should be exceedingly sore, when by the latest accounts the best New Zealand was only bringing 3½d. per lb. (and best Australian merino only 2¼d.), thus showing the enormous and unreasonable difference of 3½d. per lb. between the price of New Zealand and Scotch mutton, notwithstanding the acknowledged excellence of the former; or, in other words, that Scotch mutton was bringing more than double the price of the best New Zealand, and very little less than three times the price of Australian.

2. AUSTRALIAN MEAT SOLD FOR NEW ZEALAND.

While the practice of retailing New Zealand mutton for Scotch and English is prevalent in Great Britain, it is even more common for those who purchase Australian and River Plate meat to pass it off as New Zealand, thereby making an extra profit of at least 1d. per lb. by the deception; and so very general is this practice, that neither Australian nor River Plate meat is ticketed as such in any of the butchers' shops. In a good many cases certainly the word "Colonial" appears in the sign over the shop door, but I do not recollect seeing either Australian or New South Wales. Indeed, people from Australia who have been in England complain on their return that they were unable to find any shops where Australian beef or mutton was sold. The reason is plain—the butchers made a better profit by not declaring where the meat came from, the prejudice created against Australian meat being even greater than against New Zealand.

3. MARKING OF IMPORTED MEAT.

There has been a good deal of agitation in Great Britain for the marking of frozen meat, more particularly mutton, with the view, as those moving in the matter say, to prevent the deception which has so long been rife in the sale of New Zealand and Australian mutton for home-bred; and I believe that such a course would not only have the desired effect, but would in the long run be greatly to the advantage of our sheep-owners, if sufficient care were exercised that we export only prime quality; for, if we were to do so, and the meat was legibly marked, the prejudice which now exists would be removed, the meat would bring a better price, and the English householder would no longer be deceived and robbed to the extent I have shown he now frequently is.

As to the marking, some practical mode of carrying that out in a speedy and economical way could, I believe, be found. It is true that as regards such small pieces as steaks and chops the marking in a thoroughly efficient manner might not be practicable, but it might be so as regards all the joints usually cut either of beef or mutton, either as has been proposed by electricity, or with a tattoo stamp, which could be imprinted, say, two or three times on each joint.

This marking would be doing what is now done with almost every other description of produce, it would be branding it with the producer's brand, thereby in reality protecting the producer as well as the purchaser, and by giving confidence in the quality of the produce, would induce him to give a better price; at the same time the brand would prevent unscrupulous dealers from palming off inferior produce as first quality.

XIV.—Distribution and Sale of Frozen Meat in Great Britain as at present, and prospects of extension of the Trade there.

It is a difficult matter to ascertain how a great deal of the New Zealand and Australian meat which is brought to England is retailed. There are, of course, many shops in England, and some in Scotland, in which frozen meat is openly offered for sale and large quantities of both New Zealand and Australian are sold; but it is believed that the quantity disposed of in that way is not more, if it is not actually less, than what is sold without its origin being disclosed; for while something like 1,893,000 New Zealand, 605,000 Australian, and 1,373,000 River Plate sheep, making together 3,871,000, were imported in 1893, it is questionable if half that number of frozen sheep were exposed for sale in the shops as such.

While London is the great *entré* port for frozen meat, it is in London and its suburbs that the largest quantities of New Zealand and Australian meat are consumed; and the nearer the more important towns are to London, the greater the quantity of frozen meat is used in them. In the south and south-western portions of England, too, a great deal of frozen meat is sold, particularly in and around Bristol, Cardiff, Newport, and Swansea, and it may be said, speaking generally, that a great deal more frozen meat, and principally New Zealand and Australian, is sold in the south of England than in the north, or even in the midland counties. In fact, when a distance of, say, 70 or 80 miles

miles in a western and north-western direction from London, and, say, 100 to 120 miles in a northern and north-eastern is reached, the demand for New Zealand and Australian meat begins to fall off in the larger towns, and farther north in the same directions the sale becomes less, until perhaps some 40 or 50 miles further, the falling off in the sale is still greater through the increased distance from London, and its meeting the River Plate meat landed in Liverpool, the sale of which is pushed with greater energy than the New Zealand and Australian, by firms such as James Nelson and Sons and Eastman and Co., who, as I have already stated, carry on an extensive business, both wholesale and retail, in frozen meat, chiefly River Plate.

North of Huddersfield, Bradford, Leeds and York, which are all largely supplied from Liverpool, if we except Newcastle, which also receives considerable supplies of River Plate, very little frozen meat is sold till Edinburgh and Glasgow are reached, and even in these cities the sale of New Zealand and Australian mutton is by no means large. In Edinburgh, I believe, there is more of New Zealand and Australian sold than in Glasgow, in proportion to the number of the inhabitants, for not only is River Plate meat sent there in considerable quantities, but in the fall of the year, say from October to December, large numbers of inferior highland sheep, which their owners cannot keep to pay them during the winter, are put upon the Glasgow market and sold at prices which enables the butchers to kill and retail them at as low rates as they could sell the frozen mutton, and they say the Scotch mutton, though not so good as the frozen, is preferred by their customers. It could only, therefore, be during the first three months of the year that there would be much sale for our meat in Glasgow. There would, no doubt, be sale for a certain portion all the year round when provision is made for a steady supply, but the demand from April to September is, as a rule, slack for frozen meat, the Home supply being at that time large.

Although the prospects of a trade in frozen meat in Dundee are not very encouraging, still I think a small steady-growing business might be done there as well as in some of the other towns in that part of Scotland, from Edinburgh, when a distributing centre has been formed there, as there are large numbers of mill hands in Dundee.

I do not think there is any opening in Aberdeen for the sale of frozen meat, as there is an extensive business done there in slaughtering for London, and certain classes of meat are cheap.

From what has been said it will be gathered that a great deal more New Zealand and Australian meat, if prime quality, could be sold in the midland, and northern, and north-western, and north-eastern portions of England, provided the necessary fresh centres of distribution with cold stores are established; and as I have already pointed out these distributing centres are necessary, not only in order to enable our meat to maintain its ground against the North American and River Plate, which has already secured a good footing in the districts indicated, through their being more easily served from Liverpool than London, but also to assist it in displacing the American and River Plate meat and recovering lost ground.

While again it is a matter of the highest importance to obtain a good footing on the continent of Europe, and every endeavour should be made to open up markets there for our meat and other produce, we ought not to overlook the necessity for vigorous and combined work in the way of extending the business in Great Britain and Ireland, for not only would the benefit be more immediate, so far as regards the meat, than what may be expected from any endeavour on the continent, but it is to be borne in mind that the frozen-meat trade carries with it the trade in butter, cheese, fruit, game, fish, and poultry, as well as that of other articles which need the help of refrigeration in the course of their transport from Australia to Europe, and protection till they can be sold; and although the necessary refrigeration, freight, and cold storage, might to some extent, be provided for these other products independently of the frozen meat, it has only been through the establishment of the frozen-meat trade that the business in the other products was initiated, and it will only be by the extension of the frozen-meat trade that the trade in the other products will be established and extended; for they could not of themselves to any great extent afford to provide the necessary machinery, appliances and accommodation, to allow of a safe and profitable business being done.

SPECIAL AGENT IN LONDON FOR THE COLONY.

ALTHOUGH I am persuaded that it is only by the combined exertions of the different companies which have been formed for the prosecution of the meat export trade in the interests of our stock-owners, and by their working loyally together, that the trade can be placed on a satisfactory footing, and that the same thing applies to our dairy produce. I believe from what I heard while in England, that the system adopted by Queensland and some of the other colonies, of appointing special agents to make their products known, and assist in extending existing markets, and opening fresh avenues for their disposal, that that system has been of very great advantage to these colonies, not only as regards their meat and other products, but also in another direction, which is very important. I allude to the effective and practical way in which they are making the resources of the colonies they represent known to the people of Great Britain and Ireland; and although just at present, through the depression, which even yet exists in the Colonies, there may not have been the result which we have a right to expect, there is not the least doubt but their labours will bear good fruit, and lead to the introduction of considerable numbers of the most desirable class of immigrants, farmers and farming men.

If

If this be the case with respect to Queensland and some of the other Colonies there is every ground for believing that if a special agent were appointed for this Colony to act under the Agent-General the result would be even better than in that of the Colonies to which allusion has been made, for there are millions of acres of land admirably adapted for tillage in New South Wales which might be turned to more profitable account under cultivation than by depasturing sheep on the native pastures now that wool is low.

If these views are correct then I perhaps might be allowed to make a few remarks as to the class of man who should be appointed special agent.

1. He should be a good business man.
2. He should be well acquainted with the whole of the Colony and its climate, soil, and capabilities.
3. He should have a practical knowledge of the live-stock of the Colony, and how the meat and other products can be turned to best account.
4. He should be fully acquainted with our tillage, crop-growing and dairy-farming, and their prospects.
5. He should know something of our fruit-growing and wine and sugar industries, and be able to show how admirably adapted large portions of our Colony are for these industries.
6. He should be able to find new outlets for our timber.
7. He should have some acquaintance with our mining industry, and be able to speak as to its extent and prospects.
8. He should, as a practical man, be able to talk to practical men in regard to the various industries for which the Colony is adapted.

Holding these qualifications the Special Agent would keep in touch with the consignees and agents to whom our products are consigned for sale and distribution, and by visiting the more important towns in the United Kingdom and some of those on the continent, and interviewing the Chairmen of the Chambers of Commerce and the leading men in the different trades in these towns, the special agent would obtain a very large amount of valuable information which he would convey through the Department to those engaged in the sale of our products. He would also visit the principal agricultural shows, superintend the exhibition there of exhibits from the Colony, lecture on its resources, distribute pamphlets with respect to it, and meet and converse with those looking for information in regard to the Colony.

While again, the time of the Special Agent would be largely occupied in the directions indicated he would have an opportunity of ascertaining, in many cases by personal inspection, the value of any new improvements which were reported in the production, preparation, transport, or marketing of any of our exports, and would report fully through the Agent-General on these matters for the information of our producers and exporters. In fact, moving about as he would do, he would frequently obtain information on a variety of subjects which would be of value to the Colony, and which he would be careful to convey to the Agent-General.

ALEX. BRUCE,
Chief Inspector of Stock.

Sydney, 20th November, 1894.

The Linde British Refrigeration Company, Limited (Australian Agency),
Alliance Chambers, 97, Pitt-street, Sydney, 15 November, 1894.

Dear Sir,

We have the honor to hand you a plan for a refrigerating installation arranged for the purpose of testing.

The plant is to consist of one Linde refrigerating machine with a capacity equal to the melting of 4 tons of ice per day; the ammonia compressor will be combined with a steam engine and with an open-air ammonia condenser. The cooling of the rooms to be controlled by one Linde disc air cooler, with fan for causing a circulation of the air in the rooms and among the meat and produce to be refrigerated. By this system the warm and foul air is drawn from the rooms, passed over the discs of the coolers, where it is purified, and delivered back into the rooms, cold and dry; by this system also there is an entire absence of snow or moisture in the rooms. This is especially suitable for dealing with meat either when chilling or freezing, and a necessity when dealing with cheese in hot weather. For dealing with butter the air circulating is not so important, and we have, therefore, designed the plant with brine pipes in one of the rooms.

The plant would be of great utility for dealing with fresh meat (either for chilling or freezing), butter, fruit, cheese, milk, and all other perishable articles.

We estimate the cost of the whole to be as follows:—

	£	s.	d.
One Linde refrigerating machine, disc cooler, brine pipes, and pump complete, including first charge of anhydrous ammonia and calcium chloride; all delivered in Sydney—eight hundred and twenty-seven pounds sterling	827	0	0
Boiler, water pump, water connections, erection of machinery, &c.—two hundred and eighty-five pounds.....	285	0	0
Construction of insulated rooms—two hundred and fifty pounds	250	0	0
Outer building of brick—two hundred and twenty-five pounds	225	0	0

Yours, &c.,

J. WILDRIDGE AND SINCLAIR.

THE LIVE STOCK AND MEAT TRADE OF THE UNITED STATES OF AMERICA.

INTRODUCTORY STATEMENT.

WHEN I left the Colony for America it was understood that a considerable portion of my time would be devoted to visiting those parts of the United States where it was likely I would be able to obtain information that would be of service to our pastoralists or farmers, but on arriving at Chicago I had to devote my attention to the arrangement and display of our exhibits of wool, and by the time these were completed, arrangements were made for their examination by the judges.

This occupied fully two months, and it was the beginning of October before I was able to leave the Exhibition. I then made a hurried journey to Los Angeles, in Southern California, to see something of the nature of the country on the route, and attend an Irrigation Conference held in that city, at which delegates from all the Western and some of the Central States of the Union were present, as also representatives of several of the other countries attending the World's Fair. The principal business of the meeting was to ascertain the position of existing water rights in the United States, and collect materials for legislation.

After considerable discussion the resolution arrived at was that all water should be placed under the control of the Government, to be fairly apportioned under Trusts to the individual owners entitled to its use.

Very large tracts of land in Southern California are irrigated, and fresh areas of considerable extent are being constantly laid out, while water is brought very long distances from the mountains at heavy expense, and in every instance, so far as I could learn, it was laid on by gravitation. In several cases the supply was considerably increased by the flow from artesian bores.

The delegates, after the business of the meeting was concluded, were kindly shown over the famous orange and stone-fruit orchards and vineyards at Riverside, San Joseph, Los Angeles, Antonio, San Bernardino, The Perris, Alessandro, San Diego, and Santa Barbarra, which are all admirably laid out as regards levelling, service of water, and convenience for thorough irrigation, and are kept in the highest state of cultivation. As regards the excellent quality of the fruit grown in California, I need here say but little, as that has been fully dealt with in the Executive Commissioner's report on the fruit exhibited at Chicago, and that again has been fully confirmed by the excellent oranges and other fruits grown from Californian seeds, trees, and grafts received in Sydney from Mildura, as well as by the very taking samples of canned and dried fruits sent us from that State.

Along the route by which I returned to Chicago—"The Santa Fe," there is a good deal of mountainous barren country in Southern California, and even where fairly level the land is sandy and dry, and a great deal of the State which adjoins Arizona is arid and valueless, with here and there along the coast tracts of fairly good wheat land.

From Southern California again through Arizona and New Mexico, the country, as seen from the train, is the worst I ever travelled through, being barren and arid, and the vegetation of the scantiest description with exceedingly few creeks or rivers, and what there were apparently sanded up and dry during summer for the greater part of their course.

From New Mexico the country improves as the line approaches the valley of the Missouri where the far-famed corn-growing lands of America are situated, and in that of the Mississippi; and they continue to the vicinity of Chicago. As regards the land east of that city on the line to Boston the soil is comparatively light, and though generally of a kindly description and fair pasture land, it is not at all to be compared in fertility to the soil in the valleys of the Missouri and Mississippi. These remarks apply also in a considerable degree to the land along the railway from Chicago to New York, but on that line the land improves as it goes south, and approaches Philadelphia where some very good soil is seen.

While engaged at the Exposition I, of course, in accordance with the instructions I had received, took the opportunity of visiting the Union Stockyards in order to ascertain the number of stock which passed through the yards, what their quality was, how they were sold, the prices they brought, and to trace as far as possible the course of the American trade,—and I have now the honor to submit that portion of my report on these subjects which relate to the American Meat Trade.

I. THE NUMBER AND KINDS OF STOCK.

The latest returns available give the live stock in the United States as under :—

Horses	16,081,000
Mules	2,314,000
Milch Cows	15,487,000
Oxen and other Cattle	36,608,000
Sheep	45,048,000
Swine	45,206,000

II. THE LIVE STOCK EXHIBITED AT THE WORLD'S FAIR, CHICAGO.

I WILL here enumerate the different breeds of the stock exhibited at the Fair as some criterion of the description and quality of the live stock in the United States; and I may say with respect to the show of live stock, that it was in my opinion more than equal in the number and variety of breeds, and fully equal in quality of the exhibits to the best displays of the Royal English,—the leading Agricultural Show of Great Britain.

1. *Horses at the World's Fair.*

(1.) Heavy Draughts.

Under this head, at the World's Fair, the Clydesdale, the Shire, the Suffolk Punch, the Belgian, the Percheron, and the Norman were well represented. With respect to the number and character of these different breeds in the United States, it may be said that while there are a great many excellent specimens of the Clydesdale and Shire horses in the States—and the Clydesdale is very generally to be met with—the draught horses there, taken as a whole, are comparatively light, being largely of the Percheron and Norman blood; and there is no doubt that for farm work the lighter horse is the better. But not only is this the case in the country districts, but also to a large extent even in the towns, where immense quantities of goods have to be moved, and where, instead of heavy, slow-going horses moving large loads, as in Great Britain and in the Colonies, in the American States teams of comparatively light horses (what might be termed powerful light harness horses), are to be constantly met at a trot with perhaps little more than half the load which would be put on the waggons in England or in the Colonies, but going twice as fast as the heavy draughts.

The Percheron and Norman horses are specially adapted for this system of transportation. They began to be imported in 1850, and so largely have they been so, that the blood of these two French breeds, especially the Percheron, is now much more generally distributed in the United States than any other of the draught horses.

The Percheron, of which, I believe, there have been no importations into this Colony, may be described as a very compact, short-legged, small draught horse, with a rather thick neck, straight shoulder, short back, full drooping hindquarters, and rather round bone. He is, as a rule, wanting in style and action, but is hardy, staunch, and good-tempered, and as a generally-useful horse, either for the country or in the town, where very fast work is not called for, is everything that could be wished. The lighter descriptions of the breed make good 'bus and parcel delivery horses.

The Norman is another French breed, and may be described as an upstanding, powerful, well-bred, well-shaped, light harness horse, with good head and rein. Like the Percheron, the Norman is very much used as a waggon horse in the American cities and also on the farms, but he is much superior in shape, action, and style to the Percheron; and as I believe the Normans would make excellent sires to put to our light, well-bred mares, I would recommend some of our horse-breeders to import them from France.

(2.) Light Harness.

The representatives of this description of horse at the Exhibition were the Cleveland, the Yorkshire coaching horse, the German coach horse, and the French coach horse, a very stylish animal.

(3.) The Saddle Horse.

This section included the English thorough-bred, the English hackney, the Morgan horse, the American hackney, the Arab, and the American, French, and Russian trotters. The breeds of horses in this section, which have not been introduced into Australia, are the American hackney and the French and Russian trotters. The American hackney is apparently a second but higher-standing edition of the English horse of the hackney breed.

The French trotter is a more stylish horse than the American, but not so fast; and the Russian, which has many of the characteristics of his Arab progenitor, also shows more breeding than the American, and is said, if properly trained and driven, to be as fast.

(4.) Shetland Ponies.

There were 85 entries in this section, and many of the exhibits were everything that could be wished in shape, action, style, and character.

(5.) Jacks and Jennets.

This was a well-filled section, and some very large and useful specimens were exhibited.

2. *Cattle at the World's Fair.*

(1.) Beef Cattle.

These were represented at the World's Fair by the Shorthorns, Herefords, Aberdeen Angus, Gal-
loway, Red Polls, and Polled Durhams, and the display was a very grand one both as regards numbers and quality, more especially of the four first-mentioned breeds.

(2.)

(2.) Milch Cattle.

The classes in this section were represented by the Jerseys, Guernseys, Ayrshire, Shorthorn, Holstein, Dutch Belted Cattle, and Brown Swiss; and the same remarks as to large numbers and excellent quality apply to most of the classes in this division, but with even greater force. This will be readily understood when it is borne in mind that there are over 16,000,000 of milch cows in the United States.

It was the importance of the dairy industry in the States that induced the Chief of the Agricultural Department to institute and carry out the elaborate experiments and tests conducted in the Dairy section of the Fair,—the detailed report of which may be shortly expected from America, along with other printed papers which are to be furnished to the Colonies and countries taking part in the Exposition. The Jerseys and Guernseys took the principal prizes at the Fair, both in the butter and cheese contests.

3. *Sheep at The World's Fair.*

This section was represented by the American Merino, the Delaine Merino, the Rambouillet, the Leicester, the Lincoln, the Cotswold, the Dorset Horn, the Southdown, the Shropshire Down, the Oxford Down, the Hampshire Down, and the Cheviot. Here again the classes were very well filled, and the sheep show was considered the most extensive and best of the kind ever held in the United States. There was a strong display of the American Merino, and a fairly good show of the Delaine breeds, and the exhibits in both these merino classes were of high quality.

There was also a good exhibit of extra large-framed well-woolled Rambouillet Merinos from Prussia. Several of the English breeds mentioned were forward in unusually large numbers; and, although a good many of the exhibits were not up to the English standard, there were others, more particularly the recent importations, that would hold their own in any showyard.

4. *The Pigs at the World's Fair.*

In this section the following breeds were represented:—The Berkshire, Poland China, Duroc Jersey, Victoria, Chester Whites, Essex, Large York, Small York, Tamworth, Suffolk, and Cheshire; and there is no doubt but that the show, if not the most extensive—there were 1,418 exhibits—was one of the best that has been seen in any part of the world.

The breed which made the most extensive display was the Poland China; but while this is the case—and the class was an excellent one, and contained many pigs of very high merit, and several were perfect models of what pigs ought to be—the Berkshire classes, although not so well filled as the Poland China, showed pigs of exceptionally high quality and form, and fully maintained the honor of the breed against their rivals of the Poland China blood.

These and the other black breeds find by far the greatest favour in the United States. For one white pig to be seen in the stockyards there are fifty black; and although the white classes were very fairly represented at the World's Fair, nothing like the same interest was taken in them as in the black breeds, especially the Berkshire and Poland China. These remarks apply also to the two red breeds—the Duroc Jersey and Tamworth; and with regard to the Tamworth, so much have the breeders of pigs in the States given their attention to shapes, early maturity, and propensity for fattening, that objections to the defects of the breed as regards these points were very freely expressed, and their good qualities of hardiness and large proportion of red meat overlooked.

III. THE CHICAGO UNION STOCKYARDS.

1. *Their Extent, Capacity, and Business Arrangements.*

THE stockyards were first erected in Chicago in 1856, with a capacity for 5,000 cattle and 30,000 pigs. In 1865 a new company was formed with a capital of £100,000, which acquired a tract of 320 acres of land (the site on which the existing yards now stand), and commenced business in December of that year with yards covering 120 acres, of various sizes, capable of accommodating from one to ten car loads, and 1,200 cattle pens and 1,000 sheep and pig pens were sufficient to accommodate the stock, while it now requires 2,000 cattle and 1,500 sheep and pig pens; and 50,000 cattle, 30,000 sheep, 200,000 pigs, and 40,000 horses may find quarters at these yards to-day. The horse exchange and pavilion is 530 feet long and 185 feet wide, with display track 36 feet wide and 530 feet long, and an amphitheatre sale-room capable of seating 3,000 people.

In 1892, 5,571,796 cattle, 197,576 calves, 7,714,435 pigs, 2,145,079 sheep, and 86,998 horses passed through the yards, while the largest receipts of stock in one week during that year were 95,524 cattle, 8,479 calves, 300,488 pigs, 69,966 sheep, and 3,679 horses.

On the arrival of stock at the sheds they are watered and fed at the following rates:—Hay, 4s. 2d. to 6s. 3d. per cwt.; corn, 4s. 2d. per bushel; and the yardage charges are: horses and cattle, 1s. 0½d.; calves, 7½d.; pigs, 4d. and 2½d.

There is an exchange building on the ground, with offices of some 140 commission firms, a restaurant, barber's shop, telegraph, &c., attached to the yards.

About 100 firms do packing and other business, and about 20 of these are prominently identified with meat-curing. Their plants are estimated at \$5,000,000, with capital of \$50,000,000; their employes number about 40,000, and the annual pay roll, \$300,000,000.

There are about 150 miles of railroad trucks in the yards, and the various companies have an arrangement with the Market Company for all freight and traffic both in and out of the yards. The stock arrive during the night or early morning, and freight is despatched in the afternoon and evening.

The cattle, sheep, and pigs are sold by the live weight, and on the sale being completed, which it is by private bargain, and not by auction, they are sent to the scales, where they are inspected, weighed, and the certificated weight given.

The scales can weigh up to 100,000 lb., but the average weight of a carload is about 25,000 lb.

The

The following report of a week's transaction in stock at Chicago, which is taken from the *Breeders' Gazette*, of 20th June last, gives a good idea of the business done and the prices obtained at the Union Stockyards:—

2. Report referred to.

Numbers of Stock.

Day.	Cattle.	Calves.	Hogs.	Sheep.	Horses.
Wednesday	14,614	636	32,105	8,305	307
Thursday	13,415	897	32,640	10,150	208
Friday	7,317	495	32,680	6,688	188
Saturday	1,267	83	21,882	564	86
Monday.....	13,607	555	34,500	4,650	180
Tuesday.....	4,500	1,000	20,000	9,000	200
Sales for the Week	54,720	3,666	173,807	39,357	1,169

Prices of Cattle and Calves.

	Per 100 lb.	
	\$	\$
First quality fully-matured beeves, from 1,600 to 1,700 lb. live weight	4.90 to	5.10
Second quality choices smooth fat steers, from 1,450 to 1,600 lb. "	4.65 to	4.85
Good to choice steers, weighing 1,300 to 1,400 lb. "	4.25 to	4.65
Medium to good steers, " 1,200 to 1,300 lb. "	4.00 to	4.50
Fat steers " 1,050 to 1,200 lb. "	4.25 to	4.50
Common butcher's steers, weighing 900 to 1,200 lb. "	3.25 to	4.00
Feeder's steers " 900 to 1,200 lb. "	3.25 to	3.75
Stocker's young steers " 600 to 850 lb. "	2.50 to	3.30
Butcher's stock, poor to extra, cows, heifers, mixed stuff, all weights, according to quality	1.25 to	3.75
Bulls, common to choice fat	1.50 to	3.50
Springers, common to choice, per head	20.00 to	45.00
Veal calves, poor to common	2.50 to	3.50
" fair to choice	4.00 to	5.00

Prices of Pigs.

Common to prime light, averaging less than 200 lb. live weight	...	4.00 to	4.70
Pigs, averaging from 200 lb. to 275 lb.	4.50 to	4.85
" " heavier	4.60 to	5.00

Prices of Sheep.

Poor to choice sheep, per 100 lb. live weight	...	1.00 to	3.50
Yearlings " "	2.00 to	3.75
Spring lambs " "	3.00 to	4.50

3. How Stock are weighed at the Union Stockyards.

On being sold the stock are taken by an employee of the salesman to one of the scales, *i.e.*, weighbridges which are provided by the Market Company, and there weighed by an officer of the company, who enters the weight in a register and hands a note of it to the person in charge; and the stock are paid for in accordance with the price agreed to, and the weight certified in the note. In this way all the purchaser has to judge is the quality of the stock, and, on the other hand, the seller is paid for every pound the stock weigh. I would recommend that the same course be adopted in the Colony at the principal markets, and that stock be sold by live weight.

An Act (copy of which Sir Saul Samuel has sent me) has recently been passed in Great Britain for the purpose of initiating the system of selling by live weight as in America, and weighbridges have been erected at the cattle-markets in the principal towns. I may add, however, that under the English Act it is optional for the seller to sell by weight, and the stock-owners have hitherto been somewhat slow in adopting that system, notwithstanding its advantages; but they are gradually coming to do so.

4. The removal of the Abattoirs and their re-erection near the Saleyards.

In going into details with respect to the Chicago stockyards and the conduct of the enormous business done in the Union Stockyards, one of my objects was to contrast the arrangements there with the manner in which stock are sold and slaughtered in Sydney, with the hope that I might thereby hasten the alterations which are so urgently called for in the mode of carrying on that business here.

For a long time the abattoirs on Glebe Island were a serious nuisance to the people of the Glebe and Balmain; but there has of late years been a change to a considerable extent in this respect for the better. The people in the suburbs, however, between Homebush and Glebe Island, are still subjected to the inconvenience and risk arising from the driving of the cattle to the abattoirs; and the cattle still suffer from the dogging and rushing and cruelty inflicted on them by the way, and the starvation they get in the waiting-paddocks,—while the waste and deterioration of meat, which all this occasions, is a serious loss to our stock-owners.

I would therefore suggest, as has often been done, that the slaughter-houses be brought as close as possible to the Flemington yards, or that an entirely new site be obtained where both the saleyards and slaughter-houses could be erected in close proximity to each other, and where there would be far more and far better waiting-paddocks for the stock than can now be conveniently obtained.

If the alteration first alluded to were adopted, then sufficient land on a suitable site on the old Homebush Estate, belonging to Mr. Wentworth, near the Parramatta River—as at one time suggested by Mr. F. L. Barker—would have to be resumed; and if sufficient land were resumed, due care taken in selecting the site, and proper arrangements made for dealing with the offal and bi-products, no nuisance need be occasioned to the people in the neighbourhood. In proof of this I need only point to the Union Stockyards and Slaughter-houses at Chicago, which are in the centre of the city, to the slaughter-houses in London and all the other large cities in Great Britain, and to those in Berlin, Brussels, and Paris, on the Continent,—all of which are closely surrounded with shops and dwelling-houses, and occasion no nuisance beyond what the stock traffic entails—while the site now proposed, on the old Homebush Estate, would, if a sufficient area of land were resumed, be very isolated, and at a safe distance from dwelling-houses, other than those of the people at work at the yards and abattoirs.

If again the other alteration mooted were considered advisable, such a site as that indicated could, I think, be obtained on Mr. Wentworth's land some 3 or 4 miles beyond Parramatta, on the Great Western line; and if that were not at too great distance (less than an hour by train from Sydney) for the butchers to attend the sales, it would be the better site on account of the large extent of land which could be got at a reasonable price for the yards and slaughter-houses, and the number of paddocks in the neighbourhood which could be used by the stock waiting for sale or slaughter.

Should this alteration be entertained, and, say, 100 acres resumed, a good many of what are termed noxious trades—many of which are connected with stock and their products—could be carried on upon the same land; and its purchase would thus get rid of another serious difficulty. As regards the railway traffic, again; if the abattoirs are to be removed, and are not to be brought together, as here suggested, at Homebush, it will I think be seen that no more suitable site than that beyond Parramatta can be got, so far as railway accommodation is concerned.

IV.—THE CATTLE OF THE UNITED STATES.

1. *Description.*

Although I had heard that the quality of the cattle in the States of late years had improved, I found it a good deal better than I expected on the occasions on which I visited the Union yards, and the beef in the slaughter-houses, to which visitors were admitted, was generally good, and in many cases very prime. But while this is the case, hundreds, I might say thousands, of very inferior cattle, principally poor cows, bulls, and stags were to be seen every sale-day in the yards which never left there alive, and were disposed of somehow—most likely in the shape of canned meats and sausages; and if this is the case it accounts for the small amount of nutriment which a great deal of the American canned meat contains, compared with that of the Australian and the New Zealand companies, which put up only prime beef and mutton.

The majority of the cattle in the Union yards had more or less of the Shorthorn blood, but they were in many cases polled, the system of dehorning being very general in the States. This, however, does not account for all the polled cattle brought forward, as there are not only a good many Aberdeen, Angus, and Galloway cattle, but also a breed of pure polled Durhams in the United States, which is fully recognised as such by the Breeders and Agricultural Societies, and, in framing the prize list of the Live Stock Show to be held at the World's Fair polled Durhams were allotted a separate class. I would strongly recommend that the system of dehorning should be adopted in this and the other Colonies. The operation is easily performed, and the advantages of dehorning are too manifest to need anything to be said in its favour.

It will be gathered from the statement and description in this report of the different breeds of cattle exhibited at the World's Fair that most of the leading races of beef and milking cattle to be met with in Great Britain have been introduced into the United States, and with the best possible effect. But although the very great improvement noticed has been effected by these importations there are still in a good many instances rough cattle to be seen, which show very decided traces of the old Spanish breed, particularly among those offered at Kansas city, and there is yet ample room for the improvement, which has set in so strongly throughout the States, to continue and spread.

The best fat cattle offered in the Chicago market are, of course, those which, after having been fattened for a time on the pasture, are topped off on corn and hay; and a large proportion of these cattle, as regards size, breeding, and quality, compare favourably with the best Scotch, English, and Irish breeds of bullocks. In fact, taken as a whole, prime fat cattle of heavy weights are proportionately much more numerous in America than in Great Britain or Ireland, as the tendency there of late years has been to turn their fat stock off young, and not keep them to the ages and weights which they frequently attain in the States. This system of early marketing, which is spreading in the old country, no doubt pays the breeder best, while the consumer does not object to young beef if the cattle are well bred and prime fat; neither does the retail butcher, as young stock of this description give proportionately more meat and less bone. In the United States, however, it is different, and it suits the packing companies better in the circumstances under which the trade there is done to give longer prices per 100 lb. for heavy weights. For instance, while prime bullocks weighing say 800 lb. dressed weights sold at \$4.75 per 100 lb. live weight, the same day bullocks going 950 lb. and upwards brought \$5.25, and the difference which this discloses is quite a usual one.

The improvement referred to in the quality of the cattle in the United States, of recent years, has been quite phenomenal. Twenty years ago the greater part of the cattle in the States were very inferior, and the very best of them—some of those in the States east of the Mississippi—were only on a par with the second-rate Scotch and English cattle. Now, however, all this is changed, prime fat cattle are to be met with a good long way west of the Mississippi, and every week there are now being shipped to Great Britain from America 5,000 or 6,000 bodies of chilled beef, and 9,000 or 10,000 live cattle, the great proportion of which are prime and some very prime beef. No doubt a good many pure-bred cattle, principally Shorthorns had been imported previous to 1870, and larger numbers still in 1871, 1872, 1873, and 1874; but it was not until the chilled-beef trade, which was initiated in October, 1875, and successfully established

established (which it was very soon after), that the great influx of pure-bred cattle—principally Short-horns, with considerable numbers of Herefords, some Devons, and afterwards a good many black polled cattle—took place, and continued up to a recent date. With these heavy importations of pedigree stock, a great many herds were formed to breed stud bulls, and as the export trade in chilled beef and afterwards in live fat cattle was a profitable one, and as both grass and corn of excellent quality were plentiful in the States, it can readily be imagined that owners were not slow in improving the quality of their meat, especially as they soon found, what is now so well known to us, that to do a paying trade only meat of the best quality need be put on the London and other important markets in England.

The cost of fattening cattle in America is considerable, and it is this which will enable the Australian Colonies, where the stock are fattened almost wholly on grass, to compete successfully in the British and Continental meat-markets with the United States. There, very few cattle are fattened on grass alone; and it is the almost universal practice to give the cattle corn (maize) as well as grass—that is when grass is available, and where it is not, to supply hay or some other fodder instead. It takes from five to six months in this way to fatten a bullock, and during that time he will consume from 60 to 80 bushels of corn, costing at a moderate average price (say) 1s. 5d. per bushel, and with the grass, hay, or fodder supplied, would amount to (say) from £5 7s. 6d. to £6 16s. 8d. for each head of cattle. But from this would have to be deducted the profit, say 30s. to 40s., made by fattening pigs, the custom being to put (say) one pig in along with each head of cattle to fatten on the grass and on the corn which the cattle leave or drop.

2. *The prices made by Cattle in the Chicago yards.*

Prime fat bullocks weighing (say) 1,400 lb. live weight (which would be about the average of our best Australian cattle) have, during the first six months of this year, been selling at the Union Stock-yards at prices ranging at from \$3.50 to \$5.15, and averaging during that time (say) \$4.17 per 100 lb. (*i.e.*, 17s. 4½d. per 100 lb., or 2½d. per lb. live weight), and that for 1,400 lb. would make the price in Chicago of a bullock of the description mentioned \$58.38, or in our money (calculating the dollar at 4s. 2d.) £12 3s. 3d.

To compare this again more closely with the prices current in our markets and those of the neighbouring colonies, it will be necessary to ascertain what the cost of the beef would be if calculated as it is in Australia by the 100 lb. dressed weight. With that view we will take the shrinkage at the rate usually allowed in prime beef, *i.e.*, 40 per cent. This leaves 60 per cent. of the gross weight of 1,400 lb. of dressed carcass, which would be 840 lb., and which costs £12 3s. 3d. This would make the price of prime fat cattle of the class mentioned sold on foot at Chicago, during the first half of the present year, 28s. 11½d. per 100 lb. dressed weight, or very nearly 3½d. per lb., a price which is nearly as high as prime American beef of that class often brings in London, taking both fore and hind quarters together, and such as would leave very little margin of profit to the American shipper after paying freight and charges, if he purchased at the prices quoted, and had to rely solely on the sale of the beef.

But, in the first place, although the prices given are those which I have quoted as ruling in Chicago, it may fairly be presumed that they are only given for beef of the very best description and prime quality, and that a great deal of the meat sent to Great Britain from America has been purchased at rates under those quoted as "top." This is in any case very probable, but I think it will be seen to be almost certain to be so when it is recollected that the meat trade in Chicago is very largely controlled by some six or eight of the leading companies in that city. Then the hide, fat, and other offal falls to the exporter; and, considering the exceedingly complete and thorough way in which the whole of the bi-products of the stock are turned to account and utilised by the great packing companies, they do not rely solely or even to any great extent on the amount realised from the carcass for a profit, inasmuch as they get large returns from the offal and bi-products. Then, again, by clearing the American markets of a large portion of the stock these packing companies are able to keep control of the American home meat trade; and thus, although they may make little or no profit on the meat they export, they gain indirectly by its leaving America, and charge higher prices for what they dispose of there.

3. *Veal.*

During the period here mentioned veal was selling in Chicago at an average of say ¼d. per lb. more than beef, but the price is a comparatively fluctuating one.

4. *How Cattle are slaughtered at Chicago.*

The cattle on being weighed are removed on viaducts built over the yards to pens in the packing-houses, which are in close proximity to the yards, and they remain there till required for slaughter, when they are passed singly into a narrow pen, over which a man with a long-handled hammer stands and drops the bullock with a blow on the forehead. Immediately he falls a lever is pulled, when the floor is raised at the back, and at the same time the partitions at the sides open and the carcass slides out upon the dressing-floor. There a man decapitates the body with a single stroke of the knife, others cut off the legs at the joints, another fixes hooks in the tendons of the gambel joints, others begin to skin the body; and in a very short time it is hanging dressed.

The backbone is then split with a cleaver, and the carcass is slid on an overhead truck into the chill-room.

In the meantime the heart and liver are dissected from the lungs and other portions of the body, and hung on hooks and racks, and the entrails and paunch are cleared of tallow.

5. *The Bi-products from the Bullock.*

These are the cheek meat, heart, liver, tongue, sweetbreads, tallow, blood, guts, weasand, bladder, hide, switch, and offal. The skin of the head, with that of the legs and tail, goes to the glue factory; the cheeks are used for Bologna sausages; the tongue is pickled and smoked; the skull goes to the glue-house, and is boiled, and then to the fertiliser factory; and of the feet the glue and bone houses get a part; neatsfoot oil is also obtained from them; the sweetbreads are made into pancreation; portions of the liver and heart are used for sausages; the blood goes to the fertiliser; and the horns are sold, to be made into knife-handles, buttons, and combs.

It is through the saving and utilising of absolutely every portion of the bullock that the packer can make a profit at the prices at which dressed meat is now sold to the retail butcher.

V.—THE SHEEP OF THE UNITED STATES.

1. Description.

The sheep of the United States are usually spoken of and described under the following divisions or heads:—

- (1.) "The Natives," *i.e.*, Mexican Sheep.—These are the descendants of the sheep introduced by the Spaniards into Mexico about three centuries ago, considerable numbers of which are still to be met with in that country, and some of the same breed are also to be seen in the south-western portions of the United States in a very unimproved state; while the glaring defects in size, shapes, and fleece shown by a good many of the sheep on the ranches on both slopes of the Rocky Mountains, but more especially towards the south, clearly indicate that they are related, though perhaps distantly, to the original Spanish sheep, "The Natives."
- (2.) "The Scrubs."—These are to be found in the South-eastern States (Florida, Alabama, Mississippi, and Louisiana), and may be described as the descendants of Mexican sheep, which have at times been interbred with sheep of improved breeds, but generally neglected, as the climate and soil in these States are not favourable to sheep-breeding.
- (3.) "The Grade Merinos."—These include the offspring of all ewes, other than Merino, to which pure or well-bred Merino rams have been put, whether these ewes be Natives for the descendants of Native ewes and Merino rams, or of Merinos and crosses of Merinos and Natives, or Merinos and some of the English breeds, or the Merino and the crosses of the Merino and the English. But, of course, in many cases the pure Merino has been so often put to the descendants of the Native ewes that these grades show few, or none, of the faults of the Natives, and, in many cases, are classed as Merinos. This is not the case in regard to the crosses of the Merino and English sheep, for, as will be seen from what is afterwards said with regard to the direction in which breeding has lately been tending in the States, that it has not been, nor is now, the practice to return to the Merino, but rather to breed up for English or mutton sheep.
- (4.) "The Merino."—This includes—
 1. The Silesian Merino.—Live weight, fully matured, rams (say) 120 lb.; ewes, 80 lb.
 2. The Vermont " " " " 130 lb.; " 90 lb.
 3. The Delaine " " " " 150 lb.; " 120 lb.
 4. The Black Top " " " " 180 lb.; " 130 lb.
 5. The Dickson " " " " 200 lb.; " 150 lb.
 6. The Rambouillet " " " " 250 lb.; " 150 lb.
- (5.) "The English" *i.e.*, the Mutton Breeds:—

1. The English Leicester,	6. The Shropshire Down,
2. The Border Leicester,	7. The Hampshire Down,
3. The Cotswold,	8. The Oxford Down,
4. The Lincoln,	9. The Suffolk,
5. The Southdown,	10. The Dorset Horn,
	11. The Cheviot.

Of these, at first the English Leicester was the breed most frequently used for crossing with the Merino; but, afterwards, the Cotswold was preferred, and latterly the Southdown and Shropshire have come into more general use in the States than any of the other British breeds.

This is especially the case as regards the Shropshire, which is now looked upon there as the best all round English sheep for crossing. The Oxford and Hampshire Downs have also been used to a considerable extent, and, more recently, a good few breeders have tried the Dorset Horn, and are satisfied with the result. Lincolns have been but very little tried, which is rather strange, considering that the Lincoln with the Merino, while it makes good mutton, clips a much heavier fleece of excellent cross-bred wool than any other first class; and that the price of wool in the United States has for many years been very high.

2. Estimated number of Sheep of the different classes in the United States.

So far as I could ascertain, neither official nor any other reliable returns have been collected of the relative numbers of the different breeds or classes of sheep in the United States; and the only thing I could do towards arriving at any conclusion on this question was to obtain the opinion of gentlemen largely connected with the American wool trade, and that of the sheepowners with whom I came in contact. This I did, and as it is of very great importance to our sheepowners, both from a mutton and wool producing point of view, to learn how this matter stands, I now venture to submit the estimate given below of the different classes of sheep in the United States, based on the opinions I obtained, and in some measure, also, on information contained in the report published in 1892 by the Department of Agriculture on the Sheep Industry of the United States.

Estimate mentioned above:—

Scrubs	(say)	1,000,000
Natives and very inferior grades	"	3,000,000
Other Merino grades	"	17,000,000
Pure Merinos	"	5,000,000
Registered Merinos	"	1,000,000
Crossbreds (got by Merino ewes and British rams)	"	15,000,000
Pure-bred British sheep	"	2,500,000
Registered British sheep	"	500,000
										45,000,000

It may, perhaps, seem that the number of crosses of the British blood are over-estimated, and it may possibly be that they now are so; but if they are, it is only a question of very short time when the number stated will be considerably under the mark, for the report alluded to, by the Department of Agriculture on the Sheep Industry, clearly shows that in almost every State east of and including North Dakota, Minnesota, Iowa, Missouri, and Arkansas, the majority of the farmers, except where they own registered

registered merino flocks, are using rams of some of the British mutton breeds, instead of the merino, with their merino ewes; for they have discovered that while it does not pay to breed merinos on cultivated land, it does pay well to keep cross-bred sheep on it.

Not only is this the case with the farmers in the eastern portion of the United States, but in large portions of Texas, Oregon, Washington, and California quite as many, if not more, mutton rams are being used as merino; and it may be said that in all the States, even in those where the largest numbers of merinos and grade merinos are kept, and where formerly only merinos were bred, considerable numbers of crosses with English blood are being bred.

As I said, our sheep-owners are deeply interested in ascertaining how far the system of crossing now so generally followed in the States will be followed up, for if it is to become much more general, it will be a matter for consideration by Australian owners how far they will go into breeding cross-breds, seeing that, if the sheep-owners in the States adopt that system as generally as those in South America, the production of merino wool must decrease, and the owners in this and neighbouring Colonies might in that case do better to stick to the greater part of their merinos, and only breed a sufficient number of cross-breds to make up the surplus which we find it necessary to export.

Nor is this the only contingency which may arise. If the farmers in the United States go very strongly into cross-breeding with mutton-producing rams, there would then, in that case, be a good deal more mutton produced than could be consumed there; and if so, it is only natural that those now in the beef export trade should turn their attention to mutton, and send over to Great Britain large numbers of fat sheep both alive and in a chilled state. If this should happen, competition in the mutton trade, as well as the beef, would have to be faced by our sheep-owners; but, as I said, when alluding to that in beef, that the balance of the advantages is in our favour, and if they are turned to proper account, we are bound to win.

3. *The Quality and Price of the Sheep and Lambs in the Union Stock-yards.*

1. Quality.

Although there has of recent years been a very great improvement in the quality of the sheep and lambs offered as fat in the Chicago market, still a large portion of them are very inferior, many of them being not only badly fattened merinos, but merinos defective in size and quality. These defects were also noticeable in the cross-breds; and it was evident that the ewes from which they had been bred had not been of the right stamp, and that pure-bred rams of the best English breeds had not been used.

2. Price.

The average price in the Union stock-yards during the first six months of this year, of prime fat wethers of any of the Downs breeds, or first-class crosses from merino ewes and the best kinds of British rams, weighing from 60 lb. to 70 lb., has been about \$3.45 per 100 lb., or, say, 1½d. per lb. live weight, which, taking the loss of weight in slaughtering at 50 per cent.—the usual rate allowed for shrinkage in fat sheep,—makes the wholesale price of the very best mutton in Chicago 3¼d. per lb. dressed weight; the second grade, 2½d. per lb.; and the third grade, say, 1¾d. per lb., while there were a good many sheep at every sale which were sold at even lower figures than that last quoted.

The comparatively low prices which a large proportion of the fat sheep bring at Chicago is attributable to some extent to the demand for mutton being less steady than for beef and pork, but mainly to the scarcity of really prime sheep, which not only leads to the owners' direct loss in the low prices they receive, but also to their indirect disadvantage in as far as it renders it impossible for intending exporters to find a sufficient number of first-class sheep to make regular shipments.

I may state, however, that the low prices have been attributed to another cause. It is said that the mutton portion of the meat trade in Chicago has been "cornered" by three of the largest packing companies, who practically hold the control of it.

However this may be, there is exceedingly little mutton, either alive or dead, exported from the United States; and, to show how very insignificant that trade has hitherto been to Great Britain, I give the following extract from the Annual Statement of the Trade of the United Kingdom for 1892:—

IMPORTS FROM THE UNITED STATES.

Year.	Live Sheep and Lambs.	Fresh Mutton.
1888	1,203	cwt. 7,157
1889	18,690	1,609
1890	3,904	134
1891	10,537	10,574
1892	2,829	72

At one time the consumption of mutton in the United States was very small, compared with that of beef and pork; but within the last fifteen or twenty years a considerable demand for mutton has arisen, and, although it is a somewhat fluctuating one, the demand is increasing, and likely to continue to do so, with the large increase in the number and quality of the mutton breeds of sheep now taking place in the United States.

4. *How Sheep are Slaughtered at Chicago.*

Sheep are taken from the yards, when weighed, to the packing houses, and dealt with very much in the same way as cattle.

The most noticeable difference in the mode of slaughtering sheep at Chicago from that followed in the colonies is that, as in the case of cattle and pigs in Chicago, different portions of the work of killing and dressing is done by different hands, many of the hands on the work being only young lads.

Under this system the sheep is hung on an overhead truck and passed from one hand to the other, who each does his allotted portion of the work.

VI.—THE PIGS OF THE UNITED STATES.

1. *Description.*

As I have already stated, the leading breeds of pigs in the United States are the Berkshires and Poland China, and of the two I understand the Berkshire and the pigs showing Berkshire grades are more generally distributed than the Poland China, although that breed is also a very general favourite. In fact, the fat pigs to be seen at the Union Yards are apparently little else but Berkshire or Polands or crosses of these two breeds; and in no part of the world are there to be found anything approaching to the number, quality, weight, and uniform quality of the pigs offered day by day in the Chicago stock-yards.

In 1892 over seven millions of pigs passed through the Union Yards. This would give an average of very nearly 25,000 pigs a day; and when we consider how enormous this number sent to a single market is, and that the greater portion of these pigs dressed to more than 200 lb. each, we can understand how the United States can claim that the value of the products from the pigs in the States for 1892 amounted to \$241,000,000, or about £60,000,000; and that after supplying her own people with all the pork, bacon, hams, sausages, and lard they required she could export and dispose of pigs and the products of pigs, the greater part of excellent quality, to the value of \$85,450,401, or, say, £17,000,000 sterling, as shown by the following statement:—

Extracted from the statement of agricultural exports from the United States for 1892:—

							\$
Live pigs	364,081
Lard oil	901,575 gallons	496,601
Bacon	507,919,830 lb.	39,334,933
Hams	76,856,559 „	7,757,717
Pork, fresh	377,746 „	30,246
„ salted or cured	80,336,481 „	4,792,049
Lard	460,045,776 „	33,201,621

Over £17,000,000

\$85,977,248

This has been accomplished by improving the quality of the pigs, keeping only those best adapted for the trade; by supplying them with plenty of the best kinds of food; by providing convenient markets for the disposal of the pigs to the best advantage; by erecting suitable packing houses with all the latest and most approved machinery and labour-saving and refrigerating appliances; by dealing scientifically with the whole products, but especially with what until recently was termed offal; by being exceedingly careful while sending out their products in as taking a form as possible to do a thoroughly honest trade; and last, but not least, by leaving no stone unturned till markets were found for their goods in all parts of the world. Dealing with the business in this way it was only natural that those engaged in it should succeed; and it can, I think, be fairly asserted that they have met with the success which they deserved.

I have frequently drawn the attention of our pastoralists and farmers to the advantage of increasing the number of pigs they kept, there being only some 300,000 in the whole Colony, while in the United States there are more than 52,000,000, giving a better and more certain return than any other description of stock.

We ought, with our exceedingly favourable climate, the abundance of both outdoor and indoor food for pigs, to have at least ten times as many as we now have; and if we adopt the means which have been so successful in the United States we must be as successful, for both as to climate and cost of food we have the advantage; and as regards bacon, hams, and lard, which require little or no refrigeration in transit to Europe, and can, therefore, be conveyed at comparatively low freights, we would not be placed at the same disadvantage as we now are with respect to some of our products, such as meat, butter, and fruit. The products from the pig can be both kept and carried at comparatively cheap rates. If anything further were required to be said in order to show the very great profitableness of pig farming the most convincing fact which could be adduced is, that with 52,000,000 pigs, those in the trade in the United States claim to have dealt with, what they speak of as an ordinary annual cast of pigs, *i.e.*, 24,000,000 pigs, or very nearly 50 per cent. of the whole number in the States.

This may at first sight appear to be a great exaggeration, but when it is recollected that a breeding sow has two litters a year and that there will on an average be, say, seven in a litter, and that pigs at less than 12 months old, if properly fed, are fit for the butcher, the correctness of the statement need not be questioned.

In any case the extraordinary prolificness of the pig cannot be disputed.

I would strongly recommend the introduction of the Poland-China pigs. They have more “red” meat than the Berkshire, and make a fully wider side of bacon.

I cannot close this portion of my report better than by giving an extract from an article which appeared in the *Butchers' Gazette* of 13th June last, on the advantages of pig farming, to which the extract so forcibly calls attention; but I, of course, do not allow that nowhere outside the United States can it be so profitably carried on, for, as I have already stated, it can be so in this Colony, *viz.*:—“The hog is the only reliable money maker, the rent payer, the bread winner, and mortgage lifter *par excellence* of the Corn States. He may make more money for his owner some years than others; he may be overtaken at times by disease, but in the long run he always pays a handsome profit in any corn-growing district. Other countries may grow ‘pigs’ in comparatively small numbers, but nowhere outside of the United States can hogs making such astonishing weights at such an early age be produced in such enormous numbers at such slight cost. Only two weeks ago there were over 300,000 head bought and paid for at four primary receiving points in six days, and even that great ‘run’ was absorbed without a ‘break.’ There is no over-estimating the importance of the hog crop as a leading factor in American agricultural prosperity. We have virtually a monopoly of the world’s markets so far as cheap or fine quality is concerned, and should make the most of it.”

2. *The Price of Pigs in Chicago.*

The average price of prime heavy pigs in the Union stock-yards during the first six months of this year, weighing, say, 250 lb. and over, was \$4.96 per 100 lb. live weight, which would make the cost of the pig in our money £2 11s. 8d., or, say, 2½d. per lb., and if the loss in killing were, say, 30 per cent. that would give

give a dressed carcass of, say, 175 lb., and would make the cost per lb. dressed weight, say, 3½d. per lb. The current price during the same period in the Smithfield market was about 5½d., which would seem to leave sufficient margin for fresh pork to be shipped from America to England; but it does not appear that any pork in a chilled state has been dealt with in that way, the packing companies having evidently made more money out of hams and bacon curing and pickled pork than they would have done by sending chilled pork to the British and other markets; and if additional proof were required beyond what I have already adduced of the profits which our pastoralists and farmers could make by breeding and fattening pigs and making pickled pork, hams, and bacon in an extensive and systematic manner, as the business is conducted in America, this fact should convince them of the soundness of my suggestions under this head.

3. *How Pigs are killed at Chicago, cut up, and utilised.*

Like cattle and sheep, the pigs are conveyed after being weighed to the packing houses, and there placed in receiving pens which are allotted to them in the third or fourth floor of the building in order that they may, while being killed and dressed, pass by gravitation from the one person to the other engaged in the work until it is completed. Although the mode in which this is done has more than once been described, I will here briefly state how it is so:—A portion of the pigs is confined in a small pen; a man stands among them and puts a clutch attached to a rope connected with a steam windlass on one of the hind legs of the nearest pig. It is immediately pulled up and carried on a travelling truck to a butcher who sticks it. The pig then slides down the track into the scalding tank. There it is rolled about by machinery, and then lifted into the scraping machine (*i.e.*, a large box lined with brushes, the sides of which move up and down and rub the bristles off the pig), from which it passes on to two men, one on each side of it, who scrape off any bristles which the machine may have missed. The pig is then hoisted and passed on runners to the man who disembowels it, another cuts off its head, another washes off the loose bristles with cold water. The back-bone is then split with a cleaver, and the two sides are passed into the chill room. It is said that the whole of this work has frequently been done in less than 12 seconds.

While this is being done the fat is taken from the entrails, the tripe is sent one way, the heart and liver another. The entrails are cleaned and sent to the casing department, part of the head is sent to the sausage room, and the gut fat to the lard refinery.

In the division of the parts, the top of the head, the ears, and tail go to make "head cheese." The heart and liver are converted into liverwurst, the entrails into sausage casings, the stomach into pepsin; the bristles go to the hairfield to be sorted and baled for market, the feet and tongues are pickled and put in small kegs, and the blood, which is a powerful fertiliser, is caught and dried.

After from eighteen to thirty-six hours the carcass is taken to the cutting room, placed on a cutting block, and cut up with great cleavers; the hams and shoulders are sent to the curer, who keeps them for weeks in huge pickling tubs, in contact with a solution of salt, granulated sugar, and other ingredients, each curer having some secret formula which he jealously guards. Frequent handling ensures the absorption of the solution.

When thoroughly cured, the hams are washed in cold water and sent to the smoking house. Some of them contain 10,000 to 20,000 hams; and the smoke is made from hickory wood smothered by sawdust. Only reliable experts have charge of the smoke-houses.

VII.—THE MANUFACTURE OF BI-PRODUCTS.

1. *Sausages.*

The production of sausages by the packers at the Union Stock-yards in 1892 amounted to about 75,000,000 lb., in which many of the parts of cattle, sheep, and pigs that would otherwise have been wasted were utilised. Where the manufacture is carried on everything is arranged with the view to thorough cleanliness, and the greater part of the work, including the chopping, mixing, seasoning, and filling, is done by machinery. If the sausages are made of pork, they are placed in the chill room till required to be sent out, and other sorts are sent to the smoke-room for a few hours and then boiled.

2. *Tallow.*

Considerable portions of tallow are still required for soap and candle-making, but of recent years a new use has been found for it, and to-day millions of pounds are converted into olio oil, most of which is exported to Holland, to be there converted into butterine, but considerable quantities of that article are now also made in America.

3. *Glue.*

Hoofs, horn-piths, bones, and hide-trimmings are the bi-products from which glue is made. Enormous amounts of these materials were at one time wasted, but latterly turned to account, and some 15,000,000 lb. of glue are manufactured by the packers in Chicago.

4. *Beef Extract.*

The process of manufacture of beef extract consists in extracting the juices from lean beef by forcing cold water through the meat. These are boiled to coagulate the albumen in it, after which a whole clear liquid remains, which is reduced to the consistency of a paste in a vacuum kettle at a very low temperature.

5. *Wool.*

The wool is pulled from the sheepskins by means of improved appliances, and the pelts are cured and sold to the tanner. The wool is washed by machinery before it is pulled, and centrifugal wringers are used to dry the wool; and when pulled the wool is graded, dried with hot-air blowers, put in bales, and sent direct to the manufacturers.

6. *Pepsin.*

This article is made from the membranous lining of the stomach of the pig by dissecting this lining from it, and, after washing, putting it in earthen croches placed in shallow tanks and surrounded with water kept at a temperature of about 104° Fahr. The linings are covered with acidulated water, which digests them in a few hours, after which the liquid is drawn off and naturalised by the addition of an alkali; then it is dried on shallow plates in hot-air chambers at a temperature of 124° Fahr. The drying process takes from six to twelve hours, after which it is scraped off. It is then the scale pepsin of commerce.

7. *Pancreatin.*

It is a new product, made from the pancreas glands, commonly called the liver sweetbread. Its medicinal value is its action on the liver and its power in digesting fats. The pancreas glands are cut fine and churned in acidated water and dried cloths, after which the product is treated by a gasoline process that extracts the fat from it; it is then ground into powder. There is an essence and glycerine made from it also.

8. *Butterine.*

Butterine is composed of butter, butter oil, neutral lard, and olio oil.

Creamery butter and butter made at the factory daily, are the milk products used in butterine.

Butter oil is made by pressing the oil from American cotton seed, and is used in small quantities to soften the texture of the butterine.

Neutral lard is a pure chilled leaf lard, cooked at a low temperature, and is then put into bath of pure water for about forty-eight hours, which removes all flavour, leaving a perfect neutral material.

Olio oil is made from the leaf, the choicest fat of beef cattle, which is chilled in ice water and then melted at a temperature of 140° Fahr. into truck tanks, where it is allowed to stand in a room kept at a temperature sufficiently warm to keep it from hardening until it grains. From this is then pressed a perfectly soluble oil known as olio oil, which is the only beef product used in butterine, and the stearine remains in the press.

The above products, when properly combined, salted, and worked the same as butter, form what is known as butterine, which is one of the purest and most wholesome articles of food in greatest use.

9. *Hair and Bristles.*

The hair saved from the hide trimmings of the cattle hides, and the bristles from hogs, are taken to a field and spread out on the ground to cure. There they are stirred and raked about like hay till thoroughly dried. They are then baled and put in soaks. The best bristles are sold to brushmakers, and the rest go to the manufacturers of mattresses, &c.

10. *Bones.*

After the glue has been extracted from the bones those of them that are of no value for manufacturing purposes are dried and ground as fertilizers. The shank bones of cattle are sawn into pieces, and after boiling are dried and sent to the comb or button factory. Horns go to the same destination.

11. *Fertilizers.*

When any portion of the ox, the sheep, the pig, cannot be turned to better account it is made into manure, and, if blood, it is dried and ground. All the water used in washing, scrubbing, and cleaning is run into tanks and boiled and evaporated to the consistency of syrup. After that it is put in ovens and baked or dried, and then mixed with bone-dust or dried blood, packed in bags, and sent back to the farmers to help to make the corn and other crops grow to produce more beef, mutton, and pork.

VIII.—THE EXPORT OF LIVE CATTLE FROM THE UNITED STATES.

It will be seen from the amount which appears in the statement of the Value of the Exports of Animals and Animal Products from the States for 1892 (afterwards given at page 17 of this report, *Appendix A*), that this is a most important branch of the American stock trade. The statement referred to shows that 394,607 cattle, valued at \$85,099,095 (*i.e.*, about £7,000,000) were exported that year. This would make a weekly average of 7,588 head. For 1893, the number was considerably less, only 248,825, and the value, £4,667,152; but it appears from the returns received for the present year, from 1st January to 16th August last, that the shipments this year (1894) will be considerably higher than those in 1893, for up to the date mentioned more cattle were landed in England from the United States than during the whole of 1893.

This increase seems still to be going on, and by the end of the year it is fair to assume that the number of cattle shipped to the United Kingdom will be equal, or nearly equal, to the heavy importations of 1892, and that the decrease in 1893 was a temporary and exceptional one.

The nominal rate of freights of live cattle from America to Great Britain is £3 per head; but with the present scarcity of cargo the rate is really a matter of arrangement between the shippers and the owners of the steamers, who are said at times to accept as low as £2 per head.

There is nothing to report that is new with regard to the mode of shipping the cattle in America and securing them on the steamers, or better than that followed in the colonies, but the accommodation on board the steamers and the convenience for feeding and watering the stock is much better than is usually provided on steamers engaged in the Tasmanian and New Caledonian stock trade; and, what is of still greater importance, the system of ventilation is very complete and effective. This has been brought about principally by the supervision of Government inspectors, who see very strictly to the enforcement of the Acts and Regulations which bear on the shipment of live cattle, more especially of those which relate to the proper ventilation of the steamers.

Under the Imperial regulations live stock are not allowed to be imported from any country in which any infectious or contagious disease to which the stock are subject exists, except for slaughter at ports notified for the purpose, such as those at Deptford, Liverpool, or Glasgow, where quarantines have been set apart for the reception, sale, and slaughter of such stock. As, therefore, the Imperial authorities believe that pleuro-pneumonia exists in the United States, and also in Canada, all the cattle imported from either of these countries have to be landed at one or other of the ports mentioned. They are there taken to the lairs provided for them in the sheds at the dock, and tied up until their turn comes to be offered for sale, when they are run out singly into the sale ring, around which the purchasers are seated, and sold by auction. They are then taken back to the lairs and removed to the slaughter-houses, which are attached to the lairs, and slaughtered as required by the purchasers, and the carcase and offal are inspected before they are removed.

If it should be found that a paying trade in live stock from Australia can be established, our cattle will have to be dealt with in the same manner as the American now are, for we cannot certify that our herds are entirely free from pleuro-pneumonia.

When

When in Glasgow I attended a sale of American cattle, the greater proportion of which were anything but prime, and they brought prices ranging from 37s. 4d. to 51s. 4d. per cwt., or say 4d. to 5½d. per lb., on the foot, according to quality; but prices for prime American, especially at Birkenhead and Deptford, rule higher than those here quoted, and at times reach as high as 56s., and for very prime even 58s. per cwt.—say 6d. to 6½d. per lb. It may be said that American cattle sell at Deptford, Liverpool, and Glasgow Docks at about 1s. per stone of 8 lb. less than home-bred stock of the same grade of quality and condition.

The accommodation at these quarantines where the foreign stock are slaughtered is excellent, and there are now very extensive cool rooms attached to them, where the meat can be chilled and kept at a reasonable charge till required; in fact, everything possible is being done to promote the live stock trade, as butchers can not only make money out of the offal, but the beef of American cattle slaughtered in England can, of course, be more readily passed off as Scotch or English than that which comes over chilled. This has helped on the increase in the shipments of live cattle from America during the last three or four years; but the principal reason for the increase is that live stock have of recent years, with the improvement of the accommodation on the steamers, the decrease in losses on the voyage, and the cheap freights through the depression in the shipping trade, paid the shippers in America better than the chilled meat.

IX.—THE CHILLED MEAT AND EXPORT TRADE.

In Chicago it may be said that the chilled or fresh meat trade has, so far as the American Home Trade is concerned, now taken the place of the live stock; for although a good many cattle intended for shipment alive to Europe and for slaughter at Boston and New York, for shipment in the shape of chilled meat to Scotland and England, are purchased in Chicago, the business formerly done there in selling live stock, which were taken and slaughtered at the principal towns in the States, is now practically supplanted by the adoption of the chilling system, which not only puts the packing companies in a position to carry on an extensive business in exporting chilled meat to Great Britain, but enables them to supply much better, as well as cheaper, meat to the consumers in the States. In carrying on the Home trade the more extensive Chicago packing companies have branches for the purchase and slaughter of stock at the principal centres of the stock traffic, such as Kansas City, Omaha, Denver, St. Louis; and for the sale of the meat and other products they have agents, and in some cases cold stores, at the larger towns, who receive regular consignments of fresh meat, bacon, hams, sausages, and other articles from Chicago, and supply the retail butchers, provision merchants, and grocers. To show the magnitude of the chilled meat trade done by the leading packing companies in Chicago, it may be stated that Swift and Company use over 3,000 refrigerator cars, and Armour and Company 2,250.

So very advantageous has the chilling of meat been found that not only at all the principal centres of the stock traffic, but almost all the slaughter-houses in the States are provided with chill rooms, into which the stock as slaughtered are regularly passed, with the view to the meat being cooled and set as quickly and as thoroughly as possible.

Then where the meat is intended for distant parts of the States, but especially where it is so for exportation to Europe, special care has to be taken that it has been thoroughly cooled and set, so that it may not only be carried without risk of taint to its destination, but that it shall also have sufficient keeping margin to admit of its being sold to the butcher and retailed by him in a perfectly sound condition. This is effected by keeping the meat in a chill room for (say) forty-eight hours, in the first instance, of course, at a moderately low temperature, but during the last portion of that time at a temperature a little below freezing point, and still lower (it has been said as low as 28° or 29° Fahr.) during the voyage from America to Europe; and so effectually is the chilling carried out that while some 5,000 or 6,000 bodies of chilled beef on an average now reach Great Britain every week from America, it is very seldom that any of the meat is landed in bad order.

The only case of the sort which I heard of while in England was that of a shipment which, through a breakdown of the steamer's machinery, was thirty-five days in delivering her cargo.

With the view to illustrate to some extent the course of the chilled meat trade carried on from America to England, and to give our owners as much reliable information as possible with respect to the prices in the States for store and fat stock, to enable them to compare their prices with those ruling in this and the other Colonies, I have prepared, and submit below, a *pro forma* statement of the dealings with a store steer 3½ years old from the time he is sold to the farmer, by whom the steer is fattened, until he is disposed of in England as a carcase of prime chilled beef, the prices appearing in the statement being averages for the half-year from 1st January last, made up from prices given in the leading Chicago Agricultural Journal.

STATEMENT of Cost of Chilled Beef in America, and Price realised in England.

Statement so far as the Farmer is concerned.

	£	s.	d.	£	s.	d.
Cost of store bullock of improved grade, 3½ years old, 1,200 lb. live weight, at \$3.18 = \$38.16	7	19	0
Cost of six months' feeding, (say) 60 bushels corn, at 35c.	4	7	6
One ton hay, at \$7.20	1	10	0
				<hr/>		
				5	17	6
Trainage to Chicago	0	10	0

				0	15	0
				<hr/>		
				14	11	6
Selling price in Chicago as a prime fat 4-year old bullock, weighing 1,450 lb., live weight, at \$4.50 per 100 lb., at 4½c. per lb., or dressed weight, the carcase giving 60 per cent. meat = 870 lb., at 18s. 9d. per 100 lb., or 2¼d. per lb.	13	11	10
<i>Add—</i>						
Profit on one pig, fattened along with the bullock (say)	1	5	0
				<hr/>		
				14	16	10
				<hr/>		
Profit to the farmer	£0	5	4

Statement

Statement so far as the Shipper is concerned.

	£	s.	d.	£	s.	d.	
Price of bullock at Chicago, weighing 1,450 lb. live weight, or, as before, 870 lb. dressed weight, at 2½d.	13	11	10	
<i>Add—</i>							
Slaughtering in Chicago	0	2	6				
Chilling	0	2	0				
Loading	0	1	0				
Freight by rail to New York, 870 lb., at 45c. per 100 lb. ...	0	16	3				
Loading on steamer	0	0	6				
Freight to England... ..	1	10	0				
Expenses, including steamer, carting meat to store, storing, and delivering	0	2	0				
Commission—selling	0	6	9				
				3	1	0	
<i>Less—</i>							
Received for bi-products, including cheek, meat, heart, liver, tongue, sweatbreads, tallow, guts, weasand, bladder, hide, switch, head, skirts, feet, shank-bones, offal, containing other bones, blood, &c.				1	10	0	
					1	11	0
Amount realised in England for 870 lb. carcass				15	2	10	
Sold there at 2s. 8½d. per stone, at 8 lb., bring = 4½d. per lb.				14	14	6	
Apparent loss				£0	8	4	

It will be seen from the foregoing statement that if the prices there given were actually paid, the transaction left neither the farmer who fattened, nor the shipper who purchased in the Chicago market, any profit. No doubt with the assistance of the pig, which was kept with the steer at but little additional cost, the farmer realised a trifling profit, but certainly not sufficient to reimburse him for the trouble, risk, and expense he was put to in the transaction, while the shipper sustained a loss; and the question seems to arise whether, looking at the price paid the breeder of the steer, and the amount he realised in Chicago and London, he did not in selling at £7 19s. receive too high a price for him. This is a most important point, for it has a direct bearing on the question whether the American stockowner can successfully compete with the Australian in the production of meat, and it would seem that that depends upon whether the breeder of the store steer (who, as a rule, is the owner of a western ranch) can make the breeding of store cattle pay, and sell at a figure which, keeping in view the price beef sells at in Great Britain and on the Continent, will enable the farmer who purchases and fattens the steer, and the shipper who purchases from the farmer for export, to make a fair profit in carrying on their portions of the trade; and I think, looking at the differences in the price of store and fat stock in the colonies, that the breeders can afford to breed and rear store steers for considerably less money than £7 19s., and my reasons for saying so are the following:—

1. If the breeder is occupying Government land he pays no rent unless the land he has is, as it sometimes has, but not very frequently, been vested in the Education Department of the State, and then the rent is very low.
2. If again the breeder is occupying land belonging to any of the great railway companies (of which there are large areas in the Western States acquired as land grants for making the railways), then in that case the rent charged him is also low, and besides he is usually able to obtain the use, without payment of rent, of considerable areas of Government land adjoining that leased from the railway company. I consider, therefore, that even if the breeder of the store steer had in very cold weather to provide some fodder to bring his cattle through the winter—which is necessary in exceptionally heavy falls of snow on the higher lying ranches in the west—he could afford to breed and sell store steers 3½ years old at, say, £6, which is £2 a head less than the price given in the above statement for the store steers; and I think that such a reduction of the prices now current in England and on the Continent for prime fat cattle continue at the present figures, would admit of both the farmer fattening and the shipper who sells in these markets making fair profits.

X.—MEAT CANNING.

Canned meats are put up by several of the larger packing companies in Chicago, among whom Nelson, Morris, & Co., Armour & Co., and Libby, McNeill, & Libby do the most extensive business in that line. In canning corned beef the meat is trimmed from the bone and slightly corned, after which it is cooked and pressed into cans by automatic machines worked under experienced eyes. The cans are all filled correctly with the right quantity, according to scale, in far less time than it takes to tell it. They are then capped and processed.

The latter work is the insertion of the can while closed in a steam-heated retort, which brings the contents to a heat and fermentation that forces the air to the top, when the can is perforated by a needle-shaped instrument, and the air escapes with a rush. The can is then sealed tight, and the contents are thus rendered proof against the climatic changes to which they may be exposed; after this the cans are washed, dried, painted, and labelled, and packed in cases ready for shipment. The principal noticeable features in the American canning trade were:—

1. The numerous and very effective labour-saving appliances in the handling of the meat, the making and filling the cans, the printing and putting on the labels, and the construction of the packing cases.
2. The colour, consistency, and taking appearance of the meat when the can is opened, which not only gives a favourable impression of the quality of the meat, but makes it very suitable for being retailed—as the 6-lb. and 14-lb. cans frequently are by grocers and others—by the pound, and even half-pound.
3. The bright and taking appearance of the can and label.

XI.—SALTED AND PICKLED BEEF.

The importance of this branch of the meat trade has of late years become considerably less. This has arisen principally, of course, through a great deal of the meat which was at one time salted being now chilled. Only the best beef is suitable for salting, and as this quality has been found to pay better chilled than salted, the more profitable course has been adopted. Besides this, both chilled beef and frozen beef and mutton have, in a vast number of cases, more particularly on board ship, taken the place of salted meat, and it is likely to do so more and more. Still the quantity of salted and pickled beef and pork exported from the United States is very considerable. In 1892 the quantity of salt beef sent away was 70,204,736 lb., valued at 3,987,829 dollars, and of pickled pork, 80,336,481 lb., valued at 4,792,049 dollars, the aggregate value being 8,779,878 dollars, or, in our own money, taking the dollar at 4s. 2d., £1,829,141 5s., a very large amount.

As this is the case, and as both salted beef and pork can be produced more cheaply in Australia than in America, while they are articles which, when properly cured, will keep for any length of time, and can be transported at comparatively low freights from one part of the world to another, it will be seen that this branch of the meat trade is one of great importance to our pastoralists and farmers, especially when it is considered how very necessary it is that every portion of the carcass should be put to the purpose for which it is best adapted, and will make the best return to the producer.

To make meat-curing a success, the work must be done at a low temperature, and, as I have elsewhere pointed out, the packing companies in the United States, notwithstanding that there were as good and very much cheaper cattle in Australia, long ago obtained a monopoly of the salt-beef trade, which they still retain, through being in a position to harvest and store in their curing-houses large quantities of natural ice from Lake Michigan, at a cost of only a dollar a ton, which enabled them to do the work at a temperature of about 40° Fahr. all the year round. Now, however, they have no such advantage, as it has been found cheaper and better to obtain the necessary cold by refrigeration, and as there are a good many freezing and chilling works in this Colony and in Queensland, there is no reason why, with the low prices of beef in Australia, compared with America, these colonies, more particularly Queensland, should not secure, if not the whole, the greater part of the salt-beef trade of the world, if the work is done honestly and carefully.

I am glad to hear that, largely with this object in view, the services of an expert, with Chicago training, have been obtained by the Queensland Government, and that a trial shipment of beef, cured and packed under his supervision, has been forwarded to London, and I trust that not only on the quality of the beef, and the portions packed, but also on the colour and condition of the meat and the package in which the shipment is sent, it will be equal to the very best American, for there is a strong prejudice against Australian salt beef on account of the inferior article which we have hitherto put up, and the American packers and their agents in London will use every effort to prevent the trade coming to Australia.

XII.—HOW THE AMERICAN SHIPMENTS OF LIVE STOCK AND MEAT ARE DISPOSED OF.

I have already made a passing allusion to the effective manner in which the shippers of live stock, meat, and other products from the United States—who are said not to exceed half a dozen in number—push their sale. They have thoroughly reliable agents in the countries to which their consignments are sent, who not only see that they are disposed of to the best advantage, but narrowly watch the markets and keep their principals advised as to their prospects. It is believed, too, that, notwithstanding the trade rivalry between the different shippers, their agents—several of whom are members of the firms they represent—co-operate as far as possible in preventing the shipment of our supplies from the States, and in regulating prices and saving the consignments from being sacrificed. But, while this is said to be the case, I understand that the co-operation is only temporary, and the arrangement as to prices a verbal one. The shippers' agents dispose of large quantities of the consignments themselves; but a good deal of them are also placed in the hands of auctioneers, brokers, and salesmen, who dispose of them under the close supervision of the shippers' agents.

XIII.—THE BEARING THE UNITED STATES BEEF TRADE HAS ON THE PRICE OF FROZEN MUTTON.

I have gone at considerable length into the particulars of the American beef trade with the United Kingdom into both the live stock and chilled meat trade because, although the importations from New South Wales at least will consist principally of sheep, the American cattle trade, more especially in the shape of chilled beef, has a very important bearing on the price of our frozen mutton in England. For those who purchase frozen mutton also at times buy chilled beef, and as the majority of them prefer beef to mutton, the result is that when the price of chilled beef is so low as to be only a little higher than frozen mutton, the beef is purchased in preference to the mutton. Then again, the American shippers are so very much nearer to England than those in Australia, and so very well and promptly advised by their agents as to the state of the meat market and its prospects, and have always ample supplies of beef at their command, that they can take advantage of the slightest rise in the market, and send over at once full supplies of beef.

And, notwithstanding that it frequently sells at prices which, taking those quoted in the Chicago market and those realised in England, must, after paying freight and charges, be anything but remunerative to the shippers, heavy shipments continue to arrive every week, and, of course, have a depressing effect on the Australian and New Zealand frozen meat trade.

The effect of the American supply on the British meat market will, however, be better grasped by our owners when the enormous quantities which were sent over during last year, in the shape of cattle and chilled beef to Great Britain, is put into the equivalent of Merino sheep weighing (say) 50 lb. each thus:—

	Sheep.
248,825 live cattle, each 900 lb. dressed weight, is 223,942,500 lb., or, say	4,478,850
14,589,949 cwt. fresh beef, which is, say	3,337,485
	<hr/>
Equivalent	7,816,335

That is to say, the quantity of beef sent in 1893 by the United States to Great Britain is considerably more than twice as much as the mutton shipped there by all the Australian Colonies, while American supply for that year was less than that for each of the previous three years.

XIV.—

XIV.—WILL PRESENT EXTENSIVE SHIPMENTS FROM THE UNITED STATES OF FAT CATTLE AND CHILLED BEEF CONTINUE?

I have heard the remark repeatedly made that it is only a question of comparatively short time when the United States, with the rapid increase of population from natural growth and immigration, will require all the meat she can produce, or, at least, that with these additions to her population, meat will rise to a figure which must make the price too high to export, and, of course, that Australian beef and mutton would then bring better prices.

As will be seen from the figures I have already quoted, there was a considerable falling-off last year in both the live cattle shipments and those of chilled meat; but, as I have shown, this decrease was only a temporary one, for the shipments of both live cattle and fresh meat have been heavy since the beginning of the present year, notwithstanding that the prices received in England for both the live cattle and meat were apparently unremunerative. But even if the supply of meat were to run so short in the United States as to diminish the quantity exported from that country, it would not fall solely to Australia to make up the deficiency; for not only is Canada steadily increasing the production of meat and shipping regularly to Great Britain, but the supply of beef and mutton from South America is bound both to improve in quality and increase in quantity, as there are large tracts of country in Argentine, and also in Uruguay and Paraguay, well adapted for cattle, still unstocked; and the improvement of the quality of both cattle and sheep is now making rapid progress in all parts of the world, and especially in Argentine.

But, apart altogether from the supplies which may come from the countries to which I have here alluded, in order more thoroughly to put our owners on their guard against relying on any considerable decrease in the shipments of live cattle and fresh meat to British and Continental markets, I fear that a shortage, such as that which some of our owners are expecting to take place in the United States, will not occur; for—what with the additions which are certain to be made there to the present area of land under tillage, with the improvements by fencing and water-conserving which will be effected on the native pastures, with the adoption of better systems of crop-growing, the laying down more land in cultivated grasses, the growing of roots, green crops, and in the breeding, management, and fattening of stock—it may, I think, be fairly assumed that the production of beef and mutton in the United States will, for a considerable time at least, keep pace with the growth of the population, especially if it should happen, as there seems to be considerable probability of its doing, that the emigration to America will not in the coming decade be so extensive as in the past. On this point see *Appendix B*, which gives an estimate of the meat supply of the United States and of the probable surplus for export. So much as regards the supply of meat likely to be sent from the United States. With respect again to the price at which it will pay stockowners and farmers to breed and fatten stock for export to the British and Continental markets, some idea of this may, I think, be gathered from what I have already stated, more especially from the *pro forma* statement which I submit in connection with the chilled meat trade; but I may add here on that point, that as there is no prospect of the land in the United States being turned to better account (grain-growing would not pay better) than by breeding and fattening stock, it must, I think, still be devoted to that purpose, and if so the stock must continue to be sent to the British and Continental markets; and it seems to be not so much a question of what price the American breeder and farmer considers it will pay them to produce and send meat to these markets, as what price the meat will bring in competition with that sent from New Zealand, Australia, and South America. That, in fact, the meat has to be produced in America and exported and sold for what it will bring. In any case the change, which those who make these statements expect, must be a gradual one; and as stockowners in this and the other Colonies need immediate relief, it will be for them to do their best, with the least possible delay, to make the advantages they possess of a more equable climate, better breeds of stock—more especially of cattle and cheaper food for them—more than counterbalance those which enables the American farmers not only to send their meat in a chilled, instead of a frozen, state to Great Britain, but also to ship live stock at a low rate of freight to the Deptford, Birkenhead, Glasgow, and other docks, where they bring better prices than those obtained for even chilled meat. When I say that our owners must do their best, I mean that they should breed and fatten stock of the primest quality and of the sort best suited for the markets to which they are to be exported; that, if sent away in the shape of meat, the works for its preparation should be of the best and most approved description, so arranged as to economise labour in all directions, and with so many and so very complete sets of appliances as to be able to deal not only with every class of stock, but even with every portion of each head of stock in the most advantageous manner; while every bit of the bi-products must be turned to the best account; and, above all, that there should be through co-operation, not only amongst owners in each Colony, but that the owners in all the Australian Colonies should as far as possible work together, especially in regard to the supply of shipping and the distribution and sale of the meat in the countries to which it is sent.

I have thought necessary here to say this much as to what owners should do; but I will, of course, when reporting on the sale of Australian meat in Great Britain and on the Continent, point out in detail the course which I think owners should take in disposing of their surplus stock, and give my reasons for the recommendations which I make.

APPENDIX A.

HAVING, in what I have already written, described the different ways in which the animal products of the United States are utilised and prepared for sale, I will here, by way of criterion as to their relative value, give the statement which appeared in the Annual Report of the Statistician of the Department of Agriculture of the United States for 1892.

Agricultural Exports, 1891 and 1892.

Animals and Articles.	Quantities.	Value.
Animals, living—		
Cattle	394,607	\$35,099,095
Horses	3,199	608,708

APPENDIX B.

ESTIMATE of the Meat Supply of the United States of America, and of the surplus for Exportation:—

<i>Population.</i>	
Population in 1890	62,622,250
Proportionate increase for 3 years, 1890-93	3,739,940
	66,362,190
<i>Consumption.</i>	
Say population, 66,000,000, consuming meat at rate of 120 lb. per head per annum ...	7,920,000,000 lb.

NUMBER OF CATTLE, SHEEP, AND PIGS, AND ANNUAL INCREASE:—

No. of Cattle in United States	52,095,568
Allowing increase at rate of (say) 11 per cent., would give...	5,730,511 Cattle
No. of Sheep in United States	45,048,017
Allowing increase at rate of (say) 13 per cent., would give...	5,856,242 Sheep
No. of Pigs in United States	45,206,498
Allowing increase at rate of (say) 47 per cent., would give...	21,247,054 Pigs

Production of Meat.

Cattle, 5,730,511, × 750 lb.	4,297,883,250 lb.
Sheep, 5,856,242, × 60 lb.	351,374,520 „
Pigs, 21,247,054, × 175 lb.	3,718,234,450 „
								<u>8,367,492,220 lb.</u>
Less quantity required for consumption	<u>7,920,000,000 „</u>
Estimated surplus for Export	447,492,220 lb.

Which is equal to (say) 8,949,844 Merino Sheep, at 50 lb. each.

1894-5.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMPORTED STOCK ACT OF 1871, AND THE IMPORTED
STOCK ACT AMENDMENT ACT OF 1884.
(REGULATIONS.)

Ordered by the Legislative Assembly to be printed, 26 February, 1895.

Department of Mines and Agriculture,
Stock and Brands,
Sydney, 25th January, 1895.

IMPORTED STOCK ACT OF 1871, AND THE IMPORTED STOCK ACT AMENDMENT ACT OF 1884.

THE following Regulations, which were made by His Excellency the Governor, with the advice of the Executive Council, for carrying into effect the provisions of the above-named Acts, relating to the importation and introduction of stock by sea into this Colony, are hereby published for general information.

SYDNEY SMITH.

1. Form O of the Regulations of the 10th January, 1893, as amended by the Regulations of the 14th September, 1894, is rescinded, and Form O which now applies solely to imported stock about to be introduced into the Colony, and which has in other respects been amended, is hereby notified in lieu thereof.

2. The fees for the inspection and transport of ship's stock, and the charges and expenses payable by such stock for sustenance or otherwise while in quarantine, shall be one-half the rate payable under Schedule O for stock intended to be introduced into the Colony.

Form O.—(Regulation 10.)

**IMPORTED STOCK ACT OF 1871, AND THE IMPORTED
STOCK ACT AMENDMENT ACT OF 1884.**

**SCALE OF TRANSPORT AND QUARANTINE CHARGES AND
EXPENSES FOR STOCK INTENDED TO BE INTRODUCED
INTO THE COLONY.**

Veterinary Surgeon's fees for inspection.

	£	s.	d.
Foreign horses and cattle.			
For one, and not exceeding four head, a fee of.....	1	1	0
For every additional head over four head, an additional fee of	0	5	0

Foreign sheep, goats, pigs, or dogs, and Australian sheep.			
For one and not exceeding 20 head	1	1	0
Any number from 21 to 50 head.....	1	5	0
" 51 to 100 ,,	1	10	0

If over 100, the charge instead of per number to be by the day or half-day, as the case may be, at the rate of £3 3s. per day.

*Charges for Transport of Stock to and from Quarantine.—
Payable each way.*

	£	s.	d.
Foreign horses or cattle.			
For one head.....	0	10	0
For every additional head arriving on board the same vessel	0	5	0

Foreign sheep, goats, or pigs.			
When conveyed with cattle or horses, every sheep, goat, or pig	0	1	0
When conveyed without cattle or horses, any number from 1 to 5	0	10	0
When conveyed without cattle or horses, any number from 6 to 20	1	0	0
When conveyed without cattle or horses, any number from 21 to 50	1	15	0

	£	s.	d.
When conveyed without cattle or horses, any number from 51 to 100	2	10	0
When conveyed without cattle or horses, any number from 101 and upwards	3	0	0

Foreign Dogs.

When conveyed with cattle or horses, every dog ...	0	1	0
When conveyed without cattle or horses, any number from 1 to 2	0	5	0
When conveyed without cattle or horses, any number from 3 to 10	0	10	0
When conveyed without cattle or horses, any number from 11 to 20	1	0	0
When conveyed without cattle or horses, any number from 21 upwards	1	10	0

Charge for sustenance in Quarantine, of foreign animals, per night.

Horses, per head	0	3	0
Cattle, per head	0	2	0
Pigs, each	0	0	6
Young pigs, under 2 months old	0	0	4
Sheep, per head	0	0	4
Dogs, per head	0	0	4
Pups, over 1 month and up to 3 months old	0	0	2
Pups, over 3 months	0	0	4

Keep of Australian sheep in Quarantine.

Sustenance and attendance per sheep per night	0	0	6
---	---	---	---

Dipping Foreign and Australian Sheep—each dressing.

1 sheep	0	10	0
2 sheep, and not more than 5 sheep, per sheep... ..	0	5	0
6 sheep, and not more than 10 sheep, per sheep... ..	0	3	0
11 sheep, and not more than 20 sheep, per sheep... ..	0	2	0
21 sheep, and not more than 40 sheep, per sheep... ..	0	1	6
41 sheep, and not more than 100 sheep, per sheep... ..	0	1	0
101 sheep, and not more than 200 sheep, per sheep... ..	0	0	9
201 sheep and over, per sheep	0	0	6

N.B.—Besides the charges and expenses specified above for inspection, transport, sustenance, and dipping, the cost and expense of disinfecting stock, or the vessel by which they arrive, or the fittings thereof, or the effects of their attendance, as well as all other charges and expenses of every description incurred through the importation of foreign or Australian stock, shall be paid by their owner to the Inspector.

1894.

(SECOND SESSION.)

NEW SOUTH WALES.

IMPORTED STOCK ACTS, 1871 AND 1884.

(NOTIFICATION OF CANCELLATION OF FORM O, REGULATION 10, AND SUBSTITUTION IN LIEU THEREOF.)

Presented to Parliament, pursuant to Act 35 Vic. No. 6, sec. 13.

Department of Mines and Agriculture,
Stock and Brands,
Sydney, 14th September, 1894.

IMPORTED STOCK ACT OF 1871, AND THE IMPORTED STOCK ACT AMENDMENT ACT OF 1884.

His Excellency the Governor, with the advice of the Executive Council, has been pleased to cancel Form O of the Regulations of 10th January, 1893, issued under the abovenamed Acts, and to substitute the following in lieu thereof.

SYDNEY SMITH.

Form O.—(Regulation 10.)

1894.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

IMPORTED STOCK ACTS FURTHER AMENDMENT BILL.
(MESSAGE No. 30.)

Ordered by the Legislative Assembly to be printed, 22 November, 1894.

R. W. DUFF,
Governor.

Message No. 30.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Governor recommends to the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with "A Bill to amend the Imported Stock Act of 1871, and the Imported Stock Act Amendment Act of 1884; and for other purposes in connection therewith."

Government House,
Sydney, 22nd November, 1894.

1894-5.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

BATHURST COMMON.

(PETITION FROM RESIDENTS OF BATHURST AGAINST THE RESUMPTION BY THE GOVERNMENT OF PORTION OF THE BATHURST COMMON, FOR THE PURPOSES OF A MODEL FARM.)

Received by the Legislative Assembly, 13 March, 1895.

To the Speaker and Members of the Legislative Assembly, in Parliament assembled.

The humble Petition of the undersigned, residents of the City of Bathurst, and persons entitled to the use and enjoyment of the Bathurst Common,—

SHOWETH :—

1. That we are informed it is the intention of the Government to resume a portion of the Bathurst Common for the purposes of a Model Farm.

2. That we beg to respectfully enter an objection to such a proceeding.

Your Petitioners therefore humbly pray that your Honorable House may be pleased to give effect to your Petitioners' request and refuse to sanction such a resumption.

And your Petitioners, as in duty bound, will ever pray, &c., &c., &c.

[Here follow 349 signatures.]

1894-5.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

RESUMPTION OF PORTION OF BATHURST COMMON
FOR MODEL FARM.

(PETITION FROM CERTAIN INHABITANTS OF THE CITY OF BATHURST AND SURROUNDING DISTRICT,
IN FAVOUR OF.)

Received by the Legislative Assembly, 2 April, 1895.

To The Honorable the Speaker and Members of the Legislative Assembly of New South Wales.

The humble Petition of certain inhabitants of the City of Bathurst and surrounding district,—

SHOWETH :—

That your Petitioners are gratified to know that certain lands in the vicinity of Bathurst have recently been resumed for the purposes of a model farm.

That your Petitioners have learned with regret that notwithstanding such resumption, certain steps are being taken by petition to your Honorable House with a view to having the resumption cancelled.

That your Petitioners are still of opinion that such resumption will largely benefit agriculturists and others in the western districts, by being the means of imparting instruction and information, and forwarding agricultural pursuits generally.

That your Petitioners are desirous that operations should at once be commenced to bring the resumption referred to into practical effect.

Your Petitioners, therefore, humbly pray,—

1. That the said resumption be maintained.
2. That operations be at once commenced to bring the resumption referred to into practical effect.

And your Petitioners, as in duty bound, will ever pray.

[Here follow 764 signatures.]

(SECOND SESSION.)

NEW SOUTH WALES.

VINE DISEASES ACT, 1893.

(REGULATION UNDER.)

Presented to Parliament, pursuant to Act 56 Vic. No. 22, sec. 52.

Department of Mines and Agriculture,
Sydney, 31 July, 1894.

VINE DISEASES ACT OF 1893.

PURSUANT to the provisions of the Act 56 Victoria No. 22, section 52, His Excellency the Governor, with the advice of the Executive Council, hereby makes the following Regulation:—

For the purposes of the election of Members of the Board of any Vine District proclaimed under the Act aforesaid, each vinegrower whose name and address appear upon the Vinegrowers' Roll of any such District shall be entitled to vote within the District to which such Roll refers in accordance with the scale hereunder mentioned:—

Area of Vineyard.	Number of Votes to which the Owner or Occupier is entitled.
1 acre and under... ..	One vote.
Over 1 acre and up to 2 acres	Two votes.
Over 2 acres and up to 3 acres... ..	Three votes.
Over 3 acres and up to 5 acres... ..	Four votes.
Over 5 acres and up to 10 acres	Five votes.
Over 10 acres and up to 20 acres	Six votes.
Over 20 acres and up to 40 acres	Seven votes.
Over 40 acres and up to 75 acres	Eight votes.
Over 75 acres and up to 100 acres	Nine votes.
Over 100 acres	Ten votes.

T. M. SLATTERY.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

VINE DISEASES BILL.
(MESSAGE No. 55.)

Ordered by the Legislative Assembly to be printed, 3 April, 1895.

FREDK. M. DARLEY,
Lieutenant-Governor.

Message No. 55.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Lieutenant-Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill relating to Vine Diseases; to prevent the introduction into this Colony, or removal from place to place in this Colony, of diseased grapes or grape vines, or any insect or other pest, or any other matter or thing which may injuriously affect any grape vine or vineyard; and to eradicate any disease affecting grapes, grape vines, or vineyards; to quarantine and, if necessary, destroy any grapes, grape vine, vineyard, package, or implement; to proclaim vine districts; to appoint a Central Board; and for other purposes incidental thereto; and to repeal the Act 56 Victoria No. 22.

*Government House,

(MESSAGE NO 56.)

Ordered by the Legislative Assembly to be printed, 3 April, 1895.

FREDK. M. DARLEY,
Lieutenant-Governor.

Message No. 56.

In accordance with the provisions contained in the 54th section of the Constitution Act, the Lieutenant-Governor recommends for the consideration of the Legislative Assembly the expediency of making provision to meet the requisite expenses in connection with a Bill to prevent the introduction of, and to eradicate diseases affecting fruit trees; to prevent the introduction of, and to destroy any insects, birds, or animals which are injurious to fruit trees; to inspect, and, if necessary, quarantine, any orchard, building, or place containing or supposed to contain any infected trees, plants, or fruit, and to destroy any such tree, plant, or fruit, or any insect, bird, or animal; and for any purposes incidental thereto.

*Government House,

COOTAMUNDRA RACECOURSE - BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred on the 30th October, 1894, "*The Cootamundra Racecourse Bill*,"—beg to report to your Honorable House:—

That they have examined the witnesses named in the list (whose evidence will be found appended hereto); and that the Preamble having been satisfactorily proved to your Committee, they proceeded to consider the clauses of the Bill, in which it was not deemed necessary to make any amendment.

Your Committee now beg to lay before your Honorable House the Bill without amendment.

JNO. F. BARNES,
Chairman.

No. 1 Committee Room,
Sydney, 1st November, 1894.

1894.

PROCEEDINGS OF THE COMMITTEE.

THURSDAY, 1 NOVEMBER, 1894.

MEMBERS PRESENT:—

Mr. Barnes,		Mr. Fitzpatrick,
Mr. Carroll,		Mr. Watson,
Mr. Travers-Jones.		

Mr. Barnes called to the Chair.

Entry from Votes and Proceedings appointing the Committee *read* by the Clerk.

Printed copies of the Bill *referred*, together with original Petition to introduce same before the Committee.

Present:—T. P. MacMahon, Esq. (*Solicitor for the Bill*).

Frederick A. Pinkstone called in, sworn, and examined.

Witness withdrew.

Solomon Cohen called in, sworn, and examined.

Witness withdrew.

William Hall Matthews called in, sworn, and examined.

Room cleared.

Preamble considered.

Question,—“That this Preamble stand part of the Bill,” put and passed.

Clauses 1 to 29 read and *agreed to*.

Title read and *agreed to*.

Chairman to report the Bill, without amendment, to the House.

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

COOTAMUNDRA RACECOURSE BILL.

THURSDAY, 1 NOVEMBER, 1894.

Present:—

MR. WATSON,	MR. CARROLL,
MR. TRAVERS-JONES,	MR. FITZPATRICK,
MR. BARNES.	

J. F. BARNES, ESQ., IN THE CHAIR.

Mr. MacMahon, Solicitor, appeared for the promoters of the Bill.

Mr. Frederick A. Pinkstone called in, sworn, and examined;—

1. *Mr. MacMahon.*] What is your occupation? I am a journalist.
2. You reside at Cootamundra? Yes.
3. Do you produce the grant of this land? I do.
4. Is the description in that grant similar to the description contained in the Bill now before the Committee? Yes; it is the same.
5. The present trustees of the land are John Frederick Barnes, Patrick James O'Donnell, James Connell, Solomon Cohen, and Frederick Pinkstone? Yes.
6. Who were the original trustees? John Frederick Barnes, Patrick James O'Donnell, William George Archer, Frederick Pinkstone, and Edward Strongitharm.
7. What became of Archer and Strongitharm? Archer removed from the district and resigned; Strongitharm is deceased.
8. And I believe that Mr. James Connell and Mr. Solomon Cohen were appointed in their places? Yes.
9. What were the purposes for which the land was granted to the trustees? It was granted for racing purposes and for a recreation ground.
10. Does the grant provide that the trustees shall have power to make rules and regulations? Yes.
11. Also that the Government shall have power to appoint new trustees? Yes.
12. Have the trustees for many years past permitted members of the Cootamundra Turf Club to have the use and enjoyment of the land for horse-racing? Yes; for the past seventeen or eighteen years.
13. Have the Cootamundra Turf Club expended large sums of money in making, forming, and improving the racecourse in sowing grasses, planting trees, and erecting stands on the land? Yes.
14. How much have they expended altogether? I should say over £2,000.
15. Is the club desirous of erecting and maintaining other improvements on the land which will require a large outlay? Yes; they contemplate making other improvements, including the removal of the grandstand to another site, which will entail an expenditure of perhaps £1,000.
16. Is it necessary, in order to enable them to raise that money, that the trustees should be empowered to grant leases of the land to the said club? It is absolutely necessary.
17. Is that the only way that the money referred to can be raised? Yes. Hitherto we have been personally responsible for the amount of £1,000. In these times we do not like to undertake personal responsibilities in such matters.
18. Are the trustees desirous of obtaining such advantage? Yes.
19. Are they members of the club? Yes, all the trustees have been members during my time.
20. Are you a member of the club? Yes.
21. What position do you hold? I am a committee-man.
22. How have the club signified their willingness to accept a lease? They are the originators of the movement for the passing of the Bill to enable the leases to be granted.
23. Did they pass a resolution to that effect? They did.

Mr. F. A.
Pinkstone.
1 Nov., 1894.

Mr. F. A.
Pinkstone.
1 Nov., 1894.

24. Has any action been taken by any subscribers to the club of a contrary nature? No; due notice has been given publicly extending over some months of the intention to apply for the Bill, but there has been no opposition to it.
25. Has application been made to the trustees for the lease? Yes; but we find that they have not got power to grant a lease. Hence the necessity for the Bill.
26. Have there been any other organised public amusements held on the course? No; it has been used almost exclusively for racing purposes. There are other grounds about the place suitable for purposes of amusement.
27. What other grounds do you refer to? The public park in the town, about 12 acres, which is used for genuine recreation purposes. The Council has been granted a large domain outside the town, and the show people have about 30 acres.
28. Are all those lands that you have mentioned nearer to the town than the racecourse, and more convenient for the general body of the people? Yes; the recreation ground or park and the show-ground are right in the township. The domain is a little more convenient than the racecourse.
29. Are there buildings erected on the show-ground? Yes, a grand-stand and all the buildings necessary for show purposes.
30. Has any opposition been offered to the use of the racecourse for the purposes for which the ground was originally contemplated by the trustees or by the Cootamundra Turf Club? No; we have never had any collision with the people as to this grant at all.
31. As a matter of fact is the reserve used for any other purposes than for horse-racing and cricket and for picnicking? Up to the present it has been used almost exclusively for horse-racing. There was one coursing meeting on it, and there have been Sunday-school picnics on it. If the weather is uncertain they go on the racecourse to get the shelter of the grand-stand.
32. No objection has ever been offered to people going there? None whatever.
33. Have you any means of knowing whether the people of Cootamundra are opposed to the passing of the Bill or not? I have every means of knowing, especially being a journalist. It would be my duty to conserve the interests of the people. I have never known the people to be dissatisfied with the management of the ground.
34. To your knowledge has any petition been presented to Parliament against the passing of the Bill? No petition has been presented against it.
35. As far as you know there is not the slightest wish to prevent the reserve from being used for the various purposes contemplated by the grant? No.
36. So the passing of the Bill will not interfere in any way with any of these privileges? I am sure it would not.
37. In your judgment, will not the passing of the Bill have the effect of rather affording increased facilities for public amusement? Yes.
38. Do you think the racecourse could be made into a thorough recreation ground? Yes, it might be made of great use to the people for recreation purposes.
39. I presume that the Cootamundra Turf Club do not think themselves justified in spending a large sum of money in improving the racecourse unless they can obtain a lease? That is so; they want some security.
40. I suppose that if a lease were not granted the club would fall through? We fear that that would be the result. There is great difficulty in getting anyone to become personally responsible for the large amount of money that we wish to expend upon the ground.
41. I believe that hitherto certain persons have been personally responsible? Yes.
42. Who are they? The trustees.
43. Do you know for what amount they were responsible? They have been responsible for the amount of about £1,000 at one time.
44. *Mr. Watson.*] For what purpose? For the purpose of making improvements.
45. That is in addition to what was expended by the Turf Club? No; it is expended by the Turf Club with the sanction of the trustees. The money formally goes through the hands of the trustees.
46. *Mr. Carroll.*] The trustees are always the responsible parties? Yes.
47. *Mr. MacMahon.*] Has the Agricultural Society ever held a show on the ground? No.
48. Has the ground ever been refused to any public body at all? No.
49. Who has been mainly instrumental in improving the course? The club and the trustees have always been working harmoniously together, and they have assisted each other in the matter. The money has been raised by profits on race-meetings.
50. Then, as a matter of fact, all the money comes from the Turf Club? Yes.
51. Have you any idea of the by-laws intended to be submitted to the Executive under the Bill? They are framed on the same principle as the A.J.C. All our meetings are under the rules of the A.J.C.
52. I suppose that the present trustees are the leading members of the club? Yes; they are members of the committee.
53. I suppose the club embraces all the leading people in the district of Cootamundra? Yes; all who take an interest in racing.
54. And of the town of Cootamundra too? Yes.
55. Do you know what number of paying members there are in the Turf Club? About 150.
56. What is the annual subscription? One guinea.
57. So far as you know, is the Cootamundra Turf Club the leading race club in that part of the country? We generally have the largest attendance at our meetings in that part of the country. I have known the attendance to be as high as 4,000. Cootamundra being a junction of railways running in four directions, people concentrate in that place. The club has a high reputation throughout the Colony, and I believe it is the only club in the country which has been accepted by the consultation people.
58. It is the only country club on the races of which Mr. Adams would have a sweep? It is the only one that I know of.
59. I think you said you were not aware of any instance in which the Turf Club has refused the ground to any public body? I am sure that they never did.
60. Was there any charge? No; we have not been able to make any charge.
61. From your knowledge of the objects of the club, do you think it is likely they would charge anyone except on race days? I think not.

62. Has this rule been approved of by the trustees? Yes, they have all seen it, and given their approval. I approve of it myself, and I know from conversation with others that they are all in favour of it.

Mr. F. A.
Pinkstone.

63. The Bill, if passed, does not oblige the trustees to grant leases? No. It simply empowers them to grant leases.

1 Nov., 1894.

64. You believe that it would not in any way be detrimental to the public interests if this power were given? I believe it would not be detrimental to the public interest in any way whatever.

65. Have you any idea how much more money the Turf Club will require to complete the contemplated improvements? If they carry out all the improvements in contemplation it will cost another £2,000. They would like to make this racecourse a grand centre. We contemplate running a siding on to the racecourse.

66. *Mr. Watson.*] It will not leave you much out of £2,000 if you are going to make those contemplated improvements? It would certainly cost £2,000 to make them.

67. *Mr. MacMahon.*] You told us that there were other places for recreation? Yes. There is abundant provision for recreation of all kinds. There are the park, the domain, a large reserve, the rifle-butts, and the show-ground. The town is well furnished with public grounds of all kinds.

68. How far is the racecourse from the town? It is an incorporated borough, comprising 9 square miles, and the racecourse is on the north-east boundary.

69. *Mr. Watson.*] How far from the post-office? I should say that it is within 2 miles.

70. Is the course within the corporation boundaries? No; the grant commences on the boundary-road of the borough.

71. Have the corporation made any objection to this Bill? None whatever.

72. The reserves that you spoke about in the town—do they come under the Public Parks Act? One is regulated under the Public Parks Act.

73. Which is that? The Albert Park.

74. That is the one that you said contained 12 acres? Twelve or thirteen acres. It is highly improved.

75. Is the racecourse higher than the park? The racecourse is on the northern end of the town, and Albert Park is in the centre of it. The large domain is on the southern end of the town. The Council are the trustees for the Park.

76. *Mr. MacMahon.*] Is the racecourse subject to floods? It was subject to floods, but we spent a lot of money in drainage.

77. *Mr. Watson.*] What is the method of electing persons members of the club. Is it open to anyone to become a member? Anyone is eligible to become a member.

78. There are no conditions? No.

79. Has a candidate to run the gauntlet of a ballot? No; he has to be proposed in committee.

80. Therefore it is not necessarily open to anyone to become a member? A candidate has to be proposed, seconded, and elected. I never heard of anyone being rejected.

81. Are there any other clubs in that district for the purpose of carrying on racing? There is a pony and galloway club.

82. *Mr. Carroll.*] Do they use the same course? Yes; by permission.

83. *Mr. Watson.*] Have they made any objection to the Bill? None whatever.

84. You say the Turf Club have spent £2,000. Did the trustees become responsible for the money on behalf of the Turf Club? The trustees have been responsible for all the money spent by themselves and the Turf Club. The overdraft was £1,000, that being the highest amount at any one time that the account was overdrawn.

85. I understood you to say that the club had spent £2,000 in all? Yes.

86. That has been spent on the racecourse? Yes.

87. Then how could the trustees become responsible? All the expenditure has been through the trustees. The members of the Turf Club have not generally been responsible for the overdrafts. It was the trustees.

88. *Chairman.*] Is it not a fact that the trustees were answerable to the banks for an overdraft of £1,000? Yes.

89. During that time did not the Turf Club pay in a certain amount of money to the trustees, which was spent, but they were always liable for that £1,000 overdraft? Yes.

90. *Mr. Watson.*] It is proposed to borrow moneys;—is it proposed to mortgage the ground? No; to mortgage the lease. The ground could not be made valid security.

91. I did not know whether the Bill might not give you power to mortgage the ground? We are not asking for that power.

92. You do not think that there is any danger in giving this club the exclusive right to this ground for twenty-one years? There is no danger to anyone.

93. *Mr. Travers-Jones.*] As regards this money for which the trustees are responsible to the bank—has it been paid back? There is still part of it remaining for which we are responsible to the bank.

94. I suppose that this Bill is asked for in the interest of the general public of Cootamundra? Yes, I am sure of that.

95. *Mr. Carroll.*] I understand that the trustees are always responsible for all moneys in country race-clubs? Yes.

96. *Mr. MacMahon.*] Have the Cootamundra Turf Club power to prevent trespassers on the land or to prevent anyone from doing damage? No, that is our difficulty.

97. *Chairman.*] This Bill is brought in mainly to give the trustees power to sue or to be sued? Yes; and to preserve our property generally.

98. So that they will be able to turn off the course anyone who misbehaves himself? Yes; men with travelling stock are a great nuisance. They break the locks and get on to the ground in spite of us. We shall have to put on a caretaker to watch the ground.

Mr. Solomon Cohen called in, sworn, and examined:—

99. *Mr. MacMahon.*] What is your occupation? I am a storekeeper residing at Cootamundra.

100. Were you present when Mr. Pinkstone was examined? I was.

101. Were his answers true in every respect? Yes; I should like to tell the Committee the difficulties that we have to contend with. A great deal of trespassing takes place on the racecourse. We have it all improved and fenced in; but only the other day somebody broke it open and put in a flock of sheep, but

Mr.
S. Cohen.

1 Nov., 1894.

Mr.
S. Cohen.
1 Nov., 1894.

we are powerless to act. We keep the door locked and we have duplicate keys for the trainers who want to go and gallop their horses, but people break the fences down. I heard it stated some time ago that people could go on to the course on race-days without paying anything under this dedication. If that got known we should be ruined.

102. I believe some people have done so? I would not say that they have, but they have threatened to do it. The whole of our revenue is derived from the gate-money.

103. On race-days it costs the Turf Club a considerable sum of money does it not? We give away between £500 and £600 for the two days' racing.

104. So the club stands to lose a considerable sum of money? We could not hold races. We should have to give it up. The gates bring us in about £100.

105. *Chairman.*] There are only two meetings a year? Yes; the spring meeting and the annual meeting.

106. It is not made a trade of? No, it is only for pleasure.

107. How many days racing are there in the two meetings? Three days.

108. *Mr. Travers-Jones.*] The course is required for training purposes at other parts of the year? Yes; we have no training track at present but we want to make one.

109. This Bill will give you power to deal with trespassers? Yes, that we want to do. If a person breaks through a fence we have no power to act.

110. *Mr. MacMahon.*] Have you anything further to say? I can only reiterate what Mr. Pinkstone has said. There is not any objection to the Bill or to the trustees granting leases to the racing club.

111. *Mr. Watson.*] There has been no move in opposition to the Bill on the part of other clubs? Not at all. We get on amicably with them.

112. *Chairman.*] There was a little difficulty with the pony club? Yes; they said they would race there in spite of us. They used our grand-stand and our track, and they said that if we did not almost give it them for nothing they would race there in spite of us.

113. *Mr. Watson.*] In spite of whom? They say that under that dedication the trustees cannot stop them from racing there.

114. *Mr. MacMahon.*] Did the galloway club ever spend money on the course? Not at all. They make us spend money.

115. They are really imposing upon the Cootamunda Turf Club? Certainly. We have purposed holding a race meeting in, say, September, but they have advertised one for August, and they have gone and cut in before us tearing up the track and doing a great deal of damage which we had to spend money in repairing.

116. For which they do not recompense the club? They give very small recompense and they say that if we do not let them go there for what they offer they will go for nothing. All they give us for racing there is £3, and they have the use of the course, the paddocks, the saddle-cloths, and everything. The money received for admissions comes to £25 or £30.

117. *Mr. Travers-Jones.*] Has a protest been made by any public body against the passing of the Bill? No.

118. *Mr. Carroll.*] Are the public of Cootamundra aware that the Bill is before the House? Yes; it has been well advertised, and no one has the slightest objection to it.

119. But there is no intention to prevent the pony club from using the land? No, we would help them; a great many of the members of the Turf Club are members of the pony club.

Mr. William Hall Matthews called in, sworn, and examined:—

Mr. W. H.
Matthews.
1 Nov., 1894.

120. *Mr. MacMahon.*] I believe you reside at Cootamundra? I do.

121. How long have you been there? Twenty years.

122. I suppose you are aware that a piece of land at Cootamundra has been dedicated to the purposes of a racecourse? Yes.

123. Are you also aware that there is a racing club at Cootamundra? Yes.

124. You are also aware that they are making application to Parliament for a Bill to enable them to deal with the racecourse? Yes.

125. I believe this fact has been advertised several times in the local papers? Yes.

126. Do you know whether any objection has been taken to this Bill? I have not heard of any.

127. As far as you know there has been no petition presented to Parliament against it? There has been no objection whatever to it.

128. I suppose there is a large population at Cootamundra? About 2,500.

129. Do you think it would be beneficial to Cootamundra if the Bill were passed? I can see no disadvantage.

130. Do you know whether the Cootamundra club have spent much money on the ground? They have spent a great deal of money, and it is very well improved indeed.

131. *Mr. Watson.*] Sufficiently improved to require no more in that direction? All the ordinary improvements are there; but further improvement might be done in the direction of clearing the ground and planting ornamental trees.

132. *Mr. MacMahon.*] As far as you know the Cootamundra clubs have no power to charge anyone to go on the course? So I have been told.

133. Do you know whether they have power to deal with trespassers? I understand that the same difficulty exists in that respect.

134. You are not one of the trustees? No.

135. Are you a member of the Turf Club? No.

136. *Chairman.*] You are aware that this Bill is to give the trustees more power? Yes.

137. So that they can sue and be sued, and keep their course in order? Yes.

138. You are aware that any money derived from the course is to be expended on the course only? Yes, that is what I understand.

139. *Mr. MacMahon.*] I suppose you do not know whether the trustees are personally responsible for the overdraft? I have been told so.

140. *Mr. Carroll.*] In your opinion the passing of the Bill will not have the effect of depriving the people in the district of any privileges that they now enjoy? I do not think so.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

PRESBYTERIAN CHURCH PROPERTY MANAGEMENT
ACT AMENDMENT BILL.

TUESDAY, 27 NOVEMBER, 1894.

Present:—

MR. AFFLECK, MR. FRANK FARNELL,
MR. STOREY.

DAVID STOREY, ESQ., IN THE CHAIR.

John A. Aitken, Esq., appeared as solicitor for the Bill.

The Rev. William Scott Frackelton called in, sworn, and examined:—

1. *Chairman.*] What are you? I am a Presbyterian minister, at Randwick.
2. *Mr. Aitken.*] By virtue of your office, you are a member of the General Assembly of the Presbyterian Church of New South Wales? Yes.
3. So that you know all that the General Assembly has done in respect to the present Bill? Yes. I am also a member of the committee of the General Assembly entrusted with the carrying through of this Bill.
4. Is the Bill in the form in which it was approved by that committee? Yes; it is in the form approved of by the Committee and by the General Assembly.
5. Will you look at clause 1, in regard to the application of moneys arising from the sale of land held by the trustees. Do you know the reason of that clause being put in the Bill? Yes; the latter part of the clause contains these words:—"The proceeds arising from such sale in and towards the erection, improvement, or maintenance of a church, minister's dwelling-house, or school-house upon other lands vested in the said trustees in trust for the said congregation, or upon the unsold portion of any of the said first-mentioned lands." We already have an Act of Parliament, which gives us power to sell, called the Presbyterian Church Property Management Act, 1881. Under that Act we consider that we have this power in regard to the proceeds arising from the sale of land; but some are inclined to think that the wording of the Act is not sufficiently clear and distinct. There is no doubt as to the power of sale; but some thought that the power to use the money in this way might be doubtful, and the object in this clause is to make the point perfectly clear. The majority are satisfied with the provision in the existing Act, but one or two seem to think that it is not sufficiently explicit with regard to the point referred to.
6. Will you explain to the Committee why the power contained in clause 2, with regard to mortgage, which is one of the main provisions of the Bill, is being sought? A number of us, and also a number of solicitors, still think that the greater power, which consists in the ability to sell, covers also the power of mortgage.

The Rev
W. S.
Frackelton.

The Rev.
W. S.
Frackelton,
27 Nov., 1894.

mortgage. There are others who say that in order to mortgage an explicit power must be given by Parliament. Acting, as in past years, on the power which we thought we possessed, and which numbers of us still think we possess under the greater power—the question never having been tested in Court—we found that this had been done in some cases, done in good faith and good feeling that we had the right. These mortgages have been taken and interest has been paid upon them; but now, some of the mortgages falling due, this question has arisen again, and in order that everything may be right, and that the mortgagees may have the power to receive the mortgages rightly, we wish that this clause should be inserted, which only gives us a right intended to be given to us under the original permission to sell.

7. Will you explain why these mortgages were given instead of the land being sold? If we sold the land it would pass from our possession, and the result would be that land which should be kept for the purposes of the Church would become alienated. But by mortgaging, we are able to raise the money and erect a congregation, and thus gain a valuable property for the Church, and for the good of the community, without having to alienate our lands, which we should be compelled to do if we had not the power to mortgage.

8. And these mortgages would be given for erecting improvements on the land directly in connection with the objects of the trust? Yes. It is not to divert the trust, but simply to carry out the provisions of the trust more effectively than could otherwise be the case.

9. *Mr. Affleck.*] Under the power of sale contained in clause 2, might not the trustees sell the land for a sum less than the amount of the mortgage? The power of sale is subject to the mortgage, and there could be no interference with the right of the mortgagees.

10. *Mr. Aitken.*] Will you explain clause 4, which validates mortgages executed before the passing of the Bill? This clause is simply to validate mortgages as to which some doubt might now exist. The trustees, in a *bona fide* manner, and believing they had the right under the power to sell, have effected certain mortgages; and so that there shall be no misinterpretation hereafter, we ask Parliament to validate those mortgages for the protection both of the mortgagees and the trustees. If these mortgages are not valid, the mortgagees have no claim upon the Church; and if they are valid, this clause will simply declare so in an Act of Parliament. It removes any doubt; it protects those who lent the money in good faith, and it also protects the Church in the rights which it now has. The clause does not affect any of the trusts which now exist regarding the property; these must be carried out in their entirety. It does not violate any trust, nor make any trust invalid, or change it in any way.

11. Then you are clearly of opinion that it validates mortgages contracted for carrying out the objects of the trust, which objects could not have been effected by a sale of the land? Yes. All these mortgages have been given with the sanction of the General Assembly and of the congregations, according to the provisions of the Presbyterian Church Property Management Act.

12. Was the provision in clause 5 in regard to the appointment of special trustees also before the General Assembly of the Church? It was before the General Assembly, and was fully discussed, and its necessity was such that at the meeting of the General Assembly it was unanimously approved of. We felt the need of it, because the *ex-officio* trustees, the Moderator and the Clerk of the General Assembly, did not become *de facto* trustees unless trustees had been duly elected by the congregation. If money were left to the Church at large, it not being a congregation, these *ex-officio* trustees could not, in the opinion of the judges, become trustees in respect of that money, unless other trustees were also appointed. Instead of having individuals specially appointed as trustees, it has been thought better to have a continuous trust, composed of the Moderator and the Clerk of the General Assembly and the Conveners for the time being of certain Standing Committees of the General Assembly elected year by year. In this way we have a continuous trust which is not broken.

13. Will you explain to the Committee who these officers are to whom reference is made in the clause? The Moderator is the chief head of our Church, and he is constitutionally elected from year to year. The "Clerk for the time being of the said General Assembly" is the official who communicates all actions of the Assembly, and attests all acts which are done, and he is elected for life, or during good behaviour. The "Chairman for the time being of the Treasurership Committee" is chairman of the committee which has control of the general funds of the Church, apart from the congregational funds, and he also is elected annually by ballot. The next officer is the "Convener for the time being of the Sustentation Fund Committee." This is a committee which receives and controls the money paid in to the officers in order to pay the different ministers of the Church, and to supplement their income in the smaller charges when there is an excess of money. This fund has received donations, and therefore we thought it proper that the chairman of the committee should be a member of the trust, as probably a large sum in gifts and donations will in future be given specially to this Sustentation Fund. It has received a large number of gifts already, by will and otherwise, amounting to a large sum of money. The other officer mentioned in the clause is the "Convener for the time being of the Church Property Law and Documents Committee of the said General Assembly." This is a committee which is elected by the General Assembly, and its duty is to look into all titles, to see that the Church property is carefully looked after, and to deal with every application for mortgage or sale before it comes to the General Assembly. The convener of this committee has a full knowledge of all Church property. Any property left to the church would pass into the control of this committee rather than into the control of any other committee of the Church. These were the reasons why the officers mentioned were specially chosen to administer the trust.

14. *Chairman.*] Is it a fact that as the law now stands, if money is left to the Presbyterian Church as a body, there are no trustees to receive it? There are no trustees to receive it, simply because the *ex-officio* trustees do not become trustees *de facto* until another body is elected, and we have no power to elect a body for the whole Church at large, but only for a congregation.

15. In a case of that kind, what would be the procedure; would it be necessary to apply to the Court of Equity to have trustees appointed? Either that, or to apply to Parliament to have a special Act. The officers who have been chosen form a perpetual trust, with power of removal on the part of the General Assembly in case of the non-election of any trustee who might not act in accordance with the judgment of the General Assembly. This matter has been most carefully thought out, and the provision in the Bill has the unanimous approval of the General Assembly.

Mr.

Mr. William Wood called in, sworn, and examined :—

16. *Chairman.*] What are you? I am at present acting secretary of the Presbyterian Church of New South Wales. Mr. W. Wood.
27 Nov., 1894.
17. *Mr. Aitken.*] You are an elder of the Church? I am an elder of the Church, and I hold a seat in the General Assembly by virtue of my appointment to represent a congregation there.
18. Will you explain to the Committee, briefly, the urgency which exists for the passing of the present Bill? I have a special set of documents here, including an application from one congregation, which affords a very good illustration of the extreme urgency for the measure. It is an application from a congregation at Kempsey for relief in this particular direction. They had a loan, by overdraft, from a Bank over their church property. One of the guarantors for this loan died, and the executors foreclosed. They said they must have this money repaid for which this particular executor had become responsible, and they now demand the money. The trustees for the congregation have succeeded in obtaining a provisional mortgage. It is really a friendly act by one of themselves to prevent trouble or litigation on the part of the trustees of the deceased person. Unless this Bill is made law before the meeting of our next General Assembly, about the 7th or 8th March, we cannot give relief in this particular case. We also desire, at the same time, to give relief to other congregations similarly situated.
19. Could you give the particulars of other cases if necessary? Yes. I might mention that I am in a position to assure the Committee that every step has been taken legally from a Church law point of view in regard to the introduction of this Bill. I have in my hand a formal extract, signed by the Clerk of the General Assembly, stating that a *pro re natâ* meeting was properly called, and giving the finding of the Assembly authorising the Church Property Law and Documents Committee to take all necessary steps for the introduction of this Bill.
20. Is it not also a matter of urgency for the protection of some of the properties? Yes; it is absolutely necessary for the protection of properties that this power should be obtained. For instance, where a mortgage has become due for renewal, the mortgagees refuse to renew, and threaten to take over the property from the Church entirely, and unless we are able to show them by virtue of this Bill that we have the power to renew, the mortgagees will not renew, but will foreclose on the property, which is a very valuable one in an inland town.
21. *Chairman.*] Is it a fact that under the Act of 1881, although the Church has power to sell, yet if it sells part of a Church property it has not power to build upon the remaining portion of that property? That is so. Under section 13 of the present Act, if we have a piece of land with a church upon it, and there is a heavy debt on the property, and if there is a valuable site with a frontage adjoining, and we sell it, we cannot apply the proceeds towards the liquidation of the debt on the building erected on the other portion of the land; but we must apply the proceeds to the purchase of another piece of land and build elsewhere. One of the objects of the Bill is to relieve the trustees from such an awkward position as that, and to enable them to do what is a businesslike and natural thing to do, namely, to liquidate the debt on the property on the remaining portion of land if they think fit to do so.

HOLT'S WINGELLO ESTATE BILL.

REPORT.

THE SELECT COMMITTEE of the Legislative Assembly, for whose consideration and report was referred on 13th November, 1894, "Holt's Wingello Estate Bill," beg to report to your Honorable House:—

That they have examined the witnesses named in the List* (whose *See List, p. 4. evidence will be found appended hereto) and that the Preamble having been satisfactorily proved to your Committee they proceeded to consider the Bill, in which it was deemed necessary to make an amendment.

Your Committee now beg to lay before your Honorable House the Bill as amended by them.

THOMAS BAVISTER,
Chairman.

*No. 2 Committee Room,
Legislative Assembly,
5th December, 1894.*

PROCEEDINGS OF THE COMMITTEE.

WEDNESDAY, 5 DECEMBER, 1894.

MEMBERS PRESENT :—

Mr. Bavister,		Mr. Hassall,
Mr. Russell Jones,		Mr. Rose.

Mr. Bavister called to the Chair.

Entry from Votes and Proceedings, appointing the Committee, *read* by the Clerk.

Printed copies of the Bill referred, together with original Petition to introduce same, before the Committee.

Present :—Cecil Cowper, Esq. (*Solicitor for the Bill*).

Cecil Cowper sworn and examined.

Witness produced lease, dated 3rd November, 1884, from Thomas Holt to Alfred William Holt, of the Wingello Park Estate; probate of will of Thomas Holt, deceased; disclaimer by Alfred William Holt, dated 31st January, 1889, of his life interest in the beforementioned will; indenture of assignment and counterpart assignment of rents from F. S. E. Holt and W. H. Holt to A. W. Holt; deed of appointment of new trustees of the will of Thomas Holt, appointing the Perpetual Trustee Company (Limited); copy of a decree of the Supreme Court of New South Wales in Equitable Jurisdiction, dated 2nd March, 1894.

Arthur John Mackenzie (*Manager of the Perpetual Trustee Company, Limited*) called in, sworn, and examined.

Witness withdrew.

Alfred William Holt called in, sworn, and examined.

Room cleared.

Preamble considered.

Question,—“That this Preamble stand part of the Bill,” put and passed.

Solicitor called in and informed.

Clauses 1 and 2 read and agreed to.

New clause to stand as clause 3 read and agreed to.

Schedule read and agreed to.

Title read and agreed to.

Chairman to report the Bill, with an amendment, to the House.

SCHEDULE OF AMENDMENT.

Page 3. Insert the following new clause to stand as clause 3 :—

Short title.

3. “This Act may be cited as the ‘Holt’s Wingello Estate Act of 1894.’”

(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON

HOLT'S WINGELLO ESTATE BILL.

WEDNESDAY, 5 DECEMBER, 1894.

Present:—

MR. HASSALL,		MR. ROSE,
MR. RUSSELL JONES,		MR. BAVISTER.
THOMAS BAVISTER, Esq., IN THE CHAIR.		

Cecil Cowper, Esq., appeared as Solicitor for the Bill.

Cecil Cowper, Esq., sworn and examined:—

1. *Chairman.*] You produce the necessary documents in this case? Yes; first a lease dated November 3rd, 1884, from Thomas Holt to Alfred William Holt, of about 700 acres of freehold land, known as the Wingello Park Estate, for ninety-nine years, from the date of giving up possession by the then present tenant. That is practically the date of the lease; he gave up possession at once. The lease contains a clause that the lessee shall not assign or underlet the premises during the said term without the license of the lessor, in writing in that behalf first obtained. I also produce probate of the will of Thomas Holt, deceased, dated January 30th, 1889, the testator having died on 5th September, 1888. I also produce a disclaimer by Alfred William Holt of his life interest in the before-mentioned will, such disclaimer being dated 31st January, 1889. I also produce indentures assigning the rents, dated 5th March, 1889, from F. S. E. Holt and W. H. Holt to Alfred William Holt. I also produce deed of appointment of new trustees of the will of Thomas Holt, dated 10th March, 1893, appointing the Perpetual Trustee Company (Limited) to be trustees of the will. I also produce a copy of a decree of the Supreme Court of New South Wales in its equitable jurisdiction, dated 2nd March, 1894, and I can say that that is a true copy of the original decree.

C. Cowper,
Esq.
5 Dec., 1894.

Arthur John McKenzie, Esq., sworn and examined:—

2. *Mr. Cowper.*] You are manager of the Perpetual Trustee Company? Yes.
3. Do you know, as a trustee, of any objection to the passing of the Bill? No.
4. Would your company give a general waiver of restriction if they could do so? Yes. I know of no reason why they should not.
5. But, as a matter of fact, you are advised by the company's lawyer that they can give no consent, because they are the trustees? Yes.
6. And also, as a matter of fact, if they gave such consent it would only operate as regards the first tenant of the land? That is so.
7. Any subsequent tenant would have to come back to the Trustee Company? It would have to go through the same process again.
8. Can you say whether the interest of the beneficiaries under Thomas Holt's will will be in any way prejudicially affected? I should say not in any way at all.

A. J.
M'Kenzie,
Esq.
5 Dec., 1894.

Mr. Alfred William Holt sworn and examined :—

- Mr. A. W. Holt.
5 Dec., 1894.
9. *Mr. Cowper.*] Was the property comprised in the lease which has been put before the Committee the property of your father? Yes.
 10. Was the covenant contained in that lease to the effect that you were not to assign or underlet the premises contained in the lease during the term without the license of the lessor introduced into the lease by inadvertence and mistake? It was.
 11. Have you only recently ascertained the effect of the covenant? Yes.
 12. You know the property well? Yes.
 13. What is the nature of it;—what is it suitable for? For agricultural purposes—orchards and small farms.
 14. Is it a suitable property for subdividing and subletting to small tenant farmers? I think so.
 15. Can you say whether any interests under Thomas Holt's will will be prejudicially affected by the passing of the Bill? Not that I know of.
 16. Is it expedient that you should have power to assign or underlet the lands contained in that lease for the whole or any part of the term still subsisting without first obtaining the aforesaid license in writing? Certainly.
 17. And is it also expedient that the said indenture of lease should be rectified by striking out therefrom the covenant before mentioned? Certainly.
 18. You are a widower, and you have three children? Yes.
 19. That is to say, Claude Alfred Wallis Holt and two female children, all of whom are infants? Yes.
 20. Your brother, Walter Henry Holt, is married? Yes.
 21. And has issue one female child, and she is an infant? Yes.
 22. You can say that all the daughters of Thomas Hall are unmarried? Yes; so far as I know.
 23. *Mr. Rose.*] How many acres are there in the estate? 1,228.
 24. What is the real object of dividing the land; will it be leased to more advantage? I think it will, because there is no land available in the district. Nearly the whole of the available Crown lands are taken up for agricultural purposes.
 25. The estate is within 5 miles of the railway? Yes.
 26. And upon its adjacent position to the railway you base the opinion that small farms are more suitable than they would be if they were a distance away? Yes.
 27. *Mr. Russell Jones.*] Without getting this power the land is tied up for ninety-nine years? I am utterly powerless and cannot deal with it.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE SELECT COMMITTEE

ON THE

NEPEAN COTTAGE HOSPITAL BILL.

WEDNESDAY, 24 APRIL, 1895.

Present:—

MR. LEES,		MR. LAW,
MR. BARNES,		MR. FRANK FARNELL,
	MR. STEVENSON.	

S. E. LEES, ESQ., IN THE CHAIR.

Mr. George Charles King Waldron called in, sworn, and examined:—

1. *Chairman.*] Are you a solicitor of the Supreme Court, and do you appear for the promoters of this Bill? Yes. Mr. G. C. K. Waldron.
2. Will you state the objects of the Bill? The object is to enable the trustees of the present Nepean Cottage Hospital to deal with a parcel of land which was vested in trustees of a hospital in the Penrith district long since fallen into disuse. The committee of the present hospital have selected a new site, and commenced the building of an hospital which will be suitable for the requirements of the place. The site of the old hospital is now useless for all hospital purposes, and it is desirable that the proceeds of the sale or exchange of that site shall be devoted to the new hospital. Satisfactory arrangements have been made in the opinion of the trustees and subscribers of the Nepean Cottage Hospital, and those arrangements now merely require the passage of this Bill to be carried into effect. 24 April, 1895.
3. *Mr. Farnell.*] Do you know whether the land was a deed of gift or whether it was purchased originally? I will produce the deed; it expresses a consideration of £50; it is dated 1856.
4. Can you tell us by whom the original trustees were appointed? No; but the land was vested in them by this deed for an estate with which they could have dealt. I will show that they are dead, and that no successors have been appointed to them.
5. Has the new site for an hospital been purchased? Yes, and it has been duly conveyed, and a building is in course of erection.
6. *Chairman.*] Do you know that the old hospital building is in a dilapidated and dangerous condition? Yes.

Mr. John Kyngdon Cleeve called in, sworn, and examined:—

7. *Chairman.*] Are you a police magistrate in the Penrith district? Yes.
8. For how long? About eight or ten years; but I have been a resident at Penrith since January, 1868. Mr. J. K. Cleeve.
9. *Mr. Waldron.*] Have you been connected with Penrith for many more years than that? As a visitor only. I lived just outside the district, at my father's place, for a number of years before that. 24 April, 1895.
10. Between 1868 and 1871 were you appointed treasurer of an hospital then established at Penrith? Yes; I became treasurer in the latter part of 1868, and remained in that office until the closing of the hospital in 1870 or 1871.
11. In your capacity as treasurer did you hold a certain deed and papers connected with the hospital? Yes; I produce the deed referred to. 12.

- Mr. J. K. Cleeve.
24 April, 1895.
12. Does that deed purport to be a conveyance from Phillip Gidley King, of the one part, to Robert Copland Lethbridge, George Cox, and James Riley, all residents of the Penrith district, and for a consideration of £50 to vest in those gentlemen as trustees of a certain parcel of land, described in the deed, the trust being to apply the land as a site for an hospital and benevolent asylum, and generally subject to the trusts in the Act 11 Victoria, No. 59? Yes.
13. Do you know whether a building was erected for an hospital and benevolent asylum on that site? Yes.
14. Was it in connection with that building that you held your appointment as treasurer? Yes.
15. About the year 1870 did it become a matter of consideration as to whether further hospital operations should continue? Yes, for want of funds. The terminus of the railway was at Penrith until the latter end of 1867, and it was then removed to the mountains. A great many business people left Penrith, and we could not get sufficient subscriptions to carry on.
16. At that time were Mr. Lethbridge or Mr. Cox alive? When I first went there Mr. Lethbridge was dead, but Mr. Cox and Mr. Riley were both alive.
17. Was it after Mr. Cox's death that the question of closing the hospital arose? Yes.
18. In conjunction with Mr. Riley had you to formally consider the question? I used to take my instructions principally from Mr. Riley. I often had conversations with him.
19. Did you have a conversation with him about the destruction of papers connected with the hospital? That was seven or eight years ago, just prior to his death. I pointed out to him that having no private office they were an encumbrance in the office I was then using, and he ordered them to be destroyed.
20. Did you then destroy any records in your possession excepting that deed? Yes; they only consisted of receipts and things of that kind. The minute-book was destroyed.
21. Are any of the papers in existence now? No.
22. Since the year 1868 up to the present time have you personally known the old building and site? Yes.
23. Has it been used for hospital purposes? No; the poor people of the district were allowed to go and stop there.
24. Was it merely a question of not interfering with them when they went there? Yes. It was a large building and it was a good place for the poor people to take shelter, until we considered that it had become dangerous, and then we had to remove them for safety. I had to take the police up on two or three occasions to clear them out and to find places for them for fear of an accident. I also got all the clergymen of the district to warn their people not to go there as it was in such a dangerous state.
25. Was the building eventually taken down? Yes, and at present it is a vacant site.
26. Were successors to the trustees ever appointed? No. I often asked Mr. Riley to get others appointed, but he never would. They were the last trustees.
27. Do you know the site of the new hospital? Yes.
28. Do you know that a building is in course of erection there for hospital purposes? Yes.
29. *Mr. Farnell.*] What do you consider is the value of the old site? It would be hardly saleable just now. I daresay it would not bring more than £50, even if it were cut up.
30. Are you satisfied that it is not the most convenient site for an hospital as compared with the site secured lately? I was one of those who thought the old site was a good one, but I consider the new one is a good site.
31. *Mr. Stevenson.*] What is the area of the old site? About half an acre.
32. *Chairman.*] In the early days, when the old site was a good one, the railway was not so great a nuisance with regard to noise and vibration as it is to-day? There is a difference of opinion on that point. I thought that the haulage of material through Penrith up to the Mountains caused a great deal more noise than the running of goods.
33. Are you aware of the Government regulations as to the size of sites for hospital purposes? No.
34. *Mr. Barnes.*] Does the railway run near the site of the old hospital? There is just the width of the street and a few allotments.

Mr. William Perritt called in, sworn, and examined:—

- Mr. W. Perritt.
24 April, 1895.
35. *Chairman.*] What are you? I am an engine-fitter, residing at Penrith.
36. What connection have you with the Penrith Cottage Hospital? I was appointed honorary secretary to the committee three or four years ago, and I still hold the office.
37. *Mr. Waldron.*] Will you produce the minute-book of the meetings in connection with the hospital? Yes.
38. Will you read the minute of the meeting of 10th February, 1890, when the original trustees were elected? It states that at the adjourned meeting a ballot was taken, which resulted in the following gentlemen being appointed trustees:—Dean Mahony, George B. Besley, John Heron, and Thomas George Fuller Cadden.
39. Did Dean Mahony die on the 3rd January, 1892? Yes.
40. Do you produce a minute showing that Dean Mahony had died and that a successor had been appointed? Yes; the minute is dated 5th January.
41. Were you present at a meeting of the committee in 1891, when Mr. John Heron resigned? Yes.
42. Do you produce the minute of the 29th January, 1892, when the Rev. George Brown and John King Lethbridge were elected in the place of Dean Mahony and Mr. Heron? Yes.
43. As honorary secretary of the hospital can you say that Messrs. Cadden, Besley, Brown, and Lethbridge are the present trustees of the hospital? Yes.
44. Are those the gentlemen in whom it is proposed to vest the site of the old hospital? Yes.
45. Was there an old hospital in Penrith before your time? Yes.
46. Do you know of your knowledge that that has fallen into disuse? Yes.
47. Do you remember that in connection with the establishment of the new hospital several meetings were held of the public, and that committees were appointed to select a new site? Yes; meetings were held for over two years.
48. Did differences of opinion exist for a long time as to the sites? Yes.
49. Eventually was the site where the present building operations are going on selected? Yes.
50. Do you know that the site was generally approved of by the subscribers? Yes.
51. No objection was ever taken to the site itself, but the objections made were that other sites would have been more suitable? Yes.

ON THE NEPEAN COTTAGE HOSPITAL BILL.

52. Can you say that opinions are now quite at rest on the point that the present site is a good one? There is no objection now. Mr.
W. Perritt.
53. Do you consider that it is expedient to utilise the site of the old hospital for the purposes of the present one? Yes. 24 April, 1895.
54. *Chairman.*] What is the area of the old site? About 1 acre.
55. What is the area of the new site? 3 acres.
56. Do you know that Dr. Ashburton Thompson, on behalf of the Government, insisted on a larger site than 1 acre? Yes; he sent to me as secretary to the committee an intimation that in future it was desirable that no hospital should have less than 3 acres adjacent to the hospital.
57. Do you know that the new site is much higher than the old one? Yes.

Mr. Thomas Walter King Waldron called in, sworn, and examined :—

58. Mr. Waldron ;—are you a law student? Yes.
59. Do you produce the certificates obtained by you from the Registrar-General's Office of the death of James John Riley, George Cox, and Robert Copland Lethbridge, the two trustees named in the documents before the Committee? Yes. Mr. T. W. K.
Waldron.
24 April, 1895.

1894-5.

NEW SOUTH WALES.

FISHERIES OF THE COLONY.

(REPORT OF THE COMMISSIONERS OF FISHERIES FOR THE YEAR 1893.)

Presented to Parliament, pursuant to Act 44 Vic. No. 26, sec. 69.

The Acting Secretary to The Commissioners of Fisheries to The Principal Under Secretary.

Sir,

Department of Fisheries, Sydney, 1st March, 1895.

I have the honor, by direction of, the Commissioners of Fisheries of New South Wales, to transmit under separate cover, for the information of the Chief Secretary, the Report of the Commissioners of Fisheries for the year 1893.

* * * * *

I have, &c.,

FRED. W. SMITHERS,

Acting Secretary.

Report of the Commissioners of Fisheries for New South Wales on the Fisheries of the Colony, for the year ending the 31st December, 1893.

Sir,

We have the honor to submit our report on the Fisheries of the Colony for the year 1893.

Finance.

The revenue of the Department shows an increase of £696 4s. 6d. over that of 1892, due principally to the special pressure brought to bear on the holders of oyster culture leases to pay up rents which had fallen into arrears. There has been recovered in this way £1,606 14s. 4d.

In the issue of fishermen's licenses we record an increase of 225 upon the number taken out in 1892, increasing the revenue by £120 10s.

We show a slight decrease in the amount recovered in fines for breaches of the fisheries laws. We regard this as a healthy sign, showing that the fishermen are awakening to the importance of observing the laws which are being administered in the best known way for conserving the industry which they follow.

In the matter of expenditure, the amount placed on the original Estimates-in-Chief was £4,985. Later on in the year it became evident that very substantial retrenchment must be effected in the Civil Service generally, and in devising the scheme for carrying this into effect the Government instructed us that the expenses of the Department must not exceed £3,000. It therefore became imperative upon us to recast the staff on new and very reduced lines. How we accomplished this somewhat difficult task will be found explained at length in the succeeding paragraph.

Official Staff.

The necessity for a very substantial reduction in our staff became at once apparent. The fisheries at the various outposts on the coast, such as the Rivers Tweed, Richmond, Clarence, and other waters along the coast line southward to Cape Howe had hitherto been supervised by the pilots or other Government officials severally stationed at those waters. We decided as a first step to dispense with the services of these officers—some ten in number—thereby at once effecting a saving of £200. Also we

considered that we could dispense with some of our Inspectors, and arranged to retire the following:—Mr. Thomas Mullhall, Assistant Inspector at Sydney; Andrew Gylor, Assistant Inspector, Manning River; Henry Curran, Assistant Inspector, Hunter River; W. N. Cain, Assistant Inspector, Brisbane Water; Henry Laman, Acting Assistant Inspector, Port Stephens; also the following Acting Assistant Inspectors and boatmen—John F. Hespe, Botany and George's River; John Cain, Brisbane Water; James Massingham, Clarence River.

In addition, we terminated the services of the two inspectors of inland water fisheries, Messrs. Osborne Wilshire and John A. Manton. Thus of the staff of twenty-seven inspectors, with which we commenced the year, we retained only seven. Consequent upon this substantial reduction of the inspectorial staff we found it would be possible to lessen the clerical staff, and so terminated the services of Mr. E. J. Ellis, the first clerk.

We have the pleasure to record that of the inspectors retrenched Messrs. Henry Laman, at Port Stephens, and Messrs. Wilshire and Manton, at the Murray River, offered their services to us gratuitously. These we gladly accepted, and they now form part of our honorary staff. We also thankfully record the gratuitous services rendered by Mr. Paget Bayley, at the Manly and Narrabeen Lagoon, Mr. Chudleigh H. Gorrick, at Lake Macquarie, and Mr. Learoyd, at the Upper George's River.

The extent of our efforts in the direction of retrenchment will be more clearly apprehended by reference to the following tabulation:—

Name.	Designation.	Length of Service.	Yearly.		Monthly Salary.			Compensation.			
			yrs. m'th.	£	£	s.	d.	£	s.	d.	
E. J. Ellis	Chief Clerk

John Hespe	"	3 May, 1885, to 25 Aug., 1893	8	3	140	11	13	4	96	5	0
Total									£1,125	0	11

All the above received compensation at the rate of one month's pay for each year of service.

We have also to intimate the subsequent retirement of Mr. William Boyd, Assistant Inspector at Lake Macquarie, owing to advancing years and failing health. Mr. Boyd was one of the first appointed inspectors, and has rendered good service to the Department.

We have referred to the reductions which the Government, in their general retrenchment scheme, imposed on all officers in the Civil Service of the Colony having salaries over £200 per annum. In addition to this, we imposed a further special reduction varying from £20 to £10, irrespective of salary, on every person remaining in employment in our Department. By all these means we have been enabled, after great consideration, to reconstruct the Department on fairly efficient lines, and to bring its cost within the limit of the £3,000 allotted to us by the Government, and afterwards voted by Parliament.

Oysters.

We report a decrease of 1,886 bags in the supply from our own waters, and of 5,396 bags from places outside the Colony, thus disclosing a falling off in the total quantity brought into consumption of no less than 7,282 bags. Queensland has supplied less than half of her usual quantity, while New Zealand is short 680 bags. The enumeration of the take from the principal coastal waters is as follows:—From the Clarence River, 567 bags as against 1,716 bags last year; Richmond River, 199 bags as against 707 bags last year; Hawkesbury, 454 bags as against 688 bags last year; Camden Haven, 302 bags as against 474 bags last year. Wallis Lake shows an increase of 128 bags; Clyde River shows

an

an increase of 283 bags ; Manning River shows an increase of 487 bags ; Hunter River shows an increase of 130 bags ; while the Hastings River and Port Stephens have maintained their average. From other waters, as will be seen in the appendices, oysters have arrived in smaller quantities. Owing to the withdrawal of inspectors from so many of our rivers, we are not in a position to supply reports as heretofore. Oyster thieving, however, still flourishes, especially in the Hawkesbury River ; nor can we expect much abatement of this evil until effective law to check it has been enacted.

Notwithstanding the insecurity afforded by the existing law, and the tendency to disease which has so generally exhibited itself amongst the oysters there has been a larger demand for areas for culture ; no less than 6,400 yards of shore have been applied for, as against 3,550 yards in 1892. We record totals of 1,200 yards in Camden Haven ; 1,600 yards in the Manning River ; 2,000 yards in Botany, George's River, and lesser areas in other waters of secondary importance.

We invite attention to the report in the appendices by the Chief Inspector of Fisheries on the oyster prospects at the Clarence River. It will be seen from it that some of the oyster culture lessees are bestowing considerable attention upon the matter. Much of the disease prevalent there is said to be due to absence of attention on the part of lessees. It was very noticeable that on unleased land, on the oyster reserve, and on leases quite uncared for, the oysters have suffered wholesale from the ravages of the worm and the crabs.

A novel appliance has been adopted by N. Cusack, an enterprising lessee. It consists of a platform built so as to be awash at low water. On this Cusack lays the oysters dredged from his beds ; they improve in quality in this position, and the action of the tide clears the shells to a considerable extent of the mud and filth, which envelopes them while in their beds, the result is that when shipping for market he has a comparatively clean oyster to bag up, and in the process he is enabled to examine and discard all unsound stuff.

The oyster industry in the Hawkesbury and George's River is in a very impoverished condition, and the reports from the local inspectors are not at all encouraging—the impediments related are the mud disease, thieving, and insufficient legislative prohibitions. In Woollaware, Toura, and Quibra Bays the mangroove oysters have certainly escaped disease, but the supply has been scarce, and only sufficient to meet the demands of picnic parties.

The reports from Port Stephens show no improvement in the oyster supply, as stated already. The average is kept up, but that average is a bagatelle compared with the yield of former years ; taking this into consideration, and the vast extent of water which that port encloses, we are compelled to admit its absolute failure as a producing factor.

Of our other waters we have no official reports ; we have, however, reliable information that at Camden Haven and Wallis Lake the beds are in excellent condition, and that the supplies are being wisely husbanded by the lessees. Mr. Dick, who owns extensive layings at Port Macquarie is prosecuting his work in a very intelligent manner, as also Mr. Barclay, on the Clyde River. It is to the efforts of these lessees, together with Mr. H. Woodward and Mr. F. Gibbins, and some others, who are working their holdings on intelligent and systematic lines, that our oyster supply has not actually died out.

Fish Acclimatisation.

We have not been in a position to accomplish anything in this direction ; the necessity for special economy in our expenditure preclude us from making the attempt. We hope, under more favourable circumstances, to be in a position next year to resume work in this direction.

The Fishing Industry.

The quantity of fish forwarded to the Eastern Fish Market has been less than usual, owing to a considerable portion of the supply finding its way into consumption through other sources. The largest supply has come from Lake Macquarie—the Tuggerah Lakes taking the second place, the Hawkesbury River, the Hunter River, and Lake Illawarra contributing in their respective usual proportions.

Owing to the recent reduction in the number of the inspectors we are not able to furnish detailed reports concerning the respective fisheries, but we have with the more limited means at our disposal maintained as strict a supervision over them as has been possible. The closed waters of Lake Macquarie have been a most useful aid in maintaining the supply, and we think the retention of them is beginning to be appreciated by the fishermen themselves.

The

The Inspector at the Hawkesbury River reports the fisheries there to be in a fairly prosperous condition. The net fishing gives profitable employment to quite a number of persons, while line fishing affords fair returns and is largely indulged in by amateurs and others following the employments as a means of recreation. During the year sharks have been very plentiful in the lower parts of the river.

The local Inspector furnishes a satisfactory report of the yield from George's River. In addition to the supply sent to the markets he says that fully 2,000 baskets of fish have been sold locally during the year.

In April last the Woronora River became open to netters; the usual tale of the wanton destruction of small fish by the nets of the fishermen has to be told. This result always follows the termination of the closure of every water, and it points to the insufficiency of the provisions of the law respecting these closures and the necessity which exists for its amendment.

Of George's River itself the Inspector reports that when the closure expired all fish with the exception of whiting were plentiful, but from that date they showed a steady decrease, and remained scarce for a considerable time. While whiting are reported to be thus scarce, black bream, on the other hand, have been more plentiful than has been the case for a number of years in all parts of the river as well as in Botany Bay and Cook's River.

In the Appendices will be found a report from the Chief Inspector recommending certain reductions in the areas at Tuggerah Lakes to be closed against net fishing.

Inland Waters Fisheries.

The returns from Moama and Koondrook, two principal centres on the Murray River from which Victoria draws her principal supply of freshwater fish, we note a substantial falling off in the quantity captured of nearly 4 tons on the take of 1892. We have no account of the distribution made from numberless points along the extensive course of this river, or of the supply obtained on the Victorian side, so that we are quite unable to estimate whether the lessened quantity reported from the two sources named represents actual diminution of the fish supply or not.

Applications for such protection as the Inland Waters Fisheries Act affords have been made to us from various quarters. In response thereto we have secured the closure against netting of the undermentioned rivers for a distance of 5 miles on either side of the following towns:—The Lachlan and the South Circle Park Lagoon at Forbes; the Murrumbidgee River at Narrandera, Wagga Wagga, and Hay; the whole of the Edwards River within the Counties of Wakool, Townsend, and Cadell; and the Murray River at Albury. We hope that this action, about the only one we are able to take under the existing law for the preservation of our freshwater fish will have the effect anticipated for it. We are sure that so far as the voluntary services offered by our late Inspectors, Messrs. Manton and Wilshire, can be made available, the waters in their respective districts will have every possible attention.

JAMES C. COX,
President.

APPENDICES.

COMMISSIONERS of Fisheries for New South Wales, 1893 :—

James C. Cox, M.D., President.

E. P. Ramsay, F.R.S.E., LL.D., &c.,
Jas. R. Hill, Esq.,Hon. S. H. Hyam, M.L.C.,
Hon. W. R. Campbell, M.L.C.*Staff.*

Lindsay G. Thompson, Secretary and Chief Inspector.

Edward J. Ellis, First Clerk.
(Services dispensed with 7th July, 1893.)Livingston F. Mann, Draftsman.

FISHERIES INSPECTORS' REPORTS.

Chief Inspector of Fisheries—Report upon his visit to Clarence River.

MEMO.—In furtherance of instructions, I visited the fisheries on the Clarence River.

Fish.	For the size of the river I find that the take of fish has been comparatively small, and in the Lake Channel particularly so. Only about six boats are working at present, with an average of two men to each boat. A small consignment is sent from Palmer's Island to Sydney by each steamboat. The fish is packed in boxes about 4 feet square by 3 feet deep; ice is spread over (say) each third layer of fish; but the system seems to me very crude and ill-considered. The superincumbent weight of the upper layers must have a very deteriorating effect on the bottom layers of fish, and as there is no provision for the outflow of the melted ice, these bottom fish, on arrival at Sydney, must be immersed in a liquid composed of water, blood, and other foul discharges; indeed, this has been the case, except in certain instances where a hole has been bored in the box to allow the escape of the liquid.
Ice-packed fish.	
Use of trays suggested.	I suggested to the fishermen whom I saw packing these fish that it would be an improvement if he provided trays at intervals so as to prevent the crushing; but he did not seem to value the suggestion, simply remarking that the fish travelled very well as they were.
Iluka Canning Company.	I visited the Iluka canning factory; it is conveniently situated at the wharf. The factory was not in operation. Filewood and Sons are the new proprietors, and they are about to start work, but they fear the scarcity of fish will prove a check to their operations. It was unfortunate that the proprietor, Mr. Filewood, senior, was absent. I saw only one of the sons, and he was not able to give me the particulars I sought as to mode of curing the fish; all he could say was that the cans were heated only to boiling point, and that no chemicals were used to bring up the temperature. I can scarcely believe this to be correct; but if it be so, canning fish becomes a very simple operation—so simple, indeed, that they could be preserved in the ordinary fruit-preserving jars; but that is a matter which can easily be determined by experiment.
Closure of channel against net-fishing.	Something ought to be attempted in order to increase the fish supply in The Clarence. Massingham, the late Inspector, a very intelligent and observant man, is most anxious that the Lake Channel should be closed against net-fishing; it certainly is a great breeding ground, and I think the attempt might be made, at any rate, for a short period, and results noted for future guidance.
Oyster fisheries.	Passing on to the oyster fisheries, I find that considerable attention is being paid to them by some of the lessees, while others are just content to take from the bed whatever nature supplies and not attempting anything like improvement or culture. It is neglect of this kind which to a large extent allows the worm to increase as it does, and to take control of and destroy beds which once had considerable value. This is in evidence from the fact that, not only the unworked oyster leases, but also the public oyster reserves in the channel are bare of oysters, not alone from the ravages of the worm, but also of the crabs, which have destroyed the oysters wholesale; while, on the other hand, beds, which have been carefully tended and worked, show the worm in but limited quantity. As an instance, I take N. J. Cusack's leases, No. 2,176 and 2,212, though the oysters occur in water of a depth from 12 to 30 feet, yet the disease is scarcely present; the oysters are sound and open well, and produce about a bushel to a haul. A large proportion of these are of so young growth that each haul requires careful and extensive culling, so extensive, indeed, that not more than twenty-five to fifty marketable oysters are obtained out of a haul. I find that Cusack has in operation a plan which I had recommended for use on other rivers, and it proves wonderfully successful. It is a platform built so as to be awash at low water; on this, which he has opposite his house, he lays the oysters dredged from his beds; the action of the tide clears the shells from their accumulation of mud and filth so that when bagging he has not only a clean oyster, but is enabled to examine and discard anything unsound. This is a system which I have always advocated, and from the result as recorded by Cusack, I should like to see it practised by every lessee who holds a worm infested area.
Neglect of lessees.	
Worm disease.	
Advantages of keeping beds worked.	
Platform for oysters.	
Origin of worm in Clarence.	It will be in recollection, perhaps, that the worm first manifested itself in the Clarence, after some cultch shells had been laid down in a lower part of the channel lease 83-64; from this the disease spread over the whole of the beds. In one bed, No. 258, which I saw dredged, where the men were getting a tin-full to the haul, 75 per cent. were affected; notwithstanding, however, the oysters were being sent to market. They were until recently sent to supply a saloon at Maclean, but the oysters would not keep; the saloon is now closed. It is regrettable that the existing law has not provided some means by which oysters so affected can be kept out of the market. It should be possible to compel the lessees to work their areas, and to take means to prevent the public estate in their control being wasted and destroyed as it is at present. There is a regulation threatening forfeiture as the result of mismanagement, but it does not reach this worm trouble. In the new Act a remedy will be provided.
Diseased oysters in consumption as food.	Many of the leases in the channel besides those mentioned are deep water beds; such a one is McKinnon's lease, No. 260; it is not being worked just now. The shore is all soft mud, the bed in mid-channel, confined to a space of 300 yds. by 50 yds., being in a depth of 15 ft. of water. Ross' lease, No. 223, is also a deep bed. Like the former, the oysters occur on the outer boundary and extend to Philp's lease, No. 258, opposite, already referred to. Cusack's lease, 2,181, is of the same character as his other leases, 2,176 and 2,212; indeed, the worm on this area is even less destructive. Oysters are found in a depth of from 4 ft. to 15 ft. of water. Cusack has spent much pains in clearing this lease from mud, and hopes to gain good results from it. He will commence work at the New Year, by which time he expects that the naere will have sufficiently hardened over the few oysters which contain the worm to allow of their being turned over. I took the opportunity to examine lease No. 860, which H. Woodward has asked to have surrendered. I find there is nothing whatever on this lease, and was advised that there never had been. Why Woodward ever took up this area was always a mystery to the local oyster-getters. Lease No. 166 is of a similar character; its surrender has already been recommended.

I had some oysters dredged from lease No. 519, locally known as the "mud patch." They opened well, and showed but little sign of the worm, evidencing the good results of keeping a bed well worked.

Joseph Barber, a local oyster-getter, sought from me information as to working oyster beds in the open sea,—he told me he knew of a bank, and hoped to find it. I told him that the existing law did not offer any concessions to the discoverer of new deposits, but that doubtless the matter would not be lost sight of when new legislation was enacted.

I visited the Oyster Reserve at Yamba. It includes about a mile and a-half of the training wall, the irregular shaped stones composing which are literally hidden from view by the compact masses of oysters of all sizes, from marketable to spat, plastered over them. I went to the wall at dead low tide, and I confess that I never saw such an extent or wealth of growth—it would be difficult to estimate the quantity, but the wall must contain thousands upon thousands of bushels. Yamba is the watering place for all parts of the Upper Clarence, and on holidays people flock to the Reserve for their day's enjoyment, and a very great value is set upon it.

LINDSAY THOMPSON,
Chief Inspector of Fisheries.

George's River Fisheries.

2 January, 1894.

I HAVE the honor to submit the following report of the fisheries under my supervision during the year ending 31st December, 1893.

This fishery has again contributed largely to the metropolitan supply, but owing to the various places from which the fishermen forward their fish to market being so extensively scattered, it is a matter of impossibility for me to obtain even a fair idea of the quantities shipped to either the Eastern or Redfern Markets; but there are, irrespective of this supply, on an average fully 2,000 baskets of mixed fish sold annually in and around this district.

In the open waters of Botany Bay and George's River, during the early part of the year, up to the end of April, sea-mullet were plentiful, some of the fishermen obtaining very large hauls. During January and February the majority of the fishermen caught good freights of bream and other fish also, which were driven out of the closed waters by the freshets. On the 18th April the waters of the Woronora and George's Rivers were opened to net fishing for thirty days, about fourteen boats taking advantage of this opportunity, and killing over 100 baskets of mixed fish, being an average of about eight baskets per boat for the first days work. From that time to the month of September fish of all kinds were very scarce, many of the boats deserting these waters for the Lakes and Cape Hawke, others working the coast, principally Curranulla beach, where they obtained nice hauls of blackfish, also fair quantities of garfish and other fish. From September to the end of the year the quantity of fish, but principally mullet and bream, steadily increased; but owing to the vast quantities of blubber fishermen found it very difficult in obtaining a clear haul in many instances after shooting, being unable to land.

In the closed waters, from January to the middle of April, when the river was opened to net fishing, all fish, with the exception of whiting, were plentiful; but during the short period the waters were open they showed a steady decrease, and remained scarce for some considerable time after the waters were again closed. From July to the end of the year there was noticeable a material increase in the quantities of fish—all varieties, excepting whiting, being very plentiful. Small whiting are plentiful on all the bars and flats, but for marketable whiting I consider this the worst season I remember for a considerable number of years. I am at a loss to account for the scarcity of these fish. The same cannot be said of black bream, however, as I believe there have been more killed this year than for a considerable number of years previous, anglers catching grand lots at night in different parts of the river.

Of prawns I may say this has been a very prosperous season, nice lots being caught all through the year at Cook's River, Lady Robinson's Beach, Kogarah, Oyster, Oatley, and Double Bays, while in the closed waters they are to be seen in fair quantities, but principally about the Salt-Pan Creeks.

During March I visited Cook's River and Shea's Creek, and reported upon the pollution of these waters from refuse flowing from boiling-downs, &c., in the vicinity.

There have been eight prosecutions during the year—four for fishing in closed waters, three for stalling, and one for fishing without a license. The net in the first instance being confiscated, while in the second case, it being a first offence, the net was returned.

Oyster Fisheries.

I am sorry to state that the oyster fisheries of George's River are still in a very bad way, due principally to the mud or worm disease, and I find no improvement whatever in the oysters. The mangrove oysters of Wolloware, Toura, and Quibra Bays, have, however, escaped the disease, but they are very scarce, owing to the quantities removed by the public under the fifteenth section, as I am unable to prove sale. There have been three applicants for oyster areas during the year, viz., W. J. Goldsmith, 1,000 yards, Quibra Bay; A. Selmon, 500 yards, Inner Toura Bay; and P. J. Baalman, 500 yards, Inner Toura Bay, also 1,000 yards Wolloware Bay, all of which areas I have measured and reported upon. During the month of July seven bags of oysters were removed from lease No. 1,972, Port Hacking, the removal of which I reported.

D. GRANT,
Assistant Inspector Fisheries.

Hawkesbury River Fisheries.

Sir,

25 January, 1894.

I have the honor of placing before you my annual report on the condition of the fisheries and oyster fisheries of the Hawkesbury River for the year 1893.

The net and line fisheries have been in fairly prosperous condition, giving employment, on the average, to about sixty persons.

The total quantity of fish caught and sent to market has been 5,737 baskets, which quantity also includes occasionally a few baskets of sea-caught fish, schnapper, &c.

The kinds of fish caught with the net have consisted principally of mullet, bream, whiting, perch, and blackfish, whilst the line fishermen contributed jewfish, flathead, and also a few schnapper. Line-fishing has also been an everyday pastime for the many picnic parties. Prawns also have been very plentiful.

Cowan Creek, and also the Lower Hawkesbury River, have again been infested with sharks, whilst turtle have often been seen in the entrance and in the lower part of the river.

The kinds of fish enumerated have been fairly plentiful in all the lower part of the river and tributaries, but on the approach of winter these fish will migrate upwards, say, to about 50 miles from the heads, and will continue in the deep waters there during the winter months, unless driven down by freshets.

Of the oyster fisheries of the Hawkesbury River, which not many years ago gave employment to several hundreds of men, I am very sorry to state that they are now in a very unsatisfactory, neglected, and, I may also say, dormant condition.

Of the many oyster leases granted under the provisions of the Oyster Act of 1884, for the express purpose of oyster culture, I beg to state that not one lessee has even attempted culture, and the whole Act may now be said to have been a total failure so far as the Hawkesbury River is concerned. There is also the old worm disease, which has not yet wholly disappeared, but at the same time it need not frighten any lessee from going on with oyster culture. A large number of leases have been cancelled through the non-payment of rent, and the few leases still in existence are mostly denuded of oysters, and are held by unscrupulous persons for points of vantage in stealing oysters off Crown lands, and also afterwards in shipping oysters.

Oyster-stealing has now taken a fresh turn. A lessee, in order not to run any risk of being caught, will be very careful for himself, but he will perhaps have a dozen poor starving men in his employ, and will buy their oysters under cover of darkness, and will afterwards brand those oysters as coming off his own lease, and will, if required, swear to it in Court. It may be said, why don't I catch them. I beg to state that I would very willingly catch them if I could. These men would upon my approach take to the bush. Again, some of these men, if not lessees, would stand their ground, and say that the oysters so gathered were for their own consumption and not for sale: and I am at once disarmed. The 15th section of the Oyster Act is responsible for much of this mischief.

I would again most respectfully urge that there cannot be any rest or improvement for the recovery of the oysters on Crown lands so long as there remains one of the present leases in existence.

I beg to call your attention to the fact that the deposits of oysters of this fine river should and would bring in a fine revenue under a different system of leasing and management, whereas now the revenue derived from it is next to nothing. I have on former occasions endeavoured to draw the attention of the Department to this fact and the importance of the subject, and the welfare of the oyster fisheries must be my excuse for again mentioning it.

P. SMITH,
Assistant Inspector of Fisheries.

Chief Inspector of Fisheries—Proposing New Closures against Net Fishing at Tuggerah Lakes.

Memo.—

I visited Tuggerah Lakes in order to be in a position to make recommendations as to new closures in those waters against net fishing.

I consider the existing closures are too extensive, and that without detriment to the lakes as a fishery more of the water might be left open to netting. I append a tracing showing what in my opinion the future closures should be.

In Tuggerah Lake I propose to dispense with the closures at Ourimbah and Saltwater Creeks; to reduce that at the entrance to Budgewoi Lake so as to confine it to little more than the entrance itself, and while amending the opening to the sea closure by making its boundary lines rectangular, to dispense altogether with the closure on the coast line.

In Budgewoi Lake I propose to relinquish the existing closures at Wallerah Creek, and to amend that embracing the large flat on the eastern portion of the lake, by starting its western boundary at the extreme southern point on the northern shore of the lake, to run about south-south-westerly to a point on the opposite shore, about 200 yards north-westerly from the western head of entrance.

In Munmorah Lake I propose to retain the entrance closure, but to reduce its northern boundary to a straight line from point to point, as shown on the tracing, and to abandon the existing closures at Calangra and Elizabeth Creeks.

I submit these proposals for the consideration of the Commissioners.

LINDSAY THOMPSON,
Chief Inspector of Fisheries.

11th April, 1893.

1894-5.

NEW SOUTH WALES.

FISHERIES OF THE COLONY.

(REPORT OF THE COMMISSIONERS OF FISHERIES FOR THE YEAR ENDING 31 DECEMBER, 1894.)

Presented to Parliament, pursuant to Act 44 Vic. No. 26, sec. 69.

The Acting Secretary to the Commissioners of Fisheries to The Principal Under Secretary.

Sir,

Department of Fisheries, Sydney, 3rd April, 1895.

I have the honor, by direction of the Commissioners of Fisheries of New South Wales, to transmit under separate cover, for the information of the Chief Secretary, the Report of the Commissioners of Fisheries for the year 1894.

I have, &c.,

FRED. W. SMITHERS,

Acting Secretary.

Report of the Commissioners of Fisheries for New South Wales on the Fisheries of the Colony, for the year ending the 31st December, 1894.

Sir,

We have the honor to submit our report on the Fisheries of the Colony for the year 1894.

Finance.

The revenue of the Department shows a decrease of £203 8s., showing a falling off in the revenue of fishermen and boat licenses of £199 5s.

In the issue of fishermen's and fishing boat licenses we record a decrease of 198 and 165.

We show an increase in the amount received in fines and forfeitures by £122 8s.

Official Staff.

To keep our expenditure within a certain limit we did not deem it necessary to increase our working staff, but reduced the number by dispensing with the honorary services of Mr. C. H. Gorrick, Assistant Inspector, stationed at Lake Macquarie, and Mr. Paget Bayly, stationed at Manly.

Consequent upon the removal of Mr. John A. O'Grady, first clerk in the Department, it became necessary to rearrange the indoor staff, without additional expenditure, viz.:—

Mr. Travelling Inspector Smithers, during the absence at any time of the Chief Inspector, to perform the duties relating to the offices of Chief Inspector and Secretary.

Mr. Livingston Mann to rank next to Mr. Smithers, and to have the general supervision of the clerical and drafting work of the office.

Mr. O'Meagher to rank next to Mr. Mann, and to take charge of the accounts and oyster culture lease registers, and to assist in the clerical work.

Oysters.

We are able to report a marked improvement in the supply of oysters which have been taken from the beds and deposits under lease for the purpose of oyster culture during the year, the number of bags removed being 8,086, showing an increase of 2,544 upon that of last year, whilst the quantities imported from Queensland was 1,536 bags as against 4,061; from New Zealand, 5,137 as against 3,208; Victoria, 52 as against 8; South Australia, 240 as against 76; Tasmania, 11 against 2; in all 6,776 bags against 7,355 of the previous year.

The

The following figures show the quantities taken from the principal leased areas :—

Clarence River, 69 bags as against 567 bags for previous year; Richmond River, 400 as against 199; Tweed River, 138 as against 8; Camden Haven, 749 as against 302; Hastings River, 216 as against 388; Manning River, 1,843 as against 1,436; Wallis Lake, 2,012 as against 880; Port Stephens, 728 as against 465; Hunter River, 302 as against 90; Hawkesbury River, 660 as against 454; Bellinger River, 56 as against 120; Evans River, 192 as against 187; George's River, 12; Shoalhaven River, 250; Clyde River, 405 as against 351; Bermagui, 24 as against 14; Twofold Bay, 30.

Notwithstanding the very limited protection at present afforded to lessees by the existing laws, there has been a greater demand for areas for oyster culture. No less than 4,650 yards of foreshore were applied for, out of which number application was made for 1,100 yards at Clyde River, 500 at Wallis Lake, 500 at Botany, 500 at Twofold Bay, and the remainder in smaller areas at other places.

We are unable to report on all the oyster-bearing waters in consequence of having no inspectors located in the districts near them. In many instances we can only obtain reports relative to the oyster-bearing waters when our travelling inspector visits them.

There certainly has been an increase in the output from some of the leases, but the increase from others must be looked upon as doubtful, for we fear that the alleged increase has been caused by overstripping the leases and robbing Crown lands. (See report from Inspector Smith in letter attached hereto.) This abuse is caused by the want of proper supervision over such leases owing to the recent retrenchments in the inspectorial staff. Being aware that such an evasion of law was being resorted to, the Commissioners issued a circular drawing attention to Regulation 28, which provides for cancellation of leases for overstripping. This being as far as the law empowers us to go, or in other words, according to the present defective Act the beds must be denuded of oysters before we can put the law in motion. Cancellation, therefore, throws back on our hands a useless bed, whilst the unprincipled lessee is not penalised. Other lessees wilfully neglect oyster culture, simply contenting themselves by working their leases bare; here, again, we are powerless to interfere under the present Act. We find it preferable to resume such denuded areas and leave them as Crown lands rather than continue to lease to such a class of lessees. We have had, and still have, lessees who systematically rob Crown lands, who, when detected, say the oysters are for their own consumption, thereby leaving us without power, under the 15th section of the Act, to prevent such plundering. Such persons use their leased grounds as a depository for their spoil, and put the number of their leases upon the bags for shipment, as required by law, whereas the oysters in the first instance actually come from Crown lands. Here, again, we have no power to act. Other instances occur in which the lessee may apply for the surrender of his lease on the ground that disease has appeared amongst the oysters, but we find that these excuses, as a rule, are on a par with the cases abovementioned—that it is not the disease that has ruined the lease but the lessee himself, as already pointed out, by overstripping. In other cases, lessees take up areas, then after almost stripping them they vacate the place; yet we have no power to interfere until the lease has attained its three years currency.

It will be seen from the foregoing that our powers are very limited under the existing Act, and that we are unable to take the necessary steps to conserve the supply or to prevent further denudation of the oyster areas of the Colony. For this unsatisfactory state of affairs we do not hold ourselves responsible, for, as far back as 1891, we submitted to the Government a draft Bill setting forth what was required to make the law effective, with a request to have it passed into law; and the difficulty is intensified owing to the Government not seeing their way to allow us funds to employ inspectors to supervise the working of leased areas and the protection of those not leased.

In the near future it may be asked what will be the value of the oyster-bearing Crown lands for leasing purposes, as owing to the very unsatisfactory manner in which the law that we are called upon to administer is framed, owing to the depredations which are being daily committed, as already referred to, some considerable time must elapse, even should a new Act be passed dealing with the oyster-bearing Crown lands for oyster culture, before the waters of the Colony can be replenished with a fresh stock of oysters fit for use, which would not have been the case if the authorities had taken the advice of the Commissioners.

Fish Acclimatisation.

The introduction of trout into several inland streams and the reservoir at Prospect, has, it is to be hoped, been successfully accomplished during the year. Through the courtesy of the Victorian Government and the New South Wales Railway Commissioners, aided by the Committee of the Ballarat Acclimatisation Society, we were able to obtain, free of cost, 250 yearling brown trout, which arrived in Sydney without the loss of a fish, and were at once placed in a small pond at the Prospect Reservoir, with the exception of twenty-five which were liberated at Gunrock Streams, Moss Vale, and we are pleased to

to note that the experiment has been so far successful, they having grown with great rapidity, and appear thoroughly at home in the ponds. Since their liberation, the death of two of these fish only having been recorded.

We also have, through the assistance of Mr. Rutherford, the Honorary Secretary, Acclimatisation Society at Wellington, New Zealand, been successful in obtaining from that society 48,000 ova, viz., 25,000 brown trout, 22,000 ferox, and 3,000 of the rainbow varieties, which the Union Steamship Company, with their usual courtesy, carried over free of charge, and landed everything in good order, and we desire again to express our thanks to the company for their liberal aid.

The ova arrived on the 7th August, and were at once sent to the troughs specially prepared for them by this Commission at the Prospect Reservoir.

The consignment opened out in good order, and not in such an advanced stage as we have hitherto received them in, and it was not till about fourteen days that the fry appeared, and progressed favourably till October, when unseasonably hot weather set in, and, to save the fry, we found that no time was to be lost in getting them out of the troughs. The Commissioners decided to distribute a portion of them into the inland waters of the Colony, which was done between the 9th and 11th of the same month.

The fry hatched were placed in the following waters:—Picton Lake, the river near Woolbrook, the lake at Uralla, the Gara, Commissioners' Water, Tom's Gully, and the Reservoir near Armidale, the waters of the Cooma district, and the Grose River. The balance were placed in the ponds at Prospect specially provided for them by the Water and Sewerage Board. The fry of the brown trout were liberated in Picton Lakes and in the waters at Waldon Station, and that of the ferox in Woolbrook, Uralla, Gara, Commissioners' Water, Reservoir at Armidale, and Tom's Gully; that of the rainbow trout in the Unincambene, Umaralla, and other waters near Cooma.

Our hatching troughs referred to were, by permission of the Water and Sewerage Board, erected just below the Prospect Reservoir, where an abundant stream of water was placed at our disposal, so essential for the hatching of the ova. The ponds, in which some 30,000 young trout are being reared, were constructed on the south-west shore of the reservoir.

This series of miniature ponds, which have been carefully designed, are supplied with water coming through a pipe from the canal to the top pond, then a fall of about a foot in the next pond, whilst, in some instances, two ponds are on the same level, and wire screens prevent the young fish passing from one pond to another. Each pond, with the exception of four at the end near the reservoir, have fish in them, the two top ones having the yearling trout imported from Ballarat and the others the fry hatched.

The fry, up to the present, appear to thrive far above our expectations, and have grown considerably, the yearlings appearing for their food at a certain hour each afternoon.

We have to record our grateful acknowledgments to the members of the Water and Sewerage Board, and to Mr. Bloxsome, for the assistance and interest displayed in the hatching and welfare of the trout.

Whilst we are doing our utmost with the means placed at our disposal, in the matter of hatching and distributing fry throughout the Colony, since the year 1888, we seldom receive evidence as to the success or otherwise of the undertaking, and even the persons who clamour for the fry are backward in forwarding information which would enable us to judge of the success or otherwise of the experiments.

Mr. Rose, near Cooma, has forwarded a large brown trout lately, weighing 7 lb., and measured 25 inches long, and 15½ inches in girth, which we had sent to the Australian Museum, where it is preserved and exhibited.

It is probable that the large fish referred to was one of the fry sent to Cooma District in October, 1889.

We have also received another trout weighing 5 lb., caught at Bibbenluke, where fry were distributed in 1890 and 1891.

In Currumbene Creek we have been informed that several trout were caught recently.

It is to be hoped that the result of the efforts of this and previous years in the hatching and distribution of trout will in time be crowned with success in stocking the waters of the Colony.

We will not relax our efforts in promoting this object, provided the Government place funds at our disposal for the purpose.

We regret to state that we have not been able to obtain a supply of Murray River cod and golden perch for distribution in waters adjacent to the metropolis, especially in the Nepean, at Penrith and Camden, where it was our intention to place them.

Inland

Inland Waters Fisheries.

The returns from Moama and Koondrook, two centres on the Murray River, from which Victoria draws her principal supply of freshwater fish, show an increase in the quantity captured. During the year 28,806 lb. of fish were sent to Victoria *via* Moama, against 27,843 lb. for the previous year, thus showing an increase of 963 lb.; and the fish forwarded *via* Koondrook amounted to 25,512 lb. as against 20,200, showing an increase of 5,312 lb.

We are of opinion that the increase as shown is to a great extent caused through the closures of certain portions of this river. We have also made closures in various rivers, generally proclaiming a distance of 5 miles in a straight line on each side of a certain town to be exempt from net fishing, and have found the plan largely beneficial.

We have before drawn attention to the inland fisheries being so imperfectly protected, there being only two inspectors to control them, and as their services are entirely honorary it must be apparent that these waters do not get a fair amount of supervision. Although knowing this, we are unable to give the desired oversight on account of insufficient funds.

The Inland Fisheries Act is very defective, as was pointed out by the Commissioners in 1891, and up to the present our suggestions have not been carried out.

We feel ourselves greatly indebted to Messrs. Wilshire and Manton for their honorary services in supervising the Murray and other waters in the districts for which they are rangers under the Forest Department, for by their energy they have protected the fisheries there to such an extent as to increase the supply of fish by 6,275 lb., as previously stated. Moreover, their efforts in putting a stop to the use of illegal nets, and so arresting the destruction of immature fish, have been most praiseworthy.

The Fishing Industry.

The record of fish forwarded to the Eastern Market, Woolloomooloo, during the year has increased by 1,248 baskets—42,272 baskets were received, as against 41,024 last year.

There was also a large increase in the schnapper received this year, no less than 4,711 dozen having arrived as against 2,585 dozen last year, being an increase of 2,126 dozen. This is exclusive of red bream, which totalled 7,000 dozen, thus showing a total of large and small schnapper of 11,711 dozen. Of black bream 9,453 dozen were received; of flathead 9,021 dozen, as against 2,931 last year; of whiting 8,181 dozen, as against 5,031 last year, being an increase of 3,150 dozen; of soles and flounders 1,746 dozen, as against 1,244 dozen last year, being an increase of 502 dozen; of king-fish 1,095 dozen, as against 409, showing an increase of 686 dozen for this year; of jew-fish 17,529 dozen, as against 6,895 of last year, being an increase of 10,534; of groper 23 dozen; of trevally 1,422 dozen; of nannegai 1,396 dozen, as against 491 dozen last year, being an increase of 905 dozen; of salmon 343 dozen; of sea mullet 19,138 dozen; and mullet of kinds 12,494 dozen were received; of long toms 113 dozen; rock-cod 167 dozen as against 309 dozen for previous year; of garfish 3,062 baskets, as against 2,082 baskets received previous year; of blackfish 3,254 dozen; teraglin 3,501 dozen; of crayfish 4,845 dozen; of prawns 5,678 baskets were received, as against 3,949 baskets for previous year.

It will be seen that the market returns for the past year amount to £25,367 15s. 2d., against £29,647 13s. for previous year, although the quantity of fish in baskets received during the year number 42,272, against 41,024 of previous year, thus showing a decrease of £4,279 7s. 10d., with an increase of 1,248 baskets of fish. Out of this number of baskets received, 1,076 were condemned as unfit for food, as against 753 for previous year, and 14 seized under the Fisheries Act, against 6 for 1893.

The Woolloomooloo Fish Markets received 42,272 baskets. Hudson's Fish Market, at Redfern, claims to have received 20,000 baskets, and also to have obtained a fair price for them.

We cannot conclude this report without expressing our strong opinion at the apathy on the part of the different Governments in not passing into law the Bills submitted by us in 1891, and in our report for that year we drew special attention to the defects in the Act of 1881, and expressed a hope that the Bill submitted by us would be passed into law during the first session. We explained that unless a radical change was made in the legislation for regulating the fisheries of the Colony, it would be impossible for them to flourish under the existing laws, one of which has been in force for ten years and to some extent proved a failure.

Although the Commissioners submitted the Bill, of which no notice has been taken, they cannot help drawing attention to the fact that since that time three Acts have been passed, viz.:—Inland Waters Fisheries Act, Sunk Nets Act, and an Amendment Act.

The Commissioners regret having to point out that the complaints made about the public sale of fish in the markets is outside their jurisdiction. They would like to point out also that the crayfish require urgent preservation which the present Act does not provide for.

JAMES C. COX,
President.

"	"	Crayfish	4,845 dozen.
"	"	Prawns	5,678 baskets.

The rivers Richmond, Clarence, and Hunter, as well as Camden Haven and Wallis Lake are all fish-producing waters, more especially the last-mentioned, yet we are unable to furnish returns of the output, being without inspectors on the several waters.

Wallis Lake.

We are of opinion that netting should not be permitted in this water during the hot months. This restriction would prevent a large waste of fine fish during the transit to market.

Port Stephens.

Port Stephens, which is energetically supervised gratuitously by Inspector Laman, has, during the past year, shipped 6,593 baskets of fish. This take was largely comprised of bream and whiting, and, upon perusal of that officer's interesting report, it will be seen that fish are plentiful in his district. He draws particular attention to the quantity of prawns in Myall Lakes, and, from other reports which we have also received, we find that very much more might have been caught could sale have been obtained for them. Even the small amount shipped apparently did not pay, as the catchers contented themselves for a short period in drying fish for the Chinese market, at a remuneration of 5d. per lb.; but as no large quantities were required, even this industry soon became extinct, solely for want of a proper market to dispose of the supply. We are convinced that Myall Lakes, if properly worked, are capable of yielding immense supplies of fish, but, on account of the remoteness of the locality from a market, and through lack of proper boats provided with cooling chambers wherein the fish might be carried, even to Newcastle, the supply is only to a very small extent availed of. By the Inspector's report it will be seen that cray-fishing is largely carried on, but mostly by foreigners.

Lake Macquarie.

Lake Macquarie has, during the year, produced 11,574 baskets of fish, whereas Tuggerah Beach Lakes produced 13,888.

We attribute this decrease to the want of supervision of the closed and open waters during the latter part of 1893. Upon our finding that the closed waters were worked continuously, and that nets of any length and mesh were used, we decided to remove the inspector from Tuggerah Lakes to this lake, and from his report it will be seen that our determination to send him there was none too soon, although by so doing we were aware that Tuggerah would be unprotected, having no officer to locate there. However, whilst trying to protect one lake we unfortunately had to leave the other without protection for the want of funds.

The closed waters here are now in a fair way to keep up the supply of fish in the lake, as by strict supervision those previously closed, though denuded of fish, were entirely stocked with a vast amount of all kinds at the close of the year.

Large quantities of schnapper, both adult and small fish, have been taken by diving nets during the year, and amongst the different catches we regret to note that numbers of adult fish were full of roe.

Tuggerah Beach Lakes.

Tuggerah Beach Lakes leads with the quantity of fish caught during the year, taking no less than 13,888 baskets, or 2,314 in excess of Lake Macquarie. We attribute the increased supply to the waters which had been previously closed being thrown open to the fishermen, and they appear to have made the most of it. From this lake large quantities of fish are sent direct to country towns, and the balance to the markets. We note that on Wyong Creek there is a large primitive cool room, into which fish intended for country use are put; it is nothing more than a large room built with hardwood, and having on the outside a wall composed of turf about a foot thick; the floor is of concrete, and for the purpose it has answered its owner fairly well. As we have no funds available to employ an inspector to supervise the lake, we fear, therefore, that our efforts to protect it will be futile. This lake is largely used by line-fishers, and with splendid results, the pleasure parties taking away large quantities of bream, flathead, and whiting, and we regret to say that by this means many small and immature fish are caught. The

The Hawkesbury.

Both net and line fishing are carried on in this river and its tributaries, more especially in the lower parts, where in the hottest weather fish can be carried fresh to Sydney.

The supply during the past year has been 5,740 baskets, as against 5,536 the previous year, being an increase of 204 baskets.

The mullet, bream, and whiting are the principal fish sent, and are on the increase.

There is no record obtainable as to the quantity of fish caught by line, which, in our opinion, must have been large.

With a view of protecting the fish supply of the river, we decided to close against the use of fishing-nets the whole of Mullet Creek, the upper portions of Mooney Mooney, Mangrove, and Berowra Creeks, the whole of Marra Marra Creek, and Cowan Creek from Jerusalem Bay upwards.

Port Jackson.

These waters take fourth place in the order of productiveness. They show a large increase in the quantity of fish and prawns taken during the year, to secure which there has been no less than 119 licensed fishing-boats used for that purpose within the harbour. We cannot express ourselves as satisfied on the score of the quantity of fish and prawns caught, for we know that great destruction has been caused to fish life owing to the use of sunken nets, which we hoped to prevent by the clause relating to the sunk nets suggested by us in 1890.

The tributaries of the port we regard to be of very great importance as nurseries for spawning fish, but, although we keep them constantly closed against net-fishing, yet the great traffic and pollution of these waters by noxious trades and sewage and dredging operations are fast making useless what were good breeding grounds or nurseries.

We regard with disfavour the vast amount of pollution to which the waters are subjected, and which is emptied into the upper portions of the harbour from tanneries, &c.; but, as the law now stands, we are powerless to take action in the matter.

We are also of opinion that the offal and other matter which is discharged outside the Heads should be taken very much further seaward than is the general rule, in order that it might be borne from the land by the tidal currents.

With regard to line fishermen, we cannot speak too strongly against the manner in which they wantonly destroy immature fish, our opinion being that such persons are the means of destroying more small fish than even the net fishermen. This subject also requires special attention, with a view to having some provision made for protecting the smaller fish.

In consequence of the large number of sharks within the waters of Port Jackson we have decided to recommend the Government to offer a reward for the destruction of these pests, on the following scale, viz. :—5s. for sharks from 8 feet to 10 feet in length, and 10s. for those over 10 feet, measured from snout to end of tail, which was approved of.

Botany Bay and George's River.

These waters have produced a little over 10,000 baskets of fish during the year. As fish-producing waters their value cannot be over-estimated, more especially during the summer months—when fish are sent to the markets or are sold in the suburbs perfectly fresh—from their adjacency to the city.

The class of fish caught appears chiefly to have been mullet and blackfish, whilst the catch of jewfish has exceeded the quantity obtained during any previous year.

As to the finer fish we cannot report any large increase in quantity caught by the net-fishermen, yet we have it on good authority that the line-fishers have been remarkably successful amongst them, their catches of whiting, red and black bream, being very large, but, considering that there are as many as 400 boats used for this purpose, we can hardly estimate the quantity so caught.

We are of opinion that the line-fishermen, here and elsewhere, destroy an incalculable number of immature fish, both in the open and closed waters, yet under the existing law we are powerless to prevent it.

We cannot pass on without drawing attention to the destruction of small fish through the constant use of the garfish net, which is used for general working.

The closed waters, which commence at the railway bridge and run upwards, were opened to the use of fishing nets by the expiration of the proclamation closing the same, with the result that the fish were "worked out." We therefore felt compelled to recommend a reclosure for a period of two years, which has had a marked effect on the quantities of fish now to be seen, clearly showing the beneficial results of such closures, as they are without doubt the backbone of all our fisheries.

Prawns.

These waters have produced large quantities of prawns during the year, more especially upon Lady Robinson's Beach. During the months of March and April the fishermen were catching up to 15 hampers of large sea prawns at a haul, and at Cook's River the average catch of smaller prawns was well kept up.

Lake Illawarra.

This lake is not alone important as a breeding ground and nursery for fish, but is valuable for its output, having during the year yielded no less than 6,189 baskets for Sydney consumption, and at least 1,000 baskets more for use at Wollongong and other places along the line. The catch for the previous year was 8,125 baskets, thereby showing a decrease of 936. We, to a great extent, attribute this to the want of closed waters. The previous closure expired in November, 1893, and not until August, 1894, were we able to have fresh closures made. For this vexatious delay we do not hold ourselves responsible, as the Act which we have to administer provides that only when the natural supply of fish has been exhausted by net-fishing or otherwise, to such a degree as to require rest for the recovery of such natural supply, we are then empowered to recommend the closure of such waters. It can be seen that we are placed at a disadvantage by having to patiently look on until the fish supply is exhausted before the law permits us to interfere, instead of allowing us the power to conserve when we see it is required.

The

The Inspector states that of the quantities caught, mullet, blackfish, bream, flathead, jewfish, and tarwhine, provide the most of the supply. With regard to black bream it is reported that the quantity caught exceeded that of any previous year, and from reports gathered elsewhere it appears that most of them were obtained upon the flats and channel at the lake's entrance, showing that they were caught when attempting to get into the lake.

Prawns.

Fairly large quantities of prawns have been caught in the lake during the year.

Shoalhaven River and Tributaries.

Although not great fish-producing waters, yet a fair catch was sent therefrom during the year, viz., about 2,000 baskets.

Jervis Bay.

We have no record of fish sent from here, but are informed that a fair quantity were sent to Sydney. The fish caught were garfish, bream, and schnapper.

Vast quantities of schnapper have been caught during the year here, both by licensed fishermen and pleasure parties, and it is only the long cartage that prevents it becoming a fair fishing station.

Berrewherè or Sussex Inlet and St. George's Basin.

This lake has produced about 1,000 baskets of fish during the year. We do not at present place much value upon it as a fish-producing water, on account of its remoteness from the markets. The fish require to be caught during the morning and delivered to the carters by 1 p.m. for transit to Nowra, a distance of 18 miles by 5-10 in the afternoon, where it leaves for Sydney to be sold the following morning.

We observe that a fair quantity of the finer fish are caught.

Upon report that the natural supply was exhausted we decided to close a portion of this water, and did so by recommending the whole of its channel from the sea entrance upwards and portion of the lake to be closed against the use of fishing nets for a period of two years. This will protect the lake considerably.

Fisheries Inspectors' Reports.

Report on Port Stephens Fisheries for 1894.

Net Fish.

The past year has been marked by an increased output of fish, as compared with the last few years, the total being 6,593 baskets.

During the winter months considerable quantities of bream and whiting were obtained from Smith's Lake, and in the early part of the summer (1894-5) large hauls of mullet, fresh water eels, and perch, were made in the Broadwater, Myall Lake.

There is every reason to believe that immense quantities of marketable mullet and blackfish have been destroyed by the fishermen in the lakes named, as there has been no supervision of those waters. From time to time the work of salting and smoking fish on a limited scale has been carried on in the lakes, but the industry has not, I believe, been a payable one, for the lack of a market.

A number of fishermen have been prosecuting their calling during the year in the upper waters of the harbour, and supplying Stroud and Clarence Town with fish, but I have no record of the quantity thus dispatched, nor have I any record of the quantity conveyed overland *via* Tellegherry Creek. If it were possible to obtain these quantities it could be shown that the total output from Port Stephens would compare favourably with that from any of the fishing stations along our seaboard.

Forty-eight baskets of green prawns have been dispatched during the year, mostly caught in Broadwater, Myall Lake, although several baskets of sea prawns of large dimensions were caught in a gar-fish net at Narragut (outside the Heads) during the month of May. Their advent at the time rather surprised the fishermen concerned, and it is said, that had they had a prawn net ready at the time, some excellent catches might have been made.

In the early part of the year large quantities of young schnapper, about 3 inches long, were met with by fishermen when hauling their nets on the outer beaches.

Prawn drying was commenced for the first time in Myall Lake during the month of February, but heavy rains coming on about that time caused the prawns to suddenly disappear, and they did not reappear in quantity until about November.

Net

Net fishing became so unprofitable towards the end of the year, that many of the fishermen were forced to abandon their calling and seek other employment.

On an average thirty-eight men and fourteen boats were employed throughout the year.

The following calendar shows the ordinary varieties of fish caught and when in season :—

January,	{	Hard gut and sand mullet and black fish plentiful; travally fairly so; bream scarce about the harbour, but fairly plentiful in the upper tributaries, and on the outside sea beaches; sand whiting plentiful; trumpeter whiting scarce during February and March; prawns of large size plentiful in Myall Lake; smaller sized prawns fairly plentiful in upper waters of harbour; crayfish season ends about middle of January.
February,		
March.		
April,	{	Sea mullet were more plentiful than for several years past. During May several baskets of sea prawns were obtained on the outer beaches; the crayfish season commences about the 10th June.
May,		
June.		
July,	{	Sea mullet became scarce in July, none about in August and September; garfish plentiful; trumpeter whiting commenced to school in latter part of September; hard-gut mullet fairly plentiful; flathead plentiful; bream scarce; schnapper plentiful.
August,		
September.		
October,	{	Trumpeter whiting abundant; bream plentiful during November and December; sand whiting plentiful from November; prawns plentiful in Myall Lake during November and December; squire (young schnapper) plentiful.
November,		
December.		

Crayfish.

Crayfishing is an industry carried on exclusively outside the Heads. I am unable to give particulars of the catch for the year, but consider the quantity far exceeds that of some years past. In former years the industry was pursued by local and Hunter River fishermen, but, during the past year or so the Greeks and Italians (the latter encamped at Broughton Island) have gained a complete monopoly, and they now practically control the market. The system of using wire traps, set in bunches of ten to the bunch, introduced by the Italians, is a great improvement on the old style of hoop-nets formerly used in the catching of crayfish. There is reason to believe that many of the Greeks and Italians during the crayfish season evade taking out licenses, and thus defraud the revenue of a considerable sum. It is impossible, in many instances, to bring the law to bear upon them, as numbers of the men never come inside the Heads. It would be well if a close season for the protection of the female crayfish were proclaimed during about two months of the spawning season. The female fish predominates and is generally regarded as a greater delicacy than the male.

Oysters.

I have not a correct record of the output of oysters during the year, as some of the lessees forward their removal notices direct to the Department, but those that passed through my hands indicate that 388 bags were despatched. The oyster worm, which has created such havoc amongst the oysters, is still in existence, but to a lesser extent than formerly. It is possible that should dryer seasons ensue, the disease may ere long be entirely eliminated.

During the year seven leases were forfeited, ten surrendered, and one declared void.

Fisheries Office, Nelson's Bay, Port Stephens,
16 January, 1895.

H. LAMAN,
Acting Assistant Inspector of Fisheries.

Sir,

1 January, 1895.

I have the honor to submit the following report of the fisheries under my supervision during the year ending 31st December, 1894 :—

In the closed waters, during January and February, mullet and jewfish were very plentiful; other varieties of fish were in medium quantities. During March the heavy freshets caused the greater part of these fish to leave the upper parts of the river. On the 19th April these waters were thrown open to net-fishing, and remained so till the 6th August. From September to the end of the year mullet and jewfish were very plentiful in all parts of closed waters. Anglers have had beautiful catches of black bream, whiting, flathead, and jewfish this year.

In the open waters, during January and February, fair quantities of mullet were to be caught about Oyster, Kogarah, and Woolooware Bays; while about Botany nice hauls of sea-garfish, trevally, and other fish were obtained. In March and April sea-mullet were in great abundance, several fishermen having from five to ten boat-loads penned up inside wire netting along the shores of Botany Bay. From the latter part of May to the end of June fish of all kinds were very scarce, several boats and crews deserting these waters for the Lakes, Cape Hawke, and Shoalhaven. July was notable for its great increase of fish, some of the largest freights of whiting and other fish I have seen caught in the river for some time being obtained just above the railway bridge at Como (these waters being open to net-fishing at this time). From August to the end of the year fish of all varieties were in fair quantities about all parts of the river and bay, but, owing to the blubber, fishermen were unable to obtain large hauls.

I may state that I consider the method now practised by the Botany fishermen in saving their mullet during the season—viz., a stockyard of wire netting fixed upon stakes in about 3 feet of water at low tide—a great improvement on the old style, as it enables them to keep their fish alive for weeks, and they can forward a supply of fresh fish to market daily instead of killing all at once and allowing them to lay on the beaches, as they have done previously.

Of prawns this has been a very prosperous season, they being very plentiful during January and February about the Salt-pan Creeks; but they dropped off in quantity from that time to the end of September, when they began to improve, and remained plentiful to the end of the year. In Cook's River, also, they have been plentiful, from seven to ten boats' crews making a living throughout the year; while about Lady Robinson's Beach, during April, they were very plentiful, about twelve boats working it regularly.

Oyster Fisheries.—I am sorry to state there is no improvement in the oysters of my district, the mud or worm disease still being very bad.

I have, &c,

J. D. GRANT,

Assistant Inspector of Fisheries.

George's River,
Liverpool,

Liverpool, 21 January, 1895.

Sir,

There is very little to report about the fishing in the upper reaches of the tidal waters of George's River. Fish have been very scarce this season, and I am of opinion that unless the sewerage from the factories on the banks of this river is purified in some way before it is discharged into the water, this splendid breeding ground for fish will be destroyed. It is of no use of the Government spending large sums of money yearly for the preservation of our fisheries if private firms are allowed to pollute the breeding grounds the same as is being done in this river. I have written to the press, I have called the attention of the Health Officer to the matter, and in my position as an alderman of the borough, I have spoken about it in my place at the council meetings until I have incurred the displeasure of the proprietors of these works. I would like the Commissioners to come and view this river for themselves.

In the fresh water above the dam the trout fry that were put in some time ago by Mr. Warby are doing well. I have heard that trout have been caught in the river at Glenfield, and also at the back of Minto station, but I have not seen them, but it is quite possible, for they may have come down from up above Campbelltown, where I put some in several years ago.

I am of opinion that the part of George's River from Mr. P. F. Adam's residence to Glenfield Farm, is one of the finest places in the Colony for the establishment of a Fish Hatchery, the water is pure and fresh, running over stony shallows to deep sandy bottoms, similar to the river at Clarke's Ford, close to Launceston, Tasmania, which is one of the best trout streams in that colony.

I have, &c.,

WILLIAM E. LEAROYD,

Hon. Inspector Fisheries.

Sir,

Wollongong, 25 January, 1895.

I do myself the honor to submit my annual report for the year ending 31st December, 1894.

During the year 7,189 baskets of fish have been taken from Lake Illawarra, of which 6,189 were sent to Sydney and 1,000 consumed locally. Ninety-seven baskets of prawns were taken during the last two months of the year. This is the first year prawns have been taken from the lake during my nine years supervision.

The varieties caught were mullet, black fish, bream, flathead, jewfish, and a fair quantity of whiting and tarwhine. Larger quantities of black bream and jewfish were taken last year than in previous years.

The lake is becoming a popular place of resort for amateur fishermen, and great quantities, principally black bream, are caught by line.

During the months of August, September, and October large quantities of black bream were caught in Mullet Creek, and other streams running into the lake. All the fish were large, from 2½ lb. to 6 lb. in weight, and all contained full roes and melts during those months.

The entrance at the sand-bar at the mouth of the lake still continues to be good, favouring the free ingress and egress of shoal and ground fish. Jelly-fish still continue to be a source of trouble, and greatly impede hauling operations. Deep sea fishing has been carried on with varying success, principally for local consumption. The channel is fairly well stocked with oysters, and there is no disease amongst them. Tom Thumb Lagoon and Para Creek have been closed, the former for a further period against net fishing, and the supply of fish is fair in these creeks. The oyster beds at the former place are in good condition.

I have, &c.,

D. W. BENSON.

Dear Sir,

Parliament House, Sydney, 31 October, 1894.

Enclosed please find letter from Mr. Edwards, of Bibbenluke, *re* trout, which may be of interest to you. I shall be glad if you will give him the directions asked for, should he have an opportunity of sending you a sample of the trout.

Faithfully yours,

GUS. T. C. MILLER.

Dear Sir,

Bibbenluke, 27 October, 1894.

I duly received your letter of 24th instant *re* fish. The trout I got here in the river at the house was a fine specimen of an English trout, silver-sides and belly, and dark red small spots on sides and belly, length 22 inches, girth 13 inches, weight a little under 6 lb. It was a female fish and had come into the shallow water to spawn; it had spawned but a little roe was left and found when the fish was opened. The male fish was seen about the same place two days after, it was much larger and more active. Some of the boys about the station had been pelting the fish; I caught and bruised it, or I would have let it go again. Several trout have been seen in this river some miles higher up, and also lower down, and some in the Delegate River 20 miles from here, so no doubt they are widely spread and increasing. I shall be glad to send Mr. Thompson the next one I get if he can tell me how to send it. We have not got ice here, and it would require to be put in spirits and I have no glass jars large enough to hold a moderately sized specimen. You did not send me the young fish you promised.

Yours, &c.,

HENRY B. EDWARDS.

Dear Sir,

Bibbenluke, 6 November, 1894.

I have the honor to acknowledge receipt of your letter of 3rd instant *re* trout.

Several fine fish have been seen in the river here lately, and some 20 miles lower down in the Delegate River, where I put in 100 young fish some two or three years ago.

I have seen a fine trout every evening this week in the river here, jumping at the flies, and it could be easily caught by anyone understanding angling, which I do not. I fear if I succeed in capturing one that I could not get the ice in time from Cooma to preserve it and send it to you, as we are 46 miles from the train.

Fish are constantly seen rising at the flies by my men who go fishing on an evening for cels.

I think there can be no doubt but that the trout are doing well in these streams and increasing.

I am, &c.,

HENRY B. EDWARDS.

Sir,

Sir,

Sydney, 6 November, 1894.

I have the honor to report for your information, I received instructions from the President to visit the trout ponds at Prospect reservoir. So on Monday, November 5th I went up to the ponds. I found the trout fry doing remarkably well, although the temperature of the water was 78 degrees in the ponds; the fry seemed to be strong and healthy.

I beg to call your attention to the temperature of the water in the reservoir. At a depth of 66 feet I found the temperature to be 67 degrees. On the surface, 78 degrees; at a depth of 40 feet, 66 degrees. In eight feet of water, near the outlet of the ponds, the thermometer recorded 78 degrees.

Considering the high temperature of the water, it was surprising to see the fry in such good health and condition.

I have, &c.,

GEORGE GLADING,

Boatman and Assistant Inspector.

Sir,

19 January, 1895.

I have the honor to report the following with reference to the waters of Lake Macquarie, which was under my supervision during the year 1894.

In the first place when I was sent here, just twelve months ago, the Lake Macquarie fishery as a whole was in a very bad state, fishermen were using long nets, besides doing pretty well as they liked in the closed waters, as a result it was some months after I came here that fish of any kinds could be seen in the closed waters, it was also some time before I could keep the fishermen within bounds, but eventually, a good number when they found that they could not do as they liked left here for other localities where no Inspector was stationed. During the months of March and April fish of all kinds were very plentiful about the Lake, particularly mullet, shoals of which could be seen everywhere, one shoal which I consider extended over five acres of water laid about for a week in the closed waters of the Lake entrance waiting for a favourable opportunity to travel.

Bream and whiting were very plentiful right through the months of June and July in the closed waters of channel entrance, they were travelling up channel to the Lake where some fine hauls were made by fishermen. Schnapper, jewfish, and soles were also plentiful during the winter months. Towards Christmas anglers were catching in the Lake entrance fine lots of bream, whiting, and flathead, their principal bait being prawns, a plentiful supply of which could be caught at night on the sand flats south of the entrance closure.

There was on an average seventy fishermen and twenty-five boats engaged in fishing, and the total number of baskets of fish sent to market and direct to different parts of the country was 11,574.

A number of fishermen were fined during the year for breaches under different sections of the Fisheries Act, some of them paying the fines, others being committed to gaol, while in some two or three cases the offenders took advantage of the time allowed them to pay the fines and cleared out to different parts of the world. I might state that the last-named were runaway sailors.

F. ALDRICH,

Assistant Inspector of Fisheries, Swansea.

Sir,

Hawkesbury River, 7 January, 1895.

I have the honor to submit my annual report on the Fisheries and Oyster Fisheries of the Hawkesbury River, the district under my charge. The fisheries of this large and important river I shall divide into the net and line fisheries and the oyster fisheries. I shall, with your permission, first deal with the net and line fisheries.

The net and line fishing industry is carried on all the year through, being principally confined to the lower part of the Hawkesbury River, and Pittwater, Cowan Creek, and all the large tributaries being at present closed against the use of fishing-nets. The waters mentioned give employment to from sixty to seventy men, and using from twenty to twenty-five boats and nets, more or less. The principal fish which resort these waters are mullet, bream, jewfish, blackfish, perch and whiting, and flathead.

The total quantity of fish sent to the Sydney market and suburbs during the past year is 5,991 baskets. Considerable line fishing is carried on by the licensed fishermen, and also by a large number of pleasure parties, with jewfish, bream, flathead, and an occasional schnapper, a fair supply of which has been caught during the summer months. Of the fishing-nets now chiefly used in the Hawkesbury River, I beg to report that the garfish-net, a most destructive net among small fish, is now generally used, and although garfish are seldom seen in this river, these nets are used all the year through.

It may not be known that these nets destroy small fish daily by the thousands; it is therefore idle to speak of protecting the fisheries, so long as these nets are allowed to be used. I beg also to state that pleasure parties destroy large quantities of immature fish, which, of course, they are allowed to do by the Act.

I beg further to state, for your information, that rumours have reached me that quantities of small, strange fish have been seen in Upper Colo Creek some months back; that several strange fish had been caught by certain residents, but I have not yet seen any. A resident from Colo informed me that he had not seen these fish since last winter. It is possible that these fish may be trout placed there by the Commissioners.

Of the oyster fisheries of this once famous Hawkesbury River, I beg to report that there are now only fifteen small leases in existence.

I beg to state, for your information, that the oyster foreshores everywhere are now seriously denuded of oysters; that no improvements have taken place in any of the leases.

I beg to state that certain localities are still infested with the worm disease, but they are mostly confined to low water, and below low-water mark. I have no hesitation in saying that plenty of oyster culture could be carried on in spite of this disease.

It is also much to be regretted that these lessees could not be compelled to go into oyster culture, or else give the leases up.

The total quantity of oysters shipped during the past year is 660 bags, but this quantity is not the result of legitimate oyster culture, but the result of thieving off the whole of the Crown lands of the Hawkesbury River.

I have, on former occasions, recommended the cancellation of the few remaining leases, as they are not held for oyster culture.

I have, &c.,

P. SMITH,

Assistant Inspector.

Memo.—

Memo.—

Whilst at the Clarence River I examined the oyster leases there, and I regret to say that I found most of the beds in a most deplorable state, through the worm disease, more especially lease 64, where every oyster is dead, even to the young ones of about three months growth. This was one of the most valuable beds on the river, and the origin of the disease may be traced to the deposit of shells and oysters from Sydney. The only way, in my opinion, to attempt to destroy the seat of the disease, which this lease undoubtedly is, would be to remove every shell from it, and leave everything on shore to bleach for say 12 months, and by this the worms will be destroyed in the shells, as also their eggs. The shells could then be laid down afresh. The bed is of no use in its present state, as no oysters can live with the pest, and by allowing the bed to remain as it is at present, it is a question whether this area is not distributing the disease; even the mere testing of the lease bits of diseased shell come into the boat only to be thrown over elsewhere to further distribute it.

Lease 888.—Disease not bad on this area; a fair supply of spat on shell and stones; marketable oysters not over plentiful; and if a few more bags be taken therefrom dredging should be stopped.

Lease 716.—Very fair supply of oysters; fair show of young stuff.

Lease 262.—Worm very bad; even the young oysters are full of it.

Lease 262A.—Next to the punt; very few oysters on it, but good bottom; being in close proximity to lease 64 it is perhaps fortunate that it is without oysters, as the disease from this area would destroy it.

I respectfully submit that there should be some supervision on this river to protect the few remaining oysters, and keep a sharp lookout for the disease from being removed from one bed to another, and to prevent beds being overworked, also to supervise the fishermen and the closed waters.

FREDK. W. SMITHERS.

11 December, 1894.

Memo.—

During my recent visit to the Hastings River I examined the leases there. I found on all of Dick's leases oyster cultivation has been carried on, and it is with pleasure that I can report the great results of his labours. His beds are well cared for, and are more than well stocked with oysters of marketable size; and his spat collectors are literally covered with young oysters, which he intends laying out as he has been doing all along. Dick collects his spat, and when of sufficient size they are transferred to suitable water to enable them to come to maturity. Altogether his beds are a credit, and I may say it is a pity others have not taken a lesson from him.

11 December, 1894.

FREDK. W. SMITHERS.

Memo.—

During my recent visit to the Manning River I made an examination of the beds now leased for oyster culture, and also the Crown lands not under lease.

I found the whole of the beds free from the disease. This is important.

As to the leased areas—taking Woodward's first, all his deep-water beds have a good supply of young stuff, and some of them are worked rather low; but his manager informs me that this working has been done before to thoroughly cleanse the beds and catching a fresh supply of spawn. I cannot endorse the correctness of this theory, as it simply means trusting to luck, and certainly without assisting nature. I would advise less working, and saving all stones dredged up from which oysters are taken off, and throwing such stones on shore to bleach before putting back on the bed, thus giving a better surface for spawn to stick to; and a quantity of shell might be served the same way. Also the foreshores of the beds might be utilised for laying down, and stones put down for catchment. If this were done it would prove of great benefit to Mr. Woodward. There is not the slightest doubt as to the oysters growing along the foreshores if any assistance be given to save spawn. Any stone which has been thrown along the foreshores by accident is covered with oysters.

His foreshore beds towards the old bar have a good supply of young oysters thereon.

The oysters throughout his leases are in good order, especially the deep beds, same as sample shown to the Commissioners. As to spawning, I submit a sample of it which must be considered as satisfactory.

Comino's bed, No. 29, is certainly a wonderful one. There were five boats working on it on my visiting there, and I found great destruction of young oysters being carried on, as all older oysters have their shells covered with young stuff; so whilst sending one marketable oyster to market at least six young ones are destroyed. I drew special attention of his men to this destruction; even the lessee, in his own personal interest, should have seen this.

The foreshores of this bed are not used for cultivation, although well suited for such.

The whole of the Crown lands not under lease have been cleared of oysters. If any supervision was on the river it would help to stop destruction of the young oysters.

In 1889 I find that oysters on the beds in the river were scarce; indeed the outlook was not promising, and no sign of a spat supply. But since, fortune has favoured the river, and I consider over a 1,000 bags of oysters will be sent to market this year. I must not omit to state that Messrs. Woodward and Comino have laid down continuously numbers of bags of New Zealand oysters on the river, more especially when oysters were scarce throughout the Manning; and perhaps to this may be attributed the fall of spat at end of 1889 and 1890.

29 December, 1894.

FREDK. W. SMITHERS.

During my last visit to Camden Haven I examined the whole of the areas leased to Mr. F. Gibbins, and it is with gratification that I am enabled to report favourably on the areas in question. Upon perusal of this report it will be seen that Mr. Gibbins belongs to the class of lessee which if the Colony had a few more of such, oyster culture would become a great success.

I found every available patch of his leases on the river was covered with ballast carefully placed in order to catch spat, thereby making barren foreshores prolific, as can be seen upon casually looking at the stones, which are covered with spat, when, upon their attaining a few months growth, they are carefully knocked off and placed upon other leases for maturing purposes. Again if whole stones are removed fresh ones are put down, everything in fact, being carried out in a most scientific and systematic manner. Any mangrove foreshores are utilised in the same way.

All along the foreshores of certain leases oysters are to be seen carefully laid down. With regard to quantities so placed, it would be impossible to estimate the number of bags that could be removed therefrom.

As to the idea that oysters removed from the Heads, mangroves, and from off the ballast heaps, would not thrive or pay if so laid down, is hereby exploded, as oysters from the three classes of places named are not alone growing well but have grown into splendid marketable oysters, and are of great saleable value.

The sequel to this success, in the first place, lies with the lessee studying conscientiously his future interests. 2. Carrying out oyster culture as far as his energy and means will permit. 3. Conservation of spat supply. 4. Avoiding overworking. 5. The interest taken in the matter by manager and men. 6. By paying the employees so much per week to attend to the areas, instead of so much per bag to gather them, as is done by others.

Taking the deep water beds as a whole they are very creditably managed indeed, and might be taken as a pattern by other oyster lessees.

The foreshores, which are used for catching spawn, present a wonderful contrast to that which prevails on other lessees' areas.

The foreshores, also, on which the oysters are laid down, present a magnificent sight, being a mass of oysters. It is highly satisfactory to know that such were removed from beds upon which they could not attain a large or rapid growth, and are now doing well where they have been transplanted, and it is still much more satisfactory to see the public estate improved in this manner.

On the whole, the oyster fisheries of Camden Haven are most complete and well worth paying a visit to.

FREDK. W. SMITHERS.

P.S.—In conclusion, I would draw attention to the fact that seven years ago Camden Haven was almost totally devoid of oyster life, and I submit that my report upon its present oyster bearing qualities will be received with pleasure by the Commissioners.

Lease 1,439.—800 yards. Has a depth of about 9 feet, and extends half-way across the creek. It has a bottom of white clay, covered with a thick layer of oyster shell, on which I found a large supply of young, and also marketable, oysters. Three years ago, this bed was stripped almost bare, and now could easily produce 900 bags of good marketable oysters without injuring it. Along the foreshore I found quantities of young oysters adhering to stones and roots of trees. Every haul I saw made, the dredge was full to the knife of oysters, and in splendid order.

Lease 2,240.—For the most part, the foreshores are covered with ballast laid down by the lessee, the remaining portion left untouched allowing the cobblers' pegs to catch the spat. The ballast is well covered with oysters, answering the purpose for which it was laid down, viz., to catch spat.

Lease 2,241.—A mangrove foreshore, upon which there is a good supply of oysters.

Lease 2,173.—This area is right down at the bar, and has a foreshore of soft rock which is used as a spat collector. 150 bags were taken from it last winter to be laid down elsewhere, and now the lease is one mass of oysters again.

Lease 2,185.—This lease is just inside the Heads; has foreshores of gravel and ballast; also utilised as a spat collector, and now well stocked with oysters, large and small.

Lease 2,204.—The whole of the foreshores of this area are covered with ballast, hundreds of tons being placed there with the object of catching oyster spat, and a most remarkable catch has been the result. Men are employed in removing bags of young oysters to the lessee's other beds for maturing purposes. Even from this lease numbers of bags of marketable oysters could be sent to Sydney. When stones with oysters are removed to other beds, fresh stones are put in their places.

Lease 542.—At old slip; has a rubble foreshore, and extends outwards about 60 yards with a rubble bottom at a depth of 10 feet, and upon which there is a good supply of oysters, both large and small. This bed is greatly used for laying down purposes. Over the bed a strong tide runs.

Lease 346.—Same class of bed as 542, and has a good supply of oysters upon it. One man dredges there at the rate of four bags a day. Some months ago quantities of oysters were placed here from lease 3,244 at the bar, and these have now developed into splendid shaped oysters.

Lease 348.—Extends outwards to depth of about 17 feet, has a good hard shelly bottom on which there is a good supply of oysters. In the deep waters there is a large amount of spat. The foreshores of the bed are utilised for laying down purposes, and the oysters laid down are doing remarkably well.

Leases 347 A and B.—These are remarkably productive beds, and must be taken together as they run from foreshore to foreshore. Most of the foreshores are used for laying down purposes, and the oysters thereupon and the oysters out in deep water are covered with spawn. Those in deep water are very plentiful, and I saw five bags a day gathered therefrom, which was thoroughly testing the capabilities of the lease. Care must be taken to prevent the dredge continuing to empty the silt in the vicinity of the lease for if this is carried on ruination of the oysters must follow.

Leases 742 and 849.—Mangrove foreshores and ballast laid down to catch spawn and oysters doing well upon it. Cobblers' pegs well stocked with spawn; all mangrove roots also covered with oysters, and from edge of pegs outward about 20 feet wide oysters laid down and doing well.

Lease 1,274.—Mangrove foreshores well stocked with oysters, and utilised for getting oysters to lay down elsewhere.

Lease 2,214.—Mangrove foreshore well stocked with oysters, and foreshore of same has oysters laid down, derived mostly from the mangrove and pegs, which are thriving well and of good shape and quality.

Lease

Lease 533.—The foreshore all ballast, smothered with oysters, and which was formerly a barren shore.

Lease 535.—Foreshore a bed of hard sand, shelly bottom; used largely for laying down purposes with oysters from other beds. There are hundreds of bags of oysters so laid down, and have turned miserable oysters into splendid marketable ones.

Lease 791.—Foreshore of hard sand, with shelly bottom; used for laying down oysters from rocks and mangrove. Hardly possible to estimate the quantity laid down, as there are such quantities all along the bed, and which are doing remarkably well.

Lease 2,242.—Used as a laying down bed only, the oysters so placed being brought from mangrove and rocks, and are doing well.

Lease 708.—Used as a laying down bed same as above.

Lease 1,244.—Mangrove foreshore, with cobbler's pegs and roots well covered with oysters. Outside the pegs, oysters laid down on good bottom with great success.

Lease 1,209.—There are very few oysters there at present, but ballast will soon be laid down for spawn to adhere to.

Lease 2,174.—Mangrove foreshore well stocked, and was only recently cleared of oysters to lay on other beds.

FREDK. W. SMITHERS.

1894.
(SECOND SESSION.)

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

ROYAL COMMISSION ON FISHERIES.
(COPY OF.)

Ordered by the Legislative Assembly to be printed, 20 November, 1894.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,
Defender of the Faith, and so forth.

To our trusty and well-beloved

The Honorable JOSEPH HECTOR CARRUTHERS, Esquire, our Secretary for Lands, of our Colony of
New South Wales ;

FRANK FARNELL, Esquire, a Member of the Legislative Assembly of our said Colony ; and

LINDSAY GEORGE THOMPSON, Esquire, Chief Inspector of Fisheries, and Secretary to the
Commissioners of Fisheries of our said Colony,—

GREETING :—

KNOW ye, that we, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you, or any two of you, as hereinafter mentioned, to make a diligent and full inquiry as to the best means of developing the Marine and other Fisheries of the said Colony, and as to the better regulation of that industry by law : And we do by these presents, grant to you, or any two of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, to conduct such experiments as may appear necessary, and to inquire of the premises by all lawful ways and means : And we do give you power at your discretion to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this our Commission : And our further will and pleasure is that you do, within three months after the date of this our Commission, certify to us, in the office of our Chief Secretary, under your or any two of your hands and seals, what you shall find touching the premises : And we hereby command all Government officers and other persons whomsoever within our said Colony, that they be assistant to you and each of you in the execution of these presents : And we appoint you, the said Frank Farnell, Esquire, to be President of this our Commission, which said Commission we declare to be a Commission for all purposes of the Act 44 Victoriae No. 1, intituled “ *An Act to regulate the taking of Evidence by Commissioners under the Great Seal.*”

In testimony whereof, we have caused these our letters to be made patent, and the Great Seal of our said Colony of New South Wales to be hereunto affixed.

Witness our Right Trusty and Well-beloved Councillor, SIR ROBERT WILLIAM DUFF, Knight Grand Cross of our Most Distinguished Order of Saint Michael and Saint George, our Governor and Commander-in-Chief of our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this twentieth day of November, in the fifty-eighth year of our Reign, and in the year of our Lord one thousand eight hundred and ninety-four.

R. W. DUFF.

[L.s.]

By His Excellency's Command,
JAMES N. BRUNKER.

Entered on record by me, in Register of Patents, No. 16, page 265, this twentieth day of November, one thousand eight hundred and ninety-four.

For the Colonial Secretary and Registrar of Records,

CRITCHETT WALKER,
Principal Under Secretary.

1894-5.

LIST OF WITNESSES.

THE TASMANIAN FISHERIES.

Alexander Morton, Esq., Curator of the Tasmanian Museum, Hobart, and a Member of the Tasmanian Fisheries Commission	PAGE. 1-3
Mr. John Whelan, Inspector of the Fish Market, Hobart	3-4
Mr. William Gates, fisherman, Hobart ..	4-5
Mr. Daniel Jones, fisherman, Hobart ..	6-7
Phillip Samuel Seager, Esq., Registrar of the Supreme Court of Tasmania, and a Member of the Tasmanian Fisheries Commission	7-9
Matthew Seal, Esq., President of the Tasmanian Fisheries Commission ...	9-10
Mr. Frederick Self, water bailiff to the Tasmanian Fisheries Commission ..	10
Mr. Frederick Pender, commission agent at the Hobart Fish Market .. .	10-11

THE VICTORIAN FISHERIES.

Captain John Pratt, master of the schooner "Elsmore," Queenschiff .. .	11-12
Mr. Benjamin Chidgey, fisherman, Queenschiff	12-13
Mr. George Werry, fisherman, Queenschiff .. .	13
Mr. Cuthbert Fox, fisherman, Queenschiff ..	13-14
Mr. William Moore, fisherman, Welshpool, Corner Inlet .. .	14-15
Mr. Henry Avery, secretary to the Port Albert Fishermen's Association ..	15-17
Mr. Thomas Jemmeson, fisherman, Cunninghame, Lakes Entrance, Gippsland ..	17-18
Mr. Thomas Murray, fisherman, Paynesville ..	18
John Clayton, Esq., Town Clerk, Melbourne .. .	19-21

FISHERIES OF NEW SOUTH WALES.

THE SOUTHERN HOME FISHERIES.

CROOKHAVEN AND SHOALHAVEN RIVERS FISHERIES. .

Mr. George Haiser, oyster lessee, Greenwell Point, Crookhaven River .. .	21-24
Mr. Robert Lonesborough, fisherman, Greenwell Point, Crookhaven River ..	24-25
Mr. Richard Baxter, fisherman, Greenwell Point, Crookhaven River .. .	26-28
Mr. Thomas Wilson, fisherman, Greenwell Point, Crookhaven River .. .	28-29

LAKE ILLAWARRA FISHERIES.

Mr. Edwin Barber, fisherman, Lake Illawarra .. .	29-33
Mr. George Daniel Hockey, fisherman, Shellharbour .. .	33-36
Mr. James William Smith, fisherman, Lake Illawarra .. .	36-38
Mr. David Walker Benson, Assistant Inspector of Fisheries, Lake Illawarra ..	39-45

NORTHERN HOME FISHERIES.

HUNTER RIVER FISHERIES.

Mr. Joel Tresidder, fisherman and fish-dealer, Carrington .. .	45-49
Mr. Edward Edmund Bull, fisherman, Waratah .. .	49-52
Mr. Hans Anderson, superintendent of Mr. Gibbins' oyster fisheries, Hunter River ..	52-53
Mr. Hartley Spur, fishmonger, Newcastle .. .	53-54
Mr. Henry Limeburner, fisherman, Newcastle .. .	54-55

LAKE MACQUARIE FISHERIES.

Mr. George Parker, fisherman, Lake Macquarie... ..	56-59
Mr. Daniel McGunness, fisherman, Lake Macquarie .. .	60-62
Mr. Theodore Gambrill, fisherman, Dora Creek, Lake Macquarie .. .	62-65
Mr. Lars Jansen, fisherman, Lake Macquarie .. .	66-67
Mr. Francis Aldrich, Assistant Inspector of Fisheries, Swansea, Lake Macquarie ..	67-71

THE HAWKESBURY RIVER FISHERIES.

Mr. Joseph Izzard, fisherman, Brooklyn, Hawkesbury River .. .	71-77
Mr. James Ross, fisherman, Peat's Ferry, Hawkesbury River .. .	77-80
Mr. Peter Smith, Assistant Inspector of Fisheries, Hawkesbury River .. .	80-84

BRISBANE WATER FISHERIES.

Mr. Simon Luccani, fisherman, Woy Woy, Brisbane Water .. .	85
Mr. William Adolphus Hannon, fisherman, Blackwall, Brisbane Water .. .	85-88
William Charles Browne, Esq., B.A., St. Hubert's Isle, Brisbane Water .. .	88-90
Mr. Frederick Henry Chapman, Kincumber .. .	90
Mr. Peter Petersen, fisherman, East Gosford .. .	91-92

TUGGERAH

TUGGERAH LAKES FISHERIES

	PAGE.
Mr Charles Kavle, fisherman, Wyong	92-95
Mr Jeremiah Ciemen, fisherman, Wyong	95-98
Mr Nicholas Boyaze, fisherman, Tuggerah Lakes	98-100
Mr Francis Aldrich, Assistant Inspector of Fisheries, Lake Macquarie	100
Mr Robert Izaid, steam boat proprietor, Wyong	100

PORT STEPHENS AND MYALL LAKES FISHERIES

Mr Samuel Lilley, fisherman, Port Stephens	100-105
Mr Edward Holbert, fisherman, Corrie Island, Myall River, Port Stephens	105-108
Mr Charles Anderson, fisherman, Telgherry Creek, Port Stephens	108-109
Mr Peter Johnson, fisherman, Telgherry Creek, Port Stephens	110-113
Mr Walter Glover, fisherman, Nelson's Bay, Port Stephens	113-115
Mr Thomas Bagnall, fisherman, Nelson's Bay, Port Stephens	116-118
Mr Henry Laman, Honorary Acting Assistant Inspector of Fisheries, Port Stephens	118-120
Mr Henry Thompson, oyster lessee, Nelson's Bay, Port Stephens	120-122

PITTWATER, NARRABEEN LAKES, AND DEE WHY LAGOON FISHERIES

Sir,

Chief Secretary's Office, Sydney, 20 November, 1894.

I am directed by the Chief Secretary to transmit herewith a Commission under the Great Seal of the Colony, appointing you, in conjunction with the other gentlemen named therein, to be a Royal Commission to make a diligent and full inquiry as to the best means of developing the Marine and other Fisheries of the Colony, and as to the better regulation of that industry by law.

2. I am desired to add that the Governor-in-Council has also been pleased to appoint you to be President of the Commission.

3. You will be provided with such clerical and other assistance as may be deemed necessary for enabling you to execute the Commission.

I have, &c.,

GRITCHETT WALKER,

Principal Under Secretary.

Frank Farnell, Esq., M.P.

Commission.

VICTORIA, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen,
Defender of the Faith, and so forth.

To our trusty and well-beloved

The Honorable JOSEPH HECTOR CARRUTHERS, Esquire, our Secretary for Lands, of our Colony of
New South Wales ;

FRANK FARNELL, Esquire, a Member of the Legislative Assembly of our said Colony ; and

LINDSAY GEORGE THOMPSON, Esquire, Chief Inspector of Fisheries, and Secretary to the
Commissioners of Fisheries of our said Colony,—

GREETING :—

KNOW ye, that we, reposing great trust and confidence in your ability, zeal, industry, discretion, and integrity, do, by these presents, authorise and appoint you, or any two of you, as hereinafter mentioned, to make a diligent and full inquiry as to the best means of developing the Marine and other Fisheries of the said Colony, and as to the better regulation of that industry by law : And we do by these presents, grant to you, or any two of you, at any meeting or meetings to which all of you shall have been duly summoned, full power and authority to call before you all such persons as you may judge necessary, by whom you may be better informed of the truth in the premises, and to require the production of all such books, papers, writings, and all other documents as you may deem expedient, and to visit and inspect the same at the offices or places where the same or any of them may be deposited, to conduct such experiments as may appear necessary, and to inquire of the premises by all lawful ways and means : And we do give you power at your discretion to procure such clerical and other assistance as you may deem necessary for enabling you duly to execute this our Commission : And our further will and pleasure is that you do, within three months after the date of this our Commission, certify to us, in the office of our Chief Secretary, under your or any two of your hands and seals, what you shall find touching the premises : And we hereby command all Government officers and other persons whomsoever within our said Colony, that they be assistant to you and each of you in the execution of these presents : And we appoint you, the said Frank Farnell, Esquire, to be President of this our Commission, which said Commission we declare to be a Commission for all purposes of the Act 44 Victoriae No. 1, intituled “ *An Act to regulate the taking of Evidence by Commissioners under the Great Seal.* ”

In testimony whereof, we have caused these our letters to be made patent, and the Great Seal of our said Colony of New South Wales to be hereunto affixed.

Witness our Right Trusty and Well-beloved Councillor, SIR ROBERT WILLIAM DUFF, Knight Grand Cross of our Most Distinguished Order of Saint Michael and Saint George, our Governor and Commander-in-Chief of our Colony of New South Wales and its Dependencies, at Government House, Sydney, in New South Wales aforesaid, this twentieth day of November, in the fifty-eighth year of our Reign, and in the year of our Lord one thousand eight hundred and ninety-four.

R. W. DUFF.

[L.S.]

By His Excellency's Command,
JAMES N. BRUNKER.

Entered on record by me, in Register of Patents, No. 16, page 265, this twentieth day of November, one thousand eight hundred and ninety-four.

For the Colonial Secretary and Registrar of Records,

CRITCHETT WALKER,
Principal Under Secretary.

Sir,

Chief Secretary's Office, Sydney, 28 December, 1894.

I am directed by the Chief Secretary to transmit herewith a Commission under the Great Seal of the Colony appointing the Honorable Robert Hoddle Driberg White, M.L.C., to be a member of the Royal Commission to inquire into the Fishing Industry of the Colony in the room of the Honorable Joseph Hector Carruthers, Esquire, M.P., resigned.

I have, &c.,

CRITCHETT WALKER,

Principal Under Secretary.

Frank Farnell, Esquire, M.P.,

President of the Royal Commission to inquire into the Fishing Industry.

EXTENSION OF COMMISSION.

ROYAL COMMISSION TO INQUIRE INTO THE FISHING INDUSTRY.

WHEREAS it is necessary to extend the time within which the Commissioners are to make their report in the above matter: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the said Commissioners are to make such report for a period of six weeks—to take effect from the 20th instant.

Given under my hand at Government House, Sydney, this twenty-eighth day of February, one thousand eight hundred and ninety-five.

By deputation from His Excellency,

FREDK. M. DARLEY,

Lieutenant-Governor.

By His Excellency's Command,

JAMES N. BRUNKER.

ROYAL COMMISSION TO INQUIRE INTO THE FISHING INDUSTRY.

WHEREAS the time appointed for the return of the Commission in the above matter was by an instrument dated the twenty-eighth day of February last, extended for a period of six weeks: And whereas it is necessary to extend the same still further: Now, therefore, I do hereby, with the advice of the Executive Council, extend the time within which the Commission are to make their return to and for a further period of three months beyond the time in and by the aforesaid instrument appointed for the purpose—to take effect from the 4th April proximo.

Given under my hand at Government House, Sydney, this twenty-sixth day of March, one thousand eight hundred and ninety-five.

FREDK. M. DARLEY,

Lieutenant-Governor.

By His Excellency's Command,

JAMES N. BRUNKER.

ROYAL COMMISSION ON FISHERIES.

MINUTES OF PROCEEDINGS.

TUESDAY, 4 DECEMBER, 1894.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The Commission, and the letter of the Principal Under Secretary accompanying it, were read by the Secretary to the Commission.

A letter was read from the Principal Under Secretary, stating that a communication had been received from the Hon. J. H. Carruthers, Secretary for Lands (who had been appointed to the Royal Commission on Fisheries), resigning his appointment as a member of the Commission.

The Secretary read a letter from the Principal Under Secretary, addressed to the President, stating that the Chief Secretary had approved of the appointment of Mr. Walter D. White as Secretary and Shorthand Writer to the Commission.

It was decided to communicate with the Chief Secretary, with a view of having a third gentleman appointed in the place of the Hon. J. H. Carruthers, the members of the Commission present deeming it inexpedient to proceed with any business until the Commission was complete.

The Secretary was instructed to obtain from the Government Printer the Report, together with Minutes of Proceedings, Evidence, and Appendices of the Oyster Culture Commission; Report of the Fisheries Inquiry Commission; and Reports of the Select Committees on the Working of the Fisheries Acts.

The members of the Commission then deliberated as to the manner of instituting a complete inquiry into the present condition and future prospects of the Fisheries of New South Wales.

[The members of the Commission, at 12:40 a.m., adjourned *sine die*.]

WEDNESDAY, 19 DECEMBER, 1894.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The President announced that the Government had been pleased to appoint the Hon. Robert Hoddle Driberg White, M.L.C., to the Commission, *vice* the Hon. J. H. Carruthers, M.P., resigned.

Correspondence :—

Letter from Miss Manning, "Levuka," Edgecliffe-road, Woollahra, with reference to the proposed publication of a cheap book on Australian Fish Cookery.

The Secretary was instructed to inform the writer that the Commission would, in all probability, communicate with her at a later date, and that any suggestions she might be able to offer would be considered.

From D. Murray, 106, King-street, Sydney, with regard to the capture of deep-sea fish by means of an electric glow-lamp suspended inside a trap, and asking for assistance in obtaining the use of the Government steamer "Thetis" for a few nights in order to test his invention.

The Secretary was instructed to reply stating the Commission would be pleased to hear Mr. Murray's views upon the subject at the next meeting.

The Secretary was directed to write to the Chief Secretary requesting him to relieve Mr. Lindsay G. Thompson from his official duties as Secretary to the Fisheries Commissioners, that gentleman's services being considered indispensable in assisting in carrying out the work of the Royal Commission on Fisheries.

The Secretary was instructed to communicate with the Chief Secretary asking him to procure, for the use of the Commission, copies of Acts of Parliament, Reports of Royal Commissions, Select Committees, and other documents relating to the Fisheries in Victoria, Queensland, New Zealand, and Tasmania.

The Hon. R. H. D. White offered to place his steam-yacht, "White Star," at the service of the Commission during their inquiry into the condition of the Fishing Industry in New South Wales, on condition that the wages of certain men employed on the vessel be paid by the Commission.

The President thanked Mr. White for his offer.

The Commission considered a circular letter having reference to the development of the Deep-sea Fisheries, which it was proposed should be forwarded to the Colonial Secretary.

The Commission considered and adopted the lines of procedure for the carrying out of their inquiry.

The Commission, at 1 p.m., adjourned until 2 o'clock.

The Commission met at the Ministerial Room, Legislative Assembly, at 2 p.m., where they interviewed Mr. Rock Davis, shipbuilder, of Brisbane Water, with reference to the construction of a vessel suitable for trawling purposes, and a well-boat.

[The Commission, at 3 p.m., adjourned until Thursday, 10th January, 1895.]

THURSDAY, 10 JANUARY, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Correspondence :—

Letters from Mr. Rock Davis, Blackwall, Brisbane Water, and C. W. Darley, Esq., Engineer-in-Chief for Harbours and Rivers, with reference to the cost of constructing a steam-trawler and a well-boat for deep-sea fishing.

Letter from Miss Manning, "Levuka," Edgecliffe-road, Woollahra, with reference to the proposed publication of a cheap book on Australian Fish Cookery.

Letter from Critchett Walker, Esq., C.M.G., Principal Under Secretary, stating that the Chief Secretary had approved of Mr. Lindsay G. Thompson, J.P., being relieved of his official duties as Secretary to the Fisheries Department until the completion of the labours of the Royal Commission on Fisheries.

Letter from the Principal Under Secretary, stating that the Prime Ministers of Victoria, Queensland, New Zealand, and Tasmania had been invited to furnish, for the information of the Commission, copies of Acts of Parliament, &c., relating to the Fisheries of their respective Colonies.

Letter from The Capitaine Oil Engine Co., Sussex-street, Sydney, with reference to the merits of the Capitaine Oil-Engine.

Letter, with papers, from T. T. Ewing, Esq., M.P., with reference to Mr. West's oyster-lease, Ballina.

The correspondence was received.

The Secretary was instructed to inform Miss Manning that the Commission would invite her to give evidence at a later date.

The Secretary was instructed to forward Mr. Ewing's letter and papers to the Chief Secretary, and to state that it having been ascertained by reference to the Fisheries Department that Mr. Ewing suggested that, under the circumstances detailed, half of the amount paid by Mr. West might be refunded, the Commission were of opinion that that was a matter in which, if Mr. Bruncker saw fit, he might exercise his clemency.

The Commission further considered a circular letter, having reference to the development of the Deep-sea Fisheries, which it was proposed should be forwarded to the Chief Secretary.

The letter was verbally amended and passed.

It was resolved that the Commission should present the letter to the Chief Secretary at 11:30 a.m. on Friday, the 11th instant.

[The Commission; at 12:10 p.m., adjourned until 11:15 a.m. on Friday, 11th January.]

FRIDAY, 11 JANUARY, 1895.

The Commission met at the Offices, Bligh-street, at 10:30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to the Chief Secretary's Office, Macquarie-street, and interviewed the Chief Secretary with reference to the question of developing the Deep-sea Fisheries of New South Wales.

The President read a letter dealing with the subject, at the conclusion of which Mr. Bruncker promised to lay the matter before the Government at the earliest opportunity.

[The Commission, at 12:45 p.m., adjourned until Wednesday, 16th January.]

WEDNESDAY, 16 JANUARY, 1895.

The Commission met at "Menzies' Hotel," Melbourne, at 4 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission deliberated as to the best manner of prosecuting their inquiries in Victoria and Tasmania.

[The Commission, at 5 p.m., adjourned until 10:30 a.m. on Thursday, 17th January.]

THURSDAY,

11

THURSDAY, 17 JANUARY, 1895.

The Commission met at the Town Hall, Melbourne, at 10:30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, accompanied by the Town Clerk of Melbourne (John Clayton, Esq.), proceeded to inspect the new Fish, Meat, and Farm Produce Markets in Flinders-street, where they were shown the method of receiving and disposing of fish; a new refrigerating truck suitable for the carriage of fish or meat for long distances by rail; and the cool storage and freezing chambers.

In the afternoon the Commission had an interview with the Premier of Victoria (Hon. G. Turner), and several members of the Cabinet in the Ministerial Room, Parliament House. The subject of fisheries and fisheries' legislation was under discussion.

Subsequently, the Commission called upon Dr. Wollaston, Secretary for Customs.

[The Commission, at 5 p.m., adjourned until 11 a.m. on Friday, 18th January.]

FRIDAY, 18 JANUARY, 1895.

The Commission met at "Menziess Hotel," Melbourne, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission interviewed the Minister for Railways with reference to their visit to Victoria.

The Commission, at 5 p.m., sailed for Launceston, per the steamer "Pateena."

MONDAY, 21 JANUARY, 1895.

The Commission met at "Hadley's Hotel," Hobart, at 5:15 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission inspected the well-boats and fish-tanks in the harbour, and subsequently visited the Fish Markets during the auction sales.

Later in the day the Commission had an interview with the Chief Secretary of Tasmania (Hon. W. Moore, M.L.C.), and other members of the Government of Tasmania.

TUESDAY, 22 JANUARY, 1895.

The Commission met at "Hadley's Hotel," Hobart, at 7:30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

At 8 a.m. the Commission, at the invitation of the Chief Secretary of Tasmania (Hon. W. Moore, M.L.C.), proceeded by express train to the Plenty River Station, from whence they were conveyed in vehicles to the Salmon Ponds at New Norfolk. Here the Commission inspected the fish hatcheries and grounds, the method adopted in dealing with the ova and breeding and developing the salmon, brown trout, and Loch Leven trout, being explained by Mr. Matthew Seal, President of the Tasmanian Fisheries Commission, and Mr. A. Morton, Curator of the Tasmanian Museum.

The Commission returned to Hobart at 7 p.m.

THURSDAY, 24 JANUARY, 1895.

The Commission met at the Town Hall, Hobart, at 10:45 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to take evidence concerning the Fishing Industry in Tasmania.

The following witnesses were sworn and examined:—Alexander Morton, Esq., Curator of the Tasmanian Museum, and a member of the Tasmanian Fisheries Commission; Mr. John Whelan, Inspector of the Fish Market, Hobart; Mr. William Gates, fisherman, Hobart; Mr. Daniel Jones, fisherman, Hobart; Phillip Samuel Seager, Esq., a member of the Tasmanian Fisheries Commission; Matthew Seal, Esq., President of the Tasmanian Fisheries Commission; Mr. Frederick Self, Water Bailiff to the Tasmanian Fisheries Commission; and Mr. Frederick Pender, commission agent and wholesale exporter of fish, Hobart.

The

The Commission concluded the taking of evidence in Hobart at 4 p.m.

Subsequently the Commission, accompanied by Matthew Seal, Esq., President of the Tasmanian Fisheries Commission, paid a visit of inspection to the Fish Market, and examined a number of well-boats lying in the Victoria Dock, and on the slip at Battery Point.

[The Commission, at 5:30 p.m., adjourned until 11 a.m. on Friday, 25th January.]

FRIDAY, 25 JANUARY, 1895.

The Commission met at "Hadley's Hotel," Hobart, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to the Government buildings, Hobart, where they had an interview with Sir Edward Braddon, K.C.M.G. (Premier of Tasmania), on the subject of the fishing industry in Tasmania.

[The Commission adjourned at 12:45 p.m.]

MONDAY, 28 JANUARY, 1895.

The Commission met at "Hadley's Hotel," Hobart, at 5 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission paid another visit to the Hobart Fish Market, where they inspected the fishing craft and stock of live fish in the wells, together with the fish-boxes and fishing-nets of various descriptions. Subsequently the Commission, accompanied by Mr. Thomas Rush, a member of the Tasmanian Fisheries Commission, attended the fish auction sales at the Fish Market.

Later in the day the Commission, at the invitation of Matthew Seal, Esq., President, and the members of the Tasmanian Fisheries Commission, were taken on a visit of inspection to various fishing-grounds and breeding-places in the Upper and Lower Derwent.

[The Commission, at 6 p.m., adjourned until Thursday, 31st January.]

THURSDAY, 31 JANUARY, 1895.

The Commission met at the "Launceston Hotel," Launceston, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

While in Launceston, the Commission interviewed Messrs. H. Weedon and R. F. Irvine (members of the Tasmanian Fisheries Commission), and discussed with them the fisheries laws of Tasmania.

The Commission left Launceston for Melbourne, per the s.s. "Pateena," in the afternoon, and arrived at Melbourne on Friday, 1st February.

FRIDAY, 1 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," Melbourne, at 3:30 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission had under consideration an invitation from the Hon. R. W. Best (Minister for Lands and Customs) to pay a visit of inspection to the various fishing centres along a portion of the Victorian Coast and to the Gippsland Lakes.

The Commission decided to accept the invitation and to meet on board the Victorian Government steamer "Lady Loch," at Port Melbourne, at 11 a.m. on Saturday, 2nd February.

[The Commission, at 4:30 p.m., adjourned until the following day.]

SATURDAY,

SATURDAY, 2 FEBRUARY, 1895.

The Commission met on board the Victorian Government steamer "Lady Loch," Port Melbourne, at 11 a.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, accompanied by the Hon. R. W. Best (Minister for Lands and Customs), proceeded down Hobson's Bay to Queenscliff where they landed, inspected the fishing boats and nets, and took evidence relative to the fishing industry.

The following witnesses were examined:—Captain John Pratt, master of the schooner "Elsinore"; Mr. Benjamin Chidgey, owner of the fishing boat "Olive"; Mr. George Werry, owner of the fishing boat "Surge"; and Mr. Cuthbert Fox, owner of the fishing boat "Petrel."

[The Commission adjourned at 6 p.m.]

SUNDAY, 3 FEBRUARY, 1895.

The Commission met on board the s.s. "Lady Loch," in Westernport Bay, Victoria, at 10 a.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to Hastings, a fishing settlement in Westernport Bay, and inspected a number of fishing craft and nets at the pier. Subsequently the Commission interviewed several of the fishermen by whom they were informed that there were between eighty and 100 fishing boats employed in the bay, and over 200 men and boys engaged in the fishing industry. No evidence was taken.

[The Commission adjourned at 1 p.m.]

MONDAY, 4 FEBRUARY, 1895.

The Commission met on board the s.s. "Lady Loch," in Corner Inlet, Victoria, at 1:30 p.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission subsequently proceeded to the pier at Welshpool, Corner Inlet, where they spent some time in inspecting the fishing craft, nets, fish, and fish-boxes. Later on they witnessed the packing of the day's catch of fish in boxes which were supplied with ice prior to their being forwarded by rail to the Melbourne Market. Afterwards the Commission took the evidence of Mr. William Moore, a representative fisherman of Welshpool.

[The Commission adjourned at 6 p.m.]

TUESDAY, 5 FEBRUARY, 1895.

The Commission met at "Gray's Hotel," Port Albert, Victoria, at 11:30 a.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission after inspecting the fishing boats in the harbour, together with the fishing nets and other appliances, took the evidence of Mr. Henry Avery, Secretary to the Port Albert Fishermen's Association.

[The Commission adjourned at 1:30 p.m.]

WEDNESDAY, 6 FEBRUARY, 1895.

The Commission met on the s.s. "Lady Loch," at Lakes Entrance, Victoria, at 9:30 a.m.

PRESENT:—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting-President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Thomas Jemmeson, a practical fisherman, was sworn and examined respecting the method of fishing pursued by the fishermen at the Lakes Entrance.

[The Commission adjourned at 10:15 a.m.]

WEDNESDAY

WEDNESDAY, 6 FEBRUARY, 1895.

The Commission met at the "Temperance Hotel," Paynesville, Gippsland Lakes, at 1:30 p.m.

PRESENT :—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Thomas Murray, a practical fisherman, was sworn and examined.

When crossing Lake King the Commission proceeded in a dingy to a spot where some fishermen were hauling their nets and spent some time in watching the men at work.

[The Commission adjourned at 6 p.m.]

THURSDAY, 7 FEBRUARY, 1895.

The Commission met on the s.s. "Lady Loch," at Lakes Entrance, Victoria, at 7:30 a.m.

PRESENT :—

The Hon. Robert Hoddle Driberg White, M.L.C., Acting President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to the jetty at Cunninghame, where they inspected a surf-net and fishing boat belonging to a fisherman named Thomas Jemmeson who, on the previous day, had given evidence respecting fishing as carried on on the Ninety-mile Beach. The surf-net was opened out on the jetty and its construction explained to the Commission. The following is a description of the net in question :— The centre of the bunt is slit to a 12-foot opening. To this opening a bag 5 fathoms long and 4 fathoms wide is laced, and to this bag a second bag 4 fathoms long and 4 fathoms wide is attached with a lacing. The second bag is composed of salmon twine. Small corks are fixed along the top of the bags at intervals of 18 inches.

The Commission, at 8:30 a.m., proceeded by steamer to Sale, *via* the Gippsland Lakes, and reached Melbourne at 10:45 p.m. the same day.

FRIDAY, 8 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," at 10:30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C., | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission considered an invitation from the Hon. R. W. Best (Minister for Lands and Customs) to visit Geelong on the 9th instant, and inspect the fish hatcheries at the Lovely Banks, distant some 7 miles from Geelong.

The Commission decided to accept the invitation and the Secretary was instructed to reply in terms of their decision.

The Commission also decided to accept the invitation of Sir Samuel Wilson to visit Ercildoune, on Monday, the 11th instant, for the purpose of inspecting the fish hatcheries at that place.

[The Commission at 11:45 a.m. adjourned until 10 a.m. on Saturday, the 9th instant.]

SATURDAY, 9 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," at 10 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C., | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, accompanied by the Hon. H. Cuthbert, M.L.C., and Dr. Wollaston, at 10:55 a.m., proceeded to Geelong, where they were met by the Hon. J. H. Connor, M.L.C., and the members of the Geelong and Western District Fish Acclimatising Society, by whom they were shown the fish hatcheries, the ponds, and the grounds at the Lovely Banks.

[The Commission returned to Melbourne at 8:30 p.m.]

MONDAY,

MONDAY, 11 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," at 6 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C., | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission, at 6:30 a.m., proceeded by train to Burrumbeet, and from thence by vehicle to Ercildoune, where they inspected the fish hatcheries and breeding ponds established and maintained by Sir Samuel Wilson, who exhibited some good specimens of the *Salmonidae*, and gave particulars regarding the success that had attended his efforts at introducing English, American, and other varieties of fish into Australian waters.

The Commission, at 3 p.m., left Ercildoune for Ballarat, arriving at that city at 5 p.m. The Commission, accompanied by the Hon. E. Morey (Mayor of Ballarat), drove to the Gardens, where they inspected the fish hatcheries and ponds belonging to the Ballarat Fish Acclimatisation Society, who possess a very complete and valuable establishment, and whose efforts in acclimatising English and American fish have been attended with marked success.

[The Commission left Ballarat at 7:25, and arrived in Melbourne at 10:35 p.m.]

TUESDAY, 12 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," Melbourne, at 3 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

John Clayton, Esq., Town Clerk of Melbourne, was sworn and examined.

[The Commission, at 5 p.m., adjourned until 3 o'clock p.m. on Wednesday, the 13th February.]

WEDNESDAY, 13 FEBRUARY, 1895.

The Commission met at "Menzies' Hotel," Melbourne, at 3 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission left for Sydney, by express train, at 5:15 p.m.

MONDAY, 18 FEBRUARY, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission deliberated as to the most expeditious and satisfactory method of conducting their inquiries into the condition of the fishing industry in New South Wales.

The Secretary was instructed to write to the Principal Under Secretary, asking him to invite the Chief Secretary to extend the period of the Commission's operations for a term of three months.

[The Commission, at 12:30 p.m., adjourned until 11 a.m. on Wednesday, 20th February.]

WEDNESDAY, 20 FEBRUARY, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary, in reply to the President, reported that no communication had been received from the Chief Secretary regarding the extension of three months asked for by the Commission, to enable them to continue their investigations into the condition of the fishing industry in New South Wales.

[The Commission adjourned, pending the receipt of a letter from the Chief Secretary, with reference to the application for an extension of time.]

FRIDAY,

FRIDAY, 1 MARCH, 1895.

The Commission met at the Offices, Bligh-street, at 3 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Secretary read a letter from the Principal Under Secretary, transmitting an instrument under the hand of His Excellency the Lieutenant-Governor, with the advice of the Executive Council, extending the time within which the "Report of the Royal Commission appointed to inquire into the Fishing Industry of New South Wales is to be made for a period of six weeks beyond the time appointed for the purpose," to take effect from the 20th February, 1895.

The President of the Commission was requested to communicate with the Principal Under Secretary acknowledging the receipt, on 1st March, 1895, of the letter and to ask him to be good enough to note that over nine days of this authorised extension of time had already expired, during which period the executive functions of the Commission had necessarily to be suspended.

[The Commission, at 4 p.m., adjourned until Wednesday, 6th March.]

WEDNESDAY, 6 MARCH, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Bertram Horwitz, Esq., Superintendent of Agents, the Equitable Life Assurance Society of the United States, (Sydney office) was sworn and examined.

[The Commission, at 12.15 p.m., adjourned until Friday, 8th March.]

FRIDAY, 8 MARCH, 1895.

The Commission met at the "Albion Hotel," Nowra, at 2.30 p.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The following witnesses were sworn and examined:—Mr. George Haiser, oyster lessee, Greenwell Point, Crookhaven River; Robert Lonesborough, fisherman, Crookhaven River.

[The Commission, at 4.45 p.m., adjourned until Saturday, 9th March.]

SATURDAY, 9 MARCH, 1895.

The Commission met at the "Albion Hotel," Nowra, at 9.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to Greenwell Point, Crookhaven River, where they closely inspected several oyster beds, at which there were evidences of destruction caused by the ravages of the worm. They also inspected several new layings in different parts of the Crookhaven and Shoalhaven Rivers.

Subsequently the Commission took evidence at the wharf, Greenwell Point, when Mr. Richard Baxter, fisherman, Greenwell Point, and Mr. Thomas Wilson, fisherman, Greenwell Point, were sworn and examined.

[The Commission, at 6 p.m., adjourned until Monday, 11th March.]

MONDAY, 11 MARCH, 1895.

The Commission met at the "Illawarra Lake Hotel," Dapto, at 10 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission took evidence with respect to the Lake Illawarra fisheries. Mr. Edwin Barber, fisherman, Lake Illawarra, Mr. George Daniel Hockey, fisherman, Shellharbour, and Mr. James William Smith, fisherman, Lake Illawarra, were sworn and examined.

The Commission, at 3.30 p.m., proceeded to Lake Illawarra, and inspected some of the fisheries there.

[The Commission, at 7 p.m., adjourned until 8.15 p.m. the same day.]

MONDAY,

MONDAY, 11 MARCH, 1895.

The Commission met at the "Illawarra Lake Hotel," Dapto, at 8.15 p.m.

PRESENT:—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Mr. David Walker Benson, Assistant Inspector of Fisheries, Department of Fisheries, Wollongong, was sworn and examined.

[The Commission, at 10.50 p.m., adjourned.]

FRIDAY, 15 MARCH, 1895.

The Commission further considered the Draft Bill to repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

The Commission considered their Draft Report for presentation to His Excellency the Governor.

The Commission having (through the Member for the district, William Stephen, Esq., M.P.) invited certain representative fishermen to attend and give evidence respecting the Botany fisheries, and the said fishermen (James Duncan and Charles Smith) not having responded to the invitation, it was decided to summon the witnesses in question to attend at the Offices, Bligh Street, at 11 o'clock on Monday, the 13th instant.

[The Commission, at 3.10 p.m., adjourned until Thursday, 9th May.]

THURSDAY, 9 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered the Draft Bill to repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

The Commission considered their Draft Report for presentation to His Excellency the Governor.

Mr. Frederick William Smithers, Acting Secretary to the Fisheries Commissioners, was sworn and examined.

[The Commission, at 1.45 p.m., adjourned until Friday, 10th May.]

FRIDAY, 10 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered the Draft Bill to repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

The Commission, at 5.15 p.m., left Sydney *en route* to Moss Vale and Berrima, for the purpose of inspecting the site on the Wingecarribee River set apart for a fish hatchery and for fish acclimatisation.

SATURDAY, 11 MAY, 1895.

The Commission met at the Railway Station, Moss Vale, at 8 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission proceeded to the Wingecarribee River, Berrima, where they inspected the site set apart for the purpose of a fish hatchery and for fish acclimatisation.

The Commission returned to Sydney at 5 p.m.

MONDAY,

MONDAY, 13 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The following witnesses were sworn and examined:—Mr. Charles Smith, fisherman, Botany, and Mr. James Duncan, fisherman, Botany.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 3·15 p.m., adjourned until Wednesday, 15th May.]

WEDNESDAY, 15 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10·45 a.m.

PRESENT :—

WEDNESDAY, 29 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission had under consideration the suggested alterations made by the Parliamentary Draftsmen in the Draft Bill to repeal the Laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

[The Commission, at 3 p.m., adjourned until Thursday, 30th May.]

THURSDAY,

THURSDAY, 30 MAY, 1895.

The Commission met at the Offices, Bligh-street, at 10.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

Mr. Henry Woodward, oyster merchant, was sworn and examined.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 3 p.m., adjourned until Monday, 3rd June.]

MONDAY, 3 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 10.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

The Commission had under consideration the desirableness of employing oil-engines for the purpose of assisting the inspectors in the work of supervising the different fisheries.

[The Commission, at 4.15 p.m., adjourned until Tuesday, 4th June.]

TUESDAY, 4 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered the Draft Bill to repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 2.45 p.m., adjourned until Thursday, 6th June.]

THURSDAY, 6 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 2.45 p.m., adjourned until Monday, 10th June.]

MONDAY, 10 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 10.30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 3.30 p.m., adjourned until Tuesday, 11th June.]

TUESDAY,

TUESDAY, 11 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 3 p.m., adjourned until Wednesday, 12th June.]

WEDNESDAY, 12 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 10·15 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 2·45 p.m., adjourned until Thursday, 13th June.]

THURSDAY, 13 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 10·30 a.m.

PRESENT :—

Frank Farnell Esq., M.P., President.
Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission further considered their Draft Report for presentation to His Excellency the Governor.

[The Commission, at 3·10 p.m., adjourned until Friday, 14th June.]

FRIDAY, 14 JUNE, 1895.

The Commission met at the Offices, Bligh-street, at 11 a.m.

PRESENT :—

Frank Farnell, Esq., M.P., President.

The Hon. Robert Hoddle Driberg White, M.L.C. | Lindsay George Thompson, Esq., J.P.

The minutes of the previous meeting were read and confirmed.

The Commission finally considered and adopted their Report for presentation to His Excellency the Governor.

The Report was signed, and it was decided to forward the same to the Chief Secretary, for transmission to His Excellency the Governor.

[The Commission, at 2·30 p.m., adjourned.]

ROYAL COMMISSION ON FISHERIES.

REPORT.

To His Excellency the Honorable SIR FREDERICK MATTHEW DARLEY,
Knight, Lieutenant-Governor of the Colony of New South Wales
and its Dependencies.

MAY IT PLEASE YOUR EXCELLENCY,—

We, the members of the Royal Commission appointed on the 20th day of November, 1894, “to make a diligent and full inquiry as to the best means of developing the Marine and other Fisheries of the Colony, and as to the proper regulation of that industry by law,” have the honor to submit the following Report:—

We have held 92 meetings up to the date of presenting this Report, and examined no less than 82 witnesses.

At a meeting called on 4th December, 1894, a letter was read from the Principal Under Secretary, stating that a communication had been received from the Hon. J. H. Carruthers, M.P., Secretary for Lands, resigning his appointment on the Commission. It was thereupon decided to invite the Chief Secretary to appoint a third gentleman in the place of the Hon. J. H. Carruthers, the Commissioners deeming it inexpedient to proceed with any business until the Commission was complete.

The first meeting proper of our Commission was held on 19th December, 1894, at which the Hon. Robert Hoddle Driberg White, M.L.C., who had been appointed a member in the room of the Hon. J. H. Carruthers, M.P., resigned, took his seat. At this meeting, after dealing with other matters of importance, we finally considered and adopted the lines which it was proposed our inquiry should cover, and which are as follow:—

1. Character, extent, and resources of the Fishing Grounds of New South Wales—
 - (a) Inlet fisheries.
 - (b) Inland fisheries.
 - (c) Deep-sea fisheries.
 - (d) Oyster fisheries.
 - (e) Varieties of fish.
2. Development of the Fisheries of the Colony—
 - (a) Fish Culture—Artificial propagation and acclimatisation of marine and fresh-water fishes.
3. The Whaling Industry—
 - (a) Whaling on the coast.
 - (b) Value of industry to New South Wales.
4. Apparatus of capture and methods of fishing—
 - (a) Nets, lines, crayfish-pots, &c.
 - (b) Trawls and well-boats.
5. Fish transit, distribution, and preservation—
 - (a) Improved methods of transit by rail.
 - (b) Improved baskets and appliances for conveyance of fish to market.
 - (c) Central and auxiliary markets.
 - (d) Cold storage.
 - (e) Fish-canning, curing, and smoking.
6. Commercial aspect of the fisheries question—
 - (a) Annual value of present catch.
 - (b) Annual value of imports from other countries.
 - (c) Possibilities of future expansion.
7. Physical researches—
 - (a) Observations regarding temperature, salinity, and density of deep-sea and inlet waters.
8. Improvements in fishing craft and apparatus.
9. Administration and control of fisheries.
10. Legislation—
 - (a) Review of past legislation in New South Wales.
 - (b) Remedial legislation for conserving and developing the fisheries,

On

Leave of
absence to
Mr. Lindsay
G. Thompson.

Development
of the deep-
sea fisheries.

On 10th January, 1895, we met again after an adjournment for the Christmas and New Year holidays. At this meeting a letter was read advising that the Chief Secretary had relieved Mr. Lindsay G. Thompson, J.P., one of our members, from his official duties as Secretary to the Fisheries Department until the completion of our labours. After further deliberation respecting the development of the deep-sea fisheries, a matter which had been and still is, engaging our earnest consideration, we specially interviewed the Chief Secretary with reference to the question, when the President read and presented the following letter, in which our views thereon are expressed at length:—

Sir,

Offices of the Royal Commission on Fisheries,
Bligh-street, Sydney, 10 January, 1895.

The Royal Commission appointed by the present administration to make inquiry into the existing condition and future prospects of the Fishing Industry in New South Wales, do themselves the honor to place before you the following statement having reference to the development of the deep-sea fisheries of the Colony:—

Apart from those portions of the Colony regularly resorted to by our fishermen, scarcely anything is known regarding the actual extent and value of our piscine resources. At the present day, so far as New South Wales is concerned, deep-sea fishing as pursued in other parts of the world—notably in the maritime countries of Great Britain, Ireland, France, Canada, the United States, Russia, Norway, Sweden, and Japan—is practically non-existent. Those who have devoted thought and attention to the condition of our fisheries do not for one moment question, indeed they have long recognised the possibility of there being a series of magnificent and, when properly worked, lucrative fishing grounds situate at no great distance from the extensive coast-line of this territory. That these fishing grounds are not being worked, and are not, therefore, yielding substantial revenues to the Treasury, is evidence of the apathy and thoughtlessness which have allowed our splendid marine resources to remain undeveloped to this day. This apathy is greatly to be regretted, inasmuch as by failing to gather in the “harvest of the sea” lying at our very doors, we are, as a consequence of our neglect, probably losing many thousands of pounds yearly. The potentiality of national wealth in the depths of the waters that wash our shores may possibly be found to be astounding, but as yet those waters are unfished. Our outer or deep-sea fishing grounds should be one of the chief sources of supply for the Metropolitan and some of the inland markets; but, mainly owing to the lack of knowledge regarding the bottoms, the several families of fish possibly inhabiting or frequenting those waters and their economic value, they are entirely useless to the Colony. With truth it may be asserted that of deep-sea fishing, *i.e.*, trawling, drifting, &c., but little, if anything is known. Surely such a state of things is a reproach to an enlightened community.

As illustrating the importance of deep-sea fisheries to other nations, it may be pointed out that the British Government have spent large sums of money in furthering the fishing industry. The French and other Governments have done likewise, and the Government of the United States in twelve years are stated to have expended a quarter of a million of money in conserving, developing, and extending the magnificent fisheries belonging to that country. In Canada a Cabinet Minister holds the portfolio of Marine and Fisheries, and in 1892 the money voted for fishery purposes by the Dominion Parliament was £108,000, while the Department has seven well equipped steamers and two sailing vessels at its disposal for the purpose of carrying on its operations.

Although successive Governments have disbursed large sums in assisting in the development of other industries, nothing has been done in the way of encouraging and building up our fisheries, which might be made one of the largest industries in the Colony and of great national benefit, as a means of providing permanent and remunerative employment to a considerable section of the people, and also of furnishing the community with a cheap and valuable food supply. In addition to this it has been repeatedly pointed out that from our fisheries, if they were what they ought to be, might be drawn the sailors to man the ships of our mercantile marine.

While other countries are yearly deriving princely revenues from the fisheries which they have, at an immense expenditure of time and money, systematically developed and fostered, and are now working with splendid advantage to themselves, we in New South Wales are actually importing fish food to the value of over £100,000 per annum; and this, despite the frequently-reiterated assertions that our seas literally swarm with fish of great variety and that they are rich in the species justly prized in the chief markets of the old world. It is a strange anomaly that while our waters are reported to be teeming with edible fishes we should continue to be dependent upon outsiders for large supplies of this wholesome and nourishing commodity.

New South Wales has done nothing in the direction of encouraging and extending her offing or deep-sea fisheries. So far as the inquiries and investigations of the Royal Commission may relate to the inlet fishing grounds the work before the Commission will, comparatively speaking, be plain sailing; but when we proceed to deal with the deep-sea fisheries and deep-sea oyster fisheries we shall enter upon our task at what might be termed its initial stage, little, if anything, being known in New South Wales of these branches of the fisheries question. In the absence of reliable data to guide us we can but assume the existence of such fisheries, though there is much to justify us in this assumption and to warrant us in expecting, as a result of our labours in this particular direction, the future establishment of an immense and ever-expanding industry.

To prosecute our inquiry into the important subject of deep-sea fisheries, and to carry our investigations to a successful issue, it is absolutely necessary that a thorough and systematic exploration, by means of a completely equipped trawling vessel, should be made of the several fishing grounds contiguous to the shore-line of the Colony. In this way the Commission expect to ascertain important, highly-valuable, and necessary information concerning the quality and habits of the fish tribes frequenting the deep sea, and also hope to be in a position to form an approximately accurate opinion as to the success or otherwise that would attend the employment of steam trawlers in these southern waters.

The acquisition of a suitable vessel will, of course, necessitate a substantial outlay in the purchase and equipment of the same: *but, on the other hand, the craft will remain a valuable asset, at all times available for useful service in the Fisheries or other Marine Departments of the Government.* The

The principal need in this respect will be a steam trawler of about 100 feet overall, 20 feet beam, and a draught of about 7 feet 6 inches. It is estimated that a vessel of some such dimensions could be purchased for something like £2,500, but to make any such boat suitable for trawling she would require to be altered at further considerable expense. It may be deemed advisable to purchase a fully-equipped trawler in England, or to construct a vessel here. In any case the trawl nets and gear must be obtained from that country. The cost of building a vessel in the Colony, completed and ready for sea, may be approximately estimated at, say, £5,500, and the probable outlay which would be incurred in altering a vessel to render her suitable for trawling would in all probability absorb the difference between the purchase money and that sum.

The Commission also invite your attention to the important question of well-boat fishing, which combines with capture the conveyance of live fish to market. To the lack of modern effective means of transit to market is to be attributed, in a great measure, the present deplorable condition of our fishing industry. It is hoped that by the adoption of well-boats, such as are in use in other countries, one section of the fisheries problem will be solved.

A boat fitted with a well, constructed on the whale-boat principle, half-decked, having a cool chamber, and suitable accommodation for her crew, and capable of riding out a storm at sea, of about 40 feet overall, 12 feet to 14 feet beam, and 4 feet draught, is estimated to cost a sum not exceeding £400.

With the boats at present in use for outside fishing it is next to impossible to remain on a distant fishing ground for any length of time, the fishermen being compelled to return to harbour to avoid danger to life and property. The time thus wasted in the passage to and fro, and in again endeavouring to pick up the locality, might very profitably be employed on the fishing ground if the boat were so constructed and equipped that she could remain in the offing for any required length of time.

This is one of the directions in which our fishermen require teaching, and the Commission desire to emphasise the fact that they cannot be taught in a more convincing manner than by affording them a practical illustration of the possibilities of such a mode of fishing. The foregoing remarks apply with even greater force to the use of the steam trawler in our waters.

The Royal Commission on Fisheries, believing it to be the purpose and intention of the Government that the investigation into the condition and prospects of our fisheries should be of an exhaustive and comprehensive nature, desire to represent at the outset that in order to deal thoroughly with the subject of deep-sea fishing—which, when once established upon a firm basis, may be expected to prove a substantial source of revenue to the State—it is imperative that funds be provided to meet the necessary expenditure in connection with this most important branch of the inquiry.

In regard to the question of expense, we desire to point out that unless the Government will supply an equipment such as we have described, it will mean that effective inquiry into this branch of the Commission's work cannot proceed. It will be a matter for deep regret if such should be the result, for it seems perfectly clear that if the fisheries of New South Wales are to be developed the offing must be tapped to produce that development. Having once proved the extent and value of the offing fisheries, it may be expected that capital and enterprise will seize the opportunity for opening up new industries, to the mutual advantage of the capitalist and the country.

As it will require time to obtain a trawling vessel and a well-boat, it is requisite that due provision should, as speedily as possible, be made for the same, so that the preparations for conducting experiments in, and testing our deep-sea waters, may not be unduly delayed.

The Commission, with confidence, leave the matter in your hands, feeling assured that in order to further the important mission with which they have been entrusted, you will give the necessary authority for the immediate purchase of the apparatus requisite for them to prosecute their investigations into these branches of an industry which opens up such enormous possibilities for this country.

We have the honor to be,

Sir,

Your obedient Servants,

FRANK FARNELL, M.P., President,

ROBERT HODDLE DRIBERG WHITE, M.L.C.,

LINDSAY GEORGE THOMPSON, J.P.,

Commissioners.

The Hon. James Nixon Brunker,
Chief Secretary.

At that interview the Chief Secretary, admitting the importance of the subject which we had brought under his notice, said he considered the progress of the Colony would only be substantially assured by the proper development of its resources, and he regarded the fishing industry generally as one of those resources. Deep-sea fishing should prove of great importance to the Colony, but that branch of the industry had hitherto been neglected. As far as the fishing operations in New South Wales were concerned, the Chief Secretary expressed an opinion that they had simply been confined to the inlets and rivers; the supply of fish was not what it ought to be, and he believed it could be largely increased. There was no reason why the people of this Colony, instead of being importers of fish, should not be exporters of that commodity. Mr. Brunker promised to submit the letter containing our representations to the Cabinet at the earliest possible moment; but so far as is known no action respecting them has yet been taken by the Government. As we desire to continue our inquiry into the deep-sea fisheries,

Opinions of
the Chief
Secretary with
regard to the
deep-sea
fisheries of
N.S.W.

No action
taken by the
Government.

we

we are hopeful that the Government will authorise the necessary expenditure in order that the project may be carried out in the complete and thorough manner which its admitted importance deserves.

Visit of the Commission to Victoria and Tasmania.

Having decided to visit Victoria and Tasmania in order to obtain the best available information respecting the fisheries of those colonies, on the 15th January we left Sydney for Melbourne *en route* to Hobart. We were absent from Sydney for about one month, during which time we visited the chief fishing centres in those colonies. Throughout our visit we received valuable assistance from the members of the two Governments and prominent officials, civil and municipal. In Tasmania we saw much that interested us. At Hobart we took the opportunity to study the well-boat system of fishing and made ourselves acquainted with the methods of conducting fish sales and of fish distribution adopted in that city. The fish tanks or boxes, moored in the Derwent, to which fish are transferred from the well-boats and kept until there is a demand for them, were also closely inspected. We attended the early morning sales at the Hobart Fish Market on several occasions, and as a result of repeated interviews with the Mayor of Hobart, the members of the Tasmanian Fisheries Commission, and other officials, gained much valuable information respecting the fish and fisheries of Tasmania. At New Norfolk we were shown the historically famous ponds in which were seen various specimens of *Salmonidæ*.

Well-boat fishing, the sale of fish, and fish distribution in Tasmania.

Salmon Ponds at New Norfolk.

Fishing centres in Victoria.

Fish acclimatisation at Ballarat, Geelong and Ercildoune.

In Victoria, we visited the principal fishing centres in Hobson's Bay and along the coast from Westernport Bay to the Gippsland Lakes. Chief among them we enumerate Queenscliff, Hastings, Welshpool, Port Albert, Cunninghame and Paynesville, at which places the evidence of practical fishermen was taken. Subsequently we visited Geelong and Ballarat, where we inspected the fish hatcheries and ponds. At the special invitation of Sir Samuel Wilson, we proceeded to Ercildoune, and inspected the salmon ponds maintained by that gentleman, as also various species of *Salmonidæ*. In Melbourne and at other places in Victoria, our investigations were specially directed to the important questions of market accommodation, fish transit and distribution. Altogether we acquired much valuable information as the result of our visit.

Visit to the Home Fisheries.

On returning to New South Wales we commenced our inquiry into the condition and possibilities of the Home Fisheries. Commencing with the Shoalhaven and Crookhaven Rivers south of Sydney, we travelled northward, visiting and inspecting the fisheries at Lake Illawarra, Botany, George's River, Port Jackson, the Hawkesbury River, Brisbane Water, Tuggerah Lakes, Lake Macquarie, the Hunter River, and Port Stephens. At each of these Fisheries, as also at the Narrabeen Lakes, we took the evidence of practical and representative fishermen. Some of the evidence so obtained is of special interest and value at the present juncture. Radical change in the administrative authority seems urgently needed, and remedial legislation is imperatively demanded. These matters will be fully dealt with further on in this Report.

Nature of the evidence taken.

The Whaling Industry.

The important subject of whaling in the waters adjacent to the Australian coast has also engaged our attention, and we are actuated by a desire to see that industry revived in New South Wales. In the early days, before the gold fever broke out, whaling in the southern seas formed one of the most important of colonial industries. Both Sydney and Hobart shared largely in the success that attended its pursuit. If the attempts now in progress to bring about a revival of the whaling industry prove successful, we expect that much gain will accrue to Sydney as a port, and to the Colony as a whole. Subject to your Excellency's approval, we hope at an early future date to furnish, in a Supplementary Report, the result of our inquiries into this subject, as well as the Deep-sea Fisheries, the important questions of Fish Acclimatisation, Development and Conservation of the Inland Fisheries, and other matters which we have proposed our inquiry should cover. Some evidence in respect to one or more of these matters has already been taken, but the information is necessarily incomplete, owing to our time having been so fully occupied in prosecuting other branches of our inquiry. We have, however, sufficient evidence to warrant us in saying that the development of the deep-sea fisheries of New South Wales is of paramount importance and absolutely essential to the future success of the fishing industry.

Supplementary Report.

As the subject matter of this Report necessarily covers a wide field, we have thought fit, for convenience of reference, to deal with it under specified headings as follow :—

The Fisheries Acts and their Administration.

The Fisheries Acts have practically failed in their purpose to promote the fishing industry. They have operated in a direction quite opposite to that which their framers intended ; are found to be bristling with defects, and in their operation have created widespread dissatisfaction.

They scarcely touch the Inland Waters Fisheries, and the amending Acts, which were intended to cure defects in this and other respects, have proved of very little help; indeed, all remedial measures which have been enacted in regard to the fisheries we find to be strangely incomplete, and to adjust but more or less imperfectly only one or two matters of complaint.

The administration of the Fisheries Acts, with the consequent control of the Fisheries, devolves by law upon a body consisting of five Commissioners, acting in an honorary capacity. Those Acts have proved defective in very many important respects, and it is not too much to say that, besides tending to impede the development of our Fisheries, have operated with undue harshness upon those directly engaged in the fishing industry. The Act of 1881 was the outcome of the evidence adduced before a Royal Commission appointed in 1880, and although it was thought at the time that it would meet most of the disabilities under which those engaged in the fishing industry at that time laboured, we regret to find that it has proved unsatisfactory and ineffective in the extreme.

Notwithstanding this the Commissioners of Fisheries, appointed under that Act, have thought fit to continue to administer it, quite regardless of the fact, which, judging from their evidence, seems well known to them, that in many ways it was not operating for the public good. Certainly they proposed remedial legislation, instance the Bill attached to their Report for 1891, but that measure, in our opinion, omits the cure of many of the defects which are present in the existing law.

We think that a body of independent influential men like the Commissioners should have used all the weight of their influence to compel the Government to introduce amended legislation, and, failing success, should, as a last resource, have tendered their resignations. Such an extreme step would, we think, have forced any Government to give the important matter of the Fisheries their attention. But, instead, we find that they continued to hold their position, quite regardless of the public good, and to work their department, not only under a useless Act, but also, without protest, suffered their staff to be so reduced in number as to be utterly ineffective for purposes of supervision or control. On occasions meetings have been held and business transacted when a quorum of members was not present. It seems hard to justify the illegality of this action when considering it in contrast with the rigid manner in which the law (in respect to the seizure of fishermen's nets—their tools of trade—and the infliction of heavy penalties) was carried out.

We think, if the Commissioners had recognised the great importance of the Fisheries, as they claim to have done, they would not have so quietly submitted to the retrenchment scheme of the Government in 1893, under which the vote for their department was reduced by some £2,000. They state that this sweeping reduction was made without consulting them, yet it does not appear that they protested against it, though they knew it would result in many important fisheries having to be left unsupervised. But it is still more unaccountable why, although honorary inspectors were available to perform at least part of the supervisory work thus left unprovided for, they dispensed with the services of some of them also, although it is admitted they performed their duties satisfactorily. We refer particularly to the case of Mr. Paget Bayly, who had charge of the Pittwater, Narrabeen, and Manly Fisheries, and who was anxious to continue to exercise the powers of an Inspector of Fisheries, but who, from some inexplicable cause (excepting that given by Mr. Bayly himself—*vide* evidence, page 128, question 4752) was not allowed to do so. One witness says that these honorary inspectors were dispensed with because they were looked upon as spies; if that be the reason, it is difficult to understand why all were not dispensed with at the same time.

Necessity for
resident
inspectors.

In connection with the question of supervision, we can scarcely lay sufficient stress on the necessity for having the Fisheries properly and efficiently controlled by resident inspectors. At the present time we find several cases where inspectors are allowed to live miles from the waters they are appointed to control. Owing to neglect to provide residences on central sites, it is a fact that one inspector has to travel from 6 to 8 miles to and from his work, another has to travel 4 miles, while even in the Parramatta River and Port Jackson Fisheries the assistant inspectors are permitted to live at Paddington and Woolloomooloo, and this despite the fact that the most important of the closed waters in the Parramatta are at least 6 or 7 miles distant from Sydney.

Inspectors
living at
distances from
their work.

Injudicious
closures of
waters against
netting.

With regard to the question of closures against the use of fishing nets we have found that some have been made which, in our opinion, have been wholly unjustifiable, inasmuch as a local knowledge of the circumstances and conditions governing the Fisheries in which such closures were made would most certainly have induced decision in an opposite direction. It has been asserted by one of the Commissioners that the object in closing waters is to give the fish a chance to go up into the breeding grounds, but even so (though the point is much open to question) what possible good could result from making such closures and straightway leaving them unsupervised is entirely beyond our comprehension. Again, while in one case the entrance to one lake has been very properly closed in order to allow the free ingress and egress of fish, in another, namely, Brisbane Water, quite the opposite course has been pursued. In this place extensive closures were made, yet the entrance was left open and entirely at the mercy of the netters, thus nullifying any effect sought to be produced by the closure, and defeating altogether the object aimed at.

Neglect of the
Commis-
sioners to visit
the fisheries.

It is a matter for very deep regret that the Commissioners of Fisheries as a body have not seen fit to make periodical visits of inspection to all the coastal Fisheries. In no case has it been shown that any such official visits have been made, or at least reported; the evidence records that but two or three of the Fisheries, and those in close proximity to Sydney, have been inspected. Consequently, the general dissatisfaction expressed towards the Commissioners as an administrative and controlling body, may be readily understood. We are of opinion that in administering an Act fairly in the interests of all classes, it is the bounden duty of those having such a charge and responsibility cast upon them to make themselves personally acquainted with the local conditions and circumstances of their trust; but even in the face of their not having made official visits themselves, they do not seem always to have followed the reports of their local Inspectors, as we have it in evidence that recommendations made by them have been disregarded.

Official visit
might have
removed
existing
disabilities.

Had the Board made official visits to the different fisheries, and come in contact with the fishermen themselves, it would have been easy for them to have discovered as we have done the disabilities under which the industry has been staggering. That they have done nothing to remove these disabilities is to be deplored; their failure in this respect is one of the gravest reasons why they should no longer continue to hold office. Indeed, the general opinion goes to show that they should be superseded as speedily as possible, and an authority of a different kind created, it being asserted that the condition of the fisheries to-day will not bear comparison with the condition existing before the Act of 1881 came into force.

Creation of a
new
controlling
body.

Development
of the fisheries
overlooked.

Another cause which may account for the present unsatisfactory state of the Fisheries is to be found in the apparent lack of interest shown in the development of the industry. The Commissioners appear to have entirely overlooked the direction incorporated in the 4th section of the Fisheries Act, which imposes upon them the duty of development. Beyond hatching some trout ova and distributing its fry, nothing in the way of development seems to have been attempted. On one or two occasions Parliament voted sums of money for the purpose, but they were not used.

Com-
missioners
administering
an
unworkable
measure.

But quite apart from these points, largely important though they are, it was to be supposed that gentlemen of position such as those of whom the Commission is composed would have absolutely refused to continue administering a measure which, had they possessed a personal knowledge of the Fisheries and the hard conditions under which fishermen labour, they would have known to be not only unsatisfactory but practically unworkable, and unjust in its incidence.

We

We have no hesitation in stating that the vitally important questions of improved market accommodation and better distribution of our fish supply should to some extent have engaged the attention of the Commissioners, inasmuch as while they had no power themselves to make alterations, they held a position of weight and influence, and might, had they so willed it, easily have made forcible, persistent, and in all probability such effective representations to the proper authorities as to have compelled the necessary improvements to be brought about. This, seemingly, they have not done, although no witnesses were more emphatic than they in their evidence given before this Commission, and also before the Select Committee of the Legislative Assembly which sat in 1889, with respect to the condition of affairs existing at the Woolloomooloo Market and the urgent need for improvement in respect to fish distribution.

Attention not given to market accommodation and distribution of fish supply.

Speaking generally, the evidence goes to show that the existing governing authority is one in which neither the general public nor the fishermen have confidence, and that it should be forthwith abolished and another created in its stead. The nature and scope of the authority we recommend is stated in the Bill for the Regulation of the Fisheries and Oyster Fisheries of the Colony attached to this Report.

Want of confidence in governing body.

We deeply deplore that it should become our duty to have to assert this conclusion, but it is forced upon us by the testimony of competent witnesses, who plead for removal of the barriers and obstacles existing between the fisheries and their practical development in several available directions.

Barriers to development.

In suggesting the abolition of the existing statutory authority, we desire to place on record that we do so on purely public grounds. Indeed, it will not for a moment be supposed that we could have anything whatever to urge against the Commissioners of Fisheries personally; but we claim that they have to a very large extent misconceived their duties and responsibilities as Commissioners. Indeed, this is apparent on almost every page of the evidence we have taken. They do not seem to have given any attention to the development of the fisheries, they have allowed fishermen to be unnecessarily harassed, and they have continued to administer Acts which they know to be to a large extent worthless for their purpose. Moreover, they suffered their staff to be reduced to such a point as to be absolutely powerless to work even those parts of the Acts which are of value. They seem to have regarded economy in expenditure as their chief aim, for when asked in evidence why certain matters had not been undertaken, the replies were to the effect that the cost would have been too great.

Commissioners' misconception of duties.

We think that the fisheries cannot be regulated and developed without expense; but we expect from that expenditure an enlargement of the industry, a further avenue for employment, and benefit in many directions to the Colony generally.

Expenditure necessary for development.

Confiscation of Fishing Nets.

It is abundantly clear, from evidence we have collected, that if the existing authority is to be credited with activity in regard to any particular provisions of the law it has been in putting into operation those parts of it, the infringement of which involves the seizure and confiscation of the fishermen's tools of trade—their nets.

Activity in seizure of nets.

Several cases of hardship, bordering upon actual destitution, have come under our notice as the result of this action, and though, doubtless, it can be fully justified by the terms of the Acts themselves, yet, knowing how unjust and cruel these provisions were, we think the cases were such as to have abundantly warranted the exercise of clemency by obtaining the restoration of fishing nets confiscated only in fulfilment of an inequitable law's demands. But we have found that not only were these confiscations upheld, but in addition cruelly long periods were, until quite lately, allowed under regulations to elapse between confiscation and subsequent sale of the confiscated articles, thereby making it difficult, if not impossible, for the men to arrange to buy back their confiscated property. Cases of this kind are not singular, and we are pained in having to recognise that such a state of matters should have been allowed to continue through so many years.

Restoration of confiscated articles seems warranted.

It

Reform should have been insisted upon.

It seems to us that reform in this matter of confiscation of fishermen's tools of trade should have been pressed with all the force and insistence which an independent and influential body like the Commissioners of Fisheries were capable of bringing to bear upon the several Ministers under whom they have been acting.

Moieties of fines to inspectors.

A possible inducement to some of the inspectors to follow particularly this business of net seizure may have been that thereby they would secure to themselves moieties of the fines and forfeitures; but, notwithstanding that this pernicious system of allowing half fines to informers is a statutory enactment, it would have been quite possible to refuse the use of it to inspectors, even though at the cost of a small addition to their salaries in lieu. It should have been recognised long since that the system served no good purpose, was a source of constant irritation to the fishermen, and savoured more of persecution for the sake of personal gain than an honest desire to uphold the law; while it placed the fishermen in the position of criminals rather than free citizens.

Closures of Waters against Net Fishing.

It would seem that this branch of fisheries administration might have been better conducted.

Care in selection of waters to be closed.

When such an important step as closing any fishing-ground against netters was in contemplation we think the utmost care should have been taken in selection, so that while effectually conserving the fisheries, the fishermen's area of operations might be impeded as little as possible. To effect this, areas to be closed should have been determined by the administrative authority after personal observation of local circumstances, and, where this was not practicable, on the recommendation of the local or other responsible authority.

Personal knowledge of local necessities requisite.

We understand, however, that important closures have been made without having in the first instance been safeguarded in either way. We are certain that if the central directing power had found opportunity to make periodical visits of inspection to at least the principal centres of fish supply, a knowledge of local necessities, both from the public and fishermen's points of view, could have been obtained, which would have proved of immense value in this direction, and would have removed the grounds on which a great many of the complaints made in the past have been based.

Inutility of certain closures.

As it is, however, closures have been proclaimed which, on account of remoteness from the market and inaccessibility to the fishermen, were of no real value in helping to maintain the continuity of supply, because, whether opened or closed, the waters could not be profitably worked.

Irritating to fishermen.

Hardship to local residents.

Such a process of administration, while it so obviously could produce no good result, served only to irritate the fishermen, and caused them to view with suspicion the inducing motives which led up to it; while at the same time hardship was created in another direction by barring the local residents along these remote waters from netting fish for their private use.

Natural closures.

In our visits to the various fishing centres we have found so many large areas covered with thick weed, over which nets could not be hauled, and which might be termed natural closures, that their existence alone should have suggested the opportunity for minimising, in many instances, artificial barriers such as it has become customary to create.

Closures ineffective because of imperfect supervision.

In practice, however, these closures, though not always selected with the discrimination which might have been exercised, have not been a complete bar to fishing operations over them, because the inspectorial oversight has been so imperfect. Where inspection has been established, it has usually consisted of but one man whose means of locomotion were confined to a boat not always suitable to the water on which it was placed. In most instances the waters allotted to a single inspector are so large that, though most industrious in his work, he could not possibly give them efficient oversight. While he was overseeing one part, the fishermen, in perfect security, could be working in another quite regardless of the law or its penalties.

Necessity for effective supervision.

Supervision, being an essential to the effectiveness of a closure of water against fishing operations, should be made as perfect as possible. That one man with a boat can oversee closures comprising many square miles of water, in many cases

cases widely separated from each other, is obviously an impossibility; to do the work at all he must have facility for rapid locomotion. We think this could be provided by the employment of small launches driven by oil engines. These engines are, we believe, in general use in many American waters. They are effective, of simple construction, and can be worked by anyone possessing ordinary intelligence. Their use, therefore, in enabling our fisheries to be patrolled without incurring expense in wages for a driver or fireman, as would be the case if steam engines were employed, is so obvious that we recommend the system should be afforded an initial trial with a view to its possible adoption generally.

Employment of launches driven by oil engines.

Closure of Port Jackson against Net-fishing.

There seems to be a rapidly-growing opinion that the waters of Port Jackson should be entirely closed against net and set-line fishing. On this subject we were interviewed by a deputation from the Amateur Fishermen's Association, with Mr. Wm. C. Shipway, M.P., as its President. The Deputation presented a petition bearing the signatures of no less than 5,104 persons, amongst them those of many gentlemen holding prominent positions in the city. The President, in speaking for the Deputation, said he wished to emphasise the fact that netting is going on in Sydney Harbour at the present day, and millions of small fish are as a consequence left to die and rot on the beaches; that within the last fortnight he had received information that both at Abbottsford, on the Parramatta River, and at Manly Beach nets had been drawn and thousands of young fish left to die. In one instance that came under his notice four dozen red bream were left to die; that was at Manly. This destruction was caused by European fishermen, and not by foreigners. His Association is of opinion that set-line fishing should be prohibited. He states that it is known from practical experience that the heads of a number of good large black bream had been found attached to lines that had been left unattended, the sharks or other fishes having eaten the bodies while the lines remained in the water. The Association considers this sort of thing should certainly be put a stop to, and asks for aid, not only on behalf of itself, but of the amateur and professional fishermen of Port Jackson. The petition, and Mr. Shipway's remarks in full, will be found in the Evidence, page 134 of this Report.

Views of Amateur Fishermen's Association.

Destruction of fish.

While we have strong views on the subject brought forward by the Deputation, we think that as the matter is to engage the immediate attention of Parliament by the introduction of a Bill specially dealing with the subject, we should not be warranted in giving it more than a passing reference here. In any case we doubt whether a recommendation that any particular closure against fishing operations should or should not be made would come within our functions. Such a matter seems to us to be one which should concern the new Department to be established under the provisions of the new Act.

We have as well had submitted to us a letter originally presented (through Mr. B. Horwitz) by the residents of Manly to the Fisheries Commissioners, suggesting the closure of the waters north of a line from Middle Head to the Inner North Head. While we consider the Commissioners might have given to this letter a more courteous reception than it seems to have received, we think, for the reasons above stated, that its subject also is beyond our functions to deal with.

Manly closures.

Fishing Nets.

We have devoted much attention to the subject of fishing nets, and from our observations and the evidence before us are convinced that the series enacted by the present law has been neither satisfactory nor economic; the principle adopted in enacting these nets seems to have been that the longer the length conceded, the larger in proportion should be the mesh, with the exception perhaps of the meshing-net.

Law respecting fishing nets unsatisfactory.

The question arises whether much gain has resulted by defining lengths and meshes of nets by statute. We think that circumstances and conditions differ so widely in the several fisheries that it is impossible to determine a statutory system of nets which shall suit such varied requirements. A net—we refer to a hauling net—that would be perfect for fishing purposes in a running tidal water like Port Jackson would be absolutely useless in tideless far-extending shallows, such as obtain in our larger

Hauling net unsuitable in some waters.

larger lakes; and the consequence has been that in the fight for bare subsistence fishermen have until quite lately been, as it were, forced, at the risk of punishment and the forfeiture of their nets, to infringe a law which they found it impossible to work under with any hope of profitable result, though we are assured that these same fishermen were as anxious to avoid destruction of fry as the Act they worked under intended them to be. We think it is a matter for deep regret that the partial relief in this direction bestowed by a recent enactment, the Fisheries Act Amendment Act of 1894, was not conceded at a much earlier period. Subject to proper safeguards against destruction of fish fry, we see no objection to the use of long nets; indeed it should be patent to anyone giving the question consideration that such nets would be rather advantageous than otherwise so far as regards the fisheries themselves, inasmuch as their use would render repeated scraping of the bottoms unnecessary, and besides reduce labour on the part of the fishermen.

Prawn nets
used by
foreigners in
evasion of the
law.

The Garfish Net.—If any net has been used illegitimately, it certainly has been the garfish net. Intended for the capture of garfish only, it has nevertheless been applied to the taking of fish of any species, and used in waters where garfish seldom or never appear. Opinion seems so very much divided on the point whether small or large mesh nets are most destructive to fish fry, that with the comparatively limited personal knowledge we ourselves at present possess, we are not prepared to assert positively whether this indiscriminate use of the garfish net has created unnecessary destruction of fish or not; that is a point for future determination on the basis of observation and actual experiment which we hope to carry out.

The Meshing Net.—This net, when confined to its legal length (60 fathoms), has, we find, not been in general use. This has been due, probably, to the insufficiency of its length and the large size of its mesh, through which a large proportion of mature fish can escape. We find no reason why the length of this net should have been limited, nor why its mesh should have been fixed at such a large gauge, nor why it should not be used as a set or drift net.

The Sunk Net.—The Act passed in 1892 to prohibit the use of sunk nets has proved in practice quite insufficient for its purpose owing to a defect in definition, which stipulates that a sunk net shall have a cod or purse attached to it. This important limitation of range has left it open to the fisherman to still sink his net, provided it is not furnished with this appendage. Availing himself of this defect the foreign fisherman especially, with supreme disregard for the future of our fishing grounds, has continued to sink his net even in the presence of the Fisheries officials, who are quite powerless to stop him.

The Inland Waters Net.—This net is somewhat general in definition. It has a four-inch mesh, must not have a cod or purse attached, and when sunk in a river or creek must be so set as to provide a passage for escaping fish between its ends and either shore. As to the suitability of this net for general purposes we do not at present express a decided opinion. The mode of fish capture in inland waters is one of several subjects with which we have yet to acquire an intimate acquaintance, and to these matters we propose to apply ourselves as soon as opportunity presents. Reasoning from our knowledge of requirements for marine fish capture we scarcely think that one class of net can be suitable for taking inland waters fish under all conditions; indeed, we note that while the Inland Waters Fisheries Act fixes the mesh at four inches, the twelfth section of the Act of 1881, which has not been repealed, allows a three-inches mesh; whether the non-repeal of this section was an oversight or intentional, or whether this question of mesh has been determined altogether haphazard we have no means of ascertaining, but that it needs regulation on the basis of evidence and experiment there can be no doubt.

The Prawn Net.—The prawn net, comprised of fifteen fathoms of inch mesh, has proved satisfactory in some waters while in others a greater length is demanded. We cannot too strongly deprecate the manner in which the law defining prawn nets has been evaded by foreign fishermen; the nets they use for the purpose are practically sunken nets, although they do not come within the provisions of the Sunk Nets Act. These foreigners attach lines of great length, by means of which their nets can be set at long distances from the shore, whence they are hauled towards it over very extensive areas of bottom. In this manner they tear up valuable feeding grounds, and destroy unknown quantities of spawn and fry. Our fishermen are loud in their denunciations of this unfair and improper practice, and it is quite time that preventive means should be taken.

The

The Crayfish Fisheries.

We have made general inquiries respecting the crayfish fisheries, and we find that beyond the means best suited for unrestricted capture, and the admission that the supply is becoming fast depleted, not much is known upon the subject; indeed, so little, that one of the Commissioners of Fisheries has stated that the crayfish fisheries was one of the things they did not understand, so that he would be afraid to give an opinion as to the shape legislation for their protection and development should take. Several of the witnesses we have examined have expressed the opinion that the female fish ought not to be captured when in roe; but as it happens that generally they are in that condition during the season when they can be most readily captured, such a restriction would tend very greatly to reduce the supply, and besides, as the fish, when in the coral stage of spawn is considered a more especial delicacy, it would probably reduce the demand for the article. We think that a means for protecting this fish might be found by exempting certain portions of the coast from fishing, and allowing in other parts the present indiscriminate capture of this crustacean, above a certain size, to be continued. We do not, however, make this suggestion with complete confidence. We have little official information to guide us, and such meagre information from witnesses, that the best remaining course open to us to acquire information is to make a personal investigation into these fisheries during the season now approaching.

Imperfect knowledge of crayfish fisheries.

Crayfish in roe.

Exempting portions of the coast from crayfish capture.

Personal investigation necessary.

Herrings.

But very little is known about the herring in New South Wales waters. One of the first to assert its presence at all was the late Sir William Macleay, F.L.S., who always exhibited an intense interest in the fisheries, both from scientific and economic stand-points. He went so far as to affirm that there is no sea on the globe favoured with a more rich or varied supply of fishes of the herring tribe than that which washes our shores. He names two principal species—the Maray, *clupea sagax*, as being almost identical with the English pilchard, and the Southern Herring, *clupea sundiaca*—which he claims to be for excellence and delicacy of flavour unsurpassable, being superior to the common herring of Scotland, and which, if preserved in oil after the manner of sardines, would eclipse even those delicacies. He says that these fish visit our coast in the winter months, passing from south to north in enormous shoals. Beyond what Sir William has told us, we know but little of the habits of the herring while on our coast, and we do not find that the Fisheries Department has ever seriously pressed the Government to undertake an investigation of the matter. Apart from the value of the herring as a food fish, we think it would be difficult to estimate its worth as oil-producing material. Dr. Cox states it is one of several neglected branches of the fishing industry, and that he would be glad indeed if our Commission would investigate its possibilities, for he thinks a very valuable industry might be created in connection with its capture and utilisation. While quite endorsing Dr. Cox's opinion, it does seem to us surprising that, with the information he seems to have possessed respecting the herring, he did not years since force his colleagues, the Commissioners, to enter upon the task he is now so anxious for us to undertake. It is not that the matter has been allowed to sleep, for ever and again it has been brought under notice by contributors to journalistic literature, and the probabilities of the value it could be made to attain largely descanted upon.

Abundance of herrings.

Neglected industry.

We admit that with existing appliances the development of this industry on profitable lines would be impossible; it would need large enterprise and large means, and before people would be willing to embark in such an undertaking they would need to have confidence in the result. That we have now arrived at a stage beyond the bare probability of the herring being indeed present on our coast is beyond question, since we have it on the authority of reliable witnesses whom we have examined that it is so. In every water we have visited we have been careful to make inquiry, and in almost every instance the presence of the herring has been affirmed. Mr. D. W. Benson, the Inspector at Lake Illawarra, states that only a fortnight previous to our visit to the lake the Maray was outside the entrance, and that had his department supplied him with a suitable boat well equipped, he could have found out, long ago, whether this fish was present in the

Enterprise and capital necessary to development.

Presence of herrings on coast.

numbers

numbers the fishermen allege them to be ; he says that the cost of the boat, added to actual expenses of a crew composed of local fishermen, would have been the only outlay. We think it extremely unfortunate that this idea of Mr. Benson's was not carried out ; and we cannot too strongly impress upon the Government the desirableness of including this amongst the several schemes we have suggested for the enlargement of the fishing industry.

Government aid necessary to development.

Owing to the costly nature of the undertaking it is one which the Government must initiate, for it could not be undertaken with much hope of immediate return. Indeed, so strongly of this opinion was Sir William Macleay that, in his papers on the industry, he instances the British Fishery Society—established about the end of the last century for the prosecution of the herring fishery in the north of Scotland,—which laboured for many years before it became a complete success, although for a long time it was largely assisted by Government grants and bounties.

We urge attention to the claims of our herring fisheries with all possible earnestness.

The Fisheries of Lord Howe Island.

Importance of Lord Howe Island fisheries.

The fisheries of Lord Howe Island, also of Elizabeth Reef, which is situated some distance from it, are reported to be of considerable importance. The President of the Fisheries Commission regards this island as the best fishery New South Wales possesses. He says that all the finer qualities of fish on our coast are to be found there. He believes also that the carriage thence to Sydney, and to other markets, could be easily accomplished by means of well-boats or cool chambers. Dr. Cox witnesses also to the value of the fisheries at Elizabeth Reef. It is said that many of the New Zealand varieties of fish are to be found at Lord Howe. When it is considered that a company in Sydney are profitably importing these same kinds from New Zealand, as well as fish from other parts, it is not too much to expect that equal benefit would result from a development of our own resources. We hope, should your Excellency be pleased to sufficiently extend the term of our Commission, to make a visit to the island and the reef, and to inquire into the extent and capabilities of their fisheries, recording the result in a Supplementary Report.

Transit by well-boats or cool chambers.

Development of resources.

Extension of Commission's time.

The Inland Fisheries.

Ineffective system of closing inland waters against netting.

These fisheries extend over the entire Colony, there is scarcely a stream within it which does not produce edible fish, all of indigenous species ; but beyond closing against netting a portion of water on either side of some few inland towns, but little or nothing seems to have been done towards conserving the natural supply ; indeed the wisdom of making such closures at all seems very much open to question, at least in some cases ; for instance, such a closure was made at Tumut and is still maintained notwithstanding protest by local residents against it. One purpose of such closure should be to afford a sufficient supply of fish to the townspeople, but the Tumut residents contend that the closure there to have been of use should have been made from the junction of the river with the Murrumbidgee. As it is the fish are intercepted by netting at that junction and prevented from passing thence to Tumut or further on to the heads of the river where the local residents suppose they travel to spawn. If this be so (but it is a point on which we have not yet found opportunity for prosecuting researches) the closure is obviously unwise from two separate points of view, the Tumut people do not gain their fish supply and spawning operations are hindered.

Tumut closure.

Possible spawning grounds of fresh water fish.

Murray River fisheries.

Messrs. Wilshire and Manton as honorary inspectors.

Passing on to the Murray River, one of the chief sources of supply, we find it is controlled by two honorary inspectors, Mr. Osborne Wilshire and Mr. John Manton. These gentlemen were formerly salaried officers but they were dispensed with under the retrenchment scheme of 1893. However, as they offered to continue performing their duties without pay, their services seem to have been accepted on that condition, and they have continued their supervision ever since.

Supervision necessarily partial.

It appears from the Annual Report on the Fisheries for 1894 that they have done this zealously and assiduously. But in waters of such extreme length as the Murray, with its ana-branches, billabongs, &c., it must be admitted that the most

most industrious service which these officers, whose time is for the most part taken up by other duties, could render, could not be fairly classed as more than a merely partial supervision.

The regulation of the Murray River Fisheries deserves most attentive consideration and care. When it is remembered that the south bank of that river forms the southern boundary of the Colony of New South Wales, and that railway transit thence to Melbourne is possible from several points, it will be manifest that this river must be a large factor in the fish supply to Victoria; and that it is so beyond doubt, we place in evidence the following return of fish sent thence during the last five years :—

1890	40,076 lb.	
1891	31,340 lb.	
1892	56,692 lb.	
1893	48,043 lb.	
1894	54,318 lb.	
Total ...							230,569 lb. =	102 18 2 17

Tons cwt. qrs. lb.

This immense take shows the exceeding value these fisheries must possess, and the necessity for their efficient supervision and regulation; indeed, the importance of such a step is recognised even by our Victorian neighbours, for we find, in a report made in 1892 by a Select Committee of the Victorian Legislative Assembly appointed to inquire into the fishing industry of that colony, a suggestion that effort should be made to check the destruction of fish caused by illegal netting, by inviting the New South Wales Government to allow their inspectors on the Murray River to be appointed for the Victorian side of it also. The Select Committee expressed the opinion that unless some such step were taken fish in that river would become exceedingly scarce.

In addition to this unsought-for corroboration of the views we ourselves hold, we obtained, during our recent visit to Victoria, an expression of opinion from some of the members of that Government in the same direction. It needs then only the institution of a conference between the authorities of each colony to have the regulation of these fisheries established on an effective basis. At present we may regard our inland fisheries generally as being at an initial point of development, so that the steps most effective to be taken for their protection and conservation have yet to be determined.

Fish Acclimatisation.

It is regrettable that so little of what might have been accomplished has been effected in this direction. So long back as the year 1889 the matter was brought under the notice of the Commissioners and, with the view to establishing a fish hatchery, a minute inspection made of the river system between Goulburn and Picton. That particular portion of the Colony was selected because it possessed a high altitude and was easily accessible from Sydney.

We attach a sketch map showing that river system; most of the streams delineated on it were visited, the result being that the Wingecarribee River at Berrima was selected as most suited for the hatchery. It was intended that various species of the salmonidæ, viz., the schoodic salmon, the rainbow trout, the brook trout, and others which it was thought would thrive well in a water so admirably adapted for that class of fish, should be propagated there, but, unfortunately, though an amount of £700 was voted by Parliament to build a caretaker's residence and start the hatchery, it was afterwards determined not to proceed with the work.

The only kind of attempt officially made to stock our rivers with trout, has been to import ova from other colonies and hatch it in Sydney. This has been done almost every year, but by the time the fry had lost its yolk-sack the Sydney temperature had increased so much that it had to be sent away for liberation in various rivers, though it had not attained a length much beyond half or three-quarters of an inch. This was in accord with an old-time practice, but it is opposed by American authorities who assert that a few pair of yearling trout are far more efficacious in stocking a stream than thousands of fish liberated in the fry stage.

We think this assertion, at any rate so far as fry-stockage is concerned, finds proof here; for though thousands of fry have been liberated in many waters in the Colony, not much has been heard of their progress, and indeed it is scarcely a matter for surprise, because fish set free at such tender age must be subject to attack and succumb to enemies of various kinds.

Process
wasteful.

Of course it is not contended that none of the fry so liberated will mature, but it is claimed that quite 90 per cent. of it will be lost—if so the process is wasteful in the extreme, and in the same degree proportionately expensive.

Efforts of
Messrs. Gale
and Campbell.

But before any move was made by the Commissioners towards obtaining fry in this way, a successful attempt at introducing the fish itself was made by Messrs. John Gale and F. Campbell, of Queanbeyan. They brought over from Ballarat, Victoria, 300 yearling trout, from 3 to 5 inches long, eighty English perch, and forty Russian carp. By untiring exertion, during a long and tedious journey, occupying over thirty hours, partly by rail and partly by coach, they were successful in reaching Queanbeyan, with all but forty of the fish alive, and the loss of these forty was evidently accidental. The perch and carp were placed in waters near Queanbeyan. About half of the trout yearlings were distributed in the Cotter, Queanbeyan, Molonglo, Yass, and Naas Rivers, and the remainder in the Little River, in the Braidwood district, thirty-four miles further on, and in stream tributaries of the Snowy River, in the Monaro district, 100 miles further on. Subsequent investigations by these enterprising gentlemen showed that in the Queanbeyan River the trout bred marvellously, specimens weighing from 3 lb. to 5½ lb. having been captured; that the Cotter River was teeming with them, and that from thence they had entered the Murrumbidgee River. While they recorded no results from the Yass and Naas Rivers, they report that in the second year after the liberation of the parent fish in the Little and Snowy Rivers, experiments they made resulted in the netting of some hundreds of small fish.

Trout in
Snowy River.

The Snowy River is said now to be swarming with trout of all ages and sizes, most probably the progeny of Messrs. Gale and Campbell's enterprising undertaking.

To the Commissioners of Fisheries may perhaps be accorded credit for the presence of some of these fish in the Monaro country, as they have liberated large quantities of fry there; but as the adult trout is a remarkably predatory fish it is not improbable that that fry may to a large extent have fallen a prey to it.

Sites for
hatcheries.

Nevertheless we are convinced that the Monaro waters are admirably suited to the salmonidæ, and if they were within easy reach of Sydney we think they would be preferable to the Wingecarribee River at Berrima as a hatching station. We favour the latter because of its accessibility, and because being at an altitude of 2,000 feet above the sea level, its waters, even in the height of summer, maintain a low temperature; but we are fully of opinion that it would be judicious to establish hatcheries, not only there, but on the Monaro, New England, and other elevated plateaus.

Erection of
Fish Hatchery
should be
preceded
with.

We think it extremely unfortunate that the Commissioners of Fisheries did not utilise the site at Berrima while the £700 voted for it by Parliament was available, and we strongly recommend that the work should be commenced at once, so that arrangements may be sufficiently advanced by the time the next hatchery season arrives, August, to allow of actual operations being commenced. We make this suggestion with perfect confidence, for during our visit to Victoria and Tasmania we gave especial attention to this matter of trout propagation. We minutely inspected most if not all the hatcheries in those colonies. In corroboration as it were of our suggestions, we have it in evidence from Mr. Philip Seager, a prominent authority on fisheries in Tasmania, that on a recent visit to New South Wales he inspected the river at Perrima, and from the temperature of the water and district found no difference between that place and their own establishment in Tasmania. We have also read his letter to the Commissioners, written when in Sydney, in which he strongly advocates the construction of the ponds. There are hatcheries in at least three of the Australian Colonies; in New Zealand there are several, and we quite disagree with the policy which has hitherto prevented their establishment in New South Wales.

The

Sketch shewing the Wingecarribee River and the adjacent river system.

PHOTO-LITHOGRAPHED AT THE GOVT. PRINTING OFFICE, SYDNEY, NEW SOUTH WALES.

The Distribution of our Fish Supply, Market Accommodation and Transit.

The question of fish distribution has constituted one of the most of the many important matters which have engaged our attention. We are strongly convinced that in the preparation of any Bill to govern and control our fisheries, however perfect its provisions may be, the serious obstacle to be encountered is the want of efficient means for distributing the supply. So that while we have, in our opinion, succeeded in preparing a Bill which goes far in the direction of remedying most if not all the grievances under which the fishermen are labouring, and besides offers large facilities for the development of the fishing industry in hitherto untried directions, yet we feel that some arrangement to bring the consumer into closer workable relationship with the producer is absolutely necessary. At the outset we admit the extreme difficulty of suggesting a system to meet this requirement, though we have made an exhaustive study of the question in all its varying stages from the time the fisherman casts his net in the waters to the time when the fish are offered for sale to the consumer.

Mode of distributing supply ineffective.

Consumer should be brought closer to the producer.

The existing mode of distribution is lamentably behind the times.

Certainly compared with the means in use in the early forties we show vast improvement, but yet our arrangements are not nearly up to date, notwithstanding the large additions to the Market at Woolloomooloo, and it cannot be otherwise while the fact remains that in nine-tenths of our inland towns marine fish-food is an unknown commodity, while in the remaining tenth, and in the immediate suburbs of Sydney also, it is quite a rarity, and an expensive luxury.

Fish a rarity in inland towns.

Surely with a coast-line like ours, indented along its entire extent with numberless fish-producing inlets, rivers, and bights, such ought not to be—the evil has resulted from a combination of causes, some at least of which seem capable of remedy. In the first place, the Woolloomooloo Market, from its location, does not possess the requirements which the best authorities have asserted to be essential for a central establishment, namely, ample area and direct access to it from the fishing-grounds by water, rail, and road. Possibly situated as Sydney is, with, from a fisheries point of view, her comparatively imperfect railway system and her varied terminal points of steamboat traffic, it would be difficult to find a market site which would include all these essentials. Still there are sites better suited than the one at Woolloomooloo; take one for instance, the Darling Harbour Railway Terminus, approachable from north and south by each of these means, water, road, and rail. We may be optimistic in hoping for more perfect accommodation when so much expenditure has recently been incurred in bettering the Woolloomooloo Market, but until such facilities as we suggest are provided we must not expect perfection in our mode of fish distribution.

Unsuitableness of Woolloomooloo market location.

Darling Harbour railway terminus suitable for a central market site.

Still something may be done in other ways to improve the position both for the public and the fisherman. For instance, the conditions of rail carriage are capable of amendment, and really the life of a fishery depends largely upon the facilities afforded by the railway both in the matter of transit and freight charges. We are informed that in England liberal concessions are made in these directions.

Importance of railways to fisheries.

Fish from the various ports are there conveyed everywhere in fitly-designed cars, and at a low uniform charge, irrespective of distance. Here, by reason of the system of railways which, with the exception of one at Newcastle, converge at the metropolitan seaport, fish must for the most part be taken to Sydney and sold before it can be forwarded on to remote inland towns. Now this often involves, besides market, cartage and commission dues, re-cartage, and a second charge for railway carriage; it is not surprising that weighted with such multiplied outlay marine fish-food should in many inland towns be all but an unknown article and that fishermen find themselves so frequently face to face with destitution and distress.

Existing inconveniences in railway transit.

We think it should be possible to effect an appreciable reduction in market dues. Let it be considered that in addition to the cost to the producer of getting his fish to market he has to forego, in market dues and middleman's commission, some 10 per cent. of its realised value, together with the other charges enumerated, and perhaps also the steamboat charges, the result involving in some instances a debit balance against the fisherman, to stand as a charge against the next consignment, while to the public the article is at the same time not retailed except at famine prices.

Market dues and other outgoings.

This

Market dues
in Victoria.

This question of market dues and charges some two years since engaged the attention of a Select Committee of the Legislative Assembly of Victoria, who in their report made the following recommendation, and we suggest its consideration in connection with any amendment of charges to be made here:—

“The market dues which fishermen have at present to pay are at a uniform rate of 3d. per basket up to 2 cubic feet.

“This, according to the evidence submitted, is excessive. Your Committee recommend that, in lieu thereof, the following should be the market dues, viz. :—

- (a) Baskets weighing under and up to 30 lb., 1d. per basket.
 - (b) Baskets weighing over 30 lb. and up to 60 lb., 2d. per basket.
 - (c) Baskets weighing over 60 lb. and up to 100 lb., 3d. per basket.
- And over 100 lb. proportionately according to weight.”

Primitive
mode of fish
treatment.

But, while reform in these directions seems possible and is strongly desirable, the fishermen must not forget that they too must contribute towards improvement. What can be much more primitive than the existing mode of fish treatment from the moment of capture? With but a few noteworthy exceptions, fish are bundled from the net into the boat, where they are often exposed to the baneful influences of the summer sun, the risk of being trodden out of shape by the boat's crew, and then having thrown upon them the superincumbent weight of a second or even third catch, until when at last the boat reaches the carrier steamer, the fish, with bursted galls and entrails, are hurriedly thrown into most unsuitable baskets, which after being dipped into the water as a sort of cleansing process are placed on the steamer, perhaps under cover perhaps not.

English prac-
tice to gut fish.

That early putrefaction results, and consignments ultimately arrive at destination in a state quite unfit for human food is not surprising. In England such practices would not be tolerated. On the east coast, at any rate, all the fish are gutted first hand, the railway is brought down to the market, and the fish are taken from the smacks direct to the railway trucks, so that unnecessary cartage and handling is avoided.

English fish-
trucks.

These trucks are in appearance something like our powder vans. They open at the top and are fitted with divisions into which the fish, sorted according to their kinds, are carefully packed and placed. The fish trains, like ours, travel as much as possible by night, so as to avail of the colder atmosphere, though provision is made for the use of ice when necessary.

Climatic ne-
cessities.

If such precautions are found requisite in an English climate, how much more necessary is it that they should be observed here?

Fishermen
should gut
their fish or
provide
covered stor-
age.

We think it should be made compulsory on fishermen to gut their fish immediately upon capture, or at any rate to provide covered storage in their boats, so as to preserve their catch from damage such as we have indicated.

Steam transit.

We have little doubt that with suitable steam transit, fish so cared for could, by such quite simple means, be generally preserved in wholesome condition for a sufficient time to allow of transmission to the central market.

Barrow and
basket system
unsuitable.

Fish-carts
with cool
chambers.

In the further process of distribution amongst consumers, the present objectionable hand-basket and barrow system, under which fish are handled and re-handled by the vendor and intending customers until it is spoiled beyond redemption, should be abolished, and its place taken by the employment of suitable carts constructed on non-heat-conducting principles, and fitted with a centre ice chamber communicating with compartments abutting on to glass fronts for display of the fish according to species, weight, and price. Fish could be travelled in these carts for sale in parts remote from local markets, or to supply previous orders. In such carts fish could be viewed and selected, quite avoiding damage by frequent handling. But a scheme such as this would not be practicable unless enterprise and capital would take it up in conjunction, perhaps, with the fishermen on some mutually equitable basis. Until something in this direction is undertaken complete means for distribution of fish food throughout the city and suburbs cannot be established; for, to ensure its general use, our people must have assurance that, with such a perishable food as fish, they will be able to obtain it free from taint and at small cost. Under the existing barrow and basket system they cannot have that assurance, while under the system

Enterprise
and capital
necessary to
ensure com-
plete system of
distribution.

we

we sketch out, ordered, controlled, and officially supervised as it would be by qualified men, that assurance would grow, the industry would grow, and the public and the fishermen would alike be benefited. Officially supervised.

At present the catches are sent from the several fisheries in baskets and boxes. It is said that by the use of baskets the fish become damaged to a great extent, while those who send it in boxes aver that it suffers no damage whatever. Fish baskets and boxes.

We have no hesitation in suggesting the adoption of the latter means. Adoption of fish boxes.

We learn that in some parts it is the practice to travel fish in large cases supplied with ice, but the arrangements are of such a primitive character that the contents become damaged and oft-times spoilt by the pressure of the ice and the weight of the several superincumbent tiers of fish. Travelling fish in cases objectionable.

Where this mode of transmission is preferred and adopted, the details could be very readily improved by fixing trays of wire netting at intervals in the boxes. The fish laid upon these trays would not suffer undue pressure, while the ice being placed on the top tray, something after the manner adopted in transmitting the ova of salmonidæ, would effect the required reduction of temperature throughout the whole of the contents, a get-a-way for the melted ice being provided at the bottom of the case. This system might be beneficially adopted where better means are not available. Of course where rail-roads are established, along which supplies of fish can be regularly transmitted, it is natural to expect that that means would be availed of; and to lessen the risk of their going bad in transit we suggest the use of refrigerating cars. We have it in evidence from the fishermen that they would gladly avail themselves of such a convenience, providing the charges therefor were made reasonable. We have no grounds for anticipating that the charges would be high, inasmuch as in every place where we have made inquiries respecting freights the fishermen appear perfectly satisfied: indeed they give the Railway Commissioners every credit for their assistance in so helping the development of this important industry. Improved construction of boxes. Refrigerating cars. Moderate railway freights.

When in Melbourne we had afforded to us the opportunity to inspect the mode there in operation for transit of perishable commodities by means of a refrigerating car of new design, which, while more economic in expense of working, was perfect for its purpose in transmitting not alone fish but other readily perishable commodities. In this connection a further recommendation is made on the authority of expert evidence, viz.: a railway cooling car, receiving cold air from machinery fixed on the engine or attached to the car and worked from its wheels. It is stated that this could be done at quite a nominal cost compared with the cost of placing ice in ordinary cars. Refrigerating cars in Victoria. Cooling car.

Our observations have led us to think that either one or other of these cars might with advantage be adopted in this Colony. Their adoption in N.S.W.

We have referred to the baskets used in fish transit—except the huge cases sometimes employed to bring fish from the Clarence River, it is difficult to conceive any kind of package more unsuited to the purpose intended—oval in shape and extending at an angle outwards from the bottom to the top, and deep enough for the fish first thrown into them to be crushed out of shape, a waste of carriage space is involved and conditions for early decomposition are created. Unsuitableness of fish baskets.

In evidence the unsuitableness of these baskets is admitted, and in lieu of them is advocated the employment of shallow boxes of rectangular shape, fitted with locks and constructed of small meshed galvanised wire netting on frames so arranged that when packed in a railway car or steam carrier, currents of air may pass all around and above and below each box; by the adoption of such packages, fish would not be subjected to unnecessary crushing or heat. If, in addition, one or other of the means above suggested were provided for charging the railway fish cars with cold air, the means of transit would be pretty well perfect. One special advantage locked boxes would have over other kinds of packages is that they would aid the prevention of fish pilfering. That is a matter of very general complaint from the fishing stations all along the home division sea-board. Fishermen are not all agreed as to where this pilfering takes place. Some aver that it is done during railway or sea transit, while others attribute it to the wharfmen or the carters; but whoever may be the culprit it is patent that the evil exists, and should, if possible, be checked. Fish boxes of improved construction. Fish pilfering.

It

Care in transmission.

It occurs to us that even locked boxes may not prove an absolute preventive; we think that an additional check would be secured by weighing the boxes at time of consignment, checking that weight at the journey's end, and again on arrival at the market. Viewed according to the rough and ready way in which it is the present custom to travel fish, this system may appear somewhat cumbersome; but as in the transmission of other merchandise care is taken to protect it from robbery, we think as much care ought to be taken in the matter of fish; and when we have in evidence a case where more than one-third of a consignment was stolen in transit, it seems quite worth while to give the subject consideration.

Well-boats for distant fisheries.

In respect to the extensive fisheries to the north and south of the home division, which are so distant as to preclude their being worked under present available facilities during the summer months, it is quite possible that regular supplies might be maintained if the system of travelling in well-boats were brought into operation; indeed, it is surprising that this mode of keeping fish alive during transit, which has been attended by most favourable results elsewhere, has not long since been adopted by our fishermen, for, without doubt, fish so presented to the public would always ensure ready sale and give profitable remuneration to all who would engage in it intelligently and systematically.

Fish-tanks live fish.

A necessary adjunct to the well-boat is the fish-tank, an enclosure of batten work, made to float or sink according to the habits of the particular class of fish confined in it. The Hobart fishermen transfer the unsold portions of their catches from their well-boats to the tanks, which are moored in the Derwent, and in them fish are kept alive until needed for consumption. Such a system might be advantageously adopted by the fishermen in this Colony. We cannot impress too strongly on the minds of those who are anxious to earn a livelihood by fishing the superiority of the well-boat and tank system of fishing over other existing methods. It was so clearly demonstrated to us when in Tasmania, where we saw fish that had been by this method kept alive for periods ranging up to three months, that we should fail in our duty if we did not strongly recommend its adoption here. It is not an easy matter to remove a prejudice, but there are no doubt numbers of our people who do not care to risk eating fish that have been dead any time, but who, if they knew they could procure fish alive, would be prepared to make it an article of frequent consumption.

Market reform.

We desire to strongly emphasise the necessity for reform in regard to the market accommodation now afforded to the fishermen and to the public.

In dealing with this question of accommodation we cannot be too emphatic in denouncing the mode in which business at the Woolloomooloo Market is conducted. According to the evidence of witnesses qualified to speak upon the subject the fish are handled and treated in a most objectionable way, and the manner of their display on the floor, where they are liable to be trodden and spat upon by the heterogenous crowd of humanity which finds its way to the market in the early morning hours, cannot be too strongly deprecated. The system not only creates a prejudice against the use of fish, but besides it offers a premium to pilferers to rob the fishermen of their property.

Deficient oversight.

We think that the regulations enforcing inspection and oversight are not adhered to as rigidly as they might be, consequently a great deal of fish is allowed to pass to the public which although not actually stale at the time would be unfit for consumption an hour or two afterwards.

Treatment of unsound fish.

Again, we have found that when fish have arrived too late for the morning sale it is, irrespective of condition short of absolute unsoundness, stored in the refrigerating room, and later on submitted to public auction. We cannot too strongly express our disapproval of this practice, because fish in that condition when removed from the cool-room and restored to its normal temperature becomes again subject to the progress of decomposition from the point where that progress was arrested. Unless, therefore, the most scrupulous care is exercised in the admission of fish to the ice-house a great risk of danger to the public health is incurred.

Markets open all day.

This brings us to the question of the necessity for markets being kept open all day for the sale of fish. Were this so the public would be able to purchase their supplies as needed.

From

From the evidence obtained, we have no hesitation in suggesting that the whole question of market accommodation and distribution is one that should engage the serious consideration of the Government. As already stated, we believe that the market at Woolloomooloo is inconveniently situated, not only to the general public but to those engaged in the fishing industry. We, therefore, recommend that a site for a central market should be procured near the Darling Harbour Railway Station, and a suitable building erected thereon, provided with all necessary siding and wharf accommodation and conveniences in the shape of the latest improved methods for the treatment of fish. This, with the aid of one or other of the refrigerating cars to which we have referred, would ensure a ready means for the transit of fish to all the inland towns connected with the railway; and it is not too much to anticipate that in many instances fish caught in the afternoon of one day could be placed on the breakfast-table of distant inland centres on the following morning.

Accommodation and distribution.

Market at Darling Harbour.

Early fish supply to inland centres.

We are confident that if our recommendations in this respect were adopted an immense stimulus would be given to the fishing industry consequent upon the improved demand for fresh fish that would arise.

Stimulus to fishing industry.

In devising any new arrangements for the better distribution of our fish supply we would like to see included a system securing the gutting of fish on the waters where captured, before sending to market. We think that such a system could be instituted by offering, at the outset, a small subsidy or special inducement in the way of lowered railway freights. It seems strange indeed that the practice of transmitting fish for long distances in a hot climate like ours, with all the elements of putrefaction present, should have obtained so long without an experiment having been made in the direction we indicate.

System of gutting fish recommended.

If the public could be educated to such a system and assured that it would be carried out under strict supervision it would mean an increased price to the fishermen, and it would mean also employment for those connected with them in carrying out the process. The practice already obtains in other countries; it is generally adopted in the North Sea fisheries where the climatic conditions are not by any means so trying as they are here, and, next to the transit and storage of live fish in well-boats and fish-tanks, it seems to be a most important means for the preservation of a perishable article.

Advantages of the system.

The after market treatment of such a delicate and impermanent food as fish cannot be too carefully guarded. It should be laid out on raised tables constructed of slate, granite, or marble, and maintained at a low temperature. The public should have the right at any time during the day to purchase at the market such supplies of fish as they require; nor should this right be confined to a central market, for we deem it absolutely essential to the complete development of the fishing industry that auxiliary markets should be established in every populated centre. We cannot expect all our people to travel *en masse* to a central market, of necessity situated somewhat out of general reach, so we must have as adjuncts to it these auxiliaries in the city and suburbs established under Municipal or Government control, and in positions most convenient of access by one or more of our means of public transit. These depôts, like the central market, should be arranged for the effective display of the fish and provided with the most perfect system of cold storage, and it should be possible for persons to obtain supplies at these markets at any time of the day. The system might also be extended to the principal inland towns, and preservation effected by means of ice where cold storage proper is not available. Such auxiliaries, while assisting to remove the congestion which confinement to one central market must necessarily entail, would place fish within reach of the masses of the people—the working man being able to obtain his meal of fish as readily as one of steak.

Market conveniences.

Auxiliary markets.

Markets at inland towns.

The evidence we have collected shows that the interference of the middleman in the sale of fish has created a most disastrous effect upon the industry—it would seem that he absorbs all the profit which accrues without sharing any of the risk or labour, and we think the existence of such an institution is a most objectionable feature in the civic administration of the Woolloomooloo Fish Market.

Middleman a block to the industry.

Striking instances have been given to us of fishermen who have had account sales rendered to them from these middlemen to whom they had consigned their take, which, instead of showing profitable returns for hard work and exposure endured, had actually brought them in debt to these same consignees.

Unprofitable returns to fishermen.

It

Fish pilfering.

It has even been represented that in consignments of a given number of full baskets of fish, the returns when to hand showed a deduction from the original quantity sent, on the ground that the baskets when received at the market were only partially full. This, it has been asserted, is one of the means by which the fishermen who ply their vocation on the distant grounds are duped. Another assertion is to the effect that at times the prime fish are picked out and sent away by the agents to their constituents in the interior, account sales being rendered to the fishermen based on the lower rates obtained at auction for the inferior fish.

Fishermen their own auctioneers.

There is almost a consensus of opinion that the middleman should be dispensed with, and facilities afforded to the general public to come into direct contact with the producer. At the Hobart Fish Market the fishermen are for the most part their own auctioneers, so that the middleman is almost unknown, and this system seems to work so well in Tasmania that we have no hesitation in recommending its adoption in New South Wales where, with the aid of auxiliary markets, it could be made even more mutually beneficial both to the catcher and the consumer.

Statistics of Fish Supply.

Results of sales.

The amount realised at the market from sales of fish in 1893 is stated to be £29,647, while in 1894, though the quantity submitted was greater by nearly 1,250 baskets, the returns are quoted at only £25,368, showing a drop of no less than £4,279. Certainly the fishermen did not benefit by this fall, nor did the consumer obtain his supply at a cheaper rate, the complaint being that the prices paid to the hawkers were simply scandalous.

Alleged cause of deficient supply.

Opinion has been expressed that our people are not a fish-eating community, and this has been advanced as a reason why the supply apparently available has always been so limited. That such is not by any means the case will be apparent even from a cursory glance at the following tables courteously supplied to us by the Government Statistician. So astoundingly opposite are the conclusions which the figures compel, that, if they originated from any less authority than Mr. Coghlan, we should be almost inclined to doubt their accuracy.

Imports of fish.

By them, however, we are presented with the facts that during the last five years, notwithstanding we possess in untold quantities a supply of fish of the choicest kinds, we have nevertheless imported, chiefly from the neighbouring Colonies and New Zealand, fresh and frozen fish to the value of £18,777; and dried and preserved fish from Europe, Asia, and America, and the Colonies too, to the value of £422,986.

Results anticipated from new legislation.

In the face of these facts we make bold to say that while it is found profitable to import fish to such an extent that in five years its value in the aggregate has amounted to nearly half a million of pounds sterling, the reason for the paucity of supply from our own waters must be sought for in some other direction than the indifference of our people to fish as an article of food; but whatever may be that reason, we hope, by the impetus we expect to result from the new legislation we propose, and the information and suggestions we offer respecting methods of fish-capture, transit, market accommodation, distribution, &c., New South Wales will take her proper place not only in supplying her own needs, but in making herself known also in the markets of the world.

Possible fish export.

The Oyster Fisheries and Legislation affecting them.

The oyster fisheries received much earlier attention in the shape of practical legislation than the net and line fisheries. In the year 1867 Dr. John Bowie Wilson, in conjunction with Mr. James Squire Farnell, were the means of obtaining the passage through Parliament of the Oyster Beds Act of 1868. Its objects were to encourage the formation of artificial beds and the improvement of the natural beds. It was a purely experimental measure, but did good service in its time. Eventually, however, unanticipated difficulties arose concerning the respective rights of lessees and licensed dredgers. The Act was not shaped to determine these difficulties, and its administration became at last hopelessly confused. A Commission appointed to inquire into the matter brought forward a Bill which would have cured the impediments found to exist, but the Government of the day could not find opportunity to bring it before Parliament. Legislation of 1868.

In 1880 a Royal Commission undertook an inquiry into the fisheries generally. So far as the oyster fisheries were concerned, it resulted in the enactment of Part II of the Fisheries Act of 1881, which, after validating the holdings or promises of leases acquired by some persons under the 1868 Act, enacted two separate modes of leasing, termed respectively a long-term lease—30 years—and an annual shore lease. In the long-term lease the rent was fixed at five shillings per acre per annum for the first four years, and twenty shillings per acre for the remainder of the term; the maximum area of any one lease was twenty-five acres. The annual shore lease was really a pre-emptive privilege to holders of riparian land. It gave to such the exclusive right to lease the shore fronting their properties at a rental of twenty shillings per 100 lineal yards, the shore in these cases being defined as between the marginal line, mean high-water mark, and an imaginary line defining an average depth of 3 feet at low water of spring tides. An almost exclusive right to these frontage waters could thus be acquired by these owners at the expense of the general public; we say almost exclusive, because the Act did certainly except from the leases natural oyster-beds and land included in public oyster reserves. The Act provided for working the natural oyster-beds by licensed dredgers at an annual license fee of £10. Legislation of 1881.

A very brief experience of this measure proved that it was unworkable, at least in some respects, and the assistance of the Legislature had again to be invoked—this invocation resulted in the existing Oyster Fisheries Act of 1884. This Act Amended Legislation of 1884.

removed the objectionable monopoly enjoyed by holders of water-frontage lands, and it allows the issue of leases to anyone for a term not exceeding fifteen years, with right of renewal, at a rental of twenty shillings per 100 yards per annum measured along the foreshore. The maximum length to be included in any one lease is 2,000 lineal yards, but as no limitation is made of the number of leases to be granted to any one individual there is practically no limit to the extent of area one person may hold.

Abolition of
royalty.

Leases were, in the first instance, granted subject to payment of a royalty of 3s. per 3-bushel bag of oysters raised, and were made of increased value to the lessee by the removal of the previous exclusion of the right to work natural oyster-beds within them. But, in 1887, an amending Act was passed abolishing the royalty, and with this amendment the Act stands as law to-day. That it has not been successful in promoting the industry is, from the evidence given by various witnesses, fully apparent. The President of the Fisheries Commission tells us that Crown lands are simply becoming denuded, and that although there has been an increase in the output, that result has been caused by over-stripping the leases and robbing the unleased lands adjacent thereto. He claims that leases so stripped are thrown back upon the Crown, and for oyster-culture purposes are made useless for years afterwards. Again, he states that some persons secure a lease of 100 yards or so, not with any intention of working it, but simply as an excuse or a blind for stripping the adjacent unleased lands. Should they be caught in the act of this unique system of robbery, they merely explain that they are using the oysters for their own consumption, and thus, so defective are the provisions of the Act, they avoid all risk of punishment. They really boat those oysters from the Crown lands to their 100-yards' lease, bag them there, brand the bags with their authorised number, and in that way get them to market. Dr. Cox states that many of these lessees apply for release under the excuse that the oysters on their areas had been destroyed by the worms. He affirms that the "man-worm" has been the trouble, not so much the ordinary worm.

Oyster
thieving.

Small
holdings
unsatisfactory

It is quite evident that the leasing of these small lengths of foreshore has been productive of great evils, and even the leasing of maximum lengths of 2,000 yards has not resulted as beneficially as it was expected to do.

Opinions of
witnesses.

Although the opinion of some witnesses is in favour of the smaller leases, yet they do not, for the most part, seem able to advance reasons for their views. One witness told us he would like to have all the leases thrown open and be able to take oysters where and when he liked, although he admitted that even the old licensing system did not prove a success. It is, however, but fair to state that after explanation of the advantages a system of leasing large areas, such as bays, arms of rivers, and such like, would confer, several of those witnesses were prepared to change their opinions.

Large leases
recommended

We strongly favour the plan of leasing in large areas, such as we have sketched in our Bill, and, beyond a nominal rental, requiring only the payment to the Crown of a fee on each bag of oysters raised. At the present time we have no knowledge of the actual state of any of our waters from an oyster-bearing standpoint. Certainly we ought to have official data on which to base the producing capabilities of any given area, but no information whatever in that direction has been gathered by the Fisheries Department, so that while it would be obviously impossible in any one case to fix a rent which would be equitable as between the Crown and the lessee, it would be quite practicable by the imposition of a scheme of payment by results to place both parties to a lease on an indisputably fair footing.

Combatting
worm disease.

We have referred incidentally to the worm disease. We think that beyond prosecuting scientific inquiries alone some practical steps should have long since been devised to combat it.

We are told by some witnesses that its eradication may be almost ensured by a constant stirring of the bottom on which the infected oysters are; again we are told that if the oysters are maintained on platforms raised above low-water mark the worm will disappear; once more, we are advised that if the oysters are removed from their beds and exposed to the sun and air for a certain period they will be ridded of the pest; and lastly, that if a diseased portion of a bed be absolutely stripped and kept stripped of oysters, as well as a margin of bottom around it, the spread of the disease can be checked and the remainder of the bed worked with profit.

Now

Now it would have been quite possible, and eminently proper too, for the Department during all the years in which the worm has been proving so destructive to have tested the efficacy of each of these suggestions, and to have published for general information the results of its investigations. We think that while lessees have been so continually pressed for the payment of rent on leases, which, though perhaps industriously tended had, from natural causes, proved unproductive, the Department should have made effort in the directions indicated in order that if possible relief might have been afforded. In the Bill we submit, we propose the system of payment by results, and we have reason to expect that it will, if proper official supervision be provided, be found to work satisfactorily.

Department
should have
experimented.

Trawling.

In the early part of our report we have referred to the system of capturing fish by trawling. As the beam trawl, though familiar by name, may not be generally known in the Colony, a brief description may be interesting. Its form is a funnel-shaped net of which the mouth is the widest part and from whence it gradually diminishes in size until it narrows almost to a point. The upper edge of the mouth of the net is secured to a wooden beam which rests at each end on an iron shoe or runner called a trawl head. The lower edge of the mouth is secured to a line called the ground rope which is made fast to each end of the beam and hangs in a bight between the trawl heads. Another rope is made fast to the two ends of the beam so as to form a span or bridle, and to the centre of this bridle is bent one end of the drag rope, the other end being secured on the trawling vessel.

Description
of net.

When the trawl is lowered in the water for working, the beam is supported in its position horizontally by the trawl heads, whilst the ground rope rests on the sea bed, thus forming a wide mouth. This apparatus is dragged along the bottom of the sea by the trawling vessel, and every movable object with which it comes in contact is swept into the net, where it remains until it is hauled up, and the contents emptied on the deck of the trawler. This trawl net is most effective for its purpose and would be a useful instrument for testing the resources of our coast line. It does seem passing strange that while fish have been at famine prices during all these years, no persistent efforts have been made to add to our supply by this well tried means of capture which has done so much to develop fisheries in other parts of the world.

Mode of using.

Effective for
fish capture.

Viewed from an economic standpoint alone it has been almost criminal neglect to have allowed such a reasonably probable source of wealth to pass for so long unheeded and untried.

One essential of a trawling ground is that it shall be free from obstructions to the passage of the net. We have at frequent intervals along our coast extensive bights having so far as is known firm bottoms and clear from impediments, along which the trawl could be drawn for miles—there is one between Newcastle and Port Stephens, another off Tuggerah, another off Shoalhaven, and elsewhere without number almost—each of these would doubtless produce large yields, not only of fish but of oysters also, for modern research suggests to us that our oyster supply has its origin in the ocean, not in rivers and inlets as has been supposed; but that is a large question and well worthy of special discussion, so it cannot have more than passing mention here.

Trawling
grounds.

We suppose that the want of a properly equipped steam trawler has been a chief obstacle in the way of proving the suitability of this method of capture, for in this colony there are not, without material alteration, any steamboats which would be suitable for working a trawl net. Such a vessel would require special construction in some points, ample beam, a good hold of the water, and special deck arrangements and appliances.

Steam trawler
and equip-
ment.

On one occasion rough trawling gear was placed on a small steam-tug, but owing to tempestuous weather and the unfitness of the tug, the experiment had after a few attempts to be abandoned. But even in this crude effort, attempted under most unfavorable conditions, a number of valuable fish, some of extremely rare species, were captured, and the existence brought to light of hitherto unknown species of fish, which proved incontestably what a small knowledge we possess of the inhabitants of our ocean floor.

Improvised
trawling
experiment.

New species
of fish.

We

Abundance of
ground fish.

Trawling
experiments
should be
undertaken
by the
Government.

We do know, however, that ground fish of various species exist in abundance, and this alone should be some warrant for expecting successful results from trawling experiments in a vessel suitably constructed, effectively equipped, and manned.

Of course, as we have explained elsewhere, it would be scarcely reasonable to expect private enterprise to step in and prosecute trawling on the bare assumption of possibility of ultimate success; but in view of the importance of the subject we think it is not expecting too much to hope that the Government will take it up as a national matter, and direct the institution of trawl surveys to test the suitability of the bights already named. This, while it would be more expeditious and far less expensive than a hydrographic survey, would supply just the information it would most concern an intending trawler to possess, as for instance not only the depth of water and character of the bottom but the fish producing capabilities as well; while to the public it would evidence the probable value of fish capture by trawling as an item of national economy and wealth.

Synopsis of the Fisheries and Oyster Fisheries Regulation Bill.

This Bill proposes a departure from existing legislation.

The witnesses whom we have examined, including Doctor James C. Cox, the President of the Fisheries Commissioners, seem unanimous in opinion that a change in the administration of the fisheries is absolutely essential. We are thus forced to the conclusion that the future control of the fisheries must be secured by other than the existing means. Indeed, the individual opinion of Dr. Cox, which, from the position he occupies, should command consideration, is that the administration of the fisheries and oyster fisheries should be separately controlled, each by a well-paid officer, but in conjunction with a paid board composed of two or three good business men who would take an interest in those industries.

In the really initial stage in which we find the fisheries at present, we hesitate to recommend a course which, however desirable it might be in itself, would involve a considerable expenditure of money over and beyond what would be absolutely required to cover the pay of a necessary working staff.

We think that, for at any rate some years to come, it would be quite within the capability of one man to control the fisheries and oyster fisheries conjointly. Such a man should be qualified for his task, and, as Dr. Cox suggests, be well paid. We think also that instead of a central paid board, it would be preferable to establish an unpaid board at each of the principal fishing centres. We have found the conditions and requirements vary so at different centres that we are sure they could be much more satisfactorily met and adjusted by local bodies, to whom those requirements would be known, than by a central board, which could only acquire its information second-hand. But, apart from this particular point, such determined hostility is expressed to so many of the provisions in the Acts in force that we have considered it expedient that all the Statutes relating to the fisheries should be repealed, excepting the Acts regulating the Fisheries of Port Hacking, starting afresh on a new basis.

Our Bill, which we entitle the "Fisheries and Oyster Fisheries Regulation Act, 1895," opens by setting out the interpretation to be applied to certain terms which are in repeated use throughout the measure.

After repealing, without prejudice to past operations and rights under them, the enactments previously referred to, it proceeds to declare that the duty of protection, development, and regulation of the fisheries shall be vested in one Commissioner, to be called the Commissioner of Fisheries for New South Wales. It proposes that the Commissioner may be assisted by local boards of advice, each board consisting of three persons, with whom the Commissioner may consult in respect to the fisheries in any particular district. These boards, to be termed local fisheries boards, will be representative of the Government, the local residents, and the fishermen, each being empowered to elect one member. In the past, much complaint has been heard of the injustice caused to fishermen through being governed in their trade by laws in the executive administration of which they have no voice. We think the proposed arrangement will afford all the representation which can be fairly claimed.

Power is taken to appoint officers for purposes of administration, including, as inspectors *ex officio*, police constables and certain employees in the Departments of Customs and Harbours and Rivers, &c. A perusal of the Bill will show that the observance of its provisions will compel the employment of a comprehensive inspecting

inspecting staff, and so, in order to cheapen the cost thereof to the fullest extent possible, it is thus proposed that the services of officers in the Departments referred to shall be availed of.

The considerable knowledge we have gained about our fisheries has served to show us that there remains so much more to be learned respecting them and their possibilities of future development that it would be altogether injudicious to attempt to bind them down, any more than is absolutely necessary, by hard and fast legislation. We have, therefore, provided in the Bill very ample power to the Executive Council to make regulations as to all details whatever. Moreover, we have specified certain different purposes which the Executive in its wisdom may, from time to time, govern by regulation in such directions as may seem fitting. We invite a perusal of these several specified purposes, and especially two new and important items,—namely, the working of deep-sea oyster-beds, and the general direction and control of ocean fisheries,—matters which have hitherto been culpably and completely neglected.

PART I.

Net and Line Fisheries.

With the foregoing explanation of the preliminary provisions, we pass on to the consideration of Part I of the Bill, Net and Line Fisheries.

We have found that much confusion and hardship have arisen to fishermen from the enactment legalising the use of several different kinds of fishing-nets, with various lengths and meshes, so obscurely defined in the Fisheries Act of 1881. Fishermen have, doubtless, frequently been led into infringement of the law from simple inability to comprehend the very abstrusely constructed sections of that Act which deal mostly with the subject. We think that these several kinds of nets may be discarded and the use of others allowed within such limits of length and mesh as may be found suitable for capturing any particular species of fish in any particular waters open to net-fishing.

The ninth section of the Bill shows clearly what we propose, and it will be obvious that it offers a large concession to the licensed fisherman; indeed, recognising the disabilities under which he has so long laboured we have used our utmost endeavours to produce this result, while at the same time taking care, in the public interest, that the efficient conservation of the fisheries shall not be jeopardised; we think the fisherman, in consideration of the enlarged privileges he will enjoy, should the Bill become law, will readily recognise the necessity for the subsequent enactments we have provided for the protection of the public estate. Amongst these conservative provisions are the prohibition of the use of illegal nets; the requirement that all nets must be emptied in at least one foot of water, so as to assist the escape of fry and immature fish, and that persons found with wetted nets in the vicinity of a hauling ground on which small fish are lying dead or stranded must show that they were not the cause of their having been left there; also that nets must be so hung that small fish and fry shall have fair opportunity for escape. We think, however, that the enactment that has hitherto given rise to so much dissatisfaction, and has proved so cruel in its incidence—we mean the punishment of a fisherman by forfeiture of his tools of trade—should be extinguished; and so it will be found that provision for the seizure of fishing-nets has no existence in our Bill. We prefer rather, and we have it in evidence as the desire of fishermen also, that instead of depriving an offender of his means of livelihood, only a fine, or in lieu a term of imprisonment should be imposed.

We have made sufficient provision against the use of sunken nets by requiring that foot lines of nets shall be weighted only to such an extent that when set the top or cork line shall not be sunken below the surface of the water. In making this condition, however, we have had to consider the fact that in some waters, the lakes for instance, the blubber is present in such quantities as to render hauling almost an impossibility. In waters so affected the practice has been to use a net technically termed a diver, this diver is simply a hauling net weighted sufficiently to sink it to the bottom in deep water at a distance from shore. The blubber being usually present for only a few feet below the surface, the net may thus for some considerable distance be drawn towards the shore below the region of its occurrence, and consequently, to a very large extent, escape contact with it. In our opinion this process of netting is absolutely essential in certain waters, such as Lakes Macquarie and Illawarra

Illawarra for instance, where the shallows extend for long distances outwards. We therefore, propose to legalise the use of dive-nets by placing it in the discretion of the Commissioner, after reference to the local fisheries board, to permit them where needed. The stalling of fish and the joining of nets together in such a manner as to unduly diminish the means of escape are also prohibited.

Substantial penalties are proposed for the punishment of persons found in possession of underweight fish. That equitable punishment in this respect should be insisted upon is absolutely essential, having in view the liberal concessions accorded to fishermen by other provisions of the measure.

The Bill then proceeds to deal with the closure of waters against fish capture. It proposes two classes of closures. The first, which is defined as "Close Fisheries," is intended to afford full protection to fish during spawning periods, and authorises the closure of a water during any months in the year. The second is to provide for conservation and continuity of the fish supply, and permits the practically permanent closure of waters as feeding grounds for young fish.

Viewed in the light of the liberal concessions which this Bill affords to fishermen, the necessity for the strict maintenance of these closures will be apparent, so it will not seem surprising that heavy penalties are suggested for any infringement of it in that respect.

Nevertheless, having before us the fact that in waters so closed marketable fish abound, we provide means in the shape of lines and set or drift nets by which they may, under conditions, be captured therein.

The Bill enacts the licensing of fishing boats and of professional and amateur fishermen, whether the fishing be for profit or pleasure. The provisions for licensing netters are much the same as at present, except that aliens must acquire a right to the privilege by first obtaining certificates of naturalization: also, it is made optional for applicants to pay their fees to a Clerk of Petty Sessions, or to the Treasury, or to the local Fisheries Inspector. A new departure is the requirement that every person fishing by line from a boat must hold a license—the fee proposed for this is quite nominal—only half-a-crown per annum. We think this quite equitable, too; because, if by means of legislation the fisheries are to be so regulated and protected that increased means of sport and amusement shall also be created, amateurs should not object to contribute towards such a result. Besides, there is the case of steamboats, which are constantly taking out large parties on fishing excursions. The capture by these parties is often very considerable, and is frequently placed on the market for sale, where it comes in competition with the professional fisherman in the prosecution of his business. We expect a large revenue will be derivable from amateur fishermen without pressing hardly on them individually.

The form in which licenses are at present issued is found to be objectionable, being liable to damage and even destruction from contact with water. We think some other form and substance might with advantage be adopted, for instance, a metal token similar to a railway season ticket. Regarding the idea so favourably, we provide in the Bill for its determination by regulation.

After prescribing to the Commissioner the right to limit the number of boats and men to be employed in any water, the remaining sections of the Bill enact certain usual provisions against fish destruction by explosives, placement of obstructions in the way of hauling nets, malicious disturbance of fish in process of capture, and for securing the identification of offenders.

PART II.

Leases of Crown Lands for General Fisheries Purposes.

This part of the Bill is mainly an adaptation of Part III of the Fisheries Act of 1881, which vests in landowners and holders the right to the influx and efflux of the tide over any area within their holdings which they may desire to lease under it. That enactment has, however, been so far a dead letter. We have thought that the scope of its intention might with advantage be extended so as to legalise the leasing for general fisheries purposes of bays and arms of inlets, as well as lagoons intercepted from tidal influence, whether situated on alienated or Crown lands. We have, therefore, modified the enactment so as to make it apply in that direction. Under this part of our Bill a lease of any such waters can be granted at a rental determined by auction or tender, for a period of fourteen years, vesting in the lessee the property in any

any fish, oysters, or crustacea within the limits of the area leased, power being taken to make regulations in the interests of the Crown for its sufficient control; moreover, a lessee will be required to enter into a bond with two sufficient sureties for the payment of the rent. In case of a lease of a lagoon or water barred from tidal influence, provision is made for admission of the tide by means of a trench or passage through the intervening shore. The remaining sections in this part of the Act supply sundry enactments which are thought necessary for controlling the concessions which a lease under it will confer. Amongst these is an important one, reserving to the Governor the right to cancel a lease for noncompliance with regulations or neglect to take measures for its sufficient development.

PART III.

Leases of Crown Land for Oyster Culture.

The conditions under which land may be leased for oyster culture will be found to be considerably modified. The existing system of leasing on the line of foreshore has, as explained in another part of our Report, not proved a success, and from the evidence taken is shown to be open to many objections. The Bill enacts that leases may be acquired by auction or tender, and may embrace any area in any river or inlet; the term of the lease is limited to ten years, the sale conditions including a nominal rental of 20s. per annum and an obligation to pay 2s. 6d. for every bag of oysters taken. Provision is made also for renewal of the term of lease, subject to such amendments in respect to rent and otherwise as may seem desirable. From date of payment of the first year's rent there will vest in the lessee the exclusive right to plant and take oysters, and a surrender may be accepted after the second year of currency should the area be found on inspection unsuitable for cultivation. A lessee whose rent or fees are in arrear will be barred from taking oysters from his lease, or from leasing a further area until all dues are paid; if a lessee should so mismanage his lease that destruction to the oysters upon it is threatened, further gathering may be stopped and the lease cancelled; to avoid the cost of accurate survey, a lease may be simply described by reference to posts, stakes, &c., or natural features sufficient to ensure definition. Lessees are protected in their holdings from disturbance or interference by unauthorised persons, but it is specially provided that fishermen shall not be barred from pursuing their calling over any parts of areas so leased not actually occupied by layings or deposits of oysters. A lessee, under penalty of cancellation, must, within two years from the date of his lease, have taken proper measures to carry out the required provisions, and when by reason of over-dredging or from any other cause an oyster-bearing area has been denuded, or the oysters thereon have become unfit for consumption as food, the further taking of oysters therefrom may be prohibited. Power is taken to proclaim oyster reserves; and on those reserves, and on Crown lands, and on areas on which dredging is prohibited, oysters are made the property of the Crown and may not be taken therefrom by any person without lawful authority, exception being allowed in favour of persons removing oysters from a reserve or Crown land for their own consumption *on the spot*. Provision is also made for prosecuting persons who may misconduct themselves or behave in a disorderly manner; an information in this respect may be laid by any person in whose sight or hearing such an offence has been committed. Presuming upon the existence of oyster deposits on the sea-coast outside headlands, power is taken to allow such deposits to be dredged under regulation by persons duly licensed in that behalf. Persons dealing in or selling oysters by retail must take out an annual license, for which it is proposed the fee of £1 shall be paid. It has been thought desirable to bring oyster-dealers under the provisions of the Bill, in order that the sale of immature oysters or the sale of oysters unfit for food may be checked, and for this purpose inspectors are authorised to seize and take away any such oysters, which may be disposed of in accordance with regulations to be made for the purpose.

PART IV.

Legal Procedure and Miscellaneous.

This part deals principally with the legal procedure to be observed in respect to informations heard under the Act.

It adopts the provisions of the Acts regulating summary convictions before justices. Provides that all proceedings may be taken by and in the name of any inspector, or any person specially authorised, or any lessee under the Act, and that no information or conviction shall be quashed through any defect or want of form—an alternative of imprisonment in lieu of fine is placed in the discretion of justices.

Persons

Persons aggrieved by any conviction, adjudication, &c., are allowed conditionally a right of appeal. Inspectors and others clothed with authority under the Bill are protected from assault and obstruction, and punishment is provided for persons refusing to give their names and addresses when legally demanded. The production of Treasury receipts, also of leases and licenses or copies thereof, or of license tokens, or *Gazettes* containing notices, regulations, or proclamations are made conclusive evidence in all Courts as to matters severally contained therein.

All fish and oysters illegally in possession of any person may be seized and condemned. The purchaser of a lease of any area is upon payment of the rent therefor for the first year deemed to be in actual possession of such area notwithstanding that the lease deed thereof may not have issued. Also power is reserved to the Governor to resume any area leased under the repealed Acts, subject to payment of compensation to the lessee. The Commissioner is required to direct and carry out experiments in modes of fish capture, also in the culture and propagation of fish and oysters, and to attempt the discovery of oyster-beds off the coast. Usual provisions are enacted to enforce penalties for non-compliance with the Act and Regulations, and special facilities are afforded for recovery of overdue rents and fees. The operative sections are arranged to come into force on the sixtieth day after passing of the Bill.

A report of the state of the fisheries is to be annually submitted to the Minister charged with the administration of the Act, and a copy is to be laid before both Houses of Parliament.

Abstract of some principal Suggestions.

1. The immediate passing into law of our Bill to regulate the Fisheries and Oyster Fisheries of the Colony.
2. A systematic exploration of our sea coast by a properly equipped Trawling Vessel to determine the capabilities of the Deep-sea Fisheries.
3. Transmission of live fish to market by means of Well-boats.
4. Employment of small launches driven by oil engines to facilitate inspectorial supervision of the fisheries.
5. Examination of the Fisheries at Lord Howe Island and Elizabeth Reef.
6. Inquiry into the Crayfish Fisheries.
7. Inquiry into the Inland Waters Fisheries.
8. Establishment of Fish Hatcheries.
9. Improved methods of fish transit.
10. Adoption of refrigerating cars for transit of fish by rail.
11. Packing fish in locked boxes instead of baskets.
12. Improvements in construction of cases for fish transit.
13. Improvements in Market Accommodation.
14. Reduction in market dues.
15. Abolition of the middleman and authority for fishermen to vend their own fish.
16. Erection of a Central Fish Market near Darling Harbour Railway Terminus, with Urban and Suburban Auxiliary Markets.
17. Substitution of fish-carts for the hawkers' basket and barrow system.
18. Gutting fish and improvements in accommodation for fish in fishing-boats.
19. Uniform charge by railway for fish carriage irrespective of distance.
20. Employment of fish tanks in connection with the well-boat system.
21. The development of the Herring Fishery.
22. Institution of experiments for eradicating the worm disease in oysters.

We have the honor to be,

Your Excellency's obedient Servants,

FRANK FARNELL,
PRESIDENT.

R. H. D. WHITE,
Commissioner.

LINDSAY G. THOMPSON,
Commissioner.

Sydney, June 14th, 1895.

58^o VICTORIÆ, 1895.

A BILL

To repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, and to provide for their better development and regulation.

WHEREAS it is expedient to repeal the laws regulating the Fisheries and Oyster Fisheries of the Colony, to make provision for their better development and regulation, and to encourage the artificial propagation of Fish and Oysters: Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Legislative Council and Legislative Assembly of New South Wales in Parliament assembled, and by the authority of the same, as follows:—

Preliminary Provisions—Appointment of Commissioner, &c.

1. This Act may be cited for all purposes as the "Fisheries and Oyster Fisheries Regulation Act, 1895." Short title.

2. In this Act, except when otherwise specially expressed, the following words within inverted commas shall bear the respective meanings hereby assigned to them:—

"Authorised purpose"—Any purpose indicated by the provisions of this Act or the regulations.

"Boat"—Any vessel or punt of any description whatsoever.

"Commissioner"—The Commissioner of Fisheries appointed under this Act.

"Crown Lands"—Any foreshore as well as any land under the sea, within three miles of the coast, or under any tidal or inland water, or under any river, lake, lagoon, or other

- water, in the Colony of New South Wales, the property in which is vested in the Crown, and is not held under lease under this or the repealed Acts.
- “Engine”—Any weir, net, implement, device, or contrivance of any kind for the purpose of taking fish, not authorised by this Act.
- “Fishing-lines”—
- “Hand-line”—Any line intended or used for the purpose of catching fish, to which not more than three fishing-hooks are attached.
- “Long Line or Bultow”—Any line intended or used for the purpose of catching fish, to which four or more fishing-hooks are attached.
- “Fish”—All or any of the varieties of marine or fresh water fishes and crustacea enumerated in the First Schedule hereto; also fish not indigenous to this Colony which may be introduced or be in any inland waters, or which may from time to time be added by regulation.
- “Fisherman”—Any person licensed to catch fish under this Act.
- “Governor”—The Governor with the advice of the Executive Council.
- “Hauling”—shall be deemed to include casting, shooting, fixing, setting, placing, or staking.
- “High-water-mark”—The mean line between high-water at spring and at neap tide.
- “Inland Waters”—All rivers and creeks for that portion of their water-course which is beyond the influence of the tides; also all fresh water lakes, lagoons, and ponds.
- “Inspector”—Inspectors or Sub-Inspectors of Fisheries appointed and Inspectors *ex officio* created under this Act.
- “Justice”—Any Justice of the Peace.
- “Lawful authority”—An authority the nature and effect whereof must be proved by the person who sets it up.
- “Lease”—Any lease issued under this Act or the Acts hereinafter repealed.
- “Leased area”—Any portion of land leased under this Act or the Acts hereinafter repealed.
- “Lessee”—Any person holding a lease under this Act or the enactments hereinafter repealed.
- “Prescribed”—Prescribed by this Act or by regulations or in a lease made thereunder.
- “Regulations”—Regulations made by the Governor in pursuance of the provisions of section seven of this Act.
- “Spat”—The spat, brood, or ware of every kind of oyster below a size which from time to time by regulation under this Act may be declared to be marketable.
- “Tidal Waters”—All waters which ebb and flow over Crown Lands, within the territorial jurisdiction of the Crown in New South Wales, or over lands leased under this Act, and every lake and lagoon in the said Colony ordinarily subject to the influence of the tides (although the communication with the sea may for the time be closed), the soil or bed whereof is the property of the Crown; together with, in each case, the soil of such Crown Lands.

Repeal of
44 Vic. No. 25,
46 Vic. No. 25,
48 Vic. No. 6,
51 Vic. No. 21,
55 Vic. No. 15,
58 Vic. No. 4.

3. The Act intituled “*An Act to provide for the development and regulation of the Fisheries of the Colony*”; the Act intituled “*An Act to amend the Fisheries Act, 1881*”; the Act intituled “*An Act for the Amendment of the ‘Fisheries Act, 1881,’ the Promotion of Oyster Culture, and the Regulation of Oyster Fisheries*”; the Act intituled

intituled "*An Act to abolish the Royalty on Oysters*"; the Act intituled "*An Act for the better preservation of Fish in Inland Waters*"; the Act intituled "*An Act to prevent the use of certain Fishing Nets, known as Sunk Nets, and to make other provision subsidiary thereto*"; and the Act intituled "*An Act to amend the Fisheries Act in certain respects*," are hereby repealed, but except as hereinafter provided, without prejudice to the past operation of, or to any right lawfully created, offence committed, or penalty incurred under, any of the said Acts.

4. The duty of protecting, developing, and regulating the Fisheries of New South Wales shall be vested in a Commissioner, to be called the "Commissioner of Fisheries for New South Wales," to be appointed by the Governor by commission under the Great Seal, and who, by that name, shall be a body corporate, with perpetual succession and a common seal, with power to hold real and personal estate, and to sue and be sued, and to take, and be the subject of all legal proceedings by such name. And the duties, powers, and authority of the said Commissioner shall extend to the territorial limits of the said Colony.

Constitution of Fisheries Commissioner.

5. The Governor, on the recommendation of the Commissioner, may appoint boards of advice, each board to consist of three persons, with whom the Commissioner may, in the general administration of this Act, consult in respect to the fisheries in any district defined by proclamation in the *Gazette*. Such boards shall be termed local fisheries boards, and shall consist of a chairman, being either the Mayor of some municipality in the district or other person, as may be nominated by the Governor, and two other persons, one to be elected by the residents in the district, not being fishermen, and one by the resident fishermen. The mode of election and of conducting the business relegated to such board by this Act shall be determined by regulations.

Local fisheries boards.

6. It shall be lawful for the Governor to appoint such officers as he may think necessary for the purposes of administration of this Act, and to assign to every such officer such title, and, subject to vote by Parliament, such salary as he may think fit. And every such officer shall act under the direction of, and be responsible for the due performance of his duties to, the Commissioner.

Appointment of officers.

7. All officers of police and constables, and, other than the professional and clerical staffs, all persons employed in the Departments of the Marine Board and Customs and Harbours and Rivers, shall be, and have, and are hereby required to exercise, the powers, duties, and authorities of inspectors of fisheries *ex officio*.

Certain persons to be inspectors *ex officio*.

8. It shall be lawful for the Governor to make regulations from time to time for the purpose of giving effect to the provisions of this Act as to all details whatever; and, in addition to any purpose hereinafter mentioned, for any of the purposes following, namely—

Regulations.

- (I) For regulating the conduct of business by the Commissioner, and defining the duties of all officers and other persons clothed with any duty or authority under this Act.
- (II) For prescribing the forms and conditions of all licenses, mode of payment of license fees, as well as special fees for licenses to capture *salmonidæ* and other species of fish not indigenous to the Colony, and the due transmission of and accounting for all moneys to the Treasury and Audit Departments, respectively.
- (III) For prescribing the mode of testing the length of nets, and the dimensions of the meshes of nets, and notwithstanding anything contained in this Act or the Second Schedule hereto, the kinds, and the minimum weights or sizes of any species of fish, legal to be caught, sold, consigned, or exposed for sale.

(IV)

-
- (IV) Providing for the sale or other disposal of any underweight fish seized or forfeited under any of the provisions of this Act.
 - (V) Prescribing a scale of rewards (and the terms and conditions of the payment thereof) for the destruction of sharks, or of cormorants, shags, or other birds which by proclamation may be declared to be destructive to fish.
 - (VI) Providing for the hauling or landing of fishing nets in such a manner as to prevent the destruction of underweight fish, and for the general regulation of net and line fishing, as well in regard to modes, places, and times of usage as in all other respects.
 - (VII) For determining all rights of priority in hauling nets, or dredging for oysters, as between fishermen, or fishermen and dredgermen, or between dredgermen only, netting or dredging on the same ground, and preserving good order amongst persons engaged in fishing.
 - (VIII) For taking oysters from Crown lands, under such limitations as to number of licensed dredgers or gatherers as the Commissioner shall deem fit, or the payment of prescribed license fees, and for the seizure and disposal of oysters unlawfully removed from Crown lands or public oyster reserves.
 - (IX) For marking the boundaries of and periodically inspecting public oyster reserves and leased areas. And to give due effect to the intent of this subsection every inspector and every officer duly authorised by the Commissioner shall have a right of entry on all lands whatever for purposes of inspection or survey, or of erecting and maintaining beacons or other marks for, or in connection with, the boundaries of leased areas or public oyster reserves.
 - (X) For the allotment or sale of young or foreshore oysters on public oyster reserves and Crown lands, to the holders of leased areas.
 - (XI) For determining the size of marketable oysters, and the penalties for taking, selling, or exposing for sale unmarketable oysters and oysters not in condition fit for food, and for disposing of or selling oysters, seized or forfeited under this Act.
 - (XII) For the protection and regulation of public oyster reserves and of oysters on Crown lands, for the limitation and regulation of dredging for oysters by divers on such Crown lands, and for the protection and regulation of all boundary beacons, buoys, or other marks.
 - (XIII) For compelling lessees to place and maintain a sufficient stock of oysters on their areas and to return all spat and undersized oysters and oysters not in a condition fit for food, together with all dead shells, cultch, and substances dredged up from beds in such a manner as may be most beneficial for the preservation of such beds, and for enforcing payment of rent or moneys overdue on leased, or applied for, areas.
 - (XIV) For prescribing the terms and conditions under which leases for oyster culture may be granted.
 - (XV) For prescribing the terms and conditions under which deposits of oysters found in the open sea may be worked, and for the general direction and control of the fisheries within territorial limits.
 - (XVI) For preventing the destruction of oysters or fish or injury to fishing or oyster grounds by deposit or placement of filth, refuse, or other deleterious matters, or by discharges from saw-mills, paper-mills, gas-works, or other manufactories,

or

or boiling-down or wool-washing establishments, and for prohibiting such matters from being deposited in or mingled with tidal or inland waters.

- (XVII) For preventing lessees and others from disposing of cultch or any dredged refuse so as to impede the access by water to Crown or private land abutting on leased areas.

It shall be lawful in any such regulations to provide for their enforcement by imprisonment for any term not exceeding *six* calendar months, or by the imposition of a penalty not exceeding in any case the sum of *fifty* pounds. And all such regulations shall, on publication in the *Gazette*, have the full force of law, and a copy thereof shall be laid before the Legislative Council and Legislative Assembly, within fourteen days after the making thereof, if Parliament be then in Session, and if not, then within fourteen days after the commencement of its then next ensuing Session.

PART I.

Net and Line Fisheries.

9. The Governor may, from time to time, declare by proclamation in the *Gazette* the lengths or depths of nets and dimensions of their meshes which in any specified water or waters shall, for the purpose of capturing any declared species of fish, constitute a lawful net: Provided always that any net which shall exceed three hundred fathoms in length, or be of less dimensions than one inch in the mesh shall be unlawful whenever and wherever used.

10. Any person using for fishing purposes in any water, or having in his possession in such water, any net of a length greater or of meshes smaller than stated in the next preceding section, or than shall have been by proclamation declared legal for use in such water, or using the same for any purpose other than that specified by proclamation concerning it shall be deemed to be using an unlawful net, and shall, for the first offence, be liable to a penalty not exceeding *five* pounds and not less than *two* pounds, and for a subsequent offence to a penalty not exceeding *twenty* pounds and not less than *five* pounds. And every person aiding or assisting in the use of such unlawful net, or being in the same boat in use at the time by the offender, shall also be liable to the like penalties. Penalties for using unlawful nets.

11. It shall be unlawful to drag or to draw on to the dry land any net containing fish; but all such nets shall be emptied in at least one foot depth of water, and any person offending against this section shall for every such offence be liable to a penalty of not less than *two* pounds and not more than *ten* pounds; and every person assisting or being in the same boat with the person so offending shall be liable to a like penalty. Nets to be emptied in the water.

12. If any fisherman or other person shall be found with a wetted net having the appearance of immediate previous use in the vicinity of any hauling ground, such ground bearing evidence of immediately previous netting, and on which small fish, dead or stranded, are present, such fisherman or other person shall, in the absence of proof to the contrary, be deemed to have contravened the provisions of the next preceding section hereof, and shall, on conviction, be liable to the penalties enacted therein. Evidence as to stranding of fish.

Fishing nets how to be hung.

13. Every net shall be deemed to be an unlawful net within the meaning of this Act, if the same, when hung, shall have the netting distributed in less proportion than eighteen inches in length of the netting to every twelve inches in length of the cork and foot lines.

Sunken nets illegal.

14. The foot lines of any net lawful under this Act may be weighted, but only to such an extent that when cast or set, or in process of using, the top or cork line of such net, on which the netting must be directly hung or affixed in the proportions hereinbefore prescribed, shall not be sunk below the surface of the water: Provided always that it shall be in the discretion of the Commissioner, after reference to the local fisheries board in any district where such board has been established to recommend to the Governor that any specified water should be exempted from any of the requirements of this section; and the Governor may, by notice in the *Government Gazette*, declare any such specified water to be exempted accordingly.

Waters not to be stalled.

15. The setting of any engine net, netting, brushwood, or other substance across or within any bay, inlet, river, or creek, or across or around any flat, in tidal waters, in such a manner that fish enclosed thereby are, or may be left, stranded at low tide, or that immature fish may be destroyed thereby is hereby declared to be illegal.

Two or more nets not to be set together.

16. Any two or more nets placed nearer to each other than sixty feet on a haul, or joined or partly joined in such a manner as to diminish the mesh or the means of escape for enclosed fish, shall be deemed to be unlawful nets under this Act.

Penalties for having under-weight fish in possession.

17. If any person shall have in his possession or on his premises or in his boat, or shall sell or consign or expose for sale, any fish of any of the species mentioned in the Second Schedule hereto of a less weight than that set opposite the name of such fish in such Schedule, or prescribed by any regulation, he shall be liable to a penalty not exceeding *two* pounds for the first offence, and for the second or any subsequent offence to a penalty not exceeding *five* pounds and not less than *two* pounds. And all such under-weight fish, together with all other fish found in the same basket or other receptacle, or on the same table, or stand, or residence, or in the same boat, cart, or vessel with such under-weight fish, shall be forfeited and be disposed of in accordance with the regulations. And any inspector may seize any fish which under this section are liable to forfeiture and take the same before any justice, or before the Commissioner or any officer or person appointed by him, or before any member of a local fisheries board, who, upon view thereof, shall declare whether or not such fish are under weight, and if he declare them to be so, shall order them, together with all the other fish found in the same basket or receptacle, to be forfeited and to be disposed of in accordance with the regulations. The provisions of this section shall not apply to any curator of a museum or zoological collector holding a permit from the Commissioner, or to the Commissioner or any inspector of fisheries or lessee capturing or being in possession of fish for purposes of pisciculture, or to any aboriginal taking or being in possession of fish for his own consumption; but in every such case of exemption the proof thereof shall be upon the defendant or person charged.

Proclamation of close fisheries.

18. It shall be lawful for the Commissioner, on the recommendation of the local fisheries board in any district where such board has been established, to declare by notice in the *Gazette* that any specified tidal or inland water or portion thereof shall be exempted from net, line, or engine fishing, or each or any of them, during any specified months in any year. The fisheries in all such waters so specified shall be termed "Close Fisheries," and the months during which the same are so declared exempt "Close months." And if any person shall,
in

in any close fishery, during any close month, place any line or engine or haul any net whatever, for the purpose of catching, taking, or enclosing fish, or in such manner that fish might be caught, taken, or enclosed thereby, such person shall be liable to a penalty not exceeding *ten* pounds and not less than *two* pounds. And every person aiding or assisting in the placing of any such line, or hauling of any such net, or being in any boat from which any such line or net shall be placed or hauled, in contravention of the provisions of this section, shall incur a like penalty: Provided always that it shall be lawful for the Commissioner, in like manner, to rescind, vary, or explain any such proclamation.

19. For the more efficient conservation of the fish supply and the protection of the feeding grounds for fry and immature fish, it shall be lawful for the Governor, when so advised by the Commissioner, to declare by proclamation to be published in the *Gazette* and by notice in some newspaper circulating in the nearest police district, that the whole or any defined portion of any inland or tidal water shall, subject to the proviso hereafter enacted, be closed against the use of engines, fishing-nets, fishing-lines, or each or any of them, for such term as the Governor shall think fit. And any such proclamation may be renewed by the Governor, if so advised by the Commissioner, for a further period, or may in like manner be explained, varied, or rescinded at any time whatever.

Proclamation closing waters against use of fishing-nets.

20. If after the publication of any such proclamation as is described in the next preceding section hereof and during the currency thereof, or of any renewal or variation thereof, and during the currency thereof, any person except an inspector shall otherwise than as is hereinafter provided, haul any net or place any fishing-line or engine for the purpose of taking or capturing fish, or by which fish may be taken or captured within the limits of the waters or area defined therein, such person shall be liable for the first offence to a penalty not exceeding *ten* pounds and not less than *five* pounds, and for the second or any subsequent offence to a penalty not exceeding *twenty* pounds and not less than *ten* pounds; and every person aiding or assisting in the hauling or otherwise fixing of such net, fishing-line, or engine, or being in any boat from which any net, fishing-line, or engine shall be hauled or placed in contravention of the provisions of this section, shall incur a like penalty. And every person convicted under this section shall, if holding a license under this Act, be deemed by conviction to have forfeited his license for the year then current. Any inspector may, with or without warrant, apprehend and take before one or more justices any person found offending against the provisions of this section, to be dealt with as hereinafter provided: Provided always that, in any water so closed against the use of fishing nets, it shall be lawful under conditions to be from time to time specified by the Commissioner for any licensed fisherman to capture therein fish of lawful weights by line or by means of a set or drift net which shall not be drawn ashore after the manner of a hauling net, but shall be cast from and hauled into a boat in a depth of water of not less than six feet.

Penalty for fishing in closed waters.

21. If any person not being an inspector shall, except as hereinbefore provided, be found with freshly caught fish or a wetted net in his boat or in his possession in waters which by proclamation under this Act are exempted from line, net, or engine fishing, or are closed against the use of fishing-nets or lines, such person shall be deemed to have been unlawfully catching or attempting to catch fish in contravention of the provisions of this Act, and every person convicted under this section shall be subject to the penalties and forfeitures provided by the next preceding section hereof: Provided always that a right shall be reserved to the defendant to prove that he was not upon such waters for any unlawful purpose under this Act.

Persons not to have freshly caught fish in closed waters.

Net boats to be licensed.

22. Every boat used, or intended to be used, for catching by net, long line, or bultow, any of the varieties of fish enumerated in the First Schedule hereto, shall be licensed. Such license shall be issued in a form or shape to be prescribed by regulations under this Act. The fee for every such boat license shall be twenty shillings, which shall be paid to the local inspector of fisheries, or to the Colonial Treasurer, or some officer authorised by him to receive license fees under this Act; and payment of such fee shall cover the interval from the date of payment to the thirty-first day of December of the same year, unless such boat shall in the meantime have been sold or disposed of by the owner, in which case the license thereof shall be deemed to be void: Provided that after the thirtieth day of June in any year a moiety only of such fee shall be payable. Every boat licensed under this section shall have painted in legible letters of such size and description, and in such conspicuous place as may be prescribed by the regulations, the registration number under letters "L.F.B.," which shall be understood to mean "Licensed fishing-boat."

Fishermen to be licensed.

23. Every person catching fish by means of a net, long line, bultow, or engine in or upon any tidal or inland waters must hold a license, which shall be issued in a form and of such substance as may be prescribed by regulations under this Act. The fee for such license shall be ten shillings, and shall be paid to some one of the persons specified in section twenty-two hereof as entitled to receive license fees. Such license shall cover the interval from the date of payment of the license fee to the thirty-first day of December of the same year: Provided that after the thirtieth day of June in any year a moiety only of such fee shall be payable. If any person shall take or attempt to take fish by a net, long line, bultow, or engine, from any such waters without having first obtained such license, or shall on demand of any inspector fail to produce such license he shall be liable for every such offence to a penalty of not less than *ten* shillings nor more than *forty* shillings: Provided always that any such license issued under this section shall entitle the holder to take fish by hand-line also.

Line fishermen to be licensed.

24. Every person catching fish by hand-line from a boat in or upon any tidal or inland waters must hold a license. The fee for such license shall be two shillings and sixpence, and shall be paid to some one of the persons specified in section twenty-two hereof. Such license shall cover the interval from the date of payment of the license to the thirty-first day of December of the same year. If any person shall take or attempt to take fish in any such waters without having first obtained such license, or shall on demand by any inspector fail to produce such license, he shall be liable for every such offence to a penalty of not less than *five* shillings nor more than *forty* shillings.

Aliens not to be licensed.

25. A license of any kind shall not be issued to any person who is not a natural-born British subject except upon production to the Commissioner by such person of his letters of denization or certificate of naturalization.

26. The Commissioner, on the recommendation of the local fisheries board, may, from time to time, by notice in the *Gazette*, limit the number of boats and men to be employed in fishing at any one time in any water; any person infringing the provisions of any such notice shall be liable to a penalty of not less than *ten* shillings and not more than *two* pounds.

Dynamite not to be used.

27. It shall not be lawful by the explosion of dynamite or any explosive substance, or by means of any poisonous or noxious thing, to destroy or take fish in any tidal or inland waters. And if any person shall explode any dynamite or any such substance in or under such waters, or place or cause to flow thereinto any poisonous or noxious thing, such person and all other persons assisting or being at the time

in

in company of such person shall for every such offence be severally liable to a penalty not exceeding *forty* pounds and not less than *ten* pounds. But nothing herein contained shall apply to any person duly authorised (the proof whereof shall be on him) to explode torpedoes or dynamite in any such waters.

28. If in any tidal water any person shall wilfully or maliciously drive or place any stake, log, stone, or other thing whatever, likely to damage a fishing-net if dragged over or against it or within the reach of a fishing-net of lawful length, and if any damage shall be sustained by any lawful fishing-net through coming into contact with such stake, log, stone, or thing, such person shall be liable to a penalty not exceeding *ten* pounds, and in addition shall pay such compensation to the owner of such net as may be awarded by the adjudicating justices. Likewise any person who by placing or mooring a boat in such a position as to obstruct any licensed fisherman from hauling on to a beach with a net, lawful under this Act, shall be liable to a like penalty: Provided always that it shall lie on the informant to prove that such person had been duly warned to abate such obstruction.

Penalty for damaging lawful nets by placing obstacles on hauling ground.

29. It shall not be lawful for any person, by the wilful firing of guns, or by the production of other disturbing noises or sounds, to frighten fish around which nets are being set by any person holding a fisherman's license. If any person shall offend against the provisions of this section he shall be liable to a penalty not exceeding *five* pounds nor less than *three* pounds.

Penalty for disturbing fish in process of being netted.

30. Every person who shall be found using a fishing-net or line in any tidal or inland water in New South Wales shall, on demand, give his true name and residence to any inspector or justice, or to any owner or occupier of land bordering such water, or over which it ebbs and flows. And if any such person shall refuse or neglect to comply with such demand, or shall give a false or fictitious name or residence, he shall be liable to a penalty not less than *one* pound nor more than *ten* pounds.

Netters to give name and residence when demanded, &c.

31. Should such inspector, justice, owner, or occupier suspect that the person so found using a fishing net has given other than his true name or residence, or either, he may thereupon seize the net or boat and hold it until satisfied of such person's identity and actual place of residence; but no claim shall lie for detention or loss of any net or boat so seized.

Identification of offenders.

PART II.

Leases of Crown lands for General Fisheries Purposes.

32. The Governor, on the recommendation of the Commissioner and local fishing board, may lease at a rental determined by auction or tender for the purpose of a fishery any Crown land below high water-mark in any river, creek, arm, or bay in any tidal water or in any lake or lagoon, whether open to or barred from the influence of the tide.

Lagoons and lakes may be leased for fisheries.

33. Any such lease may be granted for a term not exceeding fourteen years, and shall be issued subject to any regulations which from time to time may be made under this Act.

Term of lease.

34. (I) Every such lease shall vest in the lessee the exclusive right during the currency thereof of stocking the area leased with fish of any kind whatsoever, as well as oysters, spat, and other varieties of molluscs, and of taking therefrom any fish or oysters and their shells.

Property in lease.

(II) Of vesting the property (at law or in equity) in any fish or oysters while the same are within the limits of such leased area in such lessee, any rule of law to the contrary notwithstanding.

(III) Of vesting in such lessee the right to the influx and efflux of the tide into and over such area when barred from the influence thereof by means of such admission as a trench or passage through, or by the laying of pipes under the shore, or by such other means as may be prescribed.

(IV) Of vesting in such lessee the right to enter upon the shore, the property of the Crown, for the purpose of constructing works for the admission of tidal waters, and for the repair or renewal of such works, stopping the traffic thereover (if necessary) for any period not exceeding seven days in any one year in order to effect such repair or renewal.

(V) Of abrogating any rule of law so far as it might be held to confer any public right of fishing or taking oysters or fish by nets, lines, or other appliances whatsoever in or upon such area, but subject always to the right of any inspector or authorised officer to enter upon any land included in such lease, and to test its condition by such means as may seem to him proper.

Provision for bridge across trenches, &c.

35. No trench or passage through the shore for the purpose of permitting the tide to ebb and flow to and from such area, or any area leased under this Part, shall at any point exceed a width of twelve feet; and every such trench or passage shall, at the cost of the lessee, be bridged by such a substantial bridge or means of crossing as the lease shall prescribe, or (if none shall be so prescribed) as the Commissioner shall determine. And every such bridge or crossing shall be maintained in good order and repair by such lessee, and shall in every case be furnished with substantial handrails on either side, and be not less than twelve feet wide between the rails.

Lessees to find sureties for payment of rent.

36. Every lessee under this Part shall be required to enter into a bond to the Crown with two sufficient sureties to be approved by the Crown Solicitor in a sum equal to nine times the amount of rent payable under the lease, conditional for the payment of the rent reserved in the lease, as from time to time the same shall become due, and it shall be lawful for the Commissioner to take proceedings thereon, and put such bond in force, notwithstanding that such lease may have been cancelled under any of the provisions of this Act.

Lease may be cancelled.

37. Any lease so granted may be cancelled by the Governor at any time if he shall be of opinion that the conditions therein expressed, or the provisions of any regulation made at any time under this Act, have not been faithfully complied with, and such cancellation shall take effect upon notification thereof in the *Gazette*. Occupation under such lease shall not (except as hereinbefore provided) confer any right or title to the lessee to enter upon or occupy any portion of the shore surrounding or adjacent to his leased area, or to use any portion thereof not included in his lease.

Commissioner may recommend cancellation of lease in certain cases.

38. If it shall appear to the satisfaction of the Commissioner that any lessee has not, within the period of one year from the date of his lease, taken measures proper, in his opinion, for stocking the area with fish and for propagating the same, or that through carelessness or negligence an undue destruction of either mature or immature fish has been caused, then it shall be lawful for him to recommend the cancellation of the lease by the Governor. And the Governor shall have power to cancel the same accordingly by notification in the *Gazette*. And, upon the publication of such notification, all the rights and privileges granted by such lease, and the term thereby demised shall absolutely cease and determine: Provided always that, before making such recommendation, the Commissioner shall cause a notice in writing stating his intention to make such recommendation to be served on the lessee or person for the time being entitled to the lease, or, in case such person cannot be found, he shall cause such notice to

to be inserted as an advertisement at least three times in a newspaper circulating in the police district nearest to or in which the area leased is situated, and also to be published once in the *Gazette*. And no such recommendation shall be made until after the expiration of one calendar month from the service of such notice, or from the date of the last advertisement (whichever shall happen last); and the lease of the land comprised within any such cancelled lease may be disposed of by public auction or tender, subject to the provisions of this Act.

39. The limits of a leased fishery shall in every case be marked Marking limits of leased fishery. by the lessee by substantial stakes placed at a distance not exceeding fifty yards from one another, or (where such staking is not reasonably practicable) in such manner as the regulations shall prescribe. But in any proceedings taken by the lessee of such fishery for larceny or any offence or matter under this Act, it shall not be necessary for him to prove that the requirements of this section have been duly complied with.

PART III.

Leases of Crown land for Oyster Culture.

40. For the purpose of culture and propagation of oysters the Lease for oyster culture. Governor may, on the recommendation of the Commissioner, offer for sale by auction or tender the lease for any term not exceeding ten years, of any specified area of Crown land being within the head lands of any harbour, bay, estuary, port, river, creek, or other inlet, at a rental of twenty shillings per annum, provided that the lessee of any land so leased shall also pay to the Colonial Treasurer a fee of two shillings and sixpence for each and every bag, containing not more than three bushels of oysters, dredged or otherwise taken from any such leased area; and on the application of the lessee during the last year but one of the currency of any such lease the Governor may, on the like recommendation, renew the term for a like period, but subject to such amendments of rent, and such limitations in other respects as may be considered desirable.

41. Every such lease shall vest in the lessee, his executors, Property in lease. administrators, and assigns all oysters within the area leased, and as well the exclusive right, during the currency of the lease or any renewal thereof, of laying and planting oysters on, and of dredging and taking oysters from, the area leased, but subject always to the several provisions of this Act and any regulations made under it, and the right of any inspector or authorised officer to enter upon such area for any authorised purpose.

42. Occupation under any lease shall not give any right to the Abutting land not included in lease. lessee to occupy or use any portion of Crown lands abutting on but not included in his lease, except for such purposes and during such times as may be prescribed.

43. Any leased area may be described in the lease by reference Leased area how described. to posts, stakes, buoys, marks, or natural features showing the limits of such leased area in a manner sufficient to allow of their identification.

44. The Governor may, if recommended by the Commissioner, Surrender of lease. accept a surrender of a lease, after the second year of its currency, in any case where it shall appear, to the satisfaction of the Commissioner, that oyster culture cannot be carried on upon the leased area with any reasonable hope of success, or where, from any other reason, the Commissioner shall report in favour of such surrender.

45.

Lessees in arrear with rent not to apply for further areas.

45. Any lessee who shall be at any time in arrear with the rent or fees due on any one or more leased areas shall, notwithstanding anything in this or the repealed Act provided, not be entitled to take oysters from off such areas, or to lease a further area until such overdue rent shall have been paid.

Commissioner may recommend cancellation of lease in certain cases.

46. If it shall appear to the Commissioner that any lessee has not within a period of two years from the date of his lease taken proper measures to carry out the conditions of his lease, he may recommend the Governor to cancel the lease. And the Governor shall have power to cancel the same accordingly by notification in the *Gazette*, and upon the publication of such notification all rights and privileges granted by such lease, and the unexpired term thereof, shall cease and determine: Provided always, that before making such recommendation the Commissioner shall cause a notice in writing, stating his intention to make such recommendation, to be served on the holder of the lease, or in case such person cannot be found, they shall cause such notice to be inserted at least three times in a newspaper circulating in the police district nearest to the area leased, and also to be published once in the *Gazette*. No such recommendation shall be made until after the expiration of one calendar month from service or the publication of such notice in the *Gazette*.

Cancellation for mismanagement.

47. Upon receipt of a report by an inspector that a leased area is being so stripped of oysters or otherwise mismanaged by the lessee that the production of oysters thereon has, in such inspector's opinion, been so reduced as to threaten its destruction partially or wholly as an oyster-bearing area, further dredging or taking of oysters may be thereupon stopped by the Commissioner, and the Commissioner may call upon the lessee to show cause why he should not recommend the Governor to declare the lease of such lessee to be cancelled. And upon the receipt of a recommendation by the Commissioner recommending the forfeiture of any such lease, the Governor may, by notification in the *Gazette*, declare the same to be, and the same shall thereupon be cancelled accordingly.

Penalty on disorderly person.

48. Any person employed by any lessee or applicant under this Act, or the repealed Acts, for a lease of land abutting on or near to occupied premises, or any lessee or applicant himself who shall, either within view or hearing distance of such premises, conduct himself in a disorderly manner, or use obscene language, to the annoyance of the occupier or other person on such premises, shall for every such offence incur a penalty of not less than *three* pounds. Proceedings under this section may be taken by and in the name of any person in whose sight or hearing such offence shall have been committed.

When natural oyster-bearing areas may be closed.

49. Whenever the Commissioner shall report that the whole or any part of any oyster-bearing area, whether under lease under the repealed Act or this Act or not, has by over-dredging or from any other cause been reduced to such a state that the taking of oysters therefrom ought to be suspended, or that the oysters thereon are in such a condition as to be not fit for consumption as food, the Governor may prohibit, by proclamation in the *Gazette*, for any term not exceeding *three* years, the taking of oysters from such area. And if any person shall without lawful authority, at any time during the period mentioned in such proclamation, take or attempt to take oysters from any area described in such proclamation, such person shall incur a penalty not exceeding *twenty* pounds and not less than *five* pounds. And all oysters and the bags containing them found in the possession of any person so offending may be seized, and upon conviction of the offender shall be forfeited to Her Majesty. And the Governor may in like manner rescind wholly or in part any such proclamation, or any proclamation made under the hereinbefore repealed Act, relating to the

the opening or closing of oyster beds: Provided always that when on areas under lease under the repealed Acts such reduction has, in the opinion of the Commissioner, resulted from natural causes only, such as floods or disease, the lessees of such areas may be relieved from payment of rent for the period of such suspension.

50. It shall not be lawful for any person other than the lessee, ^{Injuries, &c., to} his agents or servants, within the limits of any leased area to do any ^{leases.} of the following acts, viz.:—

- (I) To take or in any way disturb or interfere with any oysters without the consent of the holder of the lease.
- (II) To allow cattle to stray; to cut or lop or remove mangroves or any timber.
- (III) To deposit or remove any stone, ballast, rubbish, or substance, or to dredge or drag with any implement, unless by direction or authority of the Commissioner, or the proper officer of the Department of Harbours and Rivers, or the Marine Board, and in any such case on payment of compensation for damage done (if any).
- (IV) To place any implement or thing likely to injure oysters, except for a lawful purpose of navigation or anchorage.

And if any person does any act in contravention of this section he ^{Penalties.} shall be liable for the first offence to a penalty not exceeding *five* pounds, and for the second offence to a penalty not exceeding *ten* nor less than *five* pounds, and for a third or subsequent offence to a penalty of *twenty* pounds; and shall be liable to make compensation to the lessee for all damage sustained by such lessee by reason of such person's unlawful act, and in default of payment the same may be recovered by the lessee in any Court not incompetent by statute in respect to the amount or nature of the claim, and whether such person has been convicted of an offence under this section or not: Provided that nothing in this section shall apply to fishermen hauling nets or fishing over any part of such leased area not actually occupied by layings or deposits of oysters.

51. The Governor, by notification in the *Gazette*, may declare ^{Portions of certain} any Crown land to be a public oyster reserve for recreation, or to be ^{Crown lands may be} exempt from any power of leasing conferred by this Part, and on the ^{exempt from leasing,} recommendation of the Commissioner in like manner may cancel any ^{or be declared public} such notification wholly or in part. ^{oyster reserves.}

52. Oysters on a public oyster reserve for recreation, or on ^{Penalty for unlawful} Crown lands, or on areas proclaimed under section forty-eight of this ^{dredging or taking} Act, also oysters taken therefrom without lawful authority, shall be ^{of oysters.} deemed to be the property of Her Majesty; and if any person, without lawful authority, shall dredge for or otherwise take any oysters from any such public oyster reserve or Crown lands, or shall be found dredging for or taking or attempting to take oysters within the limits of such reserve or Crown lands or proclaimed areas, he shall incur a penalty not exceeding *twenty* pounds and not less than *five* pounds, and all oysters found in his possession shall be deemed to be oysters unlawfully taken by him, and shall, on his conviction, be forfeited to the use of Her Majesty.

53. Nothing in this Act shall render liable to a penalty any ^{Persons may take} person who takes oysters from any oyster reserve for recreation, or any ^{oysters for their own} Crown land, for his own consumption on the spot, unless such oysters ^{consumption.} shall be in a spawning condition, or shall have spat in quantity attached, in which case it shall be within the discretion of any inspector to prohibit the taking of oysters from any such oyster reserve or Crown land; and any person who shall take oysters therefrom after being warned against doing so by any inspector shall, on conviction, be liable to a penalty of not less than *three* pounds.

Penalty on burning
live oysters for lime.

54. Every person who shall gather or burn live oysters for the purpose of converting their shells into lime whether he be the holder of a leased area or not, shall incur for every such offence a penalty not exceeding *fifty* pounds.

Deep sea oyster
deposits.

55. It shall not be lawful for any lease to be granted of any oyster bed under the open sea outside the headlands of any bay or estuary, within three miles of the coast, but the same may, on the approval of the Commissioner, be dredged by persons duly licensed in that behalf, subject to the provisions of this Act, and any regulations made under its authority.

Licensing of oyster
dealers.

56. Every person dealing in or selling oysters by retail shall take out an annual license for which a fee of one pound shall be paid. Such license shall entitle the holder to sell and dispose of oysters on any specified premises, or from any cart, stand, basket, or other receptacle, during the year commencing on the first day of January and ending on the thirty-first day of December, and shall be renewed annually by a like payment within fourteen days after the first-mentioned day: Provided that on applications for licenses made after the thirtieth day of June in any year one moiety only of such license fee shall be payable. Such licenses may be granted by the Commissioner or by any Police Magistrate or Clerk of Petty Sessions, and the fee shall be paid to the Colonial Treasurer or some officer authorised by him. And every person who shall so deal in or sell oysters without holding a license under this section shall be liable to a penalty not exceeding *ten* pounds and not less than *one* pound.

Inspector may enter
premises and seize
unmarketable
oysters.

57. Any inspector may enter any fish market, premises, place, or dwelling, or go on board any boat, and seize and take away any unmarketable oysters, or any parcel of oysters in which unmarketable oysters or oysters diseased or out of condition may be found: Provided always that on sufficient grounds being shown it shall be competent for the Commissioner to restore to the owner any or all of the oysters so seized.

PART IV.

Legal Procedure—Miscellaneous.

Procedure.

58. All offences, penalties, and forfeitures under this Act or any regulations made thereunder may be heard, determined, and recovered, and all proceedings therefor may be taken, in a summary way, by and in the name of any inspector, or by and in the name of any person specially authorised by the Commissioner, or by and in the name of any person holding a lease under this or the repealed Acts before any two or more justices, in pursuance of the provisions of the Acts regulating summary convictions before justices: Provided that if any person shall be adjudged to pay any sum, by way of penalty or otherwise, the adjudicating justices shall order such sum to be paid (together with costs to be fixed by the said justices) either forthwith or within such period as the said justices shall appoint, and if such sum and costs (if any) shall not be paid at the time so appointed, the same shall be levied by distress and sale of the offender's goods and chattels, and for want of sufficient distress, or, in the discretion of such justices, without any such distress, such offender may be imprisoned, with or without hard labour, for any term not exceeding *three* calendar months unless such sum be sooner paid. In all cases where the defendant or person charged with any offence under this Act shall plead any of the

the exemptions therein contained the proof thereof shall be upon such defendant or person charged: Provided also that no information or conviction under this Act shall be quashed through any defect or want of form.

59. It shall be competent for any justices before whom any Appeal. offence against the provisions of this Act or any regulation made under it may be heard to impose in lieu of the penalty therefor prescribed a term of imprisonment not to exceed *thirty* days.

60. Any person aggrieved by any conviction, order, or adjudication of justices under this Act, and who shall have paid into the hands of such justices, or one of them, the full amount of any penalty or sum awarded against him, together with costs, within the period fixed by the justices after such conviction, order, or adjudication, may appeal therefrom to the next Court of Quarter Sessions holden in the district in which the subject matter of the appeal arose, unless such Sessions shall be held within fourteen days from the date of such conviction, order, or adjudication, and, in that case to the Court of Quarter Sessions then next following. And such Court shall have power to hear and determine the matter in a summary way in accordance with the Acts in force regulating appeals from summary convictions. And the decision of such Court shall be final and conclusive: Provided always that the appellant shall, within seven days from the date of such aforesaid conviction, order, or adjudication, have given written notice of his intention to appeal, stating the grounds thereof to the, or one of the, adjudicating justices, and to the prosecutor: Provided also that such appellant shall enter into a bond, with two sureties approved by such justices, conditioned to prosecute such appeal with effect, and to abide the event thereof, and to pay the full amount of all costs which may be awarded against him.

61. Any person who shall assault, resist, or obstruct, or encourage Assaulting, &c., inspectors and others in execution of their duty. any other person to assault, resist, or obstruct, or shall use abusive language to any inspector, or other person whomsoever in the execution of his duty or authority under this Act shall incur a penalty not exceeding *ten* pounds nor less than *one* pound, or be liable to imprisonment not exceeding *six* calendar months. And the adjudicating justices may, in addition to any such penalty, order a sufficient sum to be paid by the offender to cover any damage or injury sustained by the person so assaulted, resisted, or obstructed, which sum shall be recoverable in the same manner as a penalty under this Act.

62. Any inspector may, with or without warrant, apprehend and Offenders may be apprehended and bailed. lodge with the gaoler or person in charge of any gaol, watch-house, lock-up, or police station any person found offending against any of the provisions of this Act, or who, on demand made, shall refuse to give his true name and address, or whom such inspector may have reason to suspect has given a fictitious name and address or incorrect information as to the ownership of any net or other article seized under any of the provisions of this Act.

63. The production of any of the undermentioned documents, What instrument, &c., to be evidence. writings, or publications shall be conclusive evidence in all Courts as to the several matters contained therein, and in the case of a lease or license, that the same was duly issued, viz.:—

- (I) A receipt showing that the rent on any lease has been paid into the Colonial Treasury.
- (II) A lease signed by the Governor or a copy thereof bearing the common seal of the Commissioner.
- (III) Any license or a copy thereof or token issued in pursuance of this Act, or regulations made under it.
- (IV) A copy of the *Gazette* containing any notice, regulation, or proclamation purporting to be made under this Act.

Search for and seizure of fish.

64. All fish and oysters of which the taking possession, exposure for sale, consignment or purchase for sale is prohibited by this Act may be searched for, seized, condemned, and dealt with according to law by any inspector or by any person holding the written authority of any justice, or any search warrant under the hand and seal of any justice, or authorised by any regulation under this Act.

Unlawful taking of oysters from contiguous leases.

65. Whenever a person shall be charged with taking oysters from any leases which may be contiguous to another or others, it shall be sufficient in alleging and proving the place from which such oysters were stolen, to allege and prove that such oysters were stolen from one or other of such contiguous leases, and that the same belonged to, and were in the lawful possession of, one or other of the lessees or owners thereof.

Limitation.

66. Every area leased under this Act shall be subject to all reclamation rights conferred by the Crown Lands Act, 1885, or any Act amending the same, and to such conditions and provisions and limitations as may from time to time be prescribed by the regulations or approved by the Governor.

Property under leases.

67. The purchaser of the lease of any area under this Act shall, upon payment of the rent therefor for the first year, be deemed to be in actual and absolute possession of such area for all purposes of this Act, notwithstanding that the deed of lease shall not have been issued; and such purchaser, or any inspector, may seize any fish or oysters removed therefrom without lawful authority; and any person who shall be found unlawfully dredging, taking, or attempting to take fish or oysters in such area, shall be liable to a penalty not exceeding *twenty-five* pounds and not less than *ten* pounds, and all fish or oysters found at the time in possession of such person shall be deemed to have been unlawfully taken by him, and may be forthwith returned to that area.

Compensation for loss of holding.

68. The Governor may, on the recommendation of the Commissioner, resume any area, a lease whereof has been granted under any of the Acts hereinbefore repealed, but subject to the payment by the Crown to the lessee thereof of compensation for the loss of such area: Provided that should the lessee of any area so resumed be dissatisfied with the amount of compensation offered to him he may elect to refer the matter to arbitration under the Arbitration Act fifty-fifth Victoria number thirty-two.

Recovery of rents and fees.

69. All rents due and payable under the provisions of this Act may be sued for and recovered by the Commissioner on behalf of the Governor. All fees due and payable under the provisions of this Act may be sued for and recovered by the Commissioner on behalf of the Crown. In legal proceedings by the Commissioner on behalf of the Crown under the provisions of this section, the Commissioner shall, in regard to costs, have the same rights and be subject to the same liabilities as the Attorney General in proceedings instituted by the Attorney General on behalf of the Crown.

Commissioner to institute experiments.

70. It shall be lawful for the Commissioner, and he is hereby required from time to time to direct the institution and carrying out of experiments in modes of fish capture, in the culture and propagation of fish and oysters, and to attempt the discovery of fishing grounds and oyster beds off the sea coast. For the purposes of this section the Governor may by notification in the *Gazette* declare any Crown land to be reserved for experiments in the culture and propagation of fish or oysters. Crown land so reserved shall be deemed to be vested in the Commissioner who shall have and exercise over it all the powers and authorities which by this Act are conferred on a lessee.

71. Any person who shall commit any act in breach of or be guilty of any default of, or non-compliance with any of the requirements or prohibitions of this Act, or any regulations hereafter made under it, shall in every case where no penalty has been enacted, be liable to a penalty of not less than *forty* shillings nor more than *ten* pounds, and to the forfeitures prescribed by section seventeen hereof: Provided always that, for the purposes of this section, the word fish shall, where necessary, be deemed to include also oysters, the spat of oysters, and crustacea.

72. The provisions contained in sections four, five, six, seven, and eight shall come into force immediately upon the passing of this Act, and all the remaining sections shall come into force on the sixtieth day after such passing.

73. The Commissioner shall as soon as possible after the thirty-first day of December in every year report to the Minister charged with the administration of this Act as to the state of the fisheries of the Colony, and such report shall be laid before both Houses of Parliament.

SCHEDULES.

FIRST SCHEDULE.

Marine Fishes.

Schnapper or Bream.	Perch.
Black Bream.	Flounder.
Flathead.	Sole.
Whiting.	Mullet—
Tarwhine.	Sea (including the variety commonly known as hard gut mullet).
Blackfish.	Flat-tail.
Garfish.	Sand.
Long Tom.	Talleygalann.
Pike.	Trevally.
Teraglin.	Rock Cod.
Silver Belly.	

Crustacea.

Crayfish (Saltwater).	Murray River Lobster (Freshwater).
Prawns.	Crayfish (of kinds).

Freshwater Fishes.

Murray Cod.	Tench.
Perch (of kinds).	Bream (of kinds).
Carp.	

And fish not indigenous to the Colony which may be introduced or be in any inland waters.

Fisheries and Oyster Fisheries Regulations.

SECOND SCHEDULE.

Lawful Weights for Fish.

Description of Fish.	Weight avoirdupois or size.
<i>Marine Fishes.</i>	
Schnapper or Red Bream	12 ounces.
Bream (Black)	6 "
Tarwhine	6 "
Blackfish	6 "
Rock Cod (Black or Red)	12 "
Gurnet	8 "
Flathead	12 "
Mullet of any variety	6 "
Whiting... ..	6 "
Flounder	6 "
Sole	6 "
Pike	8 "
Trevally... ..	6 "
Garfish	2 "
Long Tom	12 "
Teraglin... ..	16 "
Silver Belly	3 "
<i>Freshwater Fishes.</i>	
Cod (or Murray Cod)	16 ounces.
Perch (of kinds)	8 "
Carp	6 "
Tench	6 "
Bream (of kinds)	6 "
Catfish	6 "
<i>Lawful lengths for Crustacea, measured along the body from the eye to the tip of the tail, 10 inches.</i>	
Crayfish (Saltwater) from eye to tip of tail	10 inches.
Prawns	1½ "
Murray River Lobster (Freshwater)... ..	8 "

ROYAL COMMISSION ON FISHERIES.

MINUTES OF EVIDENCE.

THE TASMANIAN FISHERIES.

THURSDAY, 24 JANUARY, 1895.

[The Commission met at the Town Hall, Hobart, at 10.45 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C.

L. G. THOMPSON, Esq., J.P.

Alexander Morton, Esq., Curator of the Tasmanian Museum, Hobart, and a Member of the Tasmanian Fisheries Commission, sworn and examined:—

1. *President.*] I understand you are one of the members of the Tasmanian Fisheries Commission? Yes.
2. You are able to afford this Commission some information with respect to the fisheries of Tasmania? I have prepared a short statement which, by permission of the Royal Commission, I will read. It deals generally with the fisheries of Tasmania, and has reference to sealing.
3. The Commission will be glad to listen to your remarks, Mr. Morton. Proceed, please? *Fisheries of Tasmania.*—I cannot do better than refer the Royal Commission to the most able and comprehensive report prepared by my friend, Mr. R. M. Johnston, F.L.S. This report was read as a paper before the Royal Society of Tasmania on the 7th August, 1882. I consider it the most practical and valuable report on the fisheries question that has ever been published in Australasia. As regards our class of fishing boats, Hobart may safely claim to possess the best fishing boats in the southern hemisphere. An improvement I consider might be made, however, in the fisheries. What is required is a well-organised system of scientific investigation—I mean the Government, through the Fisheries Board, should at different seasons of the year visit the different fishing grounds, and with the aid of trawls and by other means examine and see at what time and at what places the different classes of fish are to be found. With the aid of a suitable steamer these examinations could be made at parts along the coast further than where the fishing boats now visit. By this means it is quite possible new fishing banks would be discovered, for we often hear from the fishermen themselves the following remark:—“I can’t understand how it is we do not get any fish at this place; last time I was here we got a good haul.” Is it not just possible the fish may at certain seasons go further out to sea on other banks? Such a system of investigation as that I have referred to would, I feel certain, prove beneficial to Tasmania. As a result the Colony would derive a large revenue, as it is well known that the fishing industry is a most important one, if properly looked after. There is another point, one that I have strongly advocated ever since I came to Tasmania, and that is the establishment at different parts of our coasts of fishing villages. At present all the boats have to come to Hobart with their cargoes, many times having too great a quantity needed for home consumption. Now, if these fishing villages could be formed—the Government to grant a few acres of land, cottages to be erected, and the fishermen to pay a small rental for (say) fifteen years, when the allotment would become the occupant’s property—the fishing boats, when loaded, instead of having to come up to the town, could come to a station, when, by the aid of a small steamer fitted with a well, as in the fishing boats, they could send to Hobart fish necessary for the home consumption, and the rest could be cured at the several stations for exporting. I feel satisfied this suggestion, if carried out, would work well. As a further encouragement the Government might be induced to offer a bonus for (say) the first 100 or 200 tons of preserved fish exported from the Colony. From my knowledge of the fisheries of New South Wales I feel satisfied that a class of fishing boats similar to that we have in Tasmania could be introduced with beneficial effect into that Colony. In case that was done the boats would, I think, have to anchor in another place than Woolloomooloo Bay, owing to the water in that part of Sydney Harbour being foul. Well-boat fishing on the coast of New South Wales ought to prove beneficial to the fishermen and to the consumer, as it would in all probability ensure a supply of fresh fish for the people of the Colony just as we have it in Hobart, where the people purchase their fish-food alive. *Seals and Sealing.*—In the early days sealing in Tasmanian waters was a very important industry, but owing to the want of proper supervision the seal nearly became extinct. Peron, in 1801 and 1802, found British seamen in Bass’ Straits killing all that came in their way. The schooner “Endeavour” from 9th March, 1803, to 28th May, 1804, got 9,514 skins. The schooner “Surprise” from 11th March, 1803, to 15th September, 1803, got 15,480 skins. In September, 1803, a vessel brought into Sydney 11,000 skins. It is on record that during the years 1803 and 1804 upwards of 36,000 skins were sent from the islands in Bass’ Straits, the slaughter being made without regard to sex or season. During recent years sealing has been carried on in Bass’ Straits, and some six years back representations were made to the Tasmanian Fisheries Commission that, owing to the killing of seals of both sexes and all sizes, in a short time the islands would be stripped of all the seals. The Commission advised the Government to close the seal fishing for three years, which was done with most satisfactory results. Considering that the fur seal is identical with the true fur seal of Alaska, it is absolutely essential from a commercial point of view that the Government should take all necessary steps to see the law carried out in having a close season, and that the females should be preserved. At the present time the sealing industry only gives employment to a few men in the Straits.

A. Morton,
Esq.

24 Jan., 1895.

- A. Morton,
Esq.
24 Jan., 1896.
4. Can you tell us anything with regard to the artificial propagation and acclimatisation of marine or fresh-water fishes in Tasmania? I may say that some years ago the cucumber mullet was very plentiful in the southern waters; of late years they have become almost extinct. It is the most delicate fish in Tasmanian waters. About five years ago we got several thousands, I may say millions, of ova brought down from the north-west coast. We hatched them in our ponds and liberated them in the Derwent. They are now being caught, and we hope this fish will become more plentiful. The only other fish we have gone in for propagating, with the exception of the salmonidæ, is the English perch—they have done well here.
 5. Your experiments have not been attended with any bad results? No.
 6. You are a Member of the Tasmanian Fisheries Commission? Yes.
 7. Of whom does that Board consist? It numbers twenty-five persons. The Government of the day thought it well to appoint Members of Parliament belonging to different districts, but the whole of the work devolves upon about seven members.
 8. According to that statement there is no necessity for the retention of so large a body? Not the slightest necessity.
 9. What are your powers? We have very considerable powers.
 10. Have you power to make regulations without reference to the Minister? Most decidedly; we can close fishing places.
 11. Can you close fisheries without reference to the Minister? All we have to do at any time is to publish the intention of the Fisheries Commissioners in the newspapers for one month.
 12. Are the fishermen represented on your Board? Yes. I should say that prior to the existence of the present Commission we had a body called the Salmon Commissioners. When the present Commission was formed, the fishermen wished Mr. Thomas Rush, a representative and a practical fisherman, to represent them on the Board. It was at the request of the fishermen he was elected to a seat on the Commission.
 13. So that the fishermen themselves only have one practical representative on the Commission? Yes.
 14. In regard to the sizes of meshes and nets, can you vary the sizes by regulation? Yes.
 15. On the whole your Act works satisfactorily? Satisfactorily.
 16. Has it been reported to your Commission that there has been a decrease of fish in certain places in the Derwent? We have a great number of anglers here, chiefly rod-fishing. There is more rod-fishing done in Tasmania than in any of the Colonies. There were complaints, and we passed a regulation that no seining should be permitted beyond a certain point in the river. We do not allow the fishermen to use the seine, the draw-net, or the graball in places affected by the regulation.
 17. *Mr. White.*] You define your waters for rod and for net fishing? Yes. Prior to the passing of the regulation the fishermen used to scrape in everything they could. This was brought under the notice of the Commission, and the practice was stopped. We do not allow graballs in certain waters—it is not a very arbitrary rule.
 18. *President.*] In regard to your oyster fisheries, how do you account for the present condition of the oyster fisheries here? That is a matter I am not in a position to speak very strongly upon. A few years ago oysters were in abundance here—so plentiful were they that they used to burn them for lime. I think the extinction, or almost complete extinction, of the oyster is due to the want of proper supervision. I have not been able to trace any of the worm disease you have in New South Wales. There are good beds in the sea from which numbers have been taken, and it is quite possible there may be plenty of oyster-beds there unknown to us. What is needed is a thorough examination of our beds—the sea-beds should be tested and explored. This would in all probability lead to good discoveries.
 19. You think the oyster-beds here might be resuscitated? I am of that opinion.
 20. In regard to lobster fisheries, have you any regulation as to a close season? Yes.
 21. What months in the year—during the spawning period, I suppose? Yes.
 22. *Mr. White.*] Are you of opinion that the oysters have been dying out owing to their having been taken in an indiscriminate manner? That has helped to bring about the existing condition of affairs. They were exceedingly plentiful at one time.
 23. Can you punish for oyster-stealing? Under certain limitations it is permissible to fish for oysters for about four or five months in the year.
 24. What extent of leases can be taken up for oyster culture? I think we have reduced it to 10 acres. I think it is in the Act—you will find it in our regulations.
 25. When the roe is in the lobster are the fishermen allowed to take them? I think not.
 26. *Mr. Thompson.*] You say the seals in Tasmanian waters are the same as the Alaska fur seal;—are they identical with the seals frequenting the coast of New South Wales? They are identical. We have two seals in our waters—you also have them in New South Wales. They are the brown seal and the sea leopard. The specimens sent home to the Fisheries Exhibition in 1883 were the first seen in Europe from Australia.
 27. Can the fur of our seals be improved? I am unable to say. The Tasmanian seal is pronounced by eminent authorities to be identical with the Alaska seal. The fur of the last-named seal is denser and better than ours, owing to the colder climate.
 28. If the seals were attended to something might be done to improve their commercial value? Certainly.
 29. The Commission are very much impressed with the idea of establishing well-boats in New South Wales, waters. Our idea of a well-boat is somewhat different to yours. You have a centreboard running right through the well. I saw dead fish in some of the wells in the boats;—was that due, think you, to the centreboard impeding the free circulation of water? No; fish may be damaged in being taken out of the net, and if the well-boats are overtaken by a dead calm, that would tend to prevent the circulation of the water.
 30. Fish caught by line would not be damaged by the net? No.
 31. Our idea was to have fins fore and aft of the well? It might answer.
 32. As regards the preservation of fish by closures—you close certain waters completely against netting? Yes. We have found it necessary to do so. Only the other day some dozens of small flounders were taken to the Chief Secretary (Hon. Wm. Moore), having been scraped out of the little shallow bays, which are the favourite resorts of this and other kinds of fish during the early stages of growth.
 33. Generally speaking, I suppose we may understand that if those waters are properly protected, and the taking of undersized fish by rod and line prevented, nets of any size may be used in the open waters? Most certainly.

A. Morton,
Esq.

24 Jan., 1895.

34. Of course the closures should be made with discretion? Of course.
35. What is a graball; it is rather an indefinite term? Graballs run to different lengths—they are leaded and have corks. The fishermen set them in a half circle. Many of our varieties are surface fish, and they get caught with this net.
36. It is a set net? Yes, it is a set net.
37. You say 10 acres is the maximum for an oyster lease? It is only along the coast. A line is taken from a point along a certain number of yards at high-water mark, and then we measure the distance. We can do nothing with the sea oyster-beds.
38. You have no sea oyster-beds here? Oh, yes; Mr. Saville Kent, late Inspector of Fisheries, got all his oysters from the sea-beds at and near Schouten Island. By means of a dredge he got thousands of oysters, and these were placed in the inlets.
39. What depth of water were they taken from? Ten to 20 fathoms.
40. You think it is probable they died through not having been placed in similar depths of water? We cannot say; none of our artificial beds are a success.
41. *Mr. White.*] Is anything done to prevent robbery from leased oyster-beds? If a man finds he is robbed he reports to the police. Our law is perfect in that respect; thieves are punished.
42. *Mr. Thompson.*] Have you power to declare a close season for crayfish? Yes.
43. Do you think it would be desirable, for the protection of crayfish, to close alternately, say for a year or so, some of the portions of the coast where they abound, and so compel the fishermen to obtain their supplies from other parts, instead of allowing them to work the same ground season after season? I think it would be a good thing to protect them in that way. I should strongly advise you, where you find your crayfish grounds are being stripped or the fish nearly exterminated, to close the waters altogether and give them a chance. Our crayfish is more delicate than that found in New South Wales.
44. *President.*] Can you give us any information as to your lake fishing? We have only introduced the salmonidæ there. It has been a great success, and will prove, indirectly, a great source of revenue to the Colony.
45. Would it be an advantage to encourage marine pisciculture? I am of that opinion. I look upon the fishing industry as about the fifth industry in the Colony of Tasmania. Everything possible should be done to encourage the fishing industry and place it under proper supervision, and this not only for the sake of the fishermen themselves but for the present and future good of the Colony.

Mr. John Whelan, Inspector of the Fish Market, Hobart, sworn and examined:—

46. *President.*] You are the inspector charged with the control of the Fish-market in Hobart? I am.
47. The Commissioners are desirous of obtaining some information respecting the distribution of the fish and the working of the Act of Parliament in force here. You have a good opportunity of coming into contact with all the fishermen as well as the vendors? Yes, I have.
48. What is your opinion of the Act;—does it work smoothly? As to the Fisheries Act I may say there are complaints that the Fisheries Board do nothing only prevent people catching fish.
49. The Board consists of twenty-five members? Mostly Civil servants.
50. We are told the work devolves mostly upon two or three persons? That is so.
51. Have you formed an opinion as to what would be the best plan to adopt? It would be better to have three or four active workers than the present big Board.
52. The fish brought to the Hobart Market is sold by the fishermen themselves? Yes; there is no barrier between the producer and the consumer.
53. No middlemen? No middlemen.
54. The system of well-boat fishing—of course from your knowledge of the subject you will be able to express an opinion as to whether it works satisfactorily? I do not think anything could work more satisfactorily. Of course I have seen the well-boats crowded to excess, and the fish inconvenienced thereby, but that is remedied by putting them in large boxes or tanks, kept in the water, in which they get a better circulation of air.
55. The fish do not deteriorate in those boxes? They do not. The last report of our Health Officer relative to the state of the fish-boxes and sale of fish is as follows:—

Mr.
J. Whelan.

24 Jan., 1895.

I have the honor to report that, in accordance with your instructions, I have inspected the fish-boxes now used for the storage of live fish with a view to determine if the methods adopted are in any way detrimental to the health of the community. These boxes, in number sixteen or thereabouts, are anchored in rows just in front of the present fish-market, and to them are transferred live fish brought up in the wells of the fishing boats. This morning, during market hours, I investigated the methods adopted, and I am satisfied that so far from being detrimental the boxes are alike a boon to the public and to the fishermen. When placed on the market from the boxes the fish are fresh and lively, a few only being dead and rejected. In some boxes not a dead fish was to be seen, and I am informed that they readily feed in the boxes, and may be kept in this way for a considerable period; also that the fish live better in these boxes than in the wells of the boats, and this is readily believable as the boxes float on the surface of the water, and each movement tends to change the water through the slits and holes on all sides. On several occasions there has been great mortality among the fish in these boxes, dozens having to be thrown away owing to their being poisoned with tar, or tar water from the gasworks; but this is a rare occurrence, I am informed, especially lately. To the fisherman they are a great advantage, as by selling their fish to the owners of the boxes they can at once start for more; otherwise they must keep the fish in the wells, in which the mortality is great in the still water, or force a market at perhaps a very low price. To the public and invalids they are also a boon, as they can have fish every day, even when no fishing boats are up, owing to rough weather or prolonged calms. And as long as a proper supervision is exercised to see that all dead fish are daily removed from the boxes, and only those sold which are fit for food, no harm, in my opinion, can ensue. It has been suggested that typhoid might be spread by the fish in these boxes becoming contaminated by any germs reaching the harbour from the sewers; there was a probability of this in the case of the oysters, generally eaten raw, but none whatever in the case of fish, always cooked before being eaten.

56. With reference to the charges made by the Municipal authorities, do the fishermen complain of those charges being excessive? No.
57. What are the charges? 6d. for a boat of a size not exceeding a whaleboat, for any larger size, 1s. This entitles a fisherman to a stand in the market for the display and sale of his fish.
58. That is, the fisherman pays 6d. or 1s., according to the size of his boat, for the right to dispose of the whole of the catch in the fish-market? Yes.
59. The general public is not prevented in any way from purchasing at the market? Certainly not. Policemen are in attendance at the market, and I also attend every morning. We do everything we can to induce the public to attend the fish auction sales.

- Mr. J. Whelan.
24 Jan., 1895.
60. A very large percentage of the fish brought to the Hobart market is sold alive, is it not? It is mostly sold in a live state. Fish can be kept a fortnight or longer in the wells; it is not so in the Australian Colonies.
61. Do I understand that the sums charged—1s. and 6d. respectively—for the different sizes of fishing craft are the only dues charged by the Municipal authorities here? Those are all. Of course the fisherman may employ an agent and pay him, but we do not recognise any agents; we treat with the fishermen direct.
62. Is the Hobart fish-market open all day for sales? Yes; at any time; but the sales transacted after 8 o'clock are more of a private character than is the case in the early morning, when the fisherman himself sells his own fish at public auction. After the early morning sales are over, buyers come to the market at all hours and purchase fish as they want it. All fish sold at auction or privately is closely inspected before being offered to the public.
63. Have you power to condemn fishing nets of illegal size? Yes.
64. You have regulations to guide you? We have.
65. Mr. White.] Do you know much about the oyster fisheries? No; I have not much knowledge of them.
66. Crayfish? Crayfish are sold at the market—oysters are not.
67. Are you of opinion there should be a close season for crayfish? It would be all the better for the fish and for the public in the long run.
68. Crayfish make their appearance in certain seasons and then go away again, do they not? Yes.
69. Does not the taking of the crayfish at improper seasons tend to decrease the supply very largely? Yes; but they are not much good, although they are useful for food.
70. Mr. Thompson.] Do the crayfish cast their shell every year and come to this coast after shedding? Crayfish ought to be protected when the shell is soft.
71. Can they be protected by closing certain waters at different times? Yes.
72. As to the Fisheries Commission—are there any Members of Parliament on the Commission? I do not think so—there are Civil Servants on it.
73. How is the Commission selected;—what are the qualifications necessary for membership? I cannot say. I only know two practical men on the Commission—Mr. Seal (the President) and Mr. Rush.
74. The fish in the wells are sometimes damaged as a consequence of overcrowding? Yes; that is so.
75. What is done with the fish that die in the wells? They are placed on the slabs in the market for sale if they are passed by myself as fit for food.
76. The people do not care for dead fish, do they? Sometimes they buy it, but at about 60 per cent. below the regular market prices. I might also state that there is an arrangement between the fishermen and a person whom they employ as broker. The individual in question is not connected with the Council in any way. He advances the fishermen the money for their catch in order that they may get back to the fishing grounds, instead of waiting round in the town collecting the money. The broker collects the money. He takes the risk, and for this he makes a charge of 9d. in the £1.
77. Am I right in supposing the fish hawkers are charged 1½d. per day for a license to sell fish? Yes; it is a daily license of 1½d.—a daily certificate that they were at the market, and the fish were passed as fresh.
78. President.] Can you tell us what quantity of fish passed through the market last year? There is no record kept now. Sometime ago the Fisheries Board paid me £10 yearly to obtain the information, which I produced. I am not paid now, therefore the information is not supplied.
79. Has there been a depletion of the fish supply in the rivers? A great falling off. The men complain that they have to go further away for fish.
80. Is that the result of over-netting—too many men being on the one fishing ground? I do not know how to account for it. The kingfish is extinct.
81. What did kingfish bring here? They used to bring about 5s. per dozen.
82. How long have you been in the employ of the Municipal authorities here? About eight years.
83. You have carefully watched the operations of the Fisheries Board? Yes.
84. Would it be better to have one good man to control and administer the fisheries rather than five Commissioners—say you had a gentleman like Mr. Seal? Mr. Seal is an independent man.
85. Supposing you could get a man with Mr. Seal's qualifications, do you think it would be better to pay him to administer and control the fisheries rather than to have an honorary board of twenty-five members? I am quite certain it would. I am sure it would, not only in the fisheries but in everything else.

Mr. William Gates, fisherman, Hobart, sworn and examined:—

- Mr. W. Gates.
24 Jan., 1895.
86. President.] You are a practical fisherman? Yes.
87. How long have you been engaged in fishing? Between eighteen and twenty years.
88. During that time you have devoted your attention to deep-sea fishing? Mostly deep-sea fishing.
89. Will you tell us how you conduct your fishing operations? I will speak of line-fishing and of net-fishing. We mostly fish about Tasman's Island, Maria Island, and Schouten's Island—that is for deep-sea fishing. We fish in from 30 to 65 fathoms of water. It is pretty rough fishing—coral reefs. Sometimes we do not catch much in the deep water, and pretty often we have strong tides to contend against, from two to four-knot tides. When those tides are running we have to use up to 180 fathoms of line, although we may only be fishing in 60 fathoms of water. We use from 4 lb to 7 lb. weight of sinkers. Our in-shore fishing is mostly net fishing. We use what we call graballs. On an average they are about 25 fathoms long, with a 4½ in. to 4¾ in. mesh. We catch with them silver trumpeter, and what we call school fish.
90. What depth is the graball? About 6 feet.
91. What description of fish do you catch with the deep-sea hand-lines? Real trumpeter, perch, rock cod, and gurnet.
92. You fish from a well-boat, properly equipped? Yes.
93. After landing your fish what do you do with it? As we take the fish up we throw him under our arm and put him in the well.
94. You do not prick them—prick the air bladder—at all? No.
95. Even though you do not prick them they live in your well-boats for a good while? Oh, yes.
96. What is the longest period you have kept fish in your well-boat? I have known bastard trumpeter to live for six weeks, and the real trumpeter to keep for two months; of course we feed them.
97. What do you feed them on? Mostly crayfish or shark. We jag it about and hang it in the well; the fish feed on it at will.
- 98.

98. How long do your fishing cruises generally last? Sometimes eight days; at other times two or three weeks; in the winter up to four weeks.
- 98½. On your return to Hobart you transfer your fish to the fish-boxes in the harbour? Yes; we transfer the greater portion of the catch, in order to give them more room. We thin out the fish in the wells, so to speak, and put a lot in the fish-boxes. They live better like that.
99. How many men constitute the crew of your fishing craft? Two only.
100. Do you find this system of fishing fairly remunerative? It is falling off these last two or three years.
101. What is the reason for this state of things? Owing to the scarcity of fish.
102. If you could get the fish to market there is a strong demand for them? Yes.
103. What is the average cost of a well-boat? Our big half-decked boats run about 35 feet to 40 feet long, beam 9 feet to 11 feet, and depth about 3 feet 6 inches. With her equipment such a boat would cost about £130. I have one which was built three and a half years ago; she cost £145. She is now on the slip at Battery Point. I shall be glad to show her to the Commission, if you would like to see her.
104. Thank you, Mr. Gates; we will probably avail ourselves of the opportunity this afternoon. Now, as to the Fisheries Act, do you find that the Act they have in force here works smoothly? Fairly well.
105. You do not complain of any unduly hard provisions? No, I cannot say that I do.
106. You approve of the method of selling and distribution in force in Hobart? I do, very much.
107. You have more confidence in handling and selling the fish yourself than if you entrusted the duty to a middleman? Certainly.
108. Have you done much fishing for crayfish? Yes.
109. Do you fish all the year round for them? No—the men as a body do; but there is a clause in the Act which does not allow us to take soft-shelled crayfish.
110. That is about the months of November and December, is it not? Yes.
111. Of course, being a fisherman, you have naturally observed any deposits of oysters you may have come across at different places;—can you account for the oyster-beds being deserted at the present time? I do not know that they are deserted. There are beds at different places. Others know of them besides myself.
112. Are the oysters of good size and quality? Fairly good; but the shells are soft—that makes them bad for carrying. Up in the vicinity of Schouten Island there are plenty. Oysters can readily be got there.
113. Are those shores worked or leased? Mostly leased, but not much worked.
114. Have you seen any evidence of deep-sea deposits of oysters? I cannot say that I have.
115. *Mr. White.*] You are prohibited from capturing crayfish when they are shedding their shell and when they are full of roe? There is no set time here. I know of an island on one side of which you can get crayfish good for food, and on the opposite side of that island the crayfish are soft-shelled. At the other end you will find the crayfish shedding the roe.
116. Are you of opinion the close season for crayfish should be longer than it is at present, for the purpose of affording protection to the fish? In my opinion we have no close season. There should be a close season—the fish ought to be protected. There is a difference of opinion as to whether the fish is soft-shelled or hard-shelled.
117. Do many fish die in the well during the time you are out on your cruises? Not as a rule.
118. If they die, what do they do with them? We mostly throw them overboard.
119. Would it not pay you to salt them? No.
120. Why not? In Tasmania people only buy live fish as a rule. If they are dead half their value is gone. It does not pay to export them.
121. Why? Because the duties in the other Colonies on salted fish block us.
122. Can you stand a heavy sea in your well-boat? We encounter all sorts of weather.
123. You can stay out in any weather? We can always find a harbour within 10 or 20 miles.
124. *Mr. Thompson.*] You do not think the well-boats need be made any stronger? No.
125. Would it not be better, when you get on good ground, to hang on to it instead of running the risk of losing it by leaving in rough weather? We always take cross bearings, and can readily pick up our grounds again.
126. Your boats average in depth from 3 ft. 6 in. to 4 ft., and have a draught of about 2 ft. 6 in.—I suppose there would be no advantage in increasing the draught to give more accommodation to the crew? What we have is sufficient.
127. Does the casing of the centreboard interfere with the draught in the well—I mean with the free circulation of the water? No.
128. Would it be any advantage to have centreboards fore-and-aft of the well? I do not think so. The centreboard as we have it is really an advantage, inasmuch as it keeps the water more in position.
129. You spoke of crayfish shedding the roe;—what do you mean by that? When the roe first forms it gets hard and goes along to the tail.
130. In New South Wales we call it, when in that stage, berried fish;—would you protect them when they are in that condition? It is necessary to protect them when they are shedding the roe.
131. You never think of taking a berried fish? With the roe on the tail?
132. Yes? We are not allowed to take them then.
133. The close season you suggest is for soft-shelled crayfish? They are soft-shelled at different times in different places.
134. Would a closure of three months yearly cover all this difference in time? Yes; the greater part of it.
135. There are oysters at Schouten Island—are they exposed to the sea? No; the place is not exposed to the sea altogether, it is more in the harbour. [*The witness at this stage pointed out on the map the places where the oysters are found at Schouten Island.*]
136. Where do those oysters come from? I cannot say; there is a river away up in the head of the island, but I do not think they come from there.
137. *President.*] Have you ever noticed any indications of rock oysters? None, on the outside.
138. *Mr. Thompson.*] About the deep-sea fish in the well—you say they do not get inflated with wind, and you have no occasion to prick them; have they very large sounds? Yes, fairly large.
139. Have you ever tried pricking? Yes; but I never did any good with it. None of our men prick.
140. How do you measure a grabball? From end to end, diagonally.

Mr. Daniel Jones, fisherman, Hobart, sworn and examined:—

- Mr. D. Jones. 141. *President.*] You have fished in waters other than those of Tasmania? Yes, I have.
 24 Jan., 1895. 142. Deep-sea or net-fishing, or both? Both. Deep-sea fishing and net-fishing in the seasons—we used to take our fish to Melbourne.
 143. You adopt the well-boat system? Yes.
 144. What crew do you carry? Four men.
 145. How long are you away from Hobart on your fishing cruises? Say about four weeks—according to the weather and the sort of catch we have.
 146. It depends upon the catch;—what do you consider a catch? With our vessel, the craft we used to sail in from here to Melbourne, about 300 miles, we would put in about twenty-five to thirty score of large crayfish, and from ten to fifteen dozen of trumpeter.
 147. That would be the result of your operations for a week or a fortnight? Yes.
 148. Have you found any difficulty in keeping these trumpeter and crayfish? Yes, I have. We have to feed them regularly.
 149. Do you adopt the process of pricking—allowing the air to escape from the air-bladder? I have never found it to answer, only with the schnapper on the coast of New South Wales.
 150. Have you fished on the New South Wales coast? Yes, on the Sir John Young Banks and elsewhere.
 151. What was the name of your boat—the “Rachel Thompson”? Yes.
 152. You made only one trip to Sydney? Only one, but we remained on the coast for six months.
 153. And you did very well? Very well.
 154. You adopted the process of pricking with the schnapper and it answered well? Yes; we were chartered by the Commissioners ten years ago to test the New South Wales waters, and to see what kind of fish we could fetch into Sydney alive in the well. After we were done with the Commissioners we started fishing on the coast.
 155. All your experiments proved successful? Yes; the schnapper and nannegai were the best living fish in the well.
 156. As to the success of your experiments, do they include the trials made at the instigation of the Commissioners? We were about a month in the service of the Commissioners; we fished about Botany, and down to the Five Islands, off Wollongong. We secured a good deal of fish. The vessel was thrown open for inspection on her return to Sydney, to give the public an opportunity of seeing fish kept alive in the well. We were lying abreast of Mr. Fred. Want’s place, in Double Bay, for four or five days.
 157. Do you find that the system of well-boat fishing is profitable? There is not a great deal in the fishing industry here now. Without our well-boat we could not make a do of it at all.
 158. Do the regulations framed by the Municipal authorities for the sale of fish work satisfactorily? Very satisfactorily.
 159. What is your opinion of the institution called the Fisheries Commission here? It is hardly necessary to have it. One practical man, well paid, with a good knowledge of the subject, would be better than an honorary board.
 160. You have no complaint to make about your Act? No; the only difficulty is about the crayfish. It has to be a 12-inch crayfish before it is saleable here. Very often you get a good big crayfish at 11½ inches—good in bulk—but it would not pass.
 161. Would it be better to have a regulation permitting sale by weight rather than by length? I never went into the question.
 162. Is there not a possibility of the crayfish grounds becoming extinct if wholesale fishing is carried on? Yes, there is.
 163. Should there not be a close season? There is a difference of five or six weeks sometimes between the time the crayfish found at different places are soft-shelled. There is a place at Maria Island where we sometimes get good loads of crayfish. At the other end of the island we cannot get them, and you will not get a fish on the mainland. We have the system of preventing female crayfish coming into the market with the spawn under their tail. In Sydney I always see crayfish with the spawn under their tail. It is a great sin; they have no chance to breed.
 164. In regard to oyster fisheries, you appear to be in a bad way down here? We have plenty of oyster-beds here but they are not looked after and they are not worked. Twenty-two years ago there were oysters at Spring Bay, Swansea, and South Bruni. They have worked those places out, but I know places on the coast, plenty of them, where I can dredge good mud oysters.
 165. Have you any rock oysters? No rock oysters.
 166. Has nothing been done in the way of artificial propagation of oysters? They did start fetching oysters from Schouten and they commenced to make artificial beds, but I do not know whether much came of it.
 167. Do you think deep-sea fishing on the New South Wales coast would ultimately be a success? We found nothing else but schnapper in any depth of water—that was by line fishing.
 168. You did not go north? No, near to Sydney. When I traded to the Richmond River and the ship has been in stays, wherever I could take a sounding I could always get schnapper—that was from Port Stephens past the Clarence to the Richmond River.
 169. You see no difficulty in the way of carrying out the system of well-boat fishing in New South Wales waters? The fishermen there do not understand it. It would be advisable to get practical men to work with the fishermen there and show them the grounds. They would have to be educated in the way of handling the fish.
 170. If any fish die in the wells when out fishing what do you do with them? Salt and cure them, put them in barrels and place them on the market.
 171. This market? Yes, they are used for smoking.
 172. Do you send fish to the other Colonies? Yes, to Sydney and Melbourne.
 173. Is there sufficient inducement to send fish to the other Colonies? Yes.
 174. *Mr. White.*] What is the length of your boat? Forty-five feet on the keel, 12 feet beam, 6 feet depth. She is a decked boat, ketch-rigged.
 175. What did she cost? £700, with all appliances. She is about a 30-ton boat.
 176. She will stand any weather, I suppose? Any weather. We traded to Melbourne, backwards and forwards through the Straits, and on the Sydney coast. She behaved well in a gale of wind. She is of Huon pine, and has a centreboard. With the centreboard she draws 10 or 12 feet.

177. Would you recommend a half-decked boat for work on the New South Wales coast? No, not a half-decked boat; because if the sea breaks about she is smothered. With a deck on her the water would roll off. Some of the open boats here have nearly been lost at times. Open boats have nothing to save them—a decked boat is all right. Mr. D. Jones.
24 Jan., 1895.
178. Have you regulations here dealing with the size and length of your nets? There are no stipulations so far as the length of the net is concerned; but there are regulations for seining.
179. *Mr. Thompson.*] Would you suggest the employment, for the New South Wales fisheries, of a stronger and larger boat than those used here? Yes.
180. What do you think of a boat about 40 feet long, 12 feet beam, and 6 feet deep, having sufficient accommodation for a crew of three or four, so that with the use of a sea-anchor she could ride out any storm at sea? She would be all right; but if you have too many fish in the well you will kill them if you ride out in too heavy a wind.
181. Then you think when lying-to in a heavy gale the motion would be too great for the fish in the well? Yes; if you could get a harbour it would be much better to ride the gale out there. You want a sheltered place, but not too calm water—a little motion is wanted.
182. Your centreboard is in the centre of the well;—is that an advantage? A great advantage; it gives such a lot of ventilation to the well. In our well we have four compartments. The fish cannot knock themselves about when the well is divided into compartments.
183. What do you catch crayfish with here? We use the pots and rings.
184. Did the schnapper live in the well-boat in New South Wales waters? Yes, they did very well. You must not overcrowd them.
185. Did you prick them at all? Yes.
186. When the barnacles are on the crayfish that is an evidence that they are fit to take? Exactly.
187. *President.*] Have you ever seen any indications of the presence of the herring on this coast, or on the New South Wales coast? No; they say they are up north, but I have never seen them about Hobart.
188. Have you seen the pilchard? Not here; in Victorian waters.

Philip Samuel Seager, Esq., Registrar of the Supreme Court of Tasmania, and a Member of the Tasmanian Fisheries Commission, sworn and examined:—

189. *President.*] You are Registrar of the Supreme Court of Tasmania and a member of the Fisheries Commission? Yes. P. S. Seager,
Esq.
24 Jan., 1895.
190. How long have you been on that Commission? Since its appointment. I was formerly secretary to the body that preceded it—the Salmon Commission.
191. What functions had the Salmon Commission? It was appointed entirely in relation to experimental work in introducing salmonidæ to Tasmanian waters.
192. The present Commission deals with the administration of the Act and also with the finances? Yes, subject to the approval of the Governor-in-Council.
193. You have power to disburse any sums of money you may receive as revenue? Yes, under the Act.
194. Does the body work smoothly as at present constituted? Yes.
195. Might the number be lessened? I have always felt the number to be too large.
196. You have discovered that the duties are generally left to the working bees? The attendance at our Board meetings is satisfactory, but I think that a small Board works better than a large one. I speak with the experience of being a member of five different Boards in Hobart connected with the Government. I favour a small executive Board.
197. Then you think that perhaps four or five men might be better than the present large Commission? I favour a smaller Board; but I do not wish it to be understood that I am making any reflections on the present Commission.
198. Would you favour the appointment of a gentleman at a salary to control the fisheries? The difficulty is in getting a suitable person.
199. How many men are employed directly in the fishing industry here? Well, speaking roughly, in 1888 there were eighty-six boats and 175 men engaged in the industry. There were about eighty fish hawkers indirectly interested.
200. Are the fishermen licensed? No; their boats are licensed. A register is kept of their boats; they do not pay any fee.
201. You state the Commission have power to make regulations subject to the approval of the Governor-in-Council? Yes; those regulations must be advertised a month before they are submitted. That is a most inconvenient provision in the Act. It entails considerable delay and expense, and does not produce good results.
202. Have you noticed any diminution in the fish supply during the last few years? It is reported that there is a diminution.
203. Can you tell the cause of it? It is attributed in the report of our Royal Commission to over-fishing.
204. You have power to proclaim closures? We do so.
205. How are you guided in your action in that respect;—have you any inspectors? We have power to appoint inspectors; the officers of the Police Department perform those duties as a rule.
206. Do the fishermen complain of the hardship of the law? No; on the contrary, we have petitions from them asking for closures. There is, on the other hand, a strong feeling manifested by amateurs against the protection of the fisheries—they like to draw nets freely. I may say that owing to changes in our monetary position it was necessary to dispense with the services of the water bailiff for the Derwent. The moment the fact became known poaching commenced. Public feeling was aroused, and pressure was brought to bear upon the Government, leading to his reappointment; that is evidence that protection of the breeding grounds is of value. This occurred within the last two or three weeks.
207. Can you give the Commission the value of last year's catch in Tasmania? It is very difficult to estimate the value of the fish sales, as no systematic register has been kept for the whole Colony. The actual value of the fish sold in Hobart Fish-market during the year 1888 was £5,399 16s. I have no later returns before me. If I may be permitted to offer a suggestion, I may say that I think it would be a good thing to have a record kept of the variety and number of fish caught.* If some officer were deputed to attend to this we should have a valuable record. 208.

* NOTE (on revision):—This might be done by preparing a printed list of marketable fish, supplying each fisherman with a number of copies, and requiring him to fill in one on each trip showing his catch.

- P. S. Seager, Esq., 208. Your Commission has control of the inland and marine fisheries of the Colony, but not the fish-market? The market is under the control of the municipality.
- 24 Jan., 1895. 209. How do you exercise supervision over the fisheries, say 100 miles from here? Entirely through the police.
210. Have you paid much attention to the oyster fisheries here? A little attention. The Commission prepared a report upon them. It was laid before Parliament; I will give you a copy. We know that oysters exist out in the open sea at Schouten Island. It is an industry that would be profitable, but no one touches it.
211. Have you any rock oysters here? I believe not.
212. With regard to crayfish, you have a regulation concerning them? Section 35 of our Fisheries Act is as follows:—

If any person shall, at any time after the passing of this Act, either buy or sell, or cause to be bought or sold, or shall offer or expose for sale, or shall have in his possession or control, any fish known as or called the crayfish, of a size less than shall be prescribed by the Commissioners as aforesaid, or any female of such fish of whatsoever size having eggs or spawn attached beneath its body, or which has been captured with eggs or spawn so attached, he shall upon conviction forfeit and pay for every such offence a penalty or sum not exceeding five pounds.

The following regulation was made in 1890 by the Commissioners of Fisheries:—

1. The taking of crayfish when soft-shelled is hereby prohibited; and any person who shall take, or who shall either buy or sell, or cause to be bought or sold, or shall offer or expose for sale, or shall have in his possession or control, any soft-shelled cray-fish, shall be liable to a penalty not exceeding five pounds.
213. Have you any auxiliary markets in which fish can be bought and sold? The Hobart market is the only one in the Colony.
214. In regard to the sizes and meshes of nets have you power to alter those meshes and sizes? We have fixed the meshes by regulation, and the regulation was prepared with the concurrence of the fishermen.
215. I suppose the fishermen are directly represented on your Commission? We have a member who was a practical fisherman, and who now keeps a fishmonger's establishment. He was appointed to the Commission because he was a representative fisherman and for the purpose of representing the fishermen.
216. You exercise control and supervision over the acclimatisation ponds at New Norfolk? Entire control. They are leased from Mr. Reid.
217. It has practically been a huge experiment all through? It is, historically, the first establishment of the kind in Australasia; it is of great interest to visitors from all the Colonies.
218. Your efforts there have been attended by success? Yes; from an economic standpoint the establishment is a great success.
219. You are acquainted with New South Wales;—do you think an establishment on similar lines in a suitable locality would be successful? I see no reason why it should not be so. In company with Mr. Lindsay Thompson, in 1891, I visited Berrima, in New South Wales. While there I inspected a river, and from the temperature of the water and district I certainly saw no difference between that place and our own establishment in Tasmania.
220. Can you give us the temperature of the ponds at New Norfolk? I will endeavour to obtain it and forward it to you.
221. What about well-boat fishing? It is the system that has always been adopted here as long as I can remember. It has been very successfully carried out. The fisherman comes into port with his catch, and if he does not sell all his fish he is not a loser, because he keeps the fish alive in the boat or in boxes immersed in the river.
222. Do you think the same system would prove successful if adopted in New South Wales? If you moored your boats near Watson's Bay I see no reason why the fish should not live in the wells in your waters. I do not like the arrangements of your market at Woolloomooloo; I saw the fish laid out on the floor for sale in your market. I saw them gutting fish in the troughs—a most unpleasant odour prevailed, and I was very much disgusted.
223. You have raised tables in your market and the boats lay alongside, so that there is no possibility of contamination by people treading on them or spitting upon them? There is no such risk. Captain Armstrong inaugurated a system of fish paddocks here, but it did not succeed; he proposed to establish a reserve stock of fish so as to supply the market as necessary. I think it is a feasible scheme.
224. The New Norfolk establishment;—can you give us a brief description of it, together with the varieties of fish? We have brown trout, the true salmon, salmon-trout, Loch Leven trout, and Californian trout. There are others, but we do not exactly know what they are. There are four circular ponds, varying from 127 feet to 136 feet in circumference, and a long serpentine pond, with a circumference of 650 feet. All the ponds have suitable gravel beds, and are connected with rills measuring altogether 677 feet in length, in which the spawning fish from each pond make their redds during the spawning season. The rills are supplied with water from the river Plenty, conveyed in wooden troughing and a water-race about a mile long, which, having passed through the various rills and ponds, again finds its way into the Plenty through a troughing below the last pond. The hatching-house is of fair size. It originally contained a series of hatching boxes set in the floor, arranged on a similar method to those then in use at the famous hatching-house at Stormontfield, in England; but a few years ago these were removed, and the present more modern method substituted, which is known as the "Williamson double rill system," a plate of which will be found in Vol. 1872-73 "Fresh Water Fisheries of the United States," together with a letter-press description of the method of use at p. 585 of the same vol. There is an intake trough fed from the main troughing from the Plenty. This intake is tapped by wooden taps to supply the five hatching boxes, from which the water is again led off by other wooden taps at the end of each trough, and from thence to the main rills feeding the ponds. Small wire trays are used in the spawning season for the reception of ova, and these can be multiplied to the capacity of each hatching box. The method has been found very successful and the mortality comparatively small. When the ova are hatched the young fry are kept for a considerable period in the hatching boxes, until they commence to feed well and are available for distribution. This distribution is effected by means of oval-shaped tins, tapering towards the top, with perforated tin lids. A caretaker's residence, with ornamental grounds, completes the establishment. In addition to the ova obtained from the breeding

breeding stock, many thousands are taken from fish captured by means of a simply devised fish-trap on the River Plenty, adjacent to the ponds. The dry method of artificial fertilisation is adopted. The fish bred in the ponds include salmon, (*Salmo Salar*) salmon trout, (*S. Trutta*) brown trout (*S. Fario*), Loch Leven trout (*S. Levenensis*), and American trout (*S. Fontinalis*). One interesting experiment at the ponds deserves mention. For years predatory birds (cormorants) were very troublesome, and great losses resulted. It occurred, however, to the President (Mr. Seal) and Mr. Webster, another member, that if wires were spread across the ponds the danger would be averted. The experiment has been carried out with the greatest success. Parallel wires at distances of about a foot apart are placed across all the ponds. Should a bird succeed in getting into a pond he is unable to rise and is speedily destroyed, but it is found that since the wires have been placed across the ponds the birds have avoided the locality.

225. *Mr. Thompson.*] Do amateurs pay a license for marine fishing? No; we have always thought that we ought to license their nets—something very nominal,—2s. 6d. or so.

226. *President.*] What is your revenue? About £150 yearly.

227. What is the license fee for salmon-fishing? It is 10s. for the season, 5s. for a month, and 2s. 6d. for a week. This allows them to fish anywhere.

228. *Mr. Thompson.*] If help is afforded to amateurs to get their fishing, is it not reasonable that they should contribute something toward the expenses? It has been strongly advocated by amateurs in this Colony that we should impose a fee of 2s. 6d. per rod, but there are difficulties in the way.

P. S. Seager,
Esq.
24 Jan., 1895.

Matthew Seal, Esq., President of the Tasmanian Fisheries Commission, sworn and examined:—

229. *President.*] You are President of the Tasmanian Fisheries Commission? I am. I have occupied the position for nine or ten years.
230. You have taken an active interest in the fishing industry for a number of years, and have watched its development from time to time? Yes.
231. Have you devoted any attention specially to the development of the deep-sea fisheries of Tasmania? No, it is rather beyond our scope. When we get beyond the estuary of the Derwent we are out of the pale, as it were.
232. The Commission makes regulations to control the fisheries? Yes, we have power to proclaim seasons and so forth.
233. I understand there is something like twenty-five members on your Commission;—is it absolutely necessary to have such a large number? I think it is a mistake.
234. Do you think the work might be better done by one man? I think so, supposing you had one man at the head of affairs, with a board of advice, say three or four. One man as Commissioner of Fisheries, a paid officer, and a board of advice, would be better.
235. You have no inspectors directly under your supervision? Only one man as water bailiff; his work is to look after the conservation of the home fisheries.
236. Have you noticed any depletion in the fish supply in the home waters lately? Many years ago the best market fish were more numerous than now.
237. To what do you attribute the diminution of the fish in your home fisheries? The excessive netting with the seine net.
238. You have power to make regulations as to the size of mesh, length of net, and size of fish? Yes.
239. You have also power to proclaim closures, and have exercised that power to great advantage? Very much so, in some instances.
240. You are familiar with deep-sea fishing with well-boats? Yes.
241. Has that system proved successful? Yes; the fact is the fishermen could not bring their fish to market without them.
242. I understand you have given great attention to the question of the artificial propagation and acclimatisation of fish? Yes.
243. Your operations have been successful in every instance? I think so. The great drawback to all our efforts is simply the want of protection in the inland rivers, especially on the spawning-grounds. They are netting everywhere.
244. Have you given any attention to the oyster fisheries? We have, to a limited extent only.
245. Have you done anything in the way of resuscitating the old oyster fisheries? We have; but so far without great results.
246. In regard to crayfish, you have a close season for them? No, not exactly; they are not allowed to take females with eggs or spawn attached. The fish cast their shells periodically; soft-shelled fish are not in condition, and they are not allowed to take them. The season varies very much on different parts of the coast, and the fishermen can always get crayfish somewhere. When the crayfish has a soft shell it is not in season.
247. Have you any knowledge of our New South Wales fisheries? I cannot say that I have.
248. Is it not reasonable to expect that the well-boat system could be carried out there? Certainly, the same as in Tasmania.
249. Providing we can get a temperature something approaching what you have at New Norfolk, can we not do what you have done there? With the brown trout I think you can succeed as well as we have here. In Ballarat the water is as warm as it is in New South Wales. I see no reason why fish should not be successfully acclimatised in New South Wales.
250. Your Commission issue a report every year? Yes.
251. *Mr. White.*] You have full power under your Act to punish for offences? Yes; if any offence comes within the knowledge of the water bailiff he reports it, and the offenders are summoned.
252. Your Act provides for penalties for breaches of the law? Yes.
253. *Mr. Thompson.*] You have power under your Fisheries Act to set out times and seasons when the taking of the several species of fish shall be prohibited;—do you do much in that way? We have never done anything in that way in regard to sea fish, only in so far as the nets are concerned, and regulating the size of the fish.
254. About garfish, you allow a small net for catching them? The bunt of the net is much smaller in a garfish net than in another net; we have two sizes. One is used in the summer-time and the other in the winter.

M. Seal, Esq.
24 Jan., 1895.

- M. Seal, Esq.
24 Jan., 1895.
255. I suppose you allow those nets to be used at any time, only at a certain distance from the mouths of estuaries—I am referring to garfish? Well, take Brown's River, we do not allow them to fish within a certain distance of the mouth of that river. That part is marked off.
256. Suppose a school of garfish was seen there, could they not be taken? Not according to law, not within the proscribed grounds; but it is done. With regard to the estuary of the Derwent they are only allowed to fish within a certain distance with the net at all; they can use the graball between sunrise and sunset within certain limits.
257. Where they use seines how do they provide for the protection of small fish—do they haul them ashore or empty them in the water? We have no law to provide for that; they do as they like. They always drag them right on shore. Of course the culch—that is the sea debris—brings up a lot of undersized and very immature fish. They are emptied out on the beach, and all destroyed.
258. Is there no punishment for this destruction? No.

Mr. Frederick Self, Water Bailiff to the Tasmanian Fisheries Commission, sworn and examined:—

- Mr. F. Self.
24 Jan., 1895.
259. *President.*] What position do you hold in connection with the fisheries here? Water bailiff.
260. How long have you held that position? Seven years.
261. You have a pretty good knowledge of the way in which the fishermen conduct their operations? Yes, I was fishing years before I became water bailiff.
262. You are also aware that there has been considerable destruction of fish in these waters? Yes.
263. Have you found any difficulty in carrying out the intentions of the Fisheries Act? No; the fishermen are very law-abiding.
264. They seem to be met in every reasonable way by the provisions of the Act? Yes.
265. Still you think it necessary to have inspectors to supervise the fisheries? Yes, there is more trouble from the amateur fishermen.
266. Do the amateur fishermen destroy many fry? Yes; in the first three weeks of this year a good deal of destruction went on, owing to my temporary retirement from the position I hold, and there being no one to look after the river.
267. As a rule you find the professional fishermen obey the law? They give me all the assistance they can. Professional men are very law-abiding as a rule; they do not go in for illegal acts.
268. You have jurisdiction only over the fisheries? Yes.
269. Directly they bring their fish in from the sea, and are within the home waters, your authority commences? Yes.
270. Has the system of well-boat fishing been a success? Yes; in the old days when they had dry seine boats they had to come into the market every day, but with the well-boats they can watch a school of fish and take a week or more on their trip.
271. Have you ever heard of loss of life at sea through stress of weather in connection with these boats? Not during my time.
272. They are of first-class character and able to ride out a heavy sea? Yes.
273. Do you think the system of sale now prevailing at the fish market—the fishermen being brought into direct contact with the consumer—works well? It does; it works well. The dues are very light: 1s. for a big boat, and 6d. for a small one.
274. In regard to oyster fisheries, do you know of the existence of any deposits of rock oysters? No; I had some rock oysters at my place on the Derwent, but they came from Sydney. We have the mud oyster here.
275. Is your place nearer to the sea than Hobart? About 3 miles from here, but the water is quite as salt as it is near the town.
276. Where are the mud oyster deposits? Scattered all along the shore in the river.
277. Nothing appears to have been done to develop this industry? Nothing; you can pick up a bucketful at low tide.
278. Have you any oyster leases? Outside, but not on the Derwent. There are acres of oysters out the Schouten's way; the shell is soft and the oyster poor.
279. Have you noticed any quantity of crayfish coming into the market? Yes; we get a great many; there are restrictions placed on the size of the crayfish.
280. Is the fish supply diminishing? Yes; all our fish, trumpeter and bastard trumpeter.
281. Do you think the provision which makes it compulsory on the part of the fishermen to refrain from taking female crayfish is a good one? I do.
282. *Mr. Thompson.*] Your amateur fishermen;—are they net or line men? Net mostly; nearly all the yachts carry nets. The amateur fishermen sneak up the river, put their nets down, and get away again.
283. What are they—seine nets? Seine nets and graballs.
284. The graball is a fixed net? Yes, a fixed net. The graball is set outwards from the shore, and the seine net is hauled on the beach.
285. Do you find one local bailiff sufficient for this work? Oh, no; the water is too great to look after them.
286. Have you a free pass on the railway to help you do your work? I have a free pass and it helps me greatly.
287. In your fish-market you have slabs to show the fish on;—is that a better plan than putting them on the floor? Oh, yes; the old system of having them on the floor was no good.
288. Those rock oysters up your way—I think I sent them down to Mr. Seager;—have they grown at all? Yes; but they have shown no sign of spatting.

Mr. Frederick Pender, Commission Agent at the Hobart Fish Market, sworn and examined:—

- Mr. F. Pender.
24 Jan., 1895.
289. *President.*] What is your occupation? I am a commission agent at the Fish Market, and also an exporter of fish.
290. Do you export your fish to the other Colonies? Principally to Melbourne; we have sent fish to Sydney.
291. Do you export cured or smoked fish? No; all fresh on account of the duties on the other side.
292. How do you send them fresh? Pack them alive to Victoria. 293.

293. Are your operations of very great extent? No; of late years things have fallen off, and as we are obliged to send them fresh it is against us.
294. How long have you been engaged in this business? Thirteen or fourteen years.
295. You have watched pretty closely the operations of the fishermen? I am their agent. I am thinking of putting up a place for the preservation of fish down the Derwent. At times there are tons of barracouta, and we can load a ship in a day. When the fish are in the humour they will jump aboard.
296. What are the average prices of the best species of fish? The big trumpeter is the dearest; last season they went from £1 to £4 per dozen.
297. What size were they? From 4 lb. to 20 lb. or 30 lb.—perhaps a little more.
298. What is the average price of your flounders? The average price is about 6s. per dozen; that is the price dealers have been giving for them alive; but flounders have been sold around the town dead at 2s. per dozen.
299. You are acquainted with the well-boat system of fishing;—has it proved a success? A decided success—the stuff is always in better order here than in Sydney.
300. Do you know of any conflict having taken place between the fishermen and the Fisheries Commission? They have worked fairly well together.
301. The fishermen do not complain of any hardships—do not complain of the Act? No.
302. *Mr. White.*] What is the duty on smoked fish? One penny or 2d. on the other side.
303. Would it not pay to salt the fish and send it over to the other Colonies? No; the fish we send is heavy, and it would not pay.
304. The fishermen, generally;—are they an honest class of men? They are decent, honest men so far as I know.

Mr. F. Pender
24 Jan., 1895.

THE VICTORIAN FISHERIES.

SATURDAY, 2 FEBRUARY, 1895.

[*The Commission met at Queenscliff, at 2.30 p.m.*]

Present:—

THE HON. R. H. D. WHITE, M.L.C., ACTING-PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Captain John Pratt, Master of the schooner "Elsinore," Queenscliff, sworn and examined:—

305. *Acting-President.*] What is the tonnage of your schooner? Thirty-five tons.
306. You have been engaged in fishing at King's Island, Tasmania, for some time? Yes, for the last four years.
307. What sort of fish do you generally catch? Crayfish only.
308. Do you catch them with the pots and hooks? Yes, pots and hooks.
309. What quantity do you generally catch at a time? Twenty or thirty dozen.
310. You generally bring in about how many? About a hundred and forty or a hundred and fifty dozen at a time.
311. Do you keep them in water after you catch them? Yes, in the well fitted in the schooner.
312. Do you catch crayfish at all times of the year, or is there a close season? No close season that I know of.
313. Do you catch the female with the coral when they have it under the tail? No, we do not catch any of those; we do not catch them with the spawn in them.
314. What months are the best for catching them? February and March are about the best.
315. Do you find that they shift about to different places? Yes, they shift about a good deal; they go away and come back again.
316. Is it your opinion they come in to spawn, or is it their feeding-ground? I think, as you find the fish in one place, they come in from deeper water.
317. Do you get a regular price at the market? The market varies greatly.
318. What is the usual price? They run from about 2s. to 7s. and 8s. per dozen.
319. Do you sell direct yourself or through the market? They all go to the market, and are there sold by the city auctioneer.
320. Have you tried to keep them in floating boxes here? Yes, but they did not do very long in the boxes; they got poor.
321. It is best to get them into the market quickly? Yes, as soon as possible.
322. Do many die in the wells? In hot weather a good many die; in cool weather they do right enough.
323. Do you attempt to feed them? Yes, on shark or any other fish we can get.
324. What crew do you carry on the schooner? Three.
325. I suppose she will stand almost any weather? Oh, yes; she has been pretty well tried these last three years.
326. *Mr. Thompson.*] You catch only crayfish? Yes.
327. Do you use both methods—pot and net? Yes.
328. At what time do these fish have ova under their tails? In June.
329. Where do you catch them? At the Three Hummocks Island on the Tasmanian coast.
330. Are those fish in Victorian waters? Yes.
331. How is it you go so far away? Because we get a good catch there.
332. How far is the island you speak of? A hundred and thirty miles from Queenscliff; King's Island is about 95 miles away.
333. How do you get your fish from here to Melbourne? Bag them, then land them in Queenscliff, from whence they are sent by train.
334. Do they arrive in Melbourne alive? Yes.
335. Not much damaged? Not much damaged.
336. At what period of time do they have the soft shell? Just before Christmas, the male fish.
337. You discard soft-shell fish? Yes; you won't get them when the shell is soft.
338. What is the regulation length of a marketable crayfish? Ten inches from the eye to the tip of the tail.

Capt. J. Pratt.
2 Feb., 1895.

- Capt. J. Pratt. 339. Are there many people engaged in this crayfish business? Yes, there are; it was a good business some years ago.
- 2 Feb., 1895. 340. Have you any idea of the weekly quantity necessary to supply the Melbourne market? I suppose this week there has been one hundred and twenty dozen in the market every day.
341. You do not go in for any other kind of fishing? It would not pay me to carry crayfish and scale fish.
342. Do you think well-boat fishing would answer in Victorian waters? You mean to bring the fish in alive; I think the schnapper would do very well in the wells.

Mr. Benjamin Chidgey, fisherman, Queenscliff, sworn and examined:—

- Mr. B. Chidgey. 343. *Acting-President.*] What is your occupation? I am a fisherman and owner of the half-decked fishing boat "Olive."
- Feb., 1895. 344. What length is your boat? Twenty-two feet 9 inches.
345. What sort of fishing do you engage in? Hook and line—net fishing occasionally.
346. Do you fish inside or outside the Heads? Principally inside of late years.
347. What do you catch? Different sorts—yellow tail, schnapper, trumpeter, whiting, flathead, pike, salmon, and other varieties.
348. When do you fish? In the day-time, and catch the evening train. When we miss it we catch the morning train.
349. Your fish are sent dead to the market? Yes; I have sent flounders alive from here, but they would be dead when they reached the market.
350. How many men are engaged in your boat? Two hands.
351. Taking an average for the year, what quantities do you send to market? Well, I could hardly tell you just now. Years ago we used to catch three times the quantity we are getting now of all sorts.
352. Then the fish are decreasing? Decreasing fast.
353. What do you attribute that to? Overworking.
354. Are not numbers of small fish destroyed, thus decreasing the supply? I cannot say that it is so; you cannot help killing some small fish at times.
355. What length of net do you use? About 60 fathoms.
356. What mesh? I have been using a 4-inch mesh.
357. Are you regulated as to the mesh here? No; by the size of the fish.
358. Are there no regulations to prevent your taking very small fish? No; if we catch undersized fish we incur a penalty.
359. Have you to throw many fish away, or do they generally get to market in fair condition, sending them as you do by train? A few men have lost a lot of salmon lately.
360. As a rule you get them to market in very fair condition? Our fish arrive in very fresh condition.
361. How do you send your catch to market? In baskets, by the ordinary carriages on the railway.
362. About how many boats are engaged in the class of fishing you go in for? There are between forty and fifty fishing-boats at Queenscliff—they go out daily.
363. Are they large or small boats? From 20-foot to 30-foot boats.
364. Do your boats stand any weather? Our boats will stand a fair sea.
365. Have you tried the well-boat system for keeping fish alive? No; I think the well stops the speed of the boat. We have to go a long way for fish, and the well, we think, would be against us.
366. Do you belong to a fishing association, or are you on your own account? Every man for himself.
367. Do you get along pretty harmoniously together? Yes, we do; sometimes we are a little annoyed by the mesh nets on the other shore when we are hooking.
368. Fishermen are allowed to mesh where they please? There is no restriction; they can put the nets where they choose.
369. You can catch up to what weight or size? For different classes of fish there are different weights—trout, mullet, ruffy, 2 ounces weight.
370. Have you any close season here? No regulations for closing the waters in Hobson's Bay.
371. Do you think if a portion of the bay was closed fish would multiply? It might do good.
372. *Mr. Thompson.*] You say no portion of the bay is closed? I think there is a portion a quarter of a mile on each side of St. Kilda pier and at the mouth of the Yarra.
373. The trout you refer to;—what fish are they? Australian salmon trout.
374. You say the fish supply is decreasing? Yes.
375. What is the remedy for that? So long as the waters are fished all the year round it must be so.
376. You think the fish would benefit from a close season? I do.
377. Your seine nets;—do you haul them ashore or empty them in the water? The best part of us empty them in the water to let the small fish go.
378. What depth of water do you fish in when line-fishing? From 8 to 12 fathoms inside the Heads.
379. I notice some of your baskets are like those in use in New South Wales;—do you think they are the best for the purpose? Well, this basket [*producing one—a long, narrow, shallow basket*] is for barracouta. It is a good basket for the purpose.
380. Do you find that any pilfering takes place during the transit of the fish from Queenscliff to the Melbourne market? Yes.
381. If you were to discard those baskets and substitute in their place boxes of galvanised wire netting, with an iron frame and a lock, would that not prevent pilfering? I should think it would. It would be a good thing to have ice in the boxes.
382. You do not use a well-boat yourself—have you seen them used here? I have seen one or two well-boats—they answered very well.
383. Are you of opinion that fish would live in well-boats? I am sure of it. Flounders and other varieties would live in the wells. When I am fishing at Mud Island I keep flounders alive until I land my catch.
384. Do you send your fish cleaned to market? As they are caught.
385. Would it not be better to gut them? Yes, especially if done in the saltwater; fish would keep as long again.
386. You recommend that fish should be gutted? I would, if it could be done.

387. What kind of net do you use? I use a net of 4-inch mesh and 60 fathoms.
 388. Do you use that as a seine? Yes.
 389. You have a mesh net here? Yes; a set net.
 390. What is the mesh of that? From about 2 to 2½ inches.
 391. Is it measured on the diagonal? Measured on the diagonal.
 392. What fish does it catch? All kinds.
 393. I think I heard you say the nets are baited for flathead? Baited about half-way down the net.
 394. Have you ever used a trammel net? No. There is one working here, but it frightens the fish.
 395. The salmon you get in Victorian waters;—is it a good fish? In September or October it is a good fish.
 396. Is it in roe then? I have caught them in roe.
 397. You call them salmon trout as well as salmon? Yes.
 398. We call them the arripis in Sydney? Yes; that is the fish. I was catching fish near to Balmain, in Sydney Harbour, as far back as 1859.
 399. Do you smoke or cure any of your catch? Last year we cured some barracouta. It answered very well.
 400. What class of fishing boats is employed here? Boats of my class, but a little longer.
 401. They could not ride out a heavy storm? No; the waves would make a clean sweep over them.
 402. *Acting-President.*] What did the cured barracouta fetch? I think they sold at from 6s. to 9s. per dozen. That was selling them here at Queenscliff, retail.
 403. Do you have any difficulties among yourselves when on the fishing grounds? We work pretty well together. The mesh-nets monopolise the grounds sometimes, and we line fishermen cannot get on to them.
 404. At what depth do you generally work when line-fishing? About 30 fathoms; that would be some 15 or 16 miles off.

Mr.
B. Chidgey.
2 Feb., 1895.

Mr. George Werry, fisherman, Queenscliff, sworn and examined:—

405. *Acting-President.*] You are the owner of a fishing boat? Yes. She is named the "Surge"; she is 18 feet long and 2 feet 6 inches deep.
 406. Where do you fish? Inside, with a seine.
 407. Do you fish all the year round? Yes.
 408. What fish do you chiefly catch? The Australian salmon, crayfish, trout, and mullet.
 409. What is the length of your seine? Different lengths; the salmon net is 200 fathoms, and the other net about 112 fathoms.
 410. What is the mesh of the big net? From 2 to 3½ inches.
 411. And the other net? From 1 inch to 2½ inches.
 412. Is the mesh of your nets regulated? There is no law dealing with the mesh.
 413. Do you haul the net inshore? On the beach.
 414. Do many small fish get destroyed? We do not have the net right inshore. We pick out the marketable fish and turn the small ones out, when they swim away.
 415. How many are engaged with you? Four persons.
 416. What do you do with your fish? Send them to Melbourne by train.
 417. In baskets? Yes.
 418. Do you lose any of your fish in transit? I have missed a basket now and then. There are complaints, but I do not complain much.
 419. Do you make a fair living? Prices are bad.
 420. Is the fish supply increasing or decreasing of late years? It is decreasing. As to the school fish, we get just as many now as we did in the early days. The salmon appear in as big shoals as ever.
 421. The fish you get in the Bay, are they decreasing? They are not so plentiful.
 422. How do you account for that? There are so many fishing in the Bay now to what there were in the old days. There are between fifty or sixty boats at work now.
 423. If a portion of the waters were closed would the fish get a better chance of breeding? It would be quieter for the fish, but I do not think our fish breed here. We get small fish in different parts.
 424. *Mr. Thompson.*] You say the supply of fish is steadily decreasing;—how are you going to manage by-and-bye, when the fish have gone? The school-fish—salmon and garfish—will always come to this coast.
 425. You consider nearly all the fish here are migratory? Yes; all but the flounder.
 426. Where does the flounder spawn? In the channel, I think. The salmon spawn out at sea.
 427. The salmon spawn at sea? I fancy so.
 428. You send your fish to market clean? No.
 429. Would it not be a benefit to the people to get their fish cleaned? Most decidedly; they would keep better.
 430. In regard to the different nets—you may do as you like in regard to the nets, you say? You can use 10 fathoms or 500 fathoms.
 431. *Acting-President.*] Do the fishermen complain of the present system of disposing of fish in the Melbourne market? I think it could be made a little better. Our fish go to the market, and if they cannot sell them they will condemn them.

Mr. G. Werry.
2 Feb., 1895.

Mr. Cuthbert Fox, fisherman, Queenscliff, sworn and examined:—

432. *Acting-President.*] You are the owner of a fishing boat? Yes; a half-decked boat, 23 feet long.
 433. You have been fishing outside a good deal? Yes; outside and inside, Port Albert, and everywhere.
 434. What distance do you fish from the land when outside? About 12 or 13 miles.
 435. What fish do you get on those grounds? Principally barracouta.
 436. Any schnapper? We get schnapper within 3 or 4 miles off the shore—not many schnapper caught on the Victorian coast now.
 437. Have you had any experience in trawling? I have known every expedition that went out trawling from Victoria. It was about 1859 that the first expedition went out—a cutter named the "Pomona."
 438. Had they a proper beam trawl-net? Yes.

Mr. C. Fox.
2 Feb., 1895.

- Mr. C. Fox. 439. What length of beam? It would not be so large; the vessel was not more than 20 tons, it was only a small trawl. The next expedition fitted out for deep-sea fishing was a three-masted lugger of about 30 or 40 tons. They had drift nets, trawls, and seines. They did no good—they did not catch much fish.
- 2 Feb., 1895. 440. Did they lose their nets? Yes; a school of barracouta got among them.
441. In your fishing you sound a good deal? Yes.
442. Do you come across any reefs? No reefs about 7 or 8 miles out.
443. Mr. Thompson.] Are not oyster-beds discovered by trawling? They say so. In England you get a lot of oysters in your trawls.

MONDAY, 4 FEBRUARY, 1895.

[The Commission met on the Jetty at Welshpool, Corner Inlet, at 3 p.m.]

Present:—

THE HON. R. H. D. WHITE, ACTING-PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. William Moore, fisherman, Welshpool, Corner Inlet, sworn and examined:—

- Mr. 444. Acting-President.] How long have you been fishing? Since 1857.
- W. Moore. 445. Where have you fished chiefly? Port Phillip Bay, Westernport Bay, Corner Inlet, Mallacoota, as well as outside.
- 4 Feb., 1895. 446. How long have you been at Welshpool? Since the opening of the railway—about four years.
447. How many men and boats are employed hereabouts? There are about eighteen sailing boats, eleven flats, and fifty men. There is a floating population—besides people come from Port Albert, Franklin, and Toora. In the winter-time we have an addition of about fourteen boats.
448. How long does it take you to send your catch to town? About ten hours by rail.
449. Do the fish get to market in pretty good condition? We ice them all.
450. Where do you obtain your supply of ice from? From the Railway Department in Melbourne. Some get ice from the fish auctioneers in the Melbourne market.
451. The fish generally arrive in good condition? Very good. Two years ago it cost us as much as 16s. for 2 cwt. of ice delivered here by rail, now the price is reduced to 3s. for the same quantity.
452. The class of fishing you do here is net-fishing chiefly—I suppose you do line-fishing as well? Chiefly net-fishing, but there is a lot of line-fishing done.
453. Do you use the seine or set nets? Set nets and seines—three or four different kinds of seines.
454. You are allowed to use any nets you please? Yes; but set nets ought to be done away with; they frighten more fish than any other.
455. Do your fishermen haul fish on the banks or discharge the nets in the water? In the water.
456. Young fish are caught even under the present mode of capture? Undoubtedly so. I have seen all the different laws of Victoria tried to prevent the destruction of young fish, but they have been found not to answer, because if the mesh is small enough to save fish fit for market there would be smaller fish of other species meshed and killed.
457. What marketable fish do you catch here? Schnapper, whiting, pike, yellow-tail, garfish, kingfish, flathead, mullet, silver-fish, Australian trout, flounders, and soles.
458. What extent of waters do your fishermen work over in Corner Inlet? We work over a stretch of water about 34 miles long by about from one-half to 4 or 5 miles wide.
459. Do the fish you send from here fetch satisfactory prices? Yes, since we have been sending them in ice. Before we used the ice it did not pay at all—it was like throwing the fish away to send them to market.
460. The fishermen generally are satisfied with the returns they get now? Yes.
461. Mr. Thompson.] What is the mesh of the set nets? The mesh of the set nets is from 2 to 2½ inches.
462. Is that regulated by law? No; by the fishermen themselves. There are no restrictions on any nets in Victoria either as regards length or mesh.
463. Do you think there should be any restrictions on the sizes of the nets or mesh? No.
464. What is the usual size of the net used here? About one inch in the bunt and 1½ inches in the wings.
465. Is that a garfish net? Yes it is.
466. Then you do not discriminate between a garfish net and an all-round net? No.
467. Have you done any trawling on this coast? Some years ago I was trying to trawl at Mud Island. I caught flounders and flathead. A vessel was fitted out by the Victorian Government. They went to King's Island and lay there until they nearly grounded on their beef-bones. They came back again and reported there were no fish in Bass Straits, but they did not have the trawl down more than once. That was about twenty years ago.
468. What was the size of your trawl? About 15 feet at the mouth.
469. Are you of opinion that trawling would suit on the Victorian coast? It might at the Ninety-mile Beach. The kind of fish that is here could be caught in the trawl right enough. There are plenty of plaice, flounders, and soles. They could get the proper Dutch plaice, too. They do not come into the bays; they are outside.
470. Do you think that trawling, if properly carried out, would be successful? I think so. I fail to see why it should not be successful.
471. Do you think that drift or herring nets could be advantageously used on this coast? Yes, I do. mackerel and mackerel trevalli could be caught by thousands of tons. I have steamed from Cape Everard right up to Gabo Island through one unbroken mass of those fish.
472. Do you know a net called the trammel net? Yes.
473. How do you think that would answer? I think the elaborate rigging of it would hardly pay for the results.
474. I notice you have fish-baskets here;—can you improve on that method of carrying fish? Boxes would be better, our boxes are better.

475. Supposing the railway authorities, instead of sending you ice, were to send you a cool car? That would be a wonderful improvement in the conveyance of fish.
476. In that case a box, with the sides and ends of wire netting, would be an improvement? Yes, a very great improvement.
477. You think it would be better than closed boxes? Yes.
478. Are there any waters in Victoria closed against the use of fishing-nets? Yes; all rivers and river mouths are closed.
479. For what distance? About a quarter of a mile from each side of the river.
480. How far out? About the same distance—that is, for net-fishing.
481. What are the conditions of your oyster leases? A lease costs £1; they give it to you for four years, and you pay 10s. a year for 300 acres; but that is not oysters, only a piece of ground to cultivate oysters on.
482. For cultivation only, then? Yes; they do not lease oyster beds in Victoria.
483. Have you any success with this cultivation? Yes.
484. What process of cultivation do you pursue? I save the spat with faggots made out of horizontal boughs with the bark on. I find it is better than anything else you can use here.
485. Do you allude to the rock oyster? No, a very good kind of mud oyster. Of course they cannot compete with the Sydney rock oyster, or the Queensland oyster. At Mallacoota there were some splendid oysters, but the New South Wales boats from down Twofold Bay way went in there and destroyed them all.
486. Is that place sometimes called the Genoa River? The Genoa River runs into Mallacoota Lake.
487. Then I suppose the oysters there partook of the character of the New South Wales oyster—the Womboyne oyster, for instance? They are better; they are the finest oysters I ever saw in any of the colonies. They are like the Womboyne oysters.
488. What are the railway charges for the carriage of fish—from Welshpool to Melbourne? If you send a ton, about £1 7s. 6d.; a box of 60lb. would cost 1s. 4d.
489. What does the Railway Department charge you for carrying ice? Fifteen shillings a ton for the ice, and 10s. for the carriage from Melbourne to Welshpool—120 miles.
490. Is the fish supply of Victoria decreasing? I think so in Port Phillip Bay and Westernport Bay, but not anywhere else.
491. What is the cause of the decrease in those places? I believe the set nets are the cause of it.
492. Supposing set nets were allowed, but of a larger mesh, to catch only marketable fish? It would be, all the same; they only frighten the garfish away.

Mr.
W. Moore.
4 Feb., 1895.

TUESDAY, 5 FEBRUARY, 1895.

[The Commission met at "Smith's Hotel," Port Albert, at 11:30 a.m.]

Present:—

THE HON. R. H. D. WHITE, M.L.C., ACTING-PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Henry Avery, Secretary to the Port Albert Fishermen's Association, sworn and examined:—

493. *Acting-President.*] You are secretary to the Fishermen's Association, and the owner of a fishing boat? Yes, the "Cliffy."
494. What tonnage is she? Three tons; she is an open boat, half-decked with a centreboard.
495. How long have you been engaged in fishing? About fourteen years.
496. Are there many fishing boats here? About twenty boats, including Port Albert and Tarraville. About fifty men are engaged in fishing.
497. What extent of water do you fish over? About 15 miles—that is, east and west from Port Albert.
498. Net or line fishing? Nearly all seine-fishing.
499. About what quantity of fish do you send to market, on an average? Not more than fifty baskets per day.
500. What class of fish do you catch? Flounders principally, in the summer—schnapper, pike, garfish, mullet, Australian trout and flathead. Garfish is the principal trade in the winter-time, and trevally.
501. How do you send your fish to market—by train? Yes, packed in ice in boxes.
502. Do you get a fair price for them in Melbourne? We get a fair price providing we get them to market in good condition.
503. How many hours are they in transit from here to Melbourne? They are twenty-four hours old when they get to market.
504. Do the fishermen here make a good living? Yes; those who own good boats and good gear make a good living.
505. Are they satisfied with the way the sales are conducted and the returns come in? I believe the majority are not satisfied.
506. For what reason? They think the salesmen do not handle the catches properly—do not sell it as it should be sold.
507. What other way do they propose to better the existing system? They consider the salesmen are buyers and sellers and buy a lot of the stuff in at their own prices. It is not properly submitted to public competition.
508. What facilities have you from the Government or the fish market for getting your fish to market—do they send you the ice? The Railway Department are prepared to supply any quantity of ice, delivered at the nearest station to any fishing port, at a uniform charge of 25s. per ton. The cost of the ice is 15s. per ton, and there is 10s. for freight.
509. I suppose the fishermen look upon that as a great boon? Yes; some of them were paying about £3 per ton to private agents for ice.
510. What do the fishermen propose as a better way of selling or getting rid of their fish? I believe the fishermen think that public competition at auction sales would be best.

Mr.
H. Avery.
5 Feb., 1895.

511.

Mr.
H. Avery.
5 Feb., 1895.

511. Do you know what they do in Hobart or other places? Only from hearsay; they sell at the wharf, I believe, but we cannot. Our difficulty in Victoria is—our ports are so far away from the market.
512. The facilities the Melbourne Corporation give you for keeping fish in cool rooms must be a boon to the fishermen? Yes; but we can do better if we have a plentiful supply of ice.
513. What length of seines do you use chiefly? About 150 fathoms.
514. What depth? Twelve to 22 feet; 12 feet at the end, 22 feet in the middle.
515. And what mesh is generally used? From 1¼ inch to 2 inches.
516. Have you set net-fishing? Yes, we had; we have knocked it off of late years.
517. Your mesh is not regulated by law, but chiefly left to the fishermen to regulate at discretion? The regulation size is by weight.
518. Do you consider the fishermen destroy young fish by using so small a mesh? I do not think so.
519. They never haul their nets right inshore; they are compelled to discharge in the water? Yes; it is much easier.
520. Have you any oyster-fishing here? The beds are closed. There is no fishing for oysters here, although there are several beds at Port Albert.
521. Mud oysters? Mud oysters.
522. Do you send many oysters to market? None have been sent that I know of during the last fourteen years, with the exception of oysters taken outside, along the coast, of which there are plenty.
523. That class of oyster could not compete with the good rock oyster you import? No; we cannot compete with the imported rock oyster.
524. You do not consider there is much to be done in the oyster trade here? No; not a great deal.
525. You have a Fishermen's Association;—what is its object? To benefit the fishermen generally. If it had not been for the Association I should not have been here to-day; they did not know when the "Lady Loch" would be here so they asked me to keep watch and give evidence.
526. What kind of outside fishing do you do—any net-fishing? It is mostly done with seines.
527. That is the sea-fishing? Yes; off the beaches.
528. What length of net do you use when outside? 150 fathoms long by the same depth, and 1¼ inch mesh for taking garfish.
529. Do you know of any other net being used on the beach—what they call a funnel net? That would be what we call a bag, I expect. That is for taking salmon or trevally.
530. The larger fish? Yes; much larger fish.
531. They get large hauls, do they not? Yes. It is used on the beach on account of the heavy surf. The fish go into the bag, and the men in the boats fasten a loop around the mouth of the bag. The fish are not taken to the beach at all; they are baled out of the bag into the boat.
532. Do you know of any school-fishing or trawling on this coast? I believe trawling has been done here, but not by our men.
533. How is it the fishermen do not try outside work more? They do not know where to look for the banks—it costs too much to find them.*
534. These open waters—does over-fishing lessen the supply here? These waters are continually being supplied with fresh fish, which come in from outside. Over-fishing might interfere with the supply of flounders, and that class of fish, but not with the other sorts.
535. Then the people here are pretty contented, and work well together? Yes; they have good and bad seasons; the present season is a very bad one.
536. How do you account for that? Fish is scarce, and it is a bad time of the year for outside work; too much easterly weather.
537. What distance off the coast do you generally fish for schnapper? I fish about a mile and a half from the coast.
538. Are they plentiful or scarce? I have found them pretty plentiful, but we can only go on the ground in good weather.
539. What quantity of schnapper do you get at a catch? Half a ton for a night's hooking with three men; that would be about an average in good weather.
540. Do you find the schnapper generally stay about the same grounds, or do they go away? They seem to stick pretty well to the known grounds.
541. *Mr. Thompson.*] The sales in the Melbourne markets are conducted by agents at the present time? Yes.
542. You are in favour of Corporation salesmen? Yes.
543. In Hobart they have a system by which the fishermen sell the fish themselves. I suppose you could not do that here; you must employ an agent? Yes; it is too far away from the market for us to sell ourselves.
544. Would it not be possible for the Fishermen's Association to appoint somebody to sell for them? Several of the Melbourne agents at the present time have been put there by the fishermen. The feeling among the fishermen is that there are too many salesmen in the market.
545. Do you send your fish cleaned to market? No; I have tried it, but could not sell it.
546. Do you think a system like that would be advantageous to the public? It would be the best thing that could be done. The fish would not go bad.
547. If the Government were to encourage such a system, do you think it would be satisfactory to the public? Yes, I do.
548. You send your fish away in ice; I noticed some being packed at Welshpool yesterday;—do you not find that the fish at the bottom of the boxes are very much compressed and bruised by the weight of the topmost fish resting on them? Yes, they are.
549. Would it be an advantage if, instead of the Railway Department furnishing you with ice, they were to supply you with a refrigerating car for the purpose? For my part I would sooner have a supply of ice than the car, because I could handle my fish more rapidly.
550. Have you any idea where the fish propagate here—do they propagate in the sea or in the inlets? I think a certain class spawn in the inlets.
551. What fish spawn in the inlets? Flounders and pike, I think—they are the most noticeable anyway.
552. I presume your oysters cannot be carried because the shell is so porous that it lets the water out? Yes.

553.

* NOTE (on revision):—This answer refers to trawling.

553. Have you ever tried carrying them in moss? No; I have not been in the oyster trade.
554. Have you had any experience of well-boats? No; I have seen one or two come to this port with fish.
555. In what state were the fish when they arrived here? The crayfish were very good, but the other fish were not so good; the boats were too small, the fish in them got knocked about—the well was not big enough to carry the fish properly.
556. Do you take any steps to preserve your fish? In warm weather we sometimes take ice with us, and pack the fish as we catch them.
557. You fish mostly at night? Nearly all night-fishing.
558. You have no garfish up here, have you? Yes, in the winter large quantities are taken.
559. Do you consider there is a necessity for closing a portion of your waters against net-fishing? Not in these parts.

Mr.
H. Avery.
5 Feb., 1895

WEDNESDAY, 6 FEBRUARY, 1895.

[The Commission met on board the Victorian Government steamer "Lady Loch," at Cunninghame, Lakes Entrance, Gippsland, at 9'30 a.m.]

Present:—

THE HON. R. H. D. WHITE, M.L.C., ACTING-PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Thomas Jemmeson, fisherman, Cunninghame, Lakes Entrance, Gippsland, sworn and examined:—

560. *Acting-President.*] You are the owner of a boat? Yes, the "Ada."
561. What length is she? Twenty-five feet long, 8 ft. beam, 2 ft. 6 in. deep; she is half decked and Freuch lugger rigged.
562. *Mr. Thompson.*] Has she a centreboard? Yes.
563. *Acting-President.*] Can you stand any weather in your boat off the coast? Oh, yes; we came from Tasmania in one of the same size and class.
564. How many fishermen are there at this end of the Lakes? From twenty-five to thirty boats, and about ninety men.
565. What sort of fishing is it chiefly? One portion out and the other portion inside.
566. What net do you fish with? We use a 2-inch net—cotton and hemp.
567. What length? About 150 fathoms long; it is 22 feet in the centre, and runs out to the pole about 15 feet.
568. Is it a funnel net? Yes; I will give you a description. The centre of the net is split from corkline to leadline, and a bag composed of 2½ and 2 inch of heavy stuff is laced on to each side of the split.
569. What size is the bag—about? We use a bag about 30 feet across the bottom in width, and about 5 fathoms in length
570. You do not pull your fish in at all then? We merely unlace the bag, and put a line around the mouth of it. We do not bring the net inshore; we stand in the water, put a line around the mouth of the bag, unlace the bag from the net, and then tow the bag and the fish into the Lake's Entrance channel. Then we put the fish into paddocks, thus keeping them alive until we want them.
571. How do they live in those paddocks;—do many die? They live pretty well unless you drag them through the sand and choke them. I have had them there for three months at a time.
572. What class of fish have you had in the paddocks? Salmon, silver fish, yellow-tail, Australian trout—that is all we get.
573. Can you show us a funnel net before we go away? Yes.
574. What other class of fishing do you go in for? We do not do much hooking. We hook schnapper at the fall of the year.
575. How far out? About 6 miles along the coast, at a place called the Red Bluff, at the end of the Ninety-mile Beach.
576. What months do you generally fish for schnapper? From April till the end of July.
577. Do you get any quantity? Yes; we have got 100 and 120 in a day.
578. How many boats were there on the ground at that particular time? Seven or eight. I have seen twenty boats there. They are pretty big fish, averaging about 12 lb.
579. How do you get your fish to market? By steamer. We pay 5d. per basket to have them taken to Sale, and I think it is 7d. per basket from Sale to Melbourne by train.
580. How do you keep your fish;—do you get ice or send them away as you catch them? We have nothing at all. We have had an awful lot of fish condemned this year through not having cool trucks or ice.
581. If an ice-house were erected here, would that assist in preserving your fish? I think it would be better if ice could be stored at Cunninghame and at Paynesville, higher up.
582. If they were packed in ice you believe they would go to market all right? Yes; I am sure of it.
583. What quantity of fish have you had condemned this year? During the last three months I should think one boat had over 100 baskets condemned.
584. Do you get fair prices for the fish? They have been going very low this year.
585. Are the fishermen satisfied with the way the fish are disposed of in the market? They have several complaints; they are not satisfied.
586. What do they complain of? They complain that their stuff is not sold over the table in the market. It is this way: Each salesman has an up-country trade, and he takes the stuff away. He picks out what he wants, but it does not go into the market. He gives the price that the same sort fetches in the market. All our fish ought to be sold at public auction.
587. What do the fishermen suggest as a remedy for this? I think if one man were put in by the fishermen to sell for them it would be better—a representative from each district. Those representatives would know the class of fish every morning, and a price could be put on them, according to the quality of the fish. What the fishermen want is a uniform price per pound. That would be more satisfactory. Our representatives could put a price per pound on the several kinds of fish, and people who wanted it could come and get it. The fishermen would be satisfied with a fair thing. There is about £6,000 or £7,000 paid away yearly to the principal salesmen now for conducting the sales in the market. Each

Mr.
T. Jemmeson.
6 Feb., 1895.

- Mr. T. Jemmeson. man has his own office, and so forth. The plant of one man would be sufficient to do all the work and thus lessen the charges. We have to pay 10 per cent. now, and we think the work might be done for 5 per cent.
- 6 Feb., 1895. 588. You do not mean that one salesman could do the selling at the market? No, not by himself; the representative of the fishermen would employ men to sell the catch as it was received.
589. You do not do much lake fishing here? You will get evidence concerning that at Paynesville.
590. Mr. Thompson.] The net you spoke of, you do not divide it into bunt and wings, you have one general mesh throughout? Yes.
591. The fish you catch outside, do you get most of them into your paddocks alive? Yes, mostly alive.
592. Do you feed the fish in the paddocks? No; but they would be better for being fed. I have had them feed out of my hands. They get very thin without being fed.
593. Did you ever see a well-boat? No.
594. What is the distance your fish have to be taken to Sale? Sixty odd miles.
595. The fish are taken by steamer that distance? Yes.
596. At Sale they are put in the railway trucks and sent to Melbourne direct? Yes; it is 120 miles from Sale to Melbourne.
597. How many hours elapse from the time you send the fish away from this place until they reach Melbourne? They leave here at 8 in the morning and arrive at Melbourne at 12 o'clock at night. They are sent to market, and sold at 6 o'clock the next morning.
598. Do you know anything about trawling? I never did any.
599. Do you get crayfish or lobsters here? Not here.
600. What are the nationalities of the fishermen employed here—are they British subjects, or Greeks, or Italians? There are very few Italians, but we have a lot of foreigners—Russian Finns, Swedes, and such like.
601. What is the proportion? There are more Europeans than any others. There are two Chinese crews fishing.

WEDNESDAY, 6 FEBRUARY, 1895.

[The Committee met at the "Temperance Hotel," Paynesville, Gippsland Lakes, at 1:30 p.m.]

Present:—

THE HON. R. H. D. WHITE, M.L.C., ACTING-PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Thomas Murray, fisherman, Paynesville, sworn and examined:—

- Mr. T. Murray 602. Acting-President.] You have a boat of your own? Yes.
- 6 Feb., 1895. 603. What size? Twenty-nine feet nine inches; half decked.
604. What fishing do you go in for? Meshing, principally.
605. What length of mesh net do you use? 680 fathoms; that is for perch.
606. What mesh? From $3\frac{1}{4}$ in. to 4 in.
607. What is the depth? About 7 feet.
608. Do you set your net in shallow water? In all depths, from shallow to 20 feet. It all depends where we are fishing.
609. Do you get good hauls? Fish have been extraordinarily scarce these last twelve months. I have never seen anything like it in these parts.
610. How do you account for the scarcity? Twelve months ago we had a very heavy flood, and everything seems to have been swept out of the lakes. Before that there was a good show for fish. The ground was disturbed by the heavy flood, and that had a great deal to do with the scarcity. There is any quantity of fish up the rivers. At the present time there are tons and tons in the Mitchell River.
611. What quantity did you get, say, five years ago? As many as from 500 to 600 baskets per week. We averaged between 500 and 600 per week.
612. And now? Now, you will not see a basket in a week.
613. Do they come in from the sea? I think so.
614. How many men and boats are there on the lakes altogether? About 180 men and forty boats on Lakes Wellington, Victoria, and King.
615. You are hauling every day;—do you think that has anything to do with the scarcity of fish? My opinion is that the scarcity is to some extent in consequence of the continuous fishing.
616. Would it be a good thing to close one of the lakes for a time, so that the fish might have time to breed and increase? I think it would be a good thing to close the waters. The rivers are closed within a quarter of a mile of their mouths. If we get three days' heavy rain tons of fish come down from the rivers to the lakes. The lakes are fed from the sea and the rivers. We get a quantity of salmon and yellow-tail and skipjacks in the lakes.
617. Do you manage to get your fish to market all right? We have a great difficulty. The train journey to Melbourne is right enough, but our fish remain at the railway station in Melbourne. They ought to be taken direct into the market. A great number of our fish go up the country and they are never seen in the market.
618. Do your fish reach the market in pretty good condition? During the hot weather some were condemned, but they carry very well in the cool cars on the railway.
619. There is no ice in those cars? No; I believe the cool cars are better than ice.
620. Mr. Thompson.] What nets do you use? The mesh nets are for bream and perch and the smaller net is for mullet.
621. Acting-President.] You have seine nets? We have the bream seine and the garfish seine; also the flounder seine.
622. Mr. Thompson.] How far is Paynesville from the sea? It is about 16 miles from here to Lakes Entrance.
623. Do the garfish travel all this way? Yes; they have been seen as far up as Sale—60 odd miles from the ocean.

TUESDAY,

TUESDAY, 12 FEBRUARY, 1895.

[The Commission met at "Menzies' Hotel," Melbourne, at 3 p.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

John Clayton, Esq., Town Clerk, Melbourne, sworn and examined:—

624. *President.*] You occupy the position of Town Clerk of Melbourne? Yes.

625. How long have you held the position? Three and a half years; but I have been in the service of the Council for over ten years.

626. You have had a good opportunity during your connection with the City Council of becoming conversant with the system of fish distribution adopted at the Fish-market in Melbourne? The Market Committee of the Council controls the market and the officers in charge.

627. You desire to make a statement? To facilitate your inquiry I have made notes of matters likely to be of interest. I may say that our sources of supply are from Warrnambool and Port Fairy on the one side of the bay. Then we come round to Hobson's Bay and the fishing stations in it. From thence we go to Westernport Bay, Corner Inlet, Port Albert, and the Gippsland Lakes. In addition to that, we have the fish from the Murray River, extending from Echuca to Euston, 100 miles beyond Swan Hill. Our means of conveyance is principally by rail; a small portion by road from the nearer fishing stations, and the fish caught in the deep-sea and sometimes down Warrnambool way come by water. Our imported fish are chiefly the blue cod, from New Zealand, and schnapper and whiting, from South Australia—that is, treating the Murray fish as Victorian fish. I have a return showing the fish sold in the Melbourne market during the year 1894. It is as follows:—189,520 baskets of sea-fish, 7,056 baskets of Murray fish, 1,286 boxes of imported fish, 14,354 bags of oysters, 564 bags of eels, 465 baskets of prawns, 19,122 dozens of crayfish, and 7 turtle. With reference to our Fish-market, I will forward a plan, showing details, together with the cost of the same, to the office of the Commission in Sydney. Regarding the delivery to market, the plan shows railway connection, with the receiving platform alongside the market entrance; but this, although specially designed for the purpose, has not yet been utilised, owing to the Railway Department feeling compelled to place an extra charge of 1d. per basket for shunting upon all fish which would come into the market. The result is that the fish which comes by rail from various parts of the colony is taken to the Spencer-street station, and has to be taken thence by carts to the Fish-market, entailing further handling and knocking about. The fish is taken by carts into the market in the early hours of the morning. Trolleys are provided so that it can be run to any part of the market, either from the carts or from the railway platform. The principle of the market is a series of raised stands upon which the salesmen sell the fish. These stands are of slate, and the whole of the market is paved with asphalt. The walls are lined with tiles, so that the whole of the building can be cleansed and hosed down immediately the sales are over. The market is under the control of an inspector and collectors, the duties of the inspector being to exercise a strict supervision over the quality of all fish and other produce brought into the market. The inspector, also, has powers of seizure and condemnation. When fish is condemned, the inspector issues a ticket to that effect, which is forwarded to the fisherman by the salesman to account for the disposal of his fish. Any fish seized is placed in the deadhouse and destroyed by disinfectants, to prevent its use for food, and then carted away to the desiccator and converted into manure. I hand in a return showing the quantity of fish condemned during the year 1894:—4,871 baskets of sea-fish, 295 baskets of Murray fish, 102 dozens of crayfish, 16 bags of eels, 52 bags of oysters, 93 boxes of imported fish, and 3 baskets of prawns. Seized under the Fisheries Act:—824 baskets of fish, nearly the whole of which were sent to the different charitable institutions for the inmates. As to the method of sale at the market, there are about ten salesmen or auctioneers to whom the fish is consigned by the auctioneers. They take delivery at the railway station and cart to the market, and sell on the stands as already described. The sales are conducted by auction, the whole of the salesmen selling at the same time. The first sale commences at a quarter to 6 o'clock in the morning. In the past a quantity of fish has been consigned by the salesmen to the country districts before the auction sales commenced. This practice has been complained of by the fishermen. New regulations have been prepared to deal with this and other matters which have been sources of complaint on the part of the fishermen.

628. *Mr. Thompson.*] Fish forwarded to the market is sent into the country without being offered at public auction and the fishermen complain of that? Yes; the salesmen have certain country customers. When the fish is brought to the market they select what they require and send it away by the early trains to the country before commencing to sell in the market. This has been the cause of great complaint on the part of the fishermen, who alleged that there was no check upon the returns furnished to them for the fish so disposed of. To meet these and other matters which were the subjects of complaint by the fishermen, special regulations were prepared, a copy of which I hand in. The fish is usually sold by the basket, the principal exceptions being Murray cod, and the larger fish, which are sold at per pound, and flounders, which are sold at per dozen. To facilitate inspection by the buyers, wooden platforms have been placed on top of the slate stands, making those stands from 1 to 2 feet higher than originally designed. This has been found to be a distinct advantage.

629. *President.*] What about the agents' charges? The agents' charges for the work performed by them range from 7½ per cent. to 10 per cent. on the proceeds of the sales. Concerning the regulations, I should say that at the opening of the new market the Council endeavoured to deal with the complaints made by the fishermen from time to time; but which, owing to want of space and convenience in the old market, could not then be dealt with. The first of the new regulations I have alluded to, is as follows:—

1. The market shall be open for the sale of fish, poultry, wild-fowl, hares, rabbits, and the like, at half-past 4 o'clock, ante meridian, on every day, excepting on Sundays and Christmas Days, on which days no business shall be transacted therein; and the market shall close daily at 5 o'clock post meridian.

As you see this regulation provides for the sales commencing at 5 o'clock with a view to ensuring that the fish sent to the country districts shall be sold at auction in open market prior to being sent away. No persons

J. Clayton,
Esq.

12 Feb., 1895.

J. Clayton, Esq.
12 Feb., 1895.

sons are permitted to act as salesmen except with the approval of the City Council; and such permission may be cancelled at any time for sufficient cause. To meet a complaint made, rule 8 provides that—

8. No salesman or auctioneer shall act as, or take part, directly or indirectly, in the business of a buyer or forwarding agent either on his own behalf or as agent for others.

Rule 9 was specially drawn up in order that the inspector shall be in a position to obtain, when necessary, full information from the salesmen as to the prices realised for all fish brought into the market. It reads as follows:—

9. Each salesman or auctioneer shall furnish daily to the market inspector a true and correct return of the fish and other marketable produce sold by him each day, and of the prices realised for such fish and other produce; he shall keep proper books containing such information, and also the names of the persons on whose behalf such goods are offered for sale by him, and shall produce his books to the market inspector at all times when required. He shall give to the market inspector or the lessee of the market, whenever required, correct information as to the goods which have been brought into the market by him or on his behalf, and shall, at the time of offering any such goods for sale, publicly announce the name of the person on whose behalf they are offered for sale.

630. You have no control over the fishermen so far as licenses are concerned? No.

631. *Mr. Thompson.*] You have no control over the fishing grounds? No. The Council's control is limited to the city boundaries. Our inspector also acts as an inspector under the Fisheries Act, and receives an additional salary from the Government for his services in that capacity.

632. He really administers the Act in your Fish-market? Yes, that is so. The business transacted at the market is shown in daily and weekly returns of quantities sold and prices realised. The revenue of the Council is derived from dues levied upon all fish brought into the market. The scale is as follows:—

CITY OF MELBOURNE.

MARKET dues and tolls to be levied in the General Markets of the City of Melbourne.

Upon fish.

Every basket containing fish, and of capacity not exceeding 2 cubic feet, or for so much unpacked fish as shall not exceed what such basket could contain	d.
Salt, dried, and smoked fish, per cwt.....	3
Oysters, per bushel	6
Lobsters, crayfish, or crabs, per dozen	1
Shrimps, per gallon	2
Cockles, periwinkles, and small shell-fish, per gallon	1

As to hawking Produce purchased in any general market of the City.

	Day.	Week.	Month.	Quarter.
For every cart with vegetables, fruit, or fish.....	1s.	3s.	8s.	20s.
For every wheelbarrow with vegetables, fruit, or fish.....	6d.	2s.	6s.	15s.
For every handbasket with vegetables, fruit, or fish	3d.	1s.	3s.	8s.

JOHN CLAYTON,
Town Clerk.

The Council has under consideration a scheme by which the dues upon the cheaper or commoner fish may be greatly reduced, and at the same time be more equitable with regard to the better quality of fish—the proposition being to charge a percentage upon the proceeds of the sales. The fishermen in different parts of the Colony are now being consulted in regard to this matter, and it is expected to be given effect to in the course of a few weeks. It is the intention of the Council to make an appreciable reduction as far as the cheaper class of fish is concerned. This, of course, will result in a considerable reduction in the total revenue derivable from the Fish-market.

633. *President.*] Your salesmen have offices in the market, have they not? The salesmen, in addition to their stands, are provided with offices or stores which are built around the market, each stand opening off the office. For this accommodation they pay a rental of 25s. weekly.

634. What does that 25s. per week cover? It is charged for the use of the offices and stand which is used not only for the sale of fish, but of rabbits, wild fowl, and other marketable produce. Alongside the market, as shown on the plan, the Council has erected cold storage chambers for the storage of not only fish, but meat, butter, and other produce for export. As regards the Fish-market the cold storage is provided at a charge of 1s. per basket of fish per week, or any lesser period. The word basket means a capacity of 2 cubic feet—although smaller-sized baskets are largely used by the fishermen as they produce better returns.

635. *Mr. Thompson.*] I suppose the fish placed in the smaller baskets are generally the finer fish? Generally the better fish. I may add that when a large consignment of fish is placed in the cold storage chambers a special charge, as low as one-half of the general rate, is made—for instance, when one of the deep-sea boats brings a load of fish to market. Another system of charge is that by which a space can be taken for a fixed period, the chambers being divided into small compartments for which a weekly rent is charged on the basis of 1s. per square foot floor space. In this compartment the holder may place whatever quantity he pleases, subject to such supervision and conditions as are deemed necessary to prevent injury to other goods in the chambers.

636. Can he increase his accommodation by using shelves? Yes; he may use the space to the best advantage.

637. What is the height of the chambers? About 9 feet.

638. *President.*] Now as to your method of distribution? The principal method of distribution is by hawkers who purchase at the sales and distribute by means of cart, hand truck, and basket, in the different suburbs. A few shopkeepers in the city and suburbs also distribute from their establishments to various places. This question of distribution is one of the most difficult problems we have to deal with in connection with the fishing industry, as it affects every branch, from the fisherman to the consumer. It is hoped to partially overcome this difficulty by instituting earlier sales in the Fish-market, which will allow of sufficient time to enable the hawker to get the fish to the consumer in time for breakfast the same morning. Under present conditions a very large proportion of the fish is distributed too late to be used until dinner-time at the earliest. Some of the results of the existing system are the

absence

absence of fresh fish for breakfast—which tends to discourage its use—and the loss sustained by both fisherman and consumer in consequence of the fish turning bad before sale or consumption. As the value of every fish which goes bad while in the hawkker's hands has to be charged upon those remaining to be sold, this considerably increases the cost to the consumer without giving any additional profit to either the hawkker or fisherman.

J. Clayton,
Esq.
12 Feb., 1895.

639. Have you any arrangement by which the hawkkers can clean their fish before leaving the market? No, not cleaning in your—the Sydney—sense of the term, although ample provision is made for washing either in or out of the baskets, so that every fish can be sent out perfectly clean and fresh.

640. *Mr. Thompson.*] Would you consider it an advantage for the fish to be delivered cleaned and gutted to the consumer? No doubt it would be a very great advantage because of the difficulty with the domestics.

641. Would such a scheme be practical? Certainly—it is not impracticable.

642. Have you any auxiliary markets in the Melbourne suburbs? No. Of course there are suburban markets for the sale of ordinary marketable produce; but I am not aware of any fish being disposed of there. They could hardly be termed auxiliary markets as they are held on different days and the produce, in the main, goes to them direct and not through the central market.

FISHERIES OF NEW SOUTH WALES.

THE SOUTHERN HOME FISHERIES: CROOKHAVEN AND SHOALHAVEN RIVERS' FISHERIES.

FRIDAY, 8 MARCH, 1895.

[*The Commission met at the "Albion Hotel," Nowra, at 2:30 p.m.*]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C.

L. G. THOMPSON, Esq., J.P.

Mr. George Haiser, oyster lessee, Greenwell Point, Crookhaven River, sworn and examined:—

643. *President.*] Your name is George Haiser, and you reside at Greenwell Point, Crookhaven River? Yes; I have lived there between thirteen and fourteen years.

644. Have you been engaged in connection with the oyster fisheries there? Yes.

645. Had you any connection with oyster fisheries prior to living at Greenwell Point? Yes, for twenty odd years, at Bateman's Bay, the Clyde River, the Tuross River, Durras Lake and Pambula Lake.

646. Your experience, then, in connection with oyster fisheries extends over a period of how many years? Thirty-five years.

647. And have you during that time watched closely everything connected with the growth of oysters? I have for the last twenty years.

648. In what condition were the oyster-beds when you first commenced to have anything to do with oyster fisheries? In splendid condition.

649. Has their condition altered since? Yes; very much so.

650. Can you give the Commission an opinion as to the causes which have operated detrimentally to the development of the oyster fisheries? Well, there is the overworking of the beds by the different small lessees. They go on stripping the ground from one place to another, and the beds are not given sufficient time to recoup themselves.

651. What do you mean by overworking—overdredging? Yes.

652. As to the disease which has attacked the oysters, what is the nature of the disease? In my opinion the disease is caused by floods, and the drainage from the swamps at the heads of the rivers.

653. In what manner does the disease attack the oyster? At first while the oysters are feeding they swallow the impure water, and they have not sufficient strength to spew it out again.

654. Have you discovered anything in the shape of a worm which has attacked the oyster? Yes; I have.

655. Can you give the Commission any information in regard to the disease;—can you account for its being located in different districts? About five years ago I first discovered the disease here in the Crookhaven River. I had a bed of 600 bags laid down, and I was just working that bed for market when I saw the black mud in them. I told my men not to gather any more oysters from the bed as it might recover; I thought the disease might work out of them; but it did not—it killed the whole bed of oysters, and I got no return from them.

656. Where did you get the spat from? From the river, close to the breeding grounds.

657. You hold some oyster leases;—what is the total extent? Something like 7,000 yards at the present time, in different localities.

658. Where are they located? In the Currumbene Creek, the Crookhaven River, and a small lease on the Manning River.

659. Have you given personal supervision to the oyster lease you have on the Manning? No; I have not been there.

660. Have you had any return from that lease? Yes.

661. Did you put down any spat there? No; it is natural growth.

662. Which of the places where you have placed spat for the purpose of artificially propagating the oyster has proved to be the best fattening ground? Currumbene Creek.

663. As an oyster lessee, what, in your opinion, is the best locality to select for oyster breeding or fattening, that is, having regard to the soil and the condition of water best suited to their development? Currumbene Creek is the only place for laying down—the Shoalhaven is too muddy.

664. Has the Currumbene Creek a regular supply of fresh water, and is the influence of the tide felt there? Yes; I had a lease of 1,000 yards in Jervis Bay; those oysters I have sent to Melbourne, but the disease is in them, although I did not know anything about it, and I cannot sell them.

665. Where did you get those oysters to lay down? From my breeding grounds.

666. Do you think the disease was in the spat? No; I attribute it to nothing else but the number of floods we have had, one after the other.

667.

Mr.
G. Haiser.
8 Mar., 1895.

- Mr. G. Haiser.
8 Mar., 1895.
667. Are there any other oyster lessees besides you down here? Yes; Lonesborough—I do not know of anyone else.
668. Where is your market? Melbourne.
669. You do not supply the Sydney market at all? No; very little.
670. What do you obtain for your oysters? At present the return has been as low as from 30s. to 5s. per bag.
671. How do you account for the decline in the price? The market being glutted.
672. Did you have to pay anything for the spat you laid down? Yes; the rent for the oyster leases. I had to wait for many years before I could get spat, and I did not take spat from Crown lands.
673. Have you any men working for you? Yes; six men.
674. Do you keep them constantly employed? Not in the winter. In the summer I sometimes employ as many as nine or ten men.
675. Do your beds suffer from the effects of frost? No.
676. You have never found the very cold weather act detrimentally to the oyster deposits? No.
677. What is your idea regarding the present system under which the foreshores are leased for oyster propagation;—can you suggest any improvement in the method of leasing, so that more encouragement might be given to those desirous of engaging in oyster culture? I can. Lessees should find security for the fulfilment of the conditions of their leases—sureties of (say) £200 for the proper fulfilment of the conditions. Then the wholesale destruction of the beds would not take place.
678. I suppose you have always respected the regulation in regard to the size of oysters to be sent to market; you have taken care not to send immature oysters to market? I have; at times it is impossible to avoid sending a small oyster; for instance, when oysters grow on top of each other.
679. Speaking from your experience, can you tell the Commission whether you favour the proposal for the leasing of a river, or an arm of a river, for the purpose of oyster culture, instead of favouring the system of letting 100 yards to anyone who cares to apply? I would suggest the river, because the man who has an arm would live upon the other man, by deriving benefit from the spawn which would come from the other leases on the river on to his lease.
680. As to the growth of oysters in the localities where you have held leases in this portion of the Colony—how long does it take for an oyster to become marketable from the time you lay it down? I have known them to be marketable in two years where the grounds are good, and I have known them to be as long as seven years before they become marketable. On the Manning River—I have only had that lease twelve months—from the natural deposits I have taken twenty-eight bags of oysters.
681. Where did those twenty-eight bags come from? From my lease of 200 yards.
682. Were there any oysters there when you took up the lease? No; not any. I was informed there were none on the lease. I have not been to the Manning myself.
683. You are led to believe that spat being deposited on that lease at the beginning of the twelve months, at the end of the twelve months you were able to gather twenty-eight bags of oysters from it? Yes. I had a bed at Newcastle; it was thoroughly cleaned, and in about three months afterwards the whole flat was covered with good marketable oysters.
684. *Mr. White.*] Grown in that time? Yes, grown in that time.
685. *President.*] In the Hunter River? Yes.
686. *Mr. Thompson.*] Fullerton Cove? Yes.
687. *President.*] During the time you have held these leases I suppose you have had several transactions with the Department of Fisheries in Sydney, presided over by the five Commissioners? Yes.
688. Have those transactions with the Commissioners been satisfactory in their nature? Very unsatisfactory.
689. In what way;—can you give the Commission the grounds of your dissatisfaction? Well, I have simply looked upon the Act where it says the inspectors shall go round and see the condition of the leases. I have asked for an inspector, and could never get any of my beds inspected. The leases get no protection whatever. I have only had inspectors down to see the leases twice in ten years.
690. Although you applied on every occasion for them to come and inspect? Yes.
691. Is your complaint, then, against the present Fisheries Commission, that they have not shown that interest in regard to the oyster fisheries which might have been expected of them? Yes; they have not. I do not know where the fault lies, but the oyster industry has not received justice. It has been very much neglected in the past.
692. Is there a fair prospect of those beds being resuscitated and an improvement being brought about if proper attention is given to the question? Yes; there is.
693. Have the Fisheries Commissioners on any occasion visited your oyster leases? No.
694. Have you ever known them to visit the oyster fisheries at the Shoalhaven and Crookhaven Rivers, or any other fisheries here? No; I have not.
695. If they had visited these fisheries you would have known of it? I have no doubt about that.
696. Have you any complaint to make in regard to the amount you are charged for your leases? It is hard upon a man, after paying five or six years' rent, and his crop of oysters has failed during all that period, that he should still have to pay rent.
697. Are you in favour of the amendment of the present Act to give discretionary power to the authorities to allow of a remission of rent under such circumstances or conditions? Yes; as an encouragement to those engaged in oyster culture. We receive no encouragement whatever at present.
698. Have you thought out the question of altering the administrative authority which we have at present;—have you thought of any other plan that would be more satisfactory, or that would work better in the interests of the public and of the oyster lessees and fishermen generally? I think it would be better to have the department placed under one responsible head. I mean one person to administer the Act under the Minister, and to have control of the fisheries of the Colony.
699. Then you favour the appointment of one man as Commissioner, a man with a good knowledge of the fisheries, and having an intimate acquaintance with the provisions of the Act,—a man who would devote the whole of his time to his duties, and be paid for his services? Yes; I favour that. I think it would be the best thing in the interests of the oyster fisheries, and of the fisheries generally.
700. Would you favour the appointment of local boards to advise on certain matters connected with the fisheries;—do you think such boards would assist the Commissioner? I can hardly give an opinion.

Mr.
G. Haizer.
8 Mar., 1895.

701. Are there many net fishermen in this portion of the Colony? A good many. They are scattered right down to St. George's Basin. At present I suppose there would be about seven or eight boats and about thirty or forty men.
702. How do they get their fish to market? By train and steamer.
703. Do they rely on the inlets for their fish supply or go outside? There is very little outside fishing. It is nearly all inside work.
704. Have you ever heard the fishermen complain of the provisions of the present Fisheries Act bearing harshly upon them? I have.
705. I asked you a question some time ago in regard to the best localities for laying down oysters; what I wanted to elicit from you was whether you can tell the Commission the nature of the soil or bottom best suited for the artificial propagation of oysters? A hard gravelly bottom.
706. A mud bottom is not so good? Not so good. A little good, so long as the oyster is not covered.
707. *Mr. White.*] You say you have about 7,000 yards of leased oyster-beds? Yes.
708. And that there is only one other lessee besides yourself here? Yes.
709. What frontage has he? I really cannot say.
710. *President.*] He will be examined.
711. *Mr. White.*] In your 7,000 yards how much do you set apart for growing spat, and how much for growing oysters? About 5,000 yards for spat, and the other 2,000 yards for cultivation.
- 711½. Then you give the 5,000 yards a reasonable spell, so as to get spat to cultivate the beds? Yes; I work portions of that 5,000 yards at intervals for spat collecting, so as to place it on the 2,000 yards where I cultivate the oysters.
712. Supposing the Government allowed somebody to have 100 yards lease in between your oyster grounds do you think you would be safe? No, I would not be safe. I would be in danger.
713. Any small leases in between your lease would simply be a premium for stealing? Yes, they would.
714. Is there any oyster stealing here? Yes.
715. To such an extent as to injure oyster culture generally? Yes.
716. Have steps been taken to secure the thieves? Several times I have asked for permission to prosecute, but I have never obtained any convictions. I have caught the thieves, and could have obtained convictions from time to time, but I was induced to let them off.
717. Off your 2,000 yards of cultivating grounds, what quantity of oysters do you send to market during the year? About 250 bags.
718. You employ as many as six men at times to help you get those 250 bags? Yes.
719. And you get from £1 to £1 5s. per bag? I have. This year—it was one shipment while the floods were in Queensland—I got as high as 50s. per bag.
720. Roughly speaking, what do you consider you make a year after paying rent for your leases? I have lost during the last three years. About three years ago I could clear about £300 or £400. During the last two or three years I have lost money. I am going back.
721. The worm disease;—does it clear out your beds altogether, or only partially? The whole of my breeding grounds have been destroyed by the worm. The disease is going out of my beds in the Shoalhaven, but has shown itself in Jervis Bay, and it being deep water, about 10 feet, it will clean the bed out.
722. How many bags of oysters do you take off the rocks in the shape of spat or brood to put on your breeding grounds in a year? I take about 500 or 600 bags off the 5,000 yards to put on my cultivating grounds.
723. How many years is it since the worm appeared here? The worm appeared in these beds about five years ago.
724. Do you remember the worm in the Newcastle district? Some years back it cleared out the whole of the beds there; about thirteen years ago.
725. Did you ever hear that the disease was discovered years before the time you speak of? No.
726. *Mr. Thompson.*] Thirty years ago? No.
727. *Mr. White.*] Do you sell any of your oysters in the Sydney market? Very few.
728. How do you sell there? I send them to an agent.
729. Are they satisfactorily dealt with by the salesman in the Sydney market? No.
730. Do you trust to an agent in the Melbourne market? Yes; to my sorrow.
731. You do not get fair play, then? I do not get fair play either in the Melbourne or the Sydney market with my oysters.
732. *Mr. Thompson.*] I understand you favour the idea of leasing whole rivers, but not the arms? Yes; not the arms.
733. What is the reason for that—because one man cultivates his oysters and the spat flows from his area on to another area belonging to a man who does not cultivate at all? Yes.
734. Do you think there are oyster-beds in the open sea? I do not know.
735. Do you ever see any oysters on the rocks outside the headlands? Yes.
736. Where do they come from? I cannot say. They may flow out from the mouths of the rivers.
737. Do you recollect that under the Act of 1868 oyster lessees had to find sureties in ten times the amount of their rent? Yes; I do.
738. That was not found to work well—it prevented leasing, did it not? Yes.
739. I suppose you know that neither the Government nor the Fisheries Department have any knowledge of the market value of the different oyster-beds—that is to say, they have no data on which to found it? They have no data which would guide the Commissioners, and it is a matter which has been neglected by them.
740. Do you not think, under these circumstances, that it would be equitable to fix the rent by results—I mean, to fix the rent in the shape of a royalty or fee on the number of bags of marketable oysters raised? Yes; that would be a very good thing, indeed. I would prefer to pay by results, that is, at so much per bag of oysters raised.
741. Can you account for the disease in the oysters at Jervis Bay? I have been told that diseased oysters were deposited in my deep-water bed, and in this way the disease has been communicated to them, but I cannot swear to this. I was told it, though.
742. How do the oysters in deep water recuperate themselves; that is, how are the deep beds supplied? I have to lay down spat in the deep beds. It is an artificial growth.

- Mr. G. Haiser. 743. Out of what depth of water do you take the oysters you lay down? Two feet of water.
 744. And you put them in what depth? In from 6 to 8 and 10 feet at low water.
 8 Mar., 1895. 745. Do you find the oysters suffer through being placed in the greater depth of water? No; they thrive well.
 746. Then you think nothing of the contention usually expressed that oysters must not be deposited in water deeper than that from which they have been taken? No; my oysters have grown splendidly.
 747. This disease in the oysters in Jervis Bay;—are you sure it is the result of the worm? I have seen the worm in the oyster.
-
- Mr. R. Lonesborough. 748. *President.*] Where do you reside? On the Crookhaven River.
 8 Mar., 1895. 749. How long have you resided there? Twenty-six years.
 750. Have you been engaged in connection with the development of the oyster fisheries for some time? Yes.
 751. For how many years? Fourteen or fifteen years.
 752. You have been net fishing as well? Yes; we carry on net fishing and oyster fishing.
 753. What extent of foreshore have you for oyster culture? I have 100 yards, and my father has 900 yards. We work the 1,000 yards between us.
 754. Do the leases adjoin each other? No; there are 200 yards in the Crookhaven River, where we live, and 300 yards on the shore where we live. Then there are 100 yards at Crookhaven Heads, 100 yards at Jervis Bay, and 200 yards at Jervis Bay. My 100 yards adjoin my father's, at Crookhaven Heads.
 755. Do you know whether any profit has been made from those beds? We have made a little profit out of them this year, more than last year—our market is in Sydney.
 756. How are your oysters disposed of in Sydney? We send them to Mr. Cootes, in Sydney, and he retails them and sends us the return.
 757. Does he charge you a commission for selling, or a fixed price? He pays a fixed price.
 758. What is the average price he pays you for them? 15s. per bag.
 759. Has any disease shown itself in your beds? Yes; disease in all the oyster-beds in the Crookhaven River.
 760. What is the cause of the disease in the oysters? Nothing but the fresh water. The oysters were a good deal better before the fresh came. When the fresh came it left the slime on the shell, and when the oysters drink the slime goes in and kills them.
 761. Have you heard of any other enemy to the oyster? The worm. The time that Baxter laid his down was the only time I noticed the worm in the oyster.
 762. Have you made any experiments in order to try to cope with the disease? The only experiment we tried was putting them up on the foreshore, so that every tide would leave them, and keep them clean.
 763. In doing that, and exposing them to the atmosphere, do you notice that the cold weather or frost interfere with them? They do not grow.
 764. Has that treatment proved successful in ridding the oysters of the disease? Yes.
 765. Are you troubled much with any other enemies—I mean stingrays, and so on? No; they cannot get at them where we put them.
 766. Where do you obtain your spat from? Jervis Bay.
 767. Have you a special lease set aside for the production of spat? We have two leases set aside in Jervis Bay.
 768. How long does it take for an oyster to become fit for market after placing it down? The oysters at Jervis Bay take about four years to become marketable. They are on the rock.
 769. What number of bags of oysters have you sent on an average during the last three years to Sydney? I cannot say—sixty bags this season.
 770. Have you had any visits from officers of the Fisheries Department? Mr. Benson visited us last year.
 771. Did he come down for the purpose of making an inspection of the beds? He had a look at them.
 772. How long did he remain in and around the oyster fisheries? Two or three days.
 773. Do you know whether he made any reports as to the condition of the oyster fisheries? I cannot say; he had only a short stay.
 774. Have any of the Commissioners of Fisheries been down to your place? No.
 775. You would have heard of their visit had they been there? Yes.
 776. You and your father have taken up areas in different localities;—do you approve of that system, or favour a system under which you would be able to rent or lease an arm of a river, or the main river itself, for the artificial propagation of oysters? I think it would not pay under present conditions.
 777. But if a provision were incorporated in the Act, whereby payment by results would be brought into force, I mean under which you would pay on every bag of oysters produced so much to the Government, instead of paying as you have to now so much per 100 yards, would you approve of that? That would be much better. I would support that.
 778. Have you ever received any literature from the Fisheries Department, giving you information as to oyster fisheries in other parts of the world, and what they have done to cope with diseases in other places? No; I have not.
 779. Do you think it would be advisable to have that information circulated amongst oyster fishermen? I think it would be a very good thing.
 780. Have you been engaged in net and line fishing? Yes; net fishing more particularly.
 781. Where have you fished? In the Crookhaven River, Lake Wolumla, and Jervis Bay.
 782. How many in your family hold licenses to fish? Three brothers.
 783. Have you done any outside fishing? No.
 784. Have you any idea as to whether there are oyster deposits outside? There is the mud oyster outside, that is the only oyster I know of; Jervis Bay is full of them.
 785. How do you dispose of your catches? Send them to Sydney by steamer. We have only sent thirteen baskets by rail since the railway has been opened; the railway is not accessible enough.
 786. Have you ever tried the system of well-boat fishing? No; I have not. 787.

787. By what boats do you send your fish to market? By the "Illawarra" from Greenwell Point.
788. Do your fish arrive in Sydney in good condition as a rule? I have only had one lot condemned during the last twelve months.
789. How is your fish disposed of in Sydney? They are sent to the market. An agent there looks after our interests.
790. Does he charge you a commission? Yes.
791. Are the prices realised satisfactory to you? No.
792. Do you think there is a fair return to the fishermen for their labour, when you compare the prices given to the fishermen, and the prices the public have to pay? No; I do not.
793. I suppose if you could realise for your fish what the consumer pays for them, it would give you a handsome return? Oh, yes; it would.
794. Would the system of allowing the fishermen to sell direct to the public, without the interposition of the middleman, be a good thing? Yes; but how can we get it?
795. If it can be shown to be feasible, would you support it? Yes; certainly.
796. What nets do you use? Garfish nets.
797. What fish do you catch with that net? All sorts.
798. You fish for garfish, and catch other varieties? Yes.
799. Is the length of net sufficient for you? Not the way the garfish are now.
800. Is the mesh small enough? Small enough for anything.
801. Do you use a sunken net? No.
802. You use the ordinary hauling-net? Yes.
803. I suppose you respect the law concerning the mesh of that net? As near as possible.
804. Is that mesh long enough for a hauling-net—150 fathoms? It will do me, but others want 300.
805. What descriptions of fish do you catch here? Mostly mullet and blackfish.
806. What varieties do you send to market? Mullet, blackfish, and a few other varieties.
807. Used there to be plenty of the other varieties? No; never in the Crookhaven River.
808. Have you ever been prosecuted for an infringement of the Act? No.
809. To what market do you send your fish in Sydney? Redfern—McFadyen's.
810. Did you send to the Woolloomooloo market? I used to send fish there.
811. Were all your transactions in connection with the Woolloomooloo market satisfactory? No, we had cause to complain; we never got satisfactory returns.
812. And you think, even now, they are not as satisfactory as they might be if you were brought into more direct contact with the consumer? No.
813. Have you ever done any deep-sea fishing? No.
814. *Mr. White.*] You have 1,000 yards—700 yards here and 300 yards at Jervis Bay,—and you get your spat off the Jervis Bay bed to supply the 700 yards in this river? We lay our spat on 500 yards in the river.
815. On an average how many baskets of oysters do you ship away? We have sent sixty baskets this year.
816. Your leases are not close together? No.
817. How many people go in for the cultivation of oysters here? Only ourselves and Mr. Haiser in the Crookhaven River.
818. Do you get any of your oysters stolen? Not from our beds.
819. About what time of the year do oysters spawn generally? Sometimes in the springtime; you will notice a heavy spawn about in September, and then in the autumn about March you will see more spawn. I have noticed them spawning nearly all the year round.
820. In reference to net-fishing, do you pull the net on to the beach? No; we generally land the fish a little in the water.
821. Do you destroy many small fish? Very few.
822. Are the fish as plentiful here as usual? They seem to be as plentiful this summer as any other summer, especially so far as mullet are concerned.
823. What months do you fish with the garfish net? We use the garfish net and expect to get garfish pretty well all through the year.
824. *Mr. Thompson.*] About these nets;—are not fishermen bothered by the various meshes and lengths prescribed for the different nets and parts of nets. For instance, there are different lengths and meshes for the bunt and wings of a hauling net, and other meshes and lengths for the garfish and the meshing nets; are not the fishermen themselves sometimes inconvenienced by these differences? Yes; they are greatly inconvenienced.
825. If we could devise a plan for giving the fishermen the option of using what nets they like in certain waters, subject to a maximum length and minimum mesh, and thus do away with all these differences and so forth in such a way that the public estate would not be damaged, it would be a great convenience to the fishermen? I think it would. I heard Mr. Woolley, a Melbourne fisherman, say that they are allowed to work what nets they like over there, and the system works well. If they send a small fish to market they are fined for it.
826. Do you think the Melbourne system would work well in New South Wales? I think if it works well there it would work well here. It is for the interest of the fishermen themselves to save the spawn.
827. Would you favour a stringent provision in the Act for compelling the fishermen to empty their nets in deep water, say 2 feet of water at least? Yes, I would.
828. If such a concession as that I have sketched were recommended, would you favour the absolute closure of certain portions of waters, in order to conserve the supply of fish? I think waters should be closed, and especially those waters in which the fish spawn, only allowing set nets to be used therein.
829. *President.*] Have you any closed waters here? No.
830. Have any waters been closed since you have been fishing here? No.
831. Do you think any waters here require a rest? I think portions of these waters require to be closed.
832. How many fishermen are there besides yourself in the Shoalhaven district? About thirty or forty men.
833. Can you state the number of baskets of fish sent from here weekly? We have averaged about twenty baskets.
834. And would all other fishing boats average the same? Not always.
835. Do you think 100 baskets a week are sent from here? Yes; about 100 baskets a week.

Mr. R.
Lonesborough
8 Mar., 1895.

SATURDAY, 9 MARCH, 1895.

[The Commission met at Greenwell Point, Crookhaven River, at 2:30 p.m.]

Present:—

FRANK FARNELL, ESQ., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C. |

L. G. THOMPSON, Esq., J.P.

Mr. Richard Baxter, fisherman, Greenwell Point, Crookhaven River, sworn and examined:—

- Mr. R. Baxter.
9 Mar., 1895.
836. *President.*] Your name is Richard Baxter and you reside at Greenwell Point? Yes.
837. How long have you been a resident here? About twenty-eight years.
838. Do you go in for oyster fishing or net fishing? Oyster fishing and net fishing.
839. Where have you carried on your operations? In the Crookhaven River and at Jervis Bay.
840. Have you done any net fishing in Jervis Bay? Yes.
841. What was the state of the fisheries here twenty years ago? In quality?
842. In every way;—were the fisheries more prolific than now? Oh, yes.
843. Then there has been a depletion, a decrease since then? Yes; a small falling off, not a great deal.
844. What varieties of fish did you catch twenty years ago? Well, nearly all mullet and blackfish.
845. Have you caught bream and whiting in quantity? As high as 20 bushels.
846. Do you frequently catch hauls of that quantity? Yes.
847. So that you do not rely alone upon blackfish and mullet, you obtain good hauls of other varieties? Yes.
848. What is your nearest point to send to market from here? I send by steamer from Greenwell Point, and sometimes by rail.
849. What length of a hauling net do you use? 150 fathoms.
850. Are you satisfied with that length or not? No; it is too short.
851. Would you ask that the provisions of the amending Act, extending the length to 300 fathoms, be applied to this part of the Colony? Yes.
852. Do you think that the constant hauling could be avoided by the use of a longer net? Yes; I do.
853. Have you any objection to the present mesh? The size is right enough.
854. Do you use the garfish net here? Yes.
855. Are there many garfish here in the season? They have gone off these last two or three years.
856. Can you account for that in any way? No.
857. Do you use any set nets or meshing nets? No.
858. You get a sufficient quantity of fish with the other nets? Yes.
859. How do you send your fish to market? In baskets in the cold weather; ice-chests in the summer.
860. To whom do you consign? Hudson, M'Fadyen, and Symmons.
861. Are they all located at the one market? No; they were, but M'Fadyen is in Woolloomooloo now, I believe.
862. You send fish to Woolloomooloo and Redfern? Yes.
863. Are you satisfied with the results of your transactions with those agents? No.
864. Do you think a better means should be adopted whereby the fishermen could get a better profit than at present? Yes; something ought to be done.
865. If you were brought into closer communication with the consumer, do you think you would obtain better prices? Yes; I believe we should.
866. Do you think that if you could sell your fish direct to the consumer that would be better for you? I firmly believe it would.
867. Have the returns forwarded you by the agents always been of a satisfactory nature? No.
868. Have the charges been too stiff? No; the charges are right enough.
869. Do you think they take sufficient interest in your behalf? I do not know; we are down here and they are in Sydney.
870. They could form themselves into a ring if they chose and send returns which you could not check? Oh, yes.
871. Have you had fish stolen in transit? Some of the baskets have been very slack, but I cannot say whether they were stolen.
872. Have you visited the Woolloomooloo market? Yes.
873. Comparing the system of exhibiting the fish on the floor, and showing fish on raised tables, which, in your opinion, is the best? I believe in the use of raised tables.
874. Do you think the use of raised tables would tend to remove the prejudice the public have against the system of showing fish on the ground? Yes, it would.
875. Do you think if you were able to send your fish alive to the market you would get a better price? Yes.
876. Have you tried the well-boat system? No; I have had no experience of it.
877. If that system could be instituted here, would the fishermen approve of it? Oh, yes; that would be right enough.
878. Have you been visited by an inspector from the Fisheries Commissioners? Yes, often.
879. What do you call often? Sometimes twice in three weeks.
880. Is there an inspector permanently stationed here? No.
881. Can you suggest any improvement in the provisions of the present Fisheries Act in regard to net fishing? I have not given it much attention.
882. Are there any provisions in the Act which you consider operate harshly? I think the inspector overruns us; we do not get a fair chance with the mesh.
883. Have you any closed waters here? No.
884. Do you think there is any necessity for closing the waters in order to give the fish a chance to breed? No; because there is not much chance of catching fish after they once get above the bridge over the Shoalhaven River.
885. Do you send fish of proper size to market? Yes.
886. Do you haul your net right on to the beach? No, not at all times.
887. In what depth of water? If we have a good clear beach and the tide is flowing fast we land there, otherwise we land the fish against a back net.
- 888.

Mr.
R. Baxter.
9 Mar., 1895.

888. When purchasing a net, what size do you buy in the first instance? To stand $2\frac{1}{4}$ inches we have to get $2\frac{3}{4}$ inches; that is the biggest size we can get.
889. Is that to meet the shrinkage from tanning? Yes.
890. Have you ever been prosecuted for having a net of illegal mesh in your possession? Once; we were pulled up last winter for it.
891. Who do you mean by "we"? Me, and my son, and nephew.
892. Had that net originally been passed as a legal net? Yes, it had.
893. How long had you been using it when you were summoned? About eighteen months.
894. How long does a net generally last you? Some nets last four years, but they keep shrinking all the time.
895. Do you think a provision to punish fishermen, if found catching undersized fish, would be better than paying so much attention to the mesh? Yes.
896. How many are engaged in fishing with you? Myself and four sons.
897. On an average what does your catch total in a week? About 20 bushels.
898. In regard to the visits of the inspectors, you informed the Commission that they came on an average twice in three weeks? Yes; they came twice in three weeks, but on one occasion only.
899. Did they visit you often before that or since? No.
900. For what purpose did they come twice in the three weeks? I could form no idea unless it was to look over our nets again.
901. Was that the time they instituted proceedings against you? Yes.
902. Independently of that trip, have you ever seen an inspector supervising the fisheries here? No.
903. Have any of the Fisheries Commissioners been down here to see you? No, they have not.
904. I suppose you would have heard of it if they had visited the river? Yes.
905. As a practical fisherman you have, I suppose, taken into consideration the administration of the Act. It is administered by a Board of five Commissioners—an unpaid body;—do you think it would be well to continue that system, or would it be better to appoint one man to look after and control the fisheries of the Colony? It might; I believe it would.
906. You think it would be better to have one practical man at the head of affairs who would be able to attend to the wants of the fishermen? Yes.
907. Would you favour the appointment of one man who would always be attending to the development of the fisheries of the Colony? Yes, I would.
908. A man who would be thoroughly in touch with the operations of the fishermen? Yes.
909. Do you believe when a prosecution takes place that a man's nets or tools of trade should be taken from him on his first conviction? No, I do not.
910. Would it be a wise provision to make the Act operative in this respect if a man broke the law a second time? No; I am not in favor of taking away his nets.
911. You think, then, it would be a reasonable thing to give a man a second chance? Yes.
912. Do you engage in the curing of fish at all? No; there is no sale.
913. Have you tried it? Yes, mullet, salted and smoked.
914. To what market did you send the fish? Sydney.
915. Did you not get a paying price for it? Not of late years.
916. Have you done any deep-sea fishing? Only a little schnappering about the Crookhaven River.
917. None at Jervis Bay? No.
918. You, of course, would have a pretty good idea of the fish in the sea adjacent to these rivers;—is there plenty of fish life here? Well, not very plentiful.
919. Do you hold a lease for oyster fishing? No.
920. Have you ever held leases? Yes.
921. What area did you hold? It was up at Rocky Point, Curley Bay. I had 1,000 yards.
922. Did you work that area profitably? No.
923. How many years did you hold it? Two or three years.
924. Did you get any return? No; the disease came in when they were all laid down and killed them.
925. You laid the oysters down—you made the bed? Yes.
926. Did you pay rent to the Department? Yes.
927. Did you apply for the cancellation of the lease? No.
928. Was it cancelled? It was.
929. At whose instance? The Government.
930. You paid rent for two or three years, but got no return? No.
931. Do you think a system by which a man would pay so much in the shape of a royalty on every bag raised would work better than the present system of compelling a man to pay so much for 100 yards, whether he gets any return or not from the lease? Yes, I believe it would.
932. What is the condition of the oyster fisheries round about here now—are they improving? They are improving.
933. Are oysters more numerous now than formerly? Yes; the spawn is beginning to come back again.
934. Can you account for the disease in the oysters? No; the floods bring down muddy water, and the settlings get among the oysters.
935. *Mr. White.*] You go to Jervis Bay;—how do you get there? We go round from these waters to Abraham's Bosom, and take the boat across the beach. It is about 200 yards over the sand to the bay.
936. Have you tried schnappering about Jervis Bay? Inside schnappering, in the bay.
937. Have you tried rock schnapper fishing? No.
938. Has it paid you to bring fish from Jervis Bay to market? Oh, yes; we carried the fish about 14 miles to this river.
939. What quantity did you send? Thirty or thirty-two hampers of whiting, bream, tarwhine, trevally, blackfish, tailer and black bream.
940. Did you get them to market in satisfactory condition and obtain a fair price for them? Yes; we got as high as 27s. per hamper.
941. How long ago was that? About three years ago.
942. Latterly, have you been able to get any quantity to send to market? No; they are not very plentiful these last two winters.

Mr.
R. Baxter.
9 Mar., 1895.

943. Did you have any facilities for getting your fish to market in the summer—did the Government let you have any ice? No; we had to buy the ice at 3s. per cwt.
944. If cool cars were put on the train in the summer time would that be better for you to send your fish to Sydney? If we had cool cars a great many more fish could be sent.* They go bad on the railway now, that is why we do not catch them.
945. What fish do you catch at George's Basin? Bream, whiting, blackfish, mullet, trevally and others.
946. Have any of the fishermen tried well-boats at all? Yes; well-boats from Sydney have been down here.
947. Did they take fish alive to Sydney? Yes, I believe so.
948. During the time you had oyster-beds did you have to watch them yourselves, did you ever catch anybody stealing your oysters? I cannot say that I did.
949. *Mr. Thompson.*] Who were the inspectors who came here on the occasion you referred to? Mr. Gordon and Mr. Smithers. They came together on both occasions.
950. About these nets; would it be an advantage to get rid of these divisions of bunts and wings and varied meshes, and substitute one sort of net of a certain maximum of length and minimum of mesh which the fishermen could use in open waters in such proportions and sizes as they pleased? Yes, it would be an advantage.
951. And instead of the present system, to have the destruction of small fish prevented by making it illegal to catch undersized fish? Yes, it would be a good thing.
952. You would not think it a hardship to be compelled to empty your net, in, say, a foot of water, so as to allow the young fish to escape? No; I would not think it a hardship, and I always have taken my fish out of the net in the water, so as not to destroy the young fish.
953. If such a provision were made would you object to the closing of a portion of the waters in this river, say, above the Shoalhaven Bridge? No; I would not object to that.
954. Do you require any greater extent of water than that in which you now fish? No; we are quite satisfied to have from the bridge down.
955. *President.*] About how many fishermen are there in these waters? About twenty.
956. Is the evidence you have given us similar to that which would be given by the other fishermen on the river? Yes, it is.
957. Do you belong to any fishermen's association? No; we cannot form one, although we have tried.

Mr. Thomas Wilson, fisherman, Greenwell Point, Crookhaven River, sworn and examined:—

Mr.
T. Wilson.
9 Mar., 1895.

958. *President.*] You are a fisherman and reside at Greenwell Point;—how long have you lived here? Twenty years.
959. Have you been fishing all that time? No; only about twelve or thirteen years.
960. Have you anything to do with the oyster fisheries? I was seven years on this river, in Mr. Woodward's employ, when leases were first issued on the river.
961. Have you noticed during the last few years any decrease in the number of fish in the river? Yes, I have; these last two years more especially.
962. What sort of fish do you catch? The general run is flathead and blackfish, but the way I am now in fishing I am balked by the provisions as to the mesh.
963. During your twelve or thirteen years' experience of net-fishing have you found it profitable? Not these last two or three years, it has been hard to live.
964. Is that because you cannot get to the market, or because you do not catch enough fish? I caught some prime fish last winter, but not in sufficient quantity to pay me.
965. Have you done any mullet fishing? I have not done much; the fish are not here.
966. How do you send fish to market? By the steamers; I send them in good order; if they are slack of sale the agent puts them in the ice house.
967. Do you use ice here? No; I got ice this morning to make a trial.
968. To whom do you consign your fish? Mr. Symmons, at the Woolloomooloo market.
969. Are you satisfied with the returns you get for your fish? No, I am not satisfied.
970. You think higher prices should be realised? Yes, I do.
971. Are you of opinion that a little more interest might be taken by the agents in the sale of fish for the benefit of the fishermen? Yes.
972. Do you think it would be a good thing if the fishermen were brought into closer contact with the public? Yes, I think they ought to be; it would be a very good thing.
973. Is there anything that would prevent the agents combining and regulating the prices to be paid to the fishermen, and then selling the fish at their own price to the general public? Well, I have often thought something like that might be done, but it is hard for me to say. I am 71 miles from the market and of course I do not know what goes on there.
974. Have you ever lost any fish—have your fish been stolen in transit? Oh! yes; last winter I sent two baskets of splendid flathead to market. My returns came home as two half baskets, and that happened two or three times during last winter.
975. Have you any means of tracing where the fish were stolen, whether on the steamer or in transit from the wharf to the market? No I have not, but I hardly think it was on the steamer. They go between the wharf and the market in Sydney.
976. How do you send your fish,—in baskets? In baskets generally; I am sending now in boxes.
977. Have you locks and keys to your boxes? No; they are just tied down with string.
978. Have you seen the market at Woolloomooloo? No.
979. Do you know how fish is sold there? I have heard fish is laid down on the floor in heaps.
980. Do you think it would be better to have the fish placed on raised tables, instead of laying them on the floor for sale? I think it would be better and cleaner for the fish. When they are chucked out on the flags it goes hard with the fish; the less knocking about fish get the better they keep. Last winter twelve months I sent a quantity of fish to two agents in Sydney, two baskets of bream, and a box of blackfish to each man. That was the result of a week's work, and for that I got from one agent a Post Office order for 3s. 6d., and from the other the sum of 10s., making 13s. 6d., for the week's work.
981. I suppose you think that fish should have realised a higher figure? Oh! yes; they were grand prime fish.

982. Do you think that if the agents had shown sufficient interest in the consignment, they might have got better prices? Yes, I do.
983. Would you think the fish being sold to the public would bring better prices? Oh! yes; I made 13s. 6d. out of one basket even in this district.
984. I suppose you expected to receive from the six baskets you sent to the agents something like £3? Yes, I did.
985. Do you look in the papers to see the ruling prices of fish? Yes, I do; I never get the prices I see quoted in the papers.
986. Are you satisfied with the provisions of the Fisheries Act as regards the nets? Well, hardly in some respects, and especially in regard to the meshes of the several nets. The 4-inch is too large; I could do better if the mesh was allowed to be from 3 to 3½ inches.
987. That applies to the meshing net? Yes.
988. Do you use the hauling net? No.
989. Have you ever been prosecuted for using an illegal mesh? No.
990. Have you seen any inspectors down here? Yes; Mr. Smithers and Mr. Gordon—three or four times within the last twelve months.
991. Did you see them often before that? No.
992. Have you ever seen any of the Fisheries Commissioners down here? No; Mr. Thompson and yourselves are the only gentlemen I have ever seen here.
993. Would you have known of their being here if they had visited the place? Certainly, I must have known of it.
994. You say you were engaged by Mr. Woodward to look after his oyster fisheries;—what area did he take up—1,000 yards, 2,000 yards, or 3,000 yards? He had more than that.
995. Half a mile or a mile? He had oyster leases embracing several thousands of yards in extent.
996. Did he obtain a return from those oyster-beds in the way of mature oysters? Yes; I used to send six, seven, and even as high as nine bags a week.
997. How long did that continue? When the oysters came to maturity I sent them pretty regularly.
998. Did you make layings yourself for Mr. Woodward? Yes; I laid a lot at Broughton Creek, in deep water.
999. Did they do well? Yes, they did very well; but they did not do so well as the original oyster.
1000. Where did you get the spat from? From the foreshores of his leases.
1001. That would be where the oysters would be subjected at a certain period of the day to the influence of the sun? Yes, that is so.
1002. How did you come to abandon the looking after those leases? Mr. Haiser bought Mr. Woodward out.
1003. Did you see any disease in the oysters when you were looking after the leases? Yes; once in this river, and two or three times in Berry's Creek.
1004. What was the nature of the disease,—the worm? I think I have noticed the worm in some of them.
1005. Have you ever thought out the question as to what authority should be established to administer the Fisheries Act? I think it would be better to have one Commissioner, one man interested in the fisheries to act as Commissioner, and to be always available to administer the Act properly and to give information to us. Let him visit the fisheries frequently.
1006. In regard to the sale of fish in the markets, do you seek for any other concession than being allowed to sell the fish only at one sale? I think fish ought to be sold at any time in the day, and the middleman ought to be done away with altogether.
1007. Do you know anything about the system of well-boat fishing? No.
1008. If it could be proved to work successfully, and if it could be shown that fish could be taken from distant fishing grounds alive to the Sydney market, do you think that would benefit the fishermen? I think so, it would be all to their benefit.
1009. Do you think the prices realised for fish would be better if the fishermen could sell their own fish to the consumer? I do.
1010. Have you done any deep-sea fishing? No; I should like to say something about the prices I have got for fish. About four years ago I and another sent 24 baskets of fish, mullet, to the market. We only got something like 1s. 9d. for the lot. I sent a stiff letter to the agents, saying I would have to change if my fish was not sold to better advantage. After that I sent another 19 baskets of the same class of fish, mullet and blackfish; for that lot I received something a little short of £5, whereas I had only received 1s. 9d. for the 24 baskets I had sent forward a trip or so previously. There is something wrong somewhere.

LAKE ILLAWARRA FISHERIES.

MONDAY, 11 MARCH, 1895.

[The Commission met at the "Illawarra Lake Hotel," Dapto, at 10 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C.

L. G. THOMPSON, Esq., J.P.

Mr. Edwin Barber, fisherman, Lake Illawarra, sworn and examined:—

1011. *President.*] You are a fisherman residing at Lake Illawarra? Yes.
1012. Have you lived there long? Yes; I have been fishing for thirty-four years.
1013. Have you any men in your employ? Yes; three besides myself.
1014. What market do you send your fish to? Redfern and Woolloomooloo.
1015. How do you send it? In cases, by rail.
1016. About what is the average catch per week that you send to market? Somewhere between thirty and forty baskets of fish.

Mr.
T. Wilson.
9 Mar., 1895.

Mr. E. Barber.
11 Mar., 1895.

- Mr. E. Barber. 1017. What classes of fish do you send? I am catching mullet principally, but I have two boats working; the other boat gets the mixed class of fish—blackfish, garfish, bream, whiting, flathead, and sometimes jewfish.
- 11 Mar., 1895. 1018. Have you ever had any complaint about your fish arriving at the market in an unsound condition? Very seldom.
1019. If you have been fishing for these last thirty-four years you must have had extensive transactions with the market authorities? I have.
1020. How do you arrange for the sale of your fish? They are sent to the agent, and distributed on the floor in lots and sold by auction.
1021. You mentioned the agent;—would that be the person appointed by yourself? Yes.
1022. He would be a man who would sell for other people as well as for yourself? Oh, yes.
1023. Who has acted as your agent for the last two or three years? Mr. M'Fadyen and Mr. Hudson.
1024. Before the establishment of the Redfern markets, you used to do your business with the Woolloomooloo fish market? Yes.
1025. Have you compared the prices realised in the Woolloomooloo market with those obtained at the Redfern market, so as to ascertain the best market for the sale of your fish? Well; sometimes you get better prices at Woolloomooloo than at Redfern, other times it is the opposite, just according to whatever fish is in the markets. Taking it on an average there is very little difference.
1026. Which market is the more suitable for you so far as the handling of fish is concerned? Redfern.
1027. By using the Redfern market you incur less handling? Less handling.
1028. Have you ever had reason to complain of your fish having been stolen in transit? Yes.
1029. Did you ever trace the offenders and bring them to justice? We never could do that.
1030. You send your fish in cases to market;—that is a recent experiment, is it not? I first started it about three years ago. I think I was the first to start cases.
1031. Has the experiment of sending them in cases protected you from theft more than by sending in baskets? I do not think there is much difference; the fish go in better condition to the market in boxes than in the baskets; the boxes are not nailed down.
1032. Are the boxes returned to you? Yes.
1033. Have you any complaint to make as to the loss of returned empties? No.
1034. Have you been satisfied with the prices realised by the sale of your fish in the markets? No, I have not.
1035. Do you think if the fishermen were brought into more direct contact with the consumer better prices would be realised? Yes, I do.
1036. At the present time are you dependent upon the agent as to the returns you receive for your catches? Oh, yes; we have no one else to look to.
1037. Would it be possible for the agents to enter into a conspiracy, and work the consignments of fish into their own hands to suit themselves? Yes; I have known this to be done. I have known fish to be sold there privately. When they have gone to Kelly, the clerk of the Woolloomooloo Market, to overhaul the books, they would have no record of the fish sent.
1038. At the present time does the time fixed for selling fish suit the fishermen of Lake Illawarra, or would it be better to have a regulation providing for the sale of fish at any period after their arrival in the market? I think that if they were sold at any period after their arrival it would be far better. Fish should be sold on arrival, and the public would then get fresh fish.
1039. You know the Woolloomooloo market? I have known it since it was first opened.
1040. Are you acquainted with the mode of sale and distribution of fish at that market? Yes.
1041. Do you think that the mode of display is open to any objection? Yes; there are great objections to it.
1042. Will you tell the Commission your views on the subject? In the first place they are chucked down on the floors in heaps and are liable to be trodden on and spat upon, and one thing and another, and there is no control over the fish to keep the public from trampling on them.
1043. Do you think the system under which fish is displayed is one likely to create a prejudice in the minds of the people against the use of fish as an article of food? Yes.
1044. Have you ever had occasion to have any of your consignments stored in the refrigerating chambers? Yes; I send fish up every morning by the 9 o'clock train for that purpose at the present time.
1045. Do you pay for the use of the refrigerating chamber? Yes; 9d. per case.
1046. Per day? No; for the time they are in the chamber—two or three days or a week.
1047. You can go to the limit of a week and only pay the 9d.? Yes.
1048. You have tried sending fish packed in ice from Lake Illawarra;—was it a success? The fish used to go in perfect condition, but the ice was too dear. We used to pay 1½d. per pound at that time and it used to cost £10 or £11 per week for icing.
1049. Would that be before the railway connection was established? Yes.
1050. If there were some improvement in the system of display and sale, and a reform in the distribution of the fish, do you think you could supply Sydney and its suburbs with fresh fish every morning? Yes; we could send a portion of the supply from this lake.
1051. You stated a little while ago that the Redfern market was the best one for you;—do you think it would be a good thing for the Government to establish a central fish market at the railway station or near it? I think it would; it would be a great deal better than the present Woolloomooloo market.
1052. Do you know anything of the quantities of fish sent by rail and steamer to Sydney? No; not exactly.
1053. Are you of opinion that the Redfern railway station or thereabouts would be a suitable place for everyone, at which to erect a central and convenient fish market? Yes.
1054. Taking into consideration the prices realised by your agent for the fish in the market, and the prices paid by the consumer, do you think you receive a fair return for your labour? No, sir; we do not receive one-third of the value we ought to get.
1055. Do you think it would prove beneficial to the fishermen if they were brought into more direct contact with the public;—would you favour a system such as they have in Hobart, by which the fishermen themselves sell their catches in the open market? Yes; I would favour such a system.
1056. Supposing the Railway Commissioners agreed to provide a refrigerating car for the purpose of taking fish to market, would you be disposed, and would the other fishermen at Lake Illawarra be disposed, to patronise that means of transit? Yes; providing the charges were not too high. 1057.

Mr. E. Barber.
11 Mar., 1895.

1057. And if the charges were not too high it would prove a convenience to you? Yes.
1058. What nets do you use? At the present time we are using 600 yards of a hauling net.
1059. Have the provisions of the amended Act been extended to Lake Illawarra? Yes, for three years.
1060. Does the provision contained in that Act do away with a serious complaint you had in the past? Yes; to a certain extent it does.
1061. Do you use any other kind of net? We have garfish nets and what they call meshing nets; the latter are in reality drift nets.
1062. With which net do you get the best catches? In the drift nets.
1063. Speaking on behalf of the fishermen of Lake Illawarra, can you say if you have sufficient waters in which to carry on your operations? Well, we have at the present, but a portion of the lake has been closed during the last two years. That period has expired and that part of the lake is now opened.
1064. What is the condition of that portion that was closed? It is overgrown with weeds. If it had been used the weeds would have been kept down. As it was not worked, it has taken away the food from the fish, as well as taking the fish from us.
1065. Are there any other closures in the lake? Yes; the entrance is closed and Mullet Creek is closed for half-a-mile on each side at the entrance.
1066. How do you know it is closed for half-a-mile on each side? It is staked out.
1067. Are notice boards put up? Notices are out, but Mr. Benson, our inspector, has not received them yet.
1068. In the usual course of events notice boards will be posted up? Yes.
1069. Then you have no objection to the area of water you are allowed to fish in? We have no objection to Mullet Creek and the entrance to the lake being closed, but we would like the foreshores of the lake opened.
1070. Is there a good extent of the waters of Lake Illawarra naturally protected from fishing nets? Yes, more than two-thirds of it.
1071. Is that owing to the growth of weeds and the presence of rocks in the lake? Yes, weeds and rocks abound. Some of the grounds extend for a mile into the lake—weedy flats. We have a stretch of 6 or 7 miles in length where we cannot haul at all. It is nothing but weeds.
1072. Are you troubled with blubber? Yes; it is very bad indeed.
1073. Are there any means by which you could be assisted in your operations to get rid of the blubber? No, I do not think so.
1074. Not by the use of the sunken net? Yes, we have done that several times; we have taken the corks off and let the net go down.
1075. Do you know if any sunken nets having a purse in them have been used? Not in this lake.
1076. Do you mind telling the Commission what you think of the regulations at present in force;—with regard to the mesh of nets generally, can there be any improvement made by way of assisting the fishermen, and whilst doing that protecting the fish and the interests of the public? Yes; in the first instance we would like to have a drift net of not less than 600 yards, not less than 3 inches in the mesh. That would leave it from 3 inches upwards; that would be used then in the centre, not hauled ashore at all; just shot round in a circle and then hauled into the boats again, the same as they use the drift nets in the old country. As to the hauling net, that is quite sufficient at present.
1077. Are you satisfied with the mesh of the hauling net as prescribed by the present Act? The 2½-inch bunt—the fishermen should be allowed to use that until it is worn out.
1078. Do you think it would be advisable to have the mesh throughout the hauling net 2½ inches without any bunt? No, I do not consider that is required. It would be too heavy. The 100-fathoms net is sufficient with two-and-a-half.
1079. What do you mean by two-and-a-half—2½ inches when you purchase it? Yes.
1080. Why do you purchase a 2½-inch mesh? Because it shrinks down in the tanning and you have to tan it every fortnight or three weeks to preserve it, otherwise it would be rotten in less than three months.
1081. Do you think that when a net is once pronounced legal it should continue to be regarded as legal until it is worn out? Yes.
1082. Have you known of many prosecutions taking place among the fishermen for using nets of an illegal mesh? Yes.
1083. Were there any cases of hardship in those prosecutions? Yes; I have known some cases in which a man's net was confiscated, and he had not a penny with which to buy another.
1084. Do you think that the action of the fishermen in hauling with these nets was not intended to be an infringement of the law? They did not mean to break the law: they were only earning a living; they could not possibly get a living with the limited length.
1085. Have you known of men being prosecuted for using nets of an illegal length? Yes.
1086. And do you think it was owing to the fact that it was very hard indeed to get a decent haul that they were induced to use a longer net? They could not get a living unless they did so.
1087. Do you know of any cases where the nets or tools of trade of fishermen have been confiscated? Yes.
1088. What do you think of the provision which provides for fishermen's nets being confiscated for the first offence? I think there should be no confiscation whatever. Let the party pay a fine and give him his tools to work with in order to help him to pay the fine. The confiscation only takes the bread from the man's wife and family. I would not confiscate his net. If he breaks the law next day fine him again.
1089. Do you think a provision in a Bill to make these tools of trade liable to be confiscated for a second offence would be more reasonable than the present state of things? Yes, I do.
1090. Do you think a fine would meet the case? It would meet the case better in every way. It is a very hard thing to take away a man's tools of trade, because it deprives him of a chance of getting a living.
1091. As to the license fees, are you satisfied with the fees you have to pay? Perfectly satisfied.
1092. Is Lake Illawarra pretty well supervised by the inspector? Yes.
1093. Are there many breaches of the law here? Very few. The inspector is down every day—day and night at times.
1094. Have you ever had any visits from any of the Commissioners—have any members of the Fisheries Commission in Sydney visited Lake Illawarra? I never saw any of them.
1095. Would you have seen or heard of them had they visited the lake? Oh, yes, I should.
1096. Have you taken sufficient interest in the Fisheries Act to make yourself acquainted with the several provisions, and how they operate? I have gone through the Act.

- Mr. E. Barber. 1097. Do you know whether the institution called the Fisheries Commission gives satisfaction to the fishermen or not? I do not think it has given satisfaction to the fishermen.
- 11 Mar., 1895. 1098. Do you think that is owing to the lack of interest they have shown in the fisheries of Lake Illawarra or not? I think they should have come down here and overhauled the place, and inquired into the grievances of the fishermen, but that they have not done.
1099. Are you of opinion that they would have been in a better position to deal with the matters arising on Lake Illawarra, with regard to the fisheries, if they had paid personal visits to the lake? Yes; it would have been better for the public at large, as well as for the fishermen.
1100. Do you know whether the inspectors have made any recommendations to the Fisheries Commission, and that those recommendations have not been carried out by the Commission? Yes; there have been complaints made that the recommendations were not carried out.
1101. Do you think that in connection with the administration of the affairs of an institution connected with an industry of such importance, it would be advisable to have a newly constituted establishment for the purpose of administering the Act? Yes, I certainly do.
1102. Would you favour the appointment of a Commission of (say) three or five, the fishermen being represented on that Commission, or would you favour the appointment of a gentleman, having a practical acquaintance with the fisheries of the Colony, who would at all times be ready to attend to his duties and place himself at the service of those requiring his assistance;—would you be in favour of the appointment of one man as Commissioner of Fisheries with the extra advantage of having a local board, on which would be representatives of the fishermen, to advise him concerning the grievances connected with their particular locality? I think it would be far better to have one man as Commissioner of Fisheries, and to have local boards to advise, so that the grievances of the fishermen generally might receive proper attention at the hands of those who would have a local knowledge.
1103. Have you ever had any correspondence with the Fisheries Commission? No; I had a complaint at one time before the Commissioners, when they closed Lake Illawarra. They closed it altogether for twelve months.
1104. When was that? I cannot say exactly. About ten years ago we all left here and went to Tuggerah Lakes. We met Mr. Seymour in Sydney, and he asked us the reason we were locked out from Wollongong. I said, "I do not know;" he replied, "If they had come to me I could have told them there was no occasion to shut the lake up on account of the large fish that were going from the lake to Sydney."
1105. Have you ever done any fish-curing or smoking? I have done smoking.
1106. Did it prove profitable? Yes; it paid very well at that time.
1107. Had you any difficulty in procuring the proper kind of wood for smoking purposes? No; I got the green oak and the green gum.
1108. Did you find that by using those woods the flavour of the fish was not destroyed? Yes.
1109. What varieties of fish do you smoke? Mostly mullet.
1110. Have you had any experience in deep-sea fishing? No.
1111. Have you ever seen the system of well-boat fishing? I saw a little of it at Ulladulla.
1112. Did the system answer there? No.
1113. Why? Well, the only thing we could see was that the fish were caught 3 or 4 miles out, and when brought into water of a different temperature they would turn up.
1114. Would that be so much due to the temperature of the water as to the extra buoyancy of the water in the well? This craft was 46 feet long, and 10 feet beam; she had a space of 16 feet for a well, and the full width. They had plenty of room. We thought it was the temperature of the water.
1115. What depth of water were the fish brought into? About 20 feet.
1116. What fish were they—schnapper? Mostly schnapper and nannegai.
1117. What fish mostly turned up? The schnapper.
1118. Do you know whether they adopted any process for the purpose of combating the buoyancy of the water in the well? They pricked some of them.
1119. Did those that were pricked die? No, they did not.
1120. Do you think, then, if the process of pricking the schnapper were adopted, there would be a possibility of well-boat fishing proving a success? Yes, I do.
1121. Do you think it possible that trawling could be carried out successfully on this coast? I do not think so between here and Ulladulla.
1122. Do you know of the existence of any banks? Yes; the Sir John Young Banks, off Jervis Bay.
1123. Have you ever noticed any evidences of deep-sea oyster deposits? No.
1124. Have you ever noticed, at certain times of the year, shoals of fish making their way from the south to the north? I have.
1125. How far off the coast? Sometimes from a mile and a half to 3 miles out.
1126. What did you take them to be? Chiefly mullet. I never caught any of them.
1127. That might have been the herring, so far as you know? Yes; that is true.
1128. Have you ever heard that there are shoals of what they call the maray making their way northward from the south? Yes, I have.
1129. Have you any oyster fisheries in Lake Illawarra? A few oysters at the entrance, that is all. Nobody cultivates them.
1130. How many fishermen are on Lake Illawarra at the present time? There are seventeen boats working, each boat has two men.
1131. About thirty-five or thirty-six men? Yes.
1132. Do you think that number of men is sufficient for Lake Illawarra, in order to allow of their making a living? Yes.
1133. Would you be inclined to favour a provision in a Bill which would prevent the overcrowding of fishing-grounds, so as to allow the fishermen to obtain a decent livelihood? Yes; I should think the fishermen themselves would see the necessity for keeping away.
1134. Mr. White.] You have had thirty-four years experience in the fishing industry;—have you during that time studied the question of the distribution of fish to the metropolitan suburbs? Yes; the suburban districts of Sydney have never been properly supplied.
1135. If there was a better system for supplying the suburbs would you get much better prices for your fish? Yes; we should. At the present time the poorer classes of the people are not able to buy fish from the dealers.

1136. There are times in the year when the fishermen get absolutely nothing for their catches? Yes; *Mr. E. Barber.*
sometimes good mullet are sold at less than 3d. a dozen; but the public reap no advantage from that.
1137. Then you are of opinion that if a better system was in vogue for the distribution of fish it would be beneficial to the fishermen? Undoubtedly so. *11 Mar., 1895.*
1138. Do you think it would be better to gut the fish you send to market? Yes; it would be better, it would be beneficial to the fish, especially in summer time; but if that were done, fish would require to be sold by weight. I am in favour of the gutting of fish.
1139. The lake was closed for a year—what condition was the lake in at the end of that time? The Commissioners had closed it for a year; but it was opened at the end of three months.
1140. Was there any benefit to the lake during the time it was closed? No; there is a large entrance, and the fish could go in and out as they thought fit.
1141. When the seine is drawn here, do they haul the net ashore? It is never landed ashore.
1142. Do you think the fishermen generally would approve of proper punishment being dealt out for stealing and breaking the law, especially in regard to oyster-stealing? Yes.
1143. And that the Act should contain penalties for stealing? Yes; it would give satisfaction to honest fishermen.
1144. The smoking you engaged in;—what process did you adopt, did you split and salt the fish? Yes; I dried them in the sun for a day, and then put them in the smoke.
1145. What did you get for smoked fish? I got from 3s. 6d. to 5s. per dozen.
1146. If smoked fish were properly distributed in the suburbs could you get rid of a good quantity? Yes; a great quantity.
1147. Is there much fish wasted in the sea that could be canned and tinned and made use of? Yes; especially in the mullet season. There are hundreds and thousands of tons of fish let go that could be made good use of.
1148. All through the want of a properly equipped establishment for tinning fish in the Colony? Yes; there could be a large amount of money made out of tinned fish in this Colony. No attempt, so far as I know, has been made to capture those large shoals of fish that go up and down the coast. We could tin our mullet and export it to other countries.
1149. There are some oysters in the lake? Just a few; the blacks look upon them as their property.
1150. *Mr. Thompson.*] Would it not still further add to the present demand for fish if it could be regularly sent not only to the suburbs but to the various country towns? Yes; most decidedly it would.
1151. Would there be any difficulty in sending fish—I am referring to cleaned fish—caught here, say, this afternoon, to Sydney, and forwarding it from thence to the country? I send fish to Katoomba, Harden, Junee, and Yass.
1152. But that is not generally done, is it? No; it is not.
1153. Are you of opinion that it would be an advantage to adopt some system whereby fish could be distributed in the interior? Yes; in the winter months. I do not think it would answer so well in the summer.
1154. But if it became an established system to have the fish cleaned and a proper cool car provided for their transit by rail, fish could be sent at all times? Yes; there is no reason why fish should not be distributed to the inland centres if proper facilities were afforded.
1155. Referring to nets, would it not be possible to allow the use of a net of a certain maximum length and a certain minimum mesh in waters open to net fishing;—would not that be an advantage? It would be a distinct advantage.
1156. Supposing such a concession were made, would you see any objection to the continuity of the fish supply being provided for by closed waters where necessary? I see no objection to that.
1157. You referred to fish boxes;—do you consider them superior to baskets? Yes.
1158. You said that they were liable to pilfering as well as baskets, but not in so great a degree? Yes.
1159. Could you not lock the boxes? Yes, they could be locked.
1160. Would that prevent pilfering? It would.
1161. How do you hang your nets? Generally on a third.
1162. Do you think that with a view to assist the escape of small fish that should be insisted on with all nets? Yes.
1163. Would you favour the establishment of auxiliary markets in the Sydney suburbs? Yes, I would.
1164. Do you think it would be a benefit to the fishermen and the public generally to have such markets? Yes; it would be a benefit, provided they were kept open all day long.

Mr. George Daniel Hockey, fisherman, Shellharbour, sworn and examined:—

1165. *President.*] Are you engaged in fishing on Lake Illawarra? Yes.
1166. Where do you reside? At Shellharbour.
1167. How long have you been engaged in fishing? I have been fishing off and on for the last nineteen years.
- 1167½. Have you a good knowledge of the fisheries of Lake Illawarra? I have.
1168. Are you the proprietor of a boat or boats? Of a boat and nets.
1169. Are there any others engaged in fishing with you? Only my two sons.
1170. What kinds of fish do you catch? Bream, mullet, whiting, blackfish, garfish, tailers, and jewfish.
1171. How do you dispose of your catches? We pack the fish in boxes or baskets, and send them to Sydney; they are disposed of at the Woolloomooloo market or Redfern. I am sending to Redfern now, but have sent to Woolloomooloo.
1172. You say you send in baskets and boxes;—which method has proved the most successful? Baskets, there is more ventilation.
1173. Do you consign to anyone in Sydney? Yes, to an agent.
1174. Do you get your returns promptly? We are supposed to get them weekly; but it is generally eight days before we get them.
1175. Have you sent many fish to market? A fair quantity.
1176. What is your average per week? About ten baskets.

Mr.
G. D. Hockey.
11 Mar., 1895.

- Mr. G. D. Hockey
11 Mar., 1895.
1177. Are you satisfied with the prices realised for the fish? No, I am not, by a long way. I consider I do not get one-third of what my fish is worth. The prices are something ridiculous.
1178. Have you to pay the agent's commission and charges? I have to pay 1s. in the £ to the agent, and the charges for carting my fish, 6d. per basket, from the boat or railway to market.
1179. Are you charged market dues and freight? Yes, 5 per cent. market dues.
1180. Have you ever had to complain of your fish having been stolen? My word I have—according to the price my fish realised when they went to market. The weight was $\frac{3}{4}$ cwt., weighed at the station here; when they were weighed in Sydney they were only $\frac{1}{4}$ cwt.
1181. That was the return given you by the agent? Yes; the fish went somewhere.
1182. Would it be possible for the fish to be stolen between the train and the market? Yes; but my fish were stolen in transit from Shellharbour station to the railway in Sydney. On another occasion I put three baskets of fish into the train at Albion Park station. The baskets were tied down, and I rode in the train to Dapto. I got out on the platform and I saw a man, a fireman or a driver in connection with the railways, at the fish. Would you believe it, more than one-third of each basket was taken. That was only just from Albion Park station to Dapto.
1183. Are you satisfied with the freight charged for carrying fish to market? Yes, I am—there has been a reduction.
1184. Do your fish, as a rule, arrive in good condition at the market? Yes.
1185. Your consignments depend pretty well upon catching the morning sale? Yes; fish that we catch this afternoon would be sold to-morrow morning. Fish caught this morning would have to remain in the ice-house until to-morrow morning.
1186. Would it be to your advantage to be able to send your fish at any time to the market for sale? Yes.
1187. Supposing the Railway Commissioners were disposed to place a refrigerating car on this line for the convenience of the fishermen, would you be disposed to patronise that car? Yes; I only wish it had been done long ago, and so does every other fisherman. It ought to be done; it is the very thing that would prevent cartloads and cartloads of our fish being condemned in Sydney as unfit for human food.
1188. You say it would be a great convenience to you if you could dispose of your catch right away, and have it delivered in Sydney by the agency of a refrigerating car? It would be a great benefit.
1189. Do you think it would be an advantage to do away with the agent who sells your fish? I cannot see what benefit the agents are; I cannot see why we have to pay those agents. The Woolloomooloo Fish Market is the property of the City Corporation, and as far as I understand—I am not positive—but I believe the agent has to take his account of the delivery of fish from the clerk at the market. The municipal people have to know what each man's fish brings in order to get the market dues; why could not they give us our returns direct from the market without the agent at all?
1190. Do you think it would be possible for the agents to form a ring for the purpose of disposing of the fish themselves at their own prices, and making fictitious returns for the fishermen? That is what I consider has been going on for many a long year. I know for a positive fact. I went from here on one occasion about some fish of mine I sent up, and I know for a fact that those fish never saw the market, and the agent just gave me whatever he thought proper. At that time fish were very dear, and the agent gave me 12s. a basket and sent the fish right up country. The agent told me so afterwards.
1191. Did the agent tell you what he got for the fish? He said, "I gave you 12s. a basket, and for the basket I sent away I got 30s."
1192. Do you think it would be a good idea to bring the fishermen into more direct contact with the consumer? Yes, it would be a great benefit; because under present conditions we get a long way the worst end of the stick. The consumer gains nothing by our getting a low price; it is between the agent and the dealers that the money goes now.
1193. You say you have dealings with the Redfern Market? Yes.
1194. Compared with the Woolloomooloo Market, is it better arranged, and are matters more satisfactorily conducted there than at Woolloomooloo? I think so.
1195. Have you seen the way fish are displayed in the Woolloomooloo Market? Yes, I have. I think it is a very dirty and disgraceful thing.
1196. Could that system be improved upon? I think so; it ought to be.
1197. Do you think the manner in which fish is displayed in the Woolloomooloo Market prejudices the public against the use of it as an article of food? It ought to. I feel quite confident I could not eat fish taken off that floor in that market. There are all kinds of people smoking and spitting and trampling on the fish. It is horrible.
1198. Would you approve of the system of displaying fish on raised tables in the market? Yes; there should be raised tables, so that the people could see what they are buying.
1199. From your knowledge of the Woolloomooloo and Redfern Fish Markets, which do you consider most central and most convenient for the trade—for the fishermen and for the general public? Redfern, by all means. It is far better for the purposes of distribution.
1200. The advantage, then, to be gained from having a central market would be that it would mean less handling of the fish? Yes; less handling and less carting through the streets. If fish go into the interior now they have to be carted from the railway to the market, where they are thrown on to the floor and handled and mauled about, and then put back again into the baskets and carted to the railway station. All this unnecessary handling could be saved by having a central market connected with the railway system of the Colony.
1201. In regard to the waters at present opened for net fishing in Lake Illawarra, are you satisfied with the area available for you to fish in, or do you require a further extent of water to be opened? Well, as to the closed waters in the lake, I have always been under the impression that the proper places have never been closed. I consider it is the creeks and all those places that should be closed against nets or lines or anything else. The entrance to Lake Illawarra is closed against net fishing at the present time, and, would you believe it, there is not a Sunday or scarcely a day in the week, but you will see boats at that place, and a whole crowd on the banks line fishing everywhere. The principal part of the fish taken by hooks cannot be captured by nets for the reason that the ground is not suitable. The fish are dragged out of the water and one-half of them is not used. They are left on the banks to waste and rot, and the greater number of these fish are travelling for the purpose of spawning, full-roed fish—it is a regular destruction

Mr.
G. D. Hockey.
11 Mar., 1895.

destruction of the fish. It is right enough to have the lake closed; but if it is to be closed for breeding purposes it should be closed against everything, line fishing and everything else.

1202. Do you complain of the waters being too limited at the present time? No.

1203. Did the closures ever act detrimentally to your interests? They did.

1204. Who recommended those closures in the past? I cannot tell you.

1205. Have any members of the Fisheries Commission ever been down here? No; I have never seen any of them here.

1206. If they had been here would you have known of their visit? Certainly; none of the fishermen have known of their being here.

1207. Do you think the Commission take that interest in the industry that they might? My candid opinion is that they never bother their heads about it; they never take any interest in the fishing industry. It is like a boy having a new toy—it is all right while it is new, but he soon gets tired of it, and does not care about it any longer.

1208. Do you think it would be better, in view of the circumstances you have just related, to have the control of the fisheries placed in the hands of one man as Commissioner of Fisheries, a gentleman who would have to confine his attention solely to the development of the fishing industry, and take an interest in everything connected therewith? Yes; I thoroughly believe in that.

1209. And, as a further protection to the fishing industry, are you of opinion that it would be a good thing to appoint local boards of advice, representative fishermen, to be upon such boards? Yes, that is the proper thing to do, I have not the slightest doubt about it, for the simple reason that what suits Lake Macquarie will not suit Lake Illawarra, and what suits Lake Illawarra does not suit the Shoalhaven River.

1210. Is there a diversity of circumstances connected with all the different fishing grounds? Yes, and that is the reason why the fishermen are so much divided at the present time; every man is fighting for himself. Local boards would be a great advantage, for the simple reason that the men on them would be able to advise as to what should be done to meet local requirements.

1211. Apparently you are not in favour of the continuance of a Fisheries Commission such as we have at present, which only meets once a week in an office in Sydney? No; it is no good at all. It might just as well be wiped out of existence; it is no good; it should never have been brought into existence.

1212. Do you think the fishing industry has been fostered or promoted since the appointment of the Fisheries Commission? No; it has been kept down; its progress has been retarded. I worked at fishing before the Fisheries Commission was in existence at all, and we then realised a far better price for our fish than we have since.

1213. Are you conversant with the provisions of the Fisheries Act? Yes.

1214. Are you cognisant of any defects in that Act? We are restricted to a certain sized mesh, and then we are restricted to a certain weight of fish, which I consider is an injustice. If I work a legal mesh and a legal net now, and catch any fish—if the thing was properly managed, and the fish not absurdly small—I should be allowed to dispose of them; at the present time we are not. If we send them to Sydney we are prosecuted for doing so as they would be under weight. The limit of the length of our meshing net is 120 yards, it should be 600 yards. This net has to have a mesh not less than 4 inches, and still, under the Act, we are allowed to catch a fish of 8 oz. I can very nearly put two such fish together and poke them through a 2-inch mesh. How is a fisherman to catch those big shoals of hardgut mullet, when travelling, with a 4-inch mesh? Why, you would not get one out of every thousand, and they are travelling now, immense shoals of them. The proper nets to use to catch those fish are 3 inches, 3½ inches, and 3¾ inches.

1215. What nets do you use on the lake? The nets we use now are hauling nets; we were allowed to use nets with 100 yards of bunt 2½ inches, and the wings up to 3 inches.

1216. The provisions of the amending Act have been extended to Lake Illawarra, extending the length to 600 yards? I understand about the length, but not about the mesh.

1217. Any other nets? Garfish nets. There should be an alteration there, we are only allowed 30 fathoms of garfish bunt; it should be 1 inch in mesh; it is 1½ inches now. The greater portion of the sea garfish slip the present mesh.

1218. Do you complain of the provision for the weight of fish in regard to garfish? No, I have no reason to complain, the weight of the fish should be sufficient;—a fisherman should be allowed to use what net he likes.

1219. Do you think there would not be a possibility of the destruction of under-sized fish if that were permitted? Then let the fishermen be prosecuted for it.

1220. I suppose a provision making it compulsory on the part of the fishermen to empty their nets in a certain depth of water instead of hauling them on shore would be sufficient protection against the destruction of small fry? Yes; I think there should be a restriction compelling fishermen to land their nets in every place in 2 feet of water.

1221. In regard to the provision punishing for using illegal nets, do you think that when a net is once pronounced to be legal and has been used as a legal net it should always be considered legal, and used until worn out? It should be so.

1222. In purchasing a net do you allow in the first instance for shrinkage? Yes; a quarter of an inch. If I want a 4-inch net to make 4 inches on my boat when tanned, I have to buy it 4¼ inches. Some nets shrink more than others.

1223. Then you do not believe in the confiscation or seizure of nets, or tools of trade, for any breach of that provision? No; it should not be done; it leaves many a man destitute and starving. He should be punished by a fine.

1224. And the net handed back and made legal? Yes.

1225. You think it would be sufficient to punish the man, increasing the fine or term of imprisonment for each offence, instead of taking away his tools of trade? That is the proper way to deal with the matter.

1226. Are there any other provisions of the Fisheries Act which you consider operate harshly against the fishermen? It is the mesh which causes pretty nearly all the trouble—this certain limit of mesh.

1227. Do you use the drift net? Yes.

1228. What is the mesh of that? The drift net is supposed to be 4 inches.

1229. Do you think the drift net should be reduced from 4 inches to 3 inches? The best way would be to allow the fishermen to use 600 yards, let it be meshing or hauling, which he thinks proper; that would save all difficulty; I would not allow any man to use a mesh of less than 3 inches for meshing. 123

- Mr. G. D. Hockey. 1230. Do you know anything about the system of well-boat fishing? I have seen a good many of them start with wells in their boats, but they failed.
- 11 Mar., 1895. 1231. Where did you see them? There is one now in Shellharbour; it belongs to Captain Wilson. There are two or three in Ulladulla.
1232. What size is it? The one in Shellharbour is only a small boat, 22 feet, with a small well.
1233. The Ulladulla ones? About 22-footers.
1234. Have you seen them in actual work? Yes; I do not know how fish would do in big boats, but they do not do well in the small boats.
1235. Are you sure those well-boats are constructed on the proper principle? I cannot say; I have never seen other well-boats.
1236. As a practical fisherman do you think if the well-boat system has worked successfully elsewhere—and it has been found that fish can be kept alive in the wells in Tasmanian waters for a couple of months—it would be quite possible to do it here? They ought to be able to do it here; it should be possible. If it has proved successful in other countries it might be adopted here.
1237. Fresh fish would sell better than dead fish? Oh, yes.
1238. Have you ever had any experience in trawling? No; I have not, but trawling might be a success.
1239. In regard to the oyster fisheries, have you ever seen any evidence of deep-sea deposits of oysters? I have not worked among oysters.
1240. *Mr. White.*] In sending your fish to market, do you think a skeleton box, with wire round it, would keep the fish better? Oh, yes; there would be more ventilation; that would be better for the fish.
1241. What average prices do you get for your fish? I have been sending choice fish to market. I do not think the average price for garfish, bream, and whiting, has been more than 3s. per basket to me, net.
1242. Have you had any fish condemned? No.
1243. Have you heard of the agents sending fish straight away to the country without putting it into the market for sale? I know of one case in which they did it. The agent sent my fish to the country, and gave me the average price the same class of fish fetched in the market.
1244. Is the fish supply in the lake diminishing? No; it is on the increase.
1245. Do you haul your nets ashore? The fishermen here do not haul nets ashore.
1246. Are you in favour of imprisonment instead of inflicting a fine for stealing oysters and pilfering fish;—would that put a stop to that sort of thing? I would punish them for stealing fish and oysters.
1247. Were the fish you saw in the well-boats pricked? Yes.
1248. Did they live? I have never seen fish live any longer than a week.
1249. *Mr. Thompson.*] Do you think the system of weighing fish prior to consignment and on arriving at the railway station would serve to find out where this pilfering takes place? I think that would be an excellent plan to adopt, providing the city corporation officials also weighed the fish on arrival at the market.
1250. Would it be desirable to dispense with the different nets now in use, and allow the fishermen to use in open waters a net for all purposes of a certain maximum length (say) 600 yards, and a certain minimum mesh? I consider that would be a very good thing.
1251. Do you think it would be a desirable thing to establish auxiliary markets for the sale of fish, markets to which you could send your fish at any time, and have them despatched from thence to the country towns? Anything like that would be a distinct benefit to the fishermen. It would give us an enlarged market for the sale of the fish we capture.
1252. *President.*] Have you ever noticed shoals of fish off the coast, making their way northward from the south? Yes; they appear every year.
1253. *Mr. Thompson.*] In what month? Well, February and March hard-gut mullet are travelling, blackfish and bream in January and February. This month and April are the months for the big sea mullet.
1254. The hard-gut mullet travelling out to sea? Yes.
1255. *President.*] Have you ever seen any shoals of herrings on the coast? I could not say they were herrings, but to the best of my belief they were herrings. I have seen them on a calm evening as far as the eye can reach. The biggest school I ever saw was about a mile off the Five Islands, about 2 or 3 miles off the mainland. I have never seen those fish inside the current. I have seen shoals of fish; I do not know what they were; I was looking at them last Saturday; fish about 6 or 8 inches long.

Mr. James William Smith, fisherman, Lake Illawarra, sworn and examined:—

- Mr. J. W. Smith. 1256. *President.*] Where do you reside? Lake Illawarra.
- 11 Mar., 1895. 1257. Are you engaged in fishing? Yes.
1258. Have you had any experience in net fishing? Line fishing and trawling; not net fishing.
1259. Where did you gain your experience? In the North Sea, the German Ocean—off the English coast.
1260. How many years have you been engaged in fishing? About forty-two years in all.
1261. Are you a practical trawler? I have followed it for years—sometimes trawling and sometimes ship-building. I have built fishing-boats, smacks, well-boats, and so on. I built a boat not long ago.
1262. Have you had any experience in drift net fishing in the North Sea? Yes; herring nets and salmon nets.
1263. Can you remember what the mesh of the drift net was? For the herring?
1264. Yes? It was about 1½ inch; if there were any below that they were confiscated and burned.
1265. How long have you been in this Colony? About seven years.
1266. You have had experience of our fisheries? I have been schnapper fishing—long-line fishing; the line I used was 4 miles long, the hooks 12 feet apart.
1267. How long were the snoods? They generally ran about 2½ feet to 3 feet long.
1268. Where did you practice this kind of fishing? I first tried Jervis Bay.
1269. Did you have any success? Plenty of fish but nothing but heads; the sharks took the schnapper from the lines, leaving nothing but heads. From that place I went to Wollongong, and shot lines in different parts, but I came to grief; there are plenty of fish to be caught, providing the sharks and leather-jackets were out of the road.

1270. Of course there is a great difference between the single hand line and the set line; I mean in this respect: You would have a better chance of saving your fish with the hand line than with the line you used? Decidedly; I tried those lines at Broken Bay; it was the same thing—destruction both for the lines and the fish on them.

Mr.
J. W. Smith.
11 Mar., 1895.

1271. Take one of your fishing trips. Supposing you had got a fish for every schnapper head that you hauled up, or for every hook you lost, would you have done very well? I should think I would have caught a ton; there is plenty of fish.

1272. Would you take a ton of schnapper to be a handsome return for a week's work with that line? It would be a good return for a month's work.

1273. Do you think it would pay if you could catch 1 cwt. per day with the hand line? I followed it for some time, but could not make a living. From Broken Bay I went on to Lake Macquarie. There I made a respectable living with the long line; but you do not catch many schnapper there. I caught bream, flathead, tailer, and jewfish. I used to get from three to four baskets of fish a day. I was four or five months there, and did very well.

1274. Did you use the net at all? No.

1275. How did you get your bait? From the other fishermen—salmon and so forth—that they did not want.

1276. Did you try that line in Lake Illawarra? Never; I lost my 4-mile line; the sharks cut it to pieces.

1277. Where did you lose it? Due east from Coalcliff.

1278. Where is the boat you built? At Broken Bay; a party bought her; she is a clinker built coble.

1279. What did she cost you? £75, with all equipment.

1280. Had she a well? No.

1281. Have you ever tried well-boat fishing? Yes; I have built them, too.

1282. Do you think that system would do well here? It would to a certain extent. As soon as you begin to see fish look unhealthy you want an ice-room to put them in.

1283. To work the well-boat system successfully you require to have cold storage in conjunction with the well? Yes.

1284. Do you think, under those circumstances, the system of well-boat fishing would be successful here? There is no thinking about it, sir; it is absolutely so. When your fish begin to go off, put them into the freezing apparatus, and you are sure of having them fresh.

1285. You have had experience at trawling? Yes.

1286. How much of our coast do you know? From Jervis Bay to Newcastle. In some places I could get no soundings at 25 miles off, although I tried with a line 100 fathoms long.

1287. Did you try to get soundings between the coast and that limit of 25 miles off? Yes; I got bottom at 15 miles off at 45 fathoms.

1288. How long were you fishing outside? Three years.

1289. Had you anyone else with you? My son.

1290. Did you prove the existence of any banks? No; there were a good many rocks.

1291. Have you fished off Port Hacking Heads? Yes; there is a patch of sand there.

1292. You have not been further north than Newcastle? No; I have not.

1293. So that you cannot say anything about the existence of banks to the north of Newcastle? No; I do not think you could trawl where I have been.

1294. What are your reasons for concluding that trawling operations could not be successfully carried on? On account of the bottom.

1295. Supposing a trawl survey was made, and the existence of suitable grounds on which to trawl was proved, do you think that, with a little enterprise, the trawling industry could be carried on? I think it could be carried on, and you would make a good thing out of it if you could fall in with the grounds.

1296. Would you have any objection to an experiment being made by the Government for the purpose of testing the suitability of our fishing grounds for trawling purposes; do you think it would be a good thing for the Government to test the question first? The Government ought to do it. The British, the Dutch, Norwegian, and other Governments tried the grounds first, and then companies went in for trawling and made a great success of it.

1297. During the many occasions you have been outside have you ever noticed shoals of fish making from the south to the north? Yes; I have seen them; but having no nets I could not catch them. I have seen very heavy schools of mullet.

1298. At what time of the year; can you remember? About June. I have eaten the herring. It was caught here in Mullet Creek. I examined some herrings shown me by the fishermen there. The fish had a herring head, the scales, the tail, and the fins, but it was short in the body.

1299. What flavour had the fish? Not quite the flavour of the English or the Scotch herring, but still it was the herring species.

1300. Was that like the herring you caught [showing the witness the engraving of the Southern Herring, "*Clupea sudiaca*," in the "*History of the Fisheries of New South Wales*," by Mr. Lindsay G. Thompson]? That is as near the herring as can be; yes, that is the fish.

1301. Do you think that herring could be used, and made an article of commercial value by preserving it? It could be preserved in oil in tins. It would be beautiful tinned. I really think that fish would sell very well.

1302. Do you think any use could be made of the sea mullet that come to these shores in such enormous schools? Yes; all the mullet species should be cured, tinned, and smoked; they would be of great value. They could be sent to other parts of the globe.

1303. Have you ever done any fish-smoking here? Not in this Colony. In the old country.

1304. What wood did you use? Oak. Do not have too much smoke; have a small blue flame. Keep the fish separate from one another.

1305. How long did it take to smoke the fish? If you hang 6,000 or 7,000 fish up like to-night, with a slow fire, so much that you can scarcely see them, the next morning they would be all right.

1306. Knowing how to smoke fish properly is an art? It is a business, a great business. I will tell you about curing the fish with salt. When the fish are cleaned place them in a pot of brine. If you wait for ten or fifteen minutes you will see the eye of the fish turn white. You then take it out and hang it up. If you leave them longer they get too salty.

1307.

- Mr. J. W. Smith. 1307. On the whole then, from your observations abroad and in this Colony, you think there is plenty of room for the development of the fishing industry in the way of establishing canneries and places for smoking fish? Yes, I do.
- 11 Mar., 1895. 1308. Do you intend to follow up the advice you have tendered to the Commission? Well, I am going fishing, and shall continue to smoke them; but it costs money, too much for a private man, or I would like to try tinning the fish.
1309. Have you ever come across the herring since you saw the specimens in Mullet Creek? Never; but I have not the least doubt that heavy shoals of herrings pass this coast.
1310. Have you heard the fishermen speaking of them? Oh, yes, frequently.
1311. The best way to take them would be in the drift net? All those fish that pass in the ocean must be taken by a fair drift net. It wants a lot of practice.
1312. Did you gain your experience of trawling on a steam-trawler? Sail and steam.
1313. What would be the size of a steam-trawler? Not less than 100 to 120 feet long, 20 feet beam, by 8 feet deep in the waist.
1314. And her draught? That is according to the build of the vessel, some are flatter than others.
1315. Does the steam-trawler do the better work? Decidedly; if the wind falls slack the sailer cannot get along, and you might upset the trawl.
1316. How does the current set off our coast? To the best of my knowledge to the south-east.
1317. The current setting to the south-east;—how would you trawl, with the current or against it, or could you trawl across it? In a steam-trawler I would run across the current. I would go anywhere I liked. You could trawl anywhere you liked if you had steam-power.
1318. What do you think of the varieties of fish in the New South Wales waters? Upon the whole they are of very good quality. Their flavour is good. Take the fish in New South Wales waters; as a whole they have a better flavour than the English fish, but they do not grow so large.
1319. *Mr. Thompson.*] Do you think it would be a proper thing for the Government to make experiments in trawling on the coast? I consider it is their duty to do so, and if those experiments prove a success there will be a great industry in this country. It is too much to expect private persons to go into trawling as a mere speculation.
1320. What port did you sail from in England? The Tyne. I have worked in the Hull and Grimsby fisheries.
1321. What would be the cost of an imported steam-trawler suitable for working? Of wood it would cost from £1,400 to £1,800.
1322. Do you think a trawler fit for our purposes could be purchased in England now for £2,000? You would get a beautiful wooden trawler ready for use for that. The hawser and the trawling-gear would cost about £150.
1323. Those shoals of fish that you believe to be a sort of mullet;—what month in the year have you seen them? In June.
1324. *Mr. White.*] What length was the boat that cost you £75 to build? Forty-five feet long.
1325. You built her yourself; I suppose you mean the £75 was the cost of the material? Yes; I will build you a similar one for about the same money, so much a foot.
1326. Roughly, about how many hooks would you put on that line of yours? For every mile I would put on 1,100 hooks, according to the class of fish. If they were big fish you would want bigger snoods.
1327. What do you generally bait your lines with? I generally get salmon. I used that in Lake Macquarie.
1328. Have they any justification for calling the species you have just named the salmon? They are the same shape and the same colour as the British salmon, but they have not the taste. The Australian fish do not go to the weight of the British, and they have not the taste of the English salmon.
1329. In your line fishing from Jervis Bay to Newcastle, how far off the coast did you catch fish? As far as 15 miles. It was with the hand-line.
1330. What bottom had you there? It was a shingle bottom.
1331. You do not know of any line of reef? As a rule schnapper follow the reef, and close under the reef. I find, if you get on the weather side—just the dangerous side—there is better fishing.
1332. When fishing off the coast in the old country, where did you fish from? From Yarmouth right away to the Scottish coast.
1333. What depth of water did you generally fish in? On the Dogger Bank you will fish from 10 to 30 up to 60 fathoms at the deep end of the bank.
1334. What would be the average you used to trawl in? As you leave the bank it runs from 40 to 50 fathoms.
1335. And the beam trawl works well there? Decidedly.
1336. What is the best depth to trawl in? Well, the fish shift about a great deal.
1337. *President.*] Have you a knowledge of the salmon fisheries? Yes, I have.
1338. Do you think it would be possible to acclimatise the salmon in New South Wales? I do not think so. They will not thrive in this country. It is a tropical climate. The salmon we get in England is really an Arctic fish.
1339. Consequently they are used to a temperature which we have not got here? We have not got the temperature.
1340. Is it a fact that salmon, although they breed in the upper reaches of a river, seek the lower or salt-water portion later on at different stages of their growth? When those fish have been from four to six months in the salt water they seek fresh water. The reason is because they become lousy in the salt water; they take up the lakes, remain there some time, leave their spawn behind them in the reaches, and then come down again into the sea.
1341. Then they have a double object—first to get rid of lice, and secondly to find a place in which to spawn? Yes; that is so.
1342. In regard to the salmon or sea trout and the brown trout, would it be possible to acclimatise those fish in this country? They are a cold-water fish.
1343. Has it come under your observation that trout will thrive where salmon will not? I cannot say.

Mr. David Walker Benson, Assistant Inspector of Fisheries, Lake Illawarra, sworn and examined:—

1344. *President.*] Your name is David Walker Benson, and you are an assistant inspector of fisheries;—how long have you occupied that position? About ten years.

1345. Have you been located anywhere else, engaged in the supervision of the fisheries? I held an appointment as assistant inspector on the Clarence River for about six months.

1346. How far does your jurisdiction extend? At the present time only over Lake Illawarra, Fairy Meadow Creek, and the Tom Thumb Lagoon.

1347. Have you ever been commissioned to go further south and make reports on the Shoalhaven or the Crookhaven fisheries? Yes, at times.

1348. What is the extent of Lake Illawarra? A little over 40,000 acres.

1349. Of course you live on the spot so that you may have proper control over the fisheries? No, I do not; I cannot get a residence near the waters to supervise the fisheries thoroughly. I live 7 miles away from my work, at Wollongong.

1350. Would it be an advantage to you if you lived right in the centre of your work? Oh, yes, undoubtedly so.

1351. Do you know whether any move has been made by the Fisheries Commission to locate you nearer to your work? Not personally; not from the Commissioners direct. I know Mr. Thompson, as chief inspector, has done his utmost to get me a residence near these fisheries.

1352. Where would that be? Kanahooka Point.

1353. Was land available there for a building to be erected? No; we anticipate it will be up for sale in a short time.

1354. At the point where you suggest the erection of a residence, would you have a good view of the lake? Yes; I could see all over the lake; the lake would be right under my eyes.

1355. You admit that you are at a disadvantage in living 7 miles from the scene of your duties? A very great disadvantage. In the winter months my work is all night work, and I find it very inconvenient. I have no sleep except Friday and Saturday nights; I am out all through the other nights during the winter months. I have to go home to Wollongong to see if there are any letters or correspondence from the office, and then I just get my dinner and go back to work again.

1356. Do you think it is quite sufficient for one man's duty to watch the fisheries of Lake Illawarra? Under different conditions to those at present pertaining one man could look over a larger area than he can now, for the simple reason that the fishermen would not want to break the law. The conditions are so harsh upon them under the present Act.

1357. You say you exercise control over the Tom Thumb Lagoon;—does that contain any fish? The fish work in there—in and out with the tide. At times large quantities of fish are there.

1358. Is that lagoon closed against net fishing? Yes.

1359. You do not think it would be possible under present conditions for you to exercise proper control over the Illawarra fisheries and attend to the other fisheries to the south? No.

1360. How many licensed fishermen are there on Lake Illawarra? Thirty-one at present, and eighteen boats.

1361. What is the aggregate catch for a given period? It varies very much. I can give you from 1883 to 1893—ten years. In those ten years the total was 63,862 baskets. The catch in 1895 was a little over 7,000 baskets. So far as this year has gone, 1,500 baskets have been taken out of this lake.

1362. Does the total you have given for the ten years include the fish used for local consumption? No.

1363. What would be the average number of baskets used locally per year? One thousand five hundred would be near the number used locally.

1364. Can you give the Commission any idea of the value of the catch in the year? For the last ten years it would be about £3,000 per annum.

1365. You mentioned just now something about present conditions being altogether against your being able to visit the more remote fisheries and exercise control over them;—what do you mean by "present conditions"? I was referring to the provisions of the Act.

1366. Do you believe the Act requires amending? I do.

1367. Would you mind telling the Commission what you think should be done in regard to the question of nets? The present hauling net the fishermen have under the Amending Act is sufficient; that is 600 yards; the 300-yards net was not sufficient for the men to get a living with in these waters. The conditions of the lake do not admit of their getting round the fish with a 300-yards net. The water is so shallow that to get at the fish the men would actually have to go up to their necks in water. They want a greater length of net, in order to get into deep water to take the fish.

1368. That evidence applies to hauling nets;—now with regard to the size of the mesh? The present hauling net is 2½ inches in the bunt and 3 inches in the wings. In speaking of the size of fish that would be caught or killed, I have often thought it would be better to reduce the size of the mesh if we could get the fishermen to turn the young fish out, instead of working them about amongst the blubber when in the bunt. Of course, if we cannot get the fishermen to do this, make the mesh larger for the bunt; make it 3 inches; reduce the length of the bunt; the other parts of the net to be of 3-inch mesh.

1369. Do you think, then, that the present mesh of the bunt tends to the destruction of small fish by allowing them to become meshed? Undoubtedly so. My experience has been that in the 2½-inch bunt there has been more fish killed than in the 1-inch bunt. That will save the destruction of young fish. The fishermen, as a rule, will not take the trouble to look after the young fish, especially where they haul ashore.

1370. Are there grounds in Lake Illawarra for the fishermen to haul their nets ashore? No; no place for them to haul ashore in Lake Illawarra. They have to work on what we call back nets.

1371. Are there any very small fish in Lake Illawarra? Great numbers, from (say) 1½ inch up to 3 inches—millions of them.

1372. The presence of those fish must be an evidence of fish breeding in the lake? Undoubtedly so.

1373. How much of the lake is closed against net fishing now? There are two areas—the Mullet Creek closure and the lake entrance.

1374. Do you consider it essential that those places should be temporarily or permanently closed? Well, the creek, under the present condition of hauling nets, I should make a permanent closure. If we could do

Mr.
D. W. Benson.
11 Mar., 1895.

- Mr. D. W. Benson.
11 Mar., 1895.
- do away with hauling nets in the lake, and compel the fishermen to use meshing nets, closed grounds would not be required, for the reason that the fish would not be interfered with.
1375. Do you mean by the meshing net the drift net? Yes; it is essentially a drift net.
1376. Passed from the boat and hauled into the boat? Yes.
1377. What mesh would you recommend for that net? Three inches or $3\frac{1}{2}$ inches. The legal weight of fish this net is used for is 8 oz. It is actually a mullet net. The present net, which is 4 inches in mesh, would allow a 2-lb., even a 3-lb., fish to go through it.
1378. So that there is an anomaly? The net is actually no use to the men.
1379. That is, there is loss of fish of legal weight that could be made use of; they pass through the mesh at present and escape? Yes.
1380. In regard to closures—are there any portions of Lake Illawarra that come within the category of naturally closed waters? What we call the reserve—to the north and south of the entrance, inside the lake—is undoubtedly closed naturally.
1381. What features present themselves there? Weedy flats—splendid shelter for young fish—with sandy beaches here and there for breeding purposes. At the southern end of the lake there are rocks where the fishermen cannot haul; that is, in some places.
1382. In respect to the closures made during your term here—have you recommended any portions of the lake to be closed against net fishing? Yes; I have recommended, generally, the whole of the closures.
1383. Have you recommended any cancellation of the closures? No.
1384. Have the Commissioners always acted on your recommendations as to closures? They modified my recommendation on the last occasion.
1385. Are there any other instances in which you have made recommendations to the Fisheries Commission, and they have not been carried out? In reference to closures—none.
1386. How does Lake Illawarra come to be so prolific in fish life? Owing to a great extent, in my opinion, to the extensive use of the meshing nets, coupled with the closures in certain places, and especially the closing of the entrance to the lake, which allows of the free ingress and egress of school fish.
1387. What varieties of fish are caught in Lake Illawarra? Mullet principally, bream, garfish, flathead, whiting, tarwhine, and jewfish.
1388. Since you have been in charge of these fisheries have you noticed any depletion in the supply in Lake Illawarra? In the summer months undoubtedly so; then hauling is carried on to a great extent.
1389. When there are signs or a diminution in the supply would you recommend a temporary closure? No; I would recommend that hauling be stopped, and meshing be allowed. It would be hard on the fishermen to make a temporary closure, because they may not have the means of going away elsewhere. The use of the meshing net would stop the depletion at once, because it would not work on the bottoms, and disturb the fish or their food.
1390. In catching the different varieties of fish I suppose the fishermen use the nets allowed under the Act? Yes; the fishermen use every kind of net allowed by the Act.
1391. What would you say in regard to the length and mesh of the garfish net; is it sufficient at the present time? The present length, 180 yards, is not sufficient for this lake; it is used here in a way that the fishermen call bull ringing; almost the same as the meshing net is used.
1392. Most of the garfish are meshed? They are all meshed.
1393. There is nothing in the Act to prevent the garfish net being hauled to the land? There is a regulation which prevents a bunt of less than $1\frac{1}{4}$ inch being hauled ashore.
1394. What would you recommend as a fair length for a garfish net in Lake Illawarra? I would recommend the old length of the hauling net—150 fathoms.
1395. So that it could seldom happen that fish other than garfish could be taken in the garfish net? They cannot take them; the mesh is too small.
1396. Are prawn nets used in Lake Illawarra? Yes.
1397. Since when have prawns been found in Lake Illawarra? Since October, 1894, they have been sent to Sydney.
1398. Had they been sent prior to that? No, not in quantities; they were never made a marketable commodity.
1399. Have many prawns been sent to market since the date you mentioned? Yes; 232 boxes.
1400. What is the average weight of each box? About 60 lb.
1401. Are they in the lake in appreciable quantity at the present time? Yes; they are.
1402. So that, practically, a new industry has sprung up—the capture of prawns in Lake Illawarra? Yes.
1403. As the prawn net is now being used in Lake Illawarra, what size would you recommend that to be? At the present time 30 yards is not sufficient; I would increase the length. The prawns are caught in very shallow water, and with 30 yards you cannot get around the water to catch them, especially if the net is hung on the third, as it should be.
1404. Will you explain what you mean by hanging on the third? I mean by hanging on the third, that 18 inches of net should be distributed on a foot of line.
1405. Have you had occasion to seize many nets under the provisions of the present Act? Yes; at different times.
1406. For breaches of what clause of the Act? Illegal nets, and fishing in closed waters.
1407. Have you always succeeded in getting convictions? In all cases.
1408. What was done with the nets? For fishing in closed waters the nets were confiscated; in some cases in which the nets were illegal they were returned and others confiscated.
1409. Have parties been deprived of their tools of trade by having their nets confiscated? Undoubtedly so.
1410. Do you think that is a case of great hardship? I do.
1411. What provision would you make to deal with such cases more satisfactorily, so that the men might be punished, but not have their tools of trade taken away from them? By fine or imprisonment; it would be far better to put a man in prison for a week or a month than deprive him of his means of getting a livelihood.

Mr. D. W.
Benson.
11 Mar., 1895.

1412. Have you known of cases where nets have been legal and have been used for a considerable time, and afterwards condemned as being illegal nets? Yes, I have; all nets that the fishermen have used have been legal at one time, and owing to tanning, to preserve their nets, they have come within the penalty of the law, because the nets have shrunk through tanning.

1413. And although this was known to you, you could do nothing but carry out the provisions of the Act? That is correct.

1414. Do you maintain that a fine or imprisonment would be —? Far more equitable than the confiscation of their nets.

1415. Then again, as to forfeited nets, what time would you allow for dealing with the question of forfeiture of a net? Seven days would be ample time; within that time the matter might be dealt with, but if the fisherman is kept waiting a fortnight or a month for the decision, the net being wet and not properly cared for becomes no good to him—it gets rotten.

1416. So that expedition should be used in dealing with all such cases, and more particularly if a fisherman is guiltless? Yes.

1417. And what would you suggest in regard to the method of procedure? As far as the Lake Illawarra fisheries are concerned, I consider that after the nets are seized, and the department notified, the men should be notified by the inspector as to the date on which the inquiry is to be held, so that they could attend. It is unnatural to confiscate these nets when they are not present; it is an injustice.

1418. Do the fishermen of Lake Illawarra seem inclined to work harmoniously with you? So far as I know they do, but under present conditions the men are not able to work harmoniously with me—they are always at war with me; that is owing to the defective Act. I have never made it a practice to seize nets for the sake of seizing them. I have always endeavoured to prevent the men breaking the law by suppressing the use of illegal nets.

1419. Has your conduct ever been brought under review by the Fisheries Commission? In 1892 I was reported by Inspector Smithers to the department.

1420. What for? Neglect of duty, and discourtesy to him.

1421. Would you mind telling the Commission the nature of the charge, and whether there was any truth in it—what constituted the neglect of duty, according to Inspector Smithers? The first report was to the effect that I was discourteous to him in the Police Court at Wollongong.

1422. Were you discourteous to him? No, sir, undoubtedly not. The C.P.S. could bear out what I say.

1423. Well, as to the neglect of duty, did he base his charge against you on the ground of your not having visited these fisheries often enough? One charge was that I stated in my diary I was on duty, and his report was that I was not on duty, but I was on duty that night; he was on the lake at the same time, but he did not see me, nor did I see him.

1424. However, you cleared yourself to the satisfaction of the Commission? Yes; the next charge was that I had inspected illegal nets and had taken no action.

1425. Was there any ground for that suspicion? No; I may say Mr. Smithers had seized an illegal garfish net from fishermen named George Dennis and James Duncan; this net when I inspected it was netting. It was not a net at all—it was undoubtedly illegal if it had been a net. This netting the men took out and used whilst I had my boat ashore painting and repairing her. I was unable to get on the lake at the time the seizure was made by Mr. Smithers off the mouth of the lake. The men were not fishing when he seized the net.

1426. Have the Commissioners ever expressed dissatisfaction with you in the performance of your duty? Not that I can remember.

1427. They investigated these charges, and the result was that none of them were sustained? I was not called before the Commissioners; I had to report in answer to Mr. Smithers' charges.

1428. Have you had experience with regard to deep-sea fishing? I never had an opportunity since I have been under the Fisheries Commission; my time has been taken up with inside work.

1429. Do you think, from information received from the fishermen and others, it is possible that our deep-sea fisheries can be developed? Undoubtedly so; I have often received information from the fishermen of large schools of fish passing along this coast, but I had no means whatever of finding out what species they were.

1430. Have you heard the fishermen say that the herring or pilchard pass along this coast in great numbers? Yes; I have repeatedly heard them say so. Within the last fortnight schools of pilchards, or the maray, have been outside the entrance to the lake. I have had several of these fish given to me by the men who have picked them up; they were actually coming into the lake. If the department could have given me a proper boat well equipped, undoubtedly we should have found out long ago whether these fish exist in the numbers that the fishermen allege they do, by running outside and testing the matter for ourselves when we heard that schools of fish were passing along the coast. I should not have wanted a crew; I could have taken one or two fishermen with me to work the boat, allowing for their actual expenses, so that the initial cost would have been the only cost.

1431. Have you ever seen or heard of large shoals of mullet passing along the coast in a northerly direction? Yes; at certain times of the year, generally in March and April; at the present time they are passing in immense schools. March and April are the months; they are generally full-roed about the end of April.

1432. Do any of these fish enter the lake? Yes; there are large schools.

1433. Are they captured in large quantities? At times by the use of meshing nets.

1434. Have you ever studied the question of well-boat fishing? Not seriously; my work has never brought me into contact with that class of fishing.

1435. From all you have heard, do you think it could be successfully carried out? I think so, but the facilities for getting fish away at the present time are so bad that I doubt whether it would pay. If we had better facilities our fish could be taken inland.

1436. Do you know of any case where well-boat fishing has been tried and proved successful on this coast? At the present time one of Dent's boats at Jervis Bay is engaged in well-boat fishing, and they are making it pay; she ran into Kiama the other day and quantities of fish were sold; what was not sold there was sent to Sydney by train; it was all fine fresh marketable fish.

1437. What class of fish? Schnapper.

1438. So that from all you have heard the experiment has proved successful? Quite successful.

- Mr. D. W. Benson.
11 Mar., 1895.
1439. Do you know anything of our fishing-grounds off the coast;—are they suitable for trawling operations or not? So far as I know, from my own observations, and from what the fishermen tell me, there is a splendid ground off this coast, from the Five Islands to Beecroft Head; a splendid flat bottom for miles; whether the depth would be too great for trawling I cannot say; some places it would be over 40 or 50 fathoms deep. The bank runs from about a mile and a half out, and is 9 or 10 miles broad.
1440. And about how long? Thirty miles.
1441. Do you think it would be worth the while of the Government to make an experiment in order to ascertain whether trawling would prove a success? I think it would pay the Government, for this reason: If it is found that the bottom is suitable for trawling, people would soon find capital to go in for it, and develop the deep-sea fisheries.
1442. Have you in use in Lake Illawarra what is known as the bultow or set line? No. I have a fisherman named Smith who intends using the bultow in a short time. He used it with success at Lake Macquarie.
1443. If the bultow were used, would it interfere with the net fishermen? No. The line would be used in the deepest water in the lake, and the hauling nets are used only within a certain radius of the shore. The meshing nets would not be affected, because they do not touch the bottom.
1444. Have you any knowledge of the market accommodation afforded to the fishermen in Sydney? The fishermen often complain to me of the inadequacy of the accommodation at the Woolloomooloo Market.
1445. Have they ever complained of the unsatisfactory returns they receive from their agents in Sydney? Very, very often.
1446. Do you think a better system could be devised whereby the fishermen could obtain fairer returns for their fish? Undoubtedly so. At the present time the fishermen are only working for the agents.
1447. You think, then, the agents obtain the greater proportion of the results of the labours of the fishermen? The agents and the middlemen.
1448. Would it be possible to bring the fishermen into closer communication with the general public? I think so. It would benefit the public and benefit the fishermen.
1449. Do you approve of the system adopted in the Woolloomooloo Market of displaying the fish on the floors? No; I consider it a filthy way.
1450. What would you recommend? I would recommend raised tables, so that no one could spit upon the fish, or tread upon them, and from which, when sold, they could be readily swept into baskets by the purchasers, thus avoiding unnecessary handling.
1451. Would you approve of the idea of representative fishermen being allowed to sell their fish or the catches of those engaged on the same fishing-grounds? Yes, I would approve of that; but in that case the fishermen would require more accommodation.
1452. Do you think the market at Woolloomooloo is in the most convenient and suitable position? No; the most inconvenient position for the general public to buy fish. The greater number of the residents of Sydney have no chance of going there, and buying their own fish, as was intended in the first instance.
1453. Do you think a more centrally situated market would be availed of to a greater extent by the public? Yes; one or two markets.
1454. Would you favour the establishment of auxiliary markets in the suburbs? Yes. It would mean that the general public would be able to get more fish, the system of distribution would be better—better for the public, and better for the fishermen. It would, of course, also mean an increased revenue to whatever department these markets were under.
1455. In regard to the question of transit, are the fishermen satisfied with the freights? Yes; undoubtedly so.
1456. I understand a reduction has been made lately? Yes; lately.
1457. There are no refrigerating cars on this line? No, not on this line; a great number of fish is sent by rail to Sydney. It is a source of considerable revenue to the Railway Department.
1458. Do you think if the Railway Commissioners were disposed to place a refrigerating car on this line for conveying fish to market it would be availed of, providing the charges were not too high? To Sydney?
1459. Yes; would it pay the fishermen to do that? If the department would supply those cars to send their fish inland, it would pay the fishermen. It would pay the men in the summer time, because their fish very often go bad in transit or after arrival.
1460. Supposing, in addition to the Railway Commissioners providing this car, auction sales were to take place at any time during the day at the central and auxiliary markets, would that suit the fishermen? Yes; they could catch their fish at any time if it could be placed in refrigerating cars; it could be sent by any train.
1461. It could be sold on the arrival of the 9 o'clock train, and be despatched to the country by the next train? Yes; and be fresh for breakfast in the distant inland towns.
1462. Have you heard of pilfering taking place during the transit of the fish to Sydney? Yes; very often.
1463. Where does it take place? A great number of cases which have come under my notice have been on the railway line, and during the transit of the fish from the railway to the market.
1464. Can you suggest a means by which this pilfering could be prevented? Lock the fishermen's boxes and have duplicate keys.
1465. Do you think a system of weighing at the station from whence the fish is sent, and weighing it again at the station to which it is consigned, would act as a check? I have known of a case here where a man has had his fish weighed and weighed again on arrival at the other end, and the officer at the latter place has said that the original weight was wrong. One-third of the fish was taken out of the boxes in transit.
1466. In that case did not the fishermen receive a consignment note, stating the weight, from the station whence he despatched the fish? I think he did. He made a complaint about it, but received no satisfaction.
1467. You mentioned that fish is sent to Sydney in boxes and baskets;—which do you prefer as a means of sending the fish to market? I prefer the boxes, made a little more open than at present, because the baskets are heaped one upon another, and the bottom tiers are not sufficiently rigid to withstand the pressure, and so the fish in the lower baskets get crushed, and uninviting for the market.
1468. You have control over the Tom Thumb Lagoon? Yes.
1469. Have you anything to protect there besides the ordinary fisheries? Oyster fisheries in the Thumb.
1470. Are they prolific? Very prolific in the Thumb.

Mr. D. W.
Benson.

11 Mar., 1895.

1471. Has any step been taken to prevent their being carried away for public use? Yes; the Department closed it for three years; that was on the 30th of April, 1892.
1472. Have any oyster leases been granted? None.
1473. Are the oysters taken by pleasure seekers? People go there and take a few oysters and eat them.
1474. Have you had occasion to prosecute anyone for violation of the Oyster Fisheries Act? Yes; several in reference to this water for taking oysters for the purpose of sale during the closure.
1475. What would you eventually recommend in regard to the Tom Thumb Lagoon and its oyster fisheries? I would recommend that the department lease it as a whole, or make it an oyster reserve for the benefit of the people at Wollongong; there is a large recreation ground adjoining it.
1476. Is there any line fishing in that lagoon? Yes; very fair fishing.
1477. So that pleasure seekers could avail themselves of the line fishing as well as the oyster fisheries? Yes.
1478. Have those oysters been in a healthy condition or not? Always healthy. I have never noticed any disease.
1479. Has any attempt at artificial propagation been made in the lagoon? No.
1480. Is it a fairly good ground for oyster culture? Very good.
1481. How long do you consider the spat would take to develop into a marketable oyster on that ground? There is always a good tide there. We find the oyster grows much quicker where there is a good flow of water. Within twelve months an oyster would be marketable.
1482. What kind of oysters are there? Drift, mud, and whelk oysters.
1483. Are there any rock oysters? No; in Allen's Creek there is an old bed, but very few oysters.
1484. Have you anything to do with the Minnamurra River? It is under my supervision.
1485. Are there any oyster beds or deposits there? Yes.
1486. Are there any leases? Two leases.
1487. Of what extent? 400 and 200 yards—P. T. Johnson's leases. On the bed adjoining his house there are mangrove and rock oysters. The bed down the river is all mangrove oysters.
1488. Are they of fair value as a marketable oyster? As a marketable oyster they are.
1489. Are they used locally? For local consumption.
1490. Is there any net fishing in that river? To a small extent.
1491. And what becomes of the fish caught there? It is sold locally. I may state it is some time since I visited that river, the department having instructed me not to go there unless specially directed.
1492. Have you been requested to report on any other oyster fisheries in the south? In 1892 I reported on the whole of the oyster fisheries in the Shoalhaven and the Crookhaven districts and the Jervis Bay oyster fisheries. During that visit I found the greater number of the beds in a most deplorable condition.
1493. From what cause? Owing to the mud and the worm disease, and also to overstripping. The overstripping would account for more depletion in a great number of the leases than the worm or mud.
1494. Do you think that if there had been local supervision on the part of the department that overstripping would have been prevented? Undoubtedly so; or if I had been instructed by the department to visit the place once a month. It could have been stopped by reporting to the department that such was taking place—that certain lessees were overstripping.
1495. Do you consider that the Shoalhaven and the Crookhaven grounds are good for breeding purposes? Undoubtedly so. They are first-class oyster grounds.
1496. Do you believe in the system at present in vogue, and allowed by the Act, of leaving it to the option of the lessee to take up such a low extent of oyster ground as 100 yards? No, I do not.
1497. What has been the result of the system of allowing men to peacock, as it were, 100 yards here and there? It has two very bad points in it. First as to the taking up of 100 yards with very few oysters on it. Owing to having this 100 yards the lessee could simply work the shores all round him, and there was no evidence to show where he obtained his oysters from, and for lack of supervision he has been enabled to do as he liked. The other point is this: You allow a man 100 yards, and he will simply strip the foreshores of his lease and the Government or Crown lands adjoining. After that is done he wishes to have his lease cancelled because the land is not fit for oyster culture.
1498. What would you recommend in substitution for the present system? I would recommend the leasing of the rivers as a whole, or in parts, for a number of years, with stringent conditions as to the culture of the oyster, compelling the lessee to work on his area and conduct his operations systematically and in a scientific manner. It would mean a source of great wealth to the country if this were done. Under present conditions we find our foreshores stripped. With a lease for a number of years of a river, or portion of a river, a man would spend a large amount of money in putting up cairns or fascines for spat culture, and he would not strip his area as is done now.
1499. Do you favour the continuance of the system under which oyster leases are taken up at the present time, or would you favour the system of payment by results? I would compel a man to pay a lump sum, and have the oyster-bearing waters put up to auction and leased, the same to be the rent per year.
1500. You would make the arrangement as to rent simply a matter subject to public competition? Yes; then you would find, I think, that the lessees would for their own benefit go in for oyster culture in a systematic manner.
1501. Have you known cases where oyster beds have been rendered useless or unproductive for a time, owing to floods? Yes; on the Shoalhaven and Crookhaven Rivers some were totally destroyed.
1502. Deeming that to come within the category of an act of the Almighty, would you not consider it a hardship to compel lessees to pay rent for areas which have been destroyed, the responsibility of which destruction has not rested upon them? Yes, it would be almost unjust; but that is the fault of leasing small areas in these rivers. If the rivers were leased as a whole the lessee would not be so much affected, because the whole of his beds would not be affected.
1503. Would you not take it to be a greater act of justice to ask a lessee to pay on every bag of oysters raised from his lease than to make him pay rent for beds rendered unproductive by the act of the Almighty? Yes, it might be; but I would have certain provisions compelling a lessee to systematically conduct the business of oyster culture.
1504. Would you, in the framing of an Act, be inclined to support a provision which would allow the authorities to make a concession to lessees whose beds may be destroyed in the manner I have indicated in my preceding question? Yes, I would.
1505. That is, of course, under the condition you have mentioned, of putting the leases up to public auction? Just so.

- Mr. D. W. Benson.
11 Mar., 1895.
1506. Have you seen any evidence of the existence of deposits of oysters in the deep sea? Undoubtedly, off Lake Illawarra.
1507. Do you think that by trawling we may be able to discover some oyster-beds in the deep sea? I think so. I have often picked up the shells of oysters on the beaches after a heavy sea.
1508. Have you given any attention to the crayfish fisheries? Yes; year after year.
1509. Do crayfish frequent this coast? Oh yes, in great numbers.
1510. Do you think crayfish capture is an industry which could be profitably carried on? Undoubtedly so, in a systematic manner. We can catch them at any time in Wollongong harbour, the coast is so adapted for this fish. Off the Five Islands there are numerous reefs and enormous quantities of crayfish.
1511. Can you tell us whether the Commissioners, or any of them, have visited the fisheries of Lake Illawarra? Dr. Cox was here once only. He drove to the mouth of the lake with Sir William Macleay.
1512. How long ago would that be? About six years ago.
1513. Do you know of any other visits paid by a member of the Fisheries Commission or the Commissioners? No.
1514. Do you know whether they have paid visits to any of the fisheries in the south? I cannot say; not to my knowledge.
1515. Have you ever heard the fishermen say they were not satisfied with the constitution of the present Fisheries Commission? I have heard the fishermen grumble and complain about the way they have been treated by the Commissioners.
1516. Have you heard that they have suggested they would like representation on that Board? Some time ago the fishermen said they would like to have one of their number on that Board to look after their interests.
1517. *Mr. Thompson.*] Do you think if some concession were made to the fishermen in connection with the transit of fish, they would be induced to gut and clean their fish? I think so. It would enhance the value of their consignments, and it would also extend their market.
1518. You think the fish could be sent away to all parts of the country? Yes.
1519. There would be no difficulty in fish caught this afternoon, and treated in that way, being on the breakfast table, say 200 or 300 miles in the interior next morning? There is nothing to stop it. A number of our fishermen have families, and their services could be profitably employed in gutting and cleaning the fish.
1520. Would it be advisable to discard all the nets at present in use, and to allow the fishermen to use in open waters what nets they please, within a certain maximum length and a minimum mesh, and thus do away with all these difficulties to fishermen, arising from varied meshes, lengths, and kinds, at the same time having the most stringent provision as to catching or exhibiting any undersized fish? Yes; it would stop a lot of the complaints. It would stop them altogether. The facilities for supervision would be so much greater. We would not have so many nets. Each fisherman would use whatever net was most suitable to the waters he was working in.
1521. Would this be any damage to the public estate? None whatever.
1522. *President.*] Have you ever noticed the presence of whales off the coast? Oh, yes; often off this coast. I saw a fight, which I was told lasted three days, between a thresher and a sword-fish.
1523. Do you think the whaling industry is capable of being revived? Yes; the right whales frequent this coast in large numbers. I have seen as many as thirty or forty of them within half a mile of the shore.
1524. And you think if they could be captured it would be a profitable enterprise? Yes.
1525. In regard to the question of fish canning, curing, and smoking, is that carried on to any extent in the southern fisheries? It is not carried on at all.
1526. Could it be carried on? Yes; by the development of our deep-sea fisheries.
1527. Do you think the mullet could be made an article of commercial value? Yes; and far superior to the American salmon. I have tasted them tinned by some men who used to be on the Shoalhaven River. The fish was more juicy than the imported American salmon, and it had a better flavour. We have these fish here in such enormous numbers that it would prove a profitable industry.
1528. So that the fish being available in such large quantities during certain periods of the year you think such an industry could be carried on successfully? Yes; right throughout the year; the fish are travelling at all times on this coast, but more especially during March and April, for the mullet.
1529. In regard to the fishing craft, are they of the most modern style? They are not for deep-sea fishing, only suitable for inland waters—for net fishing.
1530. Are sunken nets used in Lake Illawarra? No; the water being too shallow.
1531. You have said the blubber is a great trouble and a nuisance to the fishermen? Yes; and a great destroyer of fish.
1532. In places where the blubber is thick, would it not facilitate the operations of the fishermen to allow them to use a sunken net? They would get the blubber all the same in Lake Illawarra, the water not being sufficiently deep.
1533. Have you given any attention to the question of the development of our inland fisheries? I have never had an opportunity of doing that; my work has always been on the coast.
1534. Do you think it would be possible to stock many of our streams? I do not think the trout would do in the warm parts; but in the colder regions the trout would do very well.
1535. Do you think it would be a step in the right direction to establish fish acclimatisation ponds and hatcheries? Yes; for the stocking of the colder waters of the Colony.
1536. And do you think that by a system of rod licenses it could be made supporting, within a reasonable time? Yes; I do.
1537. *Mr. Thompson.*] Do you think it would be a hardship; if when fish become scarce in any water, instead of closing that water the use of the hauling net should be entirely prohibited? I think it would be to the benefit of the fishermen. It would not be a hardship; they could get a living with the meshing net, and all the while the fish would be replenishing.
1538. *President.*] What salary do you receive from the Fisheries Department? £140 per annum.
1539. Is that exclusive of house-rent? No; I have to pay my house-rent out of my salary.
1540. What do you pay for house-rent? 14s. 6d. per week.
1541. Are you allowed any expenses? 10s. per week for horse feed. That is to travel to and fro to the lake. I have to keep two horses for the work, and they are my own property. 1542.

1542. The £140 a year;—is that the salary at which you were appointed? No; I was appointed at £150 yearly.
1543. Then, how comes it, after ten years' service you are only receiving £140 per annum? I was reduced by the Department on the plea of retrenchment.
1544. Are you not aware that Parliament directed there should be no reduction in salaries under £200 a year? I was not aware of that.
1545. If that is so, the direction of Parliament has not been adhered to, and you have been reduced in the face of that direction? I have been reduced.

Mr. D. W.
Benson.
11 Mar., 1895.

THE NORTHERN HOME FISHERIES: HUNTER RIVER FISHERIES.

FRIDAY, 15 MARCH, 1895.

[The Commission met at the Court-house, Newcastle, at 10 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C.

L. G. THOMPSON, Esq., J.P.

Mr. Joel Tresidder, fisherman and fish-dealer, Carrington, sworn and examined:—

1546. *President.*] Your name is Joel Tresidder, and you live at Carrington? Yes.
1547. What are you by occupation? A fish-dealer; I may state that my sons are the fishermen, and I dispose of the fish, so that I am directly interested in the industry.
1548. How long have you been engaged in the industry? Well, as a fisherman and salesman, I have been at it between twenty-five and thirty years. During the past seventeen years I have been almost exclusively fishing and selling.
1549. You have combined the two branches during the last seventeen years; how long previous to that were you engaged in fishing solely? I was only fishing some two years without going in for selling. I found it was a losing game to catch fish and depend upon the agent. I found I was the best agent.
1550. What waters have you fished in? The whole of the waters in the Hunter River, the Williams, and the Patterson, as well as in Lake Macquarie.
1551. So that your knowledge of the fisheries in the Hunter district would be of practical value? Yes.
1552. You stated, just now, you and your sons were engaged in fishing—how many sons? Four are devoted to fishing, as a rule; one of my sons is paying particular attention to the bait and boats, and the other is assisting in the selling; the other two are wholly engaged in catching fish and prawns.
1553. What varieties do they catch? Our principal fish is mullet and jewfish; bream, whiting, flathead, trevally, and garfish are all limited in number.
1554. What market do you send fish to? I take the fish round myself and sell it to the people in the mining townships.
1555. You send no consignments to Sydney? No, I have not done so for years.
1556. Have the municipal authorities of Newcastle assisted you in any way by providing market accommodation? There is very little accommodation in Newcastle; it is very primitive.
1557. Is your fish inspected before you sell it? Only by the inspectors of fisheries; they come round occasionally.
1558. What I want to elicit is, whether there is any inspection of the fish before it is sold to the consumer? None; practically none.
1559. Do you, as soon as you land the catch, dispose of it to the consumer? Yes, direct.
1560. Can you tell me how many fishermen there are in Newcastle; that is, leaving out Lake Macquarie? I cannot; I do not know how many are licensed.
1561. What would be about the value of your catch during the year; what would be the average catch per week, and its value? The annual value of our fish would be about £300; that is what goes from my hands.
1562. Do you find any difficulty in disposing of the fish? No.
1563. Will you explain what apparatus is used by your sons in catching fish? The ordinary seine of 200 yards; that is the outside limit we use.
1564. Are you satisfied with the mesh and dimensions of the hauling net? Yes; quite satisfied with the seine, providing when we purchase a net of a certain size above the legal mesh we should be allowed to use that so long as the net is fit to use.
1565. In other words, you mean that when once a net is pronounced to be legal and has been used as a legal net, it should not be taken from you for any breach of the law? Just so.
1566. Have you ever had any of your nets seized? Yes; one taken by Mr. Gordon.
1567. What class of net was it? The bunt, when purchased, was $2\frac{1}{4}$ inches, the wings $3\frac{1}{2}$ inches.
1568. For what offence was it seized? Mr. Gordon claimed it as an illegal net through its being $2\frac{1}{8}$ inches.
1569. What do you think was the cause of the shrinkage? On this particular occasion it had been very wet weather. We had been working the net on the Thursday night and the Friday morning; the net had been thoroughly saturated for four or five days.
1570. Had it been dry would it have been its legal size? If you measured the net now dry, it would be over the size.
1571. Were you ever prosecuted for using an illegal net? No, unfortunately I was not; I was fully prepared to have gone into the matter had they prosecuted me.
1572. Have you made any application for the return of the net? I do not know whether Mr. Thompson, solicitor, of Maitland, applied for it.
1573. How long ago is that? The 17th of August last.
1574. What was the value of that net? About £10.
1575. Do you know whether any other seizures have taken place on the river? Yes.
1576. Have nets been confiscated for similar offences? Some have and some were returned.
1577. Have you any idea of the reason why you were not prosecuted? No.

Mr.
J. Tresidder.
15 Mar., 1895.

Mr.
J. Tresidder.
15 Mar., 1895.

1578. Do you use any other net besides the hauling net? The prawn net.
1579. Are you satisfied with the length and mesh of that net? Yes; I can speak for the fishermen on the river, and say that they are satisfied with the length of the net with this proviso, that when a net is purchased for the different sizes they may be allowed to use it until it is worn out.
1580. Do you get large catches of prawns? We always keep the supply below the demand. We could occasionally catch more than we require, but we do not do that either with our fish or prawns.
1581. Do you regulate the supply for the local market? Yes.
1582. Do you send prawns to Sydney? No.
1583. Do you think there is room for further expansion by sending prawns to Sydney? I think the market there is pretty well supplied.
1584. Have you any other complaints to make in regard to the provisions of the Fisheries Act? Several.
1585. Would you mind stating to the Commission what suggestions you can offer by way of improvement? In the first place, I wish to speak about the license. When we take out a license our boat is licensed and named in accordance with the Act. That being so, it should be all-sufficient; but such is not the case. We have been prosecuted for not having a name on the boat; but at that time the name had been on the boat. Again, we have been prosecuted for not having the license in the boat, and the inspector has called my boys by name, knowing they were licensed fishermen, and asked them if they had the license in the boat. I think that is an injustice.
1586. They deemed the name on the boat not perfectly legible, or were prosecutions taken out against the fishermen for alleged offences? A number were.
1587. Were the prosecutions sustained in the Court? I think, without any exception, all were sustained.
1588. Is it not specified in the Act that the name shall be painted on a certain place in the boat? Yes.
1589. Can you tell us whether the inspector who demanded the production of the license was a man new to the work or an old inspector? It was F. W. Smithers, an old inspector. I am not certain whether Gordon was with him.
1590. Were the prosecutions sustained on the evidence of the inspectors? On their evidence solely.
1591. Was anyone sent by the Department of Justice to inquire as to the truth of their statements? No; my boat was on the bank when the policeman came with the summons. I pointed out my boat with the name on it to him, and the policeman replied, "It is a damned shame"! It was an injustice.
1592. Are there any other provisions in the Act which you think require amending? Yes; the Act should be amended to allow the fishermen to use any and what nets they please. What I mean is, that the Act should be repealed altogether. I hold it ought to be repealed; it is no good. We want a new Fisheries Act; the present Fisheries Act is no good at all.
1593. Do you think that a stringent provision dealing with the sale and capture of young fish would be sufficient to protect the open fisheries, rather than to enforce the provision as to length of net and mesh? I can show you where I think a provision could be made that would be really a safeguard to all. Our net we procure in Sydney. It is a machine-made net. Let this net when imported be above a certain size for the seine. This would deal equitably with the whole matter.
1594. Do you use the drift net at all? Very rarely; I consider that one of the most useful nets here. As a matter of fact, it simply catches fish ready to be caught.
1595. In regard to the general administration and control of the fisheries, are you satisfied with the present institution under the Fisheries Act? I am not.
1596. Have you ever had a visit paid you by anyone of the Fisheries Commissioners? No, not by the Commissioners. None of the Commissioners have visited us that I am aware of.
1597. Would you have heard of their visit had they been here? Yes, certainly.
1598. Have you formed any idea as to what should be the administrative and controlling power for the fisheries? We have a very efficient police in this district, and the police should be empowered to supervise the landing of our fish.
1599. Do you favour the appointment of inspectors to supervise the fisheries? Not unless they are practical men.
1600. Have you an inspector stationed in this district? No; we had Mr. Henry Curan.
1601. But, with reference to the institution to govern the fisheries—in other words, to administer the Act—do you think any improvement could be made in the present system? Yes; a very considerable improvement.
1602. Can you suggest what should be done to bring about a better state of things? I think the fishermen should have a representative on a Board, if a Board is established to control the fisheries.
1603. Would you mind expressing an opinion with regard to the proposal to appoint a Commissioner of Fisheries, he to have the assistance of what might be called boards of advice, representative fishermen occupying seats on such boards;—do you think such a system would work well? Yes; I think such a system would work very well.
1604. Do you think it absolutely essential that fishermen should have representation on these local boards, because of the diversity of the circumstances connected with the several fishing grounds? Yes; I think it would be a good thing.
1605. Have you had any closures made which have operated harshly on you as fishermen? We have had closures here which have been very harsh; for instance, the lower part of the river is closed now. The river occasionally is swept as clean as if you had swept it with a besom. I have seen fish working in with the flood; they work up for half a mile, a mile, or two miles, but we dared not touch them because the mouth was closed.
1606. Do you know who made the recommendation as to the closure? I do not know.
1607. Have you, at the present time, sufficient water available for carrying on operations? Yes; ordinarily we have plenty of fishing grounds.
1608. You said you use a net only 200 yards long;—why is that? Owing to the tidal waters being so strong you cannot use a long net.
1609. You have said you are dependent pretty well upon the supply of mullet for your livelihood;—are they the sea mullet? The mud mullet, the sea mullet, and another mullet miscalled the flat-tail mullet. The flat-tail mullet is a herring pure and simple. There is another small mullet called the sand mullet.
1610. Are you ever visited by shoals of fish, such as sea mullet or garfish? Occasionally. Sea mullet very rarely come here in what we call a good shoal. They come to the mouth of the harbour; I have seen

seen them there for miles along the coast. When they come to Nobby's or the northern breakwater they split, and only a small portion come into the harbour. Formerly they came in in millions. I have seen them come in here; they have been that thick and powerful that they carried the bunt of the net away; but that has not occurred for five years.

Mr.
J. Trésidder,
15 Mar., 1895.

1611. What prevents them from coming in now? The northern breakwater and the southern breakwater, it splits them up. I have been out on the breakwater, and seen them coming along in droves, and the sharks and porpoises after them; when they got to the breakwater they split, and the big fish went for them.

1612. Have you ever seen any shoals of fish outside that might come under the category of the herring tribe? I have heard of them; they never came under my observation.

1613. Have you done any deep-sea fishing? Only with the line, and the hoop-net for crayfish. I had experience of deep-sea fishing in the old country.

1614. Have you had any experience of trawling? Yes, around the coast of England.

1615. Have you a pretty good knowledge of the bottoms along our coast? Only from dropping the lines and the kellick. We found the bottom pretty even and regular about half a mile from the shore. The bottom is better the further you go out.

1616. Is there any extent of that sort of bottom? As far as we have sounded—we have been out some two miles—the bottom is very uniform.

1617. Do you think it would be possible for trawling experiments to be carried out on the grounds off our coast which are free from reefs? The system could be carried out, but it might not be successful.

1618. Why? Our fish are different to the old country fish—they are shy.

1619. Supposing there were people inclined to enter into the enterprise, would you be willing to allow them to come here and engage in trawling operations, without having a knowledge as to whether trawling would be successful or not; or would you rather see an experiment tried by the Government, so that no mistake could be made? I would rather see an experiment made by the Government. If trawling could be made a success, there are places I could show you between here and Port Stephens. There is what might be called a gully between the beach and the outside bar; inside of that bar, particularly down within 8 or 10 miles from Port Stephens, fish is to be found in abundance. The fish are there in millions; they are in great abundance; there is an inexhaustible supply there.

1620. In what depth of water would that be? From 15 to 30 fathoms. When we were sailing along there we could see the fish tumbling about in the water.

1621. Have you ever tried well-boat fishing? No; but it is being successfully carried out at the present time.

1622. In Newcastle? Yes, in Newcastle.

1623. Who are engaged in well-boat fishing here? They have only just started; the first freight came in this week. They came in with over 200 schnapper; it is the largest well-boat built in Newcastle.

1624. How long were those people away on their fishing cruise? Not many days.

1625. Did the fish arrive in good order? In splendid condition.

1626. Where were they disposed of? In Newcastle.

1627. So that there is no question about the success of the system? No, provided the weather is favourable.

1628. Do you send any fish by rail? Very rarely; sometimes a few special orders to the north.

1629. Have you done any fish canning, curing, or smoking? Smoking.

1630. Has that proved a success? Yes.

1631. What fish did you smoke? Mullet and jewfish; there is a ready market for all other choice varieties.

1632. Have you had any experience in oyster culture? I have cultivated oysters in a small way; there is no oyster cultivation in this river; I have tried the experiment and found it successful.

1633. You have tried oyster culture yourself, and it has proved successful? Under limited conditions as to area.

1634. During the time you have been carrying on that experiment have you had any disease? No, I could eradicate the disease by the adoption of a certain system.

1635. Would you mind giving the Commission the benefit of your knowledge in that direction? It is too valuable to give away.

1636. You are of opinion that the disease which affects the oyster can be successfully coped with? Certainly.

1637. Are there many natural beds in the Hunter? The river for miles is literally the home of the oyster.

1638. Are there many lessees? According to that report in Parliament the other day there is only one lessee in the Hunter.

1639. Who is that? Mr. Gibbins.

1640. Are there any areas available for leases? For cultivation or foreshores?

1641. Both? I know one place which is second to none in the country for cultivation.

1642. Is not that taken up? No.

1643. Why do you arrive at the conclusion that it is second to none in the country for cultivation? From the natural conditions of the grounds; I have watched the grounds for a number of years. I have seen the same class of ground cultivated in the old country, in the Severn, and there it is a success.

1644. What do you consider makes the best ground for the cultivation of the oyster? The ground that is daily covered by water, occasionally dry; sandy and muddy ground, a mingling of sand and mud.

1645. The foundation must not be too soft? That is so.

1646. Have you ever applied for areas in the Hunter? No; there is one matter relating to our oyster beds and foreshores. Under the present Fisheries Commission a system has been carried out that is, I may say, one cause of the great scarcity of oysters. I refer to the denuding of our mangrove oysters; this is the one great feature that has been wrong in the past; our natural supply of spat comes from the mangroves.

1647. Do you think the Crown lands are availed of to any extent by lessees in procuring oysters for market? Yes.

1648. The lessees obtain supplies from Crown lands and pay nothing for them? Pay nothing for them.

1649.

- Mr. J. Tresidder.
15 Mar., 1895.
1649. Can you make any suggestion to the Commission in regard to the question of letting or leasing the foreshores or portions of a river;—is the present system a satisfactory one? No; it is a wrong one.
1650. Would it be a good thing to lease an arm, or a river, or a portion of a river, for oyster culture, rather than allow the present system to continue in vogue? I would lease no part of a river, neither foreshore nor channel, for oyster gathering. If any of the grounds are leased it should be places where no oysters are for cultivation. Our natural beds should be worked by license only.
1651. Do you believe in the system of paying so much per hundred yards per year, or would you support a proposal to pay by results? Pay a license and by results. I have consulted the men on the river who have been practical oystermen for years. They are willing to pay a license of £5 per annum, and a royalty of 1s. per bag.
1652. Those to be the annual charges in connection with the oyster-beds? Yes; at the same time I would restrict the gathering of oysters from the foreshores, instead of allowing what I might term the parents of our oyster-beds to remain. By taking those oysters away the source of supply is cut off.
1653. You believe the natural oyster fisheries and foreshores should be preserved? Yes, and the river oyster-beds worked; in this way there would be lucrative employment under judicious management for fifty men and boats. That would give you £250 per annum irrespective of the royalty.
1654. You think, then, the oyster fisheries in the Hunter have not had the supervision or the attention they deserved? No.
1655. Do you think they are capable of greater development under proper care? Yes.
1656. Have the Fisheries Commissioners ever visited the oyster-beds here? I have never known of them coming here.
1657. Do you know whether there are any deep-sea oyster-beds? I know of one deep-sea deposit of oysters.
1658. Is it of large extent? It is being cultivated at the present time.
1659. Is it far from here? No.
1660. Is it being worked at all? No.
1661. Being naturally developed? Yes, naturally developed.
1662. About what distance is that from the coast? Within one mile of the coast.
1663. *Mr. White.*] How did you put the oysters down on the bed on which you tried the experiment? When we brought the oysters in in the net I took out a few. I invariably placed them with their mouths up; I did not lay them down on the flat. I have placed oysters down that were no bigger than my thumb-nail; I have watched those small ones and seen them grow and develop until they became a nice table-oyster.
1664. In what time and depth of water? Nine months; the water varied from 2 to 4 feet. I believe they develop better in deeper water.
1665. Have you ever tried any means of collecting spat? No; I have seen spat.
1666. What months have you noticed the spat? You will see spat go off often in the winter-time; but chiefly in the spring and autumn.
1667. You were speaking of disease;—when does the disease generally show itself—after the floods or when? After the floods as a rule.
1668. Are you of opinion the disease comes down with the floods? It may.
1669. How would you let your ground out; for instance, if a man has 500 yards in one place, and 500 yards in another, would you let another man go in between those leases? Yes.
1670. And steal all his oysters? No.
1671. Are you aware that is done? No, I am not; I would not lease the foreshores.
1672. You have never worked oyster-beds yourself? No, and I know nothing about how the beds are robbed.
1673. What months do the prawns spawn? The prawns are very peculiar; they spawn all the year round, except two months in the dead of winter. What they do then it is impossible to say; they are buried. There should be no close months for prawning.
1674. For what reason? Because the prawns virtually close themselves by floods, cold weather, and changes.
1675. Do you think prawns should have a rest for breeding? They rest and breed of their own accord; we cannot benefit them in any way by stopping the catch.
1676. What prices do you get for your fish;—do you sell to the poorer people? I have endeavoured to make fish an article of daily consumption, and in doing so I fix the price so that it is within the reach of all persons. I give a man having a large family more fish for 6d. than I do one with a small family; each gets what he wants for the same price. The people know me, and I deal fairly with them.
1677. You are your own agent;—do the fishermen get proper treatment from the agents as a rule? No, they do not.
1678. Do the agents work for their own benefit instead of the benefit of the fishermen? I maintain they work exclusively for their own benefit. I will tell you why; the last twelve baskets I consigned to Sydney I received nothing for, and for a part of the same catch of fish, I took over the tail of the cart on the same day in the Newcastle district no less than £7.
1679. You stated the fish were shy, what is the cause of that? The water is clearer and warmer than in the old country.
1680. Have you caught crayfish? Yes.
1681. Is it right to catch crayfish with the ova under their tail? Yes; I think so.
1682. Why? The natural supply is always superabundant in everything in nature; the supply is abundant.
1683. Do you know they have stopped them from taking crayfish with the ova on them elsewhere? No; I am not aware that they are prohibited from catching them in spawn elsewhere.
1684. With the quantities of fish you have seen on the coast are you of opinion that tons of fish might be cured and distributed about the Colony as good food for the people? Yes; no doubt about that.
1685. And that fish canning and curing should be undertaken? Undoubtedly. The cormorants and sharks are very destructive to fish life.
1686. *Mr. Thompson.*] Do you think that could be in a measure remedied by offering a reward for the capture and destruction of cormorants and sharks? Yes.

1687. Would you suggest closed areas for crayfish—that is to say, that every year there should be certain areas in which crayfish should not be caught? I cannot possibly give a definite answer to that; I am not acquainted with the supply and demand.

Mr.
J. Tresidder.
15 Mar., 1895.

1688. Are you aware that under the old licensing system all the oyster-beds in the Colony were completely stripped, and that the present Oyster Fisheries Act was the outcome of that devastation? Yes.

1689. With that experience before you, why do you suggest a return to the licensing system? I have two reasons; they are that dredging will assist in cultivating the oyster, and by reserving the foreshores you have always a source of supply. The mistake has been in stripping the foreshores and allowing the natural beds to lie idle.

1690. You think, then, the foreshore oysters supply the deep beds with spat? Yes.

1691. Does this spat, when it is shed, cover the whole of the adjacent waters? It covers a limited area, according to circumstances.

1692. Have you in calm weather noticed any considerable portion of the adjacent area covered with spat? Yes, when there has been no adverse influences to disturb it.

1693. As a consequence, when the spat falls, the whole of the water that is covered will become an oyster-bed? An oyster-bed eventually.

1694. Then how is it that the Hunter River and the areas adjacent to the oyster-bearing foreshores are not one big oyster-bed? Owing to the circumstances controlling them—the rush of water, the moving sands, and so forth. Our oyster-dredge is bad, it makes the grounds too even; a proper oyster-dredge would make the ground uneven. The oyster-dredge should have a fork at the bottom; the ground should be kept rough.

1695. Do you think any spat comes in from the sea? Undoubtedly.

1696. Would it avoid subsequent shrinkage of nets if the twine were tanned before being made up? To a very great extent it would.

1697. Do you think it would be an improvement if the several prescribed kinds of nets, with their variety of lengths, sizes, meshes, and different parts, could be abolished, and one net of a maximum length and a minimum mesh substituted for general use in open waters? It would answer well here.

1698. If such an arrangement were enacted, would you object to certain suitable waters being permanently closed against all nets except set nets, in order to insure a permanency of the fish supply? I am thoroughly convinced that that would be the right thing to do, as regards closed waters. Throsby Creek and its tributaries should be continuously closed. I have seen thousands upon thousands of fish outside there.

1699. When using nets in these waters, do the fishermen haul them ashore? Not to the dry ground; we always keep the net in the water.

1700. *President.*] You are secretary to the Fishermen's Association? Yes; it numbers about fifty members.

1701. Are the opinions you have expressed in accordance with those of the persons you represent? Yes.

Mr. Edward Edmund Bull, fisherman, Waratah, sworn and examined:—

1702. *President.*] You are a licensed fisherman, working in the Hunter River District;—where do you reside? Waratah.

1703. How long have you been engaged in fishing operations? About thirty-two years.

1704. What time have you spent in connection with the Hunter River fisheries? About twenty-six years.

1705. Have you a pretty extensive knowledge of those fisheries? Yes.

1706. Have you a fisherman's union? We have an association, but not a union. They met a little while ago for the purpose of sending representatives to attend the conference held in Sydney.

1707. Were you sent as a representative? Yes.

1708. What has been the outcome of that conference;—has any good resulted? No direct good has resulted from it as far as I am aware. I am not aware of any seizure of nets having taken place since the holding of the conference.

1709. How many fishermen are engaged with you in the fishing industry? Three, besides myself.

1710. What does your catch average in a week? About sixteen baskets.

1711. What class of fish? Principally coarse fish—mullet and jewfish—although I would average about two baskets of bream, whiting, flathead, and garfish.

1712. How do you dispose of your fish? I have a local market, and send about four to six baskets per week up country.

1713. Do you realise satisfactory prices in the local market? Oh, dear, no, far from it.

1714. Do you trust to an agent to sell your fish? I sell to a retailer.

1715. Who is really the middleman? Yes; our average price to him is 6s. per basket for good and coarse fish.

1716. Is the market accommodation here satisfactory? Not at all; it is filthy.

1717. Under whose control is it? Under the control of the Corporation.

1718. Have they raised tables to display the fish upon? They have two or three wooden things; they are benches, you cannot call them tables.

1719. Do you send any fish to Sydney? Not at present.

1720. Have you sent any? Very large quantities from Lake Macquarie, Port Stephens, and the Hunter.

1721. Have all your transactions been of a satisfactory character when sending to Sydney? Quite the contrary. I have sent as many as forty baskets per week, and the returns have shown me to be 3s. or 4s. in debt.

1722. Do you think, taking the basis of the prices paid by the consumers, that the fishermen get a fair return for their labour? No; they do not.

1723. Would you favour a system by which the fishermen would be brought into more direct contact with the consumer;—would that be an advantage to them? Decidedly.

1724. Have you ever lost fish in sending to market? I have to complain very bitterly respecting the fish I send up country; there is not a weighbridge at Sandgate; that is the only way we could prevent them being tampered with.

Mr.
E. E. Bull.
15 Mar., 1895.

Mr.
E. E. Bull.
15 Mar., 1895.

1725. Do you think if fish were weighed at the station they are consigned from, and then weighed at the other end, that would act as a check, and the railway officials would exercise a closer supervision in order to prevent pilfering? Yes; strictly speaking, the guard has no check on the fish; it is very difficult to get the baskets returned. I lost over thirty baskets last year.

1726. Have you any complaint to make about the charges for the carriage of your fish? They are very high compared with the charges in England and elsewhere.

1727. What nets do you use in the Hunter district? At the present I am using a piece of garfish net in the middle of an ordinary seine. The net, when purchased, was $2\frac{1}{2}$ inches; after being tanned awhile it has gone under the $2\frac{1}{4}$ inches; we cannot afford to get new nets; we have put a piece of garfish net in them, and made a garfish net of the bunt. That is quite a common practice on the Hunter now.

1727 $\frac{1}{2}$. Should the net, when once it has been passed as legal, be considered legal? My idea is, that if I buy a net of $2\frac{1}{2}$ inches I should be allowed to use it. I buy it a quarter of an inch too large when it is first used; before it is worn out it will be a quarter of an inch too small. The only remedy we have is to put a piece of garfish net in to legalise it; it is a great nuisance.

1728. Do you think a fisherman's tools of trade should be taken from him for the first offence? Decidedly not. I would plead very hard with the Royal Commission to try and alter that; and please remember I am not pleading for myself. I have known cases in which families have actually gone hungry owing to fishermen having had their nets seized.

1729. Do you think that punishment by way of imprisonment for a period of, say, not exceeding seven days, or a fine, would be better than taking away the nets? Decidedly; by taking away the nets they frequently lose the trade they have been months in getting. Fine the man certainly; but by no means take his net away; he can make some other use of it.

1730. Do you think a provision making it compulsory for the fishermen to catch and send to market fish of only a certain size would be better than adhering so closely to the different meshes? Yes; very much better. I should say fine men heavily for catching small fish.

1731. Do you think the fishermen would work with a department that did its best to thoroughly develop our fisheries? I do; they would work very much better than at the present time.

1732. You think it is as much to their interest to have the fisheries protected, and to see that they are not depleted, as it is to the interest of the Department of Fisheries? Yes.

1733. Do you know of any unjustifiable closures having been made in the past? I consider that there was no need to close a great many of the waters. In many cases where the waters have been closed fish never attempt to spawn.

1734. Do you know upon whose report these closures took place? I cannot say.

1735. Would it be possible that an inspector would report against a closure, and that the Commission would not act upon that report? I believe that has taken place.

1736. In regard to the administration and control of the fisheries, are you satisfied with the present Board of Commissioners? No, I am not.

1737. Do you think any better means of controlling the fisheries and administering the Act could be instituted? Yes; I feel sure a better plan could be devised.

1738. Have the Commissioners, to your knowledge, paid any visits to these waters? Not to my knowledge.

1739. Would you have heard of their visits if they had come here? I think so.

1740. Do you think the Fisheries Commission, as at present constituted, gives general satisfaction to the fishermen? No; I know it does not.

1741. Would you propose any change? Yes.

1742. In what direction? I should prefer a local board to advise, as every different fishing ground would require special regulations to govern it, each fishing centre to have local government. The fishermen have been ridiculed for not knowing what they wanted; but it is not a difference of opinion—it is a difference of requirements.

1743. Would you have these local boards established to advise the present Commission, or would you prefer to see some change made in the administration of the authority at head-quarters? I should prefer to see a change at head-quarters. We must have one practical man to look after the fisheries of the Colony.

1744. You urge that someone should be appointed who would take a deep interest in the fisheries, and pay periodical visits to the different fishing grounds, so as to become acquainted with local circumstances and requirements, and be advised when and where necessary by local boards of advice? Yes, that would be a good thing for the fisheries. The mode of fishing at different centres varies so much that it requires a man having a practical knowledge of the conditions of the fisheries of the Colony to look after them, and deal with them in a proper manner.

1745. In regard to the Act being administered at the present time, do you take any exception to its provisions besides that making it compulsory on the part of the inspectors to seize your nets? It appears to me a contradiction. I have a garfish net. I am allowed to use $1\frac{1}{2}$ -in. bunt, another man may have a net 2 inches and be fined for it; that appears to me to be an anomaly. Then, in regard to seizing the net, I decidedly object to it.

1746. Have you any objection to one moiety of the fine going to the informer in cases of conviction? Most decidedly I have; I think if a policeman had the same inducement given to him a man dare not go down the street. It means persecution. I have had my net measured five times in two hours for the purpose of provoking me to a breach of the peace. That was done by Assistant-Inspector Curan; I can produce witnesses to prove that.

1747. Do you think the provision operates as an inducement to inspectors and informers to take proceedings against fishermen with a view of getting half the fine? I am quite certain of it. Then again the Act is too stringent; it is both stringent and ambiguous—it is so difficult to understand. I had a net that was just measured; I tanned it; it came on bad weather, and I could not dry it. I did not wish to lose the net. I was going to Port Stephens. I went down there totally ignorant that the tan was still in the net. I set the net one night, and I was fined for it; it was found to be one-sixteenth of an inch under the legal mesh, and my net was seized.

1748. What became of the net? It was returned to me when I was fined.

1749. On whose order was it returned to you? The order of the magistrate. I was kept a month before the case was heard by the magistrate.

1750. Consequently you were deprived of the use of that net? Yes; that is why I give this instance; it shows the injustice of taking the net from me. I had a large custom in the country at that time, and I lost six out of eight of my customers in consequence of not having my net to go fishing.

1751. What nets do you use? The seine. The strong currents in the Hunter prevent us from using more than about 75 fathoms of net. Seeing that we have to use so short a net, I would ask to have the measurements reduced by a $\frac{1}{4}$ of an inch right through; that would do away with almost every garfish net on the river. I would make a suggestion that every garfish net should have a piece of coarser net beneath it; it is incredible the small fish that would go through it, and the catch of garfish would not be interfered with, as they remain on the top of the water.

1752. Do you use a prawn net? Yes.

1753. Is the supply of prawns in the Hunter good? Very good. Were it not for the drying it would be a failure to attempt to get a living; they dry the prawns and get about 5s. per basket for them from the Chinamen.

1754. Supposing it were possible to encourage an export trade in prawns with England, would the fishermen assist and take the matter up in earnest? I think so. Prawns will keep right enough. Properly salted, they will keep six months. A good method is to steam them—that is done in Melbourne—and take the salt out again.

1755. Consignments going from here to Melbourne, well salted, are made almost fresh again by steam? Yes; they sent a man from Melbourne to the Hunter to instruct them in salting.

1756. Have you done any fish-smoking or curing? Yes; largely.

1757. Did it prove payable? Scarcely so. I will tell you the reason, and I would like you to try and remedy it. The present length of the meshing net is totally inadequate for us to make a living; you would require at least 150 fathoms to do anything at all with it.

1758. Do you ask for a reduction in the mesh of the meshing or drift net? I would recommend that there should be no reduction beyond the 3 inches. There are hundreds and thousands of fish killed in a $2\frac{3}{4}$ -in. net; they buy it 3-in., and tan it till it runs under measurement. They have a bad system. They go in the early part of the day and shoot the net; the fish get caught; if it is a hot day, about three out of every six will die. Those fish are taken out at night and thrown away, and the live ones put into the boat. Then, again, that $2\frac{3}{4}$ -in. net destroys a large number of fish that are not marketable—mullet. The 3-in. mesh just catches an 8-oz. mullet.

1759. Have you done any deep-sea fishing? Only with the lines.

1760. Have you a knowledge of the bottoms off the coast? No.

1761. Could you say if it would be advisable to go in for trawling on this coast? My experience shows that unless you had a cove or pocket in the trawl you would not succeed in confining the fish. Fish are very lively in these waters.

1762. Have you ever seen any shoals of fish on our coast? Yes; very large shoals.

1763. What fish were they? A species of herring. I have seen millions of sea garfish and sea mullet. The mullet passed so close to the shore that I saw the miners killing boxes and boxes of them with small dynamite cartridges.

1764. Do you think the herring could be made a marketable product? I am not prepared to say. The herring I have caught lacks the old country flavour. Possibly if the fish were prepared in the same manner as the old country herring, the flavor would be much better. It is a sea herring.

1765. What time of the year have you seen them? The latter end of April, May, and June.

1766. Has well-boat fishing been practised in this district? Yes; a great deal. They pen the fish without food, and they go away to skeletons. It is against their interest to do it.

1767. Sufficient attention is not given to the wants of the fish;—they require feeding to retain their flavour and condition? Yes; schnapper will fatten on boiled potatoes very rapidly.

1768. Do you think the system of well-boat fishing could be brought into use far more extensively? Oh, yes. Their method of capture is very crude. The gear wants more looking after. I think you ought to close waters against line as well as net fishing, especially against the bultow—the long line. I can take you out any day Friday, and show you a hundred of those lines up the river. They cause great destruction, and are a very great nuisance to net fishermen.

1769. Have you engaged in crayfish fishing? Yes.

1770. Are they in great quantities on this coast? Yes. They are adopting the home lobster pot. I think it was the Greeks introduced them. If the pots were larger and more open it would be better.

1771. Do you think it is necessary to have a regulation prohibiting the sending to market during the spawning season of crayfish? Certainly; I am in favour of such a regulation. I would punish anyone sending female crayfish to market while in spawn. I have often wondered why a law could not be passed prohibiting them from taking crayfish heavy with spawn. I am also in favour of judicious closures.

1772. In regard to the oyster industry in the Hunter, have you watched its progress? Yes; very closely.

1773. Do you find the beds prolific? They would be. You should remove all the shells. So long as those shells are allowed to remain on the beds, so long will the worm be there.

1774. It amounts to this then: you would have a regulation prohibiting the deposit of cultch where oyster culture is carried on? Scarcely that. I would compel every lessee—I am not in favour of leasing at all, but in favour of licensing—to denude the bed of shell. Then if you want to get the young oyster to develop quickly, procure some small rubble. The oyster will adhere to glass bottles, old boots, or anything. I am quite sure small rubble stones would answer the purpose well. I would take the whole of the shells away. I could show you beds that have been denuded of oysters for years. The shells are still in the Hunter. If you put good oysters on them the disease will attack the new ones; that stands to reason.

1775. As to the system by which the foreshores are leased, do you agree with the present system, or could you suggest anything that would prove more satisfactory? I would suggest the licensing of the centre of the river, and the leasing of the foreshores. I have never seen oyster culture attempted in this river. According to the American and other systems they cultivate them the same as you would potatoes and cabbages; they cultivate them properly. I have never seen oyster culture here. Another thing in the Act I complain of very much. Certain portions of the ground are reserved for public purposes, where the public can get a few oysters, but they are taken.

1776. By whom? The lessees.

1777. And are those oysters sent to market for sale? I could not say.

1778.

Mr.
E. E. Bull.
15 Mar., 1895.

- Mr. E. E. Bull. 1778. Is it likely they are? In all probability they are. I would license the centre of the river, and lease the shores.
- 15 Mar., 1895. 1779. In regard to the system of leasing, would you be inclined to lease the whole of a river, or an arm of the river, or continue the present system? I would not allow any man to take over a certain quantity; it becomes monopoly then, and that the fishermen want to guard against. In the very near future you will find men will lease if possible the whole of the river, and employ foreign labour to work it. I have to complain very seriously of aliens, as I term them. If they wish to become respectable citizens and remain here, let them get naturalised. They come here and indiscriminately destroy everything. They use a legal prawning net of great depth—it is really a sunken net; some of them are 400 meshes deep.
1780. Is it heavily weighted? Not heavily weighted; it is lightly corked.
1781. Would a net like that dragged over feeding-grounds cause great destruction? Yes, but that is not all; they take out the marketable prawns and other small fish; they do not put them back into the water again. They put them into a big cauldron, and stew them for hours. That is their principal food; it forms into a jelly. And then again these men do not settle down and become citizens. They kill hundreds of baskets of small fish. As soon as they get a few pounds, they clear out from the country.
1782. *Mr. Thompson.*] Would you refuse a license to aliens to fish? Let them get naturalised.
1783. Would you advocate the selling of cleaned fish? Most decidedly.
1784. Would it be an improvement if the several kinds of nets prescribed by the Fisheries Act were done away with, and one net of a maximum length, say 300 fathoms, and a minimum mesh, say 1½ inch, were substituted for use as a general net in open waters? It would be, with the exception of the prawn net, which should be lengthened.

Mr. Hans Andersen, Superintendent of Mr. Gibbins' oyster fisheries, Hunter River, sworn and examined:—

- Mr. H. Andersen. 1785. *President.*] You are superintendent of the oyster fisheries in the Hunter belonging to Mr. Gibbins? Yes.
- 15 Mar., 1895. 1786. How long have you held the position of superintendent? Twenty years.
1787. Have you devoted your attention to the oyster fisheries here during the whole of that time? Principally so.
1788. Were you an oyster lessee yourself? Yes.
1789. How long ago? Up to two months ago.
1790. Where are your leases? On the Hunter.
1791. Why did you discontinue your leases? I transferred to Mr. Gibbins.
1792. Did you find it profitable? I did with the first lease; but the last ten years we have been troubled with the worm disease.
1793. Can you account for the appearance of the worm in the oyster? No; they are in the ground; they come at certain times of the year.
1794. What area has Mr. Gibbins—several thousand yards? Yes.
1795. How have you found the condition of the water and the features connected with the Hunter River act with regard to oyster culture;—do the oysters there develop quickly? At times they do. It is a great deal according to the weather and the water. No spawn sets in heavy freshes.
1796. Are all your beds deep-water beds? Most of them; we have foreshores, too.
1797. Mangrove leases? Yes.
1798. How do they do? They have done nothing since 1893; the floods killed them then.
1799. Have you laid any artificial beds? Yes; time after time, but all died.
1800. Where did you get the spat from? Port Stephens, Brisbane, and almost every river on the coast, as well as New Zealand. Port Stephens was the best; they keep the longest.
1801. What was the cause of the beds not doing so well? The worm disease; it comes at a regular time every year.
1802. About what time does it come? The latter end of November and the commencement of December.
1803. Are you taking any oysters off the beds at the present time? Yes.
1804. Are they all good quality? Yes.
1805. What quantity per week? I have two men working; about twenty bags per week in fine weather.
1806. What do they realise per bag in Sydney? I cannot say; I get 15s. per bag selling here.
1807. Are there any other lessees besides Mr. Gibbins in the Hunter? There was one; he has forfeited.
1808. Has Mr. Gibbins had any of his leases cancelled? Three of them; he could not use them. They were not suitable for oyster culture.
1809. Is the worm the only disease that affects the oyster here? That is all.
1810. Did it ever in one year strip the whole of the beds? In one year it stripped the whole lot; you could go all over the beds and not find a live oyster.
1811. Can you form any idea as to the origin of the disease? No, I cannot; it comes at a regular time every year.
1812. Have you ever dredged up the ground on which the oysters are laid to see whether the worm exists there? We dredged up the shells and bad ones. I employed six men at it. Still the disease made its appearance.
1813. Do you believe in the present system of leasing? I do, if properly carried out.
1814. You believe in proper supervision being exercised? Yes; as long as the beds are properly worked they can be brought back into good condition—not like some of the beds which were stripped, and no chance given for preserving the immature oyster spat.
1815. Would you favour the idea of leasing an arm of a river, or the whole river, or a portion of it, instead of the present system of allowing persons to take up 100 yards here and there, the lessee to pay according to results—so much on every bag of oysters? That would be fairer to the lessee.
1816. Would you, in addition to that, impose certain restrictions compelling persons to exercise due care, and take a proper interest in the beds? Yes.
1817. How long does it take an oyster to come to maturity from the time it is laid down? When it is first formed you can only see it with a magnifying-glass. It takes twelve months from the spatting age here. In other rivers and waters it takes longer.
1818. That would be in deep-water layings, where they are fully covered? Yes. 1819.

1819. The foreshore oysters, how long would they take to develop? In some places a long time, in other places they grow quickly.
1820. Have you used any artificial means for catching spat? No.
1821. You have not deposited any culch on your oyster layings for the purpose of catching deposits of spat? No.
1822. Have you ever noticed any indications of deep-sea oyster deposits? No.
1823. I suppose your knowledge of the fisheries other than oyster fisheries is only limited? Yes.
1824. As to the size of oysters, do you think the size prescribed under the Act is large enough for a marketable oyster? Yes, it is. There is a difference in oysters; some of them are very full, although not quite up to size.
1825. So that a marketable oyster could pass through the ring, and in such a case you think a man should not be prosecuted? No.
1826. How would you guard against the sending of oysters of an unmarketable size to market? The men who get the oysters should be punished.
1827. You think that stringent supervision would have the effect of preventing the sending to market of unmarketable oysters? Yes, I do.
1828. Have you, during the time you held leases, and since you have been manager for Mr. Gibbins, ever known of a visit being paid to the district by any one or all of the Fisheries Commissioners in Sydney? No; I have had none of the Commissioners down here.
1829. *Mr. White.*] Do you suffer from oyster stealing at all? Yes; a great deal.
1830. Do the inspectors help you to try and detect the thieves in any way? No, never.
1831. Have you ever noticed whether the bags of oysters brought from Port Stephens by steamer are properly branded? A number of the bags are not branded according to law.
1832. Do the inspectors ever interfere? Not to my knowledge.
1833. Have you any inspector here? Not at present.
1834. *Mr. Thompson.*] Would you advise the return to the old system of licensing? No. That was the greatest mistake ever made in this fishery.
1835. You recollect what the President said to you about the suggested system of charging for oyster-beds by results;—what would be a fair royalty to charge on a bag of oysters? I can hardly answer that question.
1836. Do you think a larger fee should be paid for a deep-bed oyster than for a foreshore oyster? No; I do not.

Mr.
H. Andersen.
15 Mar., 1895.

Mr. Hartley Spur, fishmonger, Newcastle, sworn and examined:—

1837. *President.*] You are a resident of Newcastle, carrying on business as a fishmonger here;—how long have you been engaged in that business? About twelve years.
1838. Is your business an extensive one? Not at present; it has been.
1839. How do you account for the falling-off? When I started here, nearly twelve years ago, there was only one alien in the place—a Greek or an Italian, I forget which. At the present time, I believe I am the only white man getting a living at the business in Newcastle.
1840. In other words, these aliens are engaging in the same line of business as you did twelve years ago? Yes.
1841. How do you obtain your fish and oyster supplies? From the Hunter River, Lake Macquarie, and Port Stephens. I purchase directly from the fishermen themselves.
1842. Do you make an arrangement for the year or according to the quality of the fish? With regard to prawns, I engage to take my supply from a certain party from October to the last day of May—our prawning season. With regard to fish, I make an arrangement to take my supplies from certain boats; if they cannot supply me I have to go elsewhere.
1843. I understand there are no properly conducted market sales in Newcastle? No; I have been a tenant on the market wharf, Newcastle, for eleven years. I have had one stand continuously, sometimes three. I have a wife and family to support, and have to live decently; the aliens—you can see it on the market wharf yourselves—have a little room about 11 ft. x 10 ft. This is occupied by three Greeks. These men, of course, should be earning men's wages. I have to compete against them, and it is a natural thing, from their mode of living, that they can undersell me, because the wages of the three combined should be three times more, and their expenses are not one-third of mine.
1844. When using the word alien, do you refer to persons who have not been naturalised? Yes; I am informed that they are not naturalised. I was so informed by the police.
1845. And your contention is, I suppose, that these people, before they are allowed to engage in the business in competition with our own people, should be naturalised? Yes. What I would say is that our fishmongering business should be licensed the same as the fishermen. Then I think we would have a more respectable class of men engaged in fishmongering than at present. I am a good salesman and a good curer. That is how I have been able to compete against these men, for the fish these men would have had to throw away I have cured and turned into a marketable commodity.
1846. You think that if a proper licensing system were instituted, and better control established, it would be better for the industry? I am sure of it.
1847. Have you done any fish-curing? I have sent fish I have cured from here to San Francisco, and it has come back again in good condition. I have orders for as many as I can supply.
1848. What fish do you cure? The sea mullet—any mullet—bream, schnapper, whiting, flathead. I can cure any fish.
1849. Do you smoke them? Yes; or salt and dry. We have a great industry coming on at the present time in the river here. I refer to the drying of prawns.
1850. Do you think further developments might take place, and that the industry might be carried on successfully if the smoking, curing, and canning of fish were practised? I do.
1851. You have had experience in sending fish from here to San Francisco? Yes.
1852. Do you think a similar experiment could be made with prawns? Of course. I have sent prawns from here to China. I am sending them now in a dried state.
1853. Do the prices you realise pay you for your trouble? Not now. Times are bad with the Chinamen as well as ourselves.

Mr. H. Spur.
15 Mar., 1895.

- Mr. H. Spur. 1854. Do you put the prawns to any advantage locally in the way of curing them? Only a few Chinamen around here use them. I do a good bit of trade with them for their countrymen in the interior.
- 15 Mar., 1895. 1855. Do you consign any prawns to Sydney? I send a few in a fresh state. I used to send a great quantity. Since these Greeks have come here one of them will buy here for his countrymen in Sydney, Melbourne, and Adelaide. There is one thing I should like to mention to the Commission; it is with regard to crayfish. I once bought 47½ dozen of crayfish. Out of that quantity I believe there were 44 dozen she fish; out of that 44 dozen I believe 40 dozen of them were in spawn. Now, according to my reading of Professor Huxley, these fish contain an enormous quantity of ova. Our fishermen are destroying them. The consequence is, next season the fish are scarce and dear, and I cannot go into the market and sell them to the miners at the price. The miners are the principal buyers in this district.
1856. Would you be in favour of a provision in an Act prohibiting the taking of female crayfish with the ova attached? Yes; I would have a close season for them; I would not allow them to be touched.
1857. How are the oysters in the Hunter? Growing very fast at the present time.
1858. Are they of good flavour? The best flavoured I have bought in the country.
1859. Have you noticed any indications of disease in the oyster? Some of the old oystermen say there is a disease, but I have not seen it. I bought a bag of oysters a fortnight ago, and out of that bag I could not get a bucketful fit for the plate.
1860. Were they undersized? They were undersized.
1861. Your statement warrants the assumption that some supervision is necessary to see that oysters of a marketable size are sent to market? Yes, certainly.
1862. Mr. White.] Do you purchase oysters from the Port Stephens steamer? Yes.
1863. Are the bags properly branded according to law? I suppose they are. I am not supposed to take notice of those matters. I am not an inspector.
1864. But you are supposed to see they are branded. Do you buy oysters privately from anybody at the steamers? Yes; through the owner of the steamer, or through the agent on the steamer.
1865. Who do you buy from? Clayton and Kennedy, of Port Stephens.
1866. About what price do you pay on an average? All prices. I paid 15s. per bag for the last I bought. I have paid as high as £2 2s. per bag.
1867. What price do you get for your prawns in China? At the present time about 4½d. per pound dried; that would be about 4s. per basket.
1868. What wood do you use in smoking fish. If I can get the oak I use that. I use sawdust mostly. I believe the oak gives the best flavour, and the ordinary cedar sawdust.
1869. Mr. Thompson.] About the crayfish: Are you of opinion that the female should not be sold when in spawn? Yes.
1870. Do you think that instead of preventing the females from being sold it would be desirable to close certain places where the fish congregate? I would leave them open, but I would make the fishermen put the female crayfish back again.
1871. Would you recommend that aliens should not be licensed to fish unless they become naturalised? I would. I have no objection to them as men, but let them comply with the same conditions as we have to comply with; let the municipal authorities deal with them as we are dealt with.

Mr. Henry Limeburner, fisherman, Newcastle, sworn and examined:—

- Mr. H. Limeburner. 1872. President.] Your name is Henry Limeburner, and you reside in Newcastle;—how long have you lived here? About fifty years; I was born here.
- 15 Mar., 1895. 1873. Have you a good knowledge of the fisheries in the Newcastle district? I have done no net fishing, but have done a good deal of schnapper fishing outside.
1874. Have you given particular attention to the outside fisheries? I have fished outside for a living.
1875. How long have you actually been engaged in line fishing? It is thirty years since I first started fishing outside.
1876. Comparing the state of the fisheries thirty years ago with the present time what would you say of our fisheries at present? Well, you could go outside then and get plenty of fish; but all the old fishing grounds seem to be deserted now.
1877. What is the cause of that? Some say the silt here; but I cannot say. There is plenty of fish to the northward, especially about the Solitary Islands.
1878. Then you do not find the fish in such numbers now on the old grounds as you did in the early days? No.
1879. Does the Harbours and Rivers Department empty punts of silt near the fishing grounds? Yes.
1880. Do you think that by emptying the silt on those grounds it would be likely to cover the food on the grounds? Yes, I do. The rocks to the northward were very rugged at one time; now they are much smoother than they were. That, I think, is owing to the silt lying on them.
1881. Is the current very strong? About a couple of miles an hour. It runs southerly, and sometimes I have noticed it running northward.
1882. How far off the coast would that be? About 3 miles.
1883. Have you ever fished at any greater distance from the coast? I have fished off Catherine Hill Bay, about 4 or 5 miles out at sea, and got fish.
1884. Did you get schnapper there? Yes.
1885. Did you get schnapper in payable quantities? Oh, yes; we got a good many at the time at that distance. I had a little steamer about twelve months ago; I sounded outside where we were getting our fish; I sounded for 8 miles out from the coast, north and south, and found a smooth bottom—all sand.
1886. For what distance did you make those soundings? About 10 miles.
1887. Do you think that bottom you discovered would be suitable for trawling? Oh, yes, I am certain of it; there are no rocks there? There was an old fisherman at Lake Macquarie who used to go out 8 miles due east from the lake entrance, and he got good schnapper, good fish, any amount of them. This was some years ago; I fancy there are rocks where schnapper congregate at that distance out.
1888. Have you ever tried the well-boat system of fishing? No; I had a little steamer, but she had no well. We had a big tank on deck, but it did not answer very well—we could not get the proper temperature of water.

Mr. H.
Limeburner.
15 Mar., 1895.

1889. Do you know of any other person who has tried the well-boat system, and, if so, can you say whether it proved a success? Yes; three boats went out to-day. There are three well-boats running here regularly.
1890. What market do they supply? Newcastle.
1891. And do the fish live in the wells? The new boat that has just started running came in the other day with at least 400 schnapper in the well.
1892. How long had she been out? Inside of a week; it was her first trip. They caught the fish off the Manning River.
1893. When you were fishing outside, did you simply use the one hook and line? Sometimes we used three or four hooks on one line. I have caught as many as three or four schnapper on one line off Broughton Islands, about 8 miles to the north of Port Stephens.
1894. Was that lately? About twelve months ago.
1895. Are you in favour of the adoption of the well-boat system? Oh, yes; the fish keep well enough outside, but when they come into the harbour they seem to die.
1896. Of course you have noticed the difference between the water in the harbour and in the open sea; is it not possible to account for the fish dying from the fact of the water being polluted? Something of that sort; yes, it must be so.
1897. Have you caught other varieties of fish besides schnapper? All sorts.
1898. So that anyone entering upon the industry would not be dependent solely upon schnapper? No; there are all sorts of fish. Sometimes, at the Broughton Islands, I have seen the sea alive with mackerel.
1899. Do you think those mackerel could be turned into a marketable commodity? Yes; if they were cured straight away.
1900. You have had a good deal of knocking about on the coast? Yes; ever since I was a boy.
1901. Have you ever seen any shoals of fish on the coast? Yes.
1902. What were they? Tailer; I have seen schools of sea mullet; but I have not seen any sea mullet yet this year.
1903. Did you ever come across any species of herring? Yes; I have seen them in this harbour, and I have seen them outside. The fishermen caught what they said was the true English herring in the river; it was displayed in the market; they said they caught it right at the top of the Williams River.
1904. It has been asserted that shoals of herring pass our coast from south to north; is it not possible the shoals of fish you have seen might have been a species of the herring? It is quite possible.
1905. Had the water any peculiar oily appearance while those shoals of fish were travelling? Oh, yes; the sea looked quite smooth along the wake of the fish as if you had thrown oil on the water.
1906. Would you consider the tailer an oily fish? No.
1907. Have you ever used the long lines—bultows? Not outside; we were going to use them. I was persuaded not to do so; it is a terrible place for sharks.
1908. Have you ever engaged in fish-curing or smoking? Never; I remember on one occasion I got a calm near Lake Macquarie, and I caught eight or ten dozen schnapper off Bird Island.
1909. Have you ever seen whales on the coast? Oh, yes.
1910. Do you think, if the whaling industry were followed up it could be turned to profitable account? I think so; I have seen dozens of whales on the coast. I have seen no sperm whales.
1911. Could you distinguish between them? Yes; there is a difference in the spouting. Black whales are very numerous at times; there are any amount of sharks here also at times.
1912. Have you ever seen any evidence of oyster deposits outside? No.
1913. When you brought your catch into Newcastle, was it subjected to any inspection to see it was fresh? No; we had our customers, and we sold to them.
1914. Have they good market accommodation for the sale of fish in Newcastle? They have a sort of market here; there ought to be something better than we have at present. They have a few old stalls; I do not think they get scrubbed from one end of the year to the other.
1915. Do the fishermen themselves sell to the public? They sell to the hawkers who retail to the public.
1916. What bait did you use for the schnapper? Starfish used to be a great bait of ours, and mullet and tailer fish.
1917. Did you ever try the red rock-cod;—is that good? Yes; I do not care much for it.
1918. Have you ever done any crayfishing? You will find plenty of crayfish outside the heads here.
1919. Do you think there should be a restriction prohibiting the supply of crayfish when the females are heavily charged with spawn? They ought not to be allowed to take them when they are in that condition.
1920. Are the catches the well-boat people bring into Newcastle readily disposed of? Yes; they get away with them pretty quickly; three days ago they had about 600 schnapper; they sold readily at very fair prices.
1921. *Mr. White.*] You think there should be protection afforded to the female crayfish when in spawn? Yes.
1922. Do you think it a desirable thing to prevent aliens from fishing unless they become naturalised? Yes; it would be the best thing that ever happened; no one gets a chance with those fellows now.
1923. *Mr. Thompson.*] What length of time is a crayfish in spawn, that is, from the appearance of the coral to the falling off of the egg or berry attached to the tail? I cannot tell you.
1924. Are not the fish when in the coral stage considered rather a delicacy? I have heard them say so; I would rather have them the other way.
1925. Supposing it to be a delicacy, it might be thought rather hard to deprive the public of it;—would it not suit all purposes if certain portions of the coast were closed against taking the crayfish for a certain season leaving other portions open; do you not think something should be done in that way to preserve the continuity of the supply? Yes; it would be a good thing.

LAKE MACQUARIE FISHERIES.

SATURDAY, 16 MARCH, 1895.

[The Commission met at the "Toronto Hotel," Lake Macquarie, at 10.15 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. George Parker, fisherman, Lake Macquarie, sworn and examined:—

- Mr. G. Parker.
16 Mar., 1895.
1926. *President.*] You reside at Toronto, on Lake Macquarie;—what are you by occupation? A fisherman; I have been fishing for twenty-five years.
1927. Have you been fishing in Lake Macquarie all that time? Not all the time on the lake—about seventeen years.
1928. Have you anyone else associated with you? Only my son.
1929. You will, of course, have a good knowledge of the state of the fisheries in the lake seventeen years ago, and their condition at the present time? Yes.
1930. Can you tell the Commission whether there has been any depletion in the fish supply in the lake, comparing it with what it was seventeen years ago? There is not so much fish in the lake now as there was.
1931. What is the cause of the depletion? More boats and more fishermen; seventeen years ago we could only count five boats, and only three out of that lot were practical fishermen. I suppose there are about fifty or sixty boats on the lake now; the place gets hauled over and over again.
1932. What varieties of fish do you catch here? Garfish, bream, mullet, and blackfish; we catch blackfish mostly. Seventeen years ago there was plenty of bream and whiting.
1933. Was the lake greater in extent years ago than now? No, it was not wider; it was a bar-harbour; at low-water it used to run very shallow; it has been dredged since.
1934. An entrance has been made for purposes of navigation? Yes, for navigation; and it has given more water for the fish to go in and out.
1935. How did you send your fish to market seventeen years ago? By steamer to Sydney, and we used to send from Belmont to Newcastle; they used to get knocked about a good deal.
1936. What is the average catch of you and your son per week? From nine to ten baskets.
1937. And what is the average price you get as a return per basket? Not more than 3s. or 4s. lately.
1938. How do you send your fish to market now? The train takes them from Toronto to Fassifern; from thence they are taken to Sydney by rail.
1939. Do you consign to an agent in Sydney? Yes.
1940. Does he send you your returns at the end of the week? We get our returns every Tuesday.
1941. Are those returns of a satisfactory nature? As far as we know, we have our doubts; it is very easy for our fish to fetch £10 in the market, and for the bill to be made out for £5 for the fishermen.
1942. You think you do not get fair value for your fish compared with what the consumer has to pay for them? Yes, that is so.
1943. If you got even one-half of what the consumer pays, would you be satisfied? Yes, we would.
1944. Would about 1d. per pound all round pay you very well? Yes, very well. The only way we have of making a few shillings is to sell our fish at the wharf, and it is then sent up country. They give us 10s. and 12s. for bream and garfish, and 8s. for blackfish and mullet.
1945. Who are the people who send fish up country? Mr. Sheddon. Last winter he took about fifty baskets per week from the men on the lake; there is a bigger demand for fish in the cold weather.
1946. You say there is a bigger demand for fish during cold weather, is that because of the absence of any means of sending fish away to the country during the hot weather? Yes.
1947. If the Railway Commissioners were to provide a refrigerating car would it be availed of to any considerable extent by the fishermen, or men like Mr. Sheddon to send fish throughout the country? Yes, it would.
1948. Where does Mr. Sheddon send the fish to? Armidale, Glen Innes, Tamworth, and Maitland.
1949. How do you send your fish to market? In baskets.
1950. Have you tried packing in cases? Yes, fish keep better in baskets in the summer, they get more air in the baskets.
1951. During your experience have you had any occasion to complain of your fish being pilfered? Yes, when we sent by steamer our baskets were opened, and we got returns for half baskets instead of the full baskets which we had sent; it was stolen on board the steamer or between the steamer's wharf and the market.
1952. Have you had reason to complain since you have sent fish by rail to market? No; the only thing we can complain of is the way they knock the fish about. Those guards throw the fish about as if they were throwing stones about—eight or nine baskets in a heap.
1953. You think sufficient care is not taken by the officials to protect the fish from injury during transit? They do not take sufficient care. I have seen the guards throw baskets about in any way at Dora Creek.
1954. Are you satisfied with the freight charges made by the Railway Commissioners? Yes; they made a reduction some time ago.*
1955. Are your baskets returned free? Yes; the only thing we complain of in that way is that the baskets are put out at the wrong stations by the guards.
1956. Have you lost any baskets? Numbers of them.
1957. What do they cost you? We used to pay 7s. 6d. each a few years ago; we get them now for 6s. 6d. and down to as low as 3s. 6d. My brother sent over twenty baskets, for which he paid 6s. 6d. each, and in a fortnight he had them all stolen with the exception of seven.
1958. Do you think that could be avoided if proper attention were given by the railway officials? Yes.
1959. Do you think they might be lost in transit between the railway station and the market? Yes; they are carted from the market to the train.

* NOTE (on revision):—"Toronto, Macquarie Lake, March 28, 1895. The President, Royal Commission on Fisheries. Sir,—When you were here lately inquiring into the fishing industry we were given to understand that the railway freights for fish were lowered; but instead of 10d. per basket (the old charge), I find since you were here it has been increased to 1s. 1d. Considering the state of things, and the price we get for our fish, after deducting railway freights, cartage, market dues, commission, &c., the fisherman has very little to support his home with.—GEORGE PARKER."

Mr.
G. Parker.
16 Mar., 1895.

1960. Is a consignment note made out for the returned empties? When we send fish away we get a consignment note; but I do not know whether the agent gets one when sending our empties back.
1961. Have you a knowledge of the fish market at Woolloomooloo? Yes.
1962. Is that market all that could be desired? No; I do not think so.
1963. Could any improvements be effected in it? Yes.
1964. In what way? I do not agree with putting the fish in heaps on the floor, where they are trodden upon and people spit upon them, and otherwise damage them. I believe in the system of displaying them on raised tables. That would show the fish off to better advantage, and be better all round.
1965. Do you think the market central enough? No; it would be better to have a main central market in the town, near the railway station. It would be more convenient, and it would be a saving to the fishermen; they would save a lot of expense in carting. At present we pay 5s. per morning for carrying our fish from the station to the market. That is the charge for one basket or twenty baskets.
1966. You think if you had a central market that handling could be avoided? Yes; the fish would go straight from the train to the market.
1967. Supposing a system was adopted by which the fishermen could be brought into closer communication with the consumer, would that be better than the present system of relying solely upon an agent? Yes, it would; we would save on our commission. We pay market dues and commission, amounting to 2s. in the £, and we should know what we were getting for the sale of our fish.
1968. Have you ever used the cold-storage chamber? No.
1969. Do you believe in having only one sale per day at the market? I believe there ought to be sales during the day; have the market open all day, then the fishermen could send their fish to market by any train.
1970. Are there any provisions of the Fisheries Act that operate harshly in Lake Macquarie; I mean in respect to the meshes and nets? Oh, yes; that is the greatest thing against us—not allowing us for the shrinkage of our net.
1971. In that answer do you refer to the question of prosecution for fishing with nets of illegal meshes? Yes.
1972. Do you believe that when a net is passed by the inspector as being legal, and it has been used by the fishermen, it should be recognised as legal until it is worn out? Certainly I do; until it is worn out.
1973. Have you taken the precaution in purchasing your net to obtain it with a larger mesh than is legal? Yes.
1974. What have you allowed for shrinkage in the case of the hauling net? Well, we have got the net here $3\frac{1}{2}$ inches; it has shrunk $\frac{1}{2}$ inch after two or three tannings.
1975. Then you do not believe in having your nets confiscated after they have shrunk through the process of tanning, and have become to a certain extent illegal? No, it is wrong.
1976. Supposing those nets were handed back to you, although they were illegal, could you make them into a legal net? No.
1977. Could they be made into a legal net in other places? They could in other places; they could make the net into a prawn net or garfish net in other places. We do not use those nets here.
1978. You used to fish with, and were only allowed to use, 150 fathoms of hauling net? Yes.
1979. Did you suffer any hardship in being limited to that size? Yes; we only just make a living with the 300 fathoms.
1980. Still you hail with a degree of satisfaction the action of Parliament in passing an Amending Bill giving you an extra 150 fathoms? Yes; it was an act of justice to the fishermen.
1981. Do you believe using the extra length of net prevents the constant hauling of the ground to a certain extent? Yes; the longer the net the less hauling, and the less fish destroyed.
1982. Are you satisfied with the length of the hauling net, or do you ask for any alteration? We are satisfied with the mesh; but we feel an allowance should be made for shrinkage.
1983. Do you think that cases arising out of seizures of nets should be dealt with immediately, so that the fishermen might not be kept waiting a month or so to know the result? Yes, certainly.
1984. Would you favour a provision in an Act giving power to fine a man, or make him go to gaol for a term, say, seven days—would that be better than taking away his tools of trade? Yes, it would be better.
1985. Do you use a drift net here—a meshing net? Yes.
1986. What other kinds of nets are used here? A garfish net, a mullet net, and the set net; then we have a net called the diver, we use it for bream. It will catch any fish where it will float, but in a certain depth of water it will not float. It is what they call a sunken net.
1987. Have they a purse in that net? No.
1988. Do you think a stringent provision in regard to the catching and sending to market of undersized fish would be better than bothering so much about the meshes of nets? Yes, I think that would be better than anything. Every one of the fishermen on the lake wants something like that carried into law.
1989. Do you haul nets on to the beach? In some places, not all. In some places we land in 2 feet of water, against a back net.
1990. Do you take every precaution to prevent the destruction of young fish? Yes; it is to our own benefit to save all the small fish we can.
1991. Are you troubled with the blubber? Yes; in the summer-time more than in the winter.
1992. In regard to the bunt of the hauling net, do you think it is the size of the mesh which protects the young fish? There is a $2\frac{1}{2}$ -inch mesh used in the bunt. There are small schnapper, bream, and tarwhine which will just get caught by the gills. As soon as they are caught like that they are strangled. A smaller mesh would be far better; there would be much less destruction of fish. We could always shake those small fish up into the bunt, pick the big fish out, and throw the little ones back into the water.
1993. Do you think a provision making it compulsory on the part of the fishermen to empty their nets in, at any rate, not less than 6 inches of water, would be a hardship? No; it would not. They could always manage that.
1994. I suppose where the flue of the net is, there would be a foot or more of water? Oh, yes; there would.
1995. Do you believe in that provision in the Act which provides for one moiety of the fine being paid to the inspector when he succeeds in obtaining a conviction against a fisherman? No; I do not see why it should

- Mr. G. Parker.
16 Mar., 1895.
- should be given to the inspector. That is what makes them so anxious to seize our nets—their getting half the fine. They ought to be doing other work than seizing fishermen's nets.
1996. You say you have been here about seventeen years? Yes.
1997. Who is the inspector here at the present time? Mr. Aldrich.
1998. How long has he been here? About two years or a little over.
1999. Who was here before Mr. Aldrich? Mr. Boyd, who is a resident on Lake Macquarie.
2000. How long had he been charged with the control of the fisheries here? Ever since the passing of the Act. I know he cost me about £50 the first time he came here.
2001. Did you consider him a good active assistant inspector? Yes.
2002. Have you ever seen any of the Fisheries Commissioners down here at Lake Macquarie? No; I have not.
2003. Have you ever heard of any one of them, or all of them, visiting this place? I think Dr. Cox has been here.
2004. Do you remember the date of his visit? Sometime after last Christmas.
2005. Where did he go to? To Swansea. I believe he had a steamer hired; he was supposed to use a trawl on the lake, but I only heard this.
2006. What is your experience of the working of the Fisheries Act;—has it been satisfactory to you? No; it has not been satisfactory to us.
2007. Would it be better to make a change in the administrative authority in Sydney; I mean in the way of altering the constitution of the present Commission? Yes; I think so.
2008. Can you suggest anything in that way that would be likely to suit the requirements of the fishermen generally? Yes; I would suggest the appointment of a qualified and practical man who should have control of the fisheries of the Colony a man who would give full attention to our requirements and see into what we want. This would be beneficial to the fishing industry. I am speaking now on behalf of the other men on the lake. I have often heard them say that is what they want.
2009. Would you object to the appointment of local boards to advise, such boards to be constituted partly of representative fishermen, their object being to advise the head authority as to local matters? I think that would be a very good thing indeed.
2010. Why do you desire that sort of thing? On account of the different circumstances and conditions attaching to the different fishing-grounds. For instance, the fisheries of Lake Macquarie are totally different to those of the Hawkesbury, Port Stephens, or the Hunter.
2011. Did the fishermen of Lake Macquarie send any representatives to the conference which took place in Sydney a little while ago? Yes; Mr. Hannell and my brother went.
2012. Have you received any benefit as a result of that conference? We have relied on the interest you, Mr. Farnell, have taken in connection with the development of the fisheries to give us some remedial legislation. All we require to put things on a proper footing is a just law and proper facilities for getting our fish to market, and a better distribution of our fish. I may tell the Commission that we want some change. I have sent sixty baskets of good fish to Sydney, and all I got as a return was 1s. 6d.
2013. Have you had any experience in connection with well-boat fishing? No; I have seen them used outside for schnapper fishing.
2014. Have you had any experience of deep-sea fishing? No; I never did any.
2015. Have you done any crayfish fishing? No; most of that is done at Port Stephens.
2016. Have you done any fish curing or smoking? Yes; I have a man next door to me who does curing. He sent fifteen dozen of smoked fish up a week ago.
2017. What fish were they? Mullet.
2018. What return did he get for the fifteen dozen smoked fish? 17s. for the lot, and a basket of fresh fish thrown in.
2019. Were they sold by the agents? He did not know how they were sold; they were sent to the Redfern market.
2020. Are there any prawns in Lake Macquarie? Yes; plenty of prawns.
2021. During the whole year round? They are very plentiful during the summer.
2022. Do you make a marketable commodity of them? No; we do not send any to market.
2023. Is that because you have no means of keeping them fresh? Yes.
2024. Are there any oysters in the lake? A few scattered about in the lake; we have dredged in the lake to see if they were on the bottom, but never got any.
2025. During your travels on the sea-coast have you ever seen any evidence pointing to the existence of deposits of oysters in the sea? I have seen spawn on the rocks away from the inlets; it is possible that spawn came from deep-sea deposits of oysters.
2026. When do the sea mullet show in the lake in any quantity? April is the best time for them.
2027. When do the garfish make their appearance? The river garfish come in about the same month.
2028. Do black bream travel about the same time? Yes, and they keep travelling later than the mullet.
2029. Have you ever caught any species of the herring in the lake? Yes.
2030. Was that purely the lake herring or —? The lake herring.
2031. Have you ever seen shoals of fish on the coast, travelling from the south to the north? Yes; we have never tried to catch them; we hardly know what they are. We see great shoals of salmon travelling outside.
2032. Do you consider portions of Lake Macquarie to be breeding and feeding grounds for the fish? Yes, portions of it; but fish when travelling, if they are ready, throw their spawn wherever they may be at the time. You can go from here to Sydney, outside, and you will see little fish in the pools, rocks, and other tide-left waters, and it is quite clear that those fish must be the result of sea-spawning. I have taken particular notice of that.
2033. Are there any portions of the lake naturally closed by the existence of patches of weed and rock? Yes, two places; they are natural closures. There is one off Dora Creek, they call it Muddy Lake, and there is Fennell Bay; they are natural closures, you cannot shoot a net in those waters.
2034. Have you ever had to complain of unjustifiable closures being made by the Fisheries Commissioners? Yes, we have.
2035. Do you know whether those closures were made on the recommendation of the inspector, or whether they were carried out at the will of the Commissioners? I think the inspector was the cause of most of the closures.
2036. Were any closures recommended by Mr. Smithers? I cannot say.
- 2037.

Mr.
G. Parker.
16 Mar., 1895.

2037. Does he visit the lake? Yes; he was down a couple of weeks ago.
2038. What was the object of his visit? To seize nets.
2039. What means does he adopt in order to catch the fishermen? If he sees a boat hauling across the bay he will not go straight to it in his boat, but he puts ashore and sneaks round upon us. I never knew him to come straight to us yet.
2040. Do you know of his having disguised himself in order to try and catch fishermen? No.
2041. Are there many red bream caught in the lake? Yes, fish not marketable; that is where this 3-in. mesh comes in. It destroys a lot of red bream, young fish.
2042. What extent of waters have you open to net fishing? I suppose there must be close upon 50 square miles. This lake is a hauling ground right round from one side to another. There are scarcely 50 yards upon which you could not haul.
2043. Do you think it is absolutely essential that the entrance to the sea should be kept open? Certainly, it should be kept open.
2044. Where does the greater portion of the fish supply in the lake come from? From the sea.
2045. Are there any Chinamen fishing here? No; there were some, but they are played out.
2046. Did the Chinamen use any other methods besides the net for catching fish? No, just the simple hauling net.
2047. Do the Europeans use different methods;—do they employ the long line or bultow? Yes, there was one man who did.
2048. Is there any necessity to close any further extent of water? No; we have enough closed now.
2049. You think the lake is well supplied with fish? Yes.
2050. *Mr. Thompson.*] Are you satisfied with the 300 fathoms of net? Most of the fishermen are not satisfied; they say it would be a fair thing to have 400 fathoms.
2051. Do you think it would be an improvement if the several existing nets were abolished and one general net of a maximum length and a minimum mesh substituted in their places for use in open water? Yes; I think that would be a very good thing; I am in favour of that. The fishermen generally would favour that so long as provision was made to prevent small fish from being destroyed or sent to market.
2052. If such an arrangement were brought about, would you object to certain waters being kept closed so as to provide for the continuity of the fish supply, at the same time to allow the marketable fish in those waters to be captured by means of set nets? Yes; that would be a good thing and very beneficial to the fishermen. In that way the breeding and feeding grounds would not be disturbed and no unmarketable fish would be caught.
2053. Would it not minimise the shrinkage of nets and be advantageous all round if the twine were tanned before being made up? Yes, it would; that would make a big difference to us.
2054. Have you ever considered the question of leasing portions of the lake to fishermen? Yes; the fishermen were speaking of it no later than a month ago.
2055. Do you think it would be a good plan? I can hardly give an answer to that.
2056. Do you think, if you are not inclined to favourably consider that question, it would be a good idea to limit the number of fishermen on any fishery? Yes; I think it would be a good thing in the interest of the fishermen themselves. It would be a capital thing. It is better for sixty or so to get a living than for 100 to get a partial living.
2057. How long does Mr. Sheddon keep his fish before sending it to the country? He gets them here at Toronto at 4 o'clock in the afternoon, and he sends them up country by the evening train.
2058. Then neither he nor anyone else here keep fish for a day or two and then send them away? No; that is not done. At the commencement of the summer Mr. Sheddon used to take fish from the lake to an ice-house in Newcastle. They were sent away fresh.
2059. You said fish do not keep so well in the boxes as in the baskets on account of the ventilation, would that be obviated if the boxes were constructed of wire netting, stretched on an iron frame; would that give you ventilation, and be sufficiently strong to prevent crushing? Yes, that would give ventilation. I would approve of such a plan of construction.
2060. Would you approve of gutting the fish before packing them for market? The fishermen would have no time to do it now.
2061. Supposing the Government were to make concessions in the shape of cheap railway freights, or if you realised prices commensurate with the extra labour involved, would you do it then? Yes; we could find time or pay for people to do it.
2062. You experience great trouble in getting your baskets packed in the train at the various lake stations? Yes.
2063. Are the fish often damaged by the rough handling they receive? Yes, they are.
2064. Would that difficulty be removed if it could be arranged to have a truck left on the siding at the several lake stations, so that the fishermen could pack the fish themselves in readiness for the train that would take it to Sydney or elsewhere? Yes; that would be an advantage.
2065. When do the black bream spawn in the lake? About the same time as the mullet. You will get them full-roed at the time you get the mullet.
2066. Can you tell me the size of the largest black bream caught here? We caught one here weighing about 9 lb. He was about 16 inches long from the tail to the nose.
2067. What size do the blackfish attain? I have seen them go to about 7 and 8 lb.; they will grow 14 inches long.
2068. Have you ever caught any schnapper in the nets here? Yes, plenty. When I first came to the lake we used to catch seventeen or eighteen baskets in a day; none of them would go under 6 or 7 lb.
2069. Are there plenty now? You might get a basket or a couple of baskets in a day.
2070. Whereabouts are the oysters in the lake? Some at Bolton Point, some at Fennell Bay, and at the Log Hut.
2071. What kind are they? Rock oysters.
2072. In respect to the growth of the oyster here—is it rapid? A slow-growing oyster.
2073. How long does it take to develop into a mature oyster from the time spat appears on the rock? About twelve or eighteen months.
2074. *President.*] Is the evidence you have given before this Commission to-day representative of the opinions and desires of the fishermen on the lake;—are they in accord with the views you have expressed to-day? Yes, they are.

Mr.

Mr. Daniel McGuinness, fisherman, Lake Macquarie, sworn and examined:—

- Mr. D. McGuinness.
16 Mar., 1895.
2075. *President.*] You are a licensed fisherman working on Lake Macquarie—how long have you been on the lake? Nearly three years this last spell.
2076. Where were you fishing before you came to Lake Macquarie? I started fishing on the lake some years ago, and dropped it, and then I commenced again.
2077. Are there any others associated with you in fishing? One man and my two sons.
2078. What is your average catch per week? From ten to twelve baskets per week.
2079. What class of fish? Principally bream.
2080. Black bream? Yes.
2081. What net do you use in the capture of the black bream? The bunt is 3-in. I used to use 2½-in., but the fish being so scarce I used a 3-in. bunt.
2082. Is that a sunken net? Yes, what we call a diver.
2083. Do you use that net to avoid the blubber? Yes, to a certain extent.
2084. Do you use any other net besides the net you term a diver? No; it is used for hauling purposes also.
2085. What fish have you caught with this net besides black bream? Flathead, blackfish, a few schnapper, a few mullet—principally bream and flathead.
2086. How do you dispose of the fish you catch? I sell some here—that goes north—and I send to Sydney.
2087. To whom do you consign in the market? Hudson lately; I have been sending to Augustus at the Woolloomooloo Market.
2088. Prior to your dealing with Mr. Hudson, at the Redfern market, did you send your catches to the Woolloomooloo Market? Yes.
2089. Comparing the returns received from the sale of your fish at the Redfern Market with those at Woolloomooloo, from which do you get the better return? From the Redfern Market.
2090. Have you had to complain of your fish being stolen in transit to the market? My agent does not give me any information in this respect; I have no means of knowing. It is quite possible that theft does take place; I have to trust to the agent's honesty in the matter.
2091. Are you satisfied with the freight charges on the railway? Yes; I would be more satisfied if the fish were carried in a better form than at present.
2092. If the Railway Commissioners adopted the system of conveying fish in a refrigerating car, do you think the fishermen would avail themselves of it, so as to send their fish to market in good condition? We would be well satisfied with the freight if the fish were carried properly.
2093. Do you think the fishermen ought to be brought into closer communication with the public? Yes; it would be a great benefit to us.
2094. Would it be any benefit to you if the agents were dispensed with? Yes; 100 per cent. better. They get the money, and the fishermen do the work.
2095. You do not think you receive a fair amount as a return for your labour; that is, comparing the prices realised by the middleman from the general public for the sale of fish with the prices you receive from the agent. Is the present state of things satisfactory? It is not satisfactory; the fishermen have proved that they are wrongly dealt with by their agents.
2096. How do you send fish to market? In baskets; I have sent in boxes.
2097. Do they carry better in the baskets, or in the boxes? I prefer the baskets, provided they are not heaped on top of each other as they are.
2098. Do you think that under the present system the fish are liable to be crushed and injured owing to the baskets being packed upon one another? I am certain of it. The baskets are not strong enough to bear the weight of the fish. As a consequence, they are crushed to pap when they reach Sydney.
2099. Are you satisfied with the handling the fish receive? No; not all. They are used in a most beastly way by those guards. They throw them about like stones. Our fish is badly treated and our baskets are crushed to pieces. It often happens we get nothing for our fish—our agents say they are crushed. We have to pay market dues and freight for nothing.
2100. Do you always receive your empty returns? No; I have losses at times.
2101. Do you know anything of the way in which the sales of fish are conducted at the Woolloomooloo Market? Yes.
2102. Do you think that system could be improved upon? Yes; a big improvement could be made.
2103. What do you suggest in place of the present system? Well, the fish is thrown on the floor in heaps and is liable to be trodden upon, and in other ways it is not displayed to proper advantage. Then, again, the fish that is first sold often brings a better price than that which is disposed of at the end of the sale.
2104. Do you think that there is any possibility of the agents entering into an arrangement with the hawkers in regard to the disposal of fish? That is our opinion. We are led to believe that the fishermen do not receive fair treatment. It is a certainty we do not get fair treatment in the sale of our fish. We are not there, and the agents send us what returns they like. We are totally unprotected.
2105. Do you think the Woolloomooloo Market is in a good position for the conduct of the business? No, I do not.
2106. What place would you suggest for a central market? Near the railway station. It would be better for the fishermen, as there would be less handling.
2107. Would you favour a proposal to have a market fitted up with raised tables on which the fish could be properly displayed? Yes, by all means, the fishermen want that done; the fish should be shown off to advantage, and the public would buy more readily.
2108. In regard to the operations of the different provisions of the Fisheries Act, do you think they operate fairly? Well no, they do not.
2109. Is there any room for an amendment in respect to the different kinds of nets used by the fishermen on Lake Macquarie? Yes, plenty of room; a big advantage to the fisherman, and no disadvantage to the small fish. They would not be killed.
2110. You have lately had the provisions of the Amending Act extended; I believe you now use a hauling net of 300 fathoms? Yes.
2111. Does that meet with your wishes? No, not altogether. We were allowed 150 fathoms, but that was insufficient, and the men consequently used the longer length, and broke the law. If they had not done so they would have had a poor chance of getting a living. We were afraid to ask for too much for fear

we would not get anything. Our idea was if we asked for 400 or 500 fathoms we should get nothing. We asked for 300 fathoms and got it. 600 yards of net seems a lot to use, but in miles of water like this it is not sufficient.

Mr. D.
McGuinness.
16 Mar., 1895.

2112. What length of net would you like? I would be satisfied with 500 fathoms; we would not kill as many small fish with a long net like that as we would with a short net with which we would be hauling constantly.

2113. As to the mesh of the hauling net, are you satisfied with that? In one sense; but we have to tan it so much, and it shrinks up so that the inspectors come and take it from us before it is half worn out.

2114. What mesh do you purchase in the first instance? For the wings we are allowed 3 inches. I have bought $3\frac{1}{2}$ inches, and have it at home now not half worn out, and am not able to use it.

2115. Why? It has shrunk so much through tanning; it will not go 3 inches now. If I use it they will take it from me, and fine me for using it.

2116. What do you allow for the bunt when purchasing your net? We are allowed by law $2\frac{1}{4}$ inches, we buy $2\frac{1}{2}$ -in. I find that I cannot wear it out, so I am forced to buy 3-in.; it shrinks so much. I lose good fish through that; good whiting will go through a 3-in. mesh.

2117. Can you make your nets legal nets after they have shrunk in that way? No; they are no use.

2118. Are they no use to the fishermen on Lake Macquarie? No use whatever. They are not small enough to catch garfish and too small for other fish.

2119. Have you ever had any nets seized? No, I am very careful about that; I have had no trouble with the inspectors.

2120. Would you approve of a provision in an Act that would allow all fishermen to use whatever mesh they like, the length of net not to exceed a certain maximum, say 600 yards, at the same time having a stringent provision as to the capture and sale of undersized fish,—would that suit you better than the present complicated system of lengths and meshes of nets? I certainly would favour that. That is what ought to be done, as the mesh in present use kills more immature fish than if a smaller mesh was used.

2121. Do you haul your net on to the beach? As a rule. Sometimes we land against a back net, but we always turn the small fish adrift.

2122. Would it not be possible for you to land your fish in say not less than 6 inches of water? Yes, we could land them in not less than 1 foot of water.

2123. Would you consider a provision making it compulsory on the part of the fishermen to land their fish in water not less than 1 foot in depth, a hardship? No, that would not hurt the fishermen; it could be done without any inconvenience against a little back net.

2124. Do you believe in the provision by which when a man's net is seized by an inspector and the man prosecuted, the inspector receives a moiety of the fine? No; it is a rotten provision. He gets his salary; it is certain that it makes the inspector hard on the fishermen.

2125. Do you think, in respect to the seizure of nets, that the fishermen's tools of trade should be confiscated? No, not at all; the fine is bad enough without taking the net away.

2126. Would you favour a proposal to inflict a fine or imprisonment for a term, say, not exceeding seven days, rather than take the tools of trade away from the fishermen? By all means, I would be in favour of imprisonment; but leave a man his tools, he cannot work without them.

2127. Are you of opinion that cases arising out of an infringement of the Fisheries Act should be heard with as little delay as possible? Yes, certainly, because men are kept idle three or four weeks sometimes. That means a loss to the fishermen, and then your net is away for three or four weeks, and it is damaged through neglect. It is put away wet, and it rots.

2128. Do you use the drift net? No.

2129. You said you caught schnapper in the net you use? Yes.

2130. Have you caught them lately? Yes, a few.

2131. Were they of large size? About the size of a bream.

2132. What is the largest-sized black bream you have caught here? I have caught them 4 lb. in weight.

2133. What is the largest blackfish you have caught? Four pounds.

2134. When do the black bream frequent this place in greatest numbers? In the winter-time,

2135. Are the blackfish migratory fish as far as Lake Macquarie is concerned? Sometimes they are plentiful; other times they are scarce.

2136. Where do you think the lake gets its supply from? From the sea.

2137. Is Lake Macquarie a breeding and feeding ground? Yes, it is; but the greatest supply comes from the channel.

2138. You think it is absolutely essential that that opening from the sea should be kept closed, and that the ingress and egress of fish should not be interfered with at all? I would keep that channel closed; it ought to be closed.

2139. Do you know of any natural closures, closed I mean by the existence of seaweeds or rocks, in Lake Macquarie? Yes.

2140. Are those natural closures sufficient without interfering with the present waters? I am quite certain of it. I believe you cannot work the greater part of Lake Macquarie.

2141. Have you had any reason to complain of unjustifiable closures being made by the Fisheries Commission since you have been on the lake? No; I cannot say I have.

2142. Is there a pretty active supervision over the fisheries of the lake? Yes; there are mostly some inspectors knocking round.

2143. Have you ever known any or all of the members of the Fisheries Commission to visit Lake Macquarie? I did hear Dr. Cox was down here sometime ago.

2144. What was the object of his visit? I think he brought a sort of trawl, he tried it; they dragged the trawl some distance, they got it full of blubber; I heard the experiment was a failure.

2145. Apart from that visit by Dr. Cox, have you heard of any other Commissioner visiting the lake? No.

2146. Have you heard the fishermen make any suggestions as to the administration and control of the fisheries; I mean have you heard them suggest that any change should be made in the administrative authority as at present constituted? Yes; the fishermen would like a change in the present state of affairs.

- Mr. D. McGuinness.
16 Mar., 1895.
2147. What would you suggest in the place of the present Commission? As far as we are concerned the fishermen would be glad if they had a body constituted which would pay greater attention to the fishing industry of the Colony; the fishermen would like to have a say in regard to the administration of the Act, as the circumstances of the different fishing grounds vary so; this makes it necessary that advice should be given by practical fishermen. Such a state of things would give greater satisfaction than the present system.
2148. Have you ever had any correspondence with the Fisheries Commission? No.
2149. Have you ever had any visits from any of the assistant inspectors in Sydney;—did you ever hear of Inspector Smithers or any assistant inspector disguising themselves for the purpose of trying to catch fishermen? No; I cannot say I have.
2150. Have you any knowledge of the working of the well-boat system? No.
2151. Have you any knowledge of trawling? No.
2152. Have you been engaged in the capture of crayfish? No.
2153. Are you aware they exist in large quantities off the coast? I have heard so.
2154. Do you know anything of the habits of the crayfish? No.
2155. Have you engaged in the smoking of fish? Only for my own use. I thoroughly understand how to do it; but I never smoke for sale.
2156. Do you think it could be profitably carried out if there was a good demand? Yes; especially in the mullet season.
2157. Have you the proper wood for smoking? Well, sawdust from hardwood, mixed stuff, is the best. It will not flare up, it keeps smouldering, it smokes away, and is constant.
2158. Have you noticed any oyster deposits in Lake Macquarie? No; we often get large oyster shells, which must be evidence of their having existed here.
2159. Have you seen any oyster deposits on the foreshores? Yes, some—what we call the rock oyster.
2160. Have you ever seen any shoals of fish off the coast? I have not had much opportunity of seeing them. I have heard that they do pass up and down.
2161. Have you ever heard that a species of herring passes along this coast at certain times of the year? I have heard a little about it.
2162. Do you know that whales frequent the coast of New South Wales? Yes.
2163. *Mr. Thompson.*] You say you would like a net of 500 fathoms;—of what mesh? Two-and-a-half inches in the bunt and the usual wings.
2164. How many men will it take to haul that length of net? Four men will work 500 fathoms of net.
2165. Do you use a windlass? Yes; I was the first to start the windlass here.
2166. What length of hauling line do you use? About 600 to 900 yards on each net.
2167. Does that enable you to go out well into the deep water in the lake? Yes.
2168. Would not this extra length of net prevent the fish from getting out of the net while in process of hauling, without such a long length of line? We want less rope and more net.
2169. If a car were placed on a siding at the several stations, so that the fishermen could pack their fish before the arrival of the train, would that tend to diminish the damage to the fish of which you complain? That would be a great improvement.
2170. You complain of undue handling of your fish? Yes; we send fish in the cars from Toronto to Fassifern, and there it is unloaded, and placed into another truck on the train; in some cases the truck is loaded at Toronto and shunted on to the train at Fassifern, and the extra handling is avoided. It is to our advantage to have the latter system adopted.
2171. You say you sometimes send fish in boxes instead of baskets, do you find that answer? I cannot say; I prefer the basket.
2172. Supposing these boxes, instead of being made of wood, were constructed of iron wire netting fitted on an iron frame, you would get plenty of ventilation then? That would be better for carrying, better in every way.
2173. Do you advocate the gutting of fish before despatching to market? That would be better, but it cannot be done.
2174. Could it be done if you received prices which would cover the cost of your labour? Yes; it could be done if we were paid for it.
2175. Have you ever considered the question of leasing portions of the lake to fishermen? I have; I think it would be a good plan.
2176. Would you give the fishermen the same rights to the fish caught within a leased area that the oyster lessees possess in the oysters caught in their areas? Yes.
2177. Does Mr. Sheddon purchase any fish from you? He does.
2178. What does he do with them? He sends them to Newcastle, and up the Northern line.
2179. Does he keep them on hand at all, or send them right away? He sends them away; sometimes he keeps a few in a cool-room at Newcastle.
2180. Are all the fish he sends away fresh? Yes.
2181. *President.*] Is the evidence you have given before this Commission, to-day, similar to that which would be given by the other fishermen on Lake Macquarie? Yes; I have been speaking on behalf of the great majority of them.

Mr. Theodore Gambrell, fisherman, Dora Creek, Lake Macquarie, sworn and examined:—

- Mr. T. Gambrell.
16 Mar., 1895.
2182. *President.*] Your name is Theodore Gambrell, and you reside at Dora Creek—Dora Creek is a tributary of Lake Macquarie? Yes.
2183. How long have you resided there? About seven years.
2184. How long have you been engaged in fishing? About four years.
2185. Were you fishing in any other waters before you came to the creek? Not in a practical manner.
2186. Who are associated with you in your fishing operations? I have my son and two men working with me. Sometimes I have six or eight men.
2187. Do you hold a license? We all hold licenses, but I hold the boat license.
2188. What fish do you catch? Mixed kinds of fish with the net I use. It is a ground net. We fish for bream, but we do not always get them. At the present time we are getting a few mullet, bream, flathead, flounders, and sometimes an odd whiting.

Mr.
T. Gambrill.
16 Mar., 1895.

2189. What is the season for black bream? About three years ago they started to come in about this time, and kept gradually increasing until the cold weather, and they were good then until about Christmas. When I first started fishing I did not notice a bream in the lake until the latter end of June or the beginning of July. That would be four years this season.
2190. I gather from your remarks that the bream you catch are school bream—migratory fish? I believe so.
2191. Do you think the fish supply for the lake comes from the sea for the most part? I do. I have been a keen observer. I have seen two fish spawning in the lake—the catfish and long tom—but no others. The other fish, when getting near spawning, have cleared out of the lake.
2192. You say you have caught flounders at times; are they in any number? Not in a great number.
2193. Have you ever caught soles? Yes; in great number.
2194. The mullet you catch—are they the sea-mullet travelling north? I believe so. The sea mullet come into the lake, and when it is getting near the time for spawning they clear away again.
2195. Then you are of opinion that those fish spawn at sea? Yes.
2196. Have you watched closely the habits of the several species of fish? Yes; since I have been fishing.
2197. Have you seen any evidences of mullet having spawned in the upper regions of any inlet or river? I have seen millions of young fish. I have seen half an acre in a patch; they were exceedingly thick. I believe they were young mullet hatched about that locality. I am speaking now of the Hawkesbury River, about 3 miles below Wiseman's Ferry.
2198. What time of the year was that? In the latter half of the year.
2199. What is your average catch per week? It all depends upon the fish supply in the lake. Sometimes we send away sixty baskets and at other times only five baskets.
2200. How do you dispose of your catch? Send them to Hudson, at the Redfern Market.
2201. By rail? By rail from the Dora Creek platform.
2202. Do you make out a consignment note for the fish? No; the porter, being obliging, does that for us.
2203. Are the fish weighed before they are sent away? No.
2204. Does the porter give you the receipt? Yes.
2205. Not for the weight, but for the number of baskets? Yes.
2206. Are you satisfied with the freight charges? I think they are reasonable. We used to have to pay 2s. 6d. for every single basket; now it is 1s. 6d. For every three baskets we are charged 2s. 6d., every other basket after that is 9d.
2207. Have you tried the experiment of sending fish in cases? I have on different occasions; last week I sent two boxes, holding just a basket of fish. One box was sold; the other was condemned; what for, I do not know.
2208. Who gave you the information that it was condemned? Mr. Augustus.
2209. Who is Mr. Augustus? A man who used to be a fisherman on the lake, who is in Sydney, and acts as an agent at Woolloomooloo.
2210. Have any of your fish ever arrived at the market in bad condition? I have not had much fish condemned.
2211. Have you ever had any of your fish stolen in transit? I have, especially when I have been sending to private individuals. I have sent a full basket from Dora Creek platform, and only half a basket reached its destination.
2212. Can you suggest any remedy for that; do you think if the fish were weighed at the station they are consigned from, and weighed on arrival at the other end, that would act as a check? I think that would be a check; it would be a good thing, but there is no station-master at Dora Creek, so it cannot be weighed there.
2213. Have you sent fish to Woolloomooloo Market? Yes; on odd occasions.
2214. Have you a knowledge of the manner in which sales are conducted at the Woolloomooloo Market? Yes.
2215. Are you satisfied with the mode adopted for displaying fish and selling them? I am not.
2216. Have any cases come under your notice where fish have been thrown on the floor and trodden on? I have seen them on the floor very close together, with very little room for people to walk about.
2217. Would it be possible for anyone to tread or spit upon them? Oh, yes; I reckon if you wanted to spit you would have to choose a place to do so.
2218. Would it be better to have the fish displayed on raised tables? Yes; undoubtedly.
2219. Would it be a good thing for the fishermen if they were brought into closer contact with the consumer? If it is possible, do it by all means, sir.
2220. Do you consider you receive a fair return for your labour under the present system? By no means.
2221. That is, comparing the prices paid by the general public and the returns you receive from the agents, you consider you do not get a fair thing? I do not think we get one-half.
2222. If you could get one-half of what the consumer pays for the fish would that satisfy you? Certainly, I would be satisfied.
2223. About how many pounds would a basket of fish weigh when full? An ordinary-sized basket of blackfish would weigh about 90 lb.
2224. What would a basket of mullet weigh? About 70 lb.
2225. And a basket of black bream? About the same as mullet.
2226. Well, now, supposing you received 1d. per lb. for fish all round, would that be a satisfactory return for you? I would like a little more than that.
2227. In the transit of fish you use baskets? Yes.
2228. They are sent back as returned empties, and you are not charged for empties? Not charged.
2229. Do you ever lose any baskets? Oh, yes, I do.
2230. Have you ever made any claim against the Railway Department for the loss of those baskets? No; I could not tell you where they were lost.
2231. Are they addressed to you when they are returned? Yes.
2232. Does the agent make out a consignment note for those empties? I believe so.
2233. Is not a receipt given by the railway officials for so many baskets? At all the other fishing ports there are railway officials at the stations, and you have to sign for your empties.

Mr.
T. Gambrell,
16 Mar., 1895.

2234. Then you think it is probable that your losses may be set down to the fact that there is no officer in charge at Dora Creek station? That is where it comes in.
2235. What is the average price per basket you receive for fish—I mean for fish of all classes? I have known fish to bring 28s. 6d. per basket clear, and I have known them to go as low as 1s. 9d. per basket.
2236. Have you ever had any returns from your agent, bringing you in debt for fish sent? No; I have heard of those who have.
2237. Would it be possible for the agents to work in with the hawkers with regard to the sale of fish? I believe it would be possible, but it might not be done. There may be dishonest men among some agents.
2238. Do you think it would be a good idea to allow the fishermen to sell their own fish in the market? It would be a lot better for the fishermen if fishermen and consumers could be brought together.
2239. Do you believe in having one sale only of fish during the day at the Woolloomooloo Market? No; I do not.
2240. Do you think it would be a good thing to have the market open all day? Yes; if we had cool chambers to keep fish in.
2241. In regard to the operations of the provisions of the Fisheries Act, you as a representative fisherman would probably be able to tell us how the provisions of that Act work—are the fishermen satisfied with the present Act? No; they are not.
2242. Did you complain sometime ago of not being allowed a sufficient length of net for a hauling net? We did.
2243. As a result you have had the provision in the Amending Act extended to Lake Macquarie giving you double the length of net? Double the length of net in one class of net.
2244. Does that wholly meet the grievance the fishermen had in respect to the length of the hauling net or would they like it longer? They would like it longer, but under the circumstances they thought it useless to apply for a greater length.
2245. You would ask for what limit of a hauling net? I represent a meeting of fishermen recently held at Dora Creek, at which they requested me to say that they wish to have no restrictions in the length of nets.
2246. Supposing an Act were passed authorising the use of nets of a length, say, not to exceed 500 fathoms? I think that would meet all requirement and satisfy everyone.
2247. So that a provision inserted in an Act limiting the length of a net to be used to 500 fathoms would meet all the objections of the fishermen? Certainly, it would.
2248. In regard to the mesh of the hauling net, are the fishermen satisfied with that? No, they are not.
2249. Do you know what they would like in regard to the bunt and the wings? Yes; the mesh of the present bunt is very destructive to young schnapper and such like. The mesh is of that dimension which catches them and kills them. If it were a smaller mesh, say 1½ in., less destruction of small fish would take place.
2250. In respect to the wings of the hauling net, have you any objection to the mesh? No; no objection. It is quite satisfactory.
2251. In using your hauling net do you land your fish on the shore? Not at all times; we rarely strand our fish. We nearly always take them out of the net in the water.
2252. In what depth of water? Sometimes up to our waists, sometimes knee-deep; nearly always by the side of the boat.
2253. Do you think it would be a good thing to incorporate a provision in an Act to compel the fishermen to empty their nets in not less than 12 inches of water? It would be no hardship.
2254. What other nets do you use in Lake Macquarie? The garfish net.
2255. Do you use a meshing net? It is used, but it has to be sunk to the bottom. It is used as a drift net sometimes by one of the men here.
2256. Is the whole of the net sunk, or is only that portion in the deep water sunk, and that portion towards the shore left floating? It all depends where the net is shot. It is heavily weighted, and it sinks to the bottom.
2257. Is that for the purpose of escaping the blubber? To catch the flathead.
2258. Have you any complaint to make in regard to the length and mesh of the garfish net? Yes, I have.
2259. What would you suggest as an amendment? Well, I saw the fishermen at Dora Creek this morning, and they asked me to inform the Royal Commission that they wanted a net which would be 50 fathoms in the bunt with 1-inch mesh, and 50 fathoms for each wing with the mesh for the first 25 fathoms of 1½-inch, and the balance 2 inches.
2260. If your proposals as to the length and meshes of the several nets were embodied in an Act, would such an Act give general satisfaction to the fishermen? I think so.
2261. What do you think of the proposal to allow the fishermen to use any net up to a limit of (say) 500 fathoms and whatever mesh they like, provided there was a provision in the Act to prevent the catching or selling of under-sized fish? I think that would be a good thing.
2262. Do you think the fishermen would be as anxious to conserve the fisheries as the Department? The greater number of them would; if I saw a fish being slaughtered I would try and stop it.
2263. Have you ever had any nets seized by the inspectors? I had one condemned.
2264. Was that the result of a prosecution against you? No.
2265. Was it the result of an inspection by one of the assistant inspectors? One of the inspectors came to my boat and condemned it. I wanted to use it for the week. I showed him I had full-sized stuff in the centre of the net, but he would not let me. Of course he had to carry out his duty; I do not blame the inspector. He was simply carrying out the provisions of a harsh law.
2266. Do you know of anyone having been prosecuted and having his net confiscated? I have heard of cases where fishermen's nets have been confiscated.
2267. Do you not think it a hard provision in an Act to take the tools of trade away from a man on the first offence? We think the Act terribly harsh in that respect.
2268. Would it be better to make a provision inflicting a fine or imprisonment for seven days rather than take the fishermen's tools of trade away? I think so; it would be better to fine or imprison a man than to take away his tools of trade. I was a gold-digger; well, they didn't take away my spades if I committed an offence, they fine a man or send him to gaol.

2269. Are you of opinion that more expedition should be shown in regard to prosecutions under the Fisheries Act, should cases against fishermen be dealt with more expeditiously and without delay? Yes; it is a hardship to have to wait so long until the case is tried.

Mr.
T. Gambrell,
16 Mar., 1895.

2270. In regard to closed waters, I believe a portion of Lake Macquarie is naturally closed? That is so. There are miles of the lake naturally closed. We cannot work there with the net.

2271. Do you think these so-called natural closures are sufficient to allow of fish breeding? I do.

2272. Are you satisfied with the waters you have at present to fish in? The fishermen want the whole of the waters open bar the entrance to the lake.

2273. Do you know of any unjustifiable closures that have been made by the Fisheries Commission? I think it is rather hard to close Mannering Bay.

2274. Why? Shoals of mullet visit that bay, and we are not allowed to catch them.

2275. Do you think the mullet you see frequenting Mannering Bay go there to spawn? No; none of them think so.

2276. Where do you think the sea mullet spawn? Outside.

2277. Do you know on whose recommendations these closures have been made? No.

2278. Do you know whether the Fisheries Commission as a body, or any member of that body, have visited Lake Macquarie to inquire into the condition of the fisheries? I never heard of their doing so.

2279. What is the general opinion of the fishermen regarding the present Fisheries Commission? As a representative of the Dora Creek fishermen, I have their authority to say that they look upon the Fisheries Commission as a body to which it is quite useless to apply for the redress of their grievances.

2280. Do you think that an authority should be brought into existence more in touch with the fishing industry—someone who would have a practical knowledge of the fisheries? I think it would be better to have a gentleman to whom the fishermen would not be afraid to speak—a man whom we could take out in our boats and speak to about our grievances.

2281. Supposing a new institution were established in Sydney for the administration and control of the fisheries, and local boards were established on which representatives of the fishermen might have seats, those boards to be boards of advice, would that give satisfaction? Yes; I would favour such boards to advise the Chief Commissioner, our fishermen to have representation on them. It would bring them into direct contact with the head authority.

2282. Your evidence goes to show that the Fisheries Commission have not taken that interest in the fishing industry that might have been expected from them? They have not done so.

2283. Are you conversant with that provision of the Act which allows the inspector or informer to obtain half the fine in connection with convictions? Yes.

2284. Do you approve of it? No, sir; we consider it quite enough if a man is paid his day's wages for the day's work. The fishermen look upon that as an inducement to the inspectors to seize their nets, and it looks very like it sometimes.

2285. Do you engage in catching prawns? No.

2286. Have you had anything to do with the capture of crayfish? No.

2287. Do you know whether there are any natural oyster-beds in Lake Macquarie? No.

2288. Have you seen any evidence of the existence of deposits of oysters in the deep sea? No.

2289. In respect to the matter of the fishermen's license, do you complain of the amount charged? Only for the boat. We would ask for a reduction in the license; we would like it to be a registration fee—10s. for the boat for ever.

2290. How do you obtain your license at the present time? I get my license from the Acting Clerk of Petty Sessions at Cooranbong.

2291. Do you pay him the fee? Yes.

2292. How far is Cooranbong from where you live? Between 4 and 5 miles from the Dora Creek platform.

2293. Supposing there were no Clerk of Petty Sessions at Cooranbong, where would you have to go? Down to Swansea.

2294. Would it not be better to give the fisheries inspectors or assistant inspectors authority to collect the license fees? They are the men who I think ought to do it.

2295. What sort of forms are the licenses issued on? Thick paper.

2296. Will it stand any kind of weather? No; it cracks and breaks easily.

2297. If the licenses were made out on parchment, would that be better? Yes; the miner's rights are on parchment, and they stand any weather.

2298. *Mr. Thompson.*] Instead of this parchment license you refer to, would it not be better still if you had a metal ticket, something like a railway ticket? That would be better than the parchment.

2299. You spoke of catfish and Long Tom spawning in the lake;—was the milt fish present at the time? I did not see the milt fish, but the spawn was apparently quite ripe and ready for extrusion.

2300. Would it be a desirable thing to compel aliens to become naturalised before allowing them a license to fish? Yes; they should not be allowed to fish until they become naturalised. Those foreigners always haul their nets high and dry on the shore.

2301. You heard the President explaining to you about this proposed net of a maximum length and a minimum mesh? Yes.

2302. Supposing it were adopted, would it not do away with a great deal of bother? It would do away with all bother altogether. It would be very desirable to have it.

2303. In that case would you agree to the permanent closure of certain waters in order to provide for the continuity of the fish supply, at the same time allowing set nets to be used in those waters in order to catch the marketable fish which they contain? I approve of the suggestion generally, but the Dora Creek fishermen do not wish to see any portion of Lake Macquarie closed, excepting the entrance.

2304. Do you think it would minimise the shrinkage of nets if it could be arranged that the twine were tanned before it is made up? Certainly it would.

2305. Do you use the long line, the bultow, in Lake Macquarie? It was used, but did not succeed.

2306. *President.*] Would you favour a provision in an Act leaving it optional to the authorities to regulate the number of fishermen who should be allowed to fish in any ground, while giving due regard to the necessity for finding fishing-grounds for other fishermen? I would favour that.

Mr. Lars Jansen, fisherman, Lake Macquarie, sworn and examined :—

- Mr. L. Jansen.
16 Mar., 1895.
2307. *President.*] Are you a licensed fisherman on Lake Macquarie? Yes.
2308. How long have you held a license? Between eight and nine years; but I took a trip home to the old country once during that time.
2309. Have you been fishing for the most of that time on Lake Macquarie? Yes.
2310. Have you had experience in connection with fisheries elsewhere? Yes; I was brought up as a fisherman. I followed fishing in Denmark.
2311. Are the fisheries there very extensive? Yes; they are.
2312. Are many men employed in the fisheries in Denmark? Yes; they work on the co-operative principle. Every man is a shareholder. There are thousands of men employed.
2313. Do the fishermen get a fair return for their labour? They are paid on the spot. Big vessels, smacks and ketches, come and take the fish from the fishermen. They put the fish into the wells, and the vessels take them to the big cities.
2314. Are the fish sold in a market? No; to the general public. Anyone can go down and buy fish.
2315. Are they sold alive? Yes.
2316. Do the fish sold alive realise better prices than those that are dead? Oh, yes.
2317. What class of fish is caught off the Danish coast? Flounders and codfish.
2318. Do they catch them with the trawl? Yes; with the trawl, the meshing net, and the hauling net.
2319. Have you had experience in trawling? Yes; I have.
2320. Have you ever had any experience in deep-sea fishing on the New South Wales coast? No.
2321. Do you think, from the knowledge you have gained in other fisheries, it would be possible for trawling to be carried on outside; supposing a trawl survey were made, and it was found that there were miles of ground over which a trawl could be drawn, do you think it would be worth while making an experiment in trawling on this coast? It might be. I think the fish would not be on those grounds.
2322. But your opinion regarding the nature of the bottoms is not the result of practical experience here? That is so.
2323. How do they trawl in your country—with the current, against the current, or across it? Against the current. Of course they cannot do that when the tide is too strong.
2324. Have you had experience in steam trawling? No; I have only trawled from stationary vessels. We used to anchor our smacks, let the trawl overboard, and then haul it in again. That was some years ago.
2325. Is anyone engaged in fishing with you on the lake? Yes; one man.
2326. What net do you use? A garfish net.
2327. Have you used the hauling net? Yes.
2328. Where do you send your fish? To Sydney. Sometimes I sell a few here.
2329. Do you consign your fish to an agent in Sydney? To Hudson, at the Redfern Market.
2330. Have you sent fish to the Woolloomooloo Market? Yes; to Augustus and to Morris.
2331. Have you always been satisfied with the returns you obtained? No.
2332. Do you think you have received a fair price for your fish? No; I have not.
2333. Do you think if the agents and hawkers were done away with, and you were brought into closer contact with the general public, it would be better for you? Oh, yes, it would.
2334. If you got half the price the public pay the hawkers for fish, would that pay you well? Oh, yes, it would.
2335. Have you any complaints to make in regard to the provisions of the Fisheries Act? Yes; in regard to the closures and to the mesh.
2336. What would you ask for in respect to the mesh? Let a man use as small a mesh as he likes. He will save all the more fish. The bigger the mesh he is forced to use the more fish he kills. Small fish get caught and gilled. With a small mesh they would not get caught.
2337. Would you favour a proposal to allow the fishermen to use a net of a maximum length, say 500 fathoms, allowing them to use any mesh they like, providing provision is made to punish them for catching undersized fish? I favour that.
2338. You send your fish by rail? Yes.
2339. Have you cause to complain of your fish being stolen on the road? I have had seven baskets lost in two weeks, baskets and all. I tried to get some redress but could get none.
2340. Do you lose your baskets when they are being returned to you? Yes, sometimes.
2341. In regard to the closures, do you think there is too much water closed in Lake Macquarie? Yes; there ought to be none closed.
2342. Why do you say that? Because there are places in the lake overgrown with weeds; they are naturally closed. Then there is the entrance to the lake; that is closed. I think it is doing us harm to have the entrance closed.
2343. Where do you think the lake gets its supply of fish from—the sea? The fish are in the lake alright.
2344. How do they get here? They spawn in the lake.
2345. Do you think the fish in the lake were bred here? Yes.
2346. Do you know that great quantities of fish come into the lake from the sea? I have never been down to the entrance to take notice of that.
2347. You think the existing closures are sufficient to allow the propagation of enough fish to enable the fishermen to gain their livelihood without depending upon the entrance? I think so.
2348. Have you ever had any nets seized? No.
2349. Do you believe in offering an inducement to people to inform on the fishermen for using illegal nets;—do you believe in offering them half the fine? I do not think that is right.
2350. Do you believe in nets being taken away from a man? No; I do not believe in that.
2351. Would it be better to punish a man rather than seize his net? Yes; far better to punish him than take away the tools he has to work with. Fine or imprison him, but do not take away his nets.
2352. Have you watched the habits of the fish in the lake? Yes.
2353. What time do black bream spawn? February and March.
2354. Do you know whether they spawn twice a year? I think they do.
2355. What time do the sea mullet spawn? About March and April.

2356. Have you ever known or heard of any members of the Fisheries Commission visiting Lake Macquarie? Dr. Cox was here once. He hired a boat and went out into closed waters and made one or two hauls.
2357. For what purpose? To see if there was any fish near the entrance.
2358. How did they turn out? They got six or seven baskets of fish. They found the mesh was too big for catching prime fish.
2359. What mesh was it? Two and a half inches.
2360. Do you think there are too many fishermen on Lake Macquarie? No.
2361. Could you stand another fifty or sixty fishermen on the lake? Yes; and get just as many fish.
2362. Are there any young schnapper in this lake? Yes; they are very plentiful. You can cast your net anywhere and get a basket.
2363. Where do they come from? They breed in the lake.
2364. Then you do not think it is possible for them to have come from the open sea? No.
2365. Have you caught any schnapper in the lake? A few with lines. I have tried with long lines and succeeded.
2366. Have you caught them with the roe in them? I cannot say whether they had the roe in them. I sent them straight away to market.

Mr.
L. Jansen,
16 Mar., 1895.

Mr. Francis Aldrich, Assistant Inspector of Fisheries, Swansea, Lake Macquarie, sworn and examined:—

2367. *President.*] Your name is Francis Aldrich, and you are an Assistant Inspector of Fisheries stationed at Lake Macquarie? Yes.
2368. Does your control extend any further than Lake Macquarie? No.
2369. How long have you been here? About fifteen months.
2370. Were you connected with the Fisheries Department before that? Yes.
2371. Where were you stationed? At Tuggerah Lakes.
2372. How long were you at Tuggerah Lakes? Two years.
2373. Were you stationed anywhere else before that? Yes; I was assistant to Mr. Grant, the Inspector of Fisheries at George's River and Botany.
2374. Had you any connection with the Department of Fisheries prior to that? No; my first appointment was to assist Mr. Grant at Botany and George's River.
2375. Prior to that were you in the employ of the Government? I was in the Telegraph Department between four and five years.
2376. How came you to leave that Department? I resigned because indoor work was against my health. I subsequently obtained a position in the Fisheries Department.
2377. How many licensed fishermen are there on Lake Macquarie at the present time? About seventy-five.
2378. Do they all appear to earn a decent livelihood? Yes; those that work.
2379. Do you mean by that there are some that loaf? Yes; and some when they do earn a pound or two never leave the public-house until it is spent.
2380. How many licensed boats are there on the lake? Twenty-five.
2381. What salary do you receive? £130 per annum.
2382. Did you receive that salary when you were first appointed as assistant inspector? No.
2383. What salary did you receive? £140 per annum.
2384. So that within a period of three years you have suffered a reduction of £10 per annum;—do you know of any reason for that? It was done on the score of retrenchment. I may say I was retired in August, 1893, and reappointed a month later at the lower salary.
2385. So that you lost a month's pay and you also lost £10 per annum? Yes; but during that month I did work at the Tuggerah Lakes, for which I was not paid.
2386. What was the cause of your re-instatement? I saw the Commissioners of Fisheries, three of them, Mr. Hill, Dr. Cox, and Mr. Hyam, with reference to the matter.
2387. Did you point out that it was false economy to leave the fisheries of Lake Macquarie without any supervision? Yes, I did.
2388. Have the Commissioners found fault with you on any occasion? No.
2389. During the month that elapsed, part of which time you spent on Tuggerah Lakes, were the Lake Macquarie fisheries left without supervision? No; Mr. Boyd was re-instated to do duty, and when that occurred I received notice that my services would not be required any longer.
2390. And when you received notice of your re-instatement were Mr. Boyd's services dispensed with? Yes; the *Gazette* notice stated I was appointed *vice* John Hesse, retired.
2391. Are you allowed a house to live in? No; I am not.
2392. Do you pay your own house rent? Yes.
2393. What does that amount to per week? Five shillings per week at present.
2394. Where do you reside? At Swansea.
2395. Are there not some Government buildings at Swansea which have been unoccupied for some time? Yes; one, the property of the Harbours and Rivers Department.
2396. How long has that been unoccupied? Well people go there from Maitland, Singleton, and those districts, and they spend sometimes a week or a fortnight in the place. I am given to understand they do this by permission of Mr. Walsh, the District Engineer.
2397. Do you know whether Mr. Walsh receives any rental? I cannot say.
2398. Have you made any application for the use of this building? I spoke to Mr. Thompson once, and to Mr. Smithers lately, but I have never made an official request for it.
2399. Could that building be utilised for the inspector's residence? Yes, it is all it is fit for.
2400. Was there not a site, selected by yourself, obtained from the Government for the purpose of an inspector's residence? Yes.
2401. Is this Government building you speak of as conveniently situated for the purpose as that site? No, not nearly so.
2402. Where did you select a site? At the north end of the retaining wall, on the south bank of the channel.
2403. Are you of opinion that your present residence is not so conveniently situated for the proper discharge of your duties as one erected on the site recommended by you would be? It is not fit for me to live in if I have to watch the waters.
2404. Are you supplied with a boat? Yes.

Mr.
F. Aldrich,
16 Mar., 1895.

- Mr. F. Aldrich.
16 Mar., 1895.
2405. Do you find you can get about the lake sufficiently fast and exercise proper supervision with that boat? No, a small steam launch would suit the purpose far better.
2406. What was the total number of baskets of fish sent from Lake Macquarie during 1894? 10,000 odd. I think 20,000 baskets of fish were sent in 1892.
2407. What classes of fish were sent in 1894? A great many black bream. I think the principal fish were mullet and blackfish.
2408. What would you estimate the value of that catch of 10,000 baskets? About £4,000.
2409. What markets were they sent to? To the markets in Sydney and to the inland towns. I think about one-half of the fish from Toronto is sent to the northern towns.
2410. What time of the year do the mullet appear in the lake in any great numbers? From before Christmas up to April; if the weather is bad they clear out from the lake before April.
2411. What mullet are those? Sea mullet.
2412. So that the lake is fed from the sea by shoals of sea mullet? Yes; they come into the lake.
2413. Do they breed in the lake? I think so.
2414. Have you ever noticed any young fry about? Oh, yes.
2415. Where do you think their breeding grounds are? My theory of it is that they breed wherever they are, whether at sea or in the lake.
2416. When do the black bream make their appearance in any great numbers? About May. Last May and June I saw more black bream in the channel and in Lake Macquarie than ever I saw before; they must be in the lake at the present time.
2417. Are those black bream the school bream or bream the result of spawn deposited in the lake? They are fish travelling.
2418. Then you think they come in from the sea? I am sure of it.
2419. Are they what you call migratory fish? Exactly, if you caught a fish coming in from the sea you would notice it very bright and silvery in appearance, different altogether in colour and look to the inside fish.
2420. I suppose any of those fish remaining in the lake would change their characteristics? I think so.
2421. Is the entrance to Lake Macquarie a good place for noticing the habits of fish? For the habits of fish travelling.
2422. The blackfish;—are they a local fish? They travel, but I think they are more local than bream, although when bream travel you will always find whiting and blackfish accompanying them.
2423. Have you seen many soles or flounders caught here? Yes; a good many flounders caught at the entrance to the lake. About the middle of winter, I have seen millions of soles and speared them myself.
2424. Was that at the entrance to the lake? Yes, in the south channel, the original channel.
2425. Do the sea garfish frequent the lake very much? I have not seen any sea garfish in the lake.
2426. Do you think it is absolutely essential that the entrance to the lake should be kept open—I mean that there should be a free channel so as to allow of the free ingress and egress of fish? Oh, yes, certainly it is.
2427. In order to protect the fish and allow them to enter the lake, do you consider it necessary the entrance should be closed to net fishing? Yes, I think it should be a permanent closure.
2428. Can you tell the Commission the largest-sized black bream you have seen caught in Lake Macquarie? I saw one caught at Mark's Point—it was in November last—it weighed 5 lb.
2429. Was it in spawn at that time? Yes.
2430. What is the largest-sized blackfish you have seen caught? About the same size—5 lb.
2431. And the largest mullet caught in the lake? About 7 lb. in Lake Macquarie. I saw one a long time ago; it weighed 9 lb.; it was caught at Botany.
2432. Do you consider the grounds of Lake Macquarie good feeding as well as breeding grounds? Yes.
2433. Taking the lake as a whole, what extent of water is available for the fishermen to haul at the present time? Two-thirds of the lake are available.
2434. Has the other third been closed against net fishing by proclamation? Part of it; the other parts are naturally closed by the existence of weeds and rocks.
2435. How much would you say is naturally closed by weeds and rocks? About 10 square miles.
2436. Have you recommended any closures in Lake Macquarie? No.
2437. Have you ever heard the fishermen complain of not having sufficient water open to them? I have—one or two; they are the worst men we have to deal with.
2438. Do you think there is sufficient water opened to net fishing considering the number of men on the lake? Yes, I do.
2439. What nets do they principally use in catching fish? The diver-hauling net, 2½ inches in the bunt, and 3 inches in the wings.
2440. Do they use the meshing net? Only in the winter-time. Mr. Hellings told me yesterday he had seen one boat using a meshing net; that is the first I have known of this year.
2441. Why do they use the meshing-net only in the winter-time? Because the fish will mesh only at night, and being cold weather they will keep for transmission to market. They use the hauling net in the summer because they catch fish at any time with it.
2442. Do they haul their nets on to the shore so that the fish become stranded? Sometimes.
2443. Do any of the fishermen haul their nets on to the shore, allowing the top and bottom lines to be on the shore, and the flue of the net to be in a certain depth of water? Sometimes they do, especially if the inspector is about.
2444. Have you seen evidences of the destruction of many young fish? Yes, I have.
2445. Do you think that if proper supervision were exercised that destruction could be minimised? Yes, it could.
2446. In regard to the mesh of the hauling net, do you know if it is satisfactory to the fishermen as well as in the interests of the young fish;—does it protect them sufficiently? Yes, I think so; I have heard no complaint about it.
2447. Under the provisions of the Amending Act a longer net has been allowed in Lake Macquarie? Yes; 600 yards. I think the mesh should not be less than 3 inches throughout. In Lake Macquarie, at the present time, the fishermen say they cannot get net suitable for the present bunt. Nearly every new net on the lake now is 3 inches in the bunt and 4 inches in the wings. The fishermen think those meshes are more suitable, being lighter than the prescribed meshes.

Mr.
F. Aldrich.
16 Mar., 1895.

2448. Do you think the meshes you have just mentioned are sufficient to protect young fish from being destroyed? Yes, with the exception of young schnapper. In the wings of a net when hauled to shore you will sometimes see a basket of these little red bream. The smaller the mesh the better it would be for them because it would not damage them.

2449. Supposing the mesh of the bunt were considerably reduced, do you think that would be a means of averting the destruction you have just alluded to? I cannot see how it would, because if you saved the schnapper you might destroy other small fish.

2450. Do the other small fish get meshed? Yes.

2451. So that it matters not what mesh may be adopted, some fish will be destroyed? Yes.

2452. It must be so where the round fish and the compressed fish are taken together in the one net? Yes.

2453. What would you think of a proposal to allow of a hauling net being used of any length up to 300 fathoms, with whatever mesh the fishermen liked to use, so long as there was a provision made compelling them to empty their nets, in, say, not less than a foot of water, and further, that a provision should be made to punish them severely for sending undersized fish to market? I do not think that would suit, any sized mesh with 300 fathoms.

2454. Which do you think would be of greater value to the fisheries of Lake Macquarie, to retain the present meshes of the hauling net which, according to your evidence, destroy a great number of young schnapper, or to adopt a smaller mesh and protect those small schnapper, and put up with the loss of the other varieties of fish? I take it the present system would be the least destructive. If you allow a fisherman to use any mesh in the net he liked up to 300 fathoms, he might have it a 1 inch mesh, and if that was so, on the flat at the south end of the entrance closure there would be tons of little whiting, 2 inches long, destroyed in one haul.

2455. Do you think it would be possible for the fishermen to haul a net of 1 inch and 600 yards long over those flats. Yes, but if the net were shot out in deep water on a muddy bottom it would be impossible to use it.

2456. Supposing the Department made restrictions as to the use of these nets in certain waters, would that overcome the difficulty? Yes it would.

2457. Have you ever had occasion to seize any hauling nets? Yes, several times; for using them in closed waters.

2458. Were those nets confiscated? Yes.

2459. What would be the average value of the nets so seized? About £15.

2460. If in any new legislation, power were taken to declare by proclamation the particular size of a net to be used for specified purposes, I suppose your objection to a maximum length and a minimum mesh would cease? Yes, it would.

2461. Do you think it is necessary that the present length of net should be allowed in the lake? I think it is.

2462. You have said the fishermen use the meshing net, does that require any alteration as far as the length and mesh are concerned? Yes; my idea of a meshing net is that it does not matter what length it is provided it is used in free water.

2463. Do you think the mesh at present allowed is sufficient to permit of the capture of all the marketable fish? No. I have had many complaints about that from the fishermen; they say it is too large and will not catch a good marketable fish; I mean a fish that is liable to escape.

2464. Would any harm result from allowing the use of the meshing net in closed waters to catch the marketable fish there? I do not think there would be any harm with a mesh of not less than four inches, providing it was used under supervision.

2465. Would there be any likelihood, then, of the feeding or breeding grounds being disturbed? Not at all.

2466. Are garfish nets used on the lake? Very seldom; it is the poorest place I have ever seen for garfish, they are so small.

2467. Garfish do not develop very well in the lake? No.

2468. Do the fishermen use the garfish net under the plea of fishing for that class of fish and take other fish with it? Yes.

2469. Do you think there should be any alteration in the length or mesh of the garfish net? I think it is plenty small enough, the mesh of the garfish net. I do not think it would hurt to have the bunt of the net a little longer, because river garfish cannot be caught in the same way as the sea garfish.

2470. Have you ever noticed an anomaly in the Act in regard to the length of the garfish net? Yes? the assumption is that it should be only 90 fathoms in length, whereas the Act states it can be any length.

2471. Are prawn nets used in the lake? Only by private individuals for catching bait for line fishing.

2472. Are prawns in any quantity in the lake? Yes; in times of heavy rain, when the water is fresh and high, you can get plenty of prawns.

2473. Do they use set lines in the lake? Occasionally; once in two or three months.

2474. Have you seen any shoals of fish making their way from the southward to the north, outside? I have not; I have heard of them.

2475. Have you heard there is a species of herring travelling on the coast? Yes; on one occasion I was told of their being washed ashore in myriads on the Nine-mile Beach, north of Lake Macquarie entrance. It was an Englishman who told me about it; he said he knew that they were herrings right enough, because he had seen them and eaten them in England many a time. I was two days late, or I should have got some specimens.

2476. Have you had any experience in deep-sea fishing? No more than schnapper fishing with the line.

2477. Do you know whether sand-banks exist off this coast? I cannot say.

2478. Have you had any experience of well-boat fishing? No; I saw a small well-boat in Lake Macquarie some time ago.

2479. Were the fish in it alive? Yes; I ate a schnapper that came out of that well after it had been there three days.

2480. Was that schnapper caught in Lake Macquarie? Outside, off Catherine Hill Bay; I saw the well-boat come in over the bar.

2481. Do you think the well-boat could be brought into more general use with a little more enterprise on the part of the fishermen? Yes, I do; if I were a fisherman to-morrow the first thing I would go in for would be a well-boat of some description.

2482. Do you think it would be much better for the development of the industry if that kind of fishing were adopted? Yes.

2483.

- Mr. F. Aldrich.
16 Mar., 1895.
2483. Do you think fish would realise a better price alive than dead? Certainly; there would be a bigger demand for fish, too.
2484. Do you know anything of the way in which the business is conducted at the Woolloomooloo Market; have you ever heard the fishermen complain of the manner in which business is carried on there? Yes; they are always complaining of losing their fish, and not getting sufficient money for them.
2485. Do you think any improvement could be effected in the method of displaying the fish in that market? If they were placed on stands or raised tables it would be much better than putting them on the floor.
2486. Do you think the Woolloomooloo Market is the most centrally situated market? If it were in direct communication with the railway it would be far better as the greater proportion of the fish is sent to market by rail.
2487. Would that prevent much of the handling which now takes place? Yes; unnecessary handling and carting.
2488. In regard to the number of fishermen on Lake Macquarie, do you think, for general application, it would be a good idea to limit the number of fishermen on any fishing grounds? Yes; I think it would be a very good idea.
2489. You think it would be better to allow 75 or 80 fishermen to have a fair means of earning a livelihood at one place than to permit double that number to obtain only a partial livelihood? Yes, I do.
2490. Do you know of any crayfish fisheries near Lake Macquarie? Yes; crayfish are in about the month of September, just outside the lake.
2491. Are those fisheries worked at all? Very little.
2492. Have you noticed when the crayfish spawn? No, I have not.
2493. Have you seen full-roed crayfish sent to market? Not many of them.
2494. Do you know they are sent to market in full roe? I have heard so.
2495. Do you think it would be a good thing to prevent the capture and sale of female fish when in roe? Certainly it would.
2496. Have you ever seen whales off the coast? Yes.
2497. What species? Humpbacks principally, I have seen those in droves.
2498. Do you know anything of the oyster fisheries? Very little. When I was in George's River I used to know a little about them. At the time I left the disease was very destructive in that river, and they were all destroyed.
2499. You have a knowledge of the system by which areas are let out as oyster leases;—do you think that is a satisfactory system? I think it would be better if the rates charged were a little cheaper to allow smaller parties to have a say as well as other people with means.
2500. You have no oyster fisheries in Lake Macquarie? No.
2501. Would it be a good provision to allow of the leasing of an arm of a river for oyster culture? Yes.
2502. The lessee to be subject to certain conditions and proper supervision, and to pay according to results, instead of at per 100 yards? Yes. I think that would be far better than the present system.
2503. Have you ever heard of any pilfering of oysters taking place? Yes.
2504. Do you think it is caused by indiscriminately granting areas of 100 yards between larger leases? People take up those areas of 100 yards because they can work the adjoining areas as well as their own.
2505. Does it also give them the opportunity of stealing from Crown lands? Yes.
2506. Have you ever seen any evidence of deep-sea deposits of oysters in the lake? I have seen the shells, any amount of shells everywhere.
2507. Have you not some oyster deposits on the foreshores at the entrance to the lake? On the retaining wall.
2508. Where do you think the spat came from? I can hardly say.
2509. Have the Fisheries Commission on any occasion visited Lake Macquarie? Yes; the President has been down twice.
2510. What length of time elapsed between the two visits? About three weeks or a month.
2511. What was the object of his visit in the first instance? I cannot say; we were dredging in the middle of the lake, the President and myself.
2512. Who accompanied Dr. Cox on the first occasion? Mr. Hedley, from the Sydney Museum, and Mrs. Cox.
2513. Did he do anything else besides dredge the lake for shell fish? I rowed him down the channel as far as the bar; he looked at the beach and returned to Belmont.
2514. How long did he stay? Two days.
2515. Did he make any inquiries regarding the fisheries? He made a few inquiries concerning the fisheries of the lake.
2516. Had you any official intimation of his proposed visit? I was instructed to meet him on the arrival of the train at Toronto.
2517. What did he do on the second occasion he visited the lake? Trawling with the steamer on the lake, he and Mr. Waite and Mr. Thompson were down together.
2518. What did he trawl for? To see if fish could be caught in the lake with the trawl.
2519. Did he catch any? Yes, one flathead the first try; the last haul we got about a dozen flathead.
2520. What else did he do? I engaged some fishermen to haul a net in closed waters.
2521. Was that for the purpose of ascertaining whether the fish supply in closed waters was good or not? Yes; and also to show Mr. Waite the fish in the closed waters, and likewise other specimens.
2522. What did the experiment prove? Proved there was plenty of fish.
2523. How long did he remain on that occasion? About twenty-four hours altogether.
2524. Have any of the other Commissioners visited the lake to your knowledge? Not to my knowledge.
2525. Would it be a good idea, instead of issuing the fishermen's license on paper, to give them a medal, something that could be tacked on the boat? Yes; it would be always on hand when demanded by the inspector, and it would not be destroyed by water.
2526. Would it be better to allow the inspectors to issue licenses and collect fees? Yes, it would be far better for the fishermen and for the revenue. There are occasions when runaway sailors come to Lake Macquarie and obtain work; I go looking to see if they have licenses and find they have none. If I threaten a prosecution they will go away. On other occasions, if I was allowed to take fees, the fishermen employing these men would give me the money; I have had it offered to me on several occasions.

2527. *Mr. Thompson.*] Why cannot river garfish be caught the same as sea garfish? The sea garfish can be hauled in the flue of the net without attempting to escape; the river garfish will travel along the net and escape at the ends.
2528. Would you favour 500 fathoms of net rather than 300 fathoms as a maximum length? No, I would not; I think 300 are sufficient.
2529. Have you ever considered the question of leasing the lake in portions to the fishermen? No.
2530. On the face of it do you think it would be a good plan? It would require some study to give an answer.
2531. Would you license amateur fishermen? I would make them pay a small license.
2532. Would you refuse to license aliens until they become naturalised? Yes, I would; they are our whole trouble in the fishing.
2533. Would it be advantageous to establish a system of sending fish gutted to market? Yes, it would be advantageous if it could be adopted.
2534. What difficulty would there be in the adoption of such a plan? The fishermen would not do it unless they got an extra price commensurate with their labour.
2535. Do you think the public would be willing to pay the extra price for the convenience offered them? Yes; I think so.
2536. Do you think the fishermen would gladly adopt the plan of gutting their fish if an inducement were offered in the shape of reduced freight by rail? Yes.
2537. Which species of mullet is it that goes to the sea and returns as the sea mullet? The hard-gut; we call them "bullies."
2538. Have you found any difference in the condition of mullet when captured in the daytime and when captured at night? I have never noticed any difference.
2539. Have you heard that mullet captured in the daytime are full of mud, and that when taken at night their stomachs are perfectly clean? I have not. It might be so if the fish were captured after feeding.
2540. Do you favour the opinion expressed by some persons that the smaller the mesh used the less the destruction of small fish? The smaller the mesh, the lesser destruction to the compressed fish.
2541. Do you favour the seizure of a fisherman's nets, his tools of trade, for breaches of the law? No; I would fine him or imprison him.
2542. You think that would meet the case? Yes.
2543. You have heard a great deal about fish being pilfered in transit;—would you think it a good plan, in substitution for the baskets, to employ locked boxes of galvanised wire netting stretched on iron frames? That would be far better than the present system of carrying fish in baskets, and if locked it would prevent pilfering.

Mr.
F. Aldrich.
16 Mar., 1895.

THE HAWKESBURY RIVER FISHERIES.

MONDAY, 18 MARCH, 1895.

[*The Commission met at the "Brooklyn Hotel," Brooklyn, Hawkesbury River, at 10.45 a.m.*]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Joseph Izzard, fisherman, Brooklyn, Hawkesbury River, sworn and examined:—

2544. *President.*] Your name is Joseph Izzard, and you reside at Brooklyn, on the Hawkesbury River? *Mr. J. Izzard.*
Yes.
2545. What are you by occupation? A fisherman; I also own a number of boats. *18 Mar., 1895.*
2546. How long have you been engaged in fishing? Nearly twenty-eight years; fishing has been my chief occupation during that time.
2547. Where have you fished—on the Hawkesbury River? Yes; with the exception of a few months, when I was fishing at Cape Hawke.
2548. Do you consider you have a good practical knowledge of the fisheries of the Hawkesbury River? Yes, I do; I have a good knowledge of the fisheries here.
2549. How many fishermen are there on the river? About forty licensed fishermen.
2550. And the evidence you are about to give before this Commission, can that be accepted as evidence which would be given by the fishermen if all of them were examined before us? As far as I know it can be; they look upon me as their leading man, and I am to give evidence in their behalf.
2551. Have you a Fishermen's Association on the Hawkesbury? Yes; we had a meeting a short time ago, at which matters affecting the fishermen were discussed. I can show you the result of one of our last meetings in this petition, which I beg to hand in to the Royal Commission:—

Petition to the Royal Commission on Fisheries.

Hawkesbury River, 16 March 1895.

We, the undersigned fishermen and others, resident on the Hawkesbury River, do hereby humbly request you to use your best influence to have the waters declared closed between the north and south heads of Broken Bay as far up as Croppy Point against sea mullet fishing, for a period of two months from date, so as to enable the mullet to spawn, and thereby greatly increase their number in these waters in the near future.

Four other men wished to have their names added to the petition, but they are away.

2552.

- Mr. J. Izzard. 2552. Did you belong to any Fishermen's Association in Sydney? I did, but of late the Fishermen's Association has been broken up. We were 500 strong, or about that on one occasion.
- 18 Mar., 1895. 2553. Did that Association do any good to the fishermen? I do not know that it did, through the fault of the fishermen themselves.
2554. In what way? Some wanted too many concessions; others wanted nets out of reason altogether; others wanted unreasonable weights. They could not agree among themselves.
2555. Do you think that want of unanimity was due to the diversity of interests connected with the different fishing grounds? I think it had something to do with it.
2556. What was the name of the Association you belonged to in Sydney? The New South Wales Fishermen's Association.
2557. Was it the only one in existence? Yes; so far as I know. I am told they have formed one since in Woolloomooloo, but it is a sort of benefit society, I think.
2558. Have you ever attended any representative meetings or conferences of fishermen held to take into consideration the question of our fisheries? I attended one conference at the Town Hall, in Sydney, a few months back.
2559. Did any good result from that conference? I think not. The only good I know of was the railway authorities made a little concession in regard to the carriage of fish.
2560. Of late you have been engaged in fishing and boat-letting;—was it necessary for you to combine boat-letting with fishing in order to earn your livelihood? I found we had such a small extent of water to work in, and there are so many boats that we scarcely had a haul, so I went in for boat-letting.
2561. Have you anyone associated with you in your fishing operations? Two sons and two men. My two sons are licensed fishermen. One man is licensed also; the other attends to the boatshed.
2562. What is your average catch per week? About fourteen baskets.
2563. Where do you consign your fish? To the Redfern Market; sometimes to Woolloomooloo, but seldom there.
2564. Do you send your fish by rail? Yes.
2565. What classes of fish are they? Mullet, bream, whiting, flathead, jewfish, blackfish—occasionally a few soles and flounders.
2566. You have had business with the Woolloomooloo Market;—did you consign to an agent there? Yes.
2567. Were you always satisfied with your returns? No; I was very often in debt.
2568. Have you ever had to complain of the loss of fish in transit between the Hawkesbury and the market? Yes; not by rail; by the carters only.
2569. You think the pilfering takes place between the railway station and the market? Yes.
2570. What would be the average weight of your baskets of fish? Three-quarters of a hundredweight.
2571. You are not satisfied with the prices realised by the agents;—would it be better to adopt a system by means of which the fishermen could be brought into closer communication with the consumer? Yes; that would be a very great advantage to us.
2572. Would the fishermen generally be satisfied if they received (say) half of the amount paid by the public for fish? Yes; it would be nearly a quarter more than they get now. Last year I sent one basket of whiting from Cape Hawke; the basket brought 8d., and I saw a hawker retail one of the fish from that basket and obtain a shilling for it in Sydney.
2573. How many fish would that basket contain? About 5 dozen whiting.
2574. So that if you had realised half of what was obtained by the hawker for that basket of fish, taking it for granted that all the fish were sold at the price stated, you would have received about 30s. for your basket instead of 8d.? Yes. On another occasion I sent ninety-three baskets of bream and whiting from Cape Hawke to Sydney, and I only received £3 for the lot.
2575. Are you familiar with the manner in which they conduct business at the Woolloomooloo Market? Yes.
2576. Do you think there is any room for improvement in the way of displaying the fish? Yes; a great deal.
2577. Do you object to the fish being thrown on the floor in heaps? Very strongly.
2578. Do you think that system creates a prejudice in the public mind against the use of fish, in consequence of the fish being trodden upon and spat upon? Yes; it only requires one visit to that market to prove that. I have seen men come in out of the streets and scrape the fish together with their dirty boots in heaps on the floor, and I have seen them tread upon and spit upon the fish. It is disgusting.
2579. Do you think it would be an advantage to display the fish upon raised tables? That would be a great improvement.
2580. In disposing of your fish do you arrange to catch the only sale at the market? We try to; if we miss that early sale we have to pay for storage in the cold chamber, 9d. per basket.
2581. Would it be an advantage to have the market open all day for the sale of fish, or to have sales two or three times a day? I think two sales would be sufficient, say one in the early morning and the other at 10:30 a.m.; it would allow of men who had been fishing all night to send their catch to market in time for the second sale.
2582. Is the market at Woolloomooloo centrally situated? It is not.
2583. Would you recommend that a more central site be selected for a fish market? I would recommend a site somewhere near the Haymarket; a site contiguous to the railway station would give satisfaction, and it would stop a lot of pilfering.
2584. Would a site where fish could be taken from the railway trucks, and put right into the market, thereby saving extra handling, be more satisfactory to you? Yes; that would be a great boon to the fishermen, and it would save cartage.
2585. Supposing it was arranged that fishermen could sell their own fish in the market, would that be agreeable to the men? I hardly think that would suit, for the simple reason that they would be hanging out for a price until too late in the day.
2586. Do you think there is any possibility in existing circumstances of the agents working in with the hawkers to their own advantage? I feel sure they do. I am sorry to say auctioneers do so too, occasionally.
2587. You have sent some of your fish to Redfern, is that to Mr. Hudson's market? Yes.
2588. Have your dealings with that market been more satisfactory than with the Woolloomooloo Market? Yes; a great saving to me; there is no chance of stealing, and no cartage. 2589.

2589. Do you think you would realise better prices for your fish if you could send them gutted and cleaned to market? It could not be done on the far-away stations. Mr. J. Izzard.
2590. But supposing the prices realised for the gutted fish were sufficient to recoup the fishermen for engaging extra labour for the work, is there any reason why it should not be done? I think it could be done then; it simply depends upon the prices received. 18 Mar., 1895.
2591. Have you sent fish to the interior? Yes.
2592. Did you send them in the ordinary way, or packed in ice? In the ordinary way; that was in the winter time. I never attempted it in the summer time.
2593. If the Railway Commissioners were disposed to institute a better means for the carriage of fish by placing a refrigerating car on the line for the use of the fishermen, would it be availed of? I think it would be very beneficial to the fishermen in distant places. I do not know that it would be a great benefit to the men here.
2594. Do you think if such a means were adopted, it would be possible to send fish to the towns in the interior? Oh, yes; it would.
2595. Looking at the population of New South Wales, do you think the quantity of fish is consumed that might be consumed? No; for the simple reason that the hawkers charge too high for the fish, and there is no proper means of sending fish in good condition to the inland towns.
2596. Have you had to complain of the loss of returned empties? Oh, yes; any amount.
2597. You think, then, that not sufficient care is taken to insure the safe delivery of returned empties? No; on several occasions my baskets have been carried on to Dora Creek, and sent back to the Hawkesbury in a week's time, but that is generally the fault of the agent.
2598. Does the agent make out a consignment note for returned empties? He generally puts a ticket on them.
2599. Does he send you a receipt for them? No; the guard has a paper, a manifest.
2600. Have you sent any fish in boxes? I generally send in boxes now. I prefer boxes when sending by rail. I use the baskets when sending by steamer.
2601. Why? The weight; when the baskets are packed four or five deep, those underneath suffer great injury, owing to the weight resting upon them; the boxes resist the weight better.
2602. In regard to the classes of fish you send to market, are those fish you have mentioned sent all the year round from the Hawkesbury? Yes.
2603. When are the black bream in greatest numbers? Generally when there are freshes on.
2604. Are they the school black bream? Yes; it is the only time we get many black bream when there are freshes in the river.
2605. Is the Hawkesbury a spawning-ground for black bream? Yes, parts of the river.
2606. What is the largest black bream you have caught here? $5\frac{1}{2}$ lb. I saw one caught by the line; it weighed 6 lb. and some ounces.
2607. Speaking generally, do you think the Hawkesbury fisheries contain breeding-grounds? Yes.
2608. As to the mullet, when do they seem most prolific in the Hawkesbury? In February they are generally thickest. They generally begin to travel about the latter end of March.
2609. Do you think the sea mullet spawn in the Hawkesbury? I do. I think they come into the mouths of all the rivers for that purpose.
2610. Do you think they spawn at sea? No, I do not. I think they come into the smoother water for protection during the spawning season.
2611. What is the largest blackfish you have caught? I have caught some very large ones at Cape Hawke.
2612. But here on the Hawkesbury? Not more than 7 lb.
2613. Have you fished for garfish? Yes; a little.
2614. When are they to be found in greatest numbers in the river? So far as the river is concerned we only get a few that we call river garfish, but they are very scarce.
2615. Do you catch jewfish in the net? Yes; in great quantities.
2616. At what time of the year do they make their appearance in great quantities? January, February, and March; they are very thick at the present time.
2617. Have you ever caught any schnapper in your net? Yes.
2618. Do you think they enter the Hawkesbury to spawn? It is possible they do; we get so many small ones here.
2619. What nets do you use? A mullet net, 150 fathoms long, $2\frac{2}{3}$ -inch bunt, and 3 inches in the wings, a prawn net, also, and a meshing net, having a 4 inch mesh.
2620. In respect to the hauling net, is the length allowed you by law sufficient for you to carry on your work in the Hawkesbury? Quite sufficient in the Hawkesbury River.
2621. Are you satisfied with the meshes of that net? Yes.
2622. Do you haul your net on to the shore? Yes; the mullet net or hauling net.
2623. Do you empty your fish from the net on the shore or into the boat? Into baskets, and carry them to the boat; all the small fish we throw back into the water.
2624. In hauling do you allow the lead-line to be brought on to the shore and the top-line also, and permit the flue of the net to remain in any depth of water? Yes; that is what we call hauling to shore, as long as we have the lines on shore.
2625. Do you think it is a protection to the young fish you may have caught with the others? Yes; it allows them to escape.
2626. Would it be considered a hardship if it were made compulsory for the fishermen to empty their nets in at least a foot of water? It could not possibly be done in all cases in this river; some of the places where we haul are pretty steep.
2627. Have you seen many young fish killed by the use of the hauling net? Yes; I have seen a quantity of young fish killed by the hauling net when the blubber is bad.
2628. Do you often find young fish getting meshed in the bunt? A few; not many, as a rule.
2629. From what you have said, I take it you do not require the provision of the Amending Act giving you a further length of net to be extended to this place? Not on the Hawkesbury River.
2630. If you were allowed to use a net of smaller dimensions as to mesh than you now use, would there not be less likelihood of small fish getting killed by being meshed? There is no doubt about it; the $2\frac{1}{4}$ -inch mesh now allowed kills a lot of small fish which are not of a marketable size.

- Mr. J. Izzard. 2631. Supposing you were allowed to use a net of any dimensions you liked, and were compelled to land your fish in a certain depth of water, and that there was a stringent provision to punish fishermen for catching or sending undersized fish to market, would that be more satisfactory to you? Yes, I think it would.
- 18 Mar., 1895. 2632. Have you ever had any nets seized? No.
2633. Have you heard of fishermen who have had nets seized? Yes.
2634. Was it for having nets of illegal size as to mesh? Yes, on some occasions, and for fishing in closed waters.
2635. Do you know whether the nets so seized were of a legal mesh in the first instance? There have been nets seized in closed waters which were of a legal mesh, and the nets seized in open waters were of a legal mesh in the first instance.
2636. How do you account for them becoming of an illegal mesh? In consequence of the tanning and constant use of the nets.
2637. Were those nets returned to the fishermen? I never knew of a case on the Hawkesbury yet where the nets were returned, with the exception of one prawn net to Mr. Gardiner.
2638. Do the fishermen when purchasing a net allow for shrinkage? Yes; they generally allow half an inch in the bunt and a quarter of an inch in the wings.
2639. What is your idea in respect to seizures;—do you think nets should be confiscated for the first offence? No; I consider a man's tools of trade should not be taken from him. The fine should be made heavier.
2640. You would not object to a provision being incorporated in an Act making an offence punishable by fine or imprisonment for a term not exceeding seven days;—would you prefer that rather than see a man's tools of trade taken away from him altogether? Yes, I would; it is a very serious matter taking away a man's tools of trade, especially in the case of a fisherman; why, his wife and family may be left starving.
2641. What would you consider to be the value of those nets? From £18 to £25.
2642. Are you of opinion that more expedition ought to be shown in dealing with offences under the Fisheries Act? Yes; great delays have taken place in respect to prosecutions, and men have been debarred from using their nets for a considerable period while they have had to wait for the decision of the Court.
2643. Do you think cases should be dealt with within a period of (say) seven days from the time of instituting proceedings? Yes.
2644. You have used a prawn net;—was that used for the purpose of catching prawns for market? Yes.
2645. What quantity do you generally send to market? About a basket a night on an average.
2646. Is this a prawn breeding-ground? I have seen a lot of small prawns here, but I do not know much about them.
2647. Is there much prawning done in the Hawkesbury River? No; very little.
2648. You use a meshing net of 4 inches;—do you think that mesh might be reduced with advantage? I think the meshing net ought to be reduced to 3½ inches and another 60 fathoms added to it. No man can make a living with 60 fathoms of net.
2649. I suppose it is possible that, by the use of the present mesh, good marketable fish make their escape? Yes, it is; fish weighing 1 lb. can go through a 4-inch mesh.
2650. What fish do you generally catch in the meshing net? Mullet, bream, jewfish, flathead, and blackfish.
2651. What is the largest mullet you have caught in the meshing net? Six pounds.
2652. Have you caught any larger ones in the hauling net? Yes—6½ lb.
2653. In respect to closed waters, are you as anxious as the Government to protect the breeding-grounds? Yes.
2654. Have any unjustifiable closures taken place on the Hawkesbury River? Yes, in 1881, about 100 miles of the waters of the river were closed against net fishing.
2655. Were those waters in the main river? In the main river and its tributaries.
2656. Supposing only the tributaries had been closed, would you consider that a hardship? Yes.
2657. Why? In winter-time the fish always make up the tributaries in deep water, and there they continue for warmth. You would not catch twenty baskets in the main river.
2658. Are there many people living on the upper reaches of the Hawkesbury who obtain their food supplies by catching fish? Yes.
2659. And these closures have to an extent deprived them of the means of subsistence? Yes.
2660. Have any closures been made lately that have acted prejudicially to the interests of the fishermen? Yes; Mooney Creek and Mullet Creek are both closed.
2661. Who recommended those closures? Mr. Smith recommended portions of those creeks to be closed, and the Fisheries Commission closed the whole of Mullet Creek and the greater portion of Mooney Creek. Other creeks that were already closed were necessary closures.
2662. Would harm result if the fishermen were allowed to use meshing or drift nets in closed waters? If they were confined to that size of mesh alone they could do no harm.
2663. They could then get marketable fish in closed waters and not disturb the feeding or breeding grounds? That is so; the meshing net will never disturb breeding or feeding grounds.
2664. And consequently the young fry would be protected? Yes.
2665. Do you believe in that provision of the Act which allows a moiety of the fine to go to the informer? No; I do not approve of it.
2666. Do you think that acts as an inducement to inspectors and others to be harsher to the fishermen than they ought to be? Yes; that should be done away with altogether. I can prove it. The inspectors have recommended larger closures than were necessary in order to give them a greater field for catching fishermen using nets in closed waters, and thus make them liable to be fined or have their nets confiscated.
2667. Do you complain of any other provision of the Act operating harshly upon the fishermen? I think the inspector should be allowed to issue licenses to the men to save them expense.
2668. Have you any objection to the amount charged for the license? It is hardly heavy enough.
2669. Are you not supposed to have your license in your boat? Yes; according to the Act.
2670. Is the paper on which the license is issued durable? No; it is not sufficiently durable to be always carried in the boat.
2671. Would it be an advantage to have it printed on parchment? It would be an advantage.

2672. I suppose you are of opinion that if the licenses were issued by the inspector, fishermen would not be harrassed so much by being requested to produce their licenses so often? That is so. The inspector would know everyone on the river, and it would save him a lot of trouble. Mr. J. Izzard.
18 Mar., 1895.
2673. Would you favour a provision limiting the number of men to the respective fishing-grounds? No; I am not in favour of that.
2674. So that if a fishing-ground was only capable of giving employment to forty fishermen, you would have no objection to double that number fishing in the waters? No.
2675. I suppose your objection is prompted by unselfishness? Yes; that is so.
2676. Do you know of any occasions when any or all of the Fisheries Commissioners have visited the Hawkesbury River? No.
2677. Do you think if any one or all of them had visited these fisheries you would have heard of it? It would seem very funny if the Fisheries Commission came and we did not hear of it.
2678. Have you ever approached the Commissioners as a body asking for relief or redress of your grievances? Not the Commission.
2679. Have you ever approached the Colonial Secretary and made representations which have afterwards been sent on to the Commissioners? Yes, six or seven times.
2680. Did your deputations to the Colonial Secretary result favourably? We got very good promises, but that is all; we got no actual redress from the Fisheries Commission as the result of our deputation.
2681. Did you as a member of the Fishermen's Association ever approach the Colonial Secretary and ask for certain reforms? Yes, on three different occasions.
2682. Did you get any satisfactory result? No, I never heard any more about the matter.
2683. Can you give the Commission the names of the Colonial Secretaries you have waited upon? Yes; Sir Henry Parkes, on four or five occasions; Mr. Barton, on behalf of Sir George Dibbs, on another occasion; and Mr. Brunner on one or two occasions.
2684. Did they express sympathy with you on those occasions? Yes; particularly Sir Henry Parkes. He promised faithfully he would see that something was done. On the last occasion he told us he was powerless to do anything. He said the Commission was appointed by Act of Parliament, and it would take an Act of Parliament to remove that body.
2685. Do you know whether the Commission have visited any of the other fishing grounds? No, not that I have heard of.
2686. Do you think that the Fisheries Commission, as a body, have carried out their duties satisfactorily to the fishermen and to the public? No, I do not.
2687. Would you deem it advisable to continue the present authority, or would you suggest or recommend the creation of another administrative authority? I would suggest that the present Commission be abolished, and that there should be appointed in their place one man as Chief Commissioner, and one head inspector who should be a travelling inspector; in addition to this we should have local boards to advise, on which fishermen representing the different fishing centres should have seats. The travelling inspector should be a thoroughly practical man. The Chief Commissioner should be a gentleman having a thorough knowledge of our fisheries and the working of the Act, so as to give satisfaction to all parties.
2688. Then you think it desirable to create an authority that will take more interest in the development of our fisheries,—you would like to see a man appointed who would pay periodical visits to the different fishing grounds? Yes; I think that would be a good thing.
2689. You do not think it possible for the present Fisheries Commission to have a knowledge of the local circumstances of the fishermen, and to be able to administer the Act fairly, they not having travelled about and acquired a knowledge of the local conditions of the respective fisheries? No, I do not.
2690. Have you had any experience in oyster culture? A good deal.
2691. Have you held any leases? No.
2692. Have you known those who have? Yes.
2693. Has the system of leasing been satisfactory? No; it has been a fraud upon the public.
2694. Do you know whether the oyster-beds in the Hawkesbury have been attacked by any disease? Yes, the worm has been troublesome here; I think the difficulty could have been coped with if the lessees had paid a little more attention to experiments.
2695. Did the worm attack the natural or the artificial beds, or both? The artificial beds first, and then worked itself into the natural beds.
2696. Have many oysters been obtained from the leases here? Not many of late years.
2697. Is that owing to the ravages of the worm? No; those 100 yards leases could not produce one-tenth of the oysters that it was said came off them.
2698. Was that because there were facilities for the men who held the 100 yards to steal oysters from the larger leases and from the Crown lands? Yes.
2699. Would you favour a provision which would prevent that state of things occurring, by leasing, say, an arm of a river to one man? Yes; I would favour leasing a creek or an arm or a side of a river to one man.
2700. Does the present system appear to you to be like indiscriminate free selection? Yes. There is on Berowra Creek a lease of 200 yards which brings into the State £2 per annum as revenue, and I am prepared to pay 100 sovereigns per year for the creek. The man who has the 200 yards simply has the whole of the creek to himself for £2, and I am prepared to give 100 sovereigns to the Commission for the lease of the whole creek any time they think fit.
2701. During the time the oyster-beds, natural and artificial, have been attacked by the worm disease, have the lessees paid rent to the Fisheries Commission? I think only one or two.
2702. Was it because they were unable to get any results from their beds that they were not able to pay their rent? They had no money, and you cannot get blood out of a stone.
2703. Would you be in favour of a provision by which lessees should pay so much per bag as royalty instead of charging an annual rental for their oyster leases, provided that due consideration were given to the proper working of the oyster-beds, so as to ensure the systematic working of the oyster fisheries? I am in favour of that; it would be a good thing.
2704. Do you know anything about the growth of oysters in the Hawkesbury River? Yes.
2705. How long does it take for an oyster to develop into a marketable oyster after the spat has been noticed? On some occasions they are large enough for market in seven months; on other occasions fourteen months.

- Mr. J. Izzard. 2706. How do you account for that? If the spat is in very strong water they do not grow so well as in quieter water. I can prove that by taking the spat from the one place and putting it in sweeter water than the other; the spat placed in the sweeter water will grow much quicker than spat placed in stronger water.
2707. Probably the growth of oysters in the upper portions of the river is owing to the fact of their obtaining their due proportion of fresh water? Yes, it is.
2708. Have you had any practical experience in deep-sea fishing? Only with the line.
2709. Where have you fished with the line? Off Sydney Heads, wide off Long Reef, Broken Bay, and other places.
2710. What description of fish did you catch? Schnapper, nannegai, morwong, flathead, sweep, and Sergeant Baker.
2711. In catching the Sergeant Baker have you ever noticed that its existence at a given place is evidence of schnapper frequenting that ground? Yes, I have found it to be so; the appearance of the morwong is a still better sign of the existence of schnapper.
2712. During your trips outside have you discovered any smooth bottoms that would be suitable for trawling over? Yes; in several places.
2713. Have you ever done any trawling? No.
2714. Have you had any experience in connection with the use of the drift net outside? No.
2715. Have you ever noticed any shoals of fish travelling from the south to the north? Yes; great schools of fish.
2716. What were they? Some call them herrings. I caught a few of them; but I do not think they are the same class of fish as the English or Scotch herring.
2717. Do you think the fish you caught could be made into a marketable commodity? Possibly so.
2718. Have you seen shoals of other kinds of fish travelling? Yes; large shoals of mullet, kingfish, tailer, and other fish I do not know the name of. They were like mackerel.
2719. How far off the coast would that be? Four and five miles off—between Broken Bay and Sydney.
2720. Have you ever done any well-boat fishing? I have seen well-boats.
2721. Do you think they could be used in connection with the fisheries of the Hawkesbury River, in order to carry fish alive to market? Yes, they could. If the fish could be kept alive they would sell well. There is no doubt about that.
2722. Have you done any fish-curing? Yes.
2723. By what means? I have tinned, salted, dried, and smoked them.
2724. Have you sent any to market? I have sent salted and smoked fish to the market, but no tinned fish. I have sent samples and could get orders for tinned whiting, bream, and garfish, and some mullet, but I could not get a sufficient quantity of bream and whiting to fill the orders. The first sample I sent in to Sydney I received an order for 1 ton of bream, a ton of whiting, and half a ton of mullet. I wanted them to reverse the order, but they would not do so. Had I known what I now know I could have filled the order by getting my supplies from the northern rivers.
2725. Do you think there is room for development in the fish-canning industry? Yes; I am sure there is a great industry to be created in that direction.
2726. You only want the fish and the enterprise? Yes.
2727. You speak from having had practical experience in fish-curing and canning? Yes, I do; I have a thorough knowledge of it. I gave samples of fish canned by myself to different people to taste, and they said they never eat anything to equal it.
2728. Have you seen any whales on the coast? Yes; I have seen as many as seven at one time while running from Sydney to Broken Bay.
2729. What species? The black whale, I think; they were very large.
2730. Mr. Thompson.] What temperature did you obtain when tinning fish? I will tell you the process. The first thing is to clean your fish and put them in salt and water for twenty-five minutes; then take them out and hang them up for eight hours in the smoke-house; then you cut up the fish and weigh it, put them in your tins, and solder them up. You then put them into a pot and boil for four hours; at the end of that time take them up and punch a hole in the top of the tin to let the steam escape; you leave them open for four minutes, then solder up again, and after that the tins should be put into very cold water for three hours. If either end of the tin becomes convex, that is an evidence that the fish will not retain its quality. The remedy for that is to boil a second time and punch a second time; but they are what we call do-overs.
2731. How long do you find these tins of fish to last? I have had them for two years, and the fish remained fresh and in good condition.
2732. Would it not minimise the shrinkage of nets if the twine of which they are made were tanned before being made up? Yes, it would. If the twine had two good tannings before being made up, I feel sure it would not shrink more than one-sixteenth of an inch.
2733. Have you ever considered the question of leasing out waters in portions to fishermen? Yes, it could be done; but it would not be profitable, because you would want a man to watch the water continually; it would be rather a monopoly, too.
2734. Would it be an improvement if your fish-boxes were made of wire netting instead of wood? It would be if it were not that the dust in process of carting through the streets would destroy the appearance of the fish.
2735. Have you any trouble at this railway station in loading your fish? We had some time ago, but since we have had good officers on the railway here the baskets of fish have been loaded with the greatest of care.
2736. Can you tell me when the black bream spawn? My experience of the black bream is that they do not spawn at the same time as the mullet. About a fortnight ago—that was in February—I caught a few and they were ready to drop their spawn, while in others I caught at the same time the spawn was scarcely formed.
2737. Is there any other time of the year in which you have found them in spawn? Yes; in May, just a little.
2738. Do you ever find them in spawn in September or October? Yes; in September.
2739. Where do the mullet spawn? It has been my experience that the mullet come down from the heads and work towards the sea. They spawn in the mouths of the river, on the sandy bottoms. 2740.

2740. You do not use the long line here—the set line? No; I do not approve of it. It is not used in the river, except by amateurs. Mr. J. Izzard.
2741. How would it do instead of having the fishermen's licenses made of parchment to construct them of metal, something like a railway ticket? I think that would be very good for the fishermen; they could nail them on to the side of their boat, and there they would be. I approve of that for both boat and fishing licenses. 18 Mar., 1895.
2742. Do you think amateur fishermen should be licensed? No.
2743. Would you refuse a license to aliens until they became naturalised? No.
2744. Are crayfish plentiful at the mouth of the Hawkesbury? They were very plentiful some years ago. I have known 24 dozen caught by one boat at the mouth of the Hawkesbury.
2745. *President.*] Do you think you have sufficient water opened to net fishing at the present time? No; we have waters closed now that would be a boon to the fishermen, and no harm to the industry to have worked; that is Mullet Creek and Mooney Creek. At night-time you can hardly hear one another speak the fish make so much noise. They are all big mullet, and fit for market; they will go away in a few weeks.
2746. Are there any other waters closed besides those you have mentioned? Yes; 6 or 7 miles of Berowra Creek and Marra Marra Creek, and several miles of Mangrove Creek, and the greater part of Cowan Creek.
2747. Do you think the best time for ascertaining the condition of the fisheries—that is, for ascertaining the supply of fish there may be in the fisheries—is the night time? Yes. You can go up any creek in the day time, and you will not see a mark on the water; if you go up at night you can hardly hear yourselves speak, owing to the noise made by the fish.
2748. Have you any knowledge of the fishing-grounds about Woy Woy;—are they adapted for breeding-grounds, and so forth? Yes; those grounds are well adapted for breeding-grounds; it would be better, instead of closing a portion here and there, that a big arm should be closed altogether. I consider those few acres closed here and there are nothing but traps for fishermen.
2749. Do you believe in preserving breeding-grounds by closures wherever justifiable? Yes. Also I advocate the use of garfish nets in proper places—not up the rivers; they are very destructive to young fish. The garfish net should not be used above Croppy Point.
2750. Would any harm result from amateur fishermen visiting Woy Woy and catching mature fish? I think harm will result if there is not a stringent provision to prevent them catching undersized fish.
2751. Do you wish to add anything to the petition you have presented to the Commission to-day? Yes. I would like to say that we wish the request for closing the heads to apply also to the tributaries below Croppy Point—that will include Cowan Creek and Pittwater.

Mr. James Ross, fisherman, Peat's Ferry, Hawkesbury River, sworn and examined:—

2752. *President.*] Your name is James Ross, and you reside at Peat's Ferry? Yes. Mr. J. Ross.
2753. How long have you held a license? Since 1881. 18 Mar., 1895.
2754. Are any other persons fishing with you? My son and another man at present.
2755. Have you confined your attention to the Hawkesbury River, or have you fished elsewhere? On the Hawkesbury. I have never been anywhere else.
2756. Do you notice any difference in the fish supply in the Hawkesbury at the present time, comparing it with the time when you commenced fishing? A little difference in some parts of the river.
2757. Are the choice varieties of fish as plentiful now as they were in 1881? Hardly so plentiful.
2758. Do you think over-fishing has anything to do with it? There are such a lot of boats where the choice fish are that it disturbs them and drives them away.
2759. What fish are you catching now? Mullet generally.
2760. Do you send your fish to market by rail? Yes.
2761. What is your average catch per week? About four or five baskets per week.
2762. Where do you send your fish? To the Redfern Market.
2763. Have you sent any fish to Woolloomooloo? Not for some years.
2764. Were you satisfied with your transactions with the Woolloomooloo Market when you were sending fish to that place? No; very dissatisfied.
2765. I suppose you disposed of your fish through an agent? Yes.
2766. Are you of opinion that you received fair prices for your fish compared with the prices the public had to pay? No.
2767. Do you think that if the fishermen generally received, say, half of the amount the public pay for fish, it would be a fair return for their labour? We would be well satisfied.
2768. Do you think it would be an advantage to the fishermen if they were brought into closer business relations with the general public? I am sure it would be. It is what we have been trying to do.
2769. Have you a knowledge of the system adopted in the Woolloomooloo Market;—have you seen the way the fish are displayed there? I have. I have seen fish thrown upon the ground and walked over, and spat upon.
2770. Do you think the perpetuation of such a system as that tends to increase the consumption of fish? No; it does not.
2771. Would you favour the method of displaying fish on raised tables, instead of throwing them on the ground? Yes; it would be much better.
2772. Have they raised tables at Redfern? I believe they have.
2773. Do you find fault with the charges made by the Railway Commissioners for the carriage of fish? No.
2774. Do the officials on the railway handle your fish in a proper manner? Yes; I think so, as far I have seen.
2775. Have you ever lost any fish between the place of consignment and their destination? On one occasion.
2776. Have you any idea where they were lost? No.
2777. Do you think they were stolen? I cannot say. The agent wrote to me stating that he had not received the fish, and asked me to inquire into the matter, but I let it drop.
2778. Have you ever lost any returned empties? Yes; many a time.

2779.

- Mr. J. Ross. 2779. Do you think more care should be exercised in this matter? Yes; more care should be shown.
- 18 Mar., 1895. 2780. Do you think the market at Woolloomooloo is in a proper position, or would it be better to have a more central site for a fish market? Yes, it would; the Woolloomooloo Market is not central enough.
2781. If we had a central market, say at the Redfern Railway Station, would it not save the present unnecessary handling of the fish? Yes; it would.
2782. Have you sent fish to market in boxes? Yes; mostly in boxes.
2783. Which do you find the best—boxes or baskets? Boxes.
2784. You send your fish so as to catch the early morning sale, the only sale at the market in Sydney? Yes.
2785. Would it assist the fishermen in the disposal of their catches if two or more sales were held per day at the market? I am sure it would be a very great advantage if there was an extra sale at the market, say about 10.30 a.m.
2786. Why? Because we could remain at home all day and we could catch our fish at night, and they would be in first-class order to send to market for that sale. A mullet caught during the day is as full of mud as he can hold, but the same mullet caught after 9 o'clock at night would be free from mud; his entrails would be red and clean.
2787. What nets do you use? The hauling net and the garfish net. I use a meshing net occasionally.
2788. Would you like any alteration made so as to allow of a greater length of the hauling net in the Hawkesbury River? No; I am satisfied with the length.
2789. Are you satisfied with the mesh? No; for good reasons.
2790. What are they? I would like to see no closed waters, only at certain times.
2791. So that you think that by prescribing nets of certain dimensions such as will protect the young fish that is all that is necessary, and no closures need be made? Yes; that is all I think should be done.
2792. Do you haul your net on to the shore so that the fish get stranded? Well, in certain places you cannot do anything else.
2793. In what depth of water do you take your fish out of the net when you do not haul right on to the shore? In some places it would not be deeper than 6 inches.
2794. I suppose you haul your lines on to the beach clear of the water, allowing the flue of the net to remain in 6 or 12 inches of water? Well, barely that much at times.
2795. Have you found undersized fish get meshed in the bunt? Plenty of times. I have taken them out until I have been sick and tired of it.
2796. Would you suggest, in order to obviate that, that the bunt should be made smaller? No.
2797. What would you suggest? I would suggest nothing less than a 2½-inch bunt, and that the river be thrown open.
2798. You think the undersized fish could escape through the 2½-inch mesh? Yes.
2799. Would it not be possible to prevent the smaller fish being meshed by using the smaller mesh? I cannot see it.
2800. Are you satisfied with the mesh of the wings? That is correct.
2801. Have you ever had your nets seized? Never.
2802. Have you known those who have had nets seized? Yes.
2803. For fishing in closed waters? I believe so.
2804. And for fishing with an illegal mesh? Yes; on some occasions.
2805. Do you know whether the nets when first used were of a legal mesh? Yes; I remember one net. The mesh of that was legal.
2806. Was that net confiscated? Yes; it was.
2807. Do you believe a fisherman should lose his net for committing an offence against the Act? No.
2808. Would a fine or term of imprisonment—say, not exceeding seven days—be better than confiscating a man's net, and leaving him without his tools of trade? Yes; it would.
2809. How do you account for the net becoming illegal after it has been once passed as legal? Owing to the shrinkage of the net through the constant tanning.
2810. Do not the fishermen allow a certain amount for shrinkage when buying their nets? Some of them do—not all.
2811. You use a garfish net;—are you satisfied with the dimensions of that net? Yes; I am satisfied with the garfish net the way it is at present; but I am against garfish nets, although I use one.
2812. Why? Because they seem to me to be too destructive to the small fish.
2813. Do you catch many garfish in the Hawkesbury? Not at present.
2814. Do you believe in the provision which allows an inspector, or an assistant inspector, half the fine in connection with the prosecutions of fishermen? No, I do not; I am against that altogether. The inspector ought to be satisfied with his salary. I do not think it is right that he should have half the fine.
2815. In regard to the meshing net; do you use that frequently? That is a net I would like used more than any other.
2816. Would you like that to be of longer length? Yes; I do not see why we should not have the same length of meshing net as of hauling net—150 fathoms.
2817. You would have no alteration in the mesh of that net? Yes; we should have from 3 inches upwards, instead of 4 inches.
2818. Are you of opinion that a lot of marketable fish escape through the 4-inch mesh? Yes; certainly.
2819. Would you favour a proposal permitting the use of nets up to a maximum length, say 150 fathoms, the fishermen being allowed to use whatever mesh they liked, provided they were compelled to empty their nets in not less than 6 inches of water, and that there was a stringent provision to prevent the possibility of undersized fish being sent to market;—would that be better than having these complications in respect to the length and mesh of nets such as we now have? Yes; it would be better. It would take all the trouble away from the fishermen.
2820. Do you think all the closures that have been made have been justifiable ones? No.
2821. Have any of those closures operated harshly against the fishermen? Yes; they have.
2822. Have any waters been closed on the score that they were being depleted, when such was not the case? Yes; on one occasion.
2823. When was that? In 1891, I believe. The closure was on the river, from Bar Island upward.
2824. Is the Hawkesbury River a breeding-ground? It is to a certain extent.
2825. Would you favour closures to allow the fish to breed if such closures were justifiable? Yes.

Mr. J. Ross.
18 Mar., 1895.

2826. In order to obtain a good supply of fish for the Sydney market, would you favour a proposal to allow a meshing net, or any other kind of drift net, to be used in closed waters so as to catch the marketable fish? I would favour that, providing closures are made at the heads of waters, and not at the mouths.
2827. In regard to the administration and control of the fisheries, you are doubtless aware that a Board of Commissioners was appointed under the Act of 1881 to administer that Act? Yes.
2828. Has it come to your knowledge that any one or all of the members of that Board have visited the Hawkesbury River fisheries? Not to my knowledge; they could not have come without my knowing of it.
2829. Have you and others approached the Colonial Secretary at different times with a view of obtaining redress for your grievances? Yes.
2830. Has any good resulted from your labours in that direction? No.
2831. Are you satisfied with the Fisheries Commission as at present constituted? No, I am not; I am very dissatisfied with it.
2832. Do you think anything should be done to try and bring about a reform in the administrative authority? I think one practical fisherman should be appointed at the head of affairs, a person who would take a little more interest in the fishermen and their grievances than the present Commission does.
2833. Do you think it absolutely necessary that the person charged with the control of the Fisheries Department should have a personal knowledge of the circumstances connected with the several fishing-grounds? Yes, I do.
2834. Have you done any well-boat fishing? None.
2835. Any trawling? None.
2836. Have you done any deep-sea fishing? None.
2837. Have you had any experience of oyster culture on the Hawkesbury River? A little.
2838. Have you held a lease? I held somewhere about 2,000 yards.
2839. Where? Mooney Creek and Porto Bay.
2840. Did you get profitable returns from the beds? Yes, I could make it do.
2841. Were they natural or artificial beds? Natural.
2842. Why did you give up your leases? There was so much pilfering and thieving, I was obliged to get rid of them.
2843. Are you a believer in the system of allowing a man to take up a lease of 100 yards between larger leases? No.
2844. Has not that system been the means of encouraging stealing from the beds contiguous to that 100 yards? Most undoubtedly it has, I have proved that myself.
2845. During the time you held those leases were your beds visited with any disease? Yes, very badly.
2846. Did you do anything to try and check it? No.
2847. Do you know of anyone who tried an experiment to check the spread of the disease? No.
2848. What was the nature of the disease? I think it was a small worm which attacked the oyster and centred itself in the shell.
2849. Did your oysters develop quickly from the spat stage? It was just according to what water they were in.
2850. What water is best adapted to the rapid growth of the oyster? Mooney Creek is the best, I think, because it is very shoally.
2851. Do you think that a better system of leasing would be to lease a portion of the river or the tributaries? I think so.
2852. Would you favour the leasing of large areas for oyster culture, providing there were stringent conditions for working the leases in a systematic and proper manner, the lessee to pay a royalty on every bag, and not so much per 100 yards, as at present? That would be a very good idea, I would favour that.
2853. What do you think would be a fair price to charge as a royalty on each bag of oysters? About 2s. 6d. per bag.
2854. You think that would be the amount you, as a lessee, would be able to pay, and you also think it would give a fair return to the Government? Yes, I think so.
2855. Have you done any fish-curing? No smoking; salting and drying. I used to make my living out of it, that was when there was no limit to the meshing net, but since it has been cut down to 60 fathoms, I find it insufficient to allow of my catching enough to salt and cure.
2856. Was it because you could not get the proper kind of wood to burn that you did not go in for smoking? No; I never touched it; there was very little of it done at the time I speak of.
2857. In regard to the fishermen's license, do you advocate any reduction? No; the fee is right enough, but I think our local inspector should issue the license to us.
2858. So that instead of your being compelled to apply to the nearest clerk of Petty Sessions, who might be miles away from you, you think the local inspector should be authorised to issue the licenses? Yes; he is the fit and proper person.
2859. Would that be the means of assisting the inspector in identifying the fishermen more readily afterwards? Yes; it would.
2860. *Mr. Thompson.*] You mentioned something about garfish nets a little while ago, what do you suggest as to their use? I suggest they should not be used above Croppy Point.
2861. As to the petition for closing the mouth of the Hawkesbury, and thereby facilitating the breeding of the mullet, how do you know the mullet breeds there? I have seen the mullet come in in schools into Patonga Creek, and about the sand beaches.
2862. Have you seen them spawning there? I cannot say I have.
2863. Have you seen mullet spawning anywhere? I cannot say I have.
2864. Then if the Government acceded to the prayer of your petition presented to the Commission to-day you really do not know that the end desired would be gained? I have seen big mullet knocking about there for nearly a fortnight, when they were not disturbed so much as they are now.
2865. How high up the river have you seen the sea mullet go? Not further than Mullet Island Beach.
2866. You propose to close this water from Croppy Point downwards? Yes.
2867. Then if the fish pass that limit they could be captured? Yes; but it is very rarely they do.
2868. Do you want the prayer of your petition considered at once and a recommendation made upon it, or would you like the Royal Commission to make a recommendation to have the closure a permanent one, during the months of March and April in each year? That was the object: to have the closure every year in those months.

- Mr. J. Ross. 2869. Do you think it would lessen the liability of nets to shrink in tanning if the twine were twice tanned before being made up? Certainly it would.
- 18 Mar., 1895. 2870. Would it be an advantage to the fishermen if netting could be imported so prepared? Yes, it would be.
2871. Did you ever consider the question of dividing the waters into portions and leasing them for fishing? No; I think it would be too much of a monopoly.
2872. Would you limit the number of fishermen to each fishery? No, I would not; let as many come as they like.
2873. Would you refuse a fisherman's license to aliens, Greeks, Italians, and others, until they become naturalised? I have not given that matter much attention.
2874. Would you license amateur fishermen? Yes, something should be done in the matter.
2875. Do you think they destroy many undersized fish? Certainly; I have seen them do so on several occasions, especially small bream.
2876. Would it not be better to issue the fisherman's license in the shape of a small metal token, or something that would be more durable than the present license? I think it would be a very good thing.
2877. Would you advocate the selling of cleaned fish in the market? Yes, I strongly advocate that.
2878. What do you think of boxes made of galvanised wire-netting supported on a strong iron frame; would the ventilation be more complete than in baskets or wooden boxes? The ventilation would be good, but the fish would be liable to catch the dust.
2879. Do you know where the oyster spat comes from;—does it come from the sea? I do not know.
2880. How do you account for the existence of natural oyster-beds, for instance, those natural oyster-beds in Berowra Creek? I cannot account for them.
2881. You know there are such things as natural oyster-beds? Yes.
2882. Well, can you account for the existence of natural oyster-beds in certain places in the river? I cannot answer the question.
2883. *President.*] Have you ever noticed shoals of fish passing to the north outside? No, I have not.

Mr. Peter Smith, Assistant Inspector of Fisheries, Hawkesbury River, sworn and examined:—

- Mr. P. Smith, 2884. *President.*] What is your name? Peter Smith.
- 18 Mar., 1895. 2885. You are an Assistant Inspector of Fisheries, stationed at the Hawkesbury River? Yes.
2886. How long have you occupied that position? About thirteen years.
2887. Have you had charge of the Hawkesbury River during all that time? Yes.
2888. How many licensed fishermen are there on the Hawkesbury? About forty-six licensed fishermen and nineteen boats. Sometimes the fishermen number as many as seventy odd, and boats in proportion.
2889. Do you find them a set of men with whom you can work well? There are a good many against me. Some do not like me because I prosecute them for being in closed waters.
2890. How many baskets of fish were sent from here during 1894? The number was 5,991 baskets.
2891. About what would be the value of the consignments sent from the Hawkesbury during 1894? I am unable to say.
2892. Have you had occasion to prosecute the fishermen? Yes; at various times, for fishing in closed waters, and taking oysters off Crown lands.
2893. What means have you for travelling about and doing your duty? Only a boat, and a heavy boat, too. At night-time I often take one of my boys with me to help me. I have a large district, and sometimes a good many miles to pull.
2894. What salary are you receiving now? £140 per annum.
2895. Is that the salary you received when you were appointed? No; I then got £150 per annum. After nearly fourteen years service I am actually getting less now than I did when first appointed.
2896. Do you know what caused that reduction? They called it retrenchment. I do not know the ins and outs of it.
2897. But are you not aware that Parliament directed there should be no reduction in salaries under £200 per annum? I have heard that is so.
2898. If that is so, the Fisheries Commissioners have ignored the direction of Parliament? They have.
2899. Do they provide you with a residence? No.
2900. Do they provide you with a boat? Yes; a Government boat, but she is large, heavy, and clumsy—too heavy for one man.
2901. I suppose after your thirteen years' experience here you have a pretty extensive knowledge of the capabilities of the Hawkesbury fisheries? Without a doubt; but my practical knowledge dates back many years before that.
2902. Where did you gain any experience before you were appointed? In New South Wales; in the deep-sea fisheries, the net fisheries, and also in the oyster fisheries, many years in each branch. My experience dates back before the loss of the "Dunbar."
2903. Was it ever contemplated to retrench you from the Service? I believe it was.
2904. On what grounds? I cannot say, excepting those of retrenchment.
2905. Do you know if all the assistant inspectors in the service of the Fisheries Commission are practical men? I have reason to believe they are not. Myself and Assistant Inspector Gordon are the only practical men in the whole Department.
2906. Have you made recommendations at times to the Fisheries Commission? Yes, I have.
2907. Have those recommendations at all times been carried out? No; I do not know that they were ever carried out with the exception of the last closing of this river.
2908. Have you ever had any assistant inspector of fisheries reporting on matters connected with the Hawkesbury River fisheries, which duties could have been performed by yourself? I believe there has on different occasions.
2909. Do you think the present Fisheries Act satisfactory? No; I do not think it is satisfactory.
2910. Do you think there is any room for improvement? My opinion is that the whole Act should be repealed and a new one introduced.
2911. What nets are mostly used in the Hawkesbury? Well, they nearly all use these garfish nets now. I believe they use them all the way up to Windsor where not a garfish is seen.
2912. Is the use of those nets detrimental to the interests of the fisheries? Very much so; they are very destructive nets.

2913. What other nets do they use? Meshing nets and the hauling net—that is, 2½ inches in the bunt, and 150 fathoms long; very few use anything but that. They have all got this garfish net; they have found out the law cannot touch them, and they use those nets. Mr. P. Smith.
18 Mar., 1895.
2914. They have found out there is no limit to the length of the wings? They have found out that the law is powerless to stop them from catching any kind of fish.
2915. Do you think undersized fish are caught by those means? I am quite certain for every day that goes over our heads thousands of little fish are destroyed by those garfish nets.
2916. What would you propose to remedy this state of affairs? I would propose you make limits in every river of importance. In such places as Brisbane Water, Gosford, or Tuggerah Lakes, I would never allow a garfish net to be used; I am now speaking from practical experience.
2917. Then you would close certain waters against the use of the garfish net? Certainly I would.
2918. I suppose that would be in the event of it being shown that garfish were not in marketable quantities in those waters? Yes; because garfish do not enter those waters in sufficient quantities to warrant the use of such destructive nets.
2919. Have you heard any fishermen complain of the hauling net not being long enough? It is quite long enough on this river. Two or three years ago I had orders from the Department to examine all nets on this river, and send in a report as to their length, size, mesh, depth, and all particulars. I found a great number of nets were not the length they were allowed to be; they were less than the length allowed by law.
2920. In regard to the mesh of the hauling net do you think that is satisfactory? I think 2½ inches would be a better mesh for the bunt; it would allow the small mullet, or any other small fish, to go through better. In former times they used nothing less than 2½ inches in the bunt.
- 2921–2. Have you found, with the present mesh of the bunt, that many young undersized fish get meshed and destroyed? Yes, they often get destroyed, particularly the small mullet.
2923. Would it be better to lessen the mesh of the bunt, or increase it? I would rather increase it to 2½ inches.
2924. Do the fishermen haul their nets so that the fish become stranded? They haul all the nets ashore, with the exception of the garfish net, and the meshing net.
2925. Do they, as a rule, leave the flue of the net in a certain depth of water? When I am about they comply with the laws, when I am away there is no knowing what they do.
2926. Do you think the fishermen desire to respect the law? Some of them do not care what fish they destroy.
2927. Is the meshing net brought into general use here? Yes; the meshing net is a very good net and one I can recommend, it will not destroy small fish.
2928. Should the mesh of that be altered? To give better facilities to the fishermen I would say, make the mesh a little smaller, say, 3½ inches, and allow a greater length of net.
2929. What length? 100 fathoms if they wanted it; if they wanted more I would have no objection.
2930. Are prawn nets used here? Oh, yes, lots of them.
2931. Do they destroy many young fish? Yes, a certain quantity; but not so many as the garfish nets.
2932. What would you think of a provision in an Act allowing fishermen to use whatever net they chose, up to a maximum length, say, of 150 fathoms, there being a further provision that they were to empty their nets in not less than 1 foot of water, and provided there was a stringent provision inserted punishing them for catching or sending to market undersized fish? I am afraid the landing in 1 foot of water would not work well; there are large flats that extend a stone's throw out, and they would not have 1 foot of water over them. I am afraid it would not be practicable in the Hawkesbury River.
2933. You think, then, all that is required for the Hawkesbury River fisheries, is that there should be an alteration in the bunt of the hauling net, increasing it to 2½ inches, and that the use of the garfish net should be discontinued altogether? Yes, I do.
2934. Do you see any objection to allowing a *bona fide* meshing net to be used in the closed waters, to catch the marketable fish that may be in those waters? It would be a great concession.
2935. Do you think that the use of such a net would interfere with the feeding or breeding grounds of the fish? No, I do not. I do not think it would do any harm.
2936. As to closures generally, have you been asked to report on the question of closing certain waters in the Hawkesbury? I was once, in 1891; I was asked to define the boundaries I would recommend for closure.
2937. Did you do so? I did; fish were very plentiful at that time. My answer was that, being guided by the Act, I could not recommend the closing of any portion of the Hawkesbury River at that time.
2938. Then, in your opinion, there was no possibility of the waters, or any portion of them, becoming exhausted? Certainly not; fish were more plentiful then than they have been for twenty years. How could I recommend the closure in the face of that?
2939. Were your recommendations adhered to? No, they were not.
2940. Were closures made in spite of your report? About two months after, closures, and very extensive closures, too, were made without any further reference to me.
2941. In regard to that provision of the Act which allows the informer half the fine for informing on a person found fishing in closed waters, do you believe in that? No; I should be satisfied if it was abolished; let the fine be given to the benevolent institutions.
2942. Do you believe in the wholesale confiscation of nets? That is another matter altogether. Supposing I catch them in closed waters, if I am not allowed to touch their nets what shall I touch?—the men would run away; what should I touch?
2943. But supposing power was given you to seize their nets until such time as you obtained their names and prosecuted them? Oh, yes, I should have no objection if they would always stand their ground; an inspector does not like to be made a fool of.
2944. Do you believe in seized nets becoming the property of the Crown, instead of being handed back to the fishermen? If they were illegal nets they would be no use to the fishermen.
2945. But could they not be made into legal nets of some kind? I do not think it would answer very well.
2946. But there may be circumstances exonerating the fishermen from an intentional breach of the law; would you in that case allow them to have their nets? Having regard to the welfare of the fisheries generally I am afraid it would not be advisable.

- Mr. P. Smith. 2947. So that, according to your opinion, in cases where nets were passed as being legal, and had been used for some time, the fishermen ignorantly using these nets should have them confiscated? Yes.
- 18 Mar., 1895. 2948. In other words, their tools of trade should be taken from them? Yes; I am afraid there is no help for it, although it seems very harsh.
2949. Can you suggest to the Commission anything which would be an improvement, and which would prevent the possibility of the fishermen using illegal nets? Well, they make them illegal by excessive tanning. There is no necessity to tan them so much. I believe, when they buy a new net, if they were to use a certain amount of tar with the tan they would prevent the net from shrinking.
2950. You think, then, if they used some other preparation to preserve the net, which had not that astringency about it that tan has, say tar, that would meet the case? Tar and tan mixed.
2951. Would it be an improvement to have the twine of which the net is made tanned once or twice before it is converted into a net? That would stop it a little; it would not shrink so much.
2952. Supposing a regulation was brought into force making it compulsory to have proper supervision in regard to the manufacture of nets, and that proper ingredients were used in the tanning, would that minimise the shrinkage? It would do a great deal of good.
2953. What tan would you recommend? The wattle and the mimosa bark.
2954. Do they use the bultow, or set lines, in the Hawkesbury? No.
2955. Are you of opinion that more supervision should be exercised over the amateur fishermen? Yes; I do not see why amateurs should be allowed to catch unlawful-sized fish any more than net fishermen. And then, again, when waters are closed against net fishing, why should they be open for line fishing?
2956. Do you know the habits of the fish that frequent the Hawkesbury? Pretty well.
2957. When do the black bream come into the river in shoals? My opinion is that the black bream breeds in the Hawkesbury.
2958. About what time in the year do they breed? I have seen them full-roed in the middle of January and during the whole of February.
2959. And at any other time? It is possible floods or some other causes may alter the matter. They do not always spawn at the same time.
2960. Is it likely they have two seasons in the year for spawning? I do not think so.
2961. Are you sure schools of bream do not enter the river from the sea? They go outside the Heads sometimes, but I do not think they come from the sea.
2962. You think they are not the migratory bream? Their habitat is up the river. In flood-time they are driven down in great shoals, so that shows where they come from.
2963. In reference to mullet, what mullet is sent to market—the local mullet? The local mullet—the large mullet.
2964. Where is its habitat? From here all the way up the river. I believe they can live in fresh water as well as in salt.
2965. Which species of mullet is it that goes to the sea, and returns as the sea mullet? The hard-gut species.
2966. Which is the sand mullet? I suppose what we call the tallagallan mullet.
2967. The sand mullet is not the sea mullet? No, certainly not; the tallagallan mullet is a fish that takes the hook very well, and he is the only mullet that does so; its principal resort is the heads of the creeks, near the brackish water.
2968. Which is the best quality fish of the mullet species? The flat-tail mullet, it is not so strong as the sea mullet.
2969. Can you tell us their habitat? Some of the creeks in the Hawkesbury River; they go to sea the same as the hard-gut mullet, you will find them mixed in among the hard-gut sometimes. I have often caught them in Watson's Bay.
2970. What size does the sea mullet attain in the Hawkesbury? A good large mullet. I have seen them here that large they would not mesh in a 5-inch mesh.
2971. What size does the flat-tail mullet attain to? I have seen flat-tails mesh in a 3-inch.
2972. Do you think the Hawkesbury is visited by any of the shoals of mullet on the coast that make their way north? The shoals of mullet very seldom come above Croppy Head; they go into Pittwater and Brisbane Water.
2973. What do you think they enter the mouths of the rivers for? To drop their spawn.
2974. Do you think they spawn at sea? No, they do not; I think the mullet know a good deal better than that.
2975. Have you ever noticed the mullet spawning at the entrance to the Hawkesbury? No; I cannot say I have. I have seen a shoal of mullet in Watson's Bay, they lie off rocky points; it is quite likely they were spawning.
2976. After the lapse of a reasonable time from the visit of the sea mullet to the Hawkesbury have you noticed any fry about, giving evidence of their having spawned here? The fry would be too small to notice for a long time to come. My belief is that when the mullet have done spawning they cease to go about in shoals, they go deep, and go up the river.
2977. So that actually those mullet that do come in to spawn, and spawn at the entrance to the Hawkesbury, eventually find their way to the higher reaches of the river? Very possibly; about May the fish will be very scarce down here, and you will find them away up at Wiseman's Ferry.
2978. What time of the year do the sea mullet visit this river? April is the great month for spawning, although some of them are later than April. I have known them to be as late as the latter end of May.
2979. Seeing that these fish enter the river for the purpose of spawning, would you recommend that protective measures should be taken to prevent fishermen catching them? I believe it would be a step in the right direction.
2980. Do you believe it would be a step in the right direction if the entrance to the Hawkesbury River were closed as far as Croppy Point? Yes, that would do; but then you would have to close Sydney Harbour, and Botany in some way.
2981. Then what you say would apply to other rivers? Yes.
2982. What do you think becomes of the fry of the sea mullet? Without doubt they take into the river, where they are spawned.
2983. So that the fry of the sea mullet spawning near Cowan Creek would eventually find its way up the main Hawkesbury? Without a doubt; the fry would never think of going out to sea; the water would be too strong for them.

2984. How many kinds of whiting have you in the Hawkesbury? There is the blue-nose whiting, known as the sand whiting—you get it on sea beaches—and the trumpeter whiting. Mr. P. Smith.
2985. Which species of the whiting is most prolific? The Hawkesbury does not produce a great many whiting; the bottom is not suitable. 18 Mar., 1895.
2986. Where do the blackfish spawn? In the harbours and rivers; they generally resort to a weedy bottom.
2987. Are they caught in any quantity in the Hawkesbury? Sometimes.
2988. Are there many soles or flounders caught in the Hawkesbury? Not a great many.
2989. As to the jewfish? Any quantity.
2990. Where do they spawn? In the river.
2991. In respect to the flat-tailed mullet;—do you consider that a species of herring? No.
2992. If the Commission had received evidence to the effect that it was a true herring, the evidence of the gentleman who gave it, you would think, would not have been the result of practical knowledge? I think not; I think the flat-tail mullet is a mullet and nothing else.
2993. Have you noticed any shoals of fish passing along the coast to the northward? Oh, yes; numbers of shoals.
2994. What were they? I cannot say.
2995. Have you ever noticed with the passage of a shoal of those fish an oily substance on the water? Oh, yes; I have seen shoals of pilchards.
2996. Have you caught any? Yes; I have caught them with a hook and line in Sydney Harbour; I have always caught them with a net in the Hawkesbury.
2997. Have you seen the fish known as the southern herring in the Hawkesbury River? Yes; I have seen them in great shoals in this river, and I have caught them too; they are locally known as silver bellies. Porto Bay is a great place for them in the winter-time.
2998. At what time of the year have you seen those shoals of the maray or pilchard? Generally in the winter months.
2999. Do you think they could be converted into a marketable commodity? I daresay they could.
3000. Do you think that by curing, canning, or smoking they could be brought into local consumption? Yes; I believe they would be a very nice fish. I have noticed the maray more plentiful in Sydney Harbour than in the Hawkesbury River.
3001. Are schnapper plentiful in the Hawkesbury? Cowan Creek is a branch of the Hawkesbury; they often go into that creek because the water is cleaner and saltier there; I believe they go in there to spawn; they go in very large shoals at times.
3002. Then you are of opinion the schnapper spawn in the inlets? Yes.
3003. Do the fry develop in the river, or do they seek the sea? In the inlets they are of a certain size; you will find plenty of young schnapper in Cowan and Pittwater.
3004. Do you know anything of the Woy Woy fisheries? Yes; I fished in Woy Woy many years ago.
3005. Are those breeding grounds? Yes; there is not a better breeding ground on the coast than Brisbane Water.
3006. From your knowledge of those fisheries would you be inclined to close them for the purpose of allowing the fish to breed? I would close them for ever against garfish nets. I think that if a lawful net of 2½ inch in the bunt were used no harm would be done.
3007. Would you be inclined to close Brisbane Water against the use of all nets, with the exception of the drift net, or meshing net? Yes, I would.
3008. Is that fishery noted for the production of ground fish? Yes, for whiting, bream, soles, and flounders. I would respectfully ask that the garfish net should not be allowed in Brisbane Water. I have seen eight and ten baskets of unlawful fish in one haul of a garfish net.
3009. Would you be inclined to favour a proposal limiting the number of fishermen in these waters, rather than have a large number of men here? I am afraid it would not work very well; it would involve hardship on some people who might be excluded.
3010. Supposing the waters in New South Wales were sufficiently extensive for all who desired to engage in fishing as a means of livelihood, would there be any hardship then? I think it would lead to hardship in some cases.
3011. Have you authority to receive money for the fishermen's licenses? No, I have not.
3012. Would it be better, for the purposes of identification, that you should be allowed to issue the licenses to the fishermen, and receive the fees? Yes; it would save the fishermen the trouble and expense of going to Sydney, and I would then know who had a license. At present it is generally a couple of months before I get a return from the office, before I know who has a license; my time is taken up chasing about to see who have licenses.
3013. Would it be better to issue a medal, something that might be attached to, or nailed in the boat, instead of having the fishermen's license on paper as at present? Yes, it would be better; the paper licenses get spoiled by the wet; they could nail a medal on the boat.
3014. Have you had any experience in connection with oyster culture? I was a great many years in the trade, but my experience dates a good many years back. I have seen a good deal of oyster culture here, what we call oyster culture, laying oysters down on suitable bottoms, and allowing them to grow.
3015. Do you think the industry has been carried on properly, and in a systematic manner? No, it has not.
3016. Are you of opinion that the men who have been trying to raise oysters have not been men of experience as a class? There has been no attempt made at oyster culture on any one lease that I know of on the Hawkesbury.
3017. I suppose the lessees have depended upon natural oyster deposits for their supplies? Yes; and from what they could take off other men's leases and Crown lands.
3018. Do you approve of the system at present in vogue of allowing a person to indiscriminately take up 100 yards, wherever he chooses to? No; I wrote against it years ago, but no notice was taken.
3019. Do you think that system is availed of for the purpose of cloaking depredations; in short, do you think some people are guilty of stealing from the beds of the larger lessees? Well, stealing now takes place from Crown lands, but stealing has also taken place from the leases. I consider that what is supposed to be oyster culture is the greatest farce the Colony has ever seen.
3020. Do you mean that the lessees have not gone into it in a practical and scientific manner? They do nothing towards their leases.
- 3021.

- Mr. P. Smith. 3021. Is the ground not suitable for oyster culture? Yes; in many cases they could make plenty of improvements, and grow hundreds of bags of oysters if they went to a little trouble. The lessees stand in their own light. They denude their beds, and it is impossible to make them pay.
- 18 Mar., 1895. 3022. Would you favour a system of leasing an arm of a river? Yes; I recommended that when I appeared before you as Chairman of the Select Committee of the House in 1889.
3023. Provided there were certain conditions attaching to every lease, making it compulsory on the part of the lessee to conduct his operations in the interest of the development of the oyster fisheries, would you believe in the lessee paying by results, or would you continue the system of paying at per 100 yards, as at present? I would not recommend either, not by results, and certainly not by the 100-yards system.
3024. What would you do? I would lease the creek for a good substantial lease—nothing less than fifteen years—because a lessee, if he is to make money, must have a substantial tenure. I would have the conditions very strict, and if he would not go in for oyster culture I would take the lease away from him. The rent should be paid in advance.
3025. How would you arrive at the rental to be paid? The creek could be put up to public competition, sealed tenders could be sent in, the Fisheries Department to be allowed to accept any tender.
3026. In cases where the ravages of the worm might have taken place, and thus prevented any results being obtained from the beds, would you favour an elastic provision allowing a lessee to forego the payment of his rental for a year or two? The worms are as bad now as ever they are likely to be. I think there is no need for that. I believe it would be an advantage to let a lessee have a creek, or an arm of a river for nothing for the first year, provided he keeps it closed from oyster-getters.
3027. From your knowledge of the oyster fisheries of the Hawkesbury what do you think the value of (say) the Berowra Creek oyster fishery would be to the State for one year? It is in a very low state at present, and I am afraid the Government would not receive its full value, it has been brought down so low from mismanagement.
3028. What would you feel inclined to offer for it yourself in its present condition? It would be cheap at £100 per year. Five or six years ago I heard a gentleman say he would not mind giving £500 or £600 per annum for the whole river.
3029. What was it originally leased for? £127 per year to Mr. Gibbins.
3030. Did he take many oysters off it? Yes; his annual shipments then would be near about 2,000 bags per year.
3031. Was that the time when a royalty on oysters was in force? Before a royalty came into force.
3032. About what price per bag did he receive for those oysters? Sometimes up to 30s. and £2 per bag. When he got the lease oysters were only fetching 5s. per bag.
3033. Used he to obtain his supplies from the foreshores? Yes, he did.
3034. Did he dredge? Yes; in Berowra Creek.
3035. Do you think it would be a fairer way of arriving at a satisfactory arrangement with the lessee, providing, of course, proper supervision were exercised over his oyster fishery, for the State to receive so much on every bag of marketable oysters taken from the lease? I am afraid it would not work. An oyster lessee must also be an oyster buyer. Sometimes, when there is a glut of oysters in Sydney, which often happens, he must be prepared, if he has capital, to buy up all he can and lay them down on his lease, and watch the market. Of course in that way it would be very difficult for the Government to participate in the profits.
3036. Would it not meet the case if special areas were set aside for the purpose of allowing the layings to be made, and exempted from the royalty? I do not think it would work.
3037. Have any other oysters been introduced here? New Zealand oysters.
3038. Did they thrive well? They fattened here. It is purely a business speculation. They do no harm. They might spawn and supply the foreshores with spat.
3039. How long does it take an oyster to develop in the Hawkesbury River from the spat stage to the marketable stage? Different times, according to the places the oysters are in. At Flat Rock it would take two or three years to grow to a marketable size, whereas at the head of Mooney Creek an oyster would grow to a large size in twelve months.
3040. During the time you have been connected with the Fisheries Department how often have the Fisheries Commissioners, or any of that body, visited the Hawkesbury? The only Commissioner I remember visiting the place was Mr. Oliver. That was some years ago.
3041. Has any one, or all of the present Fisheries Commission, made an official inspection of the Hawkesbury River fisheries while you have been here? No; I have never seen them.
3042. In regard to crayfish, are there any grounds about here where they could be caught in quantities? Crayfish used to be caught near Cape Three Points. They used to be very plentiful in Broken Bay.
3043. Do you know when they spawn? About October or November.
3044. How long are they in roe? I suppose about a month.
3045. Do you believe there should be a provision prohibiting the taking of female crayfish when full-roed? Yes; they ought not to be caught in that stage.
3046. Are you of opinion that the industry of smoking, curing, and canning fish could be carried on profitably on the Hawkesbury River, providing the supplies of fish were sufficient for the purpose? Yes; I do not see why it could not be.

BRISBANE WATER FISHERIES.

SATURDAY, 23 MARCH, 1895.

[The Commission met at the "Royal Hotel," Gosford, at 11.10 a.m.]

Present:—

FRANK FARNELL, ESQ., M.P., PRESIDENT.

L. G. THOMPSON, ESQ., J.P.

Mr. Simon Luccani, fisherman, Woy Woy, Brisbane Water, sworn and examined:—

3047. *President.*] Your name is Simon Luccani, you are a fisherman, and you live at Woy Woy? Yes.
3048. How long have you been a fisherman? Close upon eleven years; since I came here from New Zealand.
3049. Where have you fished? In Lake Macquarie and Brisbane Water. I went to Victoria, and returned here six years ago; since then I have been fishing.
3050. What net do you use? A 4-inch meshing net.
3051. Is that net long enough for you to catch fish with? No; I made it deeper.
3052. Why did you make it deeper? So that I could catch the fish in the channels.
3053. What length of net would you like? I would be satisfied with a net of 100 fathoms.
3054. Have you used a hauling net? Yes; I used one eight years ago.
3055. Could you make a living with the meshing net if it were double the present length? Yes, I could; I do not go for small fish.
3056. Do you think Brisbane Water and Woy Woy are breeding grounds? They are; fish go in and out there.
3057. Do many hook-and-line men, amateur fishermen, come down to Woy Woy? Yes; they come in hundreds; sometimes 600 and 700 come. They catch a great number of fish; they take the small fish.
3058. Is that the only complaint you have to make about them? Yes; I want a chance to make a living, to keep my family.
3059. You want a longer net? Yes.
3060. Have you ever used a sunk net? No; I have not.
3061. You cannot fish now in Brisbane Water? Well, I suppose I am not to let my family starve?
3062. Do you sell your fish locally about Gosford? A little. I cannot sell much now; sometimes I do not catch any fish for a couple of weeks at a stretch.
3063. What quantity of fish do you catch in the week? Oh, if I could catch a basket of fish in a week I would be a lucky man.

Mr.
S. Luccani.
23 Mar., 1895.

Mr. William Adolphus Hannon, fisherman, Blackwall, Brisbane Water, sworn and examined:—

3064. *President.*] Your name is William Adolphus Hannon? Yes.
3065. Where do you reside? Blackwall.
3066. How long have you resided there? Close upon thirty years.
3067. Have you been engaged in fishing operations? Yes; off and on pretty well the whole of that time.
3068. Have you fished anywhere else beside Brisbane Water? Principally in Brisbane Water; but I have also fished in the Clyde River.
3069. Have you a tolerably good knowledge of the habits of the fish? Yes.
3070. At what times in the year have you noticed fish frequenting this place in greatest numbers? About this time of the year.
3071. What fish do you notice frequenting these waters? Black bream, whiting, flathead, and sea mullet. The sea mullet have been in for the last six weeks. I saw schools of sea mullet in Brisbane Water six weeks ago.
3072. What nets do you use? From 1½ inch to 3½ inches; 4 inches for a meshing net.
3073. You use a hauling net, a garfish net, and a meshing net? Yes.
3074. In regard to the hauling net, is it a sufficient length for you at the present time? I think it is a fair length.
3075. Do you ask for any extension of that net? I think it is a fair length.
3076. Are you satisfied with the mesh? I do not grumble with it myself, but there are a good many who do.
3077. Do you haul your net ashore, and strand your fish? Haul ashore.
3078. You never empty your net in the water? No.
3079. What do you do when the young fish become stranded? Turn out the small fish from the bunt of the net.
3080. Do you ever find any young fish getting meshed in the bunt? No.
3081. Any young schnapper? No.
3082. So that a mesh of 2½ inches is sufficient, you think, to prevent the destruction of young fish? I do. I do not think there could be a fairer mesh.
3083. Have you ever had your nets seized? Never.
3084. Do you think it is a good provision to have in the Act, to allow of the confiscation of the nets of a fisherman—tools of trade—for the first offence? No, it is not; not for the first offence.
3085. Do you think it is a good provision to allow the inspector or the informer half the fine—do you think that is likely to lead to persecution? I do not doubt it would.
3086. Are you satisfied with the mesh of the garfish net? Yes; quite.
3087. Are you satisfied with the length of it? Yes; I am.
3088. The meshing net;—are you satisfied with the mesh of that? I think that it ought to be reduced to 3½ inches; 4 inches is too large.
3089. Does that mesh of 4 inches allow a great number of marketable fish to escape? Yes; splendid fish. A mullet 18 inches long will go through the 4-inch mesh.
3090. Is the length of the net sufficient? Yes; I think it is quite enough for these waters.

Mr. W. A.
Hannon.
23 Mar., 1895.

3091.

- Mr. W. A. Hannon.
23 Mar., 1895.
3091. What would you think of a provision in the Act, allowing nets to be used in Brisbane Water, of a maximum length (say) 600 yards, with any mesh you like, as long as there was a provision to prevent the possibility of undersized fish being sent to market; and also a further provision making it compulsory on the part of the fishermen to empty their nets in not less than 1 foot of water? I think that would be a very just provision. If fish are not emptied into that depth of water a great many perish. That is a thing I always do in fishing. I always turn the small fish into the water—at the very least, a foot of water.
3092. Is a great portion of Brisbane Water closed at the present time? Pretty well all the free parts that ought to be closed are open.
3093. Which parts are those? The main entrance into the waters here are open, from below Webb's Reef to the bar. There are boats there fishing continuously, netting, and they prevent the ingress of fish to Brisbane Water.
3094. Are you of opinion that the closures at present existing are unjustifiable? Yes, altogether. I think the entrance to Brisbane Water ought to be closed, or the whole of Brisbane Water should be open to net fishing.
3095. What would you think of a provision which would allow of a meshing net being used in closed waters, so that the marketable fish might be caught;—would that be any concession to the fishermen? I think the local people ought to be allowed to fish with the meshing net for their own consumption.
3096. Do you think that the breeding and feeding grounds would be disturbed by the use of a meshing net? No, not in the slightest; and good fish would be caught.
3097. Is it a fact that a great number of amateur fishermen—line fishermen—visit Brisbane Water? A great number.
3098. Do they destroy many young fish? I do not think so.
3099. Have you ever noticed that there are quantities of red bream destroyed by the amateur fishermen? In the Broadwater at the present time there is a tremendous lot of red bream; they are very small, about 2 inches long.
3100. Are they caught by the amateurs with a line? Yes; often.
3101. Would it be a good thing to provide for the punishment of amateur fishermen who destroy undersized fish? Yes. I think a provision compelling them to put them back into the water, would be a step in the right direction.
3102. Where do you think those bream have come from;—were they bred locally? Bred locally, I think.
3103. You think the schnapper have spawned in Brisbane Water, and they are the result of the spawning? Yes.
3104. Are there any schnapper in Brisbane Water? Oh, yes; a great number at the present time.
3105. Do you think they enter these waters for the purpose of spawning? Yes, I do.
3106. In regard to black bream, where do you think they spawn? In Brisbane Water. They go up the creeks and spawn; as soon as there is a fresh they come down again, and go out to sea after a time.
3107. And the mullet? Yes; they spawn in Brisbane Water and up the creeks.
3108. Are you of opinion that the supply of fish in Brisbane Water is maintained not alone by local production but by supplies from the sea? By supplies from the sea; there is not the slightest doubt about it.
3109. Do you catch any soles or flounders here? Yes. They have been pretty plentiful lately.
3110. Are the grounds in Brisbane Water good breeding-grounds for the sole? I do not think they could be beaten all along those mud flats.
3111. Have you any idea when the black bream or the mullet spawn in Brisbane Water? I cannot say exactly.
3112. Did you say that at this season of the year they are making their appearance in great numbers? Yes; and for that very reason I should say this is their spawning season. Besides, when you open them, you see very large roes in the fish.
3113. In regard to sea mullet, have you ever noticed in the daytime that their stomachs would be full of mud, and that at night the mud would not be there? Yes, I have.
3114. Can you account for that in any way? No; without it is that they frequent the mud-flats in the daytime, and go to sea again at night. I think they work in and out with the tide.
3115. Can you account for the appearance of the mud in their stomachs in the daytime, and its alleged non-appearance at night? No; I cannot.
3116. But you say it is a fact? It is.
3117. What species of whiting are caught in Brisbane Water? The trumpeter whiting, and the blue-nose or sand whiting.
3118. Are they here in any quantity? They were everywhere a few years ago.
3119. Are the grounds here good breeding grounds for whiting? Very good.
3120. How many fishermen are there on Brisbane Water? About a dozen altogether, net fishermen, and a dozen boats.
3121. Do any Sydney fishermen come down here? Yes.
3122. Who are they? The Smith's, from Watson's Bay, they have gone from here now. The Smith's from Pittwater are here, two boats of them. Chamberlain is here, and others come for a week or two, and go away again.
3123. How many men are in each boat? Four, generally.
3124. Do you catch the different classes of fish you have mentioned? Yes.
3125. What is your average catch per week? About six baskets per week.
3126. Is the smallness of your catch owing to the limited extent of water you have to fish in? I think the principal reason is the manner in which the fish are blocked at the entrance from coming in here, by those waters being left open to net fishing.
3127. Where do you send your fish? To Sydney. I used to consign all to Woolloomooloo; but now I generally send to Redfern.
3128. To Mr. Hudson's market? Yes.
3129. You have had experience in sending fish to Woolloomooloo Market? Yes.
3130. Have you ever had to complain of loss of fish in transit? I have had fish lost a good many times. I put up with the loss, because I thought the least said the soonest mended.

Mr. W. A.
Hannon.

23 Mar., 1895.

3131. Did you ever try to ascertain where the theft took place? No.
3132. It might have taken place between the station and the market, or between the station you sent from, and the station to which your fish was consigned? Yes; it might.
3133. Did you send fish to an agent in Woolloomooloo Market? Yes; for several years.
3134. Were your returns always of a satisfactory character? Pretty fair.
3135. You were satisfied with the prices you obtained for your fish? I had confidence in the agent I employed.
3136. Did you notice the prices paid for fish at the time you sent your catch to market? Yes.
3137. Did it ever strike you that if the fishermen received one half of the amount paid by the public to the dealers, it would pay them very well? Yes, it did; it would pay them well.
3138. You have a knowledge of the Woolloomooloo Market, and the manner in which the fish is displayed and distributed there? Yes.
3139. Do you think the fish is shown to the best advantage? I do not like the style of throwing the fish on the floor in heaps.
3140. Are the fish liable to be trodden upon, and spat upon? They very often are; it is impossible to walk about there; the dealers and others do tread upon them.
3141. Would you suggest that raised tables be used upon which to display the fish? Yes; raised tables would be a great improvement upon the present system.
3142. You send now to the Redfern Market? Yes; but I have not fished for the last three months.
3143. Were your dealings with the Redfern Market more satisfactory than in the case of the Woolloomooloo Market? I cannot say so; there was not much difference.
3144. Do you think the Woolloomooloo Market is sufficiently central for the conduct of the fish business? It is rather out of the way now; it was a central place when fish used to be sent by boat.
3145. Do you think that a market in close proximity to the railway station would be more convenient for the fishermen and the general public? Oh, yes; very much more so.
3146. Would it prevent extra handling, and so forth? Yes; of course it would.
3147. Have you any complaint to make regarding the freight charges made by the Railway Department? No; the charge is quite reasonable.
3148. Have you ever lost any returned empties? Very seldom.
3149. What station do you send your fish from? Woy Woy.
3150. Have your fish always arrived at the market in prime condition? Yes; I think so.
3151. If the Railway Commissioners were to place a refrigerating car on the railway would it be patronised by the fishermen? Yes; I am sure it would.
3152. Would it assist in further developing the fishing industry if more than one sale a day was held at the markets? Yes; it would be a good thing.
3153. Do you know of any occasion when the Fisheries Commission, or any member of that Board, have visited Brisbane Water officially? No. I think Dr. Cox came here about four months ago.
3154. What did Dr. Cox come for? I cannot say.
3155. How long did he remain here? I think he stayed one night only.
3156. You do not know the actual object of his visit? No. I did hear some of the Commissioners were down with the Newtons.
3157. What did they do on that occasion? I heard they caught some party fishing in closed waters.
3158. In regard to the administration of the Act and the control of the fisheries, have you given the subject any attention;—can you suggest any improvement in the present condition of things? Well, the Fisheries Commissioners cannot take much interest in the industry if they are not paid for doing so.
3159. Do you think that in order to ensure a proper interest being taken in the fishing industry, whoever is charged with the administration and control should be paid? I do; and well paid, too.
3160. Would it require four or five men to do that? No; I think one man, having a good practical knowledge and an acquaintance with the fisheries of the Colony, would be able to perform the duty very well.
3161. Are you of opinion that such a man should be paid? He should be well paid, undoubtedly.
3162. And, as an extra safeguard, in the interests of the public and the fishermen, would it be a good idea to establish local boards of advice—representative fishermen to have seats on such boards—in order to advise the person charged with the administration of the Act and the control of the fisheries? Yes; it would be a good thing.
3163. Do you think that owing to the different circumstances and conditions attaching to the various fisheries of the Colony, it would be a good thing to have gentlemen on boards of advice who would have a local knowledge of the several fisheries? Yes; I do indeed.
3164. Are any set lines used in Brisbane Water? Yes; there are a few.
3165. Do they cause any inconvenience to the fishermen? I do not think so; I have never heard of any complaint about them.
3166. Do you think amateur fishermen should be required to take out a license, with just a nominal fee? The railway gets a good revenue now from them. I have not given that matter consideration.
3167. What do you think of the idea of limiting the number of fishermen on a fishing ground? It would make it better for the fishermen—a good deal better.
3168. You were saying shoals of fish enter Brisbane Water at different periods of the year? Yes.
3169. Have you ever seen shoals of fish passing along the coast at different times, going north? Yes; I have.
3170. What were they? Tailer and mullet mostly.
3171. Have you ever seen any species of herring? Yes; any number of them; great shoals of them.
3172. Could they be easily captured? Yes; with proper appliances—by the use of drift nets.
3173. Have you had any experience in trawling? No.
3174. Do you know anything of the bottoms off our coasts; would they be suitable for trawling? Well, I have been out schnapper fishing often, and from what I could ascertain the bottoms are very good. A little way out they are quite good enough for trawling over.
3175. Have you ever done any well-boat fishing? I never used a well-boat myself.
3176. Do you know of the existence of any crayfish fisheries near Brisbane Water? Yes.
3177. Could they be developed? I think so.
3178. Is anything done with them? I do not think there is any lobster fishing now on the old grounds. Next month will be the time for lobster fishing outside the Bar.

- Mr. W. A. Hannon.
23 Mar., 1895.
3179. Would you favour a close season for crayfish? Yes.
3180. That would be during the time they are in the coral state? Exactly so.
3181. Do you know anything about oysters, or oyster culture? Yes; a little.
3182. Are there any oyster leases in Brisbane Water? Yes; pretty well all leases now.
3183. Have you a lease yourself? No.
3184. How do the oysters seem to thrive here? Not very well.
3185. Do they develop quickly from the time they are laid down in the spat stage? They take a long time; I laid a lot down for Mr. Browne; they did no good for two years; they took about three years before they became of a marketable size.
3186. Have you a knowledge of the system under which the leases are granted at the present time? Yes.
3187. Do you think that system could be improved upon, by (say) leasing an arm or a portion of a river to one man for oyster culture? I think that would be a very good idea.
3188. Would you favour the proposal that instead of paying £1 per 100 yards, as at present, a person should pay by results, so much as a royalty on every bag raised? It would be a very good idea, provided you knew exactly the results that were obtained.
3189. Of course I mean that proper and stringent supervision should be exercised by the Department, and that there should be certain conditions attached to the leasing of these areas? Yes.
3190. Do you think that such a system as that would be any improvement? It would most undoubtedly. It would be a splendid idea if you could get the proper returns of oysters sent away. They are sold in sugar-bags down here. Hundreds of those bags are sent away weekly. They are sold at 5s. per bag to the gentlemen who come here fishing.
3191. Have you noticed the disease in the oysters in Brisbane Water? Some years ago a hole was bored into the oyster. This was done by what was called the borer. I have not seen any of it lately.
3192. You have no worm disease now? None whatever.
3193. Has oyster culture been carried on here, or have they simply depended upon the natural deposits of oysters? Pretty well upon the natural deposits.
3194. In regard to the waters at present open for net fishing, are they sufficient for you? I think the entrance should be closed, and the Broadwater opened. That would allow of the free ingress and egress of the fish, and it would give the Gosford people an opportunity of procuring fish.
3195. *Mr. Thompson.*] Which, in your opinion, is most destructive to young fish, a net of a large or a small mesh? The larger mesh is the most destructive. The fish do not get gilled in the small mesh.
3196. If amateurs were compelled to use nothing under a moderate sized hook, would not that minimise the capture of undersized fish by the line? Yes, it would to a very great extent.
3197. Why do you send your fish to Redfern instead of to Woolloomooloo Market—why did you make the change? Redfern is the most convenient, inasmuch as it saves me the cartage of the fish to the Woolloomooloo Market, and it also saves the handling.
3198. How long are crayfish in the coral and berried states respectively? I can hardly tell you.
3199. Would you refuse a license to aliens until naturalised? I would.
3200. Do you find much trouble in preserving the fisherman's license you get now from destruction, and spoliation? Yes; it is not durable; it would be better to change it.
3201. If instead of this paper license, the department were to provide you with a medal, or a token—something you could attach to your watch-chain—would that be better? Yes; that would be a grand thing.
3202. And, I suppose, your remark would apply also to the boat license? Yes; it would be a capital idea.
3203. Do you think the inspector should be charged with the duty of issuing licenses, instead of confining it to the Clerk of Petty Sessions? I think the inspector is the most convenient.
3204. Do you find the transmission of your fish to market in baskets unsatisfactory? Yes.
3205. Would not boxes formed on an iron-frame, and constructed of galvanised wire-netting give more air, and be otherwise preferable to the ordinary fish basket? Oh, yes, of course they would. A great improvement could be made in our present baskets.
3206. Where do the sea mullet spawn? I think they spawn in Brisbane Water, as well as at sea. I am confident they come in here to spawn.
3207. Do the black bream spawn once or twice in the year? Twice a year.
3208. In what months? I cannot give the months. I fancy they spawn twice a year, owing to the presence of small fry at different periods.
3209. *President.*] In regard to the supervision supposed to be exercised over Brisbane Water have you an inspector here? No.
3210. Had you one? Yes.
3211. Who was it? The last was Mr. Cain.
3212. How long ago would that be? I think he died seven or eight months ago. His son was afterwards employed by the Government.
3213. Who recommended the closures that have been made in Brisbane Water? The Newtons, I think.
3214. Who are the Newtons? George Newton, Harry, and Jack.
3215. Where do they hail from? Watson's Bay.
3216. What authority had they for recommending the closures? No authority; none that I know of.
3217. Are any of them inspectors? No.
3218. But do they take the credit to themselves for having obtained those closures? I have heard the other fishermen say they did boast of it, and they also said that they could do what they liked in getting the river opened or closed. That is only hearsay.
3219. Have you, in the evidence you have given to-day before this Commission, voiced the opinions of the other fishermen? I think so—at any rate, the majority of them.
3220. Have you any other grievances you would care to lay before this Commission? No.

William Charles Browne, Esq., B.A., St. Hubert's Isle, Brisbane Water, sworn and examined:—

- W. C. Browne, Esq.
23 Mar., 1895.
3221. *President.*] Your name is William Charles Browne, and you at one time represented the Electorate of Patrick Plains in the Legislative Assembly? Yes; for a period of nine years.
3222. Where do you reside now? At St. Hubert's Isle, Brisbane Water. I have lived there for about nine years.

W. C.
Browne, Esq.
23 Mar., 1895.

3223. Have you, during your residence there, had good opportunities of watching the capabilities of Brisbane Water for maintaining its fish supply;—have you watched the habits of the fish at all? I cannot say I have particularly. I notice there is a great scarcity of fish within the last twelve months—a very great scarcity.

3224. How do you account for that? Well, I attribute it to the fact that the entrance to Brisbane Water, from the Rip to the Bar, has been opened for net fishing, and this has naturally prevented the fish from entering Brisbane Water in quantities. As soon as they begin to enter they get caught; the place has been dredged repeatedly. The day before yesterday was the first time we caught anything like a fair number of fish. It was a very stormy day, and we got some good fish, flathead, squire, black bream, and red bream.

3225. Then you think the closure of Brisbane Water is not a proper one, inasmuch as the fish are prevented from having free ingress and egress at the Bar? Exactly; I think it is impolitic to close one part and leave the rest of it open.

3226. Would it be better if the portion you have mentioned were closed, and certain other portions of Brisbane Water opened? I think you should either open the lot or close it altogether.

3227. Then you would open the Broadwater for net fishing, provided the entrance was closed? I would not open the northern parts of Brisbane Water at all. They are great breeding grounds for the fish.

3228. Do many amateur line fishermen come to Brisbane Water? A great many; the traffic at Woy Woy is enormous. It is no uncommon thing to see from 100 to 150 people on that platform on a Sunday night; the traffic has grown tremendously these last twelve months. There is a great traffic here on Saturday and Sunday, and we have not got the same facilities in the way of cheap fares on the railway as they have at the Hawkesbury River.

3229. What classes of fish frequent Brisbane Water? We have flathead, black and red bream, the silver bream, whiting, flounders, blackfish, mullet, and, of course, at this time of the year, the sea mullet.

3230. Have you noticed any sea mullet coming in at the entrance? I have not seen them yet. The first lot of sea mullet I have seen this year was in the Sydney Market a week ago. They were caught up in the Parramatta River by Newton, so I was told. There have been large quantities of fish in Brisbane Water lately—mullet and black bream. You can hear them making a noise at night. At night you can see the phosphorous all over the flats.

3231. What do you think causes the mullet and black bream to enter Brisbane Water? The feed, and they come in to breed; the black bream come in for the nippers. I am of opinion that the fish spawn up in the estuaries. We have all the different kinds of fish here; tailer come in schools at times; there was a large school of tailer here about a month ago. I saw a large school of fish in Brisbane Water this morning; I was looking out of the train and I saw them making up.

3232. In regard to oyster culture, have you held any leases in Brisbane Water? Yes, I have.

3233. How did you succeed with them? Not very well; there were too many thieves about; we gave it up, it was unprofitable; there was no proper supervision there; we got no protection from the police, or from the inspectors, or anybody else; we might get a casual visit from an inspector once in two months, but that was no good. Those amateur fishermen used to supply themselves wholesale, and some of the neighbours, too.

3234. Do you agree with the system under which the beds are leased? If we had proper supervision it would be all right; an enormous amount of spat settles on the mangrove pegs, especially on the island.

3235. Do you believe in the indiscriminate manner in which leases are taken up? I think the way they are taken up is a very improper one.

3236. Would you favour the adoption of a system which would allow of the leasing of an arm, or a portion of a river, to one man, and instead of that man being compelled to pay £1 for 100 yards, require him to pay according to results, a royalty on every bag raised? I think it would be a very good system indeed; a man would have some encouragement then; he would have a certainty, and he would not be robbed if proper precautions were exercised. For oyster culture I know no place better than Brisbane Water.

3237. Do oysters develop quickly there? They do.

3238. How long do they take to develop from the spat stage? About three years.

3239. Is the oyster of good flavour and quality? Splendid; none like them, especially the whelk. In the case of the whelk-oyster the whelk travels about, and the oyster gets more food, and is very fat.

3240. Have you noticed any evidences of disease in the oysters of late? We have no diseases down here that I am aware of. Parts of the island are sandy on the shores, the oysters never do on the sand; if you let them go out too far in the mud they die. At one time I was led to understand the mud oyster was plentiful here, but I have never seen them myself.

3241. Are we to come to the conclusion from the evidence you have given, that the grounds in Brisbane Water are suitable for oyster culture, and the further development of the oyster fisheries? Yes, certainly. I am told there is one part of Brisbane Water, near Woy Woy, where there is a stream of fresh water coming into the Brisbane, and the oysters develop in a wonderful manner.

3242. Now regarding the administration and control of the fisheries of the Colony have you watched the manner in which the present Commissioners have carried out their duties? I have indeed.

3243. Have they paid that attention and manifested that interest in the development of the fisheries that might have been expected of them, during the time they have had charge of the fisheries of the Colony? I do not think so.

3244. Have the fisheries been developed to that extent the public expected they would be? Certainly not; that is evident from the small supply of fish we have. In the general opinion of the public they have not given that satisfaction it was expected they would; that is my opinion, and it is the general opinion, too.

3245. Do you know whether any one or all of the Fisheries Commissioners have visited Brisbane Water officially? I have never heard of any of them coming.

3246. Have you thought out the matter of how to improve the present system of control? I think it would be better under some executive head; it should be under executive control.

3247. Do you mean by that that there should be one man in charge who should be responsible for the administration and control of the fisheries? Yes, I do; it is a very important industry, and one man should have charge of it, and should be responsible; the fishing industry does not receive the recognition

W. C. Brown, Esq. it deserves. From the experience I have had I must say I have found the officers of the Department efficient and ready, but their work seemed to be restricted by the Fisheries Commissioners; they seemed to be checkmated by the Fisheries Commissioners themselves.

23 Mar., 1895.

3248. *Mr. Thompson.*] Would you license amateur fishermen? I think they should be licensed just the same as the people that have to get a living from it.

3249. Would you refuse a license to aliens until naturalised? Most unquestionably I would. I know that those people some time ago did more injury to the fishing industry in Brisbane Water than the whole of the other fishermen put together. They leave thousands of small fry on the beach, and they never attempt to throw young fish back into the water. I would not allow aliens to have a license. I think they are a most objectionable class of people. They have no interest in the industry. They want to make as much at it as possible, and then clear out from the country. They are most objectionable.

3250. I suppose your opinion is that Brisbane Water is properly a breeding-ground, and that being so, it ought not to be open to net fishing? I consider the northern parts of Brisbane Water to be breeding grounds for fish.

Mr. Frederick Henry Chapman, Kincumber, sworn and examined:—

Mr. F. H. Chapman.

23 Mar., 1895.

3251. *President.*] You are a resident of Kincumber;—how long have you lived in the district? Five years.

3252. During your residence in this district have you had a good opportunity of noticing the capabilities of Brisbane Water, so far as its fish supply is concerned? Yes; I have.

3253. Do you notice any decrease in the supply of fish at the present time, compared to what it was five years ago? Yes; a very material decrease.

3254. To what can the diminution be attributed? To the unlimited net fishing that has been allowed. I see no other cause for it. The fish are not allowed to come into these waters. They are caught before they arrive here.

3255. You mean by that there must be something prohibiting their ingress to Brisbane Water? Undoubtedly.

3256. Is that owing to the fact that the entrance is opened to net fishing? Undoubtedly it is.

3257. Do you suggest that the entrance should be closed in order to permit of the free ingress and egress of the fish? Certainly I do.

3258. Would you, providing that the entrance were closed, allow the Broadwater to be opened to net fishing, if the head waters were closed? I am dead against nets being used in these waters at all.

3259. Do many amateur fishermen visit Brisbane Water? Not so many as I would like to see.

3260. Do you think the waters ought to be reserved for amateur line fishing? Yes, I do; it would benefit all of us if the waters were only opened to line fishing—there is plenty of room outside for net fishing.

3261. Are you of opinion that amateur fishermen should be compelled to pay a nominal sum as a license, so that the fee might cover the cost of supervision? I would not object to that.

3262. Do you think there should be some stringent provision for preventing the destruction of undersized fish by amateur line fishermen? I do.

3263. Would that be met by prohibiting the use only of a certain sized hook; would that minimise the destruction of young fish? That is a question; it depends upon the class of fish.

3264. Would you be in favour of a provision making it compulsory on amateur line fishermen to cast undersized fish back into the waters from which they are taken? Yes; I am in favour of such a provision.

3265. And you think it would not matter how stringent a provision was made to deal with this difficulty the amateur line fishermen would be prepared to respect such a provision? I believe so; any honorable sportsman would do so.

3266. Do you know whether there is any inspector here for supervising the fisheries? I do not think there is.

3267. Does that savour of neglect? Yes; but I think it is owing to want of means to place an inspector here.

3268. Does it not seem to you to be an anomaly that waters should be closed against net fishing, and that no official should be here to see that breaches of the law do not take place? Yes.

3269. Do you know anything about the constituted authority that administers the Act—I refer to the Fisheries Commission? I have read their reports, but they are the same old things over and over again. I have often been going to write to them, but it was the same old thing—it was no good.

3270. Do you know of any occasion when the Fisheries Commissioners, or any member of that body, have visited Brisbane Water officially? No, I do not.

3271. Do you know whether the Fisheries Commission have ever been refused any money for carrying out the proper supervision of our fisheries? I am under the impression they have complained of not having sufficient money to carry out their duties properly.

3272. Would you not naturally expect that the Commission, being charged with the control of the fisheries of the Colony, would make themselves acquainted, at stated occasions, with the local circumstances and conditions of the several fisheries? Yes, I would.

3273. Are you of opinion that anyone having authority vested in him to administer a Fisheries Act should have a practical knowledge of the whole of the fisheries in New South Wales? Yes, I am.

3274. Would it be a good idea in connection with any fresh authority that might be established that local boards of advice should be formed, fishermen to have representation on those boards? Yes; the fishermen want fair play. It would be a good idea. I take a great interest in the fishing industry. I would be glad to give them any assistance.

3275. *Mr. Thompson.*] Do you consider Kincumber a special breeding-ground? It is a breeding-ground.

3276. Do you know the times when the different classes of fish spawn? Yes, I have known them go there to spawn, but they have been driven out again by netting. The kingfish, in particular, have been driven away.

3277. You do not know the times of spawning of the different fish? I know generally when we look for them to come in.

Mr,

Mr. Peter Petersen, fisherman, East Gosford, sworn and examined:—

3278. *President.*] Your name is Peter Petersen, and you are a resident of East Gosford? Yes.
3279. How long have you resided there? Two years and a half.
3280. Have you during that time been engaged in fishing operations? About six months with the hauling net, and the remainder of the time with the meshing net. There were three of us when we were using the hauling net, but for the last two years I have worked by myself.
3281. Why did you discontinue using the hauling net? Because I could not make a living with it.
3282. Was that because you did not catch a sufficient quantity of fish? Yes; and there were a lot of boats in, and they cleaned the place out.
3283. To whom did the boats belong? They were local men.
3284. Were there any boats from Sydney? Yes.
3285. Who were the owners of those boats? The Newtons and the Smiths from Watson's Bay, and several more.
3286. Do you think they deprived you of the means of obtaining a legitimate livelihood in consequence of their coming to these grounds and working them? Yes.
3287. Was the hauling net long enough for you? Yes.
3288. Do you want any greater length of hauling net than 150 fathoms? Not here.
3289. Were you satisfied with the mesh of the hauling net? Yes.
3290. Did you haul your net ashore? No; I generally landed the fish in a foot of water.
3291. Did you find when you did that, there were several young fish of the bream variety meshed in your bunt? Yes; but there were not so many destroyed by the hauling net as by the garfish net now used.
3292. In regard to the hauling net, can you suggest any means by which the destruction of the small fish could be prevented before being caught by the gills? No; except to stop the use of garfish bunts.
3293. Do the fishermen generally empty the garfish net in a foot of water? Yes.
3294. You say you have not used a garfish net but a meshing net, in addition to the hauling net? Yes.
3295. What length? About 60 fathoms, and a 4-inch mesh.
3296. Are you satisfied with the length and mesh of that net? No; I think for a man to make a living that it requires to have 80 or 90 fathoms. That is enough for one man.
3297. And what about the mesh? A 4-inch mesh to catch the mullet.
3298. But is it not a fact that a lot of marketable fish go through the mesh as it is? Oh, yes.
3299. Would a full-grown mullet go through the meshing net? Not after it has been tanned once or twice.
3300. Is it not a fact that many fish a couple of pounds in weight go through the 4-inch mesh? Oh, yes.
3301. Would you be inclined to ask that a smaller mesh be given you;—would you like it reduced (say) by half an inch or an inch? Then a mullet would not mesh in it, and it pays me best to follow the mullet up, and let other fish alone. The right size in a meshing net for catching mullet is 4 inches.
3302. The 4-inch mesh is specially adapted for catching mullet? Yes.
3303. For catching other fish do you advocate a reduction? No.
3304. Were there more fish in these waters two and a half years ago than at the present time? Yes.
3305. How do you account for the decrease? It is owing to the use of the hauling nets. It is not only what they catch, they destroy a lot of small fish.
3306. Do you think the entrance to Brisbane Water being opened to net fishing has anything to do with the diminution of the supply? No.
3307. Why? I think the fish caught there are local, and do not go past certain points.
3308. You said something about fish travelling with the tide? That is mullet and whiting.
3309. Do black bream travel with the tide? Sometimes.
3310. Is it not quite possible they would frequent the shoals part of the way up the channel? Yes.
3311. How do you think Brisbane Water maintains its supply of fish? From the sea. A lot of fish breed here, too. The supplies of mullet come from the sea.
3312. Do you consider the grounds in Brisbane Water are breeding, as well as feeding grounds? Yes.
3313. Would you advocate the closure of certain waters for breeding purposes? I would advocate closing against the hauling net, and the use of the meshing net.
3314. What do you think of a proposal to allow fishermen to use whatever net they like, and that they be compelled to empty the net in at least 1 foot of water, and further that there should be a stringent provision in order to prevent the sending to market of undersized fish;—would that work satisfactorily? I think the small fish would still be destroyed.
3315. Would it be more beneficial to the fisheries to have a mesh by which small bream and other compressed fish are caught by the gills and killed, or to have a mesh which would prevent the capture of that class of fish, and would only bring into the foot of water the round fish? A mesh that would save the small fish would be best.
3316. Would you ask that power be given you to use the meshing net in closed waters, so that you could catch marketable fish? Yes, at this time last year shoals of mullet visited these waters, and we were prevented from catching them on account of the waters being closed to net fishing, rain came on and immediately afterwards those mullet which should have been brought into consumption went to sea, and we lost them.
3317. Do you think mullet come in here to spawn;—have you ever seen any of the young fry? Yes, millions of them.
3318. Do you think the black bream come in here to spawn? Yes, they do; there are black bream here, what they call natives; they never go outside, and others come in from the sea.
3319. Can you tell the difference between a sea black bream, and a native? Yes.
3320. What is the difference? The natives are a dark colour; the sea black bream are more shiny in colour.
3321. Have you seen many young black bream caught showing evidence of their having bred in Brisbane Water? I have.
3322. Do you think whiting spawn here? I can hardly say.
3323. How do you dispose of your fish? I sell them locally.
3324. What is your average catch per week? Two baskets a week.
3325. Where do you catch them? Down below the reef.
3326. There are no open waters above the reef? No.

Mr. P. Petersen.
23 Mar., 1895.

- Mr. P. Petersen. 3327. And you now ask that you be allowed to fish with a meshing net in the waters above the reef? Yes.
- 23 Mar., 1895. 3328. Have you ever noticed any aliens fishing here? Yes.
3329. Do they do any damage with their nets? Yes; they have very deep nets; they go right out into the Broadwater and scrape the bottoms; they do a lot of damage to the feeding grounds.
3330. Do you know whether many amateur line fishermen come to Brisbane Water? A great many come to Woy Woy.
3331. Do they obtain fair catches. Yes.
3332. It is alleged against them that they destroy many young fish;—what is your opinion? They catch a lot of young fish, but nothing to compare with the hauling nets.
3333. Would you license amateur line fishermen? They have to pay to travel by railway.
3334. Do you think the State gets a sufficient return from them in the shape of the fares they pay for travelling by rail? Yes.
3335. Have you seen any inspectors of fisheries about here lately? I have seen one in Gosford.
3336. Is he an inspector stationed here? No; only just a visiting inspector.
3337. So it is quite likely some of the fishermen could have an opportunity of hauling in closed waters, if they liked to do so? A lot of people make it their business to look after the fishermen.
3338. Have you ever seen or heard of any members of the Fisheries Commission coming here? No.
3339. Do you know anything about the oyster fisheries? No.
3340. Do you know anything about well-boat fishing? Not on this coast, but it has been a great success on the Swedish coast; I have had experience there; they have the well at the stern end of the boat, not in the centre; that is for the lake fishing; they do not use well-boats for outside fishing.
3341. Do you know anything about trawling? I have had no experience of it here; but it has been a great success in other waters.
3342. Do you know anything of our crayfish fisheries? Not much.
3343. Are you in favour of limiting the number of fishermen to a particular ground? No; if they pay their license they all ought to have the same show.
3344. Do you think there should be more water thrown open to net fishing than there is at present? I am against the use of hauling nets altogether, and there is sufficient water opened already for them.
3345. Do you believe in an inspector seizing a fisherman's net, and that net being confiscated for the first offence? No, I do not.
3346. Do you think a fine would meet the case? Yes.
3347. Are you satisfied with the way in which the present Fisheries Commission administer the Act, and control the fisheries generally, or do you think any improvement could be effected? I think the persons charged with the administration of the Fisheries Act should have a practical acquaintance with the fisheries of the Colony, and also pay periodical visits to the different fishing grounds.
3348. Do you think the administrative authority ought to be more in touch with the fishermen? Yes, I do.

TUGGERAH LAKES' FISHERIES.

MONDAY, 25 MARCH, 1895.

[The Commission met at the "Royal Hotel," Wyong, at 9:30 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Charles Kavlie, fisherman, Wyong, sworn and examined:—

- Mr. C. Kavlie. 3349. *President.*] Your name is Charles Kavlie, you are a fisherman, and you reside at Wyong? Yes.
- 25 Mar., 1895. 3350. Are you acquainted with the Tuggerah Lakes' fisheries? Yes: I have been fishing in these waters for nearly ten years.
3351. Have you fished anywhere else? In Lake Macquarie. I was there about seven years.
3352. Have you anyone else fishing with you at the present time? No.
3353. What net do you use? A meshing net.
3354. Do you use a hauling net? No.
3355. Why not? On account of the blubber, and it did not pay very well.
3356. Is the length of the hauling net sufficient? I would like to speak about that. The length of the hauling net is 300 fathoms. I think it is wrong to compel a man to use any set length. There are places in these lakes where half of that would be suitable, and other places where double the length is wanted.
3357. As to the mesh of the hauling net—are you satisfied with the mesh of the wings? Yes.
3358. Are you satisfied with the mesh of the bunt? No; I believe in having a smaller mesh in the bunt of the net than is at present allowed.
3359. Have you ever noticed any young fish meshed in the bunt of that net? A few, not many, a few of all sorts, bream, mullet, whiting, but most of them escape through the wings.
3360. Do you think a smaller mesh would be less destructive than the mesh at present used in the hauling net? I think not. The blubber kills small fish; they have been pretty plentiful in the lakes of late years.
3361. Supposing there were no blubber, which net would you consider most destructive to young fish, that with a small mesh or that with a mesh like the bunt of the hauling net? A 2¼-inch is the legal mesh, and lots of small fish are meshed in that and destroyed. If it were smaller that destruction would not take place.
3362. Then you think the destruction with a smaller net would be less than with a 2¼-inch mesh? Most undoubtedly.
3363. What size do you buy your nets—what allowance do you make for shrinkage? We always buy 2½-inch for a 2¼-inch.
3364. Do you make the same allowance in respect to every net you purchase? No, only the garfish net and the hauling net.

3365. Have you ever had any of your nets seized? Yes.
3366. Was that for fishing in closed waters, or were they of an illegal mesh? For neither one thing nor the other; my nets were unlawfully seized. Mr. C. Kavlie.
3367. Do you think the inspector was not justified in taking your net? The inspector wanted to take the net away from me without measuring it; this I would not allow, and I was prosecuted for obstruction. 25 Mar., 1895.
3368. Were you fined? Yes.
3369. Had you any evidence to prove you asked the inspector to measure your net? Yes, I had; but I think the inspector had bribed the men not to attend at the Police Court.
3370. Who was the inspector? Chudleigh Gorrick.
3371. Was he a permanent inspector? No; an honorary inspector.
3372. An honorary inspector? Yes; he said the week before he caught us, "I only want four or five boats this week to get my name up, and then I will be satisfied." I heard him say that.
3373. Was your net confiscated? No; I did not let him take the net; I was fined; it cost me £12 10s.; but I did not pay the amount, I went to Maitland Gaol for one month. In addition to the £12 10s. it cost me £10 10s. for a lawyer.
3374. Why did you not pay the fine? I had no money, and I had not earned that amount in twelve months.
3375. Did you use that net afterwards? No; I did not. There were six of us working together, I was working on a share.
3376. Did the other members of the party use it? Yes.
3377. Were you or any other member of your party prosecuted for using this net which was supposed to be of an illegal mesh? We were not prosecuted for using the net illegally, but for obstruction.
3378. So that the net has been used since by those who were working with you? Yes, it has, and it has not been seized.
3379. Do you contend now, as you did at first, that your net is of legal mesh and length? Yes.
3380. Do you consider yourself to have been unjustly dealt with through the action of Honorary Inspector Gorrick? I do.
3381. Do you believe that when once a net has been passed as legal fishermen should be allowed to use it until it is worn out? Yes; otherwise it would not pay a man to buy a net.
3382. Do you think a fisherman's net should be confiscated for offences under the Act? No; that is the greatest wrong of the whole lot.
3383. Do you think it would be better to impose a fine, or sentence a man to imprisonment—say, for not exceeding seven days—rather than take his tools of trade away from him? I do not hold with taking away a man's tools of trade. As it is we are only working for a bare loaf of bread; give us an opportunity to make a living, and we will have no grievances.
3384. What is the value of a hauling net generally? On an average you can get a fair hauling net with ropes and everything for about £30 to £35.
3385. Do you haul your net ashore so that the fish are stranded, or do you empty it in a certain depth of water? I empty in a certain depth of water.
3386. Do you carry both lines on to the shore, your lead line and top line being out of the water, and allow the flue of the net to remain in about a foot of water? The hauling net we always land on shore when we can, and when we cannot do so on account of the weeds we use what we call a back net.
3387. Have you any complaint to make about the length of the meshing net? Yes.
3388. What would you like it to be? Quite as long as a hauling net, provided it is a big mesh, then no small fish would be destroyed.
3389. What mesh would you like? From 3½ inches upwards.
3390. Are you of opinion that at the present time a lot of marketable fish escape in consequence of the 4-inch mesh being too large? Yes, a good lot of marketable fish escape through the mesh, like the whiting, and the tallygalan mullet.
3391. I suppose you would like the net to be of any length up to a limit of, say, 300 fathoms, and the mesh not less than 3½ inches;—would that enable you to earn a better livelihood? Yes, that would give us a better chance.
3392. Are you satisfied with the length and mesh of the garfish net? We could manage with it twice as long; we want a longer net to reach the fish in the deeper water, as they are scattered about a good deal.
3393. Are you satisfied with the meshes, 1½ inch in the bunt and 2 inches in the wings, of the garfish net? When that net is new it is rather big for us, rather large, and it takes several tannings to reduce it to a legal mesh.
3394. What tan do you use? For the meshing net oak bark and wattle, for the other nets ironbark.
3395. Why do you use different tanning material for the different nets? The meshing net requires to be kept soft; fish would not strike a hard net so well as a soft net; they mesh better in a soft net, and this is brought about by the use of oak or wattle bark when tanning; ironbark tanning preserves the hauling nets from destruction by the blubber.
3396. What length of garfish net would you like; would 150 fathoms be satisfactory to you? My opinion is that it would be better to have 150 fathoms, but I do not care about the fixed length.
3397. Do you think it would be a good provision to make to allow a man to use a net of whatever dimensions he liked, providing it was not longer than (say) 300 fathoms, and that he was compelled to empty that net in not less than 1 foot of water, and further, that he should be punished for sending undersized fish to market? That would be better than the present law, but I am not in favour of fixing any lengths for nets. I would punish fishermen who wilfully destroy small fish.
3398. Do you believe in allowing inspectors one-half the fine in connection with prosecutions? No, I do not; if a man cannot do his duty without being bribed like that he ought not to hold the position.
3399. Judging from your answer, are we to suppose you think that provision acts as an inducement to inspectors to persecute the fishermen? Yes, I do; I even believe they have their marks, for directly a man makes a little money the inspectors come down on him like a hawk.
3400. Where do you send your fish? To the Woolloomooloo Market.
3401. What is your average catch per week? From two to three baskets, that is by myself.
3402. What kinds of fish do you catch? Chiefly flathead and mullet.
3403. Do you consign to an agent? Yes.

Mr. C. Kavlie. 3404. Are you satisfied with your returns? No, we get very poor prices.

25 Mar., 1895. 3405. Would you be satisfied if you obtained one-half of what the public pay for fish? Yes, I am sure we would. We get 2s. or 3s. per basket, and people in Sydney have told me they could not get fish for love or money. I believe the dealers form a ring and bid so much for the fish and no more.

3406. Are you of opinion that it is possible for the agents to join with the dealers in order to derive benefit for themselves, which properly should be divided between the fishermen and the agents? It could be done.

3407. Have you a knowledge of the Woolloomooloo Market? Yes.

3408. Are you satisfied with the way fish is displayed there? No, it is a most filthy way; I worked there for three or four months laying out fish, so I know a little about it.

3409. Would raised tables be better? Far better; it would be a lot cleaner, the fish would not be trodden upon, and they would not be stolen. I have seen men standing round a heap of fish on that floor, and I have seen others kicking them behind them with their heels, and someone at the back of them picking the fish up; that is how some of the fish go in that market.

3410. Have you ever lost fish in transit between Wyong and the market? Yes; I had two and a half baskets one morning, and I lost half a basket, and fish fetched good money that morning, too.

3411. Where does the pilfering take place, on the railway line, or between the railway station and the market? I think there is a little picking all along.

3412. Do you send your fish to catch the early sale? Yes.

3413. Do you think it would be a good thing to have more than one sale in the day at the market? Yes, if you can get trains to suit; it would pay at places that have proper train convenience.

3414. Do you think the Woolloomooloo Market is centrally situated, or would you advocate the erection of a market on a more central site? I think it is out of the way.

3415. What in your opinion would form a good central site? Near or at the railway station would be a good place; there would be less handling.

3416. Do you know the waters of Tuggerah Lakes very well? Yes, I do.

3417. Do you think all the closures in the lakes are necessary? Well; I have heard the opinions of most of the fishermen, and they say that the closure at the entrance should be narrowed down to one quarter of a mile instead of half a mile. We are as anxious to protect the fish as anyone. I think there should be no closures at all except at the entrance, and the closure of the flat in the middle lake should be done away with. The lakes are naturally closed by weeds; it is impossible to haul a net on half of this lake.

3418. Would you favour the use of the meshing net in closed waters? A meshing net should be used anywhere; it destroys no small fish.

3419. You have been here for a number of years; have you ever known of any of the Fisheries Commissioners making official visits to the lakes? Dr. Cox was here once or twice; I saw him on the creek coming from Mr. Allison's place, he was examining the creek to see if he could find any cobra.

3420. Did he go any further on that occasion? I cannot say.

3421. Whose boat was he in, the boat belonging to the Department of Fisheries? He was in Mr. Allison's boat; Mr. Allison was with him.

3422. Was one of the inspectors of fisheries with them? No.

3423. Do you know of any other occasion when Dr. Cox or any other members of the Fisheries Commissioners have visited this place? No.

3424. Would you have been likely to hear of their visit had they been here officially? Yes.

3425. In regard to the supervision of the Tuggerah Lakes, is there an inspector stationed here? No.

3426. Do you have visits from inspectors? Occasionally; since Mr. Aldrich left Tuggerah not many have come down here.

3427. Was Mr. Aldrich a permanent inspector here? Yes, once.

3428. Do you ever have a visit from Mr. Smithers? Yes; sometimes he crawls through the bush on his hands and knees.

3429. Have you ever known him to disguise himself to catch fishermen? On one occasion he went to Mr. Smith, at Wyong Bay; he keeps a boarding house there. Mr. Smithers went there and said he was a gentleman from Sydney come down for the good of his health; he asked for the loan of a boat, and got it; if Mr. Smith had known who he was he would not have lent him the boat. He got out at Tuggerah platform, and went to Smith's place, so that the fishermen at Wyong would not know he was coming.

3430. Have you ever known him to wear a false beard or anything of that description? No; I have not.

3431. Are you satisfied with the way in which the fisheries of the Colony are administered and controlled? No; I am not. I have known of 100 fishermen breaking the law within the last ten years, and they are breaking it to-day; they are compelled to do so to make a living, or they would starve. The Fisheries Commissioners have known of this all along, but have done nothing to improve matters.

3432. If the fishermen were represented in connection with the authority charged with the administration of the Act would it be better for them? It would be a good thing, the fishermen should be represented on a board.

3433. Do you believe in placing any limit on the number of fishermen that should haul on (say) Tuggerah Lakes? No.

3434. Have you ever done any well-boat fishing? No.

3435. Any trawling? No.

3436. Do you know anything about oyster fishing? No; my fishing experience has been confined to net-fishing.

3437. Have you done any fish curing or smoking for market? No.

3438. Have you engaged in crayfish fishing? No.

3439. Have you done any prawn fishing? A little.

3440. Are there many prawns in the lakes? A good few, but they are not large enough; we sent away half a basket full a few weeks ago, but they were too small.

3441. *Mr. Thompson.*] Do you not find the present form of license inconvenient to keep by you;—is it not liable to get destroyed by water? Yes; we are supposed to carry the license in the boat, but not one man on the lake does it; they would get destroyed in a day. It would be a good thing to have little brass tickets with a number on them; that would be quite sufficient.

3442. Do you think that aliens should be naturalised before becoming licensed fishermen? I believe a man ought to be a certain number of years in the Colony before he can claim naturalisation papers. Mr. C. Kavlie.
25 Mar., 1895.
3443. Would you license amateur fishermen—line fishermen—would you make them pay a nominal sum? I think they could well afford to pay a nominal sum.
3444. Do you think the present fisherman's license fee too high? Yes; sometimes the men do not earn enough money to pay for it. I have not earned more than my tucker since Christmas, and yet I am now being pressed to take out a license.
3445. Then you have not your license even yet? No; and I see no prospects of getting one, and yet I am obliged to fish to live. The license fee is demanded at the most inconvenient time of the year.
3446. What time of the year would be best for the Government to claim the license fee? Quarterly. We would like to have the fees reduced to 5s. for the men, and 10s. for the boat.
3447. Have you any trouble in trucking your fish at the Wyong Railway Station? No; we pay a man to do the work and he does it.
3448. Would it be preferable to send fish in boxes instead of baskets? Yes; I should think boxes of galvanised wire netting would be a great improvement, especially if they were locked.
3449. Do you believe in sending fish gutted to market? We would willingly do so if we could make enough out of it to pay for the extra labour.
3450. Would it be an advantage to the fisherman if he were permitted to sell his own fish at the market? It would be an advantage if it could be done.
3451. Would it be a good plan to have the twine tanned once or twice before it is made up into netting? It would be great; the tan does not get into the nets properly when the net is made up.

Mr. Jeremiah Cremen, fisherman, Wyong, sworn and examined:—

3452. *President.*] What is your name? Jeremiah Cremen.
3453. Where do you reside? Wyong; I have lived here about eight years. Mr.
J. Cremen.
25 Mar., 1895.
3454. Are you a licensed fisherman? I have not renewed my license since the new year. I have three boats working on the lake now.
3455. How many men have you? Eight working with me now.
3456. In the evidence you are about to give before the Commission do you voice the opinions of any other fishermen? I represent a number of fishermen on the lakes—the men who reside at Wyong and fish on the lakes.
3457. Do you think there should be any reduction in the fees for fishermen's and boat licenses? Yes. At the present time, if the inspectors are strict enough, as soon as you get two men in the boat they will make you pay the license.
3458. Do you mean by that, that a boat proprietor has to pay the license for the two men he takes on? Yes.
3459. What would you suggest as reasonable for the licenses for fishermen and the boat? I would suggest that the boat should be registered, and that that should continue until she is destroyed; the fishing license should be annual, and one-half the price charged at the present time.
3460. Do you think there could be an improvement made in the issue of fishermen's licenses in order to make them more durable—that is, instead of having the license on a piece of paper, would it be better to issue it in the form of a small metal plate? Yes; I think it would be better. At the present we have to carry the license in the boat, and when it gets wet it becomes destroyed, and if we have not got it with us we are liable to prosecution.
3461. How many fishermen are there on the Tuggerah Lakes—I mean, how many do business with Wyong? There are about thirty-five fishermen in Wyong.
3462. What do you think of the idea of limiting the number of fishermen on each fishing ground; would that be just; would it be an improvement; for instance, supposing these lakes to be only capable of maintaining fifty fishermen, do you think 100 fishermen should be allowed here? I would limit the number of boats in any waters.
3463. Do the fishermen complain of having insufficient waters opened to them for net fishing? Well, in regard to this lake there is a lot of it you cannot work with a hauling net; there are 210 chains along the foreshores at the entrance closed, and with this quantity closed it is closing up two of the best hauls we have in the lake.
3464. Do you think that closure should be narrowed down? Yes; I think so.
3465. What would be a reasonable closure to make there? I think $\frac{1}{2}$ mile on each side of the bank of the channel would be quite sufficient.
3466. For what distance out into the lake? The flat runs, I suppose, three-quarters of a mile out, and you would have to go clear of that, to go about a mile out.
3467. Do you think a closure such as that would offer every facility for the fish to make their entrance to the lake? I think so. Fish coming up the channel do not strike to the right or the left; they go straight on.
3468. So that you favour the closure of the entrance to the Tuggerah Lakes? Yes.
3469. Is a great portion of the lakes closed naturally? Yes.
3470. By what? Growing weeds and ridgy bottom.
3471. What proportion is naturally closed like that—one-third or one-half? About half of the lakes is naturally closed.
3472. Then you do not think there is any necessity for further closures in the lakes beyond the one at the entrance? Quite so; the one at the entrance is sufficient.
3473. What kinds of fish do you catch here? Black bream, blackfish, mullet, garfish, flathead, jewfish, whiting, soles, flounders, and red bream.
3474. Do many shoals of fish enter the lakes from the sea? Yes.
3475. What are they? Black bream come in in shoals; also sea mullet, blackfish, and jewfish.
3476. Do you consider the Tuggerah Lakes a breeding as well as a feeding ground? It is a breeding ground to a certain extent, but our supply comes from the sea.
3477. Why do the fish come in here in shoals—to spawn? Yes, to spawn.
3478. Have you ever noticed any evidences of their having spawned here? Yes, you will see the fish come in here full of roe, and if you catch them some time after they are quite soft, showing they have discharged their ova.
- 3479.

- Mr. J. Cremen.
25 Mar., 1895.
3479. So there is local production in the lakes, as well as supplies from the ocean? Yes, that is so.
3480. Can you say when black bream first make their appearance in shoals in the Tuggerah Lakes? In April and May.
3481. When do the sea mullet make their appearance? We seldom get the sea mullet here, we get the hardgut mullet—the sea mullet is a large mullet, the hardgut mullet is a smaller size. The hardgut mullet has been travelling since Christmas, the others do not travel until March and April.
3482. Is not the hardgut mullet simply the same as the sea mullet but in a different stage of growth? The same fish but in a different stage of growth.
3483. Have you ever seen any shoals of fish on the coast passing northward? Yes, I have seen mullet and garfish.
3484. Have you seen any species of herring? I think not; I have heard of them being on the coast.
3485. Do you catch a local herring here? Yes.
3486. Is that herring of any marketable value? We never sell them except as bait to line fishermen.
3487. What is the average number of baskets of fish you send to market in a week? About thirty baskets per week.
3488. How is the fish conveyed from the lakes to the railway station? By steamer and cart.
3489. Is the lake deep enough for a steam-launch? Yes, but the launch cannot get from Wyong Creek to the lake; there is a bar there which requires removing.
3490. If that bar were removed and the launch placed on the lake, would it facilitate the operations of the fishermen by picking up the baskets of fish at different places on the lakes? Yes, very materially.
3491. Would it be a costly undertaking to make a channel from the creek to the lake in order to allow of the steam launch going through? No; if it were done properly the channel would keep itself open.
3492. The fish is taken by the steamer from the fishing boat, then from the launch to the railway station, and consigned to what market? Some to Woolloomooloo and some to Redfern.
3493. What would you value the thirty baskets at; I mean your weekly catch? About £20.
3494. Do you entrust them to an agent to sell for you? Yes.
3495. Are you satisfied with the returns you get? No, I am not.
3496. If you received half the money the public have to pay for fish would you be satisfied? Yes, rather, I should think so.
3497. Would the adoption of a system that would bring you into closer communication with the public be an advantage to you? I think so.
3498. Do you think you would be able to get fair prices for your fish, and would the public be able to get fish cheaper than at present? Yes, I am sure of it.
3499. You send fish to Woolloomooloo Market;—are you satisfied with the manner in which the fish are displayed and sold there? No, I am not.
3500. Do you think it would be better to adopt some other method of displaying;—do you favour the system of throwing them on the floor in heaps? It would be better to have some other method of showing the fish; they are liable to be trodden on, and spat upon, while they are lying on the floor; I have seen them so treated.
3501. Have you ever had any fish stolen in transit? I have received advices saying my baskets were not full, although I had filled them on the lake.
3502. Would it be possible for the agents and the dealers to form a ring for the purpose of purchasing fish at their own prices? Yes, certainly it would be possible.
3503. Do you think there should be more than one sale a day at the market? Yes; it would be a very good thing to have at least two sales in the day.
3504. Do you send your fish in good condition from here? Yes.
3505. Have any of your fish arrived in bad condition? Well, it has been reported that they arrived in bad condition, but I do not believe it.
3506. Supposing the Railway Commissioners placed a refrigerating car at the disposal of the fishermen, would they avail themselves of it? Certainly, during the summer months.
3507. Are you satisfied with the rates charged for the carriage of fish by rail? They are very fair.
3508. Do you get your returned empties carried free? Yes.
3509. Have you lost any returned empties? They go astray at times, but they eventually turn up.
3510. What nets do you use? A hauling net, a meshing net, and a garfish net.
3511. Are you satisfied with the length of the hauling net? 300 fathoms—I am not.
3512. What would you propose should be the length? Well, for these lakes and others like them, I think 500 fathoms of net would be little enough.
3513. Are you satisfied with the mesh of the hauling net? The size of the mesh for the hauling net is $2\frac{1}{4}$ inches in the bunt, and 3 inches in the wings. You cannot buy $2\frac{3}{4}$ inches in the small mesh, and if you buy $2\frac{1}{4}$ inches and tan it, it shrinks, until it becomes too small, and the net is illegal.
3514. What do you tan your nets with? Wattle bark, ironbark, and swamp oak; we tan with the wattle and swamp oak, when the net is tanned and cured we apply the ironbark to harden it.
3515. Are you satisfied with the length of the meshing net—60 fathoms? No, we would like it much longer.
3516. Are you satisfied with the mesh of that net? No; we would like from $3\frac{1}{2}$ inches up.
3517. Is it a fact that numbers of marketable fish escape through that mesh—4 inches—at the present time? Yes; the $3\frac{1}{2}$ inches would catch them.
3518. As to the garfish net? The length of the garfish net at the present time is 90 fathoms, we think it should be lengthened.
3519. What would be a fair thing? 150 fathoms.
3520. Do you require any alteration in the mesh of that net? Fifty fathoms of $1\frac{1}{2}$ inch and two wings of 50 fathoms of 2 inches.
3521. You do not ask for any reduction in the mesh of the garfish net? No, I think it is small enough.
3522. Do you haul your nets right on the shore? No, we land against a back net.
3523. Does that give facilities for the young fish to escape? Yes, it lets the young fish get away.
3524. What depth of water do you land in? About 18 inches of water.
3525. Have you ever seen many young fish meshed in the $2\frac{1}{4}$ -inch bunt? No; you will get a few little mullet and black bream catch their heads in it.

Mr.
J. Oremen.
25 Mar., 1895.

3526. What do you think of a provision which would allow the use of nets of any dimensions so long as they were emptied in not less than 1 foot of water, and provided that fishermen should be punished for sending undersized fish to market;—would that be a good provision? It would; the fishermen ought to protect the young fish for their own interest.

3527. And do you think that is generally done on the Tuggerah Lakes? To a certain extent it is.

3528. Do you think any harm could result from the use of the meshing net in closed waters? I see no harm in it, providing it is not used at the lakes entrance. I would keep that entrance permanently closed to net fishing.

3529. Do you think that by the use of the meshing net in closed waters, other than those you have just mentioned, many marketable fish could be captured and brought into consumption? Yes.

3530. Do you believe in that provision in the Act which allows of a man's net being confiscated? No; I do not think that a man's tools of trade should be taken from him—not for the first offence at any rate.

3531. Have you ever had any nets seized? No.

3532. Have you known of others who have had nets taken from them? Yes.

3533. And have they, owing to the operation of the Act, been deprived of their means of obtaining a livelihood? Yes, for the time being.

3534. What would be the cost of an ordinary hauling net of 150 fathoms? Thirty pounds—that is, for the net itself.

3535. Do you think it would be better to fine a fisherman heavily or imprison him for a period of (say) seven days, rather than take away his tools of trade? I think it would be better to fine him than take away his tools of trade.

3536. Would you also allow him time to pay the fine and give him his tools of trade back? Yes.

3537. Do you believe in having these prosecutions decided as soon as possible after action is taken? Yes, I do.

3538. Do you believe in the continuance of that provision which allows an informer to receive one moiety of the fine? No; he should not receive anything; it leads to persecution. If an inspector sees me entering closed waters he should stop me, and not wait until I break the law.

3539. Are the boundaries of closed waters defined by stakes? They always were up to the present time.

3540. Have the Tuggerah Lakes been left without supervision for any time by the Fisheries Department? Yes; we have had no inspector at Tuggerah Lakes this good while.

3541. Has Mr. Smithers visited this place? Yes, lately.

3542. Has he visited the lakes on other occasions? Yes.

3543. Has he been the means of originating prosecutions against fishermen? Yes, he has.

3544. What mode of procedure did he adopt to catch the fishermen? I was caught once in Big Bay, on the western side of the lake. I was in my camp. I got up and we shot our net. We never knew there was any inspector about until I saw Mr. Grant and Mr. Hesper coming out of the bush. I went up and asked them if they were inspectors. They said they were. I asked them if I could have my fish when I landed my net, and they said I could. Mr. Smithers and Mr. Aldrich were round the lake at the same time and caught a man named Johnson. We landed our net, and put the fish in the boat. I told Mr. Smithers I would pick my net up and wash it and fetch it home for him. He said I could do this for my own benefit. If I had left my net to the mercy of the inspectors they might not have washed it. They would have fetched it home dirty and muddy, and it would have been rotten when I wanted to use it. I was using a net of illegal length. I was summoned, and seven others who were with me. We had to appear at Gosford. We were each fined £2 and costs of court.

3545. Have you known of cases where inspectors have seized nets and neglected to wash them? Yes; I could mention the case of Mr. Gascoigne, whose net was taken away by the inspector, and owing to its not having been washed it became rotten.

3546. Did you ever know or hear of Mr. Smithers disguising his appearance in order to catch fishermen? No, I have not; he comes out in the night and sneaks behind you.

3547. Have you ever heard of his wearing a false beard? No.

3548. Have any of the Fisheries Commissioners inspected these lakes officially? Not to my knowledge.

3549. Did you ever hear of Dr. Cox visiting Tuggerah officially? He has been on the lake with Mr. Allison, and he has been out with Mr. Allison.

3550. Did any inspector accompany him? Not that I know of.

3551. Is he the only member of the Fisheries Commission you know of who has visited the lakes? Yes.

3552. Do you think if the Commissioners had periodically visited the lakes, and had made themselves acquainted with the conditions and circumstances under which the fishermen have to work, some improvement in the way of legislative reform might have been brought about? Yes, if they had come to the lakes the fishermen would have been able to explain their grievances, but they never came; we could not see them, and therefore we were unable to explain what we wanted.

3553. Are you of opinion then that the Fisheries Commissioners could not arrive at satisfactory conclusions respecting matters connected with the fishing industry here without having a local knowledge of the Tuggerah Lakes? No; what they knew nothing about they could not alter.

3554. Have you ever petitioned the Commissioners to obtain redress of your grievances? The only way we have ever approached them is by going to the Colonial Secretary as a deputation.

3555. As a matter of fact then during the many years you have been complaining have you ever received any redress? No.

3556. Do you think, having watched the actions of the members of the Fisheries Commission, that they are the best body to have control of our fisheries, and to administer the Act? No, I do not; the present Commission, to my knowledge, has been of no benefit to the fishermen at all.

3557. Have they not taken that interest in the fisherman and in the fisheries that might have been expected from them? No, they have not.

3558. Can you suggest any improvement in regard to the administration of the Act, and the control of our fisheries? Abolish the present Commission altogether. They are no good. I would have one Commissioner to control, and a local board to advise. I think that would be a very good plan. The fishermen should have representation on the local boards.

3559. Have you had any experience of deep-sea fishing? Not in this Colony. I have done deep-sea fishing at home on the Irish coast.

3560. Have you done any trawling? Yes.

Mr.
J. Crement.
25 Mar., 1895.

3561. Do you think it would be possible to carry on trawling operations on the coast of New South Wales, providing we find suitable bottoms? I think if the coast were properly surveyed and bottoms found it would assist in further developing the fisheries of this Colony.
3562. In what depth of water did you trawl? The banks range from 20 to 50 fathoms in depth.
3563. Have you studied the question of well-boat fishing? Yes; you cannot carry on deep-sea fishing in this warm climate without using a well-beat. Fish would keep very well in the wells in the boats.
3564. Have you been engaged in the capture of crayfish? No.
3565. Have you had any experience in connection with the oyster fisheries? Not in the Colony; I had experience at home, in Queenstown.
3566. Were they natural beds or artificial beds? Natural and artificial.
3567. Did you know of the existence of any disease there among the oysters? Yes.
3568. What was the nature of the disease? As far as I know, a slime came on the water, and the oysters seemed to die; we also found a worm in the oysters at the time, and it killed them.
3569. Did you ever notice any mud in the oysters? Yes, I did.
3570. Have you ever noticed any indications here of deposits of oysters in the deep sea? Yes; I have seen oyster-shells and oysters on the beach outside at the entrance.
3571. How do you account for the deposit of oysters on the foreshores of Tuggerah Lakes; are they from a natural deposit in the lake, or did they come from spawn thrown up from the sea? At times you can go to the entrance and you will not find one oyster there; and if you go again, it may be in a few months, you will find oysters there, as at the present time.
3572. Do you at all times see oysters right on the surf-beaten rocks at the entrance to the lakes? Yes.
3573. *Mr. Thompson.*] Would you advocate the gutting of fish before sending to market? Yes; especially in the summer months, and particularly if there were no refrigerating cars on.
3574. Do you think the Woolloomooloo Market is in the proper position for the sale of fish? Yes; for the fish that arrive in Sydney by sea; but not for the fish that is sent by rail, which forms the great bulk of the supply.
3575. Can you suggest any better site for the market? I should say at or near the Redfern railway station, in order to avoid handling.
3576. Would you allow fishermen to sell their own fish in the markets? Yes; I thoroughly approve of that system, and if it can be carried out, it will get rid of one of the greatest bugbears we have at the present time, namely, the middleman. The middleman ought to be done away with, and then the fishermen would get better prices, and the public would get cheaper fish.
3577. I suppose for that purpose you would like to see the market open all day, instead of having only one sale in the early morning? Exactly, that is what we want, and what ought to be.
3578. Would you make amateur fishermen pay a license fee, say, a nominal sum? Yes, I would; they destroy a lot of undersized fish.
3579. Should they be restricted to the capture of fish of a legal size? Yes.
3580. Do you think that could be done by requiring the amateur line fishermen to use nothing below a certain size of hook? It would minimise the destruction of fish.
3581. Would you refuse licenses to aliens until they became naturalised? Yes.
3582. Do you think the present style of baskets used for sending fish to market could be improved upon? Yes; the baskets should be flatter, and then the fish would have more room. At the present time, the basket is round and high, and the fish are heaped in one on top of another,—the consequence is that the fish at the bottom of each basket get crushed, and they are not fit for food.
3583. Do you think boxes made of galvanised wire-netting would be an improvement, especially if they were locked? Yes, it would; the fish would not be crushed, and they would have plenty of air.
3584. Which in your opinion is the most destructive to fish, a small-meshed net or a large mesh? The fish that mesh in a big mesh, 2½ in., will die; very few fish get meshed in the smaller net, the garfish net, if you land in deep water and turn those fish out that are not hurt.
3585. What proportion of net do you place on a given length of line? I hang the bunt on the half, and the wings on the third.

Mr. Nicolas Boyaze, fisherman, Tuggerah Lakes, sworn and examined:—

Mr.
N. Boyaze.
25 Mar., 1895.

3586. *President.*] Your name is Nicolas Boyaze, and you are a licensed fisherman; how long have you resided here? Seven years.
3587. How many boats have you? Three at present—I had five.
3588. How many men are working with you? Six men.
3589. Have you fished the Tuggerah Lakes only? Yes, only the lakes.
3590. How many baskets of fish do you catch in a week on an average? About ten baskets per week now; fish were very plentiful before Christmas; I used to catch over thirty baskets a week then.
3591. Are your fish brought from the mouth of Wyong Creek by steamer to Wyong? Yes.
3592. For which you pay 6d. per basket? Yes.
3593. Would it be a convenience to you and the other fishermen if the mouth of Wyong Creek were opened, and a channel made, so that a steam launch could visit the different hauling grounds and pick up the fish? It would be a great advantage.
3594. Do you send your fish to Sydney? Yes.
3595. To the Woolloomooloo Market? Sometimes to Woolloomooloo and sometimes to Redfern.
3596. From which markets have you received the best returns? They are about the same.
3597. Do you consign to an agent? When I send to Redfern I send to an agent; when I send to Woolloomooloo I consign to a private man who puts the fish where they will sell first.
3598. Are you satisfied with the returns you get for the sale of your fish? No.
3599. Do you think you ought to get a bigger price considering what the public have to pay? Yes, I do.
3600. Supposing you received half of what the public have to pay for fish, would you be satisfied? Oh, yes, I would.
3601. Do you think it would be any advantage to the fishermen or to the general public if they could be brought into closer communication with one another? Yes.

Mr.
N. Boyaze.
25 Mar., 1895.

3602. Do you approve of the manner in which fish are sold in the Woolloomooloo Market? No; I am against the way they have of disposing of fish at the Woolloomooloo Market. Fish ought not to be thrown on the floor as they are there.
3603. Would it be better to exhibit them on raised tables? Yes.
3604. Can you suggest a more central site for a fish-market than Woolloomooloo? Yes; we should have one central market near the railway station; that would save the handling of fish, and there should be more than one market for the sale of fish.
3605. Should there be more than one sale a day? It would be better to have two sales a day—morning and evening.
3606. Are you satisfied with the rate charged for the carriage of fish on the railways? I am satisfied; we can send a basket of fish from here to Sydney for 7½d., that is, anything over three comes to 7½d.
3607. If the Railway Commissioners were disposed to place a refrigerating car on the line for the convenience of the fishermen; and the markets were opened all day for the sale of fish, would that be beneficial to you? Yes, during the summer months especially.
3608. Have you ever lost any fish in transit? Not often on the railway; but I have lost a deal of fish between Darling Harbour and the market in Woolloomooloo.
3609. What is your opinion regarding the licenses issued to fishermen and fishing boats? My opinion is that the boats should be licensed, but that the men employed by the owner of the boats should not be licensed.
3610. What nets do you use? Hauling nets, meshing nets, and the garfish net.
3611. As to the hauling net;—is that sufficiently long for you now? 300 yards are not sufficient for these lakes.
3612. I suppose you were glad to have the provisions of the Amending Bill, giving you 600 yards instead of 300 yards, extended here? Yes.
3613. Was it difficult for you to get a living with the 300 yards? Yes; we had to break the law every day.
3614. Are you satisfied with the mesh of the hauling net, or would you like it smaller? I am satisfied with it just as it is.
3615. Have you, when hauling, found that young fish, more particularly the bream species, have become meshed in the 2½-in. bunt? Not in this lake so much; I have landed my fish from the water.
3616. You never haul your nets to the shore, and strand the fish? No, we do not.
3617. Are you satisfied with the length of the meshing net? It would do no harm to extend it.
3618. You use a garfish net—are you satisfied with the length and mesh of it? In catching garfish we always bull-ring them, and the 30 fathoms in the bunt is not sufficient for us to catch what we require.
3619. Are you satisfied with the mesh of that net, or do you advocate the use of a smaller mesh? The mesh at present in use is quite satisfactory.
3620. What is your opinion regarding a proposal to allow fishermen to use nets of any length up to 500 fathoms, and of any mesh so long as the fish are emptied from the nets in at least 1 foot of water, stringent provision to be made that no undersized fish should be caught or sent to market; would that be better than the present complicated system of varied lengths and meshes of nets? It would be much better.
3621. Do you think any harm would result from the use of the meshing net in closed waters? No; no harm at all.
3622. Do you agree with that provision in the Act which allows of a man's tools of trade being taken from him? No.
3623. Do you think he ought to be given another chance before his net is taken from him? Yes.
3624. Do you believe in half the fine being given to the inspector or informer? No, I do not.
3625. Do you believe in closing certain waters in Tuggerah Lakes? Yes.
3626. What portion of the lakes should be closed? The entrance to the lakes should be permanently closed.
3627. Do you think that if the entrance was permanently closed in order to allow of the free ingress and egress of fish there would be any necessity for other closures? No.
3628. Is there a large area of the lakes naturally closed at the present time? Yes; all the creeks, and some flats, owing to the existence of weeds and a bad bottom.
3629. Has an officer of the department been permanently stationed here as inspector during the last couple of years? One has visited us during the last year, but there is no resident inspector on the lakes.
3630. Has Mr. Smithers ever visited you? Occasionally; once this year.
3631. Has he taken out any summonses against people? Two in the last three months, two boats, and there were seven men in the boats.
3632. Do you know whether Mr. Smithers has disguised himself by wearing a false beard in order to catch the fishermen? No.
3633. Have any members of the Fisheries Commission visited these lakes? For pleasuring, not on duty.
3634. Who was down here? Dr. Cox.
3635. Did he not have an assistant inspector with him then? No.
3636. Who was with him? Mr. Allison and some other people from Sydney.
3637. Did he make any official inspection? No; he did not.
3638. Have any of the other Commissioners visited the lakes officially? Not to my knowledge.
3639. Do you think matters might have been improved, and necessary reforms might have been brought about, if the members of the Fisheries Commission had visited you more frequently, and thus acquired more knowledge of the circumstances and conditions of the fishing grounds? Yes.
3640. Do you believe in the present Fisheries Commission? No, sir; wipe it out altogether, and start afresh.
3641. What lines would you propose to start on? I would appoint a good man, a good practical man as head of the department, and give us local boards, the fishermen to be represented on those boards to advise the man at the head of affairs.
3642. Do you think that would work more satisfactorily in the interests of the fishermen as well as in the public interest? Yes.
3643. Do you know whether there are any crayfish fisheries on our coast? Plenty between here and Sydney.
3644. Do you think there is room for development in that direction? I should think so.
3645. Do you know anything about the oyster fisheries? No.
3646. Do you know anything about well-boat fishing? No.

- Mr. N. Boyaze.
25 Mar., 1895.
3647. Have you any knowledge of trawling? No; not in this country, I have seen them working very successfully in the old country.
3648. Is the evidence you have given to this Commission, evidence that would be given by nine out of every ten fishermen on the Tuggerah Lakes if they were present? Yes, it is.
3649. *Mr. Thompson.*] The present fisherman's license—the paper license—is it convenient for you? We are supposed to carry them with us, but we do not; they get destroyed.
3650. Would it be better to have a small medal, something that could be attached to the watch chain? Yes.
3651. The baskets you send your fish in, are they satisfactory? They could be improved.
3652. Would it be an improvement to have boxes made of galvanised wire-netting stretched on iron frames? That would be much better than baskets both in the winter and in the summer.
3653. Would it not be an advantage to send your fish to market gutted and cleaned? Yes; I would sooner clean one haul of fish than set to work and make another haul, and I could make more profit by it.
3654. Do you think it would be an improvement if fishermen were allowed to sell their fish at the market thus doing away with the agents altogether? Yes; it would be a great privilege, and it would do away with rings and other abuses. I have seen my own fish on the market floor, and I have seen one of the corporation officials in the act of stealing one of the finest on the heap, and when I remonstrated with him I was told I would be given in charge if I made a fuss.
3655. Which is the most destructive to young fish the hauling net or the garfish net? It depends on how they are hauled; if the garfish net is hauled to the shore it would kill a great number of small fish; if it was emptied in a certain depth of water those small fish would escape; in that way I favour the net with the smaller mesh.

- Mr. Francis Aldrich, Assistant Inspector of Fisheries, Lake Macquarie, sworn, and further examined:—
- Mr. F. Aldrich.
25 Mar., 1895.
3656. *President.*] How long is it since you visited the Tuggerah Lakes in your official capacity? Twelve months.
3657. Has anyone been exercising supervision over the fisheries there since you left? There has been no resident inspector in that time.
3658. So that it would be quite possible for the fishermen, in the absence of any supervision, to haul in closed waters as much as they liked? Exactly so.
3659. Practically the closures could be made of no value whatever to the fisheries? That is so.
3660. Do you think the closure of the entrance to the lakes is a justifiable one? Well, the channel and for a smaller distance north and south of the channel would answer the purpose.
3661. Would you make that a permanent closure? I would.
3662. How many men are employed on the lakes fishing? About sixty.
3663. Do they catch the best classes of fish? Yes.
3664. Are there great portions of the lakes closed to net fishing owing to the growth of weeds and bad bottoms? While I was stationed here a great portion of the lakes was overgrown with a weed they call stack grass.
3665. Did that prevent the men hauling on those grounds? Yes.
3666. Do the fishermen use the same class of nets as they do at Lake Macquarie? Yes.
3667. During the time you were stationed here as resident inspector, did you ever know of any members of the Fisheries Commission visiting the lakes officially? Not to my knowledge.
3668. Did you ever hear of any one of them visiting the lakes? No.
3669. At any rate you were never acquainted with any intended visits of the Commissioners, supposing they did come to the lakes? No.
3670. I have one more question to ask you; would the evidence given by you in respect to the fisheries of Lake Macquarie apply to a great extent to the Tuggerah Lakes fisheries? Yes, it would.

Mr. Robert Izzard, steamboat proprietor, Wyong, sworn and examined:—

- Mr. R. Izzard.
25 Mar., 1895.
3671. *President.*] What is your name? Robert Izzard.
3672. Have you been a resident of Wyong for many years? Yes, seven years.
3673. Have you during that time been closely connected with the operations of the fishermen? For six years I have done all their business; I carry the baskets of fish from the mouth of the creek up to this place.
3674. Do you know the number of baskets of fish sent away from Wyong in 1894? Well, according to the figures obtained from the Railway Department, 17,783 baskets were sent away in that year, but several of these were half baskets; I make the number to be 14,373 baskets for 1894.
3675. What would you consider the average price of each basket? I suppose they would average up to about 8s. taking them right through.

PORT STEPHENS AND MYALL LAKES FISHERIES.

SATURDAY, 6 APRIL, 1895.

[The Commission met at the "Sea Breeze Hotel," Nelson's Bay, Port Stephens, at 2 p.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Samuel Lilley, fisherman, Port Stephens, sworn and examined:—

- Mr. S. Lilley.
April, 1895.
3676. *President.*] Your name is Samuel Lilley, and you are a resident of Port Stephens;—how long have you resided here? Fifteen years.
3677. Have you been engaged in fishing operations during that time? Yes.
3678. Have you been satisfied with the working of the Fisheries and the Oyster Fisheries Act? I have found them defective in some cases. 3679.

3679. You understand, I suppose, that this is a Royal Commission, and is distinct from the Fisheries Commission in Sydney? Yes. Mr. S. Lilley.
3680. Are you engaged in net fishing at present? Yes, I have only been a licensed fisherman these last three years, but I have been twenty-five years altogether fishing. 6 April, 1895.
3681. Prior to that had you been connected with the oyster fisheries? Yes.
3682. Have you a license for your boat? No, I am fishing in another licensed boat.
3683. Are we to understand that the evidence you are about to give to-day will be that which would be given by the majority of the fishermen in Port Stephens? I think so; I have been the representative of the fishermen of Port Stephens for some time past, and will speak on their behalf to-day.
3684. How many fishermen are there in Port Stephens? About sixty fishermen.
3685. Are you satisfied with the license fee and the fee charged for a boat license? I think it a fair thing, but would prefer to pay for the licenses quarterly or half-yearly.
3686. What nets do you use in Port Stephens? Generally 150 fathoms in length.
3687. Have you had the provisions of the Amending Act extended here, giving you the privilege of using a net 300 fathoms long? Not that I am aware of.
3688. Do you find the 150 fathoms sufficient? No.
3689. Would you like the provisions of the Amending Act extended here, allowing you to use 300 fathoms? Yes.
3690. Of course, I am speaking with regard to the hauling net;—are you satisfied with the mesh of the bunt of the hauling net? I think the fishermen seem satisfied with the mesh of the bunt of the hauling net; they require a greater length of net.
3691. In using the hauling net, do the fishermen generally strand the fish or empty them in a certain depth of water? Generally strand them.
3692. Have you found many of the bream kind meshed in the 2½-inch bunt? Not many bream; very small whiting get meshed in the 2½-inch bunt.
3693. Is that because there is not many of the bream kind frequenting Port Stephens, or do they manage to work through the mesh? We mostly catch sea bream—mature fish—here.
3694. Do you look upon Port Stephens as a breeding ground? Yes, I do.
3695. You say the fishermen do not empty their nets in any depth of water? If they get a good haul of fish they generally empty them in about a foot of water.
3696. When hauling their nets do they allow, when they have a good catch, the lead line to be on shore as well as the cork line, allowing the flue of the net to remain in the water? Yes, they do.
3697. Are you satisfied with the mesh of the wings of the hauling net, 3 inches? Yes.
3698. You have said that little whiting get meshed in the 2½-inch bunt; if that bunt were made smaller would those fish be preserved? Yes. The majority of nets used here now are garfish nets, 1¼ inch, and they do not destroy any small fish.
3699. Then I suppose you contend that if the mesh were smaller the nets would be less destructive to the small fish? Yes.
3700. Is the meshing net used here? Not much.
3701. Do you think 60 fathoms is sufficient for that net? No.
3702. Would you like it extended to, say, 300 fathoms? Yes.
3703. As to the mesh of that net, 4 inches, is that too large or too small to have as a minimum? I think it is too large; it should be reduced to 3½ inches, because many marketable fish escape through the 4-inch mesh which could be caught if we had a smaller mesh.
3704. Are the fishermen satisfied with the length of the garfish net? Yes, it is quite long enough.
3705. Is the mesh satisfactory? Yes.
3706. How do they catch garfish here, by hauling the net ashore, or bull-ringing them? By hauling them ashore.
3707. The garfish you refer to would be the sea garfish? Yes.
3708. Do they use prawn nets here? None in Port Stephens. I think there are one or two men who use them at the Myall Lakes.
3709. Are any other kinds of nets used here in addition to those you have mentioned? No.
3710. What would you think of a proposal of this description: that with the view of doing away with the present complicated system of differing lengths and meshes of nets, the fishermen should be allowed to use a net of any length up to 300 fathoms, and of any mesh they liked, providing they were compelled to empty their catches in not less than 1 foot of water; and further, that there was a stringent provision to prevent the sending to market of undersized fish? I believe in that. I think the restriction should be in the fish going to market.
3711. Do you think there would be less destruction of the smaller fish, and that it would be more satisfactory to the fishermen? Yes.
3712. Has there been a general desire on the part of the fishermen to protect the young fish here? In all cases I have seen they have been returned to the waters.
3713. In connection with the seizure of nets for being of an undersized mesh, are you of opinion that such nets should be confiscated? No, I am not.
3714. Would it be better to fine a man heavily, or imprison him—say, for seven or fourteen days—rather than take his tools of trade away? Yes.
3715. As a rule, have the fishermen at Port Stephens taken the necessary precautions to have the proper length and mesh of nets before using them? Yes; when purchasing they have allowed for shrinkage.
3716. When the net is once pronounced to be legal by the local inspector, do you think it should always be held to be legal till worn out? Yes.
3717. Do you favour the use of the meshing net in closed waters, so that the fisherman may catch the marketable fish? Yes; it would only catch marketable fish.
3718. Would there be any fear of the feeding or breeding grounds being disturbed by the use of the meshing net? No.
3719. Are there any closed waters here? Yes.
3720. Do you think all the closures that have been made are justifiable closures? No; the places closed now are only sheltered places for winter fishing.
3721. Can you tell the Commission the closures in force at present? Telligherry Creek, Swan Bay, and the Karuah River—the whole of the Karuah from the punt at Alicetown, 3722.

- Mr. S. Lilley, 3722. Do you know whether the local inspector was consulted with regard to those closures? I cannot say.
- 6 April, 1895. 3723. Would it be better to have an opinion from local residents on matters of that description in every case before taking action? I think so.
3724. Fishing in closed waters;—do you believe in the seizure and confiscation of nets for that offence? No; I would fine or imprison a man, but not take his net away.
3725. Do you think the inspectors or the informers should receive half the fine in connection with offences against the Act? No; their salary should be sufficient for the duties they perform.
3726. Do you think the offering of a moiety of the fine might act as an inducement to inspectors to persecute fishermen? I should not think it would be a man who would do it, although it might be done; I know it has occurred in other rivers.
3727. What classes of fish do you catch in Port Stephens? Bream, whiting, mullet, blackfish, flathead, and garfish.
3728. How many species of bream do you catch? There are four different kinds of bream. There are the sea bream, that is the white bream; the river bream, which is darker; the fresh water bream from the Myall Lakes; and an intermediate bream that we call harbour bream.
3729. How do you account for finding these fish of different appearance in different places;—is it owing to their living in different waters? Yes.
3730. So that it is possible the white bream come in from the sea, and after living in an inlet for a certain period they become the classes of fish you have named? Yes. The last floods we had brought the lake bream down in hundreds of tons, and when we caught them they would not carry five hours; they could not get back into the lakes again, consequently they have made their way to the upper reaches of the rivers and creeks.
3731. What time of the year have you noticed black bream coming into Port Stephens in schools? I have seen them at nearly all times of the year, but they do not come in much further than Nelson's Bay.
3732. Do they come in to spawn? Yes, they do; but they do not go to the upper reaches of the rivers. They return to the sea again after spawning.
3733. Do you know when they are in roe? I cannot say with certainty. I caught 12 baskets of bream three weeks ago, and they were all in roe; the roe was soft.
3734. Would it be possible that these fish breed twice a year? I cannot say; but you can see large schools of bream and whiting anywhere near the outside beaches at the present time.
3735. Have you caught any red bream in the harbour? Yes.
3736. Are they in any quantity here? No.
3737. Have you caught any schnapper in your nets? Only at one place, Salamander Bay. We do not get many schnapper.
3738. Do you think Port Stephens is a breeding ground for the schnapper? They come here in pretty good numbers at this time of the year; they go well up the harbour.
3739. The whiting—do you catch the sea whiting here? We catch the sea whiting at the Heads, but up the harbour we catch the bluenose, or sand whiting. We also have the trumpeter whiting here; they are the richest variety of whiting we know of.
3740. What mullet do you catch? The bully mullet, the flat-tail, and a few tallagallans at the Heads.
3741. Do the sea mullet come into this place in shoals? Yes, very large shoals at times, if there is such a thing as a sea mullet. Mullet are coming down from the rivers and lakes now in quantities.
3742. Do you think that what is termed the sea mullet breeds in the estuaries? I have found it to be so.
3743. You think the supply of mullet in Port Stephens does not actually come from the sea, but is bred in the rivers and estuaries? Mostly in the lakes.
3744. Sea garfish;—where do they come from? We are dependent on the sea for our supply of sea garfish; they are in now.
3745. How do you dispose of your catches? Send them to Newcastle by steamer, and from thence to Sydney by rail.
3746. What do the steamboat proprietors charge for conveying your fish to Newcastle? 2s. per basket for good fish and 1s. for common fish.
3747. Do you include mullet in the common fish? Mullet and blackfish.
3748. Who does the business of consigning your fish to Sydney when it reaches Newcastle? The book-keeper on the steamer at Gosford.
3749. Who pays the freight from Port Stephens to Sydney? The agents in Sydney, and they deduct the difference from the proceeds of our sales.
3750. Have you any complaint to make of the charges made by the Railway Department for the carriage of fish? No; it is satisfactory.
3751. Have you to complain of the loss of fish in transit? No.
3752. To what market is your fish sent? Woolloomooloo and Redfern.
3753. Are you satisfied with the returns received from those markets? No.
3754. Do you think that if the fishermen received say one-half of what the public pay for fish it would give them a fair return for their labour? Yes, I do.
3755. How do you send your fish to market, in baskets or in boxes? In baskets.
3756. Have you any knowledge of the manner in which business at the Woolloomooloo Market is conducted? Well, I would like to give the Commission our experience of the markets. I will put it truthfully and clearly. Say there are four men in a boat, they have a haul, and catch eight baskets in one haul; we send that fish to Sydney in four different lots, each fisherman being a separate consignor of two baskets. We have found that one man would get a good price for the fish, the next man would obtain a fair price, the next would just clear himself, and the next two baskets would be condemned altogether. I could have brought you 100 account sales to prove my assertions, but I did not think they would be required. This has not happened to me alone, but to all the fishermen in Port Stephens. Lately we have been consigning our fish to a Mr. Izzard at Redfern Market, and so far our returns and transactions with him have been satisfactory. At first we thought it might be that our fish were crushed or damaged in some way, but judging from our repeated experience we can only come to one conclusion, and that is that we have been robbed right and left.
3757. Would it be a good idea to bring the fishermen into closer communication with the general public? Yes, it would.

3758. Is it possible for the agents to be in collusion with the fishmongers, so that the prices realised may be only known to themselves, and that they send you such returns as they think fit? Yes, I think that is done. I can say that on the whole, within the last four months, no fisherman in Port Stephens has had £1 clear given back to him from the Sydney markets. The only profit they have had is through the little business they have been doing with the Newcastle Ice Company, which has been started lately for the purchase of fish. They give us 12s. per basket for sand whiting, 8s. for garfish, 8s. for bream or flathead, and 6s. for mullet or blackfish, and this pays us well.
3759. In your opinion is the Woolloomooloo Market centrally situated? No, it is not.
3760. Is the system of displaying fish adopted there a good one? No; the fish should not be thrown on the ground, they are liable to be trodden upon, and this naturally creates a prejudice against the use of fish in the public mind.
3761. Would it be a good thing to establish a system by which the agents could be done away with altogether? Yes.
3762. Do you think one sale per day at the Woolloomooloo Market is sufficient? I think there should be two sales a day; that would suit the ports nearer Sydney much better than Port Stephens; the fish could be sold at the markets and sent into the country by the night trains.
3763. Do you send any fish into the country north of Newcastle? Yes; and it is from those returns I receive my profits.
3764. Do you think it would be a good thing to have a market centrally situated, possessing raised tables upon which the fish could be displayed, and allow the fishermen to sell their own fish to the general public? Yes.
3765. Would you advocate the establishment of auxiliary markets, say, one at North Sydney, one at Burwood, one at Paddington, Newtown, and in other thickly populated centres? Yes; fish would be better distributed than it is at present. It would greatly assist in the distribution of fish.
3766. Would it be a convenience to the fishermen if the Railway Commissioners were to place a refrigerating car on the northern line for the conveyance of fish to the Sydney market? Yes.
3767. Would it be an improvement if the fishermen were to gut their fish before sending to market? I hardly see how it could be done in out-of-the-way places.
3768. But supposing the prices realised for gutted fish paid for the trouble taken, could it be done then? Yes.
3769. Do you think the well-boat system could be utilised for sending live fish to market? I had a well-boat once, I tried it with schnapper, but they did not seem to keep after being caught; we could keep the bream and other kinds of fish.
3770. Did you adopt any process to try and keep the schnapper alive;—did you prick them? No, I did not.
3771. Did they knock themselves about in the well? Yes.
3772. How long did you keep them in the well? The farthest trip we made was to Seal Rocks, I suppose three days from the time we commenced to catch the fish until we reached Newcastle. Newcastle is 44 miles south from the Seal Rocks.
3773. Did the fish show a tendency to float on the top of the well? Yes; they floated on the top.
3774. Did you attempt to feed them? No.
3775. You did not try the process of pricking the air-bladder? No; I did not.
3776. Do you think if you could adopt a system by which the fish could sink in the well rather than knock themselves about on the top of the water, there would be a likelihood of their keeping well? Yes. The boat I had was about 30 feet long; I think she was rather too small to carry the schnapper. I think we had them rather too thick together in the well. If there had been plenty of well room in the boat they might have lived.
3777. Was your well divided? Only the centreboard, in a case through the centre.
3778. What depth of water had you in the well? Three feet 4 inches.
3779. Would it be an advantage if you could sell your fish alive in the market? Yes; it would.
3780. Do you believe in leaving discretion to whatever authority may be established to control the fisheries to regulate the number of fishing-boats that should be licensed to work in certain waters? Well, as far as white men are concerned, there could not be much objection to them working; our great complaint is about the aliens.
3781. Would you make it compulsory on the part of aliens to become naturalised before issuing a license to them? Yes; I have written to the papers to the effect that they should be naturalised before being licensed.
3782. As to crayfish—are the fisheries in a pretty good condition? Plenty of crayfish at Port Stephens.
3783. Do the fishermen find much difficulty in catching, landing, and sending them to market? No difficulty in catching them.
3784. What method of capture do they employ? The hoop nets; but we have a class of fishermen here who are a very undesirable class to license, they are catching crayfish by means of galvanized wire pots.
3785. Where do those men fish? At Broughton Island.
3786. What nationality are they? Italians.
3787. Is that island available for the European fishermen to engage in the capture of crayfish? It used to be the principal ground for the Port Stephens fishermen, but since the Italians have gone there they have taken complete command of the island.
3788. Do you mean to say they prevent the Port Stephens fishermen from landing there? From fishing, not from landing. They have all the principal places taken up by their pots. Our men cannot put their moorings down at all. The Italian pots are everywhere on the principal grounds.
3789. How many of those Italians are there? A great quantity in the season, that is during the latter half of the year.
3790. About how many crayfish-pots would those Italians use at the island? About 800 or 900 pots.
3791. Do they fish all the year round, or only during the season? During the season, the time when they capture the crayfish.
3792. Are they caught in quantities when in roe, that is from June to December? Yes, they are.
3793. Is it advisable that the capture of crayfish should be regulated so as to prevent improper interference with their breeding season? Yes.
3794. What prices do the Port Stephens fishermen realise for crayfish? Only a few pence per dozen.

- Mr. S. Lilley. 3795. Do you know the prices the general public have to pay for crayfish in Sydney? Yes, from 1s. to 1s. 6d. each.
- 6 April, 1895. 3796. Supposing you allowed 1s. for the crayfish, and the fishermen had a return of 6d. for each crayfish, would that be a good return? A handsome return, it would be a gold-mine.
3797. Do you think if the crayfish fisheries were properly regulated, that with a fair demand on the part of the public, and with a proper means of distribution, they could be developed and made to pay the fishermen handsomely? Oh, yes, I do.
3798. Do you think that the possibility of their being destroyed or greatly diminished in numbers should be taken into consideration by the authorities? Yes.
3799. Do you know anything of trawling? Not much.
3800. If the bottoms were found to be suitable would you favour an experiment in trawling by the Government? I would.
3801. Have you seen any shoals of fish on the coast? Yes; mullet and garfish.
3802. Any of the herring kind? No.
3803. Have you done any smoking or curing? Yes; in Port Stephens and on the Hunter.
3804. Did it pay you? No; I sent nine and a half dozen to the Redfern market and got 4s. 8d. for them; they were large mullet caught in a 4-inch mesh. That sickened me; they were properly smoked and had roes in them.
3805. What wood do you use for smoking? Rosewood.
3806. Supposing you had got a return of say 3d. each, would that have paid you? Yes.
3807. Have you had any experience in connection with the oyster fisheries in Port Stephens? Yes; Port Stephens and the Hunter.
3808. Where have you held leases? Only in Port Stephens.
3809. What area did you lease in Port Stephens? About 4,000 or 5,000 yards, but I came down to about 800 yards.
3810. Did those leases turn out a profitable investment? At first they did, but owing to the disease I had to relinquish them.
3811. How long did the disease remain in your beds? Until my leases were forfeited, about five years.
3812. When you discovered the presence of the disease in your beds, and found your oysters were being destroyed, did you make any application to the Government to surrender your leases? No.
3813. You simply took all the marketable oysters off as soon as possible? Yes.
3814. Did the Commissioners claim rent for the whole period you held your leases? Yes.
3815. And did you pay the rent? No.
3816. Did you make any application for forfeiture or surrender, or did the department forfeit them? They forfeited them for non-payment of rent.
3817. Has any claim been made upon you for arrears of rent? Yes.
3818. Have you taken any notice of that claim? No.
3819. Was the forfeiture caused through the presence of the worm disease in your beds, which prevented you getting any return from the lease? Not exactly. I had the money to pay the very day I received the notice of forfeiture. I went to Sydney to the Fisheries Department, and I was told they did not know whether the Commissioners would accept the money or not. They did not accept it.
3820. As a matter of fact you were prevented from obtaining a return equal to the rental you would have had to pay, owing to the fact of the disease having attacked your beds? Yes.
3821. After the five years you spoke of did the oysters on your leases seem to improve? No; they got worse.
3822. What is the present condition of the oyster fisheries in Port Stephens? In some places there are signs of the disease leaving the beds; I mean the foreshores.
3823. Are the Port Stephens oysters generally found in deep water beds? Yes; they are obtained by dredging.
3824. Where are the deep beds? In the Karuah River.
3825. Are there many oyster leases held here? Not now.
3826. Do you believe in the system now in vogue of leasing areas for oyster culture? Yes.
3827. Would you like the present system of leasing to a minimum area of 100 yards continued, or do you favour the proposal to lease an arm or one of the foreshores of a river? I believe in small areas.
3828. But would not a certain number of men have to be employed on the larger areas if they were taken up by one man? My experience has not shown that to be so.
3829. Do you think a man can really get a living off 100 yards of oyster lease? No.
3830. If a minimum making the limit 1,000 yards were struck, would that be better? No; he could not make a living unless he could obtain spat to lay down; of course there are different places in Port Stephens where they grow rapidly; in other places they do not flourish so well. Below the ordinary neap tide there are very few oysters. This is owing to the disease, which attacks the oyster more severely below that line. The disease does not seem to attack half-tide oysters.
3831. So that providing a person could obtain from Crown lands the necessary spat for layings, you think he could make a living off 1,000 yards? Yes.
3832. Do you think a man should be asked to pay an annual rental per 100 yards, or would it be better to charge him so much per bag, in other words, allow him to pay by results? I think both, both rent and so much per bag.
3833. What would you think a fair sum per bag? Two shillings.
3834. Do you think a man should be charged for the spat, or should that be given free? Given free, so long as he pays for the mature oyster. I think the leasing system, with a royalty, would be the best way. That would prevent the Italians and Greeks, those aliens, coming here and denuding the beds and depriving the residents of their living, as they did when the old licensing system was in force.
3835. Do you believe in stringent provisions being embodied in an Act to provide for the proper working of an oyster lease? Yes.
3836. Are many oysters sent from Port Stephens at the present time? Yes; a good many go away belonging to one or two leases.
3837. Are they of fair quality? No, I do not think it.
3838. Do you know about what they get per bag for them? Fifteen shillings, down to 1s. per bag.

3839. How long does it take an oyster to develop to the marketable stage here? About nine months on the good beds in the Karuah River or the Hunter, and about three years on the foreshores. Mr. S. Lilley.
3840. Have the oyster-beds any natural enemies attacking them? Only the stingaree. I had to fence in all my leases to protect them from the stingaree. 6 April, 1895.
3841. Are there any beds here where artificial culture is carried on? Not at present; but on some leases I held I placed 400 or 500 bags of oysters. They are on the beds yet.
3842. Are you simply dependent on the natural beds and the foreshores for the supply? Yes.
3843. Are the oysters you laid down some time ago liable to be stolen? Yes, but there are only two lessees near my place, and they will not touch them. I am in hopes of getting them back again when Port Stephens is opened.
3844. Are you satisfied with the present authority charged with the administration and control of the fisheries and oyster fisheries of the Colony? No.
3845. Have they given that attention to the industry which the public expected they would? No.
3846. Can you tell me whether on any occasion they have visited Port Stephens as a body or individually? Never to my knowledge. I have known Dr. Cox to come here, but not officially.
3847. Do you think, in connection with an institution like the Fisheries Commission, it is essential that the members of such a Board should visit the different fishing grounds occasionally to make themselves acquainted with the different conditions and circumstances? Yes.
3848. Do you think the existing authority might be altered with advantage to the industry? Yes.
3849. Can you suggest any improvement? I think fishermen should be represented on Boards of advice—local Boards. Many little things might crop up which could be dealt with by such Boards if they were empowered to investigate—to advise the head authority. I can speak from personal experience on that point. I believe if we had had a local Board here at the time my leases were forfeited they would have gone into the facts and my leases would not have been taken from me.
3850. You mentioned the word authority;—what authority would you have at the head centre—a Board such as at present exists, or what do you suggest? I think we should have one gentleman at the head—one man would be quite sufficient—a man having a thorough practical acquaintance with the fisheries of the Colony.
3851. Would you make it compulsory on his part to visit the fisheries more frequently than the present Board do? Yes.
3852. *Mr. Thompson.*] Have you any reason to complain of your oysters being stolen? Only on one occasion, some years ago.
3853. Have you heard of any complaints of oyster stealing here? Yes.
3854. Then there has been such a thing as oyster stealing? Yes.
3855. How would you remedy that? No person has been blamed more than I have for stealing oysters off Crown lands and private property. I think I should tell the Commission this, because I am innocent of the charges made against me—that is, of taking oysters off private property. I have taken oysters off Crown lands for laying down on my leases. The chief complaints against me for stealing oysters on private property was from the Hon. R. H. D. White. I have told that gentleman since who it was that was really stealing his oysters. The very men stealing his oysters were the men he had in his employ.
3856. Is the garfish net as efficient for the capture of river garfish as of sea garfish? Yes; the river garfish is a short, stumpy fish, and the sea garfish are what we call needles, and are unfit for market.
3857. Supposing it has been said that the river garfish travel along the net and escape at the ends, whereas the sea garfish make no attempt to escape—is that correct? Yes.
3858. Then the garfish net would not be as effective for the capture of the river as for the sea garfish? That is correct, but we do not fish for river garfish.
3859. Which netting shrinks the most, that made of hempen twine or of cotton? Cotton.
3860. Would it be an advantage if the hemp or the cotton could be tanned once or twice before it is made up into netting? Yes, I would like to see that done.
3861. You send fish to both markets? Yes.
3862. Which is the most convenient? Redfern; there is less cartage and less handling of the fish.
3863. Which, in your opinion, is most destructive to young fish, the smaller mesh or the larger mesh? I think the small mesh.
3864. Is it not a fact that there are less fish meshed in the smaller mesh than in the 2½-inch bunt of the hauling net? Yes.
3865. Do you find the form on which your fisherman's license is issued sufficiently durable? It is made of paper; it is liable to get destroyed.
3866. Would it not be more convenient to have a metal token about the size of a shilling, which you could tack on to your boat, or fix on your watch chain, and thus have a durable license always with you? Yes, I would approve of that.
3867. Do you find there is unnecessary handling of your fish by the railway people at Newcastle? There was; the porters used to throw the baskets into the vans, but that has been put a stop to now, and the arrangements are satisfactory.
3868. Have you considered the question of leasing portions of large waters like Port Stephens to fishermen so that they would have the right to all the fish and oysters therein;—would you approve of the apportionment of Port Stephens like that? I do not favour the system at all.

Mr. Edward Holbert, fisherman, Corrie Island, Myall River, Port Stephens, sworn and examined:—

3869. *President.*] Your name is Edward Holbert, and you reside at Corrie Island, on the Myall River;—do you carry on your fishing operations in the river or in the Myall Lakes? Sometimes in the lakes and sometimes in the Myall. Mr. E. Holbert.
3870. How long have you been fishing in this district? About nine years; I have had many years' experience in fishing. 6 April, 1895.
3871. Have you a good practical acquaintance with the fisheries of Port Stephens? Yes.
3872. Is the fish supply at the present time equal to what it was when you first commenced fishing here eight or nine years ago? There is a good supply now, but they are not quite so thick as they were.
3873. Where does the supply come from—the sea, or is it locally produced? From the sea and from the inlets.

- Mr. E. Holbert.
6 April, 1895.
3874. Is anyone associated with you in fishing? My brother and one man.
3875. What is your average catch per week? From about eighteen to twenty baskets.
3876. What descriptions of fish? Sea garfish, mullet, blackfish. The general run has been garfish and a few whiting.
3877. Any black bream? Yes, a few.
3878. Where do you send your fish? To Woolloomooloo and Redfern Markets.
3879. I suppose you send by steamer to Newcastle, and thence by train to Sydney? Yes.
3880. Have you ever had any fish stolen in transit? I cannot swear I have, but I have my suspicions about it. The agents have grumbled about the baskets not being full, but they were filled when they left here.
3881. Would it be possible for the agents to say the baskets were only half full and for them to pocket the difference? That might be. We are in utter ignorance of what goes on.
3882. To whom do you consign—an agent? Yes, an agent—Hudson, Izzard, and Augustus. I have been trying to get a little by sending my fish to different men, and I have also sent them in the name of the men in the boat.
3883. Are you satisfied with your transactions with the agents? No, I am not. I am a hard-working man. I have a family to look after, and I would not like to wrong anybody; but I am not satisfied.
3884. Do you think the return you get for your labour is a fair one, considering the prices the public have to pay for fish? We do not get one-third of what they pay, and many times we get account sales bringing us in debt. I neglected to bring the bills with me, but I will send them to you. I have a lot of account sales showing me in debt to the agents. I can also show you bills in which I have received 2s. for one lot of fish sold by one man and 6s. for a similar lot of fish, got in the same haul, sold by another man.
3885. Do you think it would be advantageous to bring the fishermen into closer communication with the general public? I do.
3886. Are you satisfied with the market at Woolloomooloo;—is it the best market, so far as situation is concerned? It is not centrally situated.
3887. Do you think a better method of displaying the fish could be devised—could there not be an improvement upon the system of throwing the fish upon the floor? Yes; raised tables would be a lot better.
3888. Would you approve of the fishermen being allowed to sell their own fish in the market? Yes; I think that would be very good. We might get a little then for our labour.
3889. Are you satisfied with the freight charged by the Railway Commissioners? I think it is a little too high.
3890. Are you aware they have made a reduction lately? No, I am not.
3891. When you receive your account sales do they simply state the charges as so much and give you no items? No, they give no details; you have to take what they send.
3892. So that you would not really know what you have to pay per basket for the conveyance of fish from Newcastle to Sydney? No.
3893. Do you think 1s. per basket is a fair charge from Newcastle to Sydney? I think it is rather much for any quantity. I can show you returns I have for twenty-seven baskets of fish sold in Sydney. I got nearly £9, and the charges came to £6.
3894. Did the railway freight only come to 27s. for the twenty-seven baskets;—would not that appear to be reasonable? I think the common fish ought to be carried cheaper; the charge is reasonable enough for prime fish.
3895. Do you think it would be a good idea to have fish sent to market gutted, provided the fishermen could get a return which would pay for the extra labour? Yes, it would; I hold with that.
3896. If a truck with cool chambers in it were placed at the disposal of the fishermen for conveying fish to Sydney, would it be patronised by them? It would, and it would be the means of preventing a lot of fish from going bad.
3897. Have you ever had any returns sent back to you with the remark that so many baskets were condemned? Yes, I have.
3898. Have you ever taken the trouble to ascertain the truth of that statement? No.
3899. Would it be possible for the agent or agents to mark the fish condemned, and for no condemnation to take place? Quite likely. I quite believe that. I have consigned six baskets of fish, some in my name and some in another man's name, and I have had something to take for my fish, but the fish sent in the man's name were condemned, and I have had to pay the charges for them, and yet those fish came out of the one haul.
3900. Do you think it is possible for the agents to be in collusion with the fishmongers? Yes, I do.
3901. Would you as a fisherman be satisfied with a return equal to one-half the price paid by the public for fish? Indeed, I would. We work for nothing, I can assure you.
3902. Are you of opinion there should be more than one sale at the Woolloomooloo Market? Yes; I believe in two sales a day.
3903. Would it be a good thing to have auxiliary distributing markets in populated areas near Sydney and other big towns? Yes, one of the best things that ever happened us.
3904. Are you satisfied with the present Fisheries Act? I am not. I can say that I am not.
3905. Do you believe that it requires amendment? Some of it is very hard on a man.
3906. What nets do you use? The garfish net in the season and a hauling net when the season is out.
3907. When is the garfish season? At this time of the year.
3908. How long does it last? It will last now until the warm weather sets in. The day garfish are in now and in the winter they come at night.
3909. Do they frequent the flats? The dark weedy bottoms, but we mostly get them outside.
3910. What is the nature of the bottoms outside? There are broad dark patches about Broughton Island—patches of kelp; they like to get over there.
3911. Do you bull-ring them? Sometimes we land against the boat, at other times we land on the rocks.
3912. Do you catch many river garfish? They are not very plentiful; we never get very many here.
3913. Are there any large black bream in the Myall Lakes? You can get any quantity.
3914. Are there any large mullet in the lakes? Pretty large. I have seen them from 5 lb. to 6 lb. in weight.
- 3915.

Mr.
E. Holbert.
6 April, 1895.

3915. Have you ever seen one 14 lb. in weight? Yes, a big sea mullet, but not the lake mullet.
3916. Does that mullet simply come into spawn or —? No. It comes in along the southern shore, then crosses to the north and goes out full of spawn.
3917. So that the mullet you catch in quantities in the Myall Lakes are locally produced? Yes.
3918. Are you satisfied with the length of the hauling net? I think a little longer net would be better for us.
3919. Would you be satisfied with 300 fathoms? I would.
3920. Would you be able to haul that net to shore? No; not in the tide, but in the lakes.
3921. Do you think the mesh of the hauling net is satisfactory? I think the big net is.
3922. Do you often find young compressed fish meshed in the 2½-inch bunt? Yes, very often.
3923. So that that mesh is really destructive to that kind of fish? Yes, the wings are; but if the bunt were smaller there would not be so many fish destroyed.
3924. Do you think that when once a net is passed as legal it should always be considered legal until it is worn out? Yes, I do.
3925. When purchasing your netting do you allow for shrinkage? Yes; I always buy my net over the sizes, and many a week I have worked for nothing through that.
3926. In respect to the garfish net, is that long enough? I would like a greater length of bunt.
3927. Does that net destroy many young fish? A great number get meshed in the 1½-inch mesh, but if the mesh were smaller still they would not be meshed.
3928. Do you think the meshing net (60 fathoms) should be longer? Yes, it is very short.
3929. Should there be any alteration in the mesh of that net? I think the 4-inch mesh is correct.
3930. But is it not possible that many marketable fish escape through it? Yes; there is no doubt about that.
3931. Do you think much injury would be done to the fisheries if that mesh were reduced to 3 inches or 3½ inches? No; because you would catch as many marketable fish as would go through the 4-inch mesh.
3932. Do you think there could be any harm resulting from using such a net in closed waters? I do not think so, not in the closed waters in Port Stephens.
3933. Do you think there would be any harm in catching the marketable fish? No.
3934. Would it be a wise provision to allow fishermen to use any length they liked up to a length of 300 fathoms, with any mesh they liked, provided they emptied the net in at least a foot of water, and further that a provision should be made to prevent the sending of undersized fish to market? I think that is correct. No experienced man will destroy small fish; it is a man's own fault if the small fish are killed, that is, provided there is no blubber in the net—if there is blubber the fish are killed before the net is hauled in.
3935. Do you believe in that section of the Act which allows of the seizure of nets for the first offence? No; I do not.
3936. Do you think a fisherman's tools of trade should be taken from him for the first offence? No; it is very hard.
3937. Do you think it would be better to fine or imprison a man rather than take away his nets which constitute his tools of trade? Yes, I do.
3938. And do you believe in all cases where proceedings are instituted against fishermen that they should be dealt with as soon as possible? Yes, I do.
3939. If that were done would that obviate cases of hardship arising in consequence of the fishermen having to wait weeks and months for cases to be dealt with? Yes.
3940. Do you believe in giving the informer half the fine? No, I do not, his salary is enough; there are many cases where they make up a case when there is no occasion for it.
3941. Can you state a case where that has been done? Yes, I can. I was fishing in Lake Macquarie for a few years, and I had to cross closed waters to go home. I was leaving one evening after I had been ashore, and just as I left the beach two inspectors came and demanded my net with a revolver. I had to give it up, my license was cancelled, and I was fined £4 10s., and lost everything, and that was the first time I was ever in a Court of Justice.
3942. Who were the inspectors? Paget Bayly, and Gordon. Bayly had the revolver. Bayly was an honorary inspector.
3943. And you say on that occasion you were innocent? I was innocent. Mr. Boyd would tell you that my net was taken out of my boat.
3944. What did that net cost? Twenty pounds.
3945. Do you think the charge for the license unreasonable at the present time? The fisherman's license is reasonable enough; the boat license is a little hard; that is thirty shillings for the year for myself and boat, and there is many a time I leave my children short to find the money to pay.
3946. Could the fisherman's license be made more durable; would you like it issued in the shape of a medal or token which you could affix to the boat? Yes, that would be a great improvement.
3947. Do you think all the closures here are justifiable closures? No; the waters that are just closed we might work this winter, and make a few shillings, but they are closed against us now; those waters close themselves all the summer time.
3948. How? We cannot go up there in the warm weather, they close themselves by reason of their distance.
3949. Do you think people having a local knowledge should be consulted with respect to those closures, instead of the Fisheries Commission having it in their power to close waters without having a knowledge of the circumstances? Yes, I do.
3950. Have any of the Fisheries Commissioners visited this place officially? No.
3951. Do you think that body has given satisfaction to the fishermen and to the general public? No, I do not.
3952. Have you heard complaints amongst the fishermen as to their want of administrative ability? Yes, I have.
3953. Do you think if they had that deep interest in the development of the fisheries that the public expect them to have they would visit the different fishing grounds very frequently? Yes; they ought to do so.
3954. Do you think the fishermen should have representation on any board, or in connection with any authority that may be empowered to administer and control the fisheries? I do.

- Mr. E. Holbert.
6 April, 1895.
3955. Would that be better accomplished by the appointment of a Commission in Sydney with a representative fisherman on it? No. I would prefer that there should be one man in authority—one man appointed by the Government—a man who thoroughly understands the fisheries, and who would work amicably with the fishermen; and I also think local boards, consisting of four or five, should be appointed, with a representative fisherman on each board, to advise the head authority in Sydney in respect to matters of local interest and concern.
3956. You believe an experienced man should be appointed—a man who would be able to pay periodical visits to the fishing grounds so as to become acquainted with their circumstances—a man who would not only have the welfare of the fishermen at heart but who would be interested in the development of the fisheries generally? Yes; that is what we want.
3957. Have you held any oyster leases? No. My brother has. I have been working on his lease.
3958. What area has he? Two hundred yards.
3959. Has that lease been attacked by the disease? Yes; at times very badly.
3960. How long ago is it since it showed itself in his beds? About two years.
3961. Where is his lease? Opposite Corrie Island.
3962. Do the oysters seem to thrive well there? They do.
3963. Do you think, instead of his being able to take up 200 yards of foreshore, it would be better for him to take up a whole arm of a river or a bay, and instead of paying a rental, contribute a certain sum as a royalty on every bag of oysters raised? Yes; I believe in that.
3964. Are you of opinion that with stringent conditions as to the working of the leases that would be better than the present system? Yes; I am.
3965. Have you had any experience in deep-sea fishing? No.
3966. Have you had any experience in the capture of crayfish? Yes; but it is two years since I caught any of them.
3967. Have you noticed them when they are in roe? Yes.
3968. What length of time is the crayfish in spawn—I mean from the time the coral forms in its abdomen until the berry is discharged from the tail? I think about four or five months; that is my experience.
3969. Should there be a close season for crayfish when they are in that condition? I think crayfish should not be captured during the last two months while the berry is under its tail.
3970. As this fish is in its primest condition when in the coral stage, would you be inclined to favour the closing of certain grounds only in order that the public might not be deprived of what is held to be a delicacy? Yes; that would be better, that would do less injury to the prospects of the fishermen.
3971. Have you ever seen any shoals of fish on the coast? I have, many a time.
3972. Of what description were they? I cannot exactly tell you.
3973. Herrings or mackerel? They were a good way out.
3974. Have you ever noticed an oily appearance on the water while those shoals of fish were making their passage northward? Yes.
3975. Have you done any fish smoking or curing? A little.
3976. What wood did you use in smoking? The swamp oak when it is decayed, so that it can just smoulder.
3977. Do you think if smoked fish could be properly distributed amongst the public it would pay you and others to engage in that industry? Yes; it would pay us better than sending them fresh in the summer-time.
3978. And I suppose that large quantities of fish that now go to waste, through not reaching market in a sound condition, could be smoked and utilised for food in that way? Yes, they could.
3979. Do you know anything of well-boat fishing? I have had no experience.
3980. Would it be an advantage to the fishermen if fish could be taken alive to the market? Yes; and I think we should get better prices.
3981. Are the prawn fisheries in the Myall Lakes extensive? Yes.
3982. Do they grow to any size? There are large prawns in the lakes.
3983. Are they sent to the Sydney market? No; they sort them and make them into what they call "chow," and sell them to the Chinamen from whom they receive about 6d. per lb.
3984. Is the evidence you have given to-day before this Commission similar to that which would be given by the majority of the fishermen in your district? Yes, it is.

Mr. Charles Anderson, fisherman, Telligherry Creek, Port Stephens, sworn and examined:—

- Mr. C. Anderson.
6 April, 1895.
3985. *President.*] Your name is Charles Anderson, you are a fisherman, and you reside at Telligherry Creek; how long have you been fishing in Port Stephens? Eleven years.
3986. Had you any previous experience? No.
3987. Have you anyone associated with you? Yes; two men besides myself.
3988. What nets do you use? We are using a hauling net.
3989. Would you like a greater length for the hauling net? Yes.
3990. Supposing it was extended to 300 fathoms, could you haul it in Port Stephens? I could work it outside the creek.
3991. Are you satisfied with the mesh of the hauling net? No.
3992. Do numbers of fish get meshed in the 2¼-inch bunt? Yes; a big quantity.
3993. Do you think a smaller mesh would prevent their getting meshed and being destroyed? Yes; it would not kill half so many.
3994. I suppose you would like the net extended to 300 fathoms, 3 inches in the wings, and, say, 1 inch in the bunt? Yes.
3995. As to the garfish net, 90 fathoms, are you satisfied with the length of that? I would like that increased in length.
3996. Would you like any alteration in the mesh? I would like it reduced to 1 inch in the bunt.
3997. Do you use a meshing net? Yes, I do; I would like that lengthened—I would like a meshing net of 300 fathoms if possible.
3998. Are you satisfied with the mesh of that net? Well it is 4 inches now; I would like it 3½ inches.
- 3999.

Mr.
C. Anderson.
6 April, 1895.

3999. Do you think you lose numbers of marketable fish through using the 4-inch mesh that would be caught by having a mesh of $3\frac{1}{2}$ inches? Yes.
4000. Do you use a prawn net? No.
4001. Is the present Fisheries Act giving general satisfaction? No.
4002. Are you of opinion that when once a net is declared to be legal it should be always considered legal until worn out? Yes; certainly until worn out.
4003. Do you think a meshing net should be used in closed waters? There would be no harm resulting from it.
4004. Are you of opinion that the provision in the present Act providing for the seizure of nets for fishing in closed waters should be repealed? Yes, it should be.
4005. I suppose you do not believe in taking a man's tools of trade away for an offence against the law? No; they had better take the man, too.
4006. Would it be better to fine or imprison a man rather than confiscate his net? Yes.
4007. Do you think the cases occurring under the Act should be heard as soon as possible after proceedings have been instituted against fishermen? Yes.
4008. Are there any closed waters in Port Stephens? Yes; Telligherry Creek is closed.
4009. Are the closures justifiable? No.
4010. Why not? For one thing they reckon it is a place for breeding fish and should be closed now, but it closes itself for six months in the year without the Commissioners closing it.
4011. Will you explain what you mean by that? I mean that in the summer the blubber drive the fish out of the creek, the winter is the only time you can catch a few fish there.
4012. Then you think that during the half-year, in the winter, it might be left open? Yes.
4013. Do you know of any other closures? Yes; Pipeclay Creek, that is the same as Telligherry.
4014. What is your average catch of fish per week? From fifteen to twenty baskets.
4015. How do you dispose of the fish? Send them by horse and cart from Saltash Wharf, Telligherry Creek, to Stockton, thence to Newcastle, where we sell them. We act as our own agents. We send to Sydney in the winter time.
4016. Are you satisfied with the result of your transactions with the Sydney markets? No; I am not.
4017. Do you think your fish ought to realise higher prices? Yes; I do that.
4018. Do you think it would be an advisable thing to get rid of the middleman? Yes; I do. They ought to have been done away with long years ago.
4019. Would it be better to bring the fishermen into closer contact with the general public? Yes.
4020. Have you had anything to do with the oyster fisheries? No.
4021. Have you engaged in the capture of crayfish? Yes.
4022. Where have you caught them? In Hannah Bay.
4023. Do you find them pretty numerous? Not so plentiful this last year or two; one time they were very plentiful.
4024. Do you think that is the result of over fishing? I do.
4025. Have you noticed crayfish when in the spawning state? Yes.
4026. Would it be a good thing to protect crayfish from the time they are in the coral stage until they shed the berry? Yes; they should be protected for one month out of six.
4027. Do you know their spawning season? They are generally in the berried stage in September and October, and they shed the berry not later than October.
4028. Instead of having the closures for one month or two months in the season, what would you think of the idea of closing certain crayfish grounds for a stated time? That would be a good thing.
4029. Have you ever seen any shoals of fish on the coast? Yes; I have seen shoals of mullet.
4030. Any of the herring tribe? No; I have seen what they call the mackerel.
4031. Are you satisfied with the present Board entrusted with the administration of the Fisheries Act and the control of the fisheries? I am not satisfied with them.
4032. Have you ever known one of them or all of them to visit this district officially? No, never.
4033. Do you think it necessary that anyone holding such a responsible position as the members of of the Commission hold, should visit the different fishing grounds at stated intervals in order to become acquainted with local circumstances and conditions? Yes, most certainly; I think it is their duty to do so.
4034. What is the general opinion of the fishermen here with regard to the Fisheries Commission? The opinion is that they have not done their duty as well as they ought to have done it.
4035. Do you think they should be abolished and a new institution created? Yes, I do; the fishermen ought to have some say in connection with the administration and control of the fisheries.
4036. In what way: can you suggest any improvement? I think the fisherman should have representation on the Board appointed to administer the Fisheries Act.
4037. Would you make it compulsory on the members of that Board to visit the several fishing grounds periodically? Yes; I would.
4038. Do you think the fishermen could always do that? Some might if they were appointed to do it.
4039. Do you think that if local institutions were established, by which the fishermen in the different places and the residents elected their own Boards with a practical fisherman on them, it would be a good thing to have such Boards to advise the head Board in Sydney? Yes; it would.
4040. The fisherman's license fee;—how does that suit you? Five shillings a year is plenty.
4041. And as to the boat license? That should be done away with altogether, let a man register his boat once and for all.
4042. Would it be better to issue the fisherman's license in the form of a medal or a token, in lieu of the piece of paper upon which it is now issued, I mean something that could be nailed in your boat and always have by you? Yes, it would; we are supposed to carry our paper licenses in our boat, but the paper gets wet; it is not durable; it is impossible for a man to carry his license, the present fishing license, in the fishing boat.

MONDAY, 8 APRIL, 1895.

[The Commission met at the "Sea Breeze Hotel," Nelson's Bay, Port Stephens, at 9.45 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Peter Johnson, fisherman, Telligherry Creek, Port Stephens, sworn and examined:—

- Mr. P. Johnson.
8 April, 1895.
4043. *President.*] What is your name? Peter Johnson.
4044. You are a fisherman and you reside at Telligherry Creek? Yes.
4045. How long have you been living there? About ten years.
4046. Have you been engaged in net-fishing and oyster-fishing during that period? Yes; I have been net-fishing since I was a boy. I have fished in the Shoalhaven River, Jervis Bay, the Clyde River and Port Stephens with the net, and in the rivers to the north of Port Stephens for oysters.
4047. What kind of fishing do you do now? I am oystering now, I do net-fishing in the winter.
4048. What nets do you use? Mostly the garfish-net.
4049. Are you satisfied with the length and mesh of that net? It is not long enough to do anything with, I think the fishermen should be allowed to use the net as long as they like. In these rivers we cannot use too great a length as the tide is against us.
4050. What descriptions of fish do you catch? Garfish; trumpeter whiting in the winter time.
4051. Are they river garfish? Yes.
4052. How many baskets of fish do you send to market in a week? About twelve baskets per week on an average, I am only working two hands now.
4053. How do you send your fish to market? By steamer to Newcastle and train to Sydney; I sometimes send my fish to Woolloomooloo Market, and sometimes to Redfern.
4054. Are you perfectly satisfied with the returns you get from the markets? No, I am not; sometimes I get in debt for my week's work.
4055. Do you mean to say you get returns from the agents bringing you in debt? Yes; that is true.
4056. Do you think that if the middlemen were done away with the fishermen would have a better chance of obtaining fairer prices for their fish? Yes; I do.
4057. Is it possible for the agents and the fishmongers to act in collusion so as to divide any profit between themselves? I believe they do that; we very often send up baskets of whiting that we know are fetching good prices and we get a mullet price back.
4058. Have you ever lost any fish in transit? Nothing to speak of; maybe a basket or so goes astray.
4059. Do you know the way the business is conducted at Woolloomooloo? Yes, very well; I purchased fish there when I had an oyster-saloon in Sydney.
4060. Can the state of affairs at that market be improved upon? Yes, I think so; the fish are put out in heaps on the floor, and I have seen people trampling on them myself, and they are stolen. I remember Mr. Seymour giving a man three months for stealing fish; the man took the fish off the heap.
4061. Do you think there should be more than one sale a day at the Woolloomooloo Market? Yes, and that would allow the consignments by the steamers from the north being disposed of without the risk of their being kept till next morning and going bad.
4062. Do you think there might be a more central market than the one at Woolloomooloo? It is suitable as far as the steamers are concerned.
4063. Do you favour the establishment of branch markets in the different suburbs for the distribution of fish? Yes; that would be a capital thing.
4064. Would it be a good thing to encourage the gutting of fish before sending to market, provided the fishermen were paid for the extra labour involved? I can hardly see how it could be done in Port Stephens, as we would not have time to gut our fish before the steamer left; she comes in to the wharf here at Nelson's Bay and goes out again very quickly.
4065. Do you use a hauling-net? Yes.
4066. Are you satisfied with the length of the hauling-net? I do not use the 300 yards myself, because I am only two-handed. The length is enough for the river, but not for the Myall Lakes.
4067. Should there be any alteration in the mesh? Yes.
4068. Do you think it should be larger or smaller in the bunt? The 2½-inch bunt is quite large enough for the hauling-net; you do not save any whiting with the present mesh.
4069. Have you noticed any small bream meshed in the 2½-inch bunt? Yes.
4070. If the mesh were smaller would that obviate the destruction of this class of fish? Yes; the bream would not get meshed and they would not be destroyed.
4071. Do you use the meshing-net? No.
4072. Do you think the meshing-net is long enough? No; I do not.
4073. Is it possible for marketable fish to escape through the 4-inch mesh? Yes; whiting and good fish escape.
4074. Would it be a proper thing to allow fishermen to catch the marketable fish that now escape with a smaller mesh? Yes; that would be much better, let us have a 3-inch mesh.
4075. Would the use of a meshing-net in closed waters do any harm? No; it would not.
4076. Do you use a prawn net? No; I have never done any prawning.
4077. Have you heard of people's nets being seized and confiscated? Yes; I have
4078. Do you think it wise or just to have in an Act a provision allowing of the confiscation of a man's net for the first offence? No; I do not.
4079. Would it be better to fine him heavily or imprison him rather than take away his tools of trade, thereby depriving him of the means of earning his livelihood? Yes; it would.
4080. Do you believe in giving the informer half the fine? No; it is quite sufficient for him to receive his salary without looking for further reward in that direction. If the man did not receive half the fine he would not take up such cases as now engage the attention of the Department.
4081. I suppose you are of opinion that all cases under the Act should be proceeded with before a competent Court as early as possible? Yes.
4082. Have you known people who were compelled to wait for a month or more for their cases to be decided? Yes. On these rivers the court is only held once a month.
- 4083.

4083. Consequently the fishermen were deprived of the use of their nets during that period? Yes.
4084. Are you satisfied with the fees charged for the fisherman's license and the boat license? No. I do not think the boat should be licensed; a man should be licensed. Very often our boats get laid up, and we have to take another, and then we are liable for that boat.
4085. Are you not allowed a substitute? I have not applied for one. I laid up three weeks last winter with my own boat rather than risk taking another boat.
4086. As to the licenses themselves—would it be more convenient, instead of having them on paper, to have a kind of token, something made of metal, which you could tack on to the boat? Yes; that would be an improvement.
4087. To whom do you apply for your license? The C.P.S. at the Tea Gardens.
4088. Would it be an improvement if the inspectors were authorised to issue the licenses? Yes; it would save a lot of inconvenience to the fishermen.
4089. How long have you been engaged in connection with the oyster fisheries in Port Stephens? About ten years.
4090. Were you connected with oyster fisheries before that? Yes, on different rivers to the north and south of Port Stephens, before the present Act became law.
4091. Have you, during that time, watched pretty closely everything connected with the growth of oysters? I have.
4092. In what condition were the oyster fisheries when you first entered upon the business? There were plenty of oysters everywhere, and they were in good condition.
4093. Has their condition altered since that time? Yes.
4094. Can you tell the Commission the causes which have operated detrimentally to the development of the oyster fisheries? The greatest cause, in my opinion, is the licensing system. Under that system the great majority of beds in the Colony were destroyed.
4095. Do you mean by over-dredging? Yes, by over-dredging. New chums to the work tore the bottoms of the beds up altogether.
4096. In other words they killed the goose that laid the golden eggs? Yes.
4097. Did they strip the grounds and not give the beds sufficient time to recoup? That is so.
4098. As to the disease that has attacked the oyster;—do you know of more than one disease? Only the worm disease.
4099. In what manner does this disease attack the oyster? The worm gets into the shell. It is only through leaving the oyster in the old beds laying still that helps to kill them; the oysters get too thick by leaving them alone.
4100. Would the disease be lessened if the oysters were moved—raked about now and then? Yes; I have proved that by actual practice myself on my beds. It is a great mistake to allow the oysters to lie still.
4101. Do you know how this disease originates? Partly through not working the beds.
4102. But has the worm its habitat in the mud? It is in the mud; the worm will not live on a clean bottom.
4103. If the bottom were thickly covered with stone or some kind of cultch, so as to keep the mud underneath, would that get rid of the worm? Yes, it would.
4104. Have you noticed the disease in other rivers? Only at Cape Hawke.
4105. What extent of oyster leases do you hold? 300 yards.
4106. Do you lay any spat down? No; at present I have no license to allow me to collect.
4107. Can you get plenty of spat in Port Stephens? Yes, at the present time I could.
4108. Where are your leases? Lemon Tree Passage, Telligherry Creek.
4109. Have you ever tried any experiments with New Zealand oysters? Yes, years ago, at Cape Hawke.
4110. Did they thrive? Very slowly.
4111. Would you be inclined to think that if those oysters were imported and laid down they would be an improvement on our own spat? I do not think so. They do not develop so quickly.
4112. Do you send oysters to market, to Sydney or Newcastle? To Sydney.
4113. Are they sold by auction? Yes.
4114. About what price do you get per bag? About 10s. and 12s. now. I sent three bags a fortnight ago, and got 16s. for the lot.
4115. How do you account for that? Well, my oysters brought 10s. per bag in the open market, but all the return I got was 5s. 4d. per bag. The rest was swallowed up in freight and commission.
4116. Have you ever known very cold weather or frosts interfere with oysters? No.
4117. What do you think of the present system under which foreshores are leased for oyster culture? The rent is too high for foreshore leases.
4118. Do you think more encouragement should be given to those desirous of engaging in oyster culture? Yes; I think 5s. per 100 yards for foreshore beds, and £1 for deep beds is sufficient.
4119. Can you tell the Commission if you favour the proposal for the leasing of a river, or an arm of a river, for the purpose of oyster culture, instead of leasing 100 yards to anyone who cares to apply? I prefer the smaller areas.
4120. Are oysters taken from the Crown lands for sale by non-lessees? Yes; oysters are stolen from the Crown lands.
4121. How long does it take an oyster to become marketable from the time you lay it down in Port Stephens? Eighteen months on some beds, two or three years in other places.
4122. During the time you have held your leases, have you had any transactions with the Department of Fisheries? One or two leases cancelled.
4123. On what grounds? I applied for the surrender of a lease of 1,700 yards. I could not pay the rent any longer.
4124. What was the cause of your inability to pay the rent? I had about 800 yards off which I never took an oyster, and the disease was that bad in the remainder that it would not pay.
4125. So that while you received nothing from the beds as a return for your labour you were —? Unable to pay the rent.
4126. In cases like that, where oyster-beds have been attacked by the disease and rendered unproductive for long periods, do you not think the system of payment by results would be better? Yes; it would be better.

Mr.
P. Johnson.
8 April, 1895.

4127. If such a system had been in force at the time you speak of, you would not have had your lease forfeited? No; I did not want to give it up.
4128. What would you say is the condition of the oyster fisheries in Port Stephens to-day;—are they improving? They are improving.
4129. Do you think there is a fair prospect of the beds being resuscitated? Yes; on the lower part of the river, not at the top. I may explain I have charge of three leases in the upper part of the Karuah River, for Mr. Woodward; a fortnight ago I went and tried those beds, but I saw no young stuff there.
4130. Did you find any old oysters there? An odd one or two on one bed only.
4131. Where did you find them? Above the Flat Rock, in the Big Branch or Serpent River.
4132. Are there any young oysters near the mouth of the river? Lots on the foreshores about the mouth of the river.
4133. Would that be as far up as Mosquito Creek? Yes; all about Sawyer's Point.
4134. What has been the cause of the destruction of the oysters up there? Too much fresh water.
4135. Is the water getting a little more salt now, and will the oysters there, if allowed to breed, afford a good supply? Yes.
4136. How long generally does the water in the river remain in a brackish condition? It has been brackish for three or four years.
4137. Did you notice any disease in the old or young oysters when you were up there? None at all in the Branch; they were quite clean and looked splendid.
4138. If layings were made at the present time, of spat collected from off some of the foreshores in Port Stephens, would they do well? Yes; if we do not get any more fresh water.
4139. Do you know whether any of the Fisheries Commissioners have paid any official visits to these fisheries? No, I do not know of any.
4140. Had they visited this place officially would you have heard of it? Yes, I think so.
4141. What do you think of the constitution of the present Commission in Sydney, are the fishermen generally satisfied with it? I do not think they are.
4142. Is any alteration necessary? Yes, I think so.
4143. Would you have an authority established that would take a deeper interest in the fisheries, and pay periodical visits to the different grounds in order to become acquainted with local conditions and circumstances? I think there should be one practical man on it.
4144. As a representative of the fishermen? Yes.
4145. Would you have five Commissioners? Yes.
4146. Have you ever noticed that there is a difference in the circumstances and conditions attached to the different grounds you have been on? Yes, they are different altogether. The habits of the fish in some waters are quite different to those in other waters.
4147. Would it be an advisable thing to have boards established locally in connection with the fisheries so as to advise the head authority on matters of local interest? Yes, I am in favour of that.
4148. If the fishermen had representation on those boards would that be satisfactory? Yes, it would.
4149. If they had that, would they be so much inclined to ask for representation on the central board? No, they would be satisfied with the local boards.
4150. Then you think the administrative authority requires alteration, and you think some better plan should be adopted so that the grievances of the fishermen, as well as the conditions attaching to the fisheries, should be thoroughly investigated by the local boards? Yes.
4151. Would the fishermen have any difficulty in selecting a man to act as their representative on those local boards? No.
4152. Have you had any experience in the capture of crayfish? No.
4153. Have you had any experience in deep-sea fishing? No.
4154. Have you ever seen any shoals of fish on the coast? Yes, shoals of mullet and garfish.
4155. Any shoals of the herring tribe? No, not outside, I have seen plenty of what we call white herring inside.
4156. Are there any turtles in Port Stephens? Yes.
4157. Are they often captured? Not often.
4158. Are they marketable? Yes, they have fetched very fair prices in the markets.
4159. About what price would a fair sized turtle bring? There were two sent away some time ago, the fishermen got £2 10s. each for them.
4160. Are turtles in sufficient numbers to induce people to fish for them alone? No.
4161. Have you done any fish-curing, canning, or smoking? No.
4162. Do you think the present closures are justifiable? Not in Port Stephens.
4163. Why do you say that? Because the whole of Port Stephens closed at the present time closes itself in the summer time; those waters are too far from the markets, we cannot get the fish into market. In the winter-time we get only marketable fish there.
4164. Judging from your answer, are we to assume that you think the upper portions of Port Stephens should be left open in the winter months? Yes, certainly.
4165. *Mr. Thompson.*] Which, in your opinion, is the most destructive to small fish, a large mesh or a small mesh? A large mesh, because it kills unmarketable fish which you cannot release without damage.
4166. Would it be an improvement if all the several prescribed kinds of nets with their different meshes and lengths were dispensed with, and fishermen were allowed to use in open waters a net within a maximum length, and a certain prescribed mesh? That would be a great improvement.
4167. I suppose if that were allowed you would not object to a stringent provision requiring fishermen to empty their nets in at least a foot of water? That is done now in Port Stephens, but it would be a good thing.
4168. Would it be advantageous to lease portions of Port Stephens to fishermen for fishing purposes? No.
4169. Do you approve of the present style of baskets for carrying fish to market? Yes, and I object to boxes.
4170. Why? They are too close, they have no ventilation.
4171. But if the boxes were constructed of galvanised wire netting on an iron frame, so that ventilation would be afforded? Oh, yes; that would be an improvement. I think they should be locked, too.

4172. Are there any Greeks or Italians here? Yes, crayfishing—one or two net-fishing.
 4173. Should they be naturalised before being licensed? Yes.
 4174. I suppose you have not many amateur fishermen here? No.
 4175. Do you think, considering the advantages that would follow from proper regulation of the fisheries, that amateur fishermen should be asked to contribute something to the revenue in the shape of a license fee? Yes, I do.
 4176. Can you tell me anything about crayfish? No; I have not been crayfishing.
 4177. Which, in your opinion, are the portions in Port Stephens which should be closed against net-fishing? There is a considerable portion of it naturally closed, there is no need for further closures. I do not consider the closures recently prescribed are necessary.
 4178. What netting shrinks most—that made of hemp or cotton? Hemp.
 4179. Supposing, instead of charging rent for your leases, we charged you so much for every bag of oysters you took off the lease, would that be fair as between you and the Government? I would approve of that.
 4180. Supposing this could be done, what would be a fair rate to charge per bag? Two shillings and six-pence.
 4181. Do you know of any instances of oyster deposits in the deep sea outside Port Stephens? I have been told they are there, but I have not seen them.

Mr.
P. Johnson.
8 April, 1895.

Mr. Walter Glover, fisherman, Nelson's Bay, Port Stephens, sworn and examined:—

4182. *President.*] You are a licensed fisherman, carrying on operations in Port Stephens;—how long have you been fishing here? Thirty-two years.
 4183. Have you any men in your employ? Two.
 4184. Where do you send your fish? To Hudson's market mostly now.
 4185. Have you had any transactions with the Woolloomooloo Market? Yes.
 4186. What is your average catch per week? About four or five baskets.
 4187. What kinds of fish are they? Bream, whiting, garfish—the best kinds.
 4188. Have you ever had any complaints about your fish arriving at the market in an unsound condition? Yes.
 4189. Do you think they really do arrive there in an unsound condition? It is hard for me to tell.
 4190. Would it be possible for you to get a return showing that certain fish had been condemned, while as a matter of fact those fish had not been condemned? Yes, it would; because we have had bills stating half had been sold and the other half condemned, and yet the half that was condemned came out of the same catch.
 4191. How do you arrange to dispose of your catch? They are sent to an agent who takes the market dues and commission out of them, and sends me what is left. We have been nearly five weeks clearing 18s.
 4192. Are you satisfied with the manner in which your fish are disposed of in the markets? No; I am not.
 4193. Viewed from a financial standpoint, I should think you would regard it as very unsatisfactory? Yes, indeed.
 4194. Would it be a step in the right direction to rid the markets of the auctioneers and middlemen? I believe it would.
 4195. Have you had any fish stolen in transit? We have lost a good many, but cannot find out where they have gone to. Only a fortnight ago we sent a half basket of whiting, and we got paid for a half basket of garfish.
 4196. You say you have sent to the Woolloomooloo Market in the past? Yes; to Augustus, Lawler, and Congdon.
 4197. Do you think the manner in which the fish are displayed for sale is the most suitable way of exhibiting them? No; they are thrown on the floor and everybody walks over them.
 4198. Would there be a possibility of their being stolen? Yes; I have been at the Woolloomooloo Market and seen fish stolen every morning.
 4199. Should there be more than one sale a day at that market? It would be better for the fishermen.
 4200. Would it be a good idea to establish branch markets in the different suburbs? Yes, that would be better; more fish would be purchased then.
 4201. In sending your fish to Redfern Market, have you less handling than if you sent to Woolloomooloo? Less handling and less to pay; they are not carted to Woolloomooloo and chucked about so much.
 4202. What do you pay per basket to send your fish to Newcastle by steamer? Two shillings.
 4203. Are you satisfied with the charge the Railway Commissioners make to convey fish thence to Sydney—1s. per basket? Yes.
 4204. If the Railway Commissioners provided a cool car, would it be patronised by the fishermen? I think so; it was the fishermen spoke about it first.
 4205. Do you think that by adopting that system supplies of fish could be sent into the interior? Yes, undoubtedly; if fish is sent fresh people will eat it.
 4206. Have you ever thought out the idea of sending fish gutted to market? Yes, you could do it with bream or whiting. I have sent two or three times to see if they would take them, but never got a reply from the people I sent to.
 4207. If you were paid for the extra labour involved you think it would be a very good thing? Yes, the fish would keep longer; that is what turns a lot of these sea bream, not being cleaned.
 4208. If you were to receive (say) half the amount the consumer pays for his fish? I think that would pay us very well.
 4209. You think then there is too big a gap at present between the fishermen and the consumer, and that the profit is pocketed by those who come between them? Yes, they are the men who get paid.
 4210. Would you approve of the system of allowing fishermen to sell to the general public? Yes, I think that would be best. Two years ago I was offered 30s. per dozen for schnapper on the wharf in Sydney, but I could not accept the offer, because I had to put them through the market.
 4211. I suppose it might happen that while you were waiting to take them through the market the fish would become deteriorated? Of course they would; they would be handled from one place to another.
 4212. Have you thought out the idea of having fish sent to market alive? No.

Mr.
W. Glover.
8 April, 1895.

- Mr. W. Glover.
8 April, 1895.
4213. Have you seen any well-boat fishing? Yes, there were two of them working here, but they lose the fish.
4214. What kinds of fish do they catch? Nearly all schnapper; they go from here to Port Macquarie, and take fish to Sydney.
4215. When do the black bream make their appearance here in shoals? They are in schools nearly all the year round, but not always inside; they are on the outer beaches.
4216. And the whiting? The same; they travel about. There are a good few outside now.
4217. Do you catch sea mullet? Yes, but they are not in yet.
4218. Have you noticed any shoals of fish outside? Not particularly.
4219. Is one sale a day at the market sufficient? No, there should be two or three during the day.
4220. Are you satisfied with the amount you are asked to pay for a fishing license? I think it is too heavy altogether.
4221. As to the license itself, is it sufficiently durable, or could the present form be improved upon by issuing a metal ticket or something of that kind? It would be more durable if we had a little metal ticket tacked on to the boat. If you get the paper license wet it is no good.
4222. What nets do you use? The garfish net.
4223. Are you satisfied with it? I would like it longer.
4224. Are you satisfied with the mesh? The mesh is right enough.
4225. Do you destroy many young fish by using that net? Not a great many.
4226. Do you destroy more by using the hauling net? There is not much difference; if you have a big hauling net you drag it right ashore. We pitch the little fish out if they are no use to us.
4227. Do you use any other nets? No.
4228. Have you noticed any of the bream kind get meshed in the 2½-inch bunt? Not many.
4229. Are the nets, as a rule, emptied on the shore or in a certain depth of water? Just on the edge in order to pick the good fish out.
4230. Do they draw their lead line and cork line on to the beach, and allow the flue to remain in the water? Yes, that is so.
4231. Which is the most destructive to young fish, the large or the small mesh? The large mesh.
4232. What do you think of the meshing net? It is right enough, but it should be prevented in places where the hauling net can be used; it should only be used along rocks where the hauling net cannot be used.
4233. Is the meshing net long enough? I think 60 fathoms enough; if others want it longer let them apply for it.
4234. Is the mesh satisfactory? A lot of good fish escape through the mesh.
4235. Do you see any objection to the use of the meshing net in closed waters? No.
4236. You do not use a prawn net? No.
4237. Instead of having all these different dimensions of nets, would it be a good idea to allow the fishermen to use any nets they like up to a maximum length, so long as they were compelled to empty their catches in not less than 1 foot of water, and provided that stringent provision was made to prevent the capture and sale of undersized fish? Yes; I think that would be a good idea.
4238. Are you in favour of that provision which allows of the confiscation of fishermen's nets for a first offence against the Act? I am not; a man's tools of trade should not be taken away from him.
4239. Would you, in order to meet cases of infringement of the Act, impose a heavy fine, or imprison a man, rather than take his tools of trade away? That would be better.
4240. Do you know of any delay having taken place in connection with proceedings against fishermen? Yes; here at the Tea Gardens.
4241. During that delay have they been deprived of their only means of getting a livelihood? Yes.
4242. I suppose you are of opinion that all such cases should be settled promptly? Yes, as soon as possible.
4243. Are you in favour of giving the inspector or the informer half the fine? No, I am not, it leads to persecution; an inspector ought to be paid a salary, that would be better all round.
4244. In respect to closed waters, have the Commissioners done right in making the existing closures? It makes no difference to the fish what closures they make; there are places up here closed now, and they are closed in the summer owing to their distance from market; those places should be opened in the winter.
4245. Would you be able to fish those grounds in the winter, and would the fish carry better in the cold weather? Yes.
4246. Have you known any members of the Fisheries Commission to visit Port Stephens officially? No.
4247. I suppose you would have heard of it had any of those gentlemen been here? Yes, certainly.
4248. What is the general opinion of the fishermen in regard to the Fisheries Commission in Sydney? Well, I do not think they have given us satisfaction.
4249. Do you think the Board should be more in touch with the fishermen? I do; they should have made themselves acquainted with the condition of places, but they have not done that.
4250. Then I suppose you think that the Commissioners, not having a practical knowledge of the fisheries of the Colony, are unable to deal fairly with the grievances of the fishermen? Yes, I do.
4251. Would it be better to establish an authority which would be more in touch with the fishermen? Yes.
4252. Do you think the fishermen should have representation on a board established for the purpose of controlling the fisheries and administering the Act? I think they ought to.
4253. Would it be a good idea to establish local boards of advice, fishermen having representation on that board? Yes, I think it would.
4254. Do you think that such boards, having a local knowledge of the circumstances and conditions of the fisheries, would be able to advise the central authority? Yes, I do.
4255. Would there be any difficulty in getting fishermen to act on such boards? No.
4256. As to the central authority, have you thought out how that should be constituted? No.
4257. But you are satisfied with one thing, that is that a change is necessary? I am.
4258. Are the prawn fisheries in Port Stephens extensive? There are plenty of prawns here, but no one fishes for them. In the Myall Lakes some fish for prawns; they dry them, and sell them to the Chinamen.

4259. Is it owing to the distance from market that prawns are not caught in Port Stephens? Yes.
4260. If some means were adopted by which the prawns could be utilised, do you think the fisheries here are extensive enough to create an industry in their capture? Yes, they are. There are prawns everywhere. You get them wherever you haul.
4261. Have you had anything to do with the capture of crayfish? A little.
4262. How do you catch them? With the hoop and net.
4263. Are crayfish pretty plentiful in this neighbourhood? They were until lately; they are getting scarce now.
4264. What has made them scarce? I do not know whether it is over fishing, or whether the crayfish shift about. Two years ago you could catch plenty on Cabbage-tree; last year you could not get any. Three years ago you could get them round the lighthouse at the entrance, but you cannot get them now. We fish at night for them. You will not get many in the daytime.
4265. Do many European fishermen engage in their capture? Yes; when we cannot do net fishing we go after crayfish. We start in June, and the crayfish are pretty thick in July and August.
4266. When are they in roe? Six months in the year, from June to Christmas.
4267. So that quantities of the crayfish must be captured when they are in the coral or berried stage? Yes.
4268. Do the men send crayfish in the berried stage to market? Yes.
4269. By doing so are not the crayfish prevented from breeding—is there not a possibility of the destruction of the crayfish? No. If you catch crayfish outside, and put them in one of the hoops, and hang it over the side anywhere near the rocks, you will see the green sea eels eating the roe out of them as fast as they can take it. I have seen as many as five eels at one crayfish.
4270. But would not that be only possible under the circumstances you have narrated? The eels follow the crayfish all round the rocks.
4271. What size do the eels attain to? They go from 1 foot to 3 feet long.
4272. Do you think there is any necessity for having a close season for crayfish? No.
4273. Do you know of any European fishermen fishing round Broughton Island? No, not this last year, on account of the Italians being there.
4274. Do the Italians fish extensively for crayfish? Yes; the islands are usurped by the Italians.
4275. How many pots would they use in crayfish capture? Last year they had 300; there is no chance for any other man to go fishing while they are about.
4276. Would you license these aliens before they are naturalised? No; it is not right to give them a license until they are naturalised.
4277. Have you done any deep-sea fishing, other than crayfish capture? I have been schnappering all round the island; that was twelve months ago. I used to catch schnapper and salt them, and sell them to the Chinamen.
4278. Have you ever discovered any bottoms free from obstructions of any sort? I only went to the reefs to catch schnapper.
4279. Have you had any experience in trawling? No.
4280. Have you held any oyster leases? No.
4281. Are you acquainted with the oyster fisheries in Port Stephens? Yes; I think I know where every oyster grows.
4282. What is the condition of the foreshores and the deep beds in Port Stephens just now? The oysters are not as good as they have been; the place has never been the same since it was leased out. Twenty-two years ago there were twenty boats working up the river, and two men in a boat. I was working there; we were turning out four, five, and six bags a day, every day. Since the leasing system the river has never been the same. When the leases were first worked all the mangroves in the river were covered with oysters. They took those oysters off and threw them into the deep water on to the deep beds, and in so doing covered the good oysters there. Those foreshore oysters will not live in the deep water; they are accustomed to being uncovered at certain times of the day.
4283. Can you account for the appearance of the worm? I believe it is owing to the small oysters having been thrown on to the deep beds in the way I have described.
4284. Do you believe in the present system of leasing areas for oyster culture? No; I do not.
4285. Would it be a good plan to lease an arm, or a creek, or a portion of a river? I think it would be best to do away with all the leases, and let any man get a bag of oysters if he wishes to do so, and then let him pay a royalty on that bag of oysters.
4286. Would it not be better to give him the lease of a large area and require him to pay by results—so much on every bag raised? Yes.
4287. Do you think the present system is such a loose system that under it the Crown lands are stripped? I do; because oysters are sent away at the present day, and the people who send them away have no lease.
4288. Do you know of your own knowledge that oysters are taken from Crown lands by people who have no right to take those oysters? Yes; leases are held by people; the oysters they send cannot possibly come from their beds; the beds would not be capable of producing them.
4289. How long does it take an oyster to mature from the spat stage in these waters? About nine months.
4290. Have you seen any turtles in Port Stephens? Yes, a few. There are a number of logger-head turtles; they are no good. The hawkbill turtle is good for market.
4291. Are many sent away? Not many.
4292. They are not in great quantities? No.
4293. Have you ever noticed any evidence of the deposit of oysters in the deep sea? No; there used to be a lot of mud oysters here.
4294. Have you ever seen any oysters on the rocks at the Heads? Yes.
4295. Where do you think they come from? From the rocks inside.

Mr.
W. Glover.
8 April, 1895.

Mr.

Mr. Thomas Bagnall, fisherman, Nelson's Bay, Port Stephens, sworn and examined:—

- Mr. T. Bagnall.
8 April, 1895.
4296. *President.*] Your name is Thomas Bagnall, you are a resident of Nelson's Bay, and a licensed fisherman;—how long have you been fishing? I have been licensed about fourteen years. I have fished here for twelve years on and off, and I have fished at Botany and Port Hacking.
4297. Is there any one else associated with you? My two sons.
4298. What nets do you use? A garfish net only.
4299. I suppose you fish for garfish and catch other fish as well? Yes; I make the one net answer all purposes; it is the best net we can find.
4300. Are you satisfied with the length of that net? No, we want as much "balloo" stuff as that again.
4301. You want twice as much in the bunt? Yes; about 160 or 180 fathoms altogether—that is what we require to get a living.
4302. Do you destroy many young fish in drawing your net? Not more than we can help.
4303. Do they get meshed in the 1-inch bunt? They mostly get meshed in the 2½-inch bunt. I have been for hours taking the little fish that have been meshed out of the net.
4304. I suppose those fish were destroyed? No. There were three or four of us; we took a great quantity out; we were some hours taking the fish out of the meshes and letting them go.
4305. What fish would they be, the bream kind? No, a small mullet.
4306. If the mesh had been smaller would those fish have been saved? They would have been all saved, they could not have meshed.
4307. Do you tan your nets? We are obliged to tan them or they would not last; every time we tan them they shrink further.
4308. If the twine were tanned before it was made up, would that minimise the possibility of shrinkage? Yes, it would; but we would have to tan again.
4309. Do you think that once a net is passed as being legal it should be always used? Yes, until it is completely worn out.
4310. As to the hauling net, is any further length required for that in these waters? They say they want about 300 fathoms.
4311. Can they work 300 fathoms here with the tide? It is this way: sometimes you can work 300 fathoms, sometimes only 200, and sometimes only 100 fathoms on account of the tide.
4312. Would you like it to be left discretionary with the fishermen as to the length they require to use? Yes, that is just what it ought to be. If they can catch the fish in one haul they do not want to make two or three hauls for them.
4313. Do you use a meshing net? I do not believe in them; they harrass the fish.
4314. If the use of the meshing net was confined to the waters near the rocks, would that do you any injury? It would disturb the fish. I do not approve of meshing nets, although hundreds approve of them, but their use is against the haulers.
4315. Do you use a prawn net? No.
4316. Do you believe that a man's net should be confiscated for the first offence against the law? No; I do not believe in that at all. We have hard work to get a living without having our nets taken from us.
4317. Should there be punishment by fine or imprisonment, rather than by taking the tools of trade away from a man? Well, when a man's tools are taken away from him he is done, he is starving completely; you may as well lock him up at once, for he not only loses his net but what he has paid for it.
4318. Do you believe in giving the inspectors or the informers one-half the fine? No; I do not. It leads to harsh action on the part of the inspectors. It makes them harsh on the fishermen, and they persecute them.
4319. What do you think of a provision to allow fishermen the use of nets up to a maximum limit, with any mesh they like, providing they empty the nets in a certain depth of water—and further, that a stringent provision is made to prevent the destruction of undersized fish? I believe in that.
4320. Do you think the closures that have been made are justifiable? They are not fair to the fishermen. They are only made just for the inspectors to catch the fishermen who go there; they are traps for the fish, and traps for the fishermen. The closures are no good at all. A good many places are shut up in the summer-time by the blubber.
4321. Does the distance of the waters that are closed prevent them being worked in the summer? Yes.
4322. Can you work them in the winter? Yes.
4323. Do you know who recommended those closures? No; there should be no closed waters here.
4324. Where do you send your fish? To Redfern and Woolloomooloo—to Newcastle by steamer and Sydney by train.
4325. Is the freight high between Newcastle and Sydney? I think we pay about 50 per cent. more than any other part.
4326. Have you any complaint to make about the charge made by the Railway Department for the conveyance of your fish from Newcastle to Sydney? It is a shilling; I think it should be lower. If it was only 3d. per basket it would be something in the year to the fishermen.
4327. That is, provided you could get the 3d.? Yes; but we have our risks to run in the market. We do not get 3d. a basket sometimes, and we are often in debt to the agents.
4328. Do you consign your fish to an agent? Yes.
4329. Does he send you account sales? He does.
4330. Are you satisfied with the manner in which your fish is sold—are you satisfied with the returns you receive? We have got to be.
4331. Do you not think, considering the prices the public have to pay for fish, that the fishermen ought to have a better return? Certainly; we do not get one-third of the amount the public have to pay for fish.
4332. Can you show the Commission any account sales which have been rendered to you, showing you are in debt to the agents? I have got any amount of them at home. I beg to show the Commission the latest one I have received, showing that I am in debt £1 11s. 9d. on a consignment of twelve baskets of fish which I sent to Sydney.
4333. You have had transactions with the Woolloomooloo Market? Yes.
4334. Would it be better to have fish displayed on raised tables than thrown on the floor? They are far better dealt with in Hudson's market than at Woolloomooloo.

4335. Are there raised tables at the Redfern Market? Yes, raised tables; no trampling on the fish.
4336. Would it not be a good thing to have the fisherman's name on all fish sold, so that the public could see where the fish came from? Yes, that would be a good idea.
4337. Do you think it would be a good thing to allow fishermen to sell their own catches to the public? Yes, very good.
4338. Should there be more than one sale a day at the Woolloomooloo Market? Yes; there should be a sale in the afternoon.
4339. Have you had any fish stolen in transit? I cannot say. Our agent said the baskets have been very short, but we have filled them here.
4340. Do you send your fish in baskets? Yes. Sometimes we send fish in boxes; sometimes we do not get our baskets or boxes back again.
4341. Have you given any attention to the question of gutting fish before sending it to market? No.
4342. If the fishermen were paid for the extra labour involved in the gutting of fish, could it be done? It could not be done at Port Stephens. Sometimes we make a haul just as the steamer comes in; we stick them on the steamer, and she is off again for Newcastle.
4343. But provided it could be done at some of the fishing-grounds nearer to Sydney, do you think it would be a good thing? Yes; it would save the fish.
4344. Supposing the Railway Commissioners placed a refrigerating car at the disposal of the fishermen, would it be patronised by them? Yes; that is what we want from Newcastle to Sydney.
4345. Have you had anything to do with the oyster fisheries here—have you held any leases? No; but the leases ought to be thrown open to anyone who chooses to get oysters; if that were so, people living near the water would be able to get a bag of oysters and get a bit of flour for them.
4346. But would you allow anyone to get oysters when they liked? Yes; but let them pay a royalty on every bag.
4347. Do all the oysters sent from Port Stephens come from the leases? No, that they do not; they come from Crown lands; the leases do not produce half that goes from here.
4348. Would it be a good idea to allow a person to take up 1,000 yards, he to pay nothing as rental per year, but give him a lease for ten years, and make him pay 2s. per bag as royalty on every bag raised? No. I would sooner have all the leases thrown open.
4349. But how would you prevent wholesale destruction if you were to allow anyone to work these oyster fisheries? There would be no beds then; it would be the same as when I was a boy—go and take where you like.
4350. If people go and take oysters off Crown lands why cannot you and others do so? I would not make a thief of myself; but it is done.
4351. How many bags of oysters are sent from Port Stephens during a week? A good many.
4352. What is your opinion as to the condition of the fisheries at the present time compared with some years back—are they improving? They are about the same now as when I was a boy. There are some months in the year better than others; that is how they were in the days I speak of.
4353. Have you had anything to do with the capture of crayfish? I have caught a few.
4354. Have you caught them when in the coral or berried stage? Yes.
4355. Are there as many crayfish now as formerly? Not as many as there used to be.
4356. How do you account for that? I cannot say whether it is from over-fishing or not.
4357. Is it a wise thing to allow crayfish to be sent to market while in the berried stage? No; that should be stopped.
4358. Would there be any harm in closing some of the fisheries for a certain time during the season, to allow the crayfish to breed? That would give them a chance to breed.
4359. I understand there are several Italians fishing for crayfish? Yes; there were four at Broughton Island the year before last.
4360. How many crayfish-pots had they? About thirty or forty; last year I believe they had about 300 or 400. If they are allowed to use those 300 pots every year, it is no good closing the place, or anything else; they will take all the fish away.
4361. Are there any turtles in Port Stephens? Yes.
4362. Are they sent to market? Yes. I have caught some. There are two different kinds. There is the logger-head turtle—he is no good; but the hawkbill turtle is good.
4363. What do they generally weigh? We caught a young one about 3 cwt.
4364. What would that turtle be worth? I think we got £5 for it in Woolloomooloo Market.
4365. As to the licenses, are you satisfied with the amount you pay per annum? There should be a reduction in the fishing license, and in the boat license.
4366. As to the form in which the licenses are issued, would it be better to give you a kind of medal, which you could screw on to your boat—would that be more convenient than the present form of license? Yes; it would be better for us.
4367. Have the Fisheries Commissioners ever visited Port Stephens? No; none of them to my knowledge.
4368. What is the general opinion expressed by the fishermen in Port Stephens in regard to the Fisheries Commission? They do not believe in it.
4369. Would they like an alteration in the constitution of the administrative authority? Yes, they would. I think they would like to have someone in charge of the whole of the fisheries who would have a practical acquaintance with them, and who would understand them and work harmoniously with the fishermen. But I think that person should have the advice of local Boards, on which a representative fisherman could act, because you would then be able to get a true opinion as to the local conditions and circumstances governing the fishery.
4370. Have you ever done any deep-sea fishing? No.
4371. Have you ever seen well-boat fishing tried? No.
4372. *Mr. Thompson.*] You prefer the licensing system for gathering oysters. Do you remember the old days when oysters were taken in that way? Yes.
4373. Did that prove a success? I cannot say that it did.
4374. Do you think fish canning would prove a profitable industry. If we could establish the canning industry, would it open up large possibilities for the fishermen? Yes; if it could be done it would be far better than sending our fish away.

Mr.
T. Bagnall.
8 April, 1895.

- Mr. T. Bagnall.
8 April, 1895.
4375. How would you check oyster stealing? Only by throwing the place open.
4376. And allow everybody to have them? Yes.
4377. Would you favour the closing of certain areas for the protection of crayfish? I have not given that matter much thought.
4378. Would you require aliens to be naturalised before giving them a license to fish? Yes.

Mr. Henry Laman, honorary Acting Assistant Inspector of Fisheries, Port Stephens, sworn and examined:—

- Mr. H. Laman.
8 April, 1895.
4379. *President.*] You are honorary Acting Assistant Inspector of Fisheries for Port Stephens;—do you hold any other position? Preventive officer for Customs.
4380. How long have you been an assistant inspector? From November, 1889, to July, 1893; then there was a break, and I was reappointed in August, 1893.
4381. Do I understand that when you were first appointed you received a salary, but since August, 1893, you have received no salary? Yes.
4382. What salary did you receive from the Department of Fisheries? £50 per annum.
4383. Did you know on what grounds the Commission dispensed with your services? Retrenchment.
4384. Were the fisheries of Port Stephens left without supervision during the break in your appointment? Yes.
4385. How long did that break last? A little more than a month.
4386. Did you offer to act as honorary inspector? I offered to do so.
4387. During the time you have been acting assistant inspector, have you been asked to report on the matter of closures? Not since August, 1893.
4388. Prior to that date, were you asked to report? Yes.
4389. Were your recommendations always acted upon? Yes, to a certain extent.
4390. Were you asked to report as to the justice of the present closures in Port Stephens? No, I was not.
4391. Have the Commissioners on any occasion officially visited Port Stephens? No;—not during my term of office.
4392. How many fishermen's licenses are issued in Port Stephens? Including the crayfish-men, about eighty. The crayfish-men do not as a rule take out licenses until June; they usually hold them for the half-year.
4393. What quantity of fish was sent away from Port Stephens in 1894? About 5,000 baskets of all sorts of fish.
4394. Have you ever heard the fishermen complain about the unsatisfactory character of the Fisheries Act? Yes; often.
4395. And of the unsatisfactory manner in which that Act has been administered? Yes.
4396. As to the mesh of the different nets, which net is the more destructive—a large or a small mesh? The garfish mesh.
4397. Do small fish get meshed in the bunt of the garfish-net? Not so much as in the bunt of the hauling net, but more young fish are hauled ashore with the garfish-net.
4398. As to the meshing-net, is there any objection to having that extended to 150 fathoms? No.
4399. Supposing the mesh was reduced from 4 inches to 3½ inches ———? It is too small now; it would be of no use then.
4400. But is it not a fact that a good many marketable fish escape now through that mesh? I do not think so.
4401. Would not a 2-lb. mullet go through that mesh? Yes; but they do not usually mesh for mullet here.
4402. Do you see any objection to the use of the meshing-net in closed waters? No; providing there was a minimum mesh of 4 inches.
4403. Have you noticed the fishermen hauling their nets here? Yes.
4404. Do they strand their fish? Not in the presence of an inspector.
4405. Prawn nets are not used very much here, are they? They were used in the Myall Lakes until the flood came.
4406. Do you advocate any alteration in those nets? No; it is long enough.
4407. As to the lengths and sizes of the mesh of the several nets at the present time—we have different dimensions for different nets—would it not be much more simple to allow the fishermen to use whatever net they choose, so long as the fish were emptied in a certain depth of water, and provided they were prevented from sending undersized fish to market? It would; but I do not think it would work. If an inspector was present with them when they were hauling the net it would be right enough, but they would land on the beach when they could.
4408. Would you favour the administrative authority having power to regulate the length and meshes of nets to be used in certain places? Yes.
4409. Are you of opinion that if a net is once pronounced to be legal, and due precaution has been taken in tanning to allow for shrinkage, it should always be considered legal until worn out? Yes.
4410. You do not believe in the confiscation of a fisherman's net for the first offence? No, I do not; it would be better to fine the man.
4411. As to the licenses issued to the fishermen, could they be improved upon, and made more durable if they were issued in the form of a metal ticket? Yes.
4412. Would you favour the issuing of licenses and collecting of fines by the inspectors? I would, because by so doing the inspector would know at once who had a license.
4413. As to the oyster fisheries, have you watched the operations of the lessees closely? Yes.
4414. Have the beds leased by these people been pretty prolific of late? Yes, within the last year or two.
4415. Do you keep a record of the number of bags of oysters that go off the leases? I do to a certain extent, but some lessees do not forward the notice of removal.
4416. So that you cannot keep a correct record? I could, if the Department made it a rule to supply me with the information which is sent to them.
4417. I suppose it is quite possible for bags of oysters to be stolen from Crown Lands and to be sent elsewhere? Quite possible.

Mr.
H. Laman.
8 April, 1895.

4418. Is it possible for small lessees, say those holding 100 yards, to rob the larger lessees? Yes.
4419. Have you reason to suspect that is done in Port Stephens? Yes, I have.
4420. Do you approve of the present system of leasing in small areas? Yes.
4421. Do you not think that the leasing of areas of 100 yards in extent leads to indiscriminate selection, and is the cause of the unsatisfactory condition of affairs? Yes.
4422. Would it not be better to lease larger areas—say an arm, or the estuary of a river—to one person, for oyster culture? No; I think not.
4423. Why? It would give a monopoly.
4424. Would you allow anyone and everyone to go upon an oyster fishery, and take whatever they liked from them, and bag the oysters and sell them? No.
4425. Would you simply carry on the present system? Yes; but I would limit the area.
4426. What limit would you have? Say 500 yards; not more than 500 yards to be taken up by one person.
4427. How many leases are there in the river? About twenty-nine.
4428. Are they held by twenty-nine persons? No, by five or six persons.
4429. Are they in good condition at the present time? Fair.
4430. Are they improving? They will never improve more than at the present; the lessees leave it to nature, and depend largely on the oysters they get from Crown lands to replenish their beds.
4431. Have the beds been visited by disease? Yes; the worm.
4432. Have any leases been forfeited on the score of nonpayment of rent? Yes.
4433. Do you know how the inability of the lessees to pay rent was brought about? Probably by the low price of oysters.
4434. Would it be through the beds proving unproductive, owing to the ravages of the worm? Yes; to some extent.
4435. Is it possible that some of the beds have been attacked for a period of three years, and for that period they have been rendered unproductive? Yes.
4436. Do you know whether anyone has made application for the surrender of his lease, and has been refused? I do not know of a case.
4437. Do you know whether there are any people in arrears? I do not know.
4438. Supposing a lease is attacked by the disease for a period of three years and rendered unproductive, is it a fair thing to charge the lessee for that three years, seeing that he has received no return from the bed in all that time? No; I would not charge the whole of the rent.
4439. Would you give the administrative authority discretionary power in the matter? Yes.
4440. Would the system of payment by results work better, and give more satisfaction; do you see any objection to that? I see no objection to that.
4441. Do you know whether any New Zealand oysters have been laid down here? Yes.
4442. How did they thrive? They lingered, and ultimately died.
4443. Do you think it was the natural condition of the grounds on which they were placed which caused their death? It was the change in the water.
4444. Which are the best oyster beds in Port Stephens? Corrie Island, some years ago, was looked upon as the best place in Port Stephens; but I think the leases held by Mr. Henry Thompson, above Middle Island, are the best.
4445. Are there any oysters in the Karuah River? There might be an odd one or two got by dredging.
4446. How do you account for their absence;—is it owing to the prevalence of floods? The prevalence of floods, the washing away of the river bottoms, the worm disease, and over-dredging.
4447. The Port Stephens oyster fisheries were very prolific at one time, were they not? They were.
4448. Do the oysters develop quickly here? Very rapidly.
4449. Have the oyster lessees tried to adopt any practical means of oyster culture? No, none of them.
4450. They have trusted to nature to a very great extent? Wholly so.
4451. Are there no cases where artificial methods are adopted for catching spat? None.
4452. How many yards does Mr. Lilley hold? He holds no leases at present.
4453. Did he hold any? Yes.
4454. The crayfish fisheries were very extensive at one time, were they not? Yes.
4455. In what condition are they now, compared with what they were some years ago? They have been overworked.
4456. Are our European fishermen wholly responsible for that? I think so.
4457. Does no blame attach to the Italians in the matter? It is only during the last two years the Italians have made their appearance on the crayfish grounds off Port Stephens.
4458. Have you seen crayfish being sent to market when in the berried stage? Yes.
4459. Do you think it would be wise to stop that sort of thing? I do.
4460. Would it be a good thing to have a close season for crayfish? Yes.
4461. Is it a fact that there are Italians, or Greeks, camped on Broughton Island, and that they use something like three or four hundred pots for the capture of crayfish? Yes.
4462. Are they licensed? They had licenses; they were all Italians.
4463. Were they naturalised? I rather doubt it. Half-a-dozen Italians will use between three and four hundred traps; it is no trouble to them, as they do not have to attend to them during the night; they set them to-day and pick out the fish to-morrow. I think if a fee were charged for all traps exceeding a certain number they would not be used so largely.
4464. I suppose these Italians really control the market by having so many crayfish always on hand, to the detriment of the European fishermen? Yes, they do.
4465. Have you had any experience in deep-sea fishing? None whatever.
4466. Have you any knowledge of the use of the trawl? No.
4467. Have you ever seen the system of well-boat fishing carried out? Yes; two well-boats put in here occasionally.
4468. Have they proved successful? Well, in one instance, yes.
4469. Where do they fish? They go as far as the Solitaries, and take their catches to Sydney and Newcastle.
4470. Have you ever heard the fishermen complain of the want of proper accommodation at the Woolloomooloo Market? Yes.
- 4471.

- Mr. H. Laman. 4171. Have you ever heard them complain of the manner in which they have been robbed by someone in the market? Yes, frequently.
- 8 April, 1895. 4472. Is the curing and smoking of fish carried on to any extent here? No; sometimes a fisherman will smoke a few mullet, he sends them to market, and gets nothing for them, and it ends there.
4473. Does it frequently happen that a fisherman will miss the steamer, and consequently his catch, which may consist of twenty baskets, will become useless? Occasionally, not very often.
4474. What is done with those fish? Thrown overboard; more fish are thrown overboard and wasted in that way when the steamer does not call here owing to bad weather.
4475. Could not those fish that are thrown away be smoked, and utilised as articles for human consumption? Yes; but they have no smoke-rooms ready.
4476. In regard to the prawn fisheries, are they extensive? Not in the Port Stephens waters, but in the Myall Lakes.
4477. Are the prawns captured in the lakes sent to Newcastle or Sydney? To Newcastle in a dried form, and sold to the Chinamen.
4478. Are the Myall Lakes pretty full of fish life? Yes; very full; the Myall Lakes cover an area of nearly 40,000 acres.
4479. Have you a boat in which to get about here? Yes.
4480. Would it not be much more convenient if you were provided with a small steam-launch? Yes; it would.
4481. Do you advocate that, in connection with extensive waters such as those you have to supervise, the inspectors be provided with some more suitable means of getting over large areas of water? Yes; one man can do very little by himself in a boat.
4482. Are turtles numerous here? Yes; fairly so.
4483. Are they captured by the fishermen? When they are caught they are caught accidentally, generally in the upper waters.
4484. How are they caught? In a net.
4485. What weight are they? All sizes, the loggerhead, or spotted, or soft turtle, is not edible; they have a very rank smell and are full of oil; they grow to an immense size, and probably weigh about 2 tons.
4486. What would be their yield of oil? Some of the fishermen got one here on the beach, and they cut his liver out, and boiled it thinking to get the oil, but it went just like a bullock's liver, and they got no oil; so they left it on the beach for the sharks. The body of the turtle was in the wash on the beach, and the oil was tried out by the sun. It was throwing off oil until the flesh rotted away.
4487. Do you think an industry might be built up in the collection of that oil? Yes; in oils generally, porpoise oil, shark oil, and turtle oil.
4488. What about the edible turtle? They do not grow so large as the loggerheads. They are called hawkbills, and weigh about 2 cwt. They are captured and sent to Sydney; they are good eating.
4489. Have you ever noticed any shoals of fish passing along the coast? No; I have not been outside.
4490. Have you heard the fishermen say they have seen shoals of fish outside? Yes; I have.
4491. Any of the herring, maray, or pilchard tribe? They did not tell me what they were.
4492. *Mr. Thompson.*] Do you think the continual stirring and working of the oyster-beds will help to eradicate the worm? I do.
4493. Where do you find this disease, below low-water mark only? No, a little higher up than that.
4494. How far up? About a quarter above neap tide mark.
4495. If platforms could be built, so as to have their floor one-third above low-water mark, and the oysters were placed on them, would they grow? I think so.
4496. I suppose you would call that practical oyster culture? Yes, I would; if I had a lease I should cultivate them in that way.
4497. Is anything of that kind attempted here? No.
4498. The lessees take just what nature gives them ——? And all they can collar.
4499. I suppose with your limited means of getting about these waters it is beyond the bounds of possibility for you to exercise supervision over the Crown lands? Of course it is.
4500. You expressed the opinion that the granting of large leases, such, for instance, as the North Arm, would create a monopoly? Yes.
4501. Do you think it would prove any greater monopoly than the leasing of Crown lands for other purposes? I think so.
4502. You think the case would not be parallel with the case of leasing land for gold-mining or coal-mining? No.
4503. Why? To go in for coal-mining, or gold-mining, requires a little capital.
4504. Does it not require a little capital, and special knowledge, to successfully follow oyster-culture, for instance these platforms, the building of "claires," the construction of "fascines," and the adoption of all the different intelligent methods of oyster culture which are practised in other countries, would not they require capital, and do you not think if a man followed any or all of these he should have a right in the property he cultivates, just in the same way as a man should have a right to the gold or coal he may win from Crown lands? Yes.
4505. That being so, where does the monopoly come in? It would not require so much money to go in for oyster culture.
4506. Have you noticed any oysters outside the Heads? Yes, I have.
4507. Where? They are outside on the rocks.
4508. Where do they come from? I think they come from deep beds in the sea.

Mr. Henry Thompson, oyster lessee, Nelson's Bay, Port Stephens, sworn and examined:—

- Mr. H. Thompson. 4509. *President.*] You are an oyster lessee, and you reside at Nelson's Bay;—how long have you lived here? Nearly five years; I have been on the river thirteen years.
- 8 April, 1895. 4510. How many leases do you hold, and what is their area? I have four leases; the area of the lot is 1,600 yards.
4511. How long have you held those leases? About ten years.
4512. When you first took them up were there plenty of oysters? Just about the same as now, I kept shifting them about; we had a great spawning season the year before last.
4513. Have you been troubled by the worm? Yes, a great deal.

4514.

4514. Did that disease do much damage to your beds? It did; there are young oysters now below half tide which have not got a touch of it.
4515. How long has the worm disease been in your leases? I have three islands; on one of these islands there is no disease, and the other two have the worm.
4516. Have you done anything to cope with the disease? Only by getting the oysters off, and cleaning the bottom, taking away the sea-weed, and so on.
4517. It is your experience that the oysters that are uncovered for a portion of the day are those which escape the worm disease? Yes, especially those on the rocks.
4518. Do the oysters develop quickly here? Yes.
4519. How long do they take from the spat stage, when they are laid down, to develop into a mature oyster? That all depends on the feeding ground.
4520. Quite so, but what is the shortest time? About eighteen months on a good feeding ground, in other places two or three years.
4521. Have you obtained good supplies while the disease was in your beds? Yes; every winter we shift the oysters from the high rocks and lay them out on the flat, and when they develop we send them to market.
4522. But you do not deposit rock oysters in the deep water? I put them below half tide in order that they may fatten. They are not allowed to remain there long enough to contract the disease.
4523. Do you know of any means by which you could rid the beds of the disease? I do not; they have tried on the Hunter to rid their beds by taking the shells away, but it did no good; the disease seems to be in the mud, it is not only the worm that does the harm to the oyster, it is the mud which he swallows, it forms a blister.
4524. Have you ever asked for the surrender of any of your leases? Yes.
4525. Have they been surrendered? Yes.
4526. On what grounds? The disease.
4527. What area did you surrender? 1,000 yards in the Karuah, and 700 in the Telligherry Creek.
4528. Used the oysters to be pretty good in the Karuah River? I never got any oysters there, I took it up to form an oyster-bed, it was a hard bottom.
4529. That would be after the dredging had taken place there, some years previously? Oh yes, that is so.
4530. How do you account for the non-existence of oysters there;—is it owing to the fact that the river was over-dredged? No; oysters were never there in payable quantities.
4531. Are you satisfied with the present system of leasing, or would you prefer some other system? I am satisfied with it.
4532. What do you think of the idea of leasing an arm, a creek, or a foreshore to one man; that is to do away with the leases of 100 yards, and give a man a larger area? I do not believe in those 100 or 200 yards leases; I believe in having 1,000, or 2,000 yards,—a man can get a living off that, but he cannot get a living out of 100 yards,—not by fair play.
4533. Do you think the Crown lands must suffer if small areas are taken up? Undoubtedly; that is my opinion.
4534. Would you favour a continuance of the present system of leasing, or would it be fairer for the lessee to pay according to results? That is my idea,—payment by results.
4535. Would you favour a man paying say 2s. 6d. per bag on every bag of oysters he took off the large lease I have suggested? I believe that would be much better than the present system.
4536. Would payment by results meet the case of a person who might have taken up a large area, and who had not obtained anything from his beds owing to the worm disease? Yes, that would be fairer, either that way, or have a sliding scale, say from 10s. per 100 yards up to £5 for a bigger ground.
4537. Do you send many oysters to Sydney? About eight or ten bags per week.
4538. What is the average price per bag? About 10s. clear money to me. I have sent oysters to Sydney and received a return of 5s. 4d. per bag.
4539. Was that when the New Zealand oysters were in? No; that was only about five weeks since. They were sold in Hudson's Market.
4540. Have you known any beds on which New Zealand oysters were laid down? I laid some on my own beds.
4541. Did they thrive well? Not at all; I think the oysters were too old when I received them.
4542. You do not think they have the carrying capacity our own oysters have? No; I do not.
4543. Have any of the Fisheries Commissioners ever visited this place officially? No; not that I am aware of.
4544. Do you think it their duty to visit the different fishing-grounds occasionally, in order to make themselves acquainted with local circumstances and conditions? I think an experienced man should come here.
4545. Do you mean to say that the Fisheries Commissioners are not experienced men? I do not think they are.
4546. What is the general opinion, in regard to the Commissioners, held by the fishermen at Port Stephens;—are they satisfied with the administration? The fishermen blame them, and they do not agree with what they have done.
4547. Would it be a good idea to establish a local Board—say for Port Stephens—to advise the central authority on matters connected with the fisheries here? I believe it would.
4548. And for a representative fisherman to have a seat on that Board? Yes; that would be a good idea.
4549. Have you ever noticed any evidence showing the existence of deep sea deposits of oysters? I have seen oysters on the rocks outside, they have been seen as far as Long Island, about 9 miles to the north.
4550. Where do you think the spat came from? It may have come from the river.
4551. Have you any knowledge of crayfishing? Yes; a little.
4552. Should there be a close season for crayfish? There are times when it is a shame to take them, I mean when they are in the berried stage; there should be a close season for crayfish, say for one or two months. The Italians are fishing for crayfish at Broughton Island.
4553. Do they use many traps? They told me they had as many as 300 belonging to one boat.
4554. Would it be a good thing to compel these people to pay so much for every crayfish pot they had? That would be a good idea.

- Mr. H. Thompson. 4555. Would you license aliens before they become naturalised? I think they should be naturalised first. About two years ago, before the Italians went to the island, there were twenty or twenty-five boats went there, now none go there. There is one boat down there for every twenty boats that used to go. Under the present system the Government only receives £2 for the one boat, whereas before these people went there and took up all the grounds with the pots the Government used to receive £50.
- 8 April, 1895. 4556. Mr. Thompson.] Are all the aliens engaged in the capture of crayfish at Broughton Island licensed? I believe one half of them are not.

PITTWATER, NARRABEEN LAKES, AND DEE WHY LAGOON FISHERIES.

SATURDAY, 30 MARCH, 1895.

[The Commission met at the "Narrabeen Hotel," Narrabeen, at 11 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

THE HON. R. H. D. WHITE, M.L.C.

L. G. THOMPSON, Esq., J.P.

Mr. Charles John Hastie, fisherman, Pittwater, sworn, and examined:—

- Mr. C. J. Hastie. 4557. President.] Your name is Charles John Hastie;—where do you reside? Pittwater.
- 30 Mar, 1895. 4558. How far is Pittwater from Narrabeen? About 10 miles; I have lived in the district about thirteen years.
4559. Are you a licensed fisherman? Yes.
4560. How long have you been a fisherman? Between twenty-five and thirty years.
4561. So that you have not devoted the whole of your time to Narrabeen and Pittwater, you have fished elsewhere? Yes; as far as Seal Rocks north and Ulladulla south, schnapper fishing.
4562. Have you fished the inlets with the net? Yes; all of them between Seal Rocks and Ulladulla.
4563. Judging from your answer, you ought to have a pretty extensive knowledge of the fisheries on the New South Wales coast? I have.
4564. Have you anyone associated with you in your fishing operations? My three sons at present; they are all licensed fishermen.
4565. Have you taken out one boat license? Only the one license.
4566. Are you satisfied with the amount the Government demands for the license? I am quite satisfied with the license, but I think it is an imposition to charge a license for a man who fishes outside the Heads. I pay my license for the net boat, but not for the other, as I fish beyond the territorial limits.
4567. How many fishermen are there in the Pittwater district? About eight licensed fishermen—permanent resident fishermen.
4568. What kinds of fish do you catch? Schnapper, flathead, nannegai, morwong—all kinds of line fish. We had a fish yesterday that would have done for the Museum if we could have caught him. It was what we call a billfish. He took six schnapper from me, and then got away. He was about 8 feet long, and had a long bill like a swordfish, with his mouth underneath the bill. The fish was blue, sky blue; he had a tail almost like a bonito, and an eye almost like a saucer, and it was nearly as large. He leapt out of the water about 10 feet, and got away; that was off the south head of Broken Bay. He was an excellent specimen—a kind of shark. I used to go with the late Sir William Macleay getting specimens.
4569. How do you dispose of your catch? I send to Woolloomooloo Market.
4570. How many baskets do you send on an average? Ten or twelve baskets per week.
4571. Do you send by boat or rail? Sometimes by rail from Peat's Ferry; sometimes by the Hawkesbury steamer; and sometimes we run them ourselves to Sydney.
4572. To whom do you consign at the Woolloomooloo Market? Fitzgerald and Lawler.
4573. Are you satisfied with the returns you receive as a result of the sales of your fish? Yes, perfectly.
4574. Are you satisfied with the market accommodation at Woolloomooloo? Yes; the only fault I find with it is the flooring of the market. It ought to be flagging instead of cement, on account of the flagging being cooler.
4575. Are not the fish, as displayed at the Woolloomooloo Market, liable to be trodden upon and spat upon;—would it not be better to display them upon raised tables? As regards spitting upon, I think they would be equally spat upon if they were upon raised tables. With the large concourse of people around them you can hardly help it.
4576. Supposing the congested state of affairs at that market was done away with by providing auxiliary markets, do you think that would be better? Yes; perhaps it would.
4577. Would sales during the day be an improvement? Yes; there would be a greater consumption of fish. It would be better than keeping the fish about in the market.
4578. What do you receive per basket for your fish, taking them all round? About £1 per basket.
4579. Do you send any sea mullet to market? No.
4580. Any garfish? The boys send garfish; the last basket they sent they got 12s. 6d. for. They were very large sea garfish.
4581. Have you ever lost any fish in transit? No.
4582. What nets do you use? A hauling net, 3 inches in the wings and 2½ inches in the bunt. Since the issue of the last regulation reducing the mesh of the garfish net, I have bought the net 1½ inch, to allow it to shrink to 1⅓-inch.
4583. Do you use any other net? In the winter-time we use the sunken net for whiting.
4584. What mesh is that? We use 2½ inches; a great many use a smaller mesh, but that ought to be prohibited.
4585. Do you use a meshing net? No.
4586. Do you use a prawn net? No.
4587. Are you satisfied with the length of the hauling net? Quite satisfied.
4588. Are you satisfied with the mesh? Quite.

4589.

Mr.
C. J. Hastie.
30 Mar., 1895.

4589. Are you satisfied with the length and mesh of the garfish net? Quite.
4590. Pittwater is at present open to net-fishing, is it not? The top portion of it, from below Scotland Island, is closed to net-fishing.
4591. Narrabeen is closed, is it not? I believe so.
4592. Have you ever hauled in Narrabeen? No; and I never would.
4593. Why? The place is full of grass; it has been closed too long.
4594. When hauling, do you empty your fish from the net in a certain depth of water? I always take care, and I have taught the boys the same, to throw the small fish into the water. I use the greatest precaution to save small fish, such as small red bream, whiting, black bream, and blackfish; but when you come on to the shallow flats you must destroy a certain proportion of small fish.
4595. Have you ever seen numbers of little red bream, black bream, and blackfish meshed in the bunt and in the wings of the hauling net? Yes, I have; you cannot help destroying the fish in that way.
4596. Do you think if a smaller mesh were used in the bunt you would be able to save those fish? I do not think so; if you had a smaller mesh you would suffocate them. If a man took time to throw the small fish out before he looked after his good fish, in the Lower Hawkesbury at any rate, he would have the bunt of his net eaten out by small sharks.
4597. What is your opinion regarding the different closures that have been made;—do you think they were justifiable? No, I think they were not justifiable. I am speaking, not on my own behalf, but for other people. I consider that the heads of the river, such as Mullet Creek and Mooney Creek, should be closed, and the other portions opened. At the present time there are mullet in Mooney Creek, but the fishermen cannot take them. These mullet will travel soon and nobody will get the benefit of them.
4598. Do you think the Narrabeen Lakes should be thrown open for net fishing? Yes, in the winter, but not in the summer.
4599. Why in the winter? Because the fish have done spawning then. In the summer the lakes should be closed because the fish enter and breed.
4600. Do you consider the Narrabeen Lakes a breeding ground? Yes; all lakes are breeding grounds.
4601. Do these lakes get their supply from the sea as well as from local production? Oh, yes; you can see the fish come in from the sea, and go out again.
4602. What would you think of a provision in an Act to allow the meshing net to be used in closed waters? I do not think it ought to be used in closed waters. I consider the meshing net ought not to be allowed, only around lakes and places where men cannot go with the hauling net to catch large fish. As to using a meshing net where a man is going to haul, it is wrong.
4603. What would you think of a provision allowing fishermen to use a net of any dimensions, say, not exceeding 300 fathoms, in any waters opened to net fishing, providing that the net was emptied in not less than 1 foot of water, and further, that a stringent provision should be made to prevent the sending of undersized fish to market;—would that be better than the present complicated system of lengths and dimensions of nets? I think if we were allowed 300 fathoms of net, and let none of it be less than 2½ inches, from that to 3 inches, that would do if we were allowed to use it on rivers as well as lakes.
4604. You are opposed to the use of a meshing net in closed waters? Yes. Principally those parties who use meshing nets in closed waters are not fishermen. They pay no license fees. I have seen men using meshing nets in closed waters, at Pittwater, with the inspector under their nose, and they have not been prosecuted.
4605. Who was the inspector? I am not certain.
4606. Who were the parties? Bulfins, of Newport.
4607. How long ago would that be? About three years ago. I have seen the yachtsmen come into Pittwater and use meshing nets in closed waters.
4608. Do you believe in fishermen's nets being seized and confiscated when they are found guilty of an offence against the law? Not for the first offence. I had one confiscated some time back. I think it was about the cruellest thing ever done. It was only a short piece of net, about 1 foot in depth, that I had attached to the lead line and the bunt.
4609. What did that net cost you? About £18. I was advised by an inspector to remove the wings of the net and make them legal, and I did so at a cost of £4. About ten days after that the net was seized and confiscated, although the bunt which was considered illegal had been passed by the inspector ten days before as being legal.
4610. Were you prosecuted? No, the net was taken out of the boat. If I had been prosecuted it would have cost me less; I should have been fined £2 and had my net restored.
4611. Do you think it would be better not to take away a fisherman's tools of trade for the first or even the second offence, but that he should be fined heavily or imprisoned, say for a term not exceeding seven days? Yes.
4612. I suppose you believe in such cases being tried as soon as possible after the alleged offence has been committed? As soon as possible. I do not wish to and never had any intention of breaking the law. I have worked as close to the Act as any man and it has cost me hundreds of pounds to do so.
4613. Do you believe in inspectors receiving half the fine? No; I consider it is only an encouragement to them to seize the net; it is like a bribe to those men who go and seize the fishermen's nets.
4614. Do you consider the Fisheries Act works smoothly? I consider it is right enough, with the exception of the provisions I have just mentioned.
4615. Are you satisfied with the Fisheries Commission—the Board appointed to control the fisheries at present—or do you think any change should be made? I am satisfied.
4616. You think they pay sufficient interest to the fishing industry to warrant the assumption that they are a body capable of developing the fisheries? I think so.
4617. Can you tell us of any occasion when all or any one of the Fisheries Commissioners have visited these fishing grounds? I cannot.
4618. Do you know of a single instance? I do not.
4619. Do you think men charged with the administration of the Fisheries Act should visit the different fishing grounds and make themselves acquainted with their conditions and circumstances? I do.
4620. Do you think, also, if they recognised that they were called upon to administer a defective Act, it was their duty to attempt to remedy it? I do that.

Mr.
C. J. Hastie.
30 Mar., 1895.

4621. Do you think it would be an improvement to establish an authority whereby the value of a practical acquaintance with the fisheries of the Colony could be utilised in the development of the industry, either by the appointment of local Boards, or by the appointment of a Board in Sydney with representative fishermen on it, or the appointment of a Commissioner of Fisheries with local Boards to advise him? I think there should be practical fishermen on the Boards to advise.
4622. Do you think if the services of a man could be secured to administer and control the fisheries, and local Boards to advise were formed, with representative fishermen on those Boards, that would tend to remove many of the grievances the fishermen now complain of? I am certain it would.
4623. Have you done much deep-sea fishing? Yes.
4624. Have you found it pay you well? Yes, it pays me very well.
4625. Do you shift your grounds much? Yes, according to the season and the weather.
4626. What time of the year do you work the southern fisheries? I have given up working the southern fisheries. I am getting too old now. I can earn a good living closer home.
4627. What time of the year did you generally visit the southern fisheries? In the winter I worked the Sir John Young Banks through and through, and round Ulladulla, Shoalhaven, Shellharbour, and Wollongong, right up to Sydney Heads.
4628. What system did you adopt for keeping your fish alive? I took a well-boat with me. I worked a well-boat the last month I was in Ulladulla, but it did not suit.
4629. Why? The schnapper fret too much.
4630. How long did you try the experiment? For a month; you keep the fish in the well for about twenty-four hours and they go off.
4631. Did you prick them? Yes, I was with a practical fishermen from Hobart. We pricked them three scales back from the pectoral fin.
4632. Did you ever prick them near the ventral fin? No, I did not.
4633. Did you keep those fish alive any time? We could keep them alive as long as we liked, but they became lean through being confined in the well.
4634. Did you feed them? Yes, on all kinds of fish.
4635. What was the size of your well-boat? Forty feet long, 10 feet beam, and between 6 and 7 feet deep; she had a well of 10 feet by 8 ft. 6 in. wide.
4636. Had she a partition in the centre? Only a centreboard, no casements at all; she was perforated with ventilation holes on each side. She was beautifully got up, but rather narrow. She used to roll about and the seas would come wallop up against the deck. I have seen four of us load that well with schnapper in two hours off Ulladulla.
4637. Did you ever try to get the fish to eat? They will eat after they are twelve hours in the well—eat ravenously.
4638. Did you ever try feeding them on what they call suction—oatmeal put into the water during the first two or three days? No; the only fish that will live in the well on this coast is rock cod, flathead, nannegai, and any kind of rock fish.
4639. You know the grounds along the coast between Seal Rocks and Ulladulla pretty well,—have you ever come across any sandy bottoms? I can find you a stretch of sand 20 miles long, bordered by rocks; that bottom would be 5 or 6 miles wide; it is between the North Head and Broken Bay, and Bungaree's Norah.
4640. Would there be plenty of edible fish on that bottom? Plenty of flathead; there might be others.
4641. Would that be a good place for a trawling experiment? It would be right enough; I have seen the trawl used.
4642. Where? Here on the coast. It was tried in Sydney Harbour, about eighteen years ago, by Mr. Buckingham. He worked it with a little open boat; it was only on a small scale.
4643. Do you think an experiment in trawling should be made in order to set at rest the doubts that exist as to whether trawling could be carried on successfully? There could be no harm. It might pay very well.
4644. During your trips along the coast, have you ever seen shoals of fish travelling from the southward, north? Yes, all kinds—the maray, four or five kinds of maray, and what they call the herring maray, almost like the English herring. [*The witness was here shown a plate "Clupea Sagax."*] Yes; that is the herring I mean.
4645. Are you satisfied that we have a species of herring travelling in great shoals along our coast at certain periods of the year? Yes.
4646. At what periods of the year? About May and June.
4647. Did you notice any particular features in connection with the water during their passage? Yes; there was a kind of grit on the water. You can find it now on the coast. It is like little eggs. It is the same as if the fish had left a shell. It is like little egg shells.
4648. Would you take that to be the spawn of some fish travelling? Yes, I do. That is what the garfish feed on—these egg shells. You will find the garfish out here about April and May.
4649. Would it be possible to catch those fish of the herring species with the drift net? You would want a fine net—a net they use to catch them with at home.
4650. Do you think they could be utilised—have you ever eaten them? Yes, I have. They could be preserved. I have eaten them. They are beautiful eating.
4651. Have you ever smoked or salted any of them? No.
4652. Have you had any experience in the capture of crayfish? I have caught a few between here and Bungaree; they are very plentiful at times.
4653. Are you acquainted with their habits? No.
4654. You cannot say what season they spawn? No.
4655. Have you noticed any evidence of deposits of oysters in the deep sea? I have had nothing to do with oyster culture.
4656. *Mr. White.*] With all your experience in fishing, has it never struck you as an extraordinary fact that we import so much cured and tinned fish, when we might cure and tin the fish we have in our own waters? Yes; it has been tried here. I have tasted some tinned smoked mullet from Cape Hawke. It was of very good flavour—better than you could import.
4657. Are you of opinion that a large trade might be done in tinned fish in this Colony without importing at all? Yes, I am.

4658. Do you think a very large industry could be established here? Yes, I do.
4659. You have had considerable experience on the coast—are the fish migratory? Yes.
4660. What time of the year do they go north? Schnapper travel north in March and April. About ten years ago I made a haul on Mackerel Beach in Pittwater, and I got twenty-six dozen schnapper; they were travelling. Mullet travel north at the same time; garfish and black bream also travel about the same time.
4661. Have you noticed that schnapper always go in schools, and if you strike a school you get plenty of fish? Yes, that is so. The schnapper I caught at Ulladulla were local fish. They were a large dark fish; you can always tell the difference; the school fish are bright red fish, the local fish are dark.
4662. Do you think that if there had been divisions in your well-boat the fish might have had a better chance of living in the wells? The boat we had was not built in a satisfactory manner for well-boat fishing.
4663. Are you of opinion that properly constructed well-boats would be advantageous to the fishing industry here? They answer well in Hobart; I do not know how they would answer here.
4664. *Mr. Thompson.*] Have you ever fished in Tuggerah Lakes? About a month in Tuggerah.
4665. Did you find the ordinary hauling-net large enough to catch fish in payable quantities? I was there in the winter and it was sufficient for me.
4666. Why do you object to 300 fathoms of hauling-net being used in the lakes? I did not object to it; what I intended to say was that if 300 fathoms is allowed in the lakes, the same length should be allowed everywhere.
4667. The grass in the Narrabeen Lakes, is it ever destroyed or removed by natural causes—for instance, by floods, or anything of that kind? I think the fresh water spreads the seed.
4668. Which mesh is most destructive to fish, the larger or the smaller mesh? I think the larger mesh.
4669. Are fish fry in Narrabeen in the winter? I never worked there much in the winter; the fish go up to the heads of the creek. There are big holes up there, and they resort to those holes in the winter.
4670. Then there are no fish except in those deep holes? Not in any quantity; that is where most of them lie.
4671. And would you net those holes in the winter? Yes.
4672. Would not such netting destroy young fish as well as old fish? There may be tributaries further up where the young fish go; I do not know much about the place.
4673. Why, then, would you recommend the opening of Narrabeen for fishing during the winter months? Because there is plenty of whiting down at the mouth and they could be caught.
4674. Would you object to drift meshing-nets or set nets being used in closed waters, under supervision, to capture those fish? I object to those nets.
4675. Would you license amateur fishermen? They ought to pay a license as well as professional fishermen.
4676. Would you require aliens to be naturalised before being licensed to catch fish? Yes, they ought to be licensed the same as we are.

Mr.
C. J. Hastie,
30 Mar., 1895.

Mr. Charles John Hastie, fisherman, Pittwater, sworn and further examined:—

4677. *President.*] Do you know the difference between this Commission and the Fisheries Commission in Sydney? I did not know until just recently. I was told this was a Royal Commission after I left the room.
4678. Were you of opinion, when you were giving evidence, that you were speaking to the members of the present Fisheries Commission? Yes, because I saw Mr. Lindsay Thompson in the room.
4679. Then are we to understand that you did not know you were giving evidence before the Royal Commission on Fisheries? Yes. I thought I was giving evidence before the Fisheries Commission.
4680. Had you known you were speaking to the Royal Commission on Fisheries, would you have expressed yourself differently concerning the other Commission, the existing body? Yes, I would have done so. I am certain they have not done their duty. What I intended to say, in giving my answers to some questions put to me, was that I was satisfied with the appointment of the Royal Commission to inquire into matters. I did not know, until just now, that your Commission was the Royal Commission. I am glad to see the appointment of the Royal Commission. The old Commission is no good; they have not done their duty. I am glad the Royal Commission has been appointed to inquire into everything.

Mr.
C. J. Hastie,
30 Mar., 1895.

Mr. Thomas John West, Paddington, sworn and examined:—

4681. *President.*] Your name is Thomas John West, and you reside at Paddington; I understand you are a frequent visitor to Narrabeen, and the adjacent fisheries? Yes, generally about once a week.
4682. The Commission desire to know whether you represent the line fishermen in the evidence you are about to give? Yes, I do.
4683. How long have you been acquainted with these fisheries, how long have you been visiting them? About forty years.
4684. How do you find the fishing now, comparing it with what it was the first few years of your experience here? Well, at times, within the last seven or eight years, it has been impossible to catch a mess of fish here.
4685. How do you account for the decrease? To a very great extent it is owing to the net-fishing. This is a small place, and when it is opened for net-fishing there are generally four or five fishing boats down here together, sometimes more than that. I have watched them very closely at times while they have been netting, and they destroy a great number of small fish; they drag the fish on to the sandy flats. I have seen bushels of small fish floating about after they have hauled their nets.
4686. Was that the result of their becoming meshed in the bunt or in the wings of the net? Yes.
4687. Do you think that a stringent provision, making it compulsory for fishermen to empty their nets in a foot of water, would minimise the destruction of live fish? It might do so, but unless you have an inspector here they would not do it.
4688. You say you have actually witnessed the destruction——? Of thousands of small fish in the Narrabeen Lakes.

Mr.
T. J. West,
30 Mar., 1895.

4689.

Mr.
T. J. West.
30 Mar., 1895.

4689. Do you consider Narrabeen a breeding and feeding ground? Yes, there is no better place in the Colony; I know no finer place than this used to be. Of late years it has suffered from the over-dragging with the nets. I know most of the lakes in the Colony, and this used to be a splendid place.

4690. Do many people visit these lakes? I do not think there is a place in the Colony where more people go to fish; a great number of amateur fishermen come here.

4691. Do you think it would be an injustice to the net fishermen if, in the interests of the large number of amateur fishermen who visit Narrabeen, these lakes were permanently closed? No injustice at all. The fishermen themselves have informed me that they have made very little out of it. This is a great breeding ground; you can see myriads of young fish in the lakes at times. I think it would be beneficial to the fishermen instead of proving injurious to them, because, if the lake gets full of water, and a passage is opened, the fish go elsewhere, and the fishermen catch them.

4692. Have you noticed the growth of weeds in the lake—is it extending? Generally about this time of the year the weed is bad. This is continually altering; places that are covered with weed now will, in three or four months' time, be quite clean.

4693. Do you think it is necessary to permit net-fishing here to keep down the growth of weed? Nets do not remove the weed at all. I have had a good deal of experience in net-fishing, and you cannot haul a net where the weeds are bad, and you cannot catch fish there for the simple reason that the lead line rolls up in the net and it comes over the weeds, and you lose all the fish.

4694. What fish do you generally catch here? Before the lake broke out this last time you could go almost anywhere and catch three or four dozen of very nice whiting, black bream, and flathead.

4695. I suppose you catch all the edible species of fish that frequent the inlets? You never catch red bream only on very rare occasions; you catch the silver bream and blackfish; any amount of blackfish, mullet, perch—very fine perch here sometimes—especially up those creeks, Deep Creek and Middle Creek. In Deep Creek I have often caught perch weighing 2 lb., in the brackish water. You will catch them further down, too.

4696. Have you ever seen any fry of the schnapper in the lakes? No.

4697. Do you know whether set lines are used in Narrabeen? I know set lines are used and nets are used there at the present time. Of course the difficulty is to catch the offenders.

4698. Is any supervision exercised over the lakes at the present time? I have not seen an inspector here for a very long time.

4699. Is it your opinion that if it is wise and discreet to close certain waters against net-fishing, for the sake of keeping up the continuity of the supply of fish, it is necessary an inspector should be appointed to give proper supervision to the waters? If you do not have an inspector you will not keep up your supply of fish. This lake has been closed for some time, but only last week fish were sent from here to Manly; those fish were taken in the lakes with nets.

4700. Do you know who caught those fish? I cannot say.

4701. Have any of the Fisheries Commissioners ever visited the lakes officially? I have never seen any of them here.

4702. Do you think if certain areas were set apart for amateur line fishermen, waters in which fishermen were not allowed to haul their nets, they would object to pay a nominal license fee annually, to meet the expenses of supervision? I know dozens of amateur fishermen who come here who would be only too pleased to pay an annual license fee in order to get proper supervision. No honest sportsman would object to pay a license fee; it would be a good thing to have one inspector to supervise two or three places such as Narrabeen and Dee Why.

4703. Have you done any deep-sea fishing? Yes, I have.

4704. Do you know anything of the fishing-grounds off the coast, are any of them suitable for trawling? I do not think there are many grounds suitable—that is my impression.

4705. Supposing there were grounds, would you favour the proposal that the Government should be requested to make an experiment in trawling on the coast? Yes, I think it would be a very good thing for the Government to do; it might be the means of catching more fish than at present and at much less cost.

4706. You spoke of Dee Why Lagoon;—do many fish breed there? Yes; but it is a lagoon that breaks out more frequently than the others, and you never get so large a fish in Dee Why as in Narrabeen; but that lake would require equally as much supervision as Narrabeen.

4707. Speaking generally of the fisheries of New South Wales, do you think it would be a wise provision to set apart certain waters within a convenient distance of populated areas in order to allow amateur fishermen to indulge in line-fishing? I think it would be a very wise thing indeed, and it is very necessary that something of that kind should be done.

4708. From your experience, do you think there are plenty of fishing-grounds further afield to which the fishermen could resort without dragging the waters so near to the populated centres? I am certain of it.

4709. Do you think they might take a little more interest in the development of our deep-sea fisheries? Yes.

4710. In regard to the administration and control of the fisheries of the Colony, do you favour a continuance of the existing Fisheries Commission, or do you think that institution might be improved upon by the appointment of someone who would display more interest in the fishing industry? If I had my way about it I would abolish the Fisheries Commission to-morrow, for the simple reason that I have never known any good result from it.

4711. You knew the condition of the fisheries of the Colony in 1881? Yes.

4712. Comparing that time with the present time, can you say whether the fisheries of New South Wales are in a better condition to-day than they were in 1881? They are in a far worse condition, there is no doubt about that.

4713. *Mr. White.*] When do the schnapper travel north or south? Schnapper generally go south about October. About that time you will find more schnapper and squire about the reefs than at any other time. I have caught them at various places from here to Wollongong. I have caught them much more readily about October and November than at any other time in the year.

4714. Have you ever noticed any shoals of fish on the coast? Yes, I have.

4715. What months do they generally travel? The sea mullet in March and April.

4716. Have you seen the herring on the coast of New South Wales? Yes; I have seen the herring in shoals. You may call it a true herring; it is very much like the herring. Tailer are also very plentiful on the coast at times.

Mr.

Mr. Donald McLean, Narrabeen, sworn and examined:—

4717. *President.*] Your name is Donald McLean—how long have you lived at Narrabeen? I have resided here for over eleven years; I am the oldest resident on the Mount Ramsay Estate, Narrabeen.

4718. Do you know anything of the fisheries of the Narrabeen Lakes? I have studied them since I have been down here, and taken much interest in the fisheries.

4719. Is the fish supply in the lakes as good as it was some years ago? It was much better some years ago; the scarcity of fish is owing to the fact that of late years the lake has been dragged so much that it has never had proper time to recover itself. I have seen eight nets in the lakes at one time, and they dragged them to such an extent that they have become almost depleted; fishermen have come here from Botany, Parramatta, Manly Beach, the Hawkesbury, and Pittwater. The fishermen, when they first came to the lakes, got a good supply of fish in one or two hauls, and with those catches they glutted the market, and consequently prices ran very low. The close time for net-fishing expired towards the end of December, and the men came down and got all the fish. It has not paid them on account of the presence of so many fishermen on the lakes at the one time. They raked the grounds and then left; this did no good to anybody.

4720. After the visits of the fishermen you allude to, did you notice any evidence of the destruction of small fish? Yes; after the first few hauls the fish became very scarce. The men hauled their nets up into the boats, then they separated the marketable fish from the unmarketable ones, and the little ones were allowed to rot on the banks.

4721. They did not empty their nets in the water? No, not at all times.

4722. Did they leave the young fish stranded at times? Yes.

4723. Any quantity? *Yes, in great quantities. Visitors have complained of the stench which has arisen from the dead fish.

4724. Is it your opinion that there are plenty of waters further afield available for the fishermen without their resorting to the Narrabeen Lakes? From what I have seen of Narrabeen and the other lakes, I can say Narrabeen is one of the principal, if not the best breeding places in New South Wales. It is said the lakes get overcrowded with fish, but that is not so, because the big fish leave the lakes after the entrance is opened. Narrabeen Lakes form a nursery for fish, and other fisheries get the benefit of this nursery.

4725. Do many amateur line-fishermen come down here? Yes, a good few.

4726. If the lakes were permanently closed to net-fishing, would it induce more frequent visits from amateur line-fishermen? Yes, I am certain of that. People would come here for the benefit of their health, and to enjoy a little fishing. Narrabeen is close to Sydney, and easily reached from all points. If these lakes are kept closed the poor man has a chance to bring his wife and family, and enjoy a little fishing; they can go out in a boat, or fish from the sides of the lake, and get sufficient to benefit themselves.

4727. Do you know whether the lakes are hauled by fishermen during the close season? I believe so.

4728. Is there an inspector stationed here who is charged with the supervision of the lakes? No; perhaps one comes on a special occasion. Unless the waters are permanently watched it is a hard matter to keep the net fishermen away.

4729. Can you see any utility in closing waters without having proper supervision over them? Certainly not.

4730. Are you of opinion that someone should be stationed in this district to protect the fisheries? Yes; someone that has an interest in the lakes should be stationed here.

4731. You know, of course, that this Commission is the Royal Commission on Fisheries? Yes, I am aware of that.

4732. Have you heard of a body called the Fisheries Commission, who now administer the Fisheries Act? Yes.

4733. During the years you have been here, do you know whether any member of that body, or that body as a whole, have visited these fisheries? No, not to my knowledge.

4734. Have you ever heard any fishermen who came from other waters boast that they could use the nets in the Narrabeen Lakes in spite of the inspectors? Yes, I have. A few weeks ago I was in Sydney, and I heard a conversation between two men in an hotel. One said to the other, "They are going to close Narrabeen." The reply was, "No fear, they will never close Narrabeen." The other man said, "How is that?" to which his friend replied, "Well, they will not close it later on." One of the men who had been speaking said to me, "They will not close Narrabeen, because the hauling would be done secretly." I replied, "How is that?" and he said, "Well, I have known a party go down there, and take a boat from a person who has boats on the lake, and capture fish with a net." Now this happened to be one of my boats, as I keep boats for hire on the lake, but the man did not know who he was speaking to at the time.

4735. Would it be a step in the right direction to permanently close the Narrabeen Lakes, as well as the Dec Why Lagoon, so as to allow amateur fishermen to come here and enjoy a few hours fishing? I think it would be a good thing.

4736. What does it cost to reach Narrabeen? By steamer, 6d. return from Sydney to Manly; by coach from Manly to Narrabeen, and return, 2s.; making the total cost 2s. 6d. return from Sydney to Narrabeen.

Paget Bayly, Esq., Brookvale, Manly, sworn and examined:—

4737. *President.*] Your name is Paget Bayly, and you reside at Brookvale, Manly? Yes.

4738. I understand you have, for a considerable time past, taken a deep interest in the fishing industry? Yes.

4739. How long have you lived at Manly? About ten years.

4740. During that time have you had good opportunities of noticing the capabilities of the several lagoons—I mean in regard to the fish supply in those places? Yes; the best opportunity, that could possibly be had.

4741. Have you been a frequent visitor to the different fisheries in this neighbourhood? Yes, frequently, by night and by day.

4742. I understand that some time ago you offered your services in an honorary capacity to the Fisheries Commissioners, with a view of having some supervision exercised over the several fisheries in this district, and

Mr.
D. McLean.
30 Mar., 1895.

P. Bayly,
Esq.
30 Mar., 1895.

P. Bayly,
Esq.
30 Mar., 1895.

and that you subsequently acted as an honorary inspector of fisheries for a considerable time? Yes; for two years and five months.

4743. How long is it since you ceased to occupy the honorary position of inspector of fisheries? Since last May.

4744. As you were receiving no salary for your services, it would not be on the score of retrenchment that they were dispensed with? No. I should like to say, also, I was the means of adding revenue to the Department.

4745. Do you mean that, in consequence of your supervision of the fisheries, everything went smoothly, and that more licenses were taken out? That the men were getting a living, and that they took out licenses which they had not taken out before.

4746. During the time you were honorary inspector did you have occasion to visit the Narrabeen Lakes very often? Oh, yes; I was a constant visitor three or four times a week, night and day. I worked very hard—as hard as any inspector in the world would work—to keep the fisheries in good condition.

4747. During the period you were exercising supervision over the fisheries here, did you prevent fishermen from hauling their nets in the closed waters? Yes; most decidedly. I stopped that as far as I possibly could.

4748. You say you gave a lot of attention to the protection of the fisheries of the Narrabeen and other lakes at Manly? Yes; and Sydney Harbour and Broken Bay as well.

4749. Did the Commissioners of Fisheries give you any reason to account for your services being no longer required? No; they wrote me and thanked me for my services, and told me they were going to appoint a paid inspector.

4750. Have they appointed him? No.

4751. Do you think the fisheries have suffered from the want of supervision? They have suffered greatly.

4752. What do you think was the reason which prompted the Commissioners to send you the intimation dispensing with your services? It is an open secret that no inspector will interfere with the Newton's net; it is an open secret that his billet is not worth it. Mr. Hill had pulled me over the coals for interfering with Pearce's net. A fortnight before my services were dispensed with a Manly fisherman came to me and complained that Newton was using an illegal net. I afterwards saw Newton and told him I should watch him, and if he put the net in I should seize it; that day Pashley came to me and told me the net was in the boat. I got a boat and found they had been hauling small garfish. I saw two of the inspectors and I took the garfish up and showed them to the inspectors. I went across to Newton's camp and said: "Someone has been hauling here, I shall put a stop to it." The next week I got the intimation to go. My conclusion is that from my having stopped Newton, and interfered with Pearce, my services were dispensed with.

4753. Where do those Newtons live? Watson's Bay, I believe.

4754. Are they old fishermen about the waters? I think so.

4755. You think, then, that the Newtons made some communication to the Fisheries Commissioners in order to have your services dispensed with? No; I think Newton made an information to Mr. James Hill, a member of the Commission, and Mr. Hill rules the roost, that is my opinion.

4756. As to the present state of the fisheries, you say that the good work you have done for the last two and a half years has practically been lost as far as its value to the fisheries is concerned? It has; but one year the fishermen had the benefit of the fish. I think the Broken Bay fishermen had the benefit, they get all the benefit of these two lakes in my opinion.

4757. In the way of these lakes providing a supply of fish for the Hawkesbury? Yes, they go direct to the Hawkesbury; the entrance is only dammed up five or six months out of the year, and in the winter they breed there, and go out into the Hawkesbury.

4758. There is an opening then—a channel made as a means of ingress or egress to the sea and the lake at certain periods of the year? Yes; half as broad as George's River at Liverpool; you can take a big fishing boat in on the tide with eight or nine men in her.

4759. Would you consider the lakes purely breeding grounds, or nurseries for fish? Purely nurseries.

4760. Would you be inclined to recommend that no nets should be used in these lakes? Well, that is a question I hardly like to answer; I recommend that no hauling-nets should be used, but under proper supervision, I do not think a meshing-net would hurt at certain seasons.

4761. That would be a net that would only catch marketable fish? Yes, marketable fish; but they are such small lakes that they might destroy the whole place.

4762. Would it be in the interests of amateur line fishermen to reserve these lakes as a field for line fishermen to have a little sport in? I never took that into consideration. I like to see the fish preserved for the general public—the amateurs can generally find fish—and so preserved that the fishermen could get a living. Amateurs do a lot of damage; the fishermen by netting Narrabeen kill the goose that lays the golden eggs. One haul kills millions of fish, and only benefits one man, who gets a few pounds out of it.

4763. Do you think, if amateur line fishermen were allowed to use the lakes, that there should be a stringent provision to prevent the catching of under-sized fish? I do, most decidedly; I think they should pay a nominal license fee to bring them within the meaning of the Act.

4764. Supposing the lakes were thrown open, how long do you think it would take for six or seven boats to exhaust the fish supply? A week. Two boats pretty well exhausted it in a month. Some parts of the lake they could not net; but six or seven boats would haul every bit of it in a day. It would not pay six boats to go for a week.

4765. Do you think at the present time, owing to the lakes not being subject to supervision, they are netted illegally? Yes; positively. They took a net out of it the other night. Some private individuals seized it on their own account.

4766. Can you understand why the Fisheries Commissioners neglect to provide proper supervision for fisheries of that character? No; I cannot.

4767. Could it have been on account of the salary or expenses which were paid to you that you were retrenched? It cost me over £100 out of my own pocket. I got 10s. a week latterly for my horse. I crippled a horse and smashed a buggy, and part of the time I got 10s. a week. I used to pay my own expenses to Sydney. I paid one man's fine out of my own pocket. I found his wife was ill, and he turned

P. Bayly,
Esq.
30 Mar., 1895.

turned out my best man afterwards; he would do anything for me. It could not have been retrenchment. In February or March there were six boats licensed by the reports I made. I have sent many men up to the office that had no licenses. I used to be about day after day to get these men to go up to be licensed. I seized Pearce's net, and Mr. Hill called me over the coals for it. Mr. Hill told me he was one of the honestest men he ever saw. On Friday, the 11th July, I seized Pearce's net.

4768. Was your removal prior to the retrenchment scheme? A long while after that. I was made an inspector for the Colony after that. It was this time twelve months I was made an inspector for the Colony, after all our inspectors went, and allowed 10s. a week, and I put my whole heart into the work, and worked hard. You could go on Manly pier and see no small fish there.

4769. As to the classes of fish in the lakes, do you think they are purely of local production or do they find their way through the channel? Oh, the channel. I have been there for years at about this time. I have gone down and stopped a week at a time at the mouth, camped out, and I have caught forty and fifty big whiting coming in on the tide, and I fished it down, and I perhaps caught one or two. They go up past the bridge and stay in all the winter, and breed in the spring. These big whiting go out again and leave their spawn. They come in in millions—bream, tarwhine, mullet, and whiting this month or any time last month, when it is open. They stay all the winter, and the first time it is opened they go out, and the lake is a mass—in October and November—of whiting of various lengths, from 3 inches to a foot long. I have noticed the mouth of Narrabeen lagoon for the last eight years.

4770. How often has it, during your residence in the vicinity, been opened to the sea? It is open to the sea six months in the year, perhaps more. In a rainy season it is open all the year. It is open more than it is shut. In a rainy season it is 30 or 40 yards broad. The year before last it was never closed all the summer. It all depends on the seasons. As a rule it is pretty well half and half. It is shut now, and it was opened about two months ago, very wide.

4771. Do you know of any occasion when the Commissioners as a body, or any one of them, have visited the fisheries of Narrabeen Lakes? No, I do not; they were coming once, but they only drove past.

4772. You have had some experience of the work of the present Fisheries Commission;—do you think there should be any change as far as the administration and control is concerned? I do; most decidedly.

4773. In what direction would you suggest an amendment? As an improvement on the Commission?

4774. Yes? I should abolish this Commission. They do not know anything about fish; they are neither use nor ornament. I have often thought over the subject myself. I think there should be an inspector of fisheries responsible to a Minister alone, and he should have the control. Until you get a good man solely responsible to the Minister, there will be no satisfaction to the fishermen or the general public. I do not think this Commission know anything about the subject.

4775. Do you think they have not shown that interest in the fisheries of the Colony the public expect of them? If they have shown any interest it only shows their ignorance; but I do not think they have ever shown any interest at all? Fishermen fishing at Manly Beach without licenses, and without supervision, except by a visit now and then from an inspector, shows bad management.

4776. You think there should be some one appointed who would have a practical acquaintance with the fisheries, some one who would be able to spare time to acquire a knowledge of the local circumstances and conditions of the fisheries? Most decidedly; there should be a man at the head responsible to a Minister alone.

4777. Would it be an advantage to establish what might be termed Boards of Advice at the different fishing centres—say, one at Tuggerah Lakes—the fishermen to have one representative on that Board, so that local matters could be referred to that Board, in order to advise the Chief Commissioner? I do not hold with that. If a man is appointed as inspector and allowed to do as he likes, he will know all about the different matters. If Jack, Tom, and Harry, are allowed to tell him what to do, he would get a variety of opinions, and between two stools he would not know what to do. A practical man knowing the wants of the place would know what to do himself, that is with his inspectors under him. I do not think he should be interfered with. A good man would work it more satisfactorily to everybody, and it would be satisfactory to the fishermen themselves. A good man could improve the fisheries. I could have effected great improvements myself. I think it wants a man with supreme command—a man who would not favour anybody; where there are a whole lot that have power they have favourites. If the fishermen were on the Board for the purpose of advice only it would be a good thing. If the inspector's word is final it would be a good thing, and I quite agree with it on these grounds.

4778. *Mr. Thompson.*] About nets, do you think it would be an advantage if we discarded the present system of nets, that is the hauling-net, and the garfish net, with their various lengths and sizes of meshes, and allowed fishermen to use any net they desired in open waters within a maximum length and a minimum mesh, relying on judicious closing of waters for the continuity of supply? If they did empty their fish into the water I would be in favour of it, but from my knowledge of fishermen I do not think they would do so, and there must be some guard against killing small fish; if they were properly supervised I should allow them to do what they liked.

4779. Would you allow the use of set-nets, or drift-nets in closed waters? I would not allow them there at all.

4780. We have heard about the duckweed in Narrabeen, do you know anything about it? Yes, the fish breed in it.

4781. You do not think its presence a disadvantage? It is an advantage, decidedly.

4782. Would anything destroy that weed, or remove it? No; you cannot remove it, unless you pull it up by the hand.

4783. Does it develop most in fresh or salt water, that is when the lake is open or closed? It is natural, it will stand either water, brackish or salt, and goes away itself in four or five years; floods take it away when it is too bad. It is what the fish breed in.

4784. I think you told the President you favoured the idea of amateur fishermen being licensed? Yes, I do, a nominal license to bring them within the meaning of the Act.

4785. About this license, do you think a metal ticket would be preferable to the paper license that is given now? Yes, I do, a great deal better.

4786. Are you of the opinion that Narrabeen is a very favourable spot for observing the habits of the several species? Yes, very.

4787. I suppose you think that by intelligent observation information could be obtained about the habits of our fish that at present we do not possess? Yes, at Narrabeen especially.

- P. Bayly, Esq.
30 Mar., 1895.
4788. Can you say with any degree of certainty what fish spawn there? I do know in some way.
4789. Can you give us a general idea what fish spawn there, and when? I have it down in my diary and will supply the information.*
4790. Would you advise the artificial opening of this lake when it has been closed naturally for a long period? It has to be opened, if there is a shower of rain the road-man has to go down and open it as it floods the houses; half a day opens it, and there is a stream that would wash a bullock team off their legs.
4791. Do you think the use of drift or set nets would be destructive to the breeding grounds? Yes, I do, I do not hold with them at all.
4792. Would you refuse a license to aliens until they are naturalised? My opinion is that they cry out about the aliens too much, for the reason that they are willing to work when others are not.
4793. You do not think they should be naturalised? No, I do not.
4794. I suppose the remarks you have made as to Narrabeen as a fishing ground would apply to Curl Curl and Dee Why? Yes.
4795. Do you know anything about well-boat fishing? No; I do not.
4796. Do you know anything about trawling? No.

Mr. James Wheeler, fisherman, Narrabeen, sworn and examined:—

- Mr. J. Wheeler.
30 Mar., 1895.
4797. *President.*] Your name is James Wheeler, and you are a resident of Narrabeen;—how long have you lived there? Altogether a little over forty years.
4798. You have a good acquaintance with the fisheries? Yes; I have followed that occupation for twenty-five years.
4799. As a professional fisherman? Yes.
4800. Were you engaged in net or line fishing? In both kinds of fishing.
4801. How long have you discontinued fishing? I carried on fishing till about twelve months ago.
4802. You are a permanent resident of Narrabeen? Yes.
4803. Have the Narrabeen Lakes proved a good source of supply for the Sydney Markets? In former years they did, but not lately, on account of their being so much closed.
4804. Do you think net-fishing in these waters increased or decreased the supply of fish? By closing them against the nets it increases the supply of fish in the harbour.
4805. Do you consider Narrabeen and the other lakes are breeding-grounds? Yes, in every sense of the word; they are nurseries.
4806. Is not an opening made naturally on certain occasions by the influence of the sea? No, not naturally; only by the flood-waters being allowed to remain. It would overflow eventually.
4807. Is Narrabeen closed at the present time? Yes.
4808. Do you consider it a justifiable closure? I do not think the fish are exhausted there at the present time; there is an abundance of fish there now.
4809. What kinds? A different class of fish to former years. The place is overrun with duckweed. We have blackfish and perch in the lakes. The principal kinds of fish to be caught now are mullet, blackfish, perch, and black bream.
4810. How do you account for the growth of the weed? I cannot say. The seed may have been carried there by the nets, or it may be owing to the birds who eat the seed.
4811. Do you think allowing the use of hauling-nets in the lake would prevent the growth of the weed? I do not think so; the weed has got such a hold of the water now that a fresh crop must come. I doubt very much if you could work seines in it.
4812. Are there many amateur fishermen patronising the lakes? Yes; very many.
4813. Do you think it a wise provision to set apart certain areas for amateur fishermen? Yes; I think such a thing would be necessary; it is a question whether Narrabeen would be most come-at-able. There are many like myself who let out boats who would say, "Shut it up against amateurs." I make as good a profit as I did out of the net-fishing; but I should like to show the Commission the true light of this thing.
4814. How many fishermen would Narrabeen support? I do not think more than two boats. In three or four months of the year they would exhaust the place.
4815. That is, by net-fishing? One or two will do very well. More could not exist; they would run one another out.
4816. So that it not being a permanent field for the fishermen, would you think it advisable to have the waters reserved for amateur line-fishermen, so as to meet the dual purpose of giving the fish a chance to breed, and to give sport to a certain class of the community who wish to indulge in fishing? It would simply afford a living for the people round the shores of it, and whether they are to be considered before the *bonâ fide* fishermen or not is a question.
4817. You mentioned just now that on an occasion when the lakes were thrown open, the waters were exhausted by the wholesale netting of eight or nine boats? Yes; there were too many there for the place.
4818. Should professional fishermen seek fields further away, rather than confine their operations to places adjacent to Sydney? Yes; as long as they have a chance of getting their fish to Sydney in a marketable state.
4819. Is there any supervision exercised over the Narrabeen Lakes at present? No, not at present.
4820. Do you think it possible the lakes get fished sometimes? There is not the shadow of a doubt about that; and since Mr. Bayly's time it has been done wholesale.
4821. In respect to the use of the meshing-net, do you consider that is the only net that should be used on the lakes? I would prohibit the use of all nets, meshing-nets or otherwise, in waters set apart for breeding purposes. 4822.

* NOTE (on revision):—Brookvale, 10th May, 1895. To the President and Gentlemen of the Royal Commission on Fisheries.—Gentlemen, I find in Narrabeen Lagoon the most garfish come in to spawn about the month of August; whiting, bream, tarwhine, in March and April; sea mullet, the end of February, March, and April. The fish cast most of their spawn on entering, but I have caught whiting and bream full of spawn up till December, and flathead that never go out nearly all the year. I have seen a basket of beautiful perch taken at a haul, and the duckweed is full of them, but I don't think they ever go out, and I don't know when they spawn. I beg to call your attention again to the beneficial effect of duckweed in any lagoon; it is a feeding and spawning-ground and should never be disturbed. In proof I wish to mention besides Narrabeen, Muddy Bay, Lake Macquarie, which is always full of fish; besides being a feeding and spawning-ground it stops netting to any extent, and in my opinion should always be kept intact. If we had more of it we would have more fish.—I have, &c., PAGET BAYLY.

Mr.
J. Wheeler.
30 Mar., 1895.

4822. Do you see any objection to the meshing-net being used generally in closed waters? A meshing-net will only catch those fish that are fit for consumption; I consider the garfish-net does a great deal of damage.
4823. Would not the 2½ or 2¼ inch bunt of the hauling-net be equally destructive? It would be a large whiting that would escape through that.
4824. What is your opinion in regard to the fish-life in the lakes—is it of local production? Yes, of local production; the bulk of the fish breed there, and when they become of mature age they escape. Just before the heavy rains you could see 100 or 150 tons of fish waiting there, and you could stand and throw them out with a shovel as fast as you could handle it.
4825. What kinds of mullet have you there? Three kinds—the hard-gut, what I believe go into the sea mullet, the flat-tail, and the tallagalan or sand mullet.
4826. Have you ever known any of the members of the present Fisheries Commission to visit Narrabeen with the view of making an efficient investigation into the conditions of the place? No, I cannot say I have; they may have gone there unknown to me, but I have never heard of them doing so. We have frequently had visits from the inspectors to try and catch the poachers.
4827. Being amongst the fishermen, and having been mixed up with them for a number of years, have you ever heard them express an opinion as to the wisdom of continuing the present Fisheries Commission? No; I cannot say that I ever have. I do not associate with the average number of the fishermen.
4828. Have you thought the matter out yourself as to whether there should be a change in the administration and control of the fisheries? Yes; I consider it requires alteration.
4829. In which way would you suggest? In the first place as regards nets.
4830. I mean as to the Commission as a body—the governing power;—you see there is a Fisheries Commission administering the Act; they are clothed with certain powers; I want to know whether you are satisfied with the way they have administered the Act, or whether it has been open to censure? Well, it is a matter that I have never gone into. As I have found the law it was my chief object to act up to it accordingly. I must confess I have lost nets at different times, through their not being up to the standard, which I have purchased according to law in Sydney, and after wear they shrink and are seized. Whether the Fisheries Commission instructed their officials to seize them I cannot say.
4831. Did you make any appeal to the Fisheries Commission? No; I never did. I knew the nets were wrong. They were right when I got them; but by frequent tanning they became illegal, and I lost them.
4832. Do you believe in a man's tools of trade being taken from him? It seems a hardship. I always used to make an allowance of a ¼ of an inch in my nets for shrinkage, and then I knew they came within the limits of the law. It is a hardship to a man who has to trust to it for a livelihood.
4833. How many fishermen are living at Narrabeen? At the present time about two, and they obtain their livelihood by hook and line; but there are fishermen outside who frequently pay nightly visits to it for the purpose of working it by the seine or net.
4834. Although the lake is closed? Yes; they have been doing so. The officials have not been successful in capturing them. They captured one small net a week ago, but the men got away.
4835. You think, then, there is a necessity for local supervision being established? Yes; you want a smart man to go about in the night-time—two would be better—to inspect these places once or twice a week at the very least.
4836. *Mr. Thompson.*] I suppose you consider the lakes very much more a breeding than a fishing ground? Yes.
4837. In fact, it is not a fishing-ground at all; it is a breeding-ground? Yes; that is so.
4838. And the fish, when they go to sea, find their way into other breeding-grounds? Yes.
4839. Do you think it desirable to preserve Narrabeen as a breeding-ground? Yes.
4840. Would you object to the use of set nets or drift nets in Narrabeen? Yes.
4841. Would you consider it desirable if these nets were used that they should be set in a certain way, cast from, and hauled into a boat, so as not to interfere with the breeding-grounds? Yes; hauled into a boat.
4842. In respect to the duckweed you spoke of, is it removed by fresh water? No; the fresh water seems to improve it from some cause or other. About ten or fifteen years ago, before the bridge went across Narrabeen, the road to Newport used to pass through the lake, and a man was paid to keep that road open; but since the bridge has been erected the water remains in a stagnant state for six or twelve months at a time. The water becomes fresh and the weed seems to grow.
4843. If the entrance could be kept open would it improve the lake as a breeding-ground? Yes.
4844. That would involve some expense? Yes; undoubtedly.
4845. Do you know anything of Dee Why as a breeding-ground? Yes, it is the same bottom—the same kind of fish there, perch, black bream, and mullet. Like Narrabeen, it is a nursery; it is not so large a body of water, but the fish congregate there just the same, and escape and leave it.
4846. Is it more open to the sea than Narrabeen? Less.
4847. Do you know anything of Curl Curl? Yes, a little; I never fished there; I fish with a line, not with a net.
4848. Would that come in the same category? Yes, the whole—Dee Why, Curl Curl, and Narrabeen—I would place them all in the same category.
4849. Is Curl Curl very often open to the sea? Not more so than Narrabeen.
4850. You agree then that this forced opening is really beneficial to the waters of breeding-grounds? It is; because the fish that arrive at maturity leave the place.
4851. Do you see any harm in amateurs fishing with lines if they caught only fish of a marketable size? No, no harm at all.
4852. Would you license amateurs? Yes, I would.
4853. Would you think it fair that if all this protection is afforded to them they should pay for it? Yes, I do, as some of them come there to catch fish for their own consumption, but then sell it.
4854. Would you make the amateurs who simply fish for their own recreation pay for the protection the law has given? Yes.
4855. Aliens—would you have them naturalised before they were licensed? Yes.
4856. Have aliens been much trouble on that lake? No; the waters are not suitable for the sunken nets, and, therefore, they do not come there.
4857. I suppose you would keep these lakes closed and use them as breeding-grounds? Yes; and owners of boats on waters set apart as breeding-grounds—men who let boats out for hire—should be licensed.

PORT JACKSON AND PARRAMATTA RIVER FISHERIES.

WEDNESDAY, 6 MARCH, 1895.

[The Commission met at the Offices, Bligh-street, at 11 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

The Hon. R. H. D. WHITE, M.L.C. | L. G. THOMPSON, Esq., J.P.

Bertram Horwitz, Esq., Superintendent of Agents, The Equitable Life Assurance Society of the United States, Sydney, sworn and examined:—

- B. Horwitz, Esq., 6 Mar., 1895.
4858. *President.*] What is your name? Bertram Horwitz.
 4859. Where do you reside? At Manly.
 4860. How long have you resided at Manly? About three years, but I have known the locality for some considerable time.
 4861. Do you take any interest in the fishing industry? I do; so much so that I was instrumental in having a petition prepared and signed by a number of prominent persons for the purpose of endeavouring to have certain of the harbour waters closed.
 4862. Are those waters included in a line drawn from Middle Head to the extreme point of Inner North Head in a straight line on the Manly side? Yes.
 4863. The waters you desire to have closed would include Middle Harbour, North Harbour, Quarantine Bay, Gasworks Bay, and Green Flats? Yes.
 4864. Did you forward the petition to the Fisheries Commission? I did.
 4865. Did you receive any reply to the prayer of the petition? I did.
 4866. Was that reply of a satisfactory nature? No indeed, it was not. The petition reads as follows:—

The Chairman, Fisheries Commission, Sydney,—

Manly, 6 November, 1894.

Dear Sir,

We, the undersigned residents of Manly and district, beg to suggest for your consideration the advisability of closing against all net-fishing the waters from (say) Middle Head to extreme point of Inner North Head in a straight line on the Manly side. The waters closed then would, of course, be the Middle Harbour, North Harbour, Quarantine Bay, Gasworks Bay, and those waters known as Green Flats.

Our reasons are as follows:—

In the first place, the abovementioned bays are without doubt the spawning and breeding places for fish, and we feel sure that you are not aware of the immense amount of destruction that is going on daily at these places.

We have seen bushels upon bushels of small fry left on the beach after each haul of the net, comprising flathead, whiting, garfish, soles, flounders, and many other descriptions, and we feel that we are doing our duty in bringing this wholesale destruction under your notice, and the public at large would be greatly benefited by your closing these waters for such time as you may deem fit.

Trusting that this Petition will meet with your favourable consideration,

We remain yours, &c.,

4867. Have you got the reply of the Fisheries Commissioners with you? Yes; I should like to read it. It is as follows:—

Sir,

Department of Fisheries, Sydney, 7 November, 1894.

I laid before the Commissioners of Fisheries your petition praying for the closure against the use of fishing nets of that portion of Port Jackson northerly of a line drawn from Middle Head to the extreme point of North Head. The Commissioners desire me to state that they consider that sufficient breeding grounds for Port Jackson are already closed; they are much obliged for the information respecting the destruction of small fish, and will instruct their inspectors in that regard.

Also, the Commissioners will be thankful if you will give them your authority for the statement that the bays to which you refer are "without doubt the spawning-places for fish." The Commissioners are most anxious to acquire information on this question, where the various kinds of fish spawn, and as so little has hitherto been found out about it, they hail with some satisfaction the solution by the petitioners of this difficult problem.

The Commissioners are very desirous to learn from accurate sources what fish spawn in our waters; where they deposit the spawn; and how long the spawn is undergoing the hatching process.

I have, &c.,

LINDSAY THOMPSON,

Chief Inspector of Fisheries.

Benjamin Horwitz, Esq., Manly.

4868. I suppose you look upon the reply as being rather satirical in its nature? I do.

4869. Are you of opinion that sufficient consideration was given to the request made by the petitioners? Most certainly not. 4870.

B. Horwitz
Esq.

6 Mar., 1895

4870. This copy of the petition embodies reasons for asking for closures to be made? Yes.
4871. I notice you say some of these beds are spawning and breeding grounds, and that you have on different occasions seen bushels of young fish left on the shore? Yes; that is correct.
4872. Would that be the result of the fishermen using nets of a small mesh and dragging the nets on to the beach? Yes, certainly.
4873. Have you ever witnessed any of the operations of the fishermen? Repeatedly.
4874. So that what you state with regard to the destruction of small fish has come under your own notice? Absolutely under my own notice. I have witnessed the destruction of young fish, and have spoken to the fishermen about it. I told them to throw the fish into the water again, but they only laughed at me. They took little notice of what I said.
4875. I notice this petition is signed by over fifty gentlemen who are residents of Manly? Yes.
4876. Can they testify to the wholesale destruction of fish in this manner? Most certainly they can. I could have got hundreds to sign the petition, but I picked some of the most influential people in Manly.
4877. What kinds of fish have you seen destroyed in this way? Flounders, flathead, bream, garfish and other sorts. Some were no larger than a half-crown piece.
4878. Do you think, if the waters you refer to were closed, amateur fishermen would have a chance of enjoying an afternoon's sport? Most decidedly I do.
4879. Do you contend that the waters adjacent to large centres of population should be closed—reserved for the use of the people? Yes. My reasons for saying so are, that there are plenty of good fish in other parts of the harbour; but notwithstanding this, the waters we would like to see closed are continually being dragged by three families of fishermen—the Pashley's, Sly's, and Skinner's. These men even go so far as to place a net right round the wharfs at Manly, and then they go inside with their boat, and splash and drive the few fish out near the wharfs. They have done this whilst I have been fishing.
4880. Do they use a meshing-net; Yes? they use all sorts of nets as far as I can make out. The present Fisheries Act is bad; it is deficient—it does not grasp the difficulty. When I wrote to the Fisheries Commission men were sent to inspect the nets at Manly, but that had no effect. When the fishermen saw the inspectors they sent a man round who whipped the lashing, or whatever it might be, out of the nets, and pulled the nets to pieces. On the arrival of the inspectors of course the nets were all right. The fishermen crowed over this and said I was damned smart, but they were smarter than I was.
4881. Have you seen the fishermen drawing what may be called a sunken-net? They can make a meshing-net a sunken-net; they often do that. If they see anyone coming they haul the net up, take the weights off, and it floats as a meshing-net.
4882. Have you seen anyone drawing a sunken-net? I have seen a large garfish-net dragged on the harbour beach by the Skinners, Slys, and Pashleys. They continually drag the place. The day before yesterday I went out on the Flats, and a man came and put his net down by my boat, and I had to clear out. These men drive the fish away. The Hon. Mr. Carruthers can corroborate what I say. He has been fishing on the Flats, and has had some good hauls, but the fishermen drive the fish away with their nets.
4883. Would your remarks concerning the waters of Middle Harbour and other parts apply equally well to the Parramatta River and other places? Certainly.
4884. Are you one of those who believe in closing the Parramatta River altogether? I believe in closing the whole of Sydney Harbour for the purpose of giving the fish a chance. I would close it for a specified period. These fellows drag their nets on the sandy beaches, and destroy great quantities of small fish. I have seen half a ton of small fish lying on the beach in Quarantine Bay—none of them were longer than 2 inches. The destruction of young fish is simply scandalous.
4885. Evidently from what you saw a very small mesh must have been used in the capture of these fish? Quite so. The fishermen shoot nets for garfish down at Manly, and although there are no garfish there they bring in all the small fish, and they are left on the beaches. I have had to go to the front of my house and shovel the young fish into the sea. The stench was awful. The destruction of fish life that takes place is lamentable, but the Act seems inadequate to alter it.
4886. Your contention is that if the harbour were closed against net-fishing, facilities would be afforded to amateur fishermen to enjoy a day's sport, and at the same time the waters would be protected from denudation? Decidedly. The fishermen can go outside and get as many fish as they want, whereas now they are simply dragging the inside out of the place.
4887. In regard to the application you made to the Commissioners when presenting your petition, have you taken any further steps towards approaching them on the subject? I wrote in reply to their letter, and then wrote to the President of the Royal Commission, as it is quite useless to take any further action so far as the old Commission is concerned.
4888. Were you of opinion that they seemed to exhibit a want of interest in the matter? Yes; they showed a want of interest in the matter in every way. I complained of a net being used at Manly as a stalling-net. The inspectors from the Fisheries Commission went down. I wrote to the Commissioners saying that where this net was used at low tide there was not more than 6 inches of water, if that. Inquiries were then made of the local sergeant of police, and he stated there was 6 feet of water at low tide. Now I am prepared to swear that there is not 4 inches of water at the spot at low tide—that is, where the net was being used, and where they say there is 6 feet of water.
4889. *Mr. Thompson.*] Have you seen fish stranded in a shallow depth of water at Manly? I have.
4890. *President.*] You contend that under section 13 of the Fisheries Act of 1881 these people should have been prosecuted? Certainly. Of course, the inspectors are known to the fishermen at Manly, and they come down in such a manner that they might just as well write to the men telling them they are coming. Their visit to the place was an utterly useless and fruitless journey.
4891. I suppose you, as an amateur fisherman, would not object to being compelled to abide by certain regulations as to the weight of fish to be caught? Most decidedly not. In reference to the destruction of the red bream, I should like to mention that I have seen the boats come in on a Sunday afternoon with as many as 140 or 200 dozen red bream—small fish. That sort of thing could easily be stopped, and it ought to be stopped by the authorities.
4892. Do you think, if there was a law providing for the proper protection of young fish, such as young schnapper, the amateur fishermen would respect it? Most certainly they would, and they would give every assistance in carrying it out. It is time some proper steps were taken to prevent this wholesale and wanton destruction of fish life.

THURSDAY,

THURSDAY, 18 APRIL, 1895.

[The Commission met at the Offices, Bligh-street, at 10.45 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

William Charles Shipway, Esq., M.P., sworn and examined:—

W. C.
Shipway,
Esq., M.P.
18 April, 1895.

4893. *President.*] Your name is William Charles Shipway, you are a Member of the Legislative Assembly, and President of the Amateur Fishermen's Association of New South Wales? Yes.

4894. You desire to introduce a deputation to this Commission? Yes; a deputation from the Amateur Fishermen's Association of New South Wales.

4895. What is the object of the deputation? Messrs. A. Spain, E. Morris, C. Wiseheart, H. Maxwell, C. Thackerary, our Honorary Secretary, and myself, as President, have been appointed a deputation to wait upon this Royal Commission, and present a petition, which is in the following terms:—

Petition to the Honorable Gentlemen of the Royal Commission on Fisheries of New South Wales.

RESPECTFULLY SHOWETH,—

That we, the undersigned persons, interested in the important subject of the fisheries of this Colony, desire to draw your attention to the urgent need that exists for the closing of the waters of Sydney Harbour and its branches against all net-fishing and set-line fishing. We would point out that the harbour has been systematically denuded of fish for years past, and, despite the zealous efforts of the Government officers who are appointed to see that the Fisheries Act is carried out, we are personally aware that large quantities of immature fish are taken from the harbour by men engaged in netting, and left to die on the beaches. We would also point out that the shallows and sandy flats—the natural spawning-grounds—are constantly disturbed by the dragging of nets, and that these waters, which, from their extent and calmness, were once the habitat and spawning-grounds of many of our largest and best edible fish, are now shunned by those fish, and promise speedily to lose all prestige as fishing waters.

That we are of opinion that these waters should be entirely closed against net-fishing and set-line fishing, and beg that your recommendation to that effect, and your earnest effort to ensure your recommendations being effective, may be made to Parliament and the Government of New South Wales.

And your Petitioners will ever pray, &c., &c., &c.

Here follows the signatures of 5,104 persons. All the members of our Association, some 300 in number, have signed this petition. Amongst the signatures will be found those of many gentlemen who hold prominent positions in the city. We now present this petition to the Commission, and we would urge the desirability of the fact of its having been presented being mentioned in your Report, in order that it may become public property, and that it may be used in connection with matters which our Association may feel disposed to support with a view of rendering substantial service to the fisheries of New South Wales. I would like, if I have your permission, to emphasize the fact that netting is going on in Sydney Harbour at the present day, and millions of small fish are as a consequence left to die and rot on the beaches in the harbour. Within the last fortnight, I have received information that both at Abbotsford, on the Parramatta River, and at Manly Beach, nets have been drawn, and thousands of young fish left to die. In one instance that has come under my notice four dozen red bream were left to die; that was at Manly. This destruction was caused by European fishermen, and not by foreigners. Our Association is of opinion that set-line fishing should be prohibited. It is known from practical experience that the heads of a number of good large black bream have been found attached to lines that have been left unattended, the sharks or other fishes having eaten the bodies while the lines remained in the water. We think this sort of thing should be put a stop to, and we hope this Royal Commission will help, not only our Association, but the amateur and professional fishermen of Port Jackson, by having the waters of Sydney Harbour closed against net-fishing and set-line fishing. If the fishermen will look at this matter in the proper light, they will see that such closure will be to their benefit, and to the advantage of the fisheries. We hope this Commission will accept our petition, and see fit to make mention of its presentation in the Report they will ultimately draw up for presentation to Parliament.

4896. Has your Association adopted rules for preventing the destruction of undersized fish? We have such rules. Certain fish are not to count, unless they are of a certain weight. I am glad you have mentioned the matter, because it has come under my notice that there is a very great destruction of small fish by certain people. Our Association has steadfastly set its face against that sort of thing.

4897. I suppose in connection with any Act that may be passed for the better regulation and development of our fisheries, the Government may rely upon the assistance of your Association to see that its provisions are properly carried out, especially those referring to the destruction of small fish? Yes; we would abide by such an Act; in fact we are now considering the advisability of offering rewards in order to help the Government, so that the law might not be broken.

4898. In regard to this petition you have presented, are you satisfied that the persons who have signed the petition have been fully acquainted with the contents of the prayer of the petition? I am certain of that.

Paget Bayly, Esq., Brookvale, Manly, sworn and further examined:—

P. Bayly, Esq. 4899. *President.*] The Commission have been taking evidence respecting the Port Jackson fisheries, and they would like to know whether, in your opinion, Port Jackson should be wholly closed against netting and set apart for the recreation and amusement of the inhabitants of the metropolis and its suburbs? That is a question I have not thoroughly made up my mind upon. If the waters were closed—I mean the breeding-grounds closed at proper places—I should be inclined to leave part of Sydney Harbour open to net-fishing.

4900. What part of Sydney Harbour would you have open to net-fishing? Well, I should not let them touch Middle Harbour or North Harbour. I would allow them to fish all down Watson's Bay and Double Bay. By closing the whole of the harbour the market might run short of fish.

4901. But supposing that proper and efficient provision were established for the transit and distribution of fish captured at other stations, so that there could be no chance of a failure of the fish supply for the metropolis, would you still be disinclined to close Port Jackson to netting? If such a state of things as that you have outlined could be brought about, I would close Sydney Harbour to-morrow.

4902.

4902. *Mr. Thompson.*] About Middle Harbour, do you consider that sheet of water a breeding-ground for fish? Yes, I do. It is as good as Narrabeen, or better.
4903. From the Spit upwards? Yes; it ought never to be netted.
4904. Do you consider Middle Harbour a nursery-ground for young schnapper? Oh, yes; anybody knows it is a nursery-ground, especially for young schnapper.

P. Bayly, Esq.
18 April, 1895.

WEDNESDAY, 24 APRIL, 1895.

[The Commission met at the Offices, Bligh-street, at 10:30 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Edward Fanning, fisherman, Blakehurst, George's River, sworn and examined:—

4905. *President.*] Your name is Edward Fanning, and you reside at Blakehurst;—have you been a licensed fisherman? Yes; I am not using my license at the present time.
4906. How long have you been engaged in fishing operations? For about thirty years.
4907. What waters have you fished in? Principally the Parramatta River and Broken Bay.
4908. Do you mean by Broken Bay the Hawkesbury River as well? Yes.
4909. How long have you fished the Parramatta River? Continually for the last thirty years.
4910. Had you anyone working with you? Yes; up to the last four or five years I used to engage men, but lately my son worked with me.
4911. How does the fish supply of the Parramatta River compare at the present time with the fish supply (say) fifteen years ago? There is no comparison whatever—no fish at all to what there were fifteen years ago.
4912. Can you give us an idea as to what you consider the cause of the decrease in the quantity of fish? The sunken prawn and garfish nets—indiscriminate working. I might further add, with reference to the Parramatta River, that I left it as I could not make a living.
4913. How long have you left it? The last six weeks.
4914. As to the closures which have taken place—have sufficient waters been allowed to be opened for the use of the fishermen in the Parramatta River? There are sufficient now, but the closures have been entirely wrong. The Fisheries Commissioners closed the head waters with the view of allowing bream and whiting to breed; but I maintain they do not breed there.
4915. Where do you think they breed? Along the channel banks. That has been open for years past, and dragged with a sunken prawn net. Every winter, some years ago, myself and two or three others used to go, two or three months in the year, with a sinking net with a 3-inch wing and 2½-inch bunt, and it was a poor day we could not get two hampers of whiting, and some days fourteen or fifteen. Since the advent of prawn nets we get none at all. The trumpeter whiting are now nearly extinct in Sydney Harbour. There is a provision in the Act that the prawn net should be worked for prawns only, but that net has been worked all the year round. This should never have been allowed.
4916. Do you consider the closures that have been made are not the proper closures? No; not proper.
4917. Have they, in some instances, been unnecessary? Yes.
4918. Do you think the deposits of deleterious matter coming from manufactories along the river has had anything to do with destroying the feeding grounds of the fish? Only to a small extent. There are no factories along the lower banks of the river. Of course, the increasing traffic may be against it somewhat, but not to a great extent.
4919. Do you think the discharge from the gas works at Mortlake would have any effect on the fish supply? It may have some on the ground fish, but not on the mullet. A lot of the stuff floats on the surface, and the fact that you can catch bream and mullet right against the works puts that away.
4920. What nets have you used on the Parramatta River? Principally 3 and 4 inch.
4921. Hauling? Hauling and meshing nets. I have not made two hauls with the garfish net this five years.
4922. As to the hauling net, are you satisfied with the length and dimensions of that net? More than satisfied. We do not need the length of hauling net that is required in other places.
4923. You say you are perfectly satisfied with the length and dimensions of the hauling net, because it is suitable for the waters of the Parramatta River? Yes; I never use 150 fathoms.
4924. You have used a meshing-net? Yes.
4925. Are you satisfied with the mesh of that net? Yes; with the mesh, but not the length.
4926. Do you think a great number of marketable fish escape through the 4-inch mesh which could be captured by a smaller mesh? Yes, undoubtedly. We should be allowed 3 inches. I have meshed mostly with a 3-inch mesh. I do not know whether it is legal or not.
4927. In hauling your net, do you haul so that the whole of the net becomes stranded on the shore? We always empty our net in the water.
4928. Do you haul your cork and lead line to the shore? Always. By landing fish on the beach or mud, it deteriorates its value in the market. A fish pulled ashore on the mud does not look so well as if landed in the water.
4929. Have you ever noticed fry of the bream kind meshed in the 2½-inch bunt? Very seldom.
4930. Would it be less likely that the compressed fish would become meshed if they were caught in a smaller bunt? It is very seldom that you get bream in quantity. You might get one or two, but very seldom, and the 2½ or 2¼ inches allows the whiting to escape, and that is some of the principal fish we should endeavour to get back again.
4931. As to the use of the meshing-net, do you think any harm could result in giving permission for a meshing-net to be used in closed waters? None whatever.
4932. As to the garfish net, have you used this net at all? No; not this five years. I have made about two hauls in the last five years. I do not use either prawn or garfish net. I pay particular attention to the mullet and bream.

Mr.
E. Fanning.
24 April, 1895.

Mr.
E. Fanning.
24 April, 1895.

4933. Do you advocate the frequent use of the garfish-net, or would you have it discontinued? Discontinued. There are no garfish in the Parramatta River worth using the net for.
4934. As to the use of the prawn net, do you think it is destructive to young fish? Most undoubtedly. The only time I used it I caught about a peck of little whiting, little flathead, and soles. That was with only a couple of hauls.
4935. Are there many garfish and prawn nets used at the present time? Principally in the Parramatta River.
4936. Who use them;—are they English fishermen? Both English and foreign. I saw them using 2½ inches for a short time.
4937. Have you seen the sunken net used at all? Yes.
4938. By our European fishermen? Yes.
4939. Do you consider they have been destructive to the breeding as well as the feeding grounds? Yes.
4940. Would you approve of a stringent provision disallowing the use of that net altogether? Yes, or not above Bradley's Head in the garfish season.
4941. Would you be inclined to license the foreigners before they become naturalised, or would you make it compulsory that they should become naturalised? I would not like to say anything on that. I would not like to express an opinion one way or the other.
4942. As to the use of all these nets in the several waters, as the circumstances and conditions of the different fisheries are not the same, do you think it would be wise to make a provision to allow the use of a net of any dimensions, subject to a certain limit as to length, provided that net was emptied in a certain depth of water, with a stringent provision preventing sending undersized fish to market? It would all depend on what bottom you hauled it on. If you hauled it on a mud bottom, no matter what provision you made, they would destroy the fish. If it was a hard bottom you could save the fish.
4943. As the Act stands at present nets must be of certain lengths and dimensions; there have been several prosecutions on account of men's nets being a little smaller in the bunt or wings than they should be, through no fault of their own, but from trying to preserve their property through tanning;—in order to prevent such a thing taking place, would you favour a provision making it compulsory that these nets should be emptied in water of a certain depth—say, a foot—and having the provision as to undersized fish, and so on—would that be better than having it as it is at the present time? Yes; but I do not see any difference. Take a garfish-net and it shrank up to an inch; no garfish would escape; and the same way with the 2½-inch net, and it shrank to 2¼ inches; it would make very little difference to the size of fish that would escape through it. At night time it would be a dangerous proceeding to haul it and to pick your fish out of the water. If you were pressed for time it would be almost impossible. It would be a wise provision if the fishermen would avail themselves of it. They could do it often in the day-time, if not at night.
4944. Do you believe if a net is once pronounced to be legal it should be considered legal till it is worn out? If it becomes unnecessarily small I put it away, but there may be other men unable to procure another net and forced to use it. I always put it away when it becomes undersized.
4945. Do you believe in the confiscation of a man's net, or tools of trade? No; I always object to that.
4946. Do you believe in giving the informer one half the fine? No. A case in point was brought under my notice:—A Mr. Derven, of George's River, was fishing with the garfish-net. It was his first haul, and yet Inspector Tynan came to him and sent in a report to the Commissioners that he had mullet from 1½ to 1 oz. in his boat. On that report the Commissioners fined him the full penalty—£2 odd—and he lost the net. Afterwards, it turned out there was no truth in the statement. It was his first haul, and he never had a fish in the boat at all. Would it have been any advantage for that man to have such fish in his boat? The Commissioners believed that report, and he was fined. He brought the matter under my notice, and I said, "We will see the Commissioners and endeavour to get the money returned." We accordingly saw Mr. Hill, who brought out the report, which I maintained was wholly untrue. This man was fined £2 odd, and the net confiscated, and he did not succeed in getting any redress from the Commission. The inspector may have been induced to tell the untruth because he got half the fine.
4947. Are you satisfied with the provisions of the present Fisheries Act;—do you think they have worked satisfactorily? No, they have not worked at all satisfactorily. I, perhaps, used to get myself into trouble with the members of the Board in trying to benefit myself and others, and found it only heaped trouble on my own head. I was the principal cause of getting the mullet reduced from 16 oz. to 8 oz. I was three weeks going about with a petition with that object in view, and ultimately we got it passed; and then, when we got it reduced you still saw fishermen getting fish under that again, and after losing time and money I gave it up, and have not troubled the Fisheries Office for years.
4948. Do you think the license fee is reasonable for man and boat? I do not object to them at all. If I was to have my wish I would probably make it heavier—perhaps from a selfish point of view—because that would debar amateurs from working at it. Amateurs pick up everything they pull ashore.
4949. Do you think amateur line fishermen should be licensed? Yes.
4950. That is, those who fish from a boat? Yes, because they compete with you in your work. I think it is unfair my paying a license, and others not doing so, who probably spoil your work.
4951. As to the form of license that is issued to the fishermen, do you think that could be improved upon by the issue of a metal medal that could be tacked on to the boat? I have not found any difficulty with it.
4952. Do you always carry it with you? No; I do not. I have been fishing all my lifetime and the inspectors know me well; but perhaps that does not apply to everyone. It is a wise provision to carry it on you. The inspectors know I have a license, and I think it is unnecessary to carry it.
4953. Of course you know under the Act you are supposed to carry it with you? Yes.
4954. Do you think a better system might be devised by which licenses are issued to fishermen;—instead of their being compelled to apply to the nearest Clerk of Petty Sessions, should the inspector have power to issue the licenses? Yes; I think so.
4955. And would it not mean that fishermen could be identified better? Just so; the local man would know the local fishermen.
4956. What classes of fish have you caught in the Parramatta River? Mullet in the summer time, and whiting in the winter.
4957. What mullet would they be—of local production? Yes; of local production.

4958. Have you not had any visits from the sea mullet? I never went to compete with the men when the mullet left our place. I left them to them; when the mullet were in season I generally went at other fish—bream or something else; they come in such quantities, they would not pay for catching. I found it better to catch other fish and leave them alone.
4959. The market becomes glutted? Yes.
4960. Where used you to consign your fish? Woolloomooloo.
4961. Did you send your fish to an agent? No; I always went with them myself.
4962. Going with them yourself you know what the fish sold for? Just so.
4963. If you had had the privilege of selling your own fish in the market, do you think that would have been better? Yes, at times; I have not been in the market for some time—my son generally goes.
4964. Do you agree with the system of displaying the fish? When there are not too many fish in the market the system does very well, but when there is a glut of fish there should be raised tables.
4965. Do you think there should be more than one sale a day? If you could induce the dealers and public to attend.
4966. Do you think it would be a good idea to establish branch markets for the purpose of distribution? Yes; fishing has grown now, it wants splitting up, there is too much confusion; too many men moving about the market; it seems to be in a turmoil.
4967. Do you think the Woolloomooloo Market is in the best position for a fish market? I always thought it was out of the way; numbers of the fishermen at Parramatta River would not go there if they could get any other place. It suited at the time the market was built, the fish now coming by train has altered the case.
4968. As you take your own fish to market in your own boat, you have been free from the grievance of having your fish stolen? Yes.
4969. Do you know that fishermen have had their fish stolen? Yes. One winter I was working down the harbour, and I put my fish out at night, but I found I lost them.
4970. Do you think, considering the price the consumers have to pay for their fish, the fisherman gets a fair return for his labour? No; sometimes he does not get anything at all, and often gets account sales showing him in debt.
4971. Do you think there should be a more extended distribution in the country towns? We tried, several of us, to improve the system of distribution. Mr. Robert Hudson went into it very extensively, travelling about. His idea was to establish cold boxes at every station along the line, leaving them in charge of the refreshment-room people. That would have done away with the bulk of the fish now being sacrificed at the market. The fishermen are greatly to blame because they would not help themselves.
4972. Do you know anything about well-boat fishing? No; what little experience I have had the fish do not seem to do well penned. They seemed to lose their scales as soon as they were taken out of the water. I tried it once or twice but gave it up.
4973. As to our oyster fisheries, have you devoted much attention to them? Very little. In the Parramatta, and other rivers close to, there is too much slime coming into them now. There used to be a good supply off Tennyson, but there is nothing to speak of now.
4974. Do you not think that the disease has attacked them in some way or another? No; I do not think there is disease in the Parramatta River. I do not think they will grow there. The filth off the roads going into the river has stopped them.
4975. If a person cared to enter into the oyster propagating industry, do you think that by artificial means he could get the foreshores clean, so that the spat could adhere? Yes; I think he could.
4976. Do you know anything about the system of oyster-leasing? No.
4977. Have you had any experience in trawling? No; I believe the Fisheries Department have tried it two or three times, but it has been a failure, owing, I believe, to want of a proper survey.
4978. As to the crayfish fisheries? I have never gone in for them.
4979. Are you satisfied that the fisheries of the Colony have been administered and controlled satisfactorily? Quite the opposite. I consider that a body being charged with the development of the fisheries of the Colony should have done something by way of experiment, or trawling, so as to offer some inducement to the *bonâ fide* fishermen. It has been their desire to force fishermen to the open sea, but whether there is a suitable field ought to be proved by some other means than by the fishermen themselves, because they have not the means at their disposal wherewith to make these experiments, nor the experience, and as the Commission had the trawling-gear and experts in the service they should have done so.
4980. Do you think any harm would result by having an experiment made in that direction to prove the grounds? I think it ought to be done. It should be proved, or otherwise, whether the fish are there, and set the matter at rest, and if this Royal Commission accomplishes that it will accomplish a very great thing.
4981. Speaking generally of the Commissioners of Fisheries, you have held a prominent position in connection with the Fishermen's Association and are well known amongst the fishermen, what is the general opinion expressed regarding the Fisheries Commission? That it is no use to go to them. You can get nothing from them. I might add, when one of their number, Dr. Ramsay, makes the sweeping assertion that "there are only one or two fishermen, and all the rest are loafers," you cannot expect much of a gentleman that uses such an expression. He says also that "they are lazy," and the Premier, Sir George Dibbs, went out of his way to call them lazy. When other people are in bed, then our work begins. There are some loafers, as in all communities. I think it is a hard statement to make about a respectable body of men. A net fisherman must not be lazy if he wants to succeed.
4982. Do you think it would be an advisable thing to alter the administrative authority controlling the fisheries? I would not abolish the Commission if you could get anything out of it; if not, abolish it at once. If we had a representative man, whom we knew was in sympathy with the fishermen, false reports would not be sent in. Sometime ago, I think last November, I got a summons for fishing in closed waters. I attended at the Police Court—I had never been in a police court but once in my life to hear a case tried—I was charged with fishing in closed waters. In opening the case, the solicitor for the Commissioners told the Magistrate I was a man with plenty of money, and I was only doing another poor man out of a job, that I was getting great loads of fish daily, and was continually writing

Mr.
E. Fanning.
24 April, 1895.

writing letters to the Department, informing on other fishermen who were working in closed waters, and doing the same thing myself; and lastly, that the Commissioners wished to press the case. For twelve months my son and I had not earned £20; and as to writing informing about other men, I never wrote a letter to the Department in my life. The solicitor made out I was a very bad man. Mr. Bull, to check that, told the Magistrate he had never met a more honest man. The evidence was contradictory, and the Magistrate dismissed the case. The truth of the matter is, I was in the bay that night; I was not fishing; we were simply taking my brother-in-law home. I went to the Commissioners, and saw them about the matter, and Mr. Thompson was deputed to inquire into it. Since the solicitor made that charge in the Police Court about my informing on men, it got abroad amongst the fishermen that I was the means of their being prosecuted. I went to two or three of them and got written apologies when they found it was not me. I went to the Commissioners—I believe Mr. Lowe was ill at the time—and they totally denied the report.* I was bad for five or six weeks after that, and have never been to the Commissioners since. That is my experience of the Commissioners, that they prosecute on untruthful reports.

4983. What would you think of the appointment of local boards for the different fisheries, to advise the local or central authority on matters connected with the fisheries, those boards to have representative fishermen on them, each board to consist of three, including one representative fisherman? Yes; that would do, so that you do not make it too expensive. I would give my time willingly if it would better the matter in any way.

4984. Do you think it would be a good innovation to allow the fishermen, as they are taxpayers, some voice in the administration of the fisheries' laws? Yes; they should have. It is time something was done.

4985. Do you know whether the Commissioners have made any official visits to any of the fisheries of the Colony? Not that I know of.

4986. Do you think a body of men charged with the administration and control of the fisheries should visit the fisheries and make themselves acquainted with their circumstances and conditions? Yes, I do. At times you will see bushels of small fish lying all along the beach. If the Commissioners saw it it would have been done away with long ago, but they do not see it. How can they administer a thing they never come in contact with?

4987. Do you think the Commissioners have the interest of the fisheries at heart? I really do believe they have. I do not believe there is one of those gentlemen that is not doing his best; they are really thinking according to their knowledge they are doing their best.

4988. But the result has not been as they think? No.

4989. What do you think of the idea of the appointment of one man as the head of the fisheries, a man who would have a practical acquaintance with the fisheries, and who would be in a position to visit the different fisheries throughout the Colony frequently? I would hail with satisfaction a change of any description whatever.

4990. Would you like to have the extra safeguard of local boards of advice, so that the fishermen could have a representative on them, and have some voice in the administration? I think that ought to work well.

4991. Is there any Fishermen's Association in existence now? It has never been wound up, but it is almost as though it was out of existence. I do not know about the others; the one I belong to is almost dead. The fishermen are so scattered that you cannot get them to attend; it is an expense they cannot afford.

4992. Have you on any occasions waited upon the Colonial Secretary as one of a deputation, to point out certain grievances under which the fishermen laboured? Almost every time there was a deputation.

4993. Have you received any redress? None whatever; we only got put off every time.

4994. *Mr. Thompson.*] Are there prawns in the Parramatta River in numbers? They are not very thick.

4995. How would you propose to capture them? If you capture them you must ruin the fish; if you have the prawns it will be at the expense of the fish.

4996. Then you would dispense with the use of prawns as a food in order to preserve the fish supply? There are prawns elsewhere.

4997. If we prevent the use of the prawn nets during what are supposed to be the spawning seasons—June, July, August, and September—would that preserve the continuity of supply? Nets would destroy young fish.

Mr. James Thomas Pashley, fisherman, Manly, sworn and examined:—

Mr. J. T. Pashley. 4998. *President.*] Your name is James Thomas Pashley, and you reside at Manly? Yes.

4999. Are you a licensed fisherman? I am.

5000. How long have you been a licensed fisherman? Since the Fisheries Act has been in force.

5001. Do you hold a boat license as well? No.

5002. The evidence you give before the Commission to-day,—will it be of that character that it will be shared by the rest of the fishermen in the Manly district? Yes.

5003. As to the license fee,—are you satisfied with that? I am satisfied with the license fee for fishermen; I think a boat ought to be licensed once, and once only. I do not think a boat should be licensed each year.

5004. You consider that the fee should be paid once and for all? Yes; while the owner paying the fee owns the boat.

5005. As to the form of license issued,—do you think there should be any improvement in that, by the issue of a medal that could be tacked on to the boat? Yes; something in the form of a railway pass. In carrying the paper license it is likely to get wet and become useless; of course, a good many fishermen do not carry their licenses about.

5006. Would you have an alteration in the system of issuing licenses so as to provide for the local inspector to issue the license? Yes; I think any local inspector or Police Magistrate should issue the license; it is very inconvenient for some people to go to Sydney to get their license.

5007. How many fishermen are there in the Manly district? As near as I can tell you, thirty-seven in Manly and district; of course, I am not including Newport or Pittwater.

5008. Where do they work principally? Principally between Middle Harbour, below the Spit, and round North Harbour, Manly, and the Quarantine Grounds.

5009. How do you dispose of your catch? We sell most of it at Manly to fish dealers; if we have any quantity we take them to market. 5010.

* NOTE (on revision):—Mr. Hill informed me that if what I said was true I was greatly maligned.

Mr.
J. T. Pashley.
24 April, 1895.

5010. In your own boats? Sometimes; sometimes by steamer.
5011. Are they consigned to an agent, or do you witness the sale yourselves? Sometimes they are consigned to an agent; generally, we witness the sale.
5012. Which do you consider best—to consign to an agent, or witness the sale yourself? Witness ourselves.
5013. Have your returns not been satisfactory in entrusting your fish to an agent? In many instances in entrusting to an agent we have lost a great quantity of fish; fish have been taken out of the baskets.
5014. Would it be possible for the agent to work in with the fish dealers? Quite possible.
5015. Do you send your fish to the Woolloomooloo Market? Generally.
5016. Are you satisfied with the accommodation there? No; I think the accommodation should be improved upon a great deal. Laying them down on the floor is not a fit way to show fish; they are trodden and spat upon; they might be put out on slabs.
5017. And with the crush of people at the market as well, is it not possible that the fish get stolen from the floor? Quite possible; a man buys a heap of fish, and it is quite possible he could take two heaps.
5018. Do you advocate the system of having raised tables? Yes.
5019. Do you think it would be a good idea to bring the fishermen into closer communication with the consumer? I do.
5020. Would you approve of a trial being made of the fishermen selling their own fish to the public? I do not think it would do in many instances. The fisherman has to catch the fish, and he would lose a great deal of time.
5021. Do you think there should be more than the one sale a day at Woolloomooloo? Yes; a morning and evening sale.
5022. Would it matter if the fish market were open all day for the sale of fish? No; I do not think it would.
5023. Would it be a good idea to have auxiliary markets established throughout the suburbs? Yes; they have been wanted a long time. It would be a great improvement both to the consumer and the fishermen.
5024. Do you think also that a system might be devised under which consignments of fish might be sent into the country towns? I do.
5025. Have you ever thought out the question of sending the fish to market gutted? I think if fish were sent gutted they would be much fresher, and it would make a great improvement. It means their keeping twice as long.
5026. What nets do you use in the capture of your fish? The ordinary mullet-net, the ordinary ground fish-net, a garfish-net occasionally, meshing-nets—4 inches.
5027. As to the hauling-net, are you satisfied with the length and dimensions of that? We are, as far as the hauling-net is concerned, but want an alteration in the garfish-net.
5028. What alteration? We want the garfish-net 100 fathoms long, half of 1½ inch, and half of 2 inches.
5029. You would have it 2 inches in the wings? Yes.
5030. Fishing with a hauling-net, do you fish above Goat Island? No; we never go up above Goat Island. We do not fish that way at all. Bradley's Head is about as far as we go.
5031. So you have an opportunity of catching garfish when they come into the harbour? Yes.
5032. And you use the garfish-net in a *bona fide* manner? Yes, we do.
5033. As to the meshing-net, are you satisfied with the length of that? Yes; quite.
5034. Sixty fathoms? Yes.
5035. Are you satisfied with the mesh of it? Yes.
5036. Is it possible that many marketable fish escape through the mesh at present? As far as we are concerned we use nothing less than 4½ inches. Three inches would suit many places better—such places as Narrabeen.
5037. You speak of Port Jackson? Yes.
5038. Do you use a sunken net at all? No; never.
5039. They have been used? Yes; every day.
5040. By whom? The Italians principally.
5041. Do they destroy the breeding and feeding grounds? I am sure they do. They are not our greatest destruction, but next to it. They are the only destructive nets used in the harbour.
5042. Would you favour their disallowance altogether? Yes; it is the opinion of the fishermen, as well as myself, that sunken nets should be abolished in the harbour.
5043. So that the fishermen you represent are as anxious to preserve the small fry as the Commissioners? Yes, they are.
5044. What classes of fish do you catch? Bream, whiting, mullet, trevally, tarwhine, blackfish, nearly all kinds, with the exception of schnapper; we go outside for them.
5045. Do you ever in your hauls discover many of the young schnapper? No; with the exception of a sunken net you would not catch on an average a small schnapper a day.
5046. Does it not happen that they get meshed in the bunt of a hauling net? No; occasionally you may get one or two; small schnapper do not come close enough in where the hauling-net touches the bottom.
5047. Do you haul your net on to the shore so that the fish become stranded, or empty your net in a certain depth of water? We haul till we come to our back net, and we pick it up and tie it; we bring the bunt of the net ashore.
5048. The lead and cork-lines on shore, and the flue of the net remaining in a certain depth of water? Yes.
5049. Do you depend, then, for your supply principally on the shoal fish that visit the harbour? Yes, principally on the shoal fish; we might say that they are nearly all shoal fish we do catch.
5050. When do the garfish make their appearance in the harbour? Generally from Christmas up to September; you may get them all the year round in small quantities.
5051. As to the mullet, when do they come in? The mullet come chiefly from the end of February to May.
5052. When do the black bream come? From the end of November till April, or sometimes you will get them earlier, it depends on the weather a good deal.
5053. Where do you think the sea mullet spawn? They come down out of the rivers to spawn, and spawn down at the mouth, outside; I have watched them on several rivers, and found at spawning time they come down the rivers. I have seen them coming down in thousands of baskets, on the Hastings River particularly.

- Mr. J. T. Pashley.
24 April, 1895.
5054. Have you ever seen any evidences in Port Jackson of the sea-mullet having deposited their spawn in the upper reaches of the river? No.
5055. Have you ever noticed an alleged peculiarity about the sea-mullet—that in the day time they are full of mud, but if caught at night-time there is no appearance of mud in them? No; I have not.
5056. What is the largest black bream you have caught in the Harbour? $4\frac{1}{2}$ lb. in weight.
5057. As to the whiting, what classes of whiting do you catch? The school whiting is the only whiting we get in the harbour; they vary from about 6 oz. to 1 lb.
5058. When do you catch them? About the mullet season.
5059. Do you believe in fishermen's nets being confiscated under the Fisheries Act? No; I think a fine or imprisonment should be inflicted rather than take their tools of trade away from them.
5060. Do you believe in offering a moiety of the fine to the informer? No; all fines should go to the Crown.
5061. As to the fish supply generally of Port Jackson, do you think it has decreased of late years? Only the schnapper, so far as I have seen. When I first went out fishing I could catch large red bream in good quantities—now you will not get one of them.
5062. Do you think the harbour wants any rest from net-fishing? No, I do not, other than sunken-nets.
5063. Would there be any harm in allowing fishermen to use a meshing-net in closed waters? No, no possible harm from that; in fact, no harm in using 3-inch in any closed waters, 3-inch kills no small fish.
5064. In regard to the administration and control of the fisheries of the Colony, are the fishermen satisfied that the fisheries are in the proper hands? No they are not; in the opinion of the fishermen that we represent, the present Commission do not know their duty, and I think, if you remember rightly, there was a resolution passed at a conference that the present Commission and its laws ought to be abolished. I do not think they are capable of carrying out their duties as Fisheries Commissioners.
5065. Might it have been possible for them to remove many of the grievances the fishermen labour under, if they had taken a little more interest in the industry? I do consider that it might, and also that the present Commission is actually influenced by one or two fishermen.
5066. Please explain the last statement? There is a certain fisherman in the harbour, who leads us to understand that if he wants a place opened or closed, he can get it done by going to the Commission, and it is known that when he has gone he has got what he wanted.
5067. Would that fisherman's name be Newton? Yes.
5068. Have you heard this man boast that he could get what he liked from the Commission? Yes, he boasted to me, and to Mr. George Sly, that he could get what he wanted.
5069. Do you think there is some necessity for a change in the constitution of the present authority? I do.
5070. Do you think it would be a good idea to establish local Boards at the different fisheries, to advise the central authority in connection with matters concerning the fisheries? I do; I think the Commission ought to be three in number, and that they should be paid, not honorary.
5071. As a central body or local body? As a central body.
5072. And would you have local Boards to advise that body? I think that would be sufficient.
5073. Would you like to see a Board appointed that would pay some attention to the fisheries, and pay frequent visits, so as to become conversant with the local conditions and circumstances? Yes; I think any Commission that is not paid will neglect their duties, and I think they should be paid well.
5074. What would you think of one man having the control of the whole of the fisheries, and of establishing local Boards consisting of three, on which there should be representative fishermen, do you think that would be likely to work well? It may work well, but I think it could be done just as well by appointing three Commissioners as I say, three men that would look after their work, not as the present Commission, for as far as I have had to do with them, they do not seem to care about anything at all.
5075. Have you known them pay an official visit to the fisheries? No; I never knew one of them, nor heard of them doing so.
5076. Have you ever had anything to do with well-boat fishing? No; I have not.
5077. Have you ever noticed at any times of the year large shoals of fish passing along the coast? I believe there is what is called the southern herring; I have seen them in good-sized shoals in the harbour, but I think they pass in large shoals outside.
5078. Have you had any experience in trawling? No.
5079. Have you had any experience in fish curing or smoking? Yes; I have smoked and cured.
5080. Have you found it to be remunerative? No.
5081. Was it because you had not the means of getting the fish distributed properly? We sold them wholesale, and it was a hard job to sell them at that.
5082. Do you think it would be advisable to license amateur fishermen? You might make them pay a small fee. I think you should make everybody fineable that has a small fish in his possession. My reason for saying so is this:—On Sunday week I counted the different catches of fish that were brought into the Manly Wharf alone, and when I had finished up at night there were forty-eight dozen red bream, the largest not weighing 4 oz., and if anybody had gone over to the corner of Manly they would have found the same number. The amateurs are the biggest fish destroyers we have; there is no doubt about that. I think the same restriction should be placed on them as on fishermen; if they are found in their possession they should be fineable.
5083. *Mr. Thompson.*] Do you think it would be a desirable thing to dispense with all the present nets, and substitute one net within a maximum length of 300 fathoms, and down to an inch mesh, which might be used with such limitations as might be necessary for any particular water? I approve of such a scheme; I think the nets should be made convenient for the requirements of any particular water.
5084. Would you allow the use of set-nets or meshing-nets in closed waters? I would. In regard to the lagoons, Narrabeen particularly has been closed against net-fishing for two years. Before it was closed there were great quantities of whiting, mullet, and bream. Since it has been closed a weed has accumulated which goes rotten on the lagoon being cleared out, and it kills the fish. The nets, of course, used to keep this down. When it has been closed for two years, or twelve months, the fish accumulate, but when they go out they are devoured by sharks and large fish. I think a large mesh should be allowed in these lagoons all the year round. I do not think garfish nets should be used at any time; but a large mesh should be used.
5085. Would you limit the number of fishermen on any water? I hardly think it would be fair to do so.

Mr.

Mr. George Sly, fisherman, Manly, sworn and examined:—

5086. *President.*] Your name is George Sly, you are a fisherman, and you reside at Manly? Yes.
 5087. How long have you been a fisherman? About twenty years.
 5088. Have you a good knowledge and acquaintance with the fisheries of the Colony? Not outside.
 5089. You have heard the evidence given before this Commission by Mr. James Pashley;—do you agree with the evidence he has given; do you think it is evidence that can be shared in by the other fishermen; and are you satisfied with the evidence he has given? Yes; with the exception of one thing: In regard to the sunken net: they may have a floating net that would reach the bottom; there are plenty of places where they could use that. The depth of the net should be limited—that is the only correction or addition I would like to make to the evidence.

Mr. G. Sly.
 24 April, 1895.

Mr. Edward Skinner, fisherman, Manly, sworn and examined:—

5090. *President.*] Your name is Edward Skinner, and you dwell at Manly;—are you a licensed fisherman? Yes.
 5091. How long have you been so? About twenty years. Not a licensed fisherman all that time, but I have been a fisherman for that period.
 5092. So that you have a pretty extensive acquaintance with the home fisheries? Yes.
 5093. You have heard the evidence given to this Commission by Mr. Pashley, do you concur in that evidence? Yes.
 5094. Are there any alterations or additions you would like to make? Yes, one; that is, that there should be some better means of preventing the amateurs selling their fish.
 5095. You would prevent them selling their fish to the detriment of the licensed fisherman? Yes.
 5096. You think they ought to leave the sale of fish to those who earn their livelihood by it? Yes; if they have more than they want they can sell them to the dealers, or bring them to the market. There should be bills printed that we might put up on the beach so that we could prevent amateurs from disturbing our hauls.
 5097. Does it frequently happen that they anchor on your hauls? Yes; every day some of them come and drop their anchor in spite of us, and we have to go in search of a policeman, and after spending some time in looking for the policeman, when we do get him we return to find the offender gone.
 5098. You would like to see a provision incorporated in the Bill, so as to prevent obstruction being placed in the way of fishermen when hauling? Yes.

Mr. E. Skinner.
 24 April, 1895.

THURSDAY, 25 APRIL, 1895.

[*The Commission met at the Offices, Bligh-street, at 2 p.m.*]

Present:—

FRANK FARNELL, ESQ., M.P., PRESIDENT.

L. G. THOMPSON, ESQ., J.P.

The Hon. George Thornton, M.L.C., sworn and examined:—

5099. *President.*] Your name is George Thornton; you are a Member of the Legislative Council of New South Wales, and have been so for a considerable time? Nearly twenty years. I was formerly a Member of the Legislative Assembly.
 5100. I understand you have taken a very deep interest in the question of the development of our fisheries, and that you have had a good deal of experience as an amateur fisherman? I have had a life experience of fishing, and I can claim to have an extensive acquaintance with the fisheries, with the fishing in Sydney Harbour, with the fishermen, and with all the various phases of the fishing industry in New South Wales.
 5101. Were you appointed a member of the Fisheries Commission? Yes; I think I was one of the first so appointed.
 5102. How was it you came to sever your connection with that body? I could not reconcile myself to carry out the duties under the law or the regulations. They were unsatisfactory, and I resigned.
 5103. In other words, you found the Act defective, and you declined to be a party to the administration of a defective Act? Quite so.
 5104. Do you think it would have been better if the whole of the Commission had resigned rather than allow the present Act to remain in force so long? I believe the late Sir William Macleay, the late Mr. Dalley, and others did resign on that account.
 5105. Was the cause of their resignation made known to the Government? It is almost too far back for me to speak with accuracy, but that is my impression. My impression is that the Government were fully cognisant of the reason for our resignation.
 5106. As a matter of fact, your action, and the action of your confrères in resigning, did not have the desired effect in the way of bringing about the necessary legislative requirements? That is so. The Act was faulty in so many respects that I disliked being a party to such a state of stupidity and uselessness.
 5107. Does your acquaintance with the fisheries of Port Jackson and the Parramatta River extend over many years? A great many years; I began to fish when I was a young boy.
 5108. What is the present condition of the fisheries, comparing them with what they were like say twenty years ago;—has there been any improvement or development worthy of the name? On the contrary, the state of the fisheries from twenty to fifty years ago bore no comparison in any respect with the present condition of the fisheries in all its phases. The condition of the fisheries of to-day will not compare with the condition they were in from twenty to fifty years ago, either for quantity, quality, or anything else connected with fishing matters generally. At the time I speak of we could go to any part of Sydney Harbour, Middle Harbour, North Harbour, Manly, the Parramatta River, and other places within the heads of Port Jackson, and always be sure of getting a good catch of fish of the best quality, schnapper particularly, from the youngest cock-schnapper to the full-grown fish. There were places we knew of where we could always catch fish, and we were never disappointed in getting a good supply of the best varieties.

Hon. G. Thornton, M.L.C.
 25 April, 1895.

5109.

Hon. G. Thornton, M.L.C.
25 April, 1895.

5109. Were you successful in catching the different varieties of fish in the upper reaches of the Parramatta River? I have not had so much experience as a fisherman in the upper as in the lower reaches of the Parramatta. I used to catch them at Ball's Head. Good fish used to be caught away up at Kissing Point on the Parramatta River, and there were good oysters there too; right opposite Kissing Point used to be one of the best oyster grounds in the Colony. In the eastern part of Port Jackson—I refer to Watson's Bay, the south side of the harbour, Quarantine Point, Green Flat, Middle Harbour, North Harbour, and in fact all round the harbour—fish of the choicest quality and in any quantity could be caught. I have been living at Manly for twelve months lately, and have been anxious to resume my former habits of fish catching. I have tried every place in the harbour, and it is not too much to say that I have not been able to get even so much as a bite. The fact is the fish are gone; I am greatly disappointed with the present state of affairs.

5110. Can you tell the Commission what has led to this condition of affairs? There are many causes: there is the enormous and continuous traffic, and the disturbance of the surface of the water by the steamers; the fish have been frightened away from their haunts. Another fruitful cause of the decay in the fish supply in Port Jackson is that nearly the whole of the harbour, excepting Middle Harbour, has been polluted by sewage matter, and offensive matter from slaughter-houses and manufactories. The debris from those places, such as kerosene, tar, and floating poisons from boiling-down establishments and tanneries, runs into the water and poison old fish and young fish alike. Another cause of the depletion is the practice followed by some fishermen of using sunken-nets; by the use of these nets nothing escapes, not even the ova of the fish. The fish enter Sydney Harbour regularly to spawn; as a rule the fish select the deepest holes to spawn in. They spawn on the seaweed and other growths at the bottom, and leave their ova amongst the leaves of the seaweed. As a result of the use of these sunken-nets the spawn, whether it is in the shape of ova or fry, cannot escape; the effect of using these sunken-nets is to destroy the spawn. Sunken-nets are the most fruitful source of the scarcity of fish in the harbour—the fact is, the fish are not allowed to breed. Another cause of the depletion is fishing, as practised by amateur fishermen. I come within the category, and I do not want to exclude myself, except to say that I never destroy young fish. It is a fact that for years past, and it still goes on, boats have been, and are engaged in the different parts of Sydney Harbour catching young schnapper. The men in those boats catch from 5 to 10 dozen every day, young fish from 1½ inches to 3 inches in length. They simply catch these fish for what they call sport. The fish are useless and cannot be eaten as food. There must be an average of 100 boats fishing in Sydney Harbour, and those boats catch an average of from 5 to 10 dozen fish, young schnapper of the size I have mentioned, and this shows you how impossible it is for the young red-bream to grow into the squire or the schnapper. Another fruitful cause of the depletion of the fish supply in the harbour is the distribution of the refuse from the slaughter-houses outside the Heads, for two reasons. First, it entices the fish outside the harbour; secondly, it induces hundred of voracious fish, not only sharks but leather jackets, kingfish, and tailer to come to the spot; they are attracted by the offal and refuse, and they make for the place where it is distributed and eat it, and they also eat the other fish. I think it is an abominable thing to empty that refuse outside the Heads; it is a pity some better plan cannot be adopted for disposing of our slaughter-house refuse. Instead of turning that refuse into manure, it is simply used for the purpose of destroying our fish. As a consequence of emptying it outside the Heads hundreds of sharks and other voracious fishes are attracted to the place. We have hundreds of sharks in Sydney Harbour now, whereas in the olden days we never had one. I am a swimmer myself, and in the early days I and others used to swim from the Fig Tree in Woolloomooloo Bay, now the site of the Sydney Baths, to Garden Island and Polts' Point. We never thought of sharks in those days. We used to swim every morning up and down the bay, and we never heard of a shark and never thought of them. I defy any man to go there now without endangering his life. That is a proof that sharks have been attracted as a consequence of this abominable system of feeding them outside Sydney Harbour. This casting of refuse outside the Heads is a fruitful cause of the diminution of our fish supply. Years ago I used to go down to what is now called Fort Macquarie and catch young schnapper—good fish too—off the red buoy. You could not get a fish there now to save your life. The Sow and Pigs used to be a favorite spot for fishing; we could get any amount of fish there, and it was just the same in Watson's Bay and at Shark Reef. At any time you could go and get two or three schnapper, but it is impossible to do so now. The same thing has happened at Manly. The aborigines, 57 years ago, showed me where I could always get a schnapper, but that is a thing of the past.

5111. Are you of opinion that the general use of nets has had anything to do with the diminution of the fish supply? Yes, the too general use of nets. I wish to speak of another thing that does a lot of mischief, that is what the fishermen call the ballahoo—the garfish net. Strange to say the present Fisheries Commission allow this garfish net, which is only supposed to be used in April, the garfish season, all the year round. The use of this net is a fruitful source of the depletion of our fish supply. I know as a fact that at Pittwater and in Sydney Harbour the men get a lot of fish that are too small for sale; small fish are destroyed in enormous quantities by the use of these garfish nets.

5112. As to Narrabeen, Dee Why, and Curl Curl Lagoons, are you of opinion that those places are natural breeding grounds for fish;—do you think they should be preserved as such? I never had much opinion of Curl Curl as a fishing or breeding ground. The proper name of that place, by the way, is Coral Coral. It was so called by the aborigines, who used to be employed in the very early days of the Colony in diving for coral there—white, crimson, and canary colour coral—specimens were obtained on the rocks along the shore at the place we now call Curl Curl. I never had much opinion of Curl Curl as a breeding ground, because, as a rule, it has no outlet to the sea, and therefore as the fish cannot enter to spawn, it is not a good place. Dee Why is oftener a lake than anything else. With regard to Narrabeen, that has always been a good breeding ground, and although sometimes closed by the filling up of the sand, it is very often open to the sea and fish enter and leave as they please. It is a very good breeding and rearing ground. The finest fish I have ever eaten in my life were caught in the Narrabeen Lakes, high up near the fresh water. I have often had good fish there; the sea mullet go up there and become very fine. In my opinion all those places should be most rigidly preserved; I refer particularly to Narrabeen.

5113. Are we to understand you would close those waters against line fishing? Yes I would; but I am not one of those who think Sydney Harbour should be closed against net fishing. I think under reasonable regulations, and with a law sufficient to punish those who broke the law and the regulations, Sydney Harbour

Hon.
G. Thornton,
M.L.C.

25 April, 1895.

Harbour might be left open without any great danger of destruction to fish, and I have another reason, which I confess operates strongly with me, and that is, that men who have been many years earning their living there should not be deprived of obtaining their livelihood in that way.

5114. Speaking of the causes, mostly through human agency, that have led to the decrease of fish in Sydney Harbour, would it be a wise thing to prevent the use of the garfish net in the harbour and elsewhere, excepting during that period when the garfish come in in large numbers? There should be a close season for garfish, as we have a close season for wild ducks. Garfish nets should only be used in the garfish season, and prohibited—most strictly prohibited—at other times.

5115. I gather from your remarks that you would prevent the use of the sunken net altogether? Absolutely. That net is destructive wherever it is used, and those men who use it, especially the foreigners, do not care what they destroy so long as they get a haul of fish.

5116. The deposit of silt outside the Heads,—who is primarily responsible for that? I hardly know what department is responsible; it is a regulation of the Government. It is a most disgraceful state of things.

5117. Is it not necessary to have an alteration in the regulation in order to prevent it being taken outside the Heads, or to have it deposited further out at sea? I can hardly say; I think it would be almost impossible to take it further away. I have had much experience in yachting and fishing, and I know if you put the silt ever so far out it will come in again, as it does now. The real remedy lies in utilising this slaughter-house refuse, garbage, and so forth by making it into a manure. Such a manure would not only clear the cost of making, but it would be of benefit to orchardists and others. When I was a Member of the Legislative Assembly I was constantly telling the Government of the day they were going to an enormous expense in putting the sewerage into Sydney harbour, and at the same time they were incurring further enormous expense in taking it out again by dredging. Many scores of thousands of pounds are annually wasted in this way; the silt comes back again and it has to be dredged out.

5118. In respect to amateur line fishermen and the destruction of young fish that takes place, would you be inclined to license them so as to have proper control over them? No; I would have a regulation to the effect that they should not be permitted to catch fish under a certain size and weight to be indicated in the regulation. I would not let them catch a fish weighing less than 4 to 8 ounces.

5119. Even if they did catch small fish would you like to see a provision compelling them to throw those fish back into the water again? Yes, I would; my blood boils sometimes when I see the destruction that goes on, the wanton destruction of young fish; but the men who use those sunken nets are worse than the amateurs, for they destroy both the ova and the young fish as well. The edible fishes that come into Sydney Harbour, such as the black bream and sea mullet, deposit their spawn in the deepest places they can find; all fishes do this. They enter Port Jackson to spawn, especially the big sea mullet and black bream, and they deposit their ova on the seaweed, which grows like grass grows in the bush; fish feed on it just the same as the cattle feed on the grass in the bush. The fish deposit their eggs upon this seaweed, and nature assists them in the process of reproduction, as the ova becomes attached to this weed, and if left alone you would soon see the place swarming with young fry. We used to see them—acres of young fish—one-eighth of an inch and a quarter of an inch long, swimming about in the water; but those sunken nets destroy all those young fish and the eggs as well.

5120. Have you ever seen any shoals of fish passing along our coast from the south to the northward? I have seen acres of fish outside, particularly the fish we call the sea salmon and the sea mullet. I have never seen any shoals of herrings, but I have seen plenty of maray. I have caught the herring in Sydney Harbour and outside the Heads, but it is an exception.

5121. Was the herring you caught known as the southern herring, or was it the maray? It is the true herring, I know what a herring is; I have seen the fish in all parts of the world; it is a herring, unmistakably so, but I have never seen them in shoals on this coast; they may, however, make their appearance in shoals off the coast.

5122. Would it be the "*clupea sUNDIACA*?" Yes, that is the fish I have seen, but not in shoals. I have seen the sea mullet from Jervis Bay to Point Danger. My impression is that the sea mullet goes right round this continent; it performs an entire circuit of the continent of New Holland. I know those fish have been caught on our coast, at Rockhampton, and still further north, and I believe they travel north to Torres Straits and go right round the continent. Speaking of the sea mullet, I have no hesitation whatever in saying that it is the finest fish in all Australia. Some people will not touch it because it is so cheap and plentiful; but in all cases where I have induced people to eat it they have pronounced it to be excellent, and it undoubtedly is a delicious fish. I have been told that down in Port Phillip they sometimes get a stray sea mullet, and I have heard it said that the fishermen can always depend on getting 7s. 6d. each for them.

5123. About the oyster fisheries. Do you know anything of their condition at the present time—do you think there is a possibility of the oyster fisheries of New South Wales being further developed? My statement as to the oyster fisheries simply is they are too much neglected. There is no proper supervision. Unscrupulous oystermen collect and destroy without let or hindrance in most of the oyster-beds in this Colony. There should be a perfect system of supervision. It could be easily and cheaply done.

MONDAY, 29 APRIL, 1895.

[The Commission met at the Offices, Bligh-street, at 10.15 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Charles Lyons, fisherman and boat proprietor, Folly Point, Middle Harbour, sworn and examined:—

- Mr. C. Lyons. 5124. *President.*] What is your name? Charles Lyons.
 5125. You reside at Folly Point, North Sydney? Yes.
 29 April, 1895. 5126. What are you by occupation? A boat letter at present.
 5127. Have you ever carried on operations as a fisherman? Yes.
 5128. How long ago? Some six years ago.
 5129. How long were you fishing? About twelve months in Broken Bay, and at different times in Port Jackson.
 5130. Do you consider you have a good knowledge of the fisheries of Port Jackson? Yes, to a certain extent.
 5131. You now carry on the work of letting boats out to people who choose to indulge in recreation and fishing? Yes, fishing parties.
 5132. Do you always see their catches when they return? Yes; when I am there.
 5133. What sort of fish do they catch? Principally black bream, a few schnapper, and jewfish. Red bream are a thing of the past.
 5134. Have you ever seen them with red bream in their possession? Frequently.
 5135. Were they full-sized red bream? No.
 5136. About what would be the weight of the smallest? About half an ounce.
 5137. Caught by amateur line fishermen? Yes.
 5138. Would it be a wise thing to make it compulsory on the part of amateur line fishermen to put these fish back into the water again when they prove to be undersized? Yes, most decidedly it would. I reckon no red bream should be caught less than 8 or 10 ounces.
 5139. Do you think the catching of these small red bream has had an effect upon the supply of red bream and schnapper in the harbour? No, I do not.
 5140. What do you think has been the cause of the decrease? The cause has been the destruction of the natural feed where the schnapper come to spawn.
 5141. Where do they spawn? Generally on the natural feed, on the congewois.
 5142. By what means have the feeding grounds become damaged and destroyed? By the sunken nets.
 5143. Who have used them? Several Europeans, but principally Italians and Greeks. I have seen at least half a ton of congewois hauled in in one haul by the Italians. I think, about three weeks ago, I was down on the Spit with Mr. MacCarthy, and we picked out 103 red bream, not one of them 2 inches long: we picked these out without turning the congewois over; the fish were lying on the top, I do not know how many would be underneath.
 5144. Simply left stranded on the beach with the congewois? Yes; dead, bruised and smothered.
 5145. What is your opinion of these sunken nets,—should they be discontinued? Yes; it is the whole cause of the harbour being depleted.
 5146. Are there any other instances you can mention where great destruction of fish has taken place? Yes; in Mr. Noble's bight, close to my shed.
 5147. Have you seen other classes of fish destroyed by the same means? Yes; many other classes of fish get destroyed,—blackfish, black bream, and the silver bream in particular.
 5148. What nets are used in Middle Harbour at the present time? There are five men fishing in Middle Harbour at the present time.
 5149. What nets do they use? James Riddell, senior, has a sunken net; I think it has a 2 inch bunt. His takings for this week were 11s.; two of his sons are fishing in boats of his own; one made 2s. 6d. and the other something under £1; they each catch their fish and sell them about North Sydney.
 5150. Has his sunken net a cod or purse to it? No.
 5151. As far as the mesh being 2 inches, it is only what he told you? I did not measure it myself.
 5152. Do they use hauling-nets? Yes.
 5153. Do they use the garfish net? Yes; one son had a garfish net.
 5154. Have you ever known any fish destroyed by the garfish net? No; not with a floating garfish net, it will not destroy any ground fish, not anything like the sunken nets.
 5155. Would you limit the depth of a garfish net? No.
 5156. Why? They cannot work them over 300 meshes, it would be too heavy for them.
 5157. Are you aware that garfish nets are used most extensively as hauling nets? Yes; in all cases they are, I know now where a sunken net is used in Middle Harbour.
 5158. Do you think it a desirable net to have in Middle Harbour? I think it most desirable to stop it.
 5159. Do you think that if Middle Harbour was closed and a meshing net only allowed in it, it would come back to its old condition? Yes, I am sure of it; it was closed some years ago for two years, and at the end of five months you could catch a feed of bream anywhere.
 5160. After the closure? Yes, after the closure.
 5161. What mesh would you think desirable to have for a meshing net for Middle Harbour? Not less than 4 inches.
 5162. Do the sea mullet visit Middle Harbour in any quantity? No, not in quantity; they have no chance to get up the river, they are all caught before they get there.
 5163. The sea garfish make their way there? Very often.
 5164. Do you think it would be desirable to close Port Jackson for a period, so as to allow of the fisheries becoming resuscitated? Yes, I am thoroughly of that opinion, but it is no use closing it as they have had it closed above the Spit; the fish have not a chance to get above the Spit, there are always fishermen on the watch at Balmoral and Grotto Beach.
 5165. Is the bed of Middle Harbour below the Spit a breeding-ground? Not to any extent, it is nearly ali sand. 5166.

Mr. C. Lyons.

29 April, 1895.

5166. Are there breeding-grounds above the Spit? Yes; beautiful breeding-grounds.
5167. Is any portion of Middle Harbour closed at the present time? No.
5168. How long has it been open? Five years.
5169. And have you noticed during your experience there that all classes of fish frequent those waters? Yes; the mullet, garfish, and whiting. It is one of the best breeding-grounds I know along the coast.
5170. Can you tell us if there is much congewoi bottom? Nearly all congewoi bottom above the Spit.
5171. I understand plenty of schnapper have been caught in Middle Harbour? Yes; they catch one or two occasionally now.
5172. Have any been caught lately? Mr. Reid caught two on Saturday last, 20th April.
5173. What was the weight of the fish caught by Mr. Reid? Nineteen pounds, I believe.
5174. Have you known of any larger schnapper being caught there? Yes; either 32 or 35 pounds.
5175. Are you patronised much by amateur line fishermen? Not to a very great extent, principally by picnic parties.
5176. Do you think if the harbour were closed you would be patronised more extensively? Yes; if there were more fish in it.
5177. Do you think the amateurs should pay a small license fee to defray the cost of supervision of these waters? It would not do any harm; you would have great trouble in collecting it. The fishermen themselves are in favour of Middle Harbour being closed. I have a petition in my shed with about 700 signatures to it in favour of closing the harbour against net-fishing. I think the petition requests the closure from Middle Head to Grotto Point, the fish have not a chance of getting into the harbour, they cannot get in to breed.
5178. Have the Newtowns signed that petition? No.
5179. To whom is that petition to be presented? To this Royal Commission.
5180. Will you send that petition to the Commission to-morrow? I will.*
5181. Are any set lines or long lines used in Middle Harbour? I have not seen any, there were some years ago but not of late years; there are too many sharks there.
5182. *Mr. Thompson.*] In respect to the prohibition of sunken nets, in case these were prevented how would you catch those large prawns? You would have to do away with the prawns.
5183. If there were certain prescribed waters in which those nets might be used—small areas which prawns are known to frequent—would that allow of their capture without much damage to the fishing interest? Yes; they could be caught to a certain extent, but how are you going to limit that.

BOTANY AND GEORGE'S RIVER FISHERIES.

THURSDAY, 25 APRIL, 1895.

[The Commission met at the Offices, Bligh-street, at 11 a.m.]

Present:--

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. John Duncan Grant, Assistant Inspector of Fisheries, Botany and George's River, sworn and examined:--

5184. *President.*] What is your name? John Duncan Grant.
5185. Where do you reside? Shipwright Bay, Blakehurst.
5186. What fisheries do you supervise or control? Botany, George's River—in fact, all parts of the Colony.
5187. I mean particularly? Botany and George's River.
5188. How long have you been stationed on those fisheries to control them? Since 1882.
5189. Are you the Inspector Grant who gave evidence before a Select Committee in 1889? Yes.
5190. Does the date 1882 mean that that was your first appointment to the Service? Under the Fisheries Department, yes.

Mr.
J. D. Grant.
25 April, 1895.

5191.

* NOTE (on revision):—The petition is as follows:—"Whereas the Commissioners of Fisheries for New South Wales have reported that the natural supply of fish in our harbours and rivers has become exhausted to such a degree, through the constant scraping and disturbing of the beds and bottoms of the same, through the perpetual dragging of nets across the same, and as it is to these beds and bottoms that the fish of our coast come to deposit their spawn and feed; We, the undersigned, fear that in a year or two, unless firm measures be adopted without delay, that Port Jackson and its arms and tributaries will be utterly depleted of one of our most healthy and essential foods; And whereas, as His Excellency the Governor of the Colony of New South Wales, in pursuance of the provisions of the Fisheries Act of 1881, and with the advice of the Executive Council, may by his proclamation, declare that the whole or any defined portion of any tidal river, inlet, estuary, lake, lagoon, or arm of the sea, shall be closed against the use of fishing nets. Now, therefore, we, the undersigned, pray that that portion of Port Jackson, known as Middle Harbour (from Grotto Point to Middle Head), in the County of Cumberland, may be closed for a period of three years against net fishing; We would point out that Middle Harbour, on account of its waters being comparatively undisturbed by the busy traffic which churns up the other estuaries of Port Jackson, and by its deep and sheltered bays; its long sweep of sand and mud banks; its non-pollution by sewage and other foreign matter; is peculiarly adapted to be the premier breeding ground and nursery of our rapidly dwindling and valuable asset, in the shape of our fishing industry; We, the undersigned, are men of long experience in this particular branch, and see only too well that in a few years even the once famous Middle Harbour Fisheries will be void and destitute of fish unless the relief prayed for is granted; Trusting His Excellency will grant the prayer of this petition, and we, the petitioners will ever pray."

[The petition is signed by J. P. Abbott, of St. Leonards, and 185 other petitioners.]

Mr.
J. D. Grant.
25 April, 1895.

5191. Is your residence conveniently situated for the supervision of the fisheries of George's River and Botany? Perfectly central.
5192. Have you to pay house rent? I have bought the bit of ground my house is built on. The Commissioners do not pay my rent.
5193. What salary do you receive? £140.
5194. Is that the same as you were appointed at? No; the appointment was £128, as acting assistant inspector and boatman.
5195. Have you been in receipt of a higher salary? Yes; in 1884 I received £150.
5196. How do you account for the reduction of £10 per annum? I cannot answer that question; they reduced it at the time of the retrenchment.
5197. Did the Commissioners give you no reason? No; they gave no reason, only the reduction of salary right through, and dismissed many hands.
5198. So that after thirteen years' service you are receiving £10 less salary than you did three or four years ago? Yes.
5199. Does your supervision as an inspector extend any further than Botany Bay and George's River? Wherever the Commissioners wish to send me. I have been in the Myall Lakes, Port Stephens, and in all parts.
5200. Have they on any special occasion used your services to report on other fisheries? Yes; to visit the other fisheries, and to report whatever I might see.
5201. Would that imply that you have an extensive knowledge of the fisheries throughout the Colony? I would not like to say that it is for that reason they sent me; I think they sent me to see if illegal fishing was going on.
5202. Can you tell me how many licensed fishermen there are in George's River and Botany, respectively? I cannot give it to you just now. Last year there were fifty-one licensed boats, and about 150 men.
5203. In both places? Yes, the whole district, Botany and George's River.
5204. Do they appear to you to earn a decent living? No, the majority do not; a very poor living, many of them.
5205. How do you account for that;—is it because the fish supply is limited, or because some of them are lazy? I do not think they are lazy. Taking the average of fishermen you will find them a very hard-working and sober class of people, in my district especially.
5206. Are you supplied with a boat? Yes.
5207. Is that the most convenient means of getting about for carrying out your duties? It is the only way in my district.
5208. Do you find you can get about fast enough to exercise proper supervision in the boat? As far as lays in my power. One cannot take a boat in all the different sorts of weather I have in my district.
5209. Do you think a small steam launch would suit your purpose better? Our work lies in too many flats for a steam launch; they would see the launch before I could get at them.
5210. Do you think a steam launch might be used to advantage in connection with many of the other fisheries? Places like Port Jackson it would suit, but not Botany.
5211. What was the total number of baskets of fish sent from Botany and George's River during 1894? I cannot say for a certainty; as near as possible, to Woolloomooloo Market, 7,800 baskets; Redfern Market, a rough average of 3,500; and local consumption, over 3,000.
5212. Do these quantities compare favourably with the fish supply in the years previous to that? Yes, I think so, but they are more distributed now. There were only seventeen boats years ago, but now there are so many boats. There are fifty licensed men, but dozens and dozens of men who are not licensed, and you cannot get at them—line men. They get fish, but you have got to prove the sale.
5213. Is that a defect in the law, that sale of fish has actually to be proved before proceedings can be taken? Yes; you must prove that they catch them for the purpose of sale, both with the line and the net.
5214. Do they fish within territorial limits? Yes; for little bream. I call them schnapper.
5215. What would you consider the value of the consignment of fish from Botany Bay and George's River for 1894, roughly? I could not value them. I do not know anything about market prices.
5216. Would you consider the fisheries of Botany Bay and George's River are keeping up their regular condition as to supply? As far as mullet goes; but as to whiting, schnapper, and river garfish there is a great falling off.
5217. To what do you attribute that falling off? The public and the amateur line fishermen who fish for pleasure and many of them sell them.
5218. It is not due to the operations of the net fishermen? To a slight extent, but nothing to what the public kills. I have seen seventy dozens of schnapper, weighing from 2 oz. to 4 oz., come in from the mouth of George's River.
5219. What would prevent the destruction of young fish? Any person who had a schnapper under 8 oz. in his possession, whether he found it, bought it, or otherwise, should be liable to a penalty. That is our best fish. Schnapper and whiting will be a thing of the past in George's River. I have seen fifteen dozen of whiting come into a boatshed; ten dozen of them would not go 1½ oz. weight. There is no remedy; we cannot interfere.
5220. Do you think the licensing of amateur fishermen would tend to control them? I think every person who uses a long line, or a net, should be licensed.
5221. Supposing we made a regulation preventing the use of certain sized hooks which would be capable of catching the small schnapper, would that minimise the destruction of the schnapper? I think not. They could put six or seven hooks on a line and jag them.
5222. You think that a stringent provision preventing the capture or being in possession of under-sized fish would meet the case? I think so.
5223. What classes of fish are sent from Botany and George's River? All sorts—the sea garfish, mullet, blackfish, and bream principally, and a great number of jewfish.
5224. What time of the year do the sea garfish show themselves in shoals? They come in in February.
5225. Do they remain long? February, March, April, May, and June, five months. I have seen them in July, but not in quantities.

Mr.
J. D. Grant.
25 April, 1895.

5226. When do the sea mullet show themselves first? In November they start to travel out of one river to another.
5227. Is it your opinion that the so-called sea mullet breed in the inlets? I believe they drop their spawn when they are travelling in the mouths of the river. They travel as soon as they drop their spawn. They lie dormant until the spawn makes again. I do not think any fish spawn in the river; I think they spawn in the mouths as they are travelling.
5228. How do you account for the presence of the young fry in the upper reaches? I think as soon as they come to maturity they take up those places for protection. Last season I could not tell you how many tons of mullet there were staked up in wire netting; in the finish it was a mass of young fish like mullet. I took the fish for mullet.
5229. Were those fish caught in an ordinary seine? Yes; they were confined there for about thirteen weeks—nine weeks for a certainty.
5230. Did that insure a fresh supply of fish being sent to the market? Yes; in my days we did not think of such a thing. I have seen 30 to 40 tons lying rotten on the Frenchmen's Beach. We dragged them ashore. Now they save every fish.
5231. Where is Frenchmen's Beach? La Perouse; I lived there about twenty years.
5232. Do they use these so-called paddocks extensively? Only this last two or three years. They buy the wire every year expressly for it.
5233. Do they keep any other classes of fish besides the mullet? No; I do not think they would do. I have kept bream in Lake Macquarie, but they all went blind and bloodshot.
5234. Was it the rubbing of the fish that caused this blindness? I cannot say.
5235. Was it for want of shelter from the sun? It might have been; I will not say.
5236. Do the black bream and whiting travel the same time as the mullet? With the hardgut you generally get a few whiting and bream travelling. We always expect them to leave the river about November when the roe is in them.
5237. Where do the black bream spawn? I think in the mouths of our inlets; they drop their spawn when they are travelling.
5238. Do you think quantities of the bream that frequent some of the inlets are the result of spawn deposited in the so-called nurseries or lakes? I think it is nearly all in the entrances. As they travel they deposit the spawn. Sometimes when you catch a fish travelling you will find the spawn coming from him.
5239. Comparing the lake system with the entrances to the rivers and inlets, would you consider the lake system a better place for producing fish life; would it be more prolific than in the entrances;—do you think they make for the lakes as natural breeding-grounds? I think when they are travelling they never go up our lakes any distance until the spawn is completely gone from them, and then they take up the head of the lakes and rivers and lay there dormant until the spawn makes again. They get the biggest hauls of whiting in the winter, because they are lying asleep and easily killed. When in roe they are much livelier.
5240. How do you account for the difference between several of the same species of fish; do you think the feeding-grounds alter their character; for instance, in the black bream—the sea bream is a whitish colour like silver, but the black bream caught on the flats, probably further up than the entrance, will be found to be darker and more solid in flesh? I suppose there are two sorts of bream; but they all travel at times. If they stop in the river any length of time I think they get dark, but get bright again when they travel, like a mullet.
5241. Is there any supply of soles or flounders coming from George's River or Botany? They are getting very scarce. The spearing has killed most of them. In the mouth of Cook's River they used to get twenty or thirty pairs many years ago—any boat that cared to go out for them.
5242. Do you consider the fisheries of Botany Bay and George's River good breeding as well as feeding-grounds? Yes.
5243. Taking the waters as a whole—Botany Bay and George's River—what extent of water is available for the fishermen to haul at the present time;—is there sufficient? Yes, there is sufficient water, but not sufficient fish for the number of fishermen.
5244. Do you think there are too many fishermen for the supply of fish? Yes; they get the fish, but they do not get the class of fish that they did; there is not fish enough.
5245. Have you any closures? Yes; many miles of them, from Como to Liverpool, closed by proclamation; but fifty men can go in with their nets, and unless I can swear I have seen them hauling I cannot touch them.
5246. Would you like to see the Act more stringent in that respect? Yes; I think any person found in that water with his boat is there illegally.
5247. Are there many portions of those waters naturally closed by the existence of weed and rock? In the summer months there is no occasion for so many closures as the winter;—the blubber, and the length of weeds in places will stop men from doing any great damage. In the summer months all fish are more lively.
5248. As to the closures which have taken place, have you, as local inspector, been asked to report on the necessity for making these closures? Yes, once; the last time they were closed.
5249. Do you mean by that, that closures have been made when you have not reported in favour of the closures? Yes.
5250. Have you ever reported against a closure being made, and have you found after that that the Commissioners have made that closure? I recommended the closing of our river down to Tom Ugly's Point, for six months, during the winter months, and it was closed for two years. I am a great advocate for closing the whole of our rivers in the winter months.
5251. Would it be a good idea to limit the number of fishermen on the different fisheries? Well, they would fish then and would not pay a license.
5252. Provided you could find fields for every professional fisherman that cared to become a licensed man; would you be in favour of allowing, say, only fifty fishermen on the waters of Botany Bay and George's River? I would not like to say; I would rather restrict them to size and the mesh of the net.

- Mr. J. D. Grant.
25 April, 1895.
5253. Have you ever heard the fishermen complain of not having sufficient water open to them? A few.
5254. Considering the number of men that are licensed fishermen in Botany Bay, and George's River, do you think they really have sufficient water open for them? Not in the summer months.
5255. What nets do the fishermen use; is there any difference between the nets they use in Botany Bay and those used in George's River? Nearly all use garfish-nets right through for general working.
5256. Are they always trying to catch garfish in a *bona fide* manner? Well, they say so; but we know they cannot catch them—they are not there to catch,—they may get a peck in a week.
5257. It is a loophole which allows them to use the garfish-net with a small mesh? That is it.
5258. Are any other nets used? Prawn nets, and the general hauling-nets; but nearly all garfish-nets and the meshing-net. Years before the Fisheries Act came into force nobody carried a garfish-net but for garfish only; but since the Act they carry it for all kinds of work.
5259. How do you account for that? Because there is not enough 2½-inch net in the general hauling net.
5260. As to the hauling-net, do you think its length is sufficient for those waters? In many places it is; in George's River they could not use more than 150 fathoms; but there are places on the big flats on the river where they might use 200 or 250; but, as a rule, 150 is large enough.
5261. As to the mesh of the hauling-net, do you think that is satisfactory? I think it ought to have 100 fathoms of 2½ inches; make the net 200 fathoms, with 50 fathoms in each wing; by giving them that, it would do away with the garfish-net seven months in the year.
5262. So that you would only allow them to use a garfish-net during the periods when the garfish show themselves in shoals? Yes, inside; let them use what they like outside.
5263. Have you ever noticed any of the young schnapper become meshed in the 2½-inch? No, it is very seldom they can reach the young schnapper, they are right out in the channel, they are very scarce now.
5264. As to the depth of the hauling-net, there is no limit under the Act; do you think there should be a limit? I do not see what for, a man will not use a deeper net than necessary.
5265. Do they haul the garfish-net to shore? Yes, they can always leave the wings, they can bunt up the fish if we are there; as a rule there are very few fish killed by fishermen and left on the shore.
5266. Do you think they use due care to protect the young fish? A good deal.
5267. As to the meshing-net, do you think the length and mesh of that net are satisfactory? It is not more than a third long enough, and the mesh is too big.
5268. What would you suggest as a reasonable alteration? Not less than 3½ inches, and not more than 150 fathoms in length, and set as a meshing-net, one end fast only to the shore, and not on any flat less than 3 feet at low water.
5269. You think that at the present time a quantity of marketable fish escape through the 4-inch mesh that might be caught in the 3½-inch? Tons of mullet; our schedule weight is 8 ounces; it takes a 2½-inch net to pick it up; all they can get is the large bream and blackfish in that; they only get the big sea mullet.
5270. Is there any harm in allowing the use of a net of the dimensions you have just mentioned in closed waters? I believe in closed waters being closed waters. In my opinion, the closed waters are all waters south and north of the railway—north of Newcastle and south of Nowra should be closed in the summer months. I was in Port Stephens this year; I saw fish brought on board the steamer with a bit of ice at 10 o'clock in the morning, in the middle of the summer. They were taken to the Sydney market; they are right enough while they are on the flags, but directly they fetch them out they are rotten, the dealers will give the men 1s. for a heap of large bream worth 4s. or 5s.; they know they can only sell one or two, but they make their money. Look at the supply of fish you would have here in the winter time if those waters were only open in the winter; as it is now, the fish in those places where they are so plentiful are wasted in the summer months through going bad on the voyage.
5271. You would open the home fisheries, or the fisheries adjacent to Sydney in the summer months? Portions; I would close the Woronora River; I would close it and never open it winter or summer; it is a great place for small fish to go in; I would give them a portion of George's River in the summer months.
5272. Is the Woronora River closed now? Yes; it is a part of the waters of George's River.
5273. Are many prawns caught in George's River and Botany Bay? Yes, it is one of the greatest prawn places in the Colony.
5274. Did you include in the returns you previously stated, the number of baskets of prawns? I can only give a rough guess; prawns are caught on Lady Robinson's Beach from the latter end of February up to the end of June; I have known 50 hampers to be caught in one haul, and the largest prawns to be seen.
5275. Are they caught at night or in the day-time? In the day-time on Lady Robinson's Beach; they are caught at other places at night.
5276. Are the mesh and length of the prawn net satisfactory? The mesh is right enough, but I think they ought to have 20 fathoms.
5277. That would give an extra 5 fathoms? Yes.
5278. Have you noticed whether there has been much destruction of fish by the net fishermen in the waters over which you have control? No more than possible. The garfish and prawning nets must destroy fish.
5279. Do you think it would be a good thing to prohibit the use of the garfish-net, except for the *bona fide* purpose of catching garfish? Yes; and only use it for five months in the year, and *bona fide* for garfish only.
5280. Do you think, instead of having the law as it stands, regulating the lengths and meshes of the several nets, that it would be a step in the right direction to allow the administrative authority to prescribe by regulation what nets should be used in certain waters? Kissing goes by favour; where nets could be used they might be used.
5281. I am going on the assumption that political influence, or any other influence is to be dormant, as far as the administration of the fisheries is concerned;—would that not work well then? I could not recommend it. I cannot see how the influence would be stopped. It would be a very good thing if it could be done straightforwardly. I approve of the principle.
5282. I think you stated you would not allow any nets to be used in closed waters? I cannot say it.

5283. Do you know whether the fishermen include in the supply of fish that are supposed to come from Botany Bay and George's River any that come from Port Hacking? I cannot say that decidedly.
5284. Do you know Port Hacking well? Yes, well.
5285. Do you think there would be any harm resulting in allowing the fishermen to catch the shoals of fish which frequent the entrance to Port Hacking, that is, in the waters to the eastward of the spit? No; I do not think it would hurt Port Hacking one bit, so long as they are not above that spit.
5286. Do you not think that whatever fish they catch there would be migratory? Yes.
5287. The waters that I have just mentioned as those which might be left open to the fishermen at Port Hacking are for all purposes sea waters, are they not? Yes, sea water; it is on the bar.
5288. Do you think that if a provision was made preventing fishing boats going beyond a certain point with nets in them, that would meet the case of fishermen breaking the law? Yes; they could not go up without being seen.
5289. Did you not say they use set-lines in the waters of George's River and Botany Bay? Yes.
5290. Do you consider they are destructive to fish life? No, I do not think so. They are evading the law. Those who use those lines say they are getting fish for their own consumption, but they are principally for sale.
5291. Have you ever seen large shoals of fish making their way from the southward to the north outside? Yes, many.
5292. What kinds? Mullet, salmon, tailor, bonito. I really cannot think of all their names.
5293. Have you ever seen any of the herring species? Once; they came right into Botany. That was two years ago. I took a sample into the Fisheries Office. They are something like the small Scotch herring.
5294. Could you identify it from a diagram? I might. [*Two diagrams were shown to the witness, who identified it as the "Clupea Sagax."*]
5295. Have you seen any evidence of the southern herring travelling? Never. I have seen a few caught, but not many.
5296. Have you ever seen any anchovies caught? I do not know what they are. The only anchovy I know of is what the Chinamen caught with a prawn net; they used to get boat-loads of small prawns and put them in a cask until the stench of them was very bad; they potted them and sent them away.
5297. Have you ever seen any of the fry of the herring or pilchard in any of the bays? No; not to my knowledge, although I have seen a great quantity of small fish in Botany Bay, with thousands of mackerel and tailor feeding on them.
5298. Would it be possible they would be anchovy? I would not like to say.
5299. Have you, in observing these fish travelling, noticed the extent of the shoals at all? I have seen acres of them.
5300. How far off the coast? Within a stone's throw, and 6, 7, 8, and 10 miles off; yes, 12 miles off.
5301. What was the appearance of the water after the fish had passed—was there any oily appearance on the surface? We took it to be spawn; there was a scum like spawn, or something small.
5302. Not oily? I would not say that;—more like seeds, only finer.
5303. It would not be the whale brit? I cannot say, but I have seen it when there have been no whales about.
5304. Have you any experience in deep-sea fishing? No, only under the Government supervision, with the trawl.
5305. How long ago was it since you tried with the trawl? I cannot say for a fact—five or seven years ago.
5306. Did you make your experiments in Botany Bay? Well, we were under the supervision of Mr. Glading, Assistant Inspector of Fisheries. We tried Jervis Bay and the coast from there to Bird Island Point.
5307. Had you proper gear and steamer? I think we had the "Ajax."
5308. Had you any chart to guide you? No; I had surveyed the coast very well myself for schnapper. I went clear of rocks, and where we were clear of rocks we dragged the trawl.
5309. Do you think the experiments you made were sufficient to induce people to come and enter into the industry by expending their money in the purchase of trawls and equipment? My opinion is that the trawl will never catch any fish that I know of, without there is fish in the ocean that I know nothing of.
5310. Have you had any past experience in trawling? Only that time. I know that all our fish will bolt from the front of the net.
5311. Is that the result of your experience during the trawl you made? In Jervis Bay the net was down three hours, and in the bow of the steamer I could catch flathead as hard as I could pull them in. When we picked up the net I had a good many on my line; you could have caught them in thousands with the line, so they either ran in front of the net or are buried in the sand. On the coast we tried it both night and day. We got one good fish down off Stanfield Bay—that is pretty deep water; we had to keep off the rocks. All the fish I know off on the coast stick to the reefs, except the surface school fish that travel on the top; I know nothing of them.
5312. You state you have never had any experience in trawling? No; I know nothing about it.
5313. Have you had any experience in well-boat fishing? I was a few trips in the Hobart boat, I think it will be a success.
5314. Do you think it would lead to a greater development if the well-boat system were brought into more general use? Yes; I do.
5315. Do you know anything of the way the business is conducted at the Woolloomooloo Market? No; nothing at all.
5316. Have you ever heard the fishermen complain of the manner in which matters are conducted there? Yes; many a time.
5317. Do you think it is centrally situated? No; a market somewhere about the Haymarket would be the most central; I think the Woolloomooloo Market is out of the way altogether.
5318. Have you any crayfish fisheries in your district? Nothing to speak of.
5319. I suppose they get them when they are in prime condition, when they are in roe? There is no trouble for them to get them with a spear in Botany.
5320. Do you think they are the same as the Port Stephens' fish? I do not think so.

Mr.
J. D. Grant.
25 April, 1895.

- Mr. J. D. Grant.
25 April, 1895.
5321. What size do those at Botany attain? I never saw one more than 2 lb.; I did not weigh them, I am guessing at the weight.
5322. Do you think we should have a close season for crayfish? Yes, I think there should be; they catch them generally when they are full of roe.
5323. Do you think it would be a good thing to prevent the capture and sale of the female fish when in roe. Would they know what they were catching till they did catch them? If they were forced to let them go again it would be a good idea. I do not know much about crayfish.
5324. Do you know anything about oyster fisheries? A little.
5325. Are they in any quantity in your district? The 15th section of the Act has ruined the river, together with the disease.
5326. Is that the section that allows of small areas being taken up? No; it is the section that allows the public to take bags by the thousands, if they like to say they are for their own consumption.
5327. You have a knowledge of the system under which the areas are leased at the present time? Yes.
5328. Do you consider it a satisfactory system? No.
5329. Do you think it would be a good thing to allow the leasing of an arm of a river, rather than continue the present system? I think that arms and bays let to one person by bulk would be far better than the present system, at a very small rental, with a royalty on their oysters. If they had a failure in the crop they would have nothing to lose—say a little bay of 4,000 or 5,000 yards; let them have it for £2 or so, with a royalty of 1s. a bag.
5330. Would you make the lessee subject to stringent provisions for efficiently working the fishery, and proper supervision? Yes.
5331. Have you any small leases of 100 or 200 yards in George's River? Not now, they are all done, I think 500 is the smallest.
5332. Have you ever heard of any pilfering of oysters taking place? Oh, a great deal; it is done every day.
5333. Do they steal them from Crown lands as well as the adjacent leases? It is the 15th section which ruins the Crown lands.
5334. Is it a fact that people who hold leases go on to Crown lands and steal those oysters for sale, and not for their own consumption? You have to prove that, and it is an impossibility to do so.
5335. Have you not a suspicion that it is done? It is the men who never get leases, that live on the Hawkesbury, and my river as well, they take them and open them.
5336. Would you suggest that a provision be made so as to prevent the possibility of things occurring which can only occur under the 15th section of the present Act, and only allow of them eating the oysters on the spot? I would recommend that there should be good large areas of public oyster reserves, Crown lands, not leased, not to be touched by any person, and all persons that get a lease to have power if they caught any person stealing oysters to give them in charge if they do not know their names. At present a person may hold a lease, and if a dozen men go on that lease and steal his oysters, and he does not know them, he cannot give them in charge, and they take the stuff away in spite of him. There is no law permitting him to give them in charge; he is to report to the Commissioners and wait till they give him power to prosecute for stealing his own property.
5337. Have you any public oyster reserves in your district? Yes; there are public oyster reserves at Como, on both sides of the river.
5338. Is George's River a breeding-ground for oysters? At the present time we have the mud disease and the worm in it. It has been one of the greatest reserves in New South Wales; the best and the largest oysters come from there.
5339. Are they natural deposits of oysters? Yes.
5340. Have the beds been dredged at all? Oh, yes; but the principal work is with the diver. There are beds that get dredged, but more by the diver than anything else.
5341. Is it possible that the beds were overworked? No; it is the disease, the mud, and the worm.
5342. As to the foreshore deposits, do they seem to thrive well on the foreshores? Yes; and they afford a living for hundreds by selling these oysters and disposing of them in bottles. I have tried my best to obtain a conviction by trying to prove sale, but I cannot swear that they are the same oysters.
5343. How long does it take an oyster to become a marketable oyster from the time it is laid down in the spat stage in George's River? I have a wall I have built alongside my boatshed; in two years from building there were large oysters on it. I was keeping them to fetch in a bag to show the Commissioners, but someone took them away.
5344. Have not experiments been made by putting down layings of New Zealand oysters in George's River? Yes; in Gawley's Bay and different parts up the river.
5345. Did they do well? They took the disease.
5346. Can you tell us how many leases there are in George's River? At the present time only two.
5347. Are they foreshores? Yes; natural oyster-beds leased. They are cut up, or cancelled for non-payment of rent, or something of that sort; the foreshores are the thing for the oysters in our district.
5348. Have any oyster lessees been summoned for arrears of rent? I think not.
5349. Can you tell us whether on any occasion the Fisheries Commissioners have visited Botany Bay and George's River fisheries officially? Yes, they have; a few times.
5350. How long since they were out last? I think something like three years ago; Messrs. Campbell, Hyam, and Hill came to test the river, to get a part of it opened.
5351. How many other times prior to that have they been there officially? Previous to that I think the President, Mr. Hill, and Mr. Hyam; we were trying the trawl in Botany Bay.
5352. What for? Trying for fish.
5353. Not shells? No; fish. The lead-line of the trawl had a chain along it which got round the propeller, and they had to leave and go to Sydney. This was a mishap. I dived under and got it clear; it was a beastly job. Dr. Cox, since that, has been up as far as Liverpool nearly.
5354. Officially? I believe so.
5355. Did he ask you to accompany him? Yes. We had the Fisheries' steamer. It is many years ago. That is the last time.
5356. What did Dr. Cox do? He had a look up and down the banks of the river.

Mr.
J. D. Grant.
25 April, 1895.

5357. Did he experiment or inspect? No; he went to the Branch. We got fast at Rocky Reach and pulled up, and the Hon. W. Long was there too.

5358. Did you receive any official communication giving you information that they were going to visit that district? I had notice they were coming, but the subject matter, which was giving them consideration was not mentioned to me. On the last occasion it was to test the river; it was mentioned then.

5359. Did you test the river as to the supply of fish? Yes.

5360. Did they cast a net? Yes; three or four times, in the open waters. We caught very little. In the closed waters they caught enough to satisfy them that there was plenty of fish there. Through that they recommended part of the closed waters to be thrown open, from Tom Ugly's Point to the bridge.

5361. Was this action taken spontaneously, or was it the result of several deputations that waited upon the Colonial Secretary, asking that more waters might be made available for the fishermen? I cannot say that; I do not know.

5362. How long did they remain on those different visits? All day on the visit I was speaking of last.

5363. Did they remain at any time longer than a day? Never.

5364. As to the issue of licenses, do you think it would be a good idea to put the issue of licenses into the hands of the local inspectors, rather than compel the fishermen to go to the nearest Clerk of Petty Sessions? I am centrally situated. The fishermen who live at Botany would have to come 8 miles, and men up the river would have to come the same distance. Many of them would, perhaps, prefer getting it done at Sydney rather than come that distance. It would be a great thing in one way, as I would know who had licenses, and who had not. At the present time I have had to chase after a few to find out.

5365. You think then, speaking generally, it would serve very well? Yes; but how about the money—should I be answerable for the money? I have no place to keep it safe from burglars. Suppose I took £50, and my house was broken into, I should have to be answerable for this money.

5366. Do you think that, instead of issuing fishermen's licenses in the form of a piece of paper, it would be a good idea to substitute a medal which could be tacked on the boat? Yes; that is a good idea. It is impossible to keep their licenses as they are, and they are under a penalty.

5367. What do you think of the fees charged for the fisherman's license and for the boat license;—are they too high? I do not think the fishermen, as a body, think them too high, but there are really many that cannot afford it.

5368. Is that because they get so poor a return for their fish? Yes.

5369. In point of fact does the middleman get the money they ought to have? I cannot answer that. In the northern and southern rivers you will find the most trouble to get the money, and that is because their fish goes to the dealers.

5370. But taking into consideration the price the consumer has to pay for the fish, do you think the fishermen get anything like a fair price for their fish? No; there are only a small quantity that remain good and are sold.

5371. Have you ever known of fishermen getting account sales of the sale of their fish, and, although these fish arrived fresh in the market, and were sold, they have been returned in debt? I have heard it said so, but I cannot say.

5372. Do you think it would be an advantage to send the fish to market gutted and cleaned? A good idea.

5373. *Mr. Thompson.*] Do you approve of oyster-gathering by divers? In places at George's River you would never get the oysters otherwise. I would also like to say that all persons who sell oysters, by the bottle or otherwise, should be licensed.

5374. They used to be got otherwise? With tongs.

5375. Do you not think the process of getting oysters by diving might be made a means for completely demolishing the beds without the knowledge of the inspector? Yes; we cannot have knowledge.

5376. Would you require aliens to be naturalised before granting them a fishing license? Yes.

5377. Would you license amateurs—I mean, of course, at a nominal fee? I would impose the same fee on every person that had a net or a long line.

5378. I mean amateur line fishermen? No; no license for amateur line fishermen.

5379. About your facilities for inspection;—you object to a steamer because you cannot get on the flats? Yes.

5380. If you could get one that would go on the flats, do you think that would help you in your supervision of your waters? Yes; if I could get one drawing 6 inches of water.

5381. When do the garfish show in Botany? February, March, April, May, and June.

5382. And the river garfish? They are not worth mentioning.

5383. The prawns at Lady Robinson's Beach—are they caught by Italians in deep water? There are only 14 feet of water where they shoot in. They can be caught without the diving-nets.

WEDNESDAY, 1 MAY, 1895.

[The Commission met at the Offices, Bligh-street, at 10.30 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. James Edwards, fisherman, Kogarah Bay, George's River, sworn and examined:—

- Mr. J. Edwards.
1 May, 1895.
5384. *President.*] Your name is James Edwards;—where do you reside? Kogarah, George's River.
5385. How long have you lived there? Thirty years.
5386. How long have you been a licensed fisherman? About fifteen years.
5387. Do you hold a boat license? Yes.
5388. How many men have you in your employ? Two.
5389. In the evidence which you are about to give before the Commission to-day, do you think that your views will be shared by most of the fishermen on George's River? Well, that is a very hard thing to say. It is a hard thing to make a law to suit all men. They seemed agreeable for me to come to give what evidence I could as a representative of them.
5390. Have you confined your operations to George's River? Yes; chiefly.
5391. Have you had any experience in fishing anywhere else? In Port Hacking a time back, and at Nowra, and at the other side of Port Stephens, just the other side of Newcastle.
5392. Comparing the state of the fisheries of George's River at the present time with that of fifteen years ago, would you consider the fisheries of as great a value now as then? No; I do not think so.
5393. Has there been a decrease in the supply of fish? Yes.
5394. Can you form any idea of the causes of the decrease? I think mostly through working so many boats, the line fishermen, and so much fish being taken.
5395. What market do you send your fish to? Chiefly to Woolloomooloo and Redfern.
5396. How do you send your fish? By cart. I sell a great many of my fish.
5397. Where do you sell them? Round Kogarah and Hurstville.
5398. What classes do you catch in George's River? Mullet, garfish, whiting, and bream.
5399. Any flathead and blackfish? Yes; at times, silver bellies.
5400. Your having direct communication with the Woolloomooloo Market would prevent the complaints arising which have taken place of fish having been stolen from you? Yes.
5401. Have you ever lost any fish at the markets? Not that I am aware of.
5402. Do you entrust your fish to an agent to sell for you? Yes.
5403. Are you satisfied with the return you get for the sale of your fish? No; we get a very low price.
5404. Do you think, considering the prices the consumer has to pay, the fishermen should get a fairer return for their labour? Yes.
5405. Have you compared the prices that you obtain in the Woolloomooloo Market with the prices you receive in the other markets? Yes; we have compared our prices sometimes.
5406. Which market do you get the best returns from? I think the Woolloomooloo Market.
5407. Do you approve of the way the fish are displayed in the Woolloomooloo Market? No; I do not.
5408. Do you think it would be better to have raised tables? Yes; or to sell them by hampers, the same as I have heard is done at Melbourne, in half and quarter baskets. That would be a great improvement.
5409. Do you think there should be more than one sale a day? Yes; a sale in the afternoon.
5410. Do you think there would be any harm in having the market open all day for the sale of fish? No; there would be no harm in it, I am sure.
5411. Do you think if the fishermen were brought into more direct contact with the consumer better prices would be realised;—if the fishermen were allowed to sell their own fish in the market would they be able to do better? I would hardly like to say. I do not know how that would be.
5412. Do you realise a better price by hawking your own fish to the general public than by sending them to the Woolloomooloo Market? Yes; by hawking them round. I am sure of that.
5413. Do you think if auxiliary markets or branch markets were established it would be a step in the right direction? Yes; I do. I am in favour of that.
5414. Is the Woolloomooloo Market centrally situated, or would you prefer to see a market established on another site? On another site. I was one of the first to propose the market at Hudson's; I thought it was far more handy for the fish coming by railway, and would save cartage to Woolloomooloo.
5415. What nets do you use? Our chief net is the garfish-net. We use a mullet-net—2½-inch net—at times, and a meshing-net.
5416. Are you satisfied with the length of the hauling-net? No; we are not. It is one of the greatest difficulties we have.
5417. Would you like it extended? Yes.
5418. What length? Not under 300 fathoms.
5419. Could you haul 300 fathoms in George's River? Yes; not everywhere—in many places we could. My idea is that it is a great mistake to give a man small tools. I think short nets are a great destruction to fish. They drive them clean off our grounds, as they cause us to make as many as thirteen and fourteen hauls. This worries the fish and drives them away. With the long net it is only necessary to make one haul.
5420. Why, then, do you use the garfish-net, which is shorter? To catch the garfish and the whiting.
5421. You want a net of 300 fathoms of garfish meshes? No; in our chief work we use the garfish-net, but we want 300 fathoms, with a bunt of 2 inches.
5422. You are not satisfied with the mesh of the hauling-net? No; reduce it to 2 inches.
5423. And what size in the wings? Three inches in the wings.
5424. Have you ever noticed young fish of the bream kind get meshed in the 2½-inch bunt? No; an odd one or two get meshed, but they are easily taken out if you do not haul them up on the dry beach.
5425. Do you haul your net right on to the shore? Very seldom. At times we cannot prevent it.
5426. Supposing there was a smaller mesh in the bunt, would that prevent these young fish getting meshed? Yes.

Mr.
J. Edwards.
1 May, 1895.

5427. Do you generally empty your net in a certain depth of water? Yes, we bunt them up in the water, take out the good fish and drag the bunt out, and turn it inside out; it is to our own interest not to kill the young fish.
5428. As to the garfish-net, are you satisfied with the length of that? No; we want 150 fathoms.
5429. So as to give you an extra length of bunt? Yes.
5430. Are you satisfied with the mesh of the garfish-net? I think it ought to be allowed to be worked down to an inch.
5431. Do you think many marketable fish escape through the mesh? No; we cannot half wear our nets out, for they come down to an inch, but the small garfish-mesh in that, and in getting them out, it pulls the gill off them; they mesh in from $1\frac{1}{2}$ to $1\frac{1}{4}$ inches; it is an eyesore to see those fish hurt and destroyed.
5432. You say the smaller the mesh the less destruction to small fish? I am certain of it.
5433. Could you haul 150 fathoms of garfish-net in George's River? Yes; almost anywhere.
5434. As to the meshing-net, is the length of that satisfactory? No; it is one of the greatest farces in the world.
5435. What would you like that extended to? There should be no limit to it; it catches nothing but full-grown fish.
5436. Do you think the mesh is satisfactory? I think 4 inches would suit most fishermen; as far as that goes some say the 3-inch meshing-net would be big enough on account of meshing flathead.
5437. Do you think $3\frac{1}{2}$ inches would be a fair compromise? Yes, I think it would suit all.
5438. Is it not possible that with the present mesh many marketable fish escape? Yes.
5439. Fish that could be caught with a $3\frac{1}{2}$ -inch mesh? Yes.
5440. Do you use a prawn net? No, I do not.
5441. Are you satisfied with the length of that net? I do not think anyone is satisfied. I think it is a farce to give a man 15 fathoms of a net. There are generally two or three men handling that, and it disturbs the fish.
5442. What length would they like? I think 50 fathoms.
5443. With the same mesh? Yes; I think they are satisfied with the mesh.
5444. Are any sunken-nets used in George's River? For prawns, and hauling, too.
5445. Those used for hauling, are they what they call the diver-nets? Yes.
5446. Is that means adopted for the purpose of escaping the blubber? Yes.
5447. Are the lead lines very heavily weighted, or just sufficient? Hardly a dozen weighted at all; if they have new lines they weight them.
5448. The prawn nets, are they heavily weighted? Some weight, some do not.
5449. The lead line is not necessary for prawn fishing? Not weighted.
5450. You say there are some that do weight their foot lines? On account of having new lines; the light net would float for an hour before it would sink.
5451. Are there any foreigners fishing? A few prawning on the beach.
5452. Are they the people who use the heavily weighted nets? Yes; I think they are the foreigners.
5453. Do you think it a proper thing to allow the use of these heavily weighted nets? I do not know that weights do any harm to the fishing.
5454. I am speaking more particularly with regard to the sunken net, which is so heavily weighted that it drags along the bottom and crushes everything it comes in contact with;—do you not think the breeding and feeding grounds get hurt by this constant hauling? I do not think weights make one bit of difference. You can haul your foot line to cut a foot under the bottom, and a team of bullocks could not bring it in. By hauling your lead line tighter it makes it cut into the bottom; it draws it narrower.
5455. Can you see any harm in using a meshing-net in closed waters? It would take the protected fish out of the water.
5456. Supposing there was a provision to allow the use of meshing-nets in closed waters, would there be any injury to the fish supply or breeding grounds of the young fish? No; no detriment to the young fish, and the provision would be hailed with satisfaction by the fishermen as giving them an extra concession.
5457. Do you believe in the confiscation of nets for breaches of the Fisheries Act? No; I do not.
5458. Do you think it would be better to fine a man heavily, or imprison him, rather than take his tools of trade from him? I think he should be fined.
5459. Do you believe in half the fine being awarded to the inspector? No; I do not.
5460. Do you think by that means persecution may take place? Yes.
5461. What would you think of a provision like this: that the fishermen should be allowed to use a net of any length up to 300 fathoms, and any mesh they like, provided they were compelled to empty their net in a certain depth of water (say) not less than a foot, and there was a stringent provision as to the sending of under-sized fish to the market? That has always been my motto. I have always had that in my head.
5462. Do you think that if the fishermen were trusted they would be as anxious to protect fish life as the Government? Yes; I think the general class of fishermen are very anxious to protect the young fish.
5463. Do you think that breaches of the Fisheries Act should be dealt with as soon as possible after they occur, instead of allowing time to elapse, which might deprive the fisherman of the use of his tools of trade? Yes, as soon as possible.
5464. As to closed waters, have you much closed water in George's River? Yes; about two-thirds of George's River are closed.
5465. In your opinion, are those closures justified? No; I do not think they are.
5466. Why do you think they are not justified? They are there for the purpose of breeding. I do not think the fish breed where they are closed.
5467. How do you arrive at that conclusion? We always wait for them coming out in Botany Bay. We wait for the bream; we wait for the whiting and mullet. They come out of George's River and go to sea. They go down in large schools. I think they come from the river and go to the sea.
5468. Does that not strike you as being sufficient evidence that they breed in the rivers, and that your contention is lost;—do they breed when they couple? I think most fishermen are under a mistake as to breeding.
5469. I want you to explain;—are those fish you catch at the mouth of George's River of local production—are they bred in George's River, or do they come from the sea, and are returning to the sea again? I am of opinion they are river fish, and go to the sea to deposit their eggs along the sea beaches.

- Mr. J. Edwards.
1 May, 1895.
5470. You do not think the ova is deposited in the river at all, but that the fry are hatched on the sea beaches? Yes; on the sea beaches.
5471. And that the river grounds are simply feeding grounds and not breeding grounds? Yes.
5472. Are the closures that have been made in George's River of long duration, have they been long closed? Three years at a time, two years, and one year.
5473. Have you ever approached the Commissioners of Fisheries, asking that more water should be given you? Yes.
5474. Did you prove successful? In one case we got from Tom Ugly's Point to Como Bridge given us.
5475. Do you know whether the local inspector was asked to report as to the necessity for those closures or not? No, I cannot say—asked by the fishermen?
5476. No, by the Fisheries Commissioners? I cannot say.
5477. Would you be prepared to say that when those closures were made the supply of fish had become exhausted? No.
5478. You think the fishing ground was maintaining its regular fish supply when those closures were made? Yes, in many cases.
5479. When do the whiting make their appearance in any numbers in the river? About April; first comes the trumpeter whiting.
5480. The black bream? I can hardly say what months they come. I cannot remember months.
5481. Would it be February and March? Just about a month before Christmas is a great time we have to look after them, and then again in the winter months.
5482. When do the garfish make their appearance? They begin to come about April.
5483. And the sea mullet at about the same time? Yes.
5484. As to the presence of shoals of fish on our seaboard, have you ever noticed them passing along the coast? Yes.
5485. What kinds? Salmou, blackfish, mullet, sea garfish, and trevally. These are the principal kinds we watch for.
5486. Have you ever noticed a species of the herring? We have a herring here, but I have never noticed it on the coast. It is what we call a river fish.
5487. Would it be the southern herring? I could not tell you; they are so scarce we do not take notice of them; they would not pay cart-hire in sending them to market, and they were never very plentiful; we just know they are there, and that is all.
5488. Have you ever heard anyone say they have seen schools of maray travelling along the coast? Yes; I have often heard that; we had a school of pilchard herrings come here once.
5489. How long ago? About five years ago. There was a telegram about a captain coming out to this country who sighted a shoal of pilchards, and he thought they would strike Port Jackson, which, I believe, they did. I saw them; they were strange fish. We went out for them and cast the net, and got about fourteen baskets. We did not know what they were; we sent them to market, and they did not know them; they sold at about 6d. a heap. [*The witness identified this fish he spoke of as the "Clupea Sagax."*]
5490. Have you had any experience in deep-sea fishing? No.
5491. Any experience in trawling? No, never.
5492. Any in well-boat fishing? No.
5493. During the whole of the time you have been connected with the George's River fisheries, do you know of any occasion when the Commissioners of Fisheries, or any one member of that body, officially visited your fisheries? Yes.
5494. Who were they? Mr. Campbell, Mr. Hyam, Mr. Hill, and somebody else.
5495. How long ago would that be? Four or five years ago.
5496. Do you know of any visits since then? I could not say.
5497. Can you tell us what is the general opinion amongst the fishermen as to the advisability of continuing the present authority that administers the Fisheries Act? They are of opinion they should be discontinued, and a new body created.
5498. They are not satisfied with the manner in which the members of that body have conducted the business? They are not.
5499. Do they think many reforms might have been brought about had these gentlemen taken sufficient interest in their work? Yes.
5500. Have the fishermen on occasions approached the Commissioners with a view of getting their grievances redressed? Yes.
5501. Have they always got them redressed? They never got them redressed except at that time when they came to see and got a portion of waters opened.
5502. Do you think the fishermen should have representation on whatever board is created for administering the Fisheries Act and controlling the fisheries? Yes.
5503. Do you think those boards should be local boards, or do you think it would be wise to continue the present Commission and appoint a fisherman on the present Commission? I should think it would be better to have one man appointed who would have a good acquaintance with the fisheries of the Colony, and who would be a practical man. Let him be appointed as head of the fisheries; local boards should be established to advise that gentleman, and on those local boards fishermen should have representation.
5504. Do you think there would be any difficulty in getting a fisherman to act on the local board? No, I do not think so; they would be only too anxious to do so for their own benefit.
5505. Do you think it would be a good idea to give power to the local boards to advise as to the number of fishermen who should be allowed on a certain fishery; that is, to limit the number of fishermen on a certain fishery? Yes, I do; I think it would be a good thing. I would be glad to leave myself if there was no more fishing for me, and I think it would be a good thing if it could be regulated.
5506. As to the oyster fisheries in George's River, do you know much about them? Yes; I worked in a diver for seven years.
5507. What is their present condition? I could hardly say about the deep works; as far as I can see, at low water they are in a bad state.
5508. Is that owing to the disease? No; I think it is owing to the public being able to get oysters just as they like. The under work you can say nothing about without a diving suit to see it.

5509. They used to be considered splendid oyster fisheries, did they not? Yes; I have got as many as fifty-seven bags a week with a diving suit.

5510. Are there many leases in George's River? No; I do not think there are many.

5511. Do you know the system under which the leases are issued at the present time? At so much per 100 yards; £1, I understand.

5512. Are you in favour of continuing that system, or would you grant leases of large areas instead of such small areas? Not to allow 100 yards?

5513. Not less than 1,000 yards? I believe in nothing less than 1,000 yards; the oysters would be improved by it. I think the 100 yards are taken up for pilfering work.

5514. Instead of the lessee paying £1 per year for 100 yards, would it be better for him to pay by results, for every bag he got off his lease? No; I do not think so.

5515. Not to pay any rental at all? No royalty.

5516. I do not mean in addition to the rental? No; I do not think so. I do not think it would work well.

5517. Why? Because a man might think the more he improved it the more rent he would be under.

5518. It would be a dual advantage—while the State was getting an extra return the lessee would be also getting an extra return, and providing the royalty was made a reasonable sum there would be no objection? Not if the royalty was made reasonable.

5519. There are some leases where it takes four years before they get any return; are you aware of that? No; I am not. I know men can hold them back for four years; but oysters are not four years coming to maturity. [The President, considering the witness did not fully understand the nature of the foregoing questions as to the leasing of areas on a larger scale and payment of royalty, here explained the subject to the witness, who, after the explanation, said that the matter now being presented to him in a different light, he thought the system suggested by the President would be reasonable, and that he would like to take up a large area under the same conditions if he could get it.]

5520. How many fishermen are there at George's River and Botany? I cannot tell you, I have no idea; it is according to the school fish—some days we are four-handed, and sometimes two-handed.

5521. *Mr. Thompson.*] Have you thought out any means for eradicating the disease in oysters? No, never.

5522. Not given it any attention at all? No.

5523. Do you think the present form of license could be improved by substituting a metal ticket which would be practically indestructible? Yes, it would be far better; we have to carry it, and cannot keep it dry.

5524. Aliens—would you require them to produce their naturalisation papers before allowing them a license? I think they should not be licensed until they are naturalised.

5525. *President.*] Is there any other information you would like to give the Commission? Yes; I would like to speak about closing rivers far off in summer time, lakes and places above where the railway can get. I think their being caught too far away is a cause of great destruction of fish, as they are not brought to market fresh. I think there should be some means adopted to close these waters in the summer, and open them in the winter.

5526. You would like the home fisheries open in the summer months, and the more distant fisheries closed? Yes.

Mr. Sampson Colbran, fisherman, Kogarah Bay, George's River, sworn and examined:—

5527. *President.*] Your name is Sampson Colbran;—how long have you been a licensed fisherman? Ever since the Commission was in existence, and have been fishing all my lifetime.

5528. Have you fished the whole time in George's River and Botany Bay? Yes.

5529. You have a pretty extensive knowledge of these fisheries? Yes.

5530. Do you speak on behalf of the fishermen of George's River? Yes.

5531. You have heard the evidence of Mr. Edwards, given before the Commission to-day;—do you agree with that evidence? Yes.

5532. Is there anything else you would like to add to the evidence given by Mr. Edwards? Yes, one point; when he mentioned about the destruction of fish, owing to the closing of the waters for two years, I approve of them being closed only for six months in the year. In the month of May, every year, there is a flood or two, and the fish are driven out by the floods to sea. I consider the public might as well have the fish as let them be driven away to sea. In any river I believe they are driven out by the flood—bream and whiting. On Good Friday morning there were over 100 baskets of bream and whiting condemned at the Woolloomooloo Market.

5533. Where did that fish come from? Different parts of the lakes.

5534. Far off places? Yes.

5535. Do you think that fish could have been sent to market in the winter time in a prime condition? Perfectly.

5536. You think it is too much to expect fish to arrive from those far-off fishing grounds in a fit condition for consumption in the summer months? I am sure of it. You can see how many baskets there are condemned in the summer months: the primest of fish, whiting and schnapper of a great length; it is a perfect sin; they are the parents of fish.

5537. In regard to closed waters, supposing, instead of allowing you to fish in closed waters for six months in the year, you had the privilege at all times, under certain conditions, of putting a 3½-inch mesh in closed waters for the capture of marketable fish therein; how would that suit you? Very well; but how about the whiting?

5538. Would not that be met by allowing, in the whiting season, the use of a mesh that would capture them? Yes.

5539. *Mr. Thompson.*] Is there any difference between the rock oyster and the drift oyster? No, I do not think so; the only difference I can see is the spat from the rock floats about until it fixes to some substance; a drift oyster has always got hold of something whatever that spats on.

5540. Will you tell me if the same applies to the spat from the drift oyster? It is just the same.

5541. Do you think the spat from the drift oyster is comparatively heavier, and not so liable to float? I do not see any difference.

5542.

Mr.
Edwards.

1 May, 1895.

Mr.
S. Colbran.

1 May, 1895.

- Mr. S. Colbran.
1 May, 1895.
5542. How do you account for the difference in the excellence of the deep-bed oyster, over the shore oyster? Mostly by lighting on different things, and the heavy tides; and it dips down into deep waters, and as it spats it might not fly away straight at once.
5543. Do you believe it is mostly the result of more favourable conditions? Only by the oyster being down deeper under the water, it makes them grow larger.
5544. How do you account for the occurrence of the deep beds? The difference is, that between these beds there is nothing for them to light on.
5545. Suppose between those beds there is ground which would be suitable for oyster culture, why do not the oysters light there? I do not know if there are any in our rivers.
5546. Have you any other information you wish to give us about oyster culture? The disease years ago was the same as now; it was a little black insect. My opinion is, the state the river has been in of late years has had a great effect upon the oysters;—there is so much slime now in the river, and when the oyster opens to feed at young flood, this slime—which is a kind of mud floating on the surface—goes in. You can open the oyster and see the mud in it.
5547. Have you seen any worms in the midst of the mud? No, I have not.

MONDAY, 13 MAY, 1895.

[The Commission met at the Offices, Bligh-street, at 10:30 a.m.]

Present:—

FRANK FARNELL, Esq., M.P., PRESIDENT.

L. G. THOMPSON, Esq., J.P.

Mr. Charles Smith, fisherman, Botany, sworn and examined:—

- Mr. C. Smith.
13 May, 1895.
5548. *President.*] What is your name? Charles Smith.
5549. Where do you reside? Botany.
5550. How long have you lived there? I was born there; about fifty years now.
5551. How long have you been engaged in fishing operations? All my life time.
5552. In what fisheries have you carried on your calling? Different parts.
5553. Will you mention them? Port Hacking, Botany Bay, Tuggerah Lakes, and Lake Macquarie is about as far as I have been.
5554. Principally, I understand, your fishing operations have been confined to Botany Bay and George's River? Principally, yes; I was two years, in the winter months, at Tuggerah.
5555. Have you been a licensed fisherman since 1881? Yes.
5556. Did you receive a note from Mr. Stephen asking you to give evidence before this Commission? No; Mr. Duncan received one from Mr. Stephen, and he showed it to me and asked me if I would attend. My name was not mentioned in the note; I did not receive any note before I received the summons.
5557. Have you any Fishermen's Association at Botany? There is one in Sydney.
5558. Is it a going concern at the present time? Yes.
5559. Who is your president? Mr. Fitzgerald.
5560. Is he an agent? Yes.
5561. How many members belong to the association? Between sixty and seventy.
5562. Does that association embrace representatives from all the fisheries in the Colony? No; I do not think so; I am not sure;—there are Lake Macquarie men in it, Tuggerah, Botany, and George's River are included.
5563. How long has that association been in existence? Between three and four years, to the best of my belief. There was one before that of which Mr. MacFadyen was president.
5564. Has that association ever had under consideration proposed new legislation in respect to the fisheries? I do not think so.
5565. Have they ever asked for redress of their grievances from the Colonial Secretary? Yes, I think they have.
5566. Do you know whether they ever got them redressed? Not that I know of. We got up a petition a little time ago to get Port Hacking opened, and we never got an answer to that.
5567. About how many fishermen are there at Botany and George's River? I believe over fifty licensed boats in Botany, some having two, and some four men in a boat.
5568. That would mean the employment of about 150 to 250 men? Yes.
5569. Have you ever attended any representative meetings or conferences of fishermen held in Sydney to take into consideration the development of the fisheries? I have not.
5570. Do you own one or more boats? I own two, my son works one.
5571. How many men have you? I have one with me, and my son has three in addition to himself.
5572. What is your average catch per week? It is very difficult for me to tell just now; sometimes nothing at all, sometimes a little. Last week I only had a basketful all the week, and the week before about twenty-two baskets.
5573. An average of about fifteen baskets per week? Yes.
5574. It all depends on the class of fish you endeavour to catch? Yes; school mullet you only get a basket now and then.
5575. Do you fish principally for prime fish? All kinds.
5576. Where do you send your fish to? Principally to Woolloomooloo; I have sent twice to Redfern.
5577. Do you send them by cart? Yes, my own cart.
5578. What classes of fish do you generally send? Garfish, whiting, blackfish, bream, mullet, pretty well all kinds except schnapper. We very rarely catch a schnapper.
5579. Are you satisfied with the returns you get from the Woolloomooloo Market? Well, we cannot do better. I am well satisfied at times. I am always there, or my son, and I put a reserve on them, and I never lose any of my fish; when I was down at Tuggerah and Lake Macquarie I had to put up with what returns I could get.
5580. Did you lose a good many fish then? Well, we always fancied we did. There is no doubt there is a good deal in a man looking after his own goods. 5581,

5581. Supposing you could sell your fish direct to the general public, would that be a better system for you? We could not do that very well; it would be very difficult to catch and sell too. Mr. C. Smith.
5582. If that system is carried out in other parts do you not think it is possible it could be carried out here? Yes; it could be carried out. Catching is one thing and selling another; you could not carry out the two. 13 May, 1895
5583. I mean, rather than trust to an agent, would it not be better to send one of your own men, instead of being confined to certain agents? You would benefit a lot by it, I believe myself.
5584. Do you know whether the fishermen as a body are satisfied with the prices realised for their fish in the market? I do not think so to hear them talk.
5585. Are you satisfied with the market accommodation and the system of displaying the fish in the Woolloomooloo Market? As far as I am concerned I am. I think they cannot find much fault with it. Some find fault with the auctioneers.
5586. Would it not be an advantage to have the fish displayed on raised tables? They would look cleaner and nicer.
5587. It would remove a prejudice in the public mind? Yes.
5588. Do you think the market should be open all day for the sale of fish? I do not think it would benefit us a great deal.
5589. Would it benefit the far-off fisheries if they had an extra sale or two a day? I do not think many dealers would attend.
5590. Do you think it would be a good thing to establish branch markets at Newtown, Burwood, Paddington, and other places? Yes; I think it would.
5591. In preparing to catch your fish, do you arrange so that you will have them caught in time to arrive at the early sale in the morning? As well as we can. We like to get the early sale in the morning.
5592. Supposing you cannot catch the first sale, what do you do with your fish? Well, if we cannot sell them on the floor, we put them in the ice-house.
5593. Have you practised any of the means of keeping fish alive by erecting paddocks at Botany? Yes; I was about the first to do so.
5594. How long have you tried that? I have had them eight or nine days.
5595. How long have you adopted the system? Fifteen or sixteen years ago.
5596. Has the system worked well? Yes, splendidly.
5597. It ensures a fresh supply for the market? Yes; you can keep them alive, and they are not sacrificed at the market.
5598. Have you noticed any deposits of spawn from the fish kept in these paddocks? No; I have not.
5599. The sea mullet are generally full-roed when caught? Not always; when full roed they are generally done. We do not expect any more mullet now; there may be a few.
5600. Do you consider the Woolloomooloo Market conveniently situated for the sale of fish? I always thought so; but it would have been better situated at the Haymarket. Woolloomooloo was right enough before the railway came into existence.
5601. You have sent some of your fish to Redfern, was that to Hudson's Market? Yes; one lot.
5602. Were your dealings more satisfactory? It was not satisfactory at all the time I sent there, it happened to be a glutted market.
5603. Supposing that the system of gutting your fish were brought into vogue, and they were sent to the market, would you get a better price? There are some schnapper sent gutted, and they do not seem to sell as well. Some of the people think they are stale. We have done this for some time at Woolloomooloo, and they do not sell as well on the floor as the others.
5604. Have you ever sent any fish into the interior? No.
5605. Do you think if the Railway Commissioners were disposed to place a refrigerating car on the line for the use of the fishermen, it would be availed of in sending fish to the inland towns? I think it would open the fish trade up a bit.
5606. How do you bring your fish to market? Mostly in baskets, barring the big mullet, which when we have any we put loose in the cart.
5607. When do the sea mullet first show themselves in Botany as a rule? Sometimes it is a bit earlier than others on account of the wet weather, we had mullet in March this year; April is generally the month for sea mullet—it is a little earlier on account of the wet weather this year.
5608. As for school black bream, when do they show themselves? About a month before the mullet, and right up to the mullet; I have noticed roes in the bream at different times this year.
5609. Do you think they spawn twice a year? The whiting do; I do not see why the bream should not.
5610. What do you think is the object of these fish in entering the harbours? Simply travelling; in the cold weather they begin to get into roe a bit and travel along the coast, and where they go or what becomes of them we cannot tell.
5611. Do you not think they enter the inlets for the purpose of spawning? I cannot say, it is an impossibility to tell; we never catch any quantity of them without the roes. At Lake Macquarie, in July, we were getting mullet full roed.
5612. Was that the lake mullet? Yes, the same as ordinary sea mullet.
5613. They do not breed at sea? No; they all breed in the harbours and bays; they go along the coast; we have had shoals come in from Port Hacking.
5614. Is it the hardgut? The hardgut and the sea mullet are the same in my opinion, the hardgut mullet is the white-roed mullet or melt.
5615. You do not think the sea mullet spawn at sea, but at the mouths of rivers? Yes, as they go along; they do not stop, as soon as they lose their roe we lose them.
5616. You think the same explanation applies to black bream; they spawn simply in the mouths, and do not enter the upper reaches to spawn? Yes, black bream and blackfish, nearly all travel except the river garfish; they do not often go to sea, all other kinds do; blackfish, bream, and whiting travel from one part to another. I do not think the river garfish do.
5617. You very seldom catch any schnapper? Very seldom; odd ones with the net, that is all.
5618. In Botany Bay? Yes.
5619. In full roe? Not that I know of.
5620. Where do you think they spawn? I have not the slightest idea; I used to catch a few in Lake Macquarie with a net.
- 5621.

- Mr. C. Smith. 5621. In hauling your net have you ever caught many of the small schnapper? Yes; a good few of the red bream at times.
- 13 May, 1885. 5622. What net do you use? All kinds—as close up to the Act as we possibly can. We buy our mullet-nets $2\frac{1}{2}$ inches centres, and $2\frac{1}{2}$ and $3\frac{1}{4}$ inches in the wings; the garfish net we have got down to $1\frac{1}{2}$ inches.
5623. Do you use a meshing net? No; I have had my hauling wings, and meshed with it.
5624. Do you use a prawn net? Yes.
5625. As to the hauling-net, do you think it is long enough? I do not think it is long enough. I do not see the use of a man making two hauls where one will do, neither with a garfish, mullet, or prawn net. We have got prawn nets at Botany 15 fathoms, and there are fifteen or sixteen boats altogether driving after these prawns. If the men were allowed to use a little more net they would get the same prawns with half the labour.
5626. As to the mesh of the hauling-net, are you satisfied with that? Pretty well satisfied with the mesh of the hauling-net; there is not sufficient 2-inch stuff in it to kill whiting. The garfish net allows 30 fathoms of each; the 2-inch net is only 50 fathoms. Fifty fathoms of 2-inch is not enough to catch whiting, I mean $2\frac{1}{4}$ -inch. Whiting is about as stiff a fish as we have got. It is the first fish that will come to the net.
5627. Do you contend, then, that the mesh of the bunt of the hauling-net should be smaller? Not in the $2\frac{1}{4}$ -inch, but in the wings.
5628. The wings should be reduced from 3 inches to $2\frac{1}{4}$ inches, the same as the bunt? Yes, for 100 fathoms.
5629. And then give you 200 fathoms more net—100 fathoms on either side of the bunt, making in all 300 fathoms of net? Yes.
5630. Do you think you would be able to haul a net of that length in Botany Bay? Yes.
5631. In George's River? Yes, it could be used, and has been used more than once before there was any Act.
5632. And after the Act, too, I suppose? Well, it has.
5633. Do you haul so that your fish become stranded? Some do; we haul our net right to the shore.
5634. Do you take the necessary precaution to protect the young fish? We do the best that we possibly can. If you have a lot of large and small fish the small ones very often get crushed.
5635. I suppose the destruction of young fish is inseparable from indiscriminate netting? Yes; most of the fishermen generally return as many young fish as they can.
5636. As to the meshing-net, do you think that is long enough? I do not know much about the meshing-net myself.
5637. Supposing you were going to engage in that class of fishing, would you think 60 fathoms sufficient? Yes, I think so. They use them round the rocks, and can have as many of these nets as they like. They just shoot them round the rocks where the fish are crossing; but I would not like to say much about it.
5638. Do you think the mesh is satisfactory, 4 inches, or do you think it should be larger, or smaller? I think it is plenty large enough. They can always have it bigger, but not smaller.
5639. Is it not a fact that plenty of marketable fish escape through the 4-inch mesh? Yes; I think there are.
5640. Would there be any injury in reducing the mesh to $3\frac{1}{2}$ inches? No, I cannot see that there would.
5641. As to the garfish net, are the fishermen satisfied with the length of that? No, no fisherman. You will not find one satisfied with the length of the garfish-net. Ninety fathoms only suits the sea garfish and if you put a garfish-net in all night, you want to get all kinds of fish to pay a man for his work.
5642. I conclude, then, you would like the garfish-net longer;—what length would you like? I think one net should be as long as another.
5643. As to the mesh? As far as I am concerned I am satisfied with the mesh.
5644. You would like to convert the garfish-net into a hauling-net? It is a hauling-net; it is not a set net.
5645. I know it is a hauling net; you would like to use the garfish-net all the year round, with a longer length? We only use a garfish-net when it is a benefit to us. When there are no garfish to be caught we do not use it. It is a heavier net to work.
5646. As to the mesh, you think it is satisfactory;—if you would like to use the garfish-net all the year round for the double purpose of catching garfish and hauling it for other fish, do you think there would be more destruction of fish by the use of that net than by the use of the hauling-net? No, I do not; except garfish, they must be very small to get hurt in the net.
5647. As to the prawn net, are they satisfied with the length of that? No; I do not think they are.
5648. What would they be satisfied with? Fifty fathoms is little enough. If a man was using 50 fathoms it would not all be small mesh.
5649. You would alter the character of the prawn net altogether? Oh, yes; I would have wings.
5650. What do you think of a provision like this: that the central authority, or authority charged with the administration of the Act, should have power to allow the use of nets of whatever kind, where suitable for particular waters,—not having so much regard to the mesh of the net at all, but only to the matter of preserving the young fish; and in order to do that, to have a stringent provision preventing the sending to market of undersized fish; and also, that the nets should be emptied in not less than a foot depth of water;—would that be satisfactory to the fishermen? It would be very uncomfortable, on the cold nights, to have to empty your nets.
5651. I understood your flue was allowed to remain in a foot of water? If you were landing just at daybreak, you would feel that you would like to get to the shore; and sometimes you would get into shallow water.
5652. Do you think it would be a good idea to allow the administrative authority to prescribe that certain nets should be used in certain waters, instead of having all these complications as to the mesh and lengths of these different nets and so on; would it be better if a strict rule was laid down by the person administering allowing the use of this, that, and the other net, of whatever mesh you like, as long as it does not exceed, say, 300 fathoms, and that you would respect the provision as to sending of undersized fish to market;—do you think that would be more satisfactory? Yes; but not to be confined to any months in the year. The inspectors should not make any particular months for garfish.
5653. Supposing that was left open to a local board, or the inspector of fisheries, to determine, would that be satisfactory;—that whenever these garfish did appear, you could make an application, and could have

a right to use it? They are here to-day and away to-morrow, and there is no inspector can name the months these garfish come in. I have had thirty-five years experience, and I do not think any inspector has had as long as that, and I could not name the months.

Mr. C. Smith.
13 May, 1895.

5654. Do you believe in nets being taken and confiscated? No, I do not; I am very much against it.
5655. You think a man's tools of trade should not be taken from him? I think they should not; it is taking the bread out of his children's mouths.
5656. Would it be better if he were fined heavily or imprisoned? I do not think it crime enough for a man to be put in prison. I know families that have gone hungry through the nets being taken. There are a lot of people fishing that can get nothing else to do, making so many of us; and if they cannot get the fish at one place they resort to the closed waters.
5657. Do you think there would be any harm in allowing the use of a meshing-net in closed waters? Well, I would not altogether approve of a meshing-net being used in closed waters.
5658. Have you sufficient water open to you for net-fishing in Botany and George's River? Not for the quantity of fishermen. There are fourteen or fifteen boats right close against one another.
5659. Do you think the closures in George's River have been justifiable? They have made George's River worse than ever it was. There are less fish in and less goes out of it through the closures. All our small fish are killed by the lines; we are not allowed to kill them. Look at the trumpeter whiting we used to get at one time?
5660. Do you think the closures have been of too long duration? Yes.
5661. Do you think that the floods have a disastrous effect as far as the fish are concerned? Yes, nothing worse; it drives the fish out. We have George's River closed for two or three years, and it has only been opened for a day and been closed again.
5662. Have you approached the Commissioners of Fisheries with a view of getting more waters? No.
5663. Have you approached the Colonial Secretary on occasions, and asked him to grant more waters? No; we tried Port Hacking and some of the fishermen have as to George's River.
5664. Do you believe in half the fine being given to the informer for catching a person fishing in closed waters? I can hardly answer; it is immaterial to the men caught to whom the fine goes.
5665. Do you think it acts as a sort of inducement to the informer or inspector to take proceedings against men and act harshly? Well, it does certainly.
5666. Do you believe that all these cases that arise under the Fisheries Act should be dealt with expeditiously, instead of keeping fishermen waiting sometimes for a month? Yes, I do. I think it would be a good thing. They keep them a long time, and keep their nets, which they do not get back very often.
5667. Do you believe in a provision that would limit the number of fishermen in different waters? No, I do not.
5668. Not even if the surplus men could be provided with grounds to go and fish in other parts? No; for every part is getting overrun now. There are a great many forced to go at it that cannot get anything else to do.
5669. Have you had any experience in oyster culture? No, I have not.
5670. Have you had any experience in well-boat fishing? No, I have not.
5671. Have you had any experience in deep sea fishing? No.
5672. Have you noticed any of the shoals of fish coming along our coast from the south to the north? Only the salmon.
5673. Any of the maray or herring tribe? No; I have not.
5674. Have you ever heard they do go along the coast in shoals? I have heard old sailors say so. Sometimes a few of the salmon come into our harbours.
5675. What fish frequent Port Hacking? All kinds of school fish.
5676. Do they go past the Spit? They nearly all go past the Spit. They cross up the river. Whiting, mullet, and sea garfish go right up the river for shelter. You will see the bream school down the river, and the whiting too.
5677. If these fish do make their way up the river it would not do to allow fishing operations at Port Hacking? They make their way up and down the river in accordance with the weather.
5678. You think they have nothing to do with the local production? Some of them stop.
5679. Do you think any harm would result from opening up Port Hacking as far as the Spit? I think it is a great pity it is not open. There is no spawning ground below the Spit in Port Hacking. It is all school fish below the Spit.
5680. So that if these school fish, which are of a migratory kind, are not captured by the fishermen, they go out to sea and are lost? Yes.
5681. What are the classes of fish that go into Port Hacking? Mullet, garfish, bream, whiting, and blackfish are the main kinds.
5682. Would the fishermen be satisfied if they were able to catch the school fish, without attempting to take the garfish at all? The bream travels just the same as the mullet. They school, and so do the blackfish and the whiting.
5683. You do not think there could be any injury to Port Hacking if opened as far as the Spit? No; it would not injure it at all.
5684. Would the fishermen be satisfied with that? Yes; if it was opened to the Spit, and allow them the school fish.
5685. Do you know whether any of the Commissioners of Fisheries have visited Botany Bay and George's River officially, to inquire into the circumstances and conditions of the fisheries? I do not.
5686. Speaking as a representative fisherman, what is the general opinion expressed in regard to the present Commissioners of Fisheries;—are they satisfied? Very dissatisfied, one and all.
5687. Do they ask that a change should be made? Yes.
5688. Have they stated in which way they would like a change? Some of them. They have not had any meetings to that effect. You can hear them discussing their grievances when they get together. Just fancy fifty boats in Botany; there are no waters for them to knock about in. George's River, up to the Pond, is monopolised; there are so many living there.
5689. Do you think it would be a good idea to give the fishermen representation in connection with the administration of the fisheries? I think it would.
5690. Supposing local boards were established—say, a board to consist of three, and the fishermen to have one representative on it, would that be satisfactory to the fishermen? Yes; I think it would.

Mr. C. Smith. 5691. Simply to have the boards established as boards of advice to the central authority; and would you have the central authority composed of a Commission, or say, one man at the head of the whole affair?
13 May, 1895. I hardly know which would be best.

5692. In having a Commission composed as it is now there would not be much difference in the way the fisheries are managed? No.

5693. Would you favour the appointment of one man at the head of the Fisheries Department, a man with a practical knowledge of the fisheries? Yes.

5694. Do you believe in licensing amateur fishermen? I think there are very few amateurs; I think all nets should be licensed.

5695. I mean line fishermen? Yes, I believe I would; our schnapper men are licensed, and they are line fishermen, and why should not the amateurs be licensed? Every man that uses a line should pay a license; they are more able to pay than the fishermen.

5696. Are you aware that these amateur line fishermen destroy a tremendous lot of young schnapper? All kinds of fish as well as young schnapper; you will see a dozen of them any day of the week down on the pier; they do not catch any red bream just now, they did some time back.

5697. As to the license which is issued to you, would it be an improvement to issue a metal medal for you to tack on to your boat, instead of the paper license? Yes, it would be an improvement.

5698. Have you any objection to the license fee which is charged? No, I have not; if it is put on all the line catchers—to serve all alike.

5699. *Mr. Thompson.*] As to aliens, would you refuse a license to them until they are naturalised? I would not like to say so; but I think it would be a very good thing.

5700. Is it your opinion they ought to be naturalised before they are licensed? Yes, that is my opinion.

5701. As to the shrinkage of the nets, would you advise that the twine should be tanned once or twice before it is made up into netting? It would not benefit us a bit; we are continually tanning, and if the twine was tanned up before it was made it would have more lay in it, and would make it harder; I would not favour the previous shrinkage.

5702. Respecting the weights of fish, if we give you a list of those which we might propose to include in any new legislation, will you state against them the weights at which you consider they should be declared marketable? Yes.

Mr. James Duncan, fisherman, Botany, sworn and examined:—

Mr.
J. Duncan.
13 May, 1895

5703. *President.*] How long have you been a licensed fisherman? Ever since they have been giving the license—about thirteen years.

5704. So that you have a good practical acquaintance with the fisheries of George's River and Botany? Yes; I have done more fishing there than anywhere else.

5705. Do you send your fish to the Woolloomooloo Market? Yes; not always—I send some to Hudson's.

5706. Do you consign to an agent? Yes.

5707. Are you satisfied with the returns you get? Yes; I am like Mr. Smith, we are pretty nearly the only two that watch our fish from beginning to end. They have not much chance to get to windward of us; I have not seen much wrong.

5708. You have heard the evidence given before the Commission by Mr. Smith;—do you concur in the evidence which he has given, or would you like to make any amendments or additions? There are a couple of matters in which I differ with Mr. Smith; that is about the meshing-net being allowed in closed waters.

5709. Do you believe in that? I think it would be a very good thing; I have seen an instance of it in George's River. There could have been a great catch of whiting by doing the same thing, and I think that allowing the use of the meshing-net in closed waters would be an improvement and a benefit.
