As already stated it is impossible to give anything but an approximation of the possible revenue, and I think the sum of £3,700 per annum may reasonably be expected as directly resulting from this extension.

The prospects of the development of the line have been regarded in my estimate in as favourable a light as possible, assuming that increased production will arise and that the district will be utilised far more extensively than hitherto in the production of fat stock. I am of opinion that for the purpose of a rough estimate the traffic may be calculated as follows:—

Description of traffic.	Value.
Wool	£300
Goods, copper, &c.	450
Produce	400
Stock	1,400
Passengers	600
Mails	576
Total	£3,726

I can only repeat how difficult it is to form an estimate of the traffic in a district of this character, where a large proportion of the business has hitherto been conducted elsewhere and which we have not handled upon New South Wales Railways. Attention may, however, be drawn to the fact that assuming this traffic is secured, it will be absolutely new, and on this account will materially increase the earnings on the existing main lines which are now in close proximity to the district which it is proposed this line should tap.

183. When the proposal to construct a line from Condobolin to Broken Hill was under consideration, you mentioned that the length of the extension from Condobolin to Euabalong would be 35 miles, but, according to this proposal, it is 48 miles? Yes.
184. Can you explain it? I cannot. At the time the proposal was before the Committee, the estimate which we had was from an old trial survey.
185. Can you say if the route proposed is that which you had in view when you gave the distance as 35 miles? I could not say, in the absence of a detailed survey.
186. Was it your idea that the line should be extended on the north side of the Lachlan, or on the south side? I think I did not express an opinion upon that.
187. You can express one now? I should imagine that a line on the south bank of the river would run in better country than on the north bank.
188. Would the distance be greater? That I do not know.
189. Can you say what the object is in going on the north side of the Lachlan instead of extending the line from Condobolin to Cudgellico, and then on to Hillston? No; I have no idea, unless it is to get directly to Broken Hill or Menindie.
190. Have you examined the country between Condobolin and Cudgellico? Yes, I have been over that country.
191. And the country through which the proposed extension will run? It is better country south of the Lachlan.
192. Have you examined the country to the north? I have travelled over it.
193. Then, for traffic purposes, would it not be better to take the more direct route—Condobolin to Cudgellico and to Hillston—instead of Euabalong? Yes, it would look so, assuming Hillston to be the objective point.
194. We are told that it is the objective point; what will be the difference in the distance? I do not know.
195. Is it your opinion that there would be a very considerable difference? It represents two sides of a triangle as against the third.
196. In your opinion, for traffic purposes, would the Cudgellico route be preferable? I should not like to say that, because the Mount Hope traffic would be more likely to come to Condobolin.

- J. Harper.
1 Sept., 1897.
197. Would the traffic of Mount Hope appreciably affect the earnings of the line? It might very appreciably in time. At present, the developments are not very great; but it is represented that that is owing to the difficulty of obtaining fuel, and the distance from the market.
198. How much is your estimate for that traffic? £200 or £300.
199. Would there be additional traffic *via* Cudgellico to a great amount? I do not think the traffic would come from the east in the direction of Cudgellico. The traffic would probably come in between Condobolin and Cudgellico, but I have not studied that aspect of the question.
200. Can you give any particular reason for taking the proposed route? No; except the one which I have given—that it is to take the direct route to Menindie or Broken Hill.
201. And except that it is the direct route to Broken Hill, you can see no reason for taking the line from Condobolin to Euabalong in preference to Cudgellico? No, assuming that Hillston is the objective point; but if the line were to be carried to Cudgellico to terminate there, then the traffic in the north-west would continue to go down to the river.
202. But not if there was a further extension to Hillston? No; it would be intercepted at Hillston, or between there and Cudgellico.
203. Would more traffic reach the line if carried between Condobolin and Hillston *via* Cudgellico than if carried by Euabalong? I am dealing with the line between Condobolin and Euabalong. I should say that a line *via* Euabalong and Cudgellico, for instance, would carry the most traffic.
204. How much longer would that line be? I should not imagine that it would be more than 10 or 12 miles longer.
205. With regard to the estimated earnings of the proposed extension, what new traffic would you expect to come to the line between Condobolin and Euabalong that would not reach Condobolin without that extension? Nothing between Condobolin and Euabalong. It would be from the west and north-west that the traffic would come.
206. To the west and north-west of Euabalong, what new traffic do you anticipate? It would be chiefly wool.
207. How many tons? Altogether, I have estimated about 1,000 tons of wool.
208. No portion of which would reach Condobolin without this extension? Yes, a portion of it would. Probably 200 or 300 tons would reach Condobolin in the event of the extension.
209. What other produce? I should expect wheat to be grown in the district.
210. Do you expect wheat to be grown to the west and north of Euabalong? No, I should expect it to be grown to the south and south-west, and as far as Lake Cudgellico. That wheat would find its way to Euabalong.
211. Is your estimate of £400 made up of agricultural produce which would be entirely new? Yes.
212. Then there is the item—Stock £1,400;—is that fat stock? Yes.
213. Without this extension to Euabalong, would any portion of that stock reach Condobolin? Yes.
214. How much? Probably nearly half of it. But assuming the extension to be carried to Euabalong it would earn so much more.
215. If there were no extension £700 of that traffic would reach Condobolin? Yes.
216. The absolutely new portion of the traffic would be represented by £700? Yes.
217. What is the basis of your estimate as to passengers? The whole thing is conjecture. I have estimated the passengers at 2,000 per annum travelling over that section of the line.
218. You said before that at Euabalong there are not more than about ninety people? Yes; but the line would be used by people in the district. It would be used by people from Cudgellico, Hillston, and Mossiel.
219. Do you think you have under-estimated it? No, I think it is a most favourable estimate.
220. Now we come to the mails, for which you have allowed £576;—what does it cost the Postmaster-General at present? I do not know.
221. I suppose it does not cost him anything like that? I should not think so.
222. So that, taking a somewhat close view of the figures, which you now present as to the probable earnings of the line, one may reduce that estimate of £3,700 very considerably? Decidedly. That is to say, as far as possible where new traffic is concerned.
223. Have you made any estimate as to the probable profits that would accrue to the branch to Condobolin and the main line to Sydney by reason of the extension from Condobolin to Euabalong? No; it would be impossible to assess that—there are so many circumstances controlling it.
224. You could not say approximately what it would be? No.
225. Is not that a factor in the consideration of an extension of this kind, the profit that would flow to the main line? Decidedly.
226. Do you think it desirable to endeavour to give some information on the point? It is absolutely impossible. I have already pointed out on one or two occasions how impossible it is to ascertain what the net profit may be over any particular line.
227. Could you not say approximately what profit would accrue to the main line upon the assumption that the extension from Condobolin to Euabalong earns in round figures £3,000? I could not. That is a problem which has been given up by every railway man in the United Kingdom and everywhere else.
228. Assuming that the average expenses would be 55 per cent., the difference would be 45 per cent.? Yes.
229. And upon that basis you could not say even approximately what the additional sum produced by the extension would be? No; I certainly could not.
230. Assuming that your expenses would be 55 per cent., about what additional sum in net earnings would come to the main line by reason of this extension? I could not tell the distance over which the traffic would be hauled. I might give a guess, but I should not like to commit myself to anything that could be taken exception to by any railway man who reads the figures.
231. If you take into consideration the traffic within what you call the competitive area? Yes.
232. Have you made an allowance of 55 per cent.? No; we do not do that. Victoria makes that allowance.
233. You make some allowance? Yes; but our allowance is not anything like that.
234. Have you taken the minimum rate in estimating a return of £3,700? Yes; I have taken a rate which I feel sure that section will absolutely bear.
235. We are to understand that you do not regard this extension as likely to be a profitable one? No, I do not. I think I emphasised that when I gave evidence before. In my report on the Broken Hill line, I said I did not consider that any extension beyond Condobolin would be profitable.

J. Harper.
1 Sept., 1897.

136. Are the Committee to understand that, in your opinion, there can be no extension beyond Condobolin that will be profitable? No Lachlan extension.
237. You say that after mature consideration? Yes.
238. That in your opinion Condobolin should be the terminus of the Lachlan line? Yes, at present.
239. Will you give your reasons? My reasons are that the traffic beyond that would not warrant the construction of the line—that is to say, it would not pay interest on the capital cost and working expenses. I am very doubtful whether it would pay working expenses.
240. Assuming the extension to Hillston, do you think it probable that that line would pay? An extension to Hillston would command a greater trade, but I am not prepared to say that it would pay.
241. The reasons that you gave, when under examination before the Committee upon the question of the extension of the line from Condobolin to Broken Hill for not extending the line beyond Condobolin, are those which you at present entertain? Yes.
242. And you are still strongly of opinion that the line should not be extended to Hillston? Not by that route.
243. I think you have already expressed the opinion that it would be very unprofitable to extend the railway from Temora in the direction of Barmedman and Wyalong? Yes.
244. Have you seen reason to change your views? Wyalong has had some development since then, and I would not like to pronounce an opinion. Wyalong has changed more than any other place in New South Wales. At the time I gave evidence, it was in a state of initiation.
245. *Mr. Hoskins.*] We have evidence that the trade of Temora has not varied much? No; It had reached the maximum at the time I speak of. I think it a good deal in favour of Wyalong, as indicating that it has maintained its level.
246. *Mr. Lee.*] According to your evidence, if the line were at any time extended from Euabalong to Menindie, it must be at an absolute loss? Yes, that was my contention before.
247. You say that no extension beyond Condobolin can pay? Not under existing circumstances.
248. Is that because the trade is not there, or on account of Victorian competition? The trade is not there. It would be satisfactory to us to have the business, and it would bring additional profit to the main line; but our rates would necessarily have to be low to compete.
249. You may depend upon live stock and wool, I presume? Yes, chiefly.
250. But there would be very little agriculture? Yes; there would be copper from Mount Hope.
251. But the bulk of the traffic would be station produce? Yes.
252. Once you get to Euabalong you have entered into the competitive area fixed by the Victorian Railway Commissioners? Yes; we are in the district from which the traffic is drawn.
253. If this line goes to Euabalong, you will have to fight the Victorian Railway Commissioners? Yes; we have to fight them at Condobolin.
254. You will have to fight them still more strongly at Euabalong? We shall be able to fight them still more strongly.
255. You say that at Condobolin they draw their trade from further south and west? Yes.
256. The more you get into the area governed by the Victorian differential rates, the more you will have to fight for the trade? Yes.
257. Consequently you will have to fight them more strongly at Euabalong than at Condobolin? Yes; but with better weapons.
258. What rate have you fixed to Sydney from there to enable you to successfully compete with them? I have no doubt the rate will pay us over those 49 miles. It certainly would not be less than the existing rate from Hay.
259. How does that compare with similar distances on similar lines, say from Narrabri? The Narrabri people pay more, I think.
260. But they are willing to pay for the convenience? Yes.
261. Have you made a rate that will leave a profit to the Department, and still enable you to get that wool from the country, hitherto taken to Victoria? Yes.
262. You are clear on that point? Yes.
263. Suppose the Victorian people are determined to hold that business, and that they still further reduce their rates, what then? I do not think they have any margin for further reduction. When you take 66 per cent. out of it, there is not much margin left.
264. Have you had reason to suppose of late years that there has been any natural diversion of traffic from that district to our railways? Yes; last year, when there was no river, it came this way.
265. Have not other conditions been made of late, such as cheaper rates? No; I do not think they have done very much lately.
266. But when the river conditions are favourable, the Victorian railways continue to get that trade? Yes; they get it at present.
267. What will be about the distance of land carriage to the river? About 120 miles.
268. That would leave an average of about 110 miles of land carriage, taking favourable conditions, roads dry, and river fairly good; what chance would a railway to Euabalong have of getting the traffic if the teams would take it down to the Murray? A very excellent one, for the simple reason that no portion of that traffic which I have estimated is more than 40 miles from the railway.
269. You do not fear anything of that kind, because your estimated traffic is within an area of 40 miles of Euabalong? No.
270. What I want to know is, what will take place under the most favourable circumstances. I know that Victoria will fight for that traffic. Under what conditions could we lose it? I cannot conceive. Such a traffic as I have estimated would come to that line, I am sure.
271. In your opinion, the line should not go beyond Condobolin? No.
272. Is there a tendency to small settlement in that country? Yes; the greater part of the small settlement is north of Condobolin, and in the neighbourhood of Condobolin. There is some in the neighbourhood of Euabalong. I have seen finer crops between Euabalong and Condobolin than at Condobolin. Between Condobolin and Cudgellico, you get into thoroughly good agricultural country. In the neighbourhood of Euabalong there is some splendid agricultural country. Even down as far as Hillston, further west, there is excellent land.
273. But they want a rainfall? They get very good average seasons.

- J. Harper. 274. *Mr. Hoskins.*] Is there any farming about Hillston? Yes; but there is no motive for producing anything but wheat. There is a mill there.
- 1 Sept., 1897. 275. *Mr. Lee.*] If the land in that country west of Euabalong is good enough, and the rainfall is sufficient, why should it not develop in the future? When you get north and west of Euabalong, the country falls off in quality.
276. In your opinion that country will be chiefly used for grazing purposes? Yes, unless there is some development which I do not foresee.
277. As far as you see at present, there is no justification for the extension of the railway beyond Condobolin? No.
278. Is there any other point by which that trade could be diverted to the railway system? Of course it would be possible by a cross country line to pick it up at Hillston. There is a line being surveyed between Koorawatha and Hillston. I should think it ought to show fairly good developments. However, that has not come under the consideration of the Commissioners and I have not been asked to report upon it. It is a matter very much bound up with the question before the Committee now.
279. From all accounts the Grenfell district seems to be attracting large numbers of agriculturists? Yes.
280. It is one of the places in the Colony which is largely developing in wheat production? Yes, more rapidly than any other part of the Colony.
281. The probability is that there will be very large freightage there for the railways? Yes.
282. You have been across the track from Temora to Wyalong and Cudgellico to Hillston? Yes.
283. How does that country compare with the route between Condobolin and Euabalong? It is more suitable for agriculture, generally speaking, assuming that it is cleared. There is a very dense scrub, and much of the land is valueless, but there is a great deal of valuable land.
284. Is there any large proportion of good land? Yes; there is a larger proportion suitable for agriculture in that district than there is north of the line between Condobolin and Euabalong.
285. Is it rabbit-infested country? Yes; some of the land between Euabalong and Wyalong is badly infested.
286. Of course an extension from Temora by Wyalong to Hillston would tap the country on one side of the river? Yes; it would not intersect the country in the same way that this extension would.
287. Have you any idea what is the value of the freight this country loses by the diversion of our trade to the Victorian railways? I do not know. I have seen a document—and I suppose I am not disclosing too much in saying so—which showed that it is estimated by Mr. Mathieson that the gain of Victoria is not more than £80,000 a year.
288. They can get £80,000 a year, and we are going to spend £108,000 to get £2,000 a year? That covers the whole of the Riverina trade. This line would not get all that.
289. If this line were made, it would involve a loss of about £3,280 a year; you do not see any prospect of its paying;—what would have to happen to give an increase of trade that would make it pay? It is possible that there might be developments at Mount Hope. If Mount Hope were to develop anything like Cobar, it would give the line a big impetus; and the country round there will carry a great deal more settlement.
290. You think it possible that when the runs are thrown open increased settlement will take place? I do not think there is much prospect of it without railway communication. The problem has been solved that, unless in an exceptionally favoured district, any distance outside of 30 or 40 miles from a railway is prohibitive as regards the production of grain.

THURSDAY, 2 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL PEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.	FRANCIS AUGUSTUS WRIGHT, Esq.
HENRY CLARKE, Esq.	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

John Harper, Goods Superintendent, Department of Railways, sworn, and further examined:—

- J. Harper. 291. *Mr. Wright.*] You estimated the revenue on the proposed extension at £3,700? Yes.
292. And you estimated that there would be 1,000 tons of wool? Yes.
- 2 Sept., 1897. 293. Have you been through the country in which this line is proposed to be made? Yes.
294. What stations are we likely to get the wool from that we do not get it from now, at Condobolin, Nyngan, or Nevertire? There are Koto, Cowan Downs, Hunthawong, and other places.
295. Hunthawong is a long way from the terminus? Yes.
296. Would it not continue to go to Carrathool instead of to Euabalong? No; I think it would go to Euabalong. The road carriage would be in favour of it.
297. Is it not as good country to travel through as the Gunbar country? I do not know that there is much difference. We may get the wool from Willandra, Yathong, Coombie, Mulga, and Moola. I fancy that all those clips would come to Euabalong.
298. Do you know that the Big Willandra is held in Melbourne? I do not know where it is held.
299. Therefore, other things being equal, the wool from there would tend to the south? No doubt; but our experience is that these big financial institutions are only too anxious to avail themselves of the cheapest means of transit.
300. Something has been said about a proposed deviation crossing the river at Condobolin, and going by the Lake to Hillston? Yes.
301. Would you not be likely by that route to intercept a larger volume of traffic than at Euabalong? Yes, decidedly, but not if taken direct to Cudgellico. I said that if the extension were effected to Cudgellico, only a lot of the traffic which would come on the line would come in at Cudgellico. 302.

302. We were told by Mr. McLachlan that Hillston is the objective point? Yes. J. Harper.
303. Would not a line crossing the river at Condobolin, and going through the Lake district be more effective than the proposed deviation north of the river? If the railway were built to Hillston the traffic I speak of would be secured by the line, whether it was north or south of the river. 2 Sept., 1897.
304. It would be secured beyond all question? Yes.
305. And a lot of traffic which you expect to get by this route? There is a possibility of cultivation, and accompanying it a possibility of carrying more stock if the line were taken from Condobolin to Hillston, *via* Lake Cudgellico.
306. That is in the Central Division? Yes.
307. Where the land is open to conditional purchase? Yes.
308. Whereas the bulk of the land along the proposed line is in the Western Division, and is not open to conditional purchase? No.
309. It naturally follows that if the line were made across the river to Condobolin, and constructed through to Hillston by the Lake, a much larger settlement would be encouraged than would be encouraged by the proposed extension? Yes—that is, as far as the surface of the land is concerned. I should like to mention the possible developments at Mount Hope. It certainly would not be to the advantage of any developments at Mount Hope were the line taken south of the river.
310. The distance from Euabalong to the Lake would not be very far? About 20 miles.
311. So that the Southern line, if constructed, would certainly intercept any traffic that would come from Mount Hope and its neighbourhood? It would pick it up at some point, but I should imagine that, as far as Mount Hope is concerned, in preference to crossing the river, they would make for Condobolin.
312. What is the distance between Mount Hope and Condobolin? I think about 85 miles.
313. So that if a railway were constructed on the southern side of the river, the prospect of increased settlement would be much greater than if a railway were constructed on the northern side of the river, and there would be nothing to prevent you from getting the products that you expect to get from this extension? No, assuming that Hillston is the objective point.
314. Then you would secure by that extension also, not only Coombie and the Hunthawong wool, but the produce of the whole country round? That would be secured by any extension to Hillston, whether it went across the country or any other way.
315. Have you travelled over both the routes? I have not travelled over the survey between Condobolin and Cudgellico, but I have travelled on both sides of the river between Euabalong and Condobolin.
316. Neither side presents great engineering difficulties? No; the country is comparatively level.
317. And the construction would be simple and cheap? Yes.
318. You make a large amount from the carriage of mails? Yes.
319. Is the Postal Department compelled to pay this sum for mails whether they use the railway or not? Yes; that allowance is made, and it always has been included; £12 for every mile.
320. You have referred to this as a national line;—why do you use the word "national"? There are interests outside the railways involved, such as securing the trade for the ports of the country.
321. For that reason you speak of it as a national line? Yes.
322. In your evidence on the proposed railway from Condobolin to Broken Hill, you spoke of it as a national line. I will quote the questions and answers. You were asked this question:
- Will you give us your definition of a national line? I cannot do more than repeat what I have already said.
- In what sense of the word would the line be a national one? I said that I considered that a national line was one the burden of which was borne by the whole community, and not by the users of the railway.
- So that you speak of a line as a national line that will entail a considerable loss in running, which must be borne by the rest of the community? Yes, a line the expense of which is not borne by the users of the railway, but by the whole country.
323. The producers have to pay for the construction of what you call a national line? I should say the general taxpayers.
324. When you apply the term "national" to a particular railway line, you wish the Committee to infer that it is one that will not pay? I should not like to say that. It might be both a paying line and a national one.
325. You describe a national line as one that has to be paid for by the general taxpayers, and which is not supported by the people who use it? Yes.
326. You have already said that in your opinion this line will not pay? Yes.
327. And you do not think that the additional traffic which will be secured by it to the main line will justify its construction? I do not. Personally I do not think that the additional traffic which will be secured by it to the main line would justify its construction.
328. I suppose that you would not like to suggest any alternative? No, I should not care to intrude any suggestion as to the policy of the country.
329. *Mr. Fegan.*] I understood from your evidence yesterday that the line now proposed is one that you could not recommend? No.
330. But by its ultimate extension to Hillston, it would gain a great deal of traffic? Yes.
331. It is with a view to its further extension to Hillston that you recommend this proposed line? No; I do not recommend it at all.
332. Could you tell us whether there are large runs or small runs between Condobolin and Euabalong? They are nearly all large ones. The most dense settlement is in the neighbourhood of Condobolin, to the south and north of it.
333. You have been over this route? Yes.
334. Did you report against it? As far as Euabalong is concerned, whatever evidence I gave on the matter you have before you in connection with the Broken Hill line. I think I was emphatic in my evidence, and I have seen no reason to alter it.
335. By what route would you make the line to Hillston? That is a matter of Ministerial policy.
336. If the line to Euabalong were brought further on would that make it better? No.
337. Is not the greater portion of the country there held by large station-owners with a sparse population? Yes.
338. *Mr. Hassall.*] Taking this line to Condobolin westward, having Hillston as its objective point, the result would be that the traffic lying west and north of Hillston would be practically drafted in there? Yes.

- J. Harper.
2 Sept., 1897.
339. Is Condobolin the best point of connection with Hillston? In the absence of surveys I should not like to express an opinion, because I occupy an official position, and my opinion might run counter to that of the engineers. My personal view is, that a line as suggested by me yesterday from between Murrumburrah and Blayney, intersecting the country and going through the best country, would be a better one than this. It seems to me that better results might be obtained by the construction of a line from Murrumburrah in the direction of Hillston, intersecting the country in the neighbourhood of Grenfell, Wyalong, and so on.
340. *Mr. Hoskins.*] Is it not a very scrubby country? Yes.
341. *Mr. Hassall.*] The country is scrubby, but the soil is good? Yes.
342. In view of the proposed construction of a railway from Coolamon to Ariaah—that is, from the Southern line—do you think it might be possible to extend the line from Temora to Ariaah? I do not.
343. Are the engineering difficulties too great? As a matter of fact, as far as the Coolamon and Ariaah lines are concerned, it lies to the east and west of the stock route. You get into very broken country, and I fancy that there would be engineering difficulties in the way of getting from Temora to Ariaah.
344. You think (that the difficulty of getting through there would be too great? I fancy so. I might point out that the settlement between Coolamon and Ariaah is to the east and west of the proposed line. It is good land.
345. Do you know anything of the country between Ariaah and Hillston? I have not been over it—some of it is very indifferent.
346. In regard to the extension to Condobolin from Parkes, does not that extension practically tap the greater portion of the traffic lying between Condobolin and Menindie? No.
347. Does the traffic come along *via* Mosgiel, and across to Carrathool? Yes; some goes to the Murrumbidgee, and some back on to the Darling.
348. Do you not think that with Hillston as a terminal point the railway would take the whole of the traffic of the west and north-west from there? No; wherever they are south of Hillston they will continue to go on to the Darling or to the Murrumbidgee.
349. Then, what traffic would the extension to Hillston serve? The Mosgiel traffic would come in; but practically, when you get past Ivanhoe, the trend would be towards Menindie and south of Mosgiel down to the Murrumbidgee. A railway to Hillston would prevent its coming in that direction.
350. Then what advantage would be derived by the extension to Hillston? It would secure business which could not be expected to come to the terminus at Euabalong. Other traffic would fall in at Hillston, and there is a possibility of developments in the shape of agriculture about Hillston, which would also mean the carrying of more stock.
351. But it would be of no use extending the line from Condobolin to Euabalong to increase the present traffic? Being so much further west, it would cause a certain traffic which now goes down the river to Victoria to be placed on the railway.
352. But, practically, it would be of no use extending the line from Condobolin to Euabalong unless you extended it further? No; there is this much in it; in the neighbourhood of Euabalong and Cudgellico there would be increased cultivation. The distance from Cudgellico to Euabalong is 20 miles, but that distance does not prohibit wheat production.
353. From your knowledge of the country, do you not think that the country between Hillston and Temora or Wyalong would be very suitable for agriculture if it were cleared? Some of it, and some of it is not.
354. In the vicinity of Hillston is the land not considered good? Yes; on the north, and immediately east of Hillston, the country is good.
355. With a view of making Hillston the objective point, which do you think the better route to follow? I should like to see the line go over the route *via* Koorawatha to Grenfell, from Grenfell to Wyalong, and from Wyalong to Hillston.
356. In the event of the extension of the railway from Condobolin, do you not think it will be better to run it on the south side of the river, *via* Lake Cudgellico, than to go *via* Euabalong and from there to Hillston? That is a point I should scarcely like to speak about; there may be engineering reasons for carrying it on the north side.
357. Is it not a fact that the whole of the country on the northern side of the Lachlan is in the Western Division, and will be locked up for the next twenty years, not being available until 1918? There is a possibility of it producing more than it does at present.
358. Would it not be better to have closer settlement? Under the present system of exchange of land, they might obtain land there suitable for settlement before 1918.
359. But the tenure of the leases in the Western Division will expire in 1918? I should imagine that there are many leasees who would only be too glad to part with some of their land for a small consideration.
360. You do not think much of the country? I do not think much of a lot of it.
361. Do you think there is any prospect of closer settlement, even if the line were constructed and land were available? I think there would be. I have seen some of the best wheat crops that I ever saw anywhere, in the neighbourhood of Euabalong. Whether the inducement would be strong enough to lead to much settlement, I am not able to say.
362. Do you think the extension to Hillston would result in a profit to the Railway Department? I do not think so. I do not think that if the line were extended from Euabalong to Hillston, it would result in a profit to the Department.
363. You think it might be taken from a more profitable point? Yes; it is simply conjecture.
364. *Mr. Roberts.*] Have you got the distance from Barmedman to Hillston, Koorawatha to Grenfell, and Grenfell to Wyalong? I think they are in Mr. Deane's report.
365. How would you view a line from Barmedman to Hillston? I think there would be nothing in it. It would pass through the very worst part of that country.
366. Do you regard it as a wise course to tap the Cudgellico district? I do not think it is essential. That is a very small area.
367. Would it not add to the expense of getting to Hillston? I do not think so. From what the surveyors have told me, I should imagine that when you get south, trying to get a direct line to Hillston, you get into a very broken country.
368. The best way is to keep more to the north? Yes, to the north.
369. Is there much settlement around Lake Cudgellico? Not much. It is an old farming and mining settlement, and both appear to be languishing very much.
- 370.

370. In making your estimate of revenue on the proposed line between Condobolin and Euabalong, have you taken into consideration any of the traffic which you would probably get, that now goes to Melbourne? Yes; that is included.
371. How many tons of wool do you expect to get? A thousand tons altogether.
372. How far west would that come? Within a radius of about 40 miles of Euabalong.
373. Is the route between Euabalong and Condobolin fairly passable in fine weather? It is an average road that you get along the rivers. Part of it is very heavy black soil. There are no improvements on it.
374. Is not that part of the country often flooded? No; it does not flood very much.
375. If this railway were constructed to Euabalong, would the stock traffic be much increased? I think so. Our experience is, that wherever a line is made the stock traffic increases, because the small holders use the line who could not afford to pay for driving long distances.
376. In the Grenfell district is not the land well adapted for the production of wheat? Yes; it is splendid country.
377. Would the yield per acre be larger around Grenfell than at Hillston? In a favourable season it would be as heavy as anywhere in the neighbourhood of Cudgellico and Hillston.
378. What is the yield? I have known them to get 24 bushels to the acre.
379. What would they get at Grenfell? I do not think that they would get any more there. The average is about 14 bushels per acre. The difference is that in the Grenfell district the failures are fewer. Further west you get more frequent failures.
380. How far does the good country round Grenfell extend towards the west? It is more or less good all the way to Wyalong.
381. Is the country between Grenfell and Wyalong better country than that between Temora and Wyalong? Yes.
382. Is it different in character? Yes; it is not so thickly scrubbed as at Temora and Wyalong.
383. It is more suitable for the growth of agricultural products?—
384. Then, is the Committee right in assuming that in order to get to Hillston you prefer going from a point on the Blayney line by way of Grenfell, Wyalong, and Cudgellico? I should like to have that considered.
385. Would your reason be that it would go through a better class of country? Yes; and it would open up more country.
386. *Mr. Hoskins.*] Taking into consideration the difference in the distance between Condobolin and Euabalong, and Condobolin and Hillston, do you think Hillston would be a more profitable terminus for the railway than Euabalong? I do not think the increased cost in interest on the capital, to construct the line between Euabalong and Hillston, and the working expenses, would be compensated for by any traffic that would be secured at Hillston.
387. Is there not a good deal of agricultural settlement at Hillston? No; it is south of Hillston.
388. Euabalong is 15 or 20 miles from Cudgellico? Yes.
389. Is there a great deal of settlement about Lake Cudgellico? There is a small township of a decaying character.
390. Is there no irrigation there? I did not see any.
391. I suppose the country about Cudgellico is very favourable for settlement? Yes; it is good country.
392. Suppose people settled down there, and engaged in agriculture, would not the country between there and Euabalong be difficult for teams to travel over? No.
393. Is Euabalong a small place? Yes; it consists of two public-houses, two stores, and four or five private houses.
394. Then nearly all the traffic that might be expected at either Hillston or Euabalong would be wool, hides, and produce from the stations, and merchandise going to the stations? Yes.
395. Is it not a fact that the country is held in large sheep runs there? Yes.
396. Have you not heard that most of the lessees of those runs are not free agents—that they cannot send the wool where they think proper, but must send it to Melbourne? I think that most of them are not agents, but simply employees.
397. Then they must send the wool to Melbourne? No; that does not follow. Some of the Victorian financial institutions, since they have shifted their head-quarters to Sydney, are not quite so conservative as they were four or five years ago. They are prepared to send their wool where they can get it carried most cheaply.
398. Then we must get some of the wool that used to go to Melbourne, because railway traction is cheaper than ordinary traction? Yes.
399. *Chairman.*] Have you been over the country from Temora to Wyalong? Yes.
400. What do you think of that country? I do not think that it is likely to be occupied for a considerable time.
401. Do you regard it as an area that is likely to have rapid agricultural development if the railway is constructed? No.
402. Have you been at Wyalong recently? Not for three years.
403. Have you any knowledge as to the importance or the stability of Wyalong? No.
404. Have you been from Wyalong to Grenfell? No. I have been from Grenfell to Yeo Yeo, and to Cootamundra.
405. Have you been from Grenfell to Young? Yes.
406. What do you think of that country? A lot of it is very good country, fit for agriculture.
407. Do you know anything about the country in that triangle between Koorawatha, Young, and Grenfell? No; but I know that we get a large amount of traffic from it.
408. What is your opinion of the Grenfell district? I think it is an exceedingly good one.
409. Does it appear reasonable to believe that the Grenfell district will soon become entitled to railway communication? It certainly appears to be making in that direction, because in a district like that, associated with the cultivation of wheat or other cereals, we generally find increased numbers of stock. It appears to be a district deserving of consideration.
410. Is Wyalong a centre which is likely to soon force itself on our notice with regard to railway communication? I think that question has already been answered. It forced itself upon us two or three years ago. I should imagine that the matter will be deserving of consideration again.

J. Harper.
2 Sept., 1897.

- J. Harper. 411. What is your opinion with regard to the capability of the country between Hillston and Cudgellico and lying south towards Gunbar? There is a lot of excellent country there. At Gunbar they have been cultivating wheat and carting it 35 miles.
 2 Sept., 1897. 412. Will the Hillston district soon become entitled to consideration? Yes.
 413. What is the distance from Condobolin to Hillston? About 120 miles.
 414. What is the distance from Young to Grenfell, or Koorawatha to Grenfell? I estimate a line at about 180 miles through to Hillston.
 415. And from Young to Grenfell, or Koorawatha to Grenfell? Thirty-six miles from Young to Grenfell, and I should imagine it would be between 26 and 30 miles from Koorawatha to Grenfell.
 416. How far is it from Temora to Wyalong? About 44 miles.
 417. There is the country lying north of the influence of the Hay line and south of the influence of the Parkes-Condobolin line, and there is the town of Grenfell likely very soon to require consideration; Wyalong stands in a similar position. Hillston also in a similar position. You can approach Hillston from Condobolin in the cheapest way at 120 miles. From Koorawatha to Grenfell is about 30 miles, and from Temora to Wyalong about 44 miles; that would give a total of 194 miles to do the same work as the extensions;—would it be wise to pick up the three stations on one line? Yes. There is more in it than that, because if you had the various lines made, at least two would be competing with one another.
 418. Therefore, the local developments on such lines as Grenfell to Young, Wyalong to Temora, and Hillston to Condobolin would require to be very much greater than the developments on one of the three lines, to justify the construction of the three? Yes.
 419. Looking at the figures without binding one's self absolutely, it would appear that a through line would be the best, not only on paper, but practically? Yes; without committing myself, I must say that it looks as if it would be a better scheme and would serve more country.
 420. Would a straight line right on be a better line to work? Undoubtedly. A short line would involve greater loss in working than a line of greater length.

Percy Scarr, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and examined:—

- P. Scarr. 421. *Chairman.*] On the 26th August, 1896, you were examined on the inquiry into the proposed railway from Condobolin to Broken Hill? Yes.
 2 Sept., 1897. 422. You gave certain evidence? Yes.
 423. That evidence is correct? Yes.
 424. How far to the east is your most easterly road there given? The road from Coolamon to Ariah is the most easterly.
 425. Have you any east from Wyalong? No.
 426. The roads that you previously gave were all lying westerly from Ariah and westerly from Cudgellico, and north-westerly towards Broken Hill? Yes, east of Ariah and north of the Lachlan.

Henry Deane, Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane. 427. *Chairman.*] You were to bring some information for the Committee? I have here some rough estimates. I am sorry that I have not had time to obtain all the information required by the Committee. I sent for Mr. Kennedy, who has come down, as I thought he would be the best officer to give information to the Committee, he having a general knowledge of the district from Temora to Wyalong and across to Hillston. I will put in the following statistics:—

RAILWAY connection with Hillston.

Route.	Length.	Rate per mile.	Estimated cost.	Distance of Hillston from Sydney.	Ruling grade.		Sharpest curve.	Remarks.
					Against.	With.		
Temora to Barmedman	23	2,300	52,900	1/100	1/100	20	Grade approximate, part only being surveyed.
Barmedman to Wyalong	17	2,300	39,100	1/100	1/100	20	
Wyalong to Hillston	118	2,500	295,000	1/100	1/100	10	
Wyalong to Cudgellico	69	2,300	158,700	1/100	1/80	16	
Cudgellico to Hillston	54	2,300	124,200	1/100	1/80	16	
Condobolin to Cudgellico	59	2,300	135,700	1/100	1/100	...	
Koorawatha to Grenfell	29	2,500	72,500	1/75	1/60	10	
Grenfell to Wyalong	53	2,500	145,000	1/75	1/60	10	
Condobolin to Euabalong	48	2,250	108,000	
Euabalong to Hillston via point A	66	easy	
Temora to Hillston via Wyalong and Cudgellico.	163	2,300	374,900	454	1/100	1/80	16	
Temora to Hillston via Wyalong direct.	158	2,500	395,000	449	
Temora to Hillston via Barmedman direct.	145	436	1/60*	1/60*	10	
Koorawatha to Hillston via Wyalong and Cudgellico.	210	2,500	525,000	See remarks.	1/75	1/60	10	
Koorawatha to Hillston via Wyalong direct.	205	2,500	512,500	See remarks.	1/75	1/60	10	Distance, Sydney to Hillston via Blayney, 441 miles. Harden, 432 miles.
Condobolin to Hillston via Cudgellico	113	2,300	259,900	444½	1/100	1/80	16	
Condobolin to Hillston via Euabalong and point A.	114½	2,300	263,350	446	1/100	1/100	20	

* Can be obtained without materially increasing the length of line; 1/100 could be got with 5 or 6 miles extra length.

N.B.—These estimates are approximate only.
 Sydney to Temora 291 miles.
 „ Koorawatha 236 miles via Blayney.
 „ „ 277 „ „ Harden.
 „ Condobolin 331½ „
 Population of Grenfell in 1896 712
 „ Wyalong, 31st December, 1894 ... 4,215

428. *Mr. Wright.*] Has the country been surveyed from Cowra to Grenfell? No. There was an exploration made, but it was stated to be not practicable with good grades.

429. *Chairman.*] What is the grade on the Temora to Cootamundra line? 1 in 75.

430. Have you any other information for the Committee? I have Mr. Jamieson's report on his exploration from Koorawatha to Grenfell and Wyalong. This is what he says with regard to the Cowra connection:—

I first selected Cowra (elevation 987 feet) as my starting point, and examined the country between there and Grenfell; but owing to the difficulties which would be incurred in crossing the Broula range (elevation of gap 1,700 feet) being so formidable, I abandoned the idea of making Cowra the starting point. I next started from Koorawatha, a platform about 18 miles south of Cowra (elevation 1,116 feet), and the route I will briefly describe is, in my opinion, the most suitable not only from an engineering point of view, but one that would best serve the interests of the district generally. A number of suggestions as regards the route have been made to me, thus showing a diversity of opinion in the district as regards the route; but, to my mind, in some instances actuated by personal motives. After making a thorough investigation of the country, keeping in view the shortest, cheapest, and best line to serve the district generally, and one that would divide the country with railway communication between the Forbes to Condobolin and South-western railway, I find the result as follows:—

Then he goes on to give a description of the line to mark the position of it, and the present survey is more or less following on his lines. Then he says:—

The route I propose passes through land very highly improved nearly the whole way. After leaving Koorawatha platform the line passes through Warrangong station (owned by Mr. Suttor, who has at present 3,000 acres under cultivation); thence passing through smaller holdings which are more or less under crop; thence into Mr. Greene's property situated on the south side of Tyagong Creek. He has 10,000 acres under crop, and he informs me that he would still cultivate more largely if the line were built. Also he is prepared to give the land necessary for railway purposes. This means passing through his land for about 8 or 10 miles. On the south side of the Tyagong Creek is Brundab holding, owned by Mr. Wood. He has at present 7,000 acres under crop, and is preparing still more land for cultivation. Mr. Wood is also prepared to be liberal with his land, if required. From Jandra, Mr. Greene's property, right through to Grenfell via Emu Creek is more or less under crop; so that, considering the highly improved country and the light nature of the works that will be required for the construction of the railway, I have no hesitation in strongly recommending that the survey be made. The country for 15 miles west of Grenfell is fairly good, and most of it is suitable for agriculture. From 298 to 311 miles the line passes through what is known as the Bland country, and appears to me to be very soft and boggy in wet seasons. This country is very similar to the Jerilderie plains. Belts of belar and myall are passed through over this length. From Baek Creek, at 311 miles, the timber country is entered again. It consists of pine, belar, and box. From 318 miles to Wyalong the Mallee scrub is entered. The total distance from Koorawatha to Wyalong is 87 miles; from Grenfell to Wyalong 54 miles.

Mr. Burge made a report on the 8th June last, and he makes the following remarks with regard to the line between Grenfell and Wyalong, two routes being shown on the map:—

Both lines pass through apparently equally settled country till the western country, which is largely black soil, is reached. Mr. Lloyd has been instructed to take up the Bimbi line, working from Wyalong. Agriculture is greatly increasing over the eastern half of this line; and though temporarily checked by drought, will no doubt feed this line well. The western half is pastoral.

FRIDAY, 3 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

William McIntyre, Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

431. *Chairman.*] What are you? Chief Electoral Officer, Chief Secretary's Department.

432. What particulars as to population have you brought? I have marked on a sketch map the population of the divisions of electorates, embracing the block of country through which the proposed line passes, 3 Sept., 1897.

433. Have you put Wyalong in? Yes, the Wyalong division.

434. Have you put Grenfell in? Yes.

435. Have you put Temora in? I have not given Temora.

436. Will you tell us what you have got? I have given the population of three municipalities. Condobolin has 855, Hillston 750, Grenfell 720. Those are small areas around those towns.

437. Temora—you have not got it? No, but I could furnish Temora.* Condobolin division has 1,505; Kiacatoo division, 130; Euabalong division, 295; Cudgellico division, 750; Hillston division, 1,330; Euglo division, which is south of Condobolin, 1,068; Barmedman division, which includes the town of Wyalong, 6,735; Marsden division, which includes Bimbi, one of the towns affected by this proposal, 1,338; Grenfell division, including the municipality of Grenfell, which I have already given, 5,142.

438. We want to know the population between Koorawatha and Grenfell? I include a great part of that population in the division of Grenfell.

George Hulton Smyth King, Clerk-in-Charge, Information Bureau and Map Sales Branch, Department of Lands, sworn, and examined:—

439. *Chairman.*] What are you? Clerk-in-Charge of the Information Bureau and Map Sales Branch, G. H. S. King, Department of Lands.

440. You have seen the evidence given by the officer holding your position previously? Yes; the evidence of Mr. Burt. 3 Sept., 1897.

441. Is that evidence correct? It is.

442.

* NOTE (on revision):—There is a population of 1,800 souls within the municipality of Temora, an area of 9 square miles surrounding that town.

G.H.S. King. 442. Will you adopt that evidence as part of your own? I will. It is as follows:—

3 Sept., 1897.

James Burt, Esq., Draftsman-in-Charge, Information Bureau, Department of Lands, sworn, and examined:—

(24. *Mr. Hassall.*) You know the proposal under the consideration of the Committee? Yes.
 625. Have you a description of the country through which the line will pass? We have no detailed description, but I can give you information as to the holdings in that district, and the rentals which the Crown receives from the land there:— Starting from Condobolin the line passes principally through alienated and reserved lands (the alienated lands being almost wholly conditional purchases and conditional leases) for a distance of about 20 miles. Thence to Euabalong, half the distance through alienated lands, and half through leased areas. From Euabalong to the Willandra Billabong, through resumed and leasehold areas, apparently intersecting a few portions of alienated land. From Willandra Billabong to Broken Hill through resumed and leasehold areas, intersecting small isolated portions of alienated lands. From Condobolin, going westward, the line apparently passes through the following pastoral holdings:—

R.A. Condobolin—£2 14s. per section; 640 acres.	L.A. Willandra—1½d. per acre.
L.A. Mowabla—½d. per acre; terminates 10 July, 1900.	L.A. Moulbong—1½d. per acre; terminates 1918.
R.A. Kiacatoo—Forfeited.	R.A. Boondarra—£2 2s. 8d. per section.
L.A. Do —1½d. per acre; terminates 10 July, 1900.	L.A. Do —½d. per acre; terminates 1918.
R.A. Booberoi—17s. 9d. per section.	R.A. Mossiel—£2 2s. 8d. per section.
L.A. Do —½d. per acre; terminates 1918.	L.A. Do —1½d. per acre; terminates 1918.
L.A. Euabalong—1d. per acre; terminates 1918.	R.A. Clare—12s. 3½d. per section.
L.A. Eribenderry—1½d. per acre; terminates 1918.	L.A. Do —1½d. per acre; terminates 1918.
R.A. Murrin—Forfeited.	R.A. Kilfera—6s. 4½d. per section.
L.A. Do —½d. per acre; terminates 1918.	L.A. Do —½d. per acre; terminates 1918.
R.A. Gunninguldrrie—3s. per section.	R.A. Manfred—14s. 4½d. per section.
L.A. Do —4s. 10d. per acre; terminates 1918.	L.A. Do —½d. per acre; terminates 1918.
R.A. Uranaway—Not renewed.	L.A. Albermarle—½d. per acre; terminates 1918.
L.A. Do —½d. per acre; 1918.	L.A. Moorara—½d. per acre; terminates 1918.
R.A. Rota—Forfeited.	L.A. Tolarno—½d. per acre; terminates 1918.
L.A. Do —½d. per acre.	L.A. Kincheega—½d. per acre; terminates 1918.
R.A. Wallandra—£2 13s. 4d. per section.	R.A. Do —£1 12s. per section.
L.A. Do —1½d. per acre; 1918.	R.A. Mount Gipps—16s. per section.

626. Where does the proposed line cross the boundary of the Central and Western Divisions? About 30½ miles from Condobolin. That boundary then follows the Lachlan River on its north side until you get to the Murray. The leaseholds in the Western Division all terminate about 1918, and the Minister has only power to resume land which is within 10 miles of a town containing fifty inhabitants.

627. Is half the land along the route of the proposed line available for settlement? No; the line passes through leasehold areas nearly the whole way.

628. What about the proposed deviation via Cudgellico and Hillston? The same remark would almost apply to that line; but the land between Condobolin and Cudgellico, which has not been alienated, is generally of a rather inferior character. It has been offered on improvement lease, but only one or two leases have been taken. It would be good agricultural land if it were cleared, and if the rainfall could be depended upon.

629. Would the deviation pass through as much alienated land as the more northerly route? Yes.

630. Then the land on the southern side of the river must be as good as that on the northern side? Yes, to judge from that circumstance.

631. Is the land on the Lachlan and the Willandra Billabong pretty good right through? I cannot say from personal knowledge; but inasmuch as every acre on the Lachlan River is held under lease, I suppose that it is. As you get out towards Broken Hill there is not quite so much land held under lease.

632. Judging from the rentals paid, the land held under pastoral lease and occupation license is of inferior quality? Yes; only two or three of the leaseholds have been reappraised, and they have been reduced to the rentals I have quoted—forty-two hundredths of a penny and thirty-three hundredths of a penny. The highest rent paid is for Eribenderry, where the rent is one and nine-tenths of a penny per acre. That is just beyond Euabalong. The country has a frontage to the Lachlan, and another frontage to the Willandra Billabong.

633. As you go further west the rentals decrease? Yes.

634. Is the land suitable for other than pastoral occupation? I could not say definitely.

635. What is the rainfall? At Broken Hill it is 9 or 10 inches per annum, and near Condobolin it is about 20 inches per annum.

636. Except on the Lachlan and on the Willandra Billabong, the line passes through what is practically dry country? Yes.

637. So that artificial water supplies will have to be obtained? Yes.

638. *Mr. Lee.* Is there much small settlement in this district? Not that I am aware of. In the western district the small settlement takes the form of homestead leases. I have a map showing the Forbes Land Board District, in which Condobolin is situated, and also a map showing that part of the Western Division through which the line will pass.

639. What are the reserves shown on the first map? They are water reserves, travelling stock reserves, and forest reserves.

640. About one-third of the land seems to be reserved? About 25 per cent. of it.

641. Are there as many reserves in the Western Division? No. Those in the Western Division are nearly all for travelling stock routes, or to provide access to water.

642. There are no large reserves which could be thrown open to allow of small settlement? No.

643. Would not the proposed line go through some portion of the resumed areas? Only to a limited extent. From 10 miles beyond Euabalong to the Willandra Billabong the line would pass through resumed areas for about 16 miles. I have made no distinction between homestead leases and pastoral leases—they both run for about the same period.

644. Then there may be a large number of homestead leases which are not indicated on the map? Yes; there are some homestead leases.

645. Are they held by the original lessees? I think the tendency has been for them to revert to the original holders.

646. Is the country suitable for small settlers? I have no personal knowledge of it, but I should not think so.

647. A great deal of the country is infested with rabbits? I believe so.

648. Are there many applications for reserves for villages or townships? I am not aware of any.

649. Where artesian bores have been put down, has there been any desire for small settlement? The only place I know of is Pera.

650. There are no improvement conditions connected with leases in the Western Division? No.

651. Do these leases stand in the names of the original lessees, or in the name of various banking institutions? I cannot say, but the information could be readily obtained.

652. Is any of the land dropping back into the hands of the Department? In the list which I read to the Committee there are only three resumed areas which have been forfeited.

653. Has that land been taken up again? No.

654. This land, although leased, is still Crown land, so that no compensation would have to be paid for it if it were required for railway purposes? No.

655. *Chairman.* What about the land through which the proposed deviation will pass? The land from Condobolin to the boundary of the Western Division is nearly all alienated, and from there to Lake Cudgellico about one-third of it has been alienated. The rest of it is comprised within leasehold and resumed areas.

656. When will the leased land revert to the Crown? In 1918.

443. What country is affected by the statement made by Mr. Burt on the 12th August, 1896? It appears to embrace country some short distance south from Condobolin, and follows apparently parallel with the dotted line on the map, some of it going from Condobolin towards Menindie.

444. What information do you bring to the Committee? I can inform the Committee how the land is held north from the Lachlan, pretty well as far as Mount Hope. On the southern side I can show the

Committee

Committee how most of the land is held from Condobolin and from Lake Cudgellico to Hillston, from Hillston to Wyalong, from Wyalong to Grenfell, from Grenfell to Koorawatha, and all the country lying between those three mentioned places and the Lachlan, and also some of the land to the south. But my investigations have not led me as far as Temora; I will furnish that subsequently. I might mention, with regard to the settlement leases in the Condobolin and Hillston land districts, that as far as I can ascertain in the Hillston land district, an area of 76,500 acres has been put up, and we have had applications for 14,400 acres out of that. With regard to the classified areas in the Condobolin district, we have made available 159,600 acres, and out of that 98,200 acres have been selected.

G. H. S. King.
3 Sept., 1897.

445. What is the total area on the south side of the river Lachlan in the Condobolin and Hillston land districts? I will look into the matter, and say as closely as I can the amount of Crown land which is likely to be affected by any railway going west from Koorawatha towards Hillston.

446. Where does the broad red band on the map, shown as the line from Condobolin to Euabalong, enter the western district? Some distance up the Lachlan from Euabalong, at a place which, I think, is locally known as Tugong.

447. How is that land held? The land in the Western Division on the north side of the Lachlan is held under pastoral lease and occupation license.

448. How long are the leases for? The leases in the Western Division expire about 1918.

449. And the occupation licenses? They are yearly licenses.

450. And can be made available at any time? They can.

451. What proportion of the land in the vicinity that we are speaking of now down the Lachlan to Tugong is under occupation license, and how much is under ordinary lease, expiring in 1918 up past Euabalong? Past Euabalong a very small proportion is under occupation license. The greater portion of the land fronting the river is under pastoral lease. Approximately about one-fourth of the area is under license.

452. Approximately one-fourth of the area is available, but the rest is under leases that expire in 1918? Yes.

453. What are the powers of the Government in regard to leases which expire in 1918;—can they take back any of the land? They have power to withdraw one-eighth within 10 miles of any town containing fifty inhabitants; but that practically confers very little power, because the land is nearly all purchased near the township.

454. Virtually, therefore, the leases have to run right out? Yes. We have a great deal of land of a very inferior character about Mount Hope, and generally to the south and west of Euabalong. We have a very large area of unoccupied land at the present time. We have not been able to place that under any form of profitable occupation. It is rabbit-infested, mallee country. The greater portion of that country is tenantless, so to speak.

455. *Mr. Trickett.*] You see the projected line shown on the map from Condobolin to Euabalong on the north side of the river;—what is the character of the country along that route; is it not inferior? It is, more especially where the Western Division crosses it. It is not first-class land once you leave Condobolin.

456. Is it land which has been sought for for purposes of settlement at all? No, not to my knowledge.

457. Has it been offered for sale on improvement lease? Not anywhere close to the line; a little further back from the river it has been.

458. Has it been a success? I think there are one or two leases taken up.

459. I suppose a large amount of that land is available, though only one or two leases have been taken up? Yes.

460. You could not speak of it as agricultural land? No.

461. I suppose that the dryness and want of rainfall are greatly against it? Yes.

462. Some of the land closer to the river is better, and nearer to Condobolin;—on the other side you have better land? Yes; as, for instance, Burrawang Run, where a large area was offered the other day, and all sold.

463. That is between Parkes and Condobolin? Yes.

464. Between Parkes and Condobolin that portion of the Burrawang run is good land? Yes.

465. When you get more to the west you get on to the dry, bad country? Yes.

Thomas Kennedy, Surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

466. *Chairman.*] You are a surveyor in the Railway Construction Branch? Yes.

467. Tell us what you know of the country through which this line is to pass? I explored from Temora to Barmedman, from Barmedman to Hillston, from Hillston up to Cudgellico, and from Cudgellico round to Wyalong, and back again to Barmedman.

T. Kennedy.
3 Sept., 1897.

468. *Mr. Trickett.*] You have not surveyed the line from Condobolin to Euabalong? No; I have been about 6 miles out there, that is all.

469. You know the country from Parkes to Condobolin? Yes.

470. Sometime ago you made two explorations from Barmedman to Hillston, and from Barmedman to Wyalong, thence to Cudgellico and Hillston? Yes.

471. We will first take the line from Barmedman to Hillston;—will you describe the country along the line of route starting from Barmedman? Starting from Barmedman it is not what you would call a flat country line. There is a high hill at the first range, which has to be crossed.

472. Would it want a cutting? Yes; there are five ranges like that to be crossed on that line. It is not a particularly easy line to construct.

473. Would this be a deep cutting or a tunnel? Nothing more than a cutting of 15 or 20 feet. There would not be any tunnel.

474. These occur at intervals along the line? Yes.

475. Are there any creeks to be crossed? No. On the whole line there is hardly anything to call a creek. You are running pretty nearly on the top of the Dividing Range, between the Murrumbidgee and the Lachlan, and there are hardly any water-courses to cross.

476. Did you ascertain what would be about the ruling grade on the line? The survey was laid down as 1 in 50 in my report. I suggested amendments on that to reduce it to 1 in 100.

- T. Kennedy. 477. Then it is a line which is capable of being reduced to a grade of 1 in 100? Yes; but it will not be a light line at that.
- 3 Sept., 1897. 478. It will be more expensive than a line from Parkes to Condobolin? Yes.
479. Do you remember what was suggested as the amount that it would cost? No. We can only speak as to grades; we have very little to do with estimates.
480. Could you give us any idea as to what it would cost per mile? It would be very hard to do that without any survey. It would cost a considerable amount in earthworks.
481. Would the natural formation be sufficient there for forming a line? Yes; it is all good soil. It is only in between the ranges that the line would be forming. It is only at the ranges that cuttings would occur.
482. What is the character of the country between those two places? It is all splendid country; mostly pine country.
483. Red soil? Yes. About half-way I used to see a couple of hundred acres with only a couple of pine trees on it.
484. Is it perfectly suitable for agriculture? Yes; nearly the whole of it, except just round the ranges; that is gravelly.
485. How would it be off for water? About half-way they have an underground supply. They were pumping it up to the station. The water was never known to fail. It is rather brackish, but they use it.
486. Settlers would have to provide tanks or wells? Yes.
487. Did you see any cultivation along the route? Except at Barmedman, I do not think there are any settlers along the line. It is all leasehold.
488. On the other line, from Barmedman to Wyalong, and Wyalong to Cudgellico, what is the land like? It is a much better class of country there. It is more settled down to Humbug Creek, which commences near Wyalong, and runs down to the Lachlan. All down there it is good soil, and it is pretty well settled, and, again, just under the hills there is a still better class of soil.
489. Are there wheat crops? I saw wheat crops half-way between Wyalong and Cudgellico.
490. The rest of the country is occupied by graziers? Yes.
491. As regards water supply along that line of route, would it be the same as from Barmedman? Yes; there is only a dry creek.
492. In what respect is the soil better than on the other route,—is the country less scrubby? There are fewer ranges. You get the myall plains and the black country, which is good. You only get a light soil on the line from Barmedman to Hillston.
493. On the route from Wyalong to Cudgellico, just about Humbug Creek, there is a range of hills? Yes.
494. How would it do instead of going on to Lake Cudgellico, if you turned off to the left, and went from there to Hillston, Hillston being the objective point? I do not know the exact country, but I should say that there would not be much difficulty in getting a line to compare with this line.
495. You have not made a survey of it, but take it as it looks on the map? I should say that it is feasible to go that way.
496. It seems a more direct route than going to Cudgellico and then to Hillston? Yes.
497. In your investigations in that part of the country, did you not ascertain that Hillston seems to be a desirable point to be reached by railway? Yes.
498. And with that view you made these two distinct surveys to Hillston? Yes.
499. What was the object then of going up to Lake Cudgellico first from Wyalong—it seems such a very round-about route? That was an alternative proposal to go round by Lake Cudgellico—the country being much easier. The route from Wyalong to Cudgellico and Hillston has been surveyed, and they have got a grade of 1 in 100.
500. You said that the line from Barmedman to Hillston could not be regarded as a light line. Would a line from Wyalong to Cudgellico and Hillston be so regarded? Yes, that could be constructed as a cheap line.
501. Then it is owing not to the different formation of the soil but the absence of those five or six ranges that intervene between Barmedman and Hillston? Yes.
502. I suppose that between Cudgellico and Hillston you pretty well traverse the river bank? You have to do that to get round the point where the Willantra weir is,—where the Billabong runs in. There is a high range which comes right down on to the river. You get round the end, then a direct line is taken on to Hillston.
503. Do you remember, when you sent in your report, whether you reported that one line was preferable to the other? I reported that the Cudgellico line was preferable to the other.
504. That is from an engineering point of view? Yes.
505. Do you remember any special portion of the line that would be more expensive than other parts? At this range, about half way between Wyalong and Cudgellico, there is one difficult point, but I believe it has been overcome.
506. *Mr. Wright.*] At the Dundoo Hills? Close to there.
507. *Mr. Trickett.*] What would be the difficulty there? A rise (getting over the water-shed) from Humbug Creek.
508. How would you get a grade of 1 in 100 there? They get 1 in 100 with the survey skirting the hills. Then just out of Cudgellico, towards Hillston 6 or 7 miles, another range is crossed. But 1 in 100 was got there with a very slight cutting.
509. Would there be any extensive creek to cross? Between Cudgellico and the Willantra weir there is Mountain Creek carrying a good deal of water, but it is dry except at flood time. It is between Willandra and Cudgellico.
510. Do you remember whether an estimate was made of the probable cost of these two lines? I could not say. Of a line from Wyalong to Cudgellico and Hillston, I do not think an estimate has been made. At the Gap, near Hillston, there is a better class of country than the first portion of the direct line from Barmedman to Hillston.
511. Is it a character of country, which with railway communication, you think would be likely to be occupied by settlers? Yes, it would all be taken up for agricultural purposes. At nearly all those places I saw cultivation. The squatters had out-stations, and I saw wheat grown of a very good quality.

512. Do you know the country to the east of Wyalong towards Grenfell? No, I have not been over that country at all. T. Kennedy.
513. Or Young? No. 3 Sept., 1897.
514. Do you know the class of country between Parkes and Condobolin? Yes.
515. How does that country compare with the country between Wyalong, and Cudgellico, and Hillston? It would be about the same class of country as that between Parkes, and Bogan Gate, and Trundle.
516. The Trundle country is a fine class of country for agricultural purposes? Yes.
517. Was it not your observation that, round to Lake Cudgellico, settlement had retrograded rather than advanced? Yes, that was on account of the rabbits. But for all that there is a good deal of land that could be cultivated and irrigated from the arms of the Lake. All that land is thickly infested with rabbits. They would hardly get out of the way of the trap when we were driving along.
518. Then I understand that you look upon either of these routes as very fair, but that the easier one along which to construct a line would be the one *via* Wyalong, and Cudgellico to Hillston? Yes. It has proved easier from the survey. We have surveys of each of the lines. The cost could be estimated.
519. If we were to ask Mr. Deane could he get an estimate made of the probable cost of these two lines? He has the information.
520. You recommended the northern line *via* Lake Cudgellico because it was easier of construction? Yes.
521. And you think that along both routes agricultural settlement would take place if the railway were constructed, but you believe that the land on the northern route *via* Cudgellico is the better class of country? Yes, it is.
522. Could you give any rough idea of the distance of the two routes from Barmedman, Wyalong, Cudgellico, and Hillston? No, I could not state exactly from memory. From Barmedman to Hillston is about 150 miles; from Barmedman *via* Cudgellico to Hillston is about 165 miles; it is 15 miles longer.
523. Is that all? Yes, that is as the surveys stand at present. If the line from Barmedman to Hillston was worked up to a grade of 1 in 100, it would increase the length by about 5 miles, so that the actual difference would only be about 12 or 13 miles.
524. *Mr. Wright.*] Are you satisfied that there are sufficient waterways left on the line between Bogan Gate and Condobolin? Yes.
525. Have you had any heavy rains since you have been there? Yes, and in no case has the water been over the line.
526. What has been the greatest rainfall? Three inches.
527. And the line was not covered then? No; it was not covered anywhere, and the openings were not complete. If proper waterways had been in, the water would have drained off much better.
528. You are not ballasting it at all? No.
529. I have a local paper, in which it is stated that the first time they have 3 inches of rain a great deal of the line would disappear? Well, we have had 3 inches of rain, and nothing has happened, except in a few places where the line was a little soft. The water came right up to the bank; but that has been remedied.
530. The surface has been raised? No; it did not interfere with the surface at all.
531. You are satisfied from your knowledge that the line will be all that is required in wet weather? Of course, in very heavy rains the line is bound to be a little soft in places, but nothing to interfere with the traffic.
532. Will the line be submerged? Never.
533. You think that the water-ways and the drainage provided will be sufficient to prevent that? I think it is ample.
534. You surveyed that line, from Wyalong to Hillston, *via* the Lake? I explored it.
535. That is the only exploration which has been made? It has been surveyed since.
536. Has a good grade been obtained? A grade of 1 in 100.
537. What kind of country is it 10 or 15 miles west of Wyalong? Close to Wyalong it is stony.
538. For many miles? For 3 or 4 miles. Then you get on to the fall to the Humbug Creek, where the country begins to improve.
539. Then you get into the blackwattle scrub? Into belar, pine, and myall country.
540. Is it all good as far as the Dundoo Hills? Yes; all the land is good from 4 miles from Wyalong to Cudgellico.
541. The lower line you have not explored? Yes; I have from Barmedman to Hillston.
542. Along there there is little good land until you get to Hillston? Seven or 8 miles from Barmedman it is not good, but from there it is splendid land right through.
543. By the southern route? Yes; but it is cut up more on account of the ranges going through it. There is not the extent of it that there is on the northern route.
544. All those spurs of the scrubby mountains are poor land? It is not good for agriculture.
545. *Mr. Clarke.*] Are you well acquainted with the line from Condobolin to Euabalong? I have not been over that line.
546. You do not know the nature of the country so well as the nature of that which you have been describing? I have not been over it; it must be an easy line to construct on account of going down the river.
547. The country you have just described is all more or less good agricultural country? Yes. It is all what is known as pine forest country—good wheat land.
548. And it is country, I suppose, in which the construction of a line would not be very expensive? No. Of course a line to Wyalong, Barmedman, Cudgellico, and Hillston, would not be a very expensive one; it would be a light line.
549. I suppose there is no cultivation going on there at present? Only small patches just round about the homesteads.
550. Simply because there is no means of communication with a market? Yes.
551. Then you consider that a railway would be advisable along whichever route is found most suitable? I think the land would be taken up and cultivated if there was a railway there.
552. I suppose that the land at the present time is in the hands of the lessees? Yes; the greater portion of it.
553. If it were thrown open you think it would be readily taken up? I think it would.
554. I think you said that the rainfall was a fair one? I have no information about the rainfall.

- T. Kennedy. 555. *Mr. Roberts.*] Have you ever been to Mount Hope? No; I have not been further west than Hillston.
- 3 Sept., 1897. 556. Then you cannot give us information about the mining reserves of that district? No.
557. You have never been to the northern side of the Lachlan? Not west of Condobolin.
558. Do you care to express an opinion as to the proposed line, or whether it would be better to reach Hillston by some other route than the one proposed? I could not say.
559. *Chairman.*] What is your opinion of a line from Temora to Wyalong with regard to agricultural settlement? The land between Temora and Barmedman is all good agricultural land.
560. And from Barmedman to Wyalong? Yes, with the exception of a few miles close to Wyalong.
561. You consider that from Temora to Wyalong is a fairly good area of land? I do; it is box and pine country.
562. You notice that there is an area coloured blue on the map showing south from Forbes to Condobolin, then coming round to Hillston, and embracing land towards Wyalong and Grenfell, a great deal of which land, although broken in places, appears to be suitable for the growth of cereals—from your knowledge of the country does that appear to be fairly accurate? From my knowledge of it, west of Wyalong, it does.
563. You know nothing of the area from Gunbar down to Carrathool? No.
564. You think Cudgellico a pretty good district? Yes.
565. If you could get through that gap, and could go west direct to Hillston, it would be the best thing to do? Yes.
566. But you say that you can work down on to the line shown as the direct line from Barmedman to Hillston? Yes, that line has been picked out as the best way to get through the country.
567. Do you think it would not have been possible instead of coming south to go north? I could not say.

TUESDAY, 7 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY. The Hon. JAMES HOSKINS. The Hon. CHARLES JAMES ROBERTS, C.M.G. The Hon. WILLIAM JOSEPH TRICKETT. The Hon. DANIEL O'CONNOR. HENRY CLARKE, Esq.		CHARLES ALFRED LEE, Esq. JOHN LIONEL FEGAN, Esq. THOMAS HENRY HASSALL, Esq. GEORGE BLACK, Esq. FRANCIS AUGUSTUS WRIGHT, Esq. FRANK FARNELL, Esq.
--	--	---

The Committee further considered the proposed Railway from Condobolin to Euabalong.

George Henry Greene, Esq., M.P., sworn, and examined:—

- G. H. Greene, Esq., M.P. 568. *Chairman.*] You are the Representative of Grenfell in the Legislative Assembly? I am.
- 7 Sept., 1897. 569. *Mr. Clarke.*] Have you any statement to make? I have no statement in writing, but I should be very happy to answer any question which may be put to me.
570. You do not wish to make any statement of your views except in answer to questions? I am hardly prepared to make a statement until I know the exact point which has to be illustrated. At present I really do not know what is before the Committee.
571. It is the consideration of the proposed line of railway from Condobolin to Euabalong, as marked on the plan? Yes; I know the locality.
572. You have been long resident in that neighbourhood? Yes; for nearly twenty years.
573. Have you a good knowledge of the country? Yes.
574. What is your opinion of the proposal to carry that railway from Condobolin to Euabalong? I am decidedly unfavourable to the carrying of that line from Condobolin to Euabalong, because I think there is a very much better line which is being surveyed now which would answer all possible purposes better than the prolongation of the line from Condobolin to Euabalong, and which would open up an altogether fresh field of rich agricultural land, and would be the easiest and shortest way of reaching Hillston, which I conceive to be about the most westerly point at which cultivation could be profitably carried on.
575. Would you describe to the Committee the route which you approve of? The route which I approve of is that starting from the Harden and Blayney line, leaving at Koorawatha, and proceeding thence westerly to Grenfell, from Grenfell on to Wyalong, and from Wyalong to Hillston.
576. That line would not touch Temora, would it? No.
577. Is the country to which you refer thickly settled? A portion of it is thickly settled, and on the rest the population is increasing very rapidly.
578. You say the line should commence at Koorawatha? Yes.
579. What would be your next section? You wish me to describe the line from Koorawatha to Grenfell?
580. Yes? It passes through what I consider the best wheat-growing country in New South Wales, or what is equal to the best. The whole way from Koorawatha to Grenfell the country has been making most enormous strides in the way of acquiring a larger population, and an enormous extent of improvement in the way of clearing for cultivation. Where there were only, we will say, ten men employed five years ago, there is work now found on properties which are being transformed into huge farms for at least 100 men. The work has been increased, I say without fear of contradiction, over tenfold, and the production has increased at an even greater ratio.
581. Have you any statistics? I can only give the statistics of three properties which are almost adjoining. The others would be so very numerous and in such small areas that it would take time to compile the statistics in respect to them, but those statistics can be very easily furnished.
582. You might furnish the Committee with those statistics at a future time? I should be happy to do that. I believe that they are at this moment in readiness, but they are not in my possession.
583. Are those farms worked on shares, or how? On the large properties they are nearly all worked on the share system. The owner of the property clears the land thoroughly, does what fencing is necessary, assists

assists the farmer pecuniarily in many ways, and in getting machinery, and then the produce is equally divided in the field. G. H. Greene,
Esq., M.P.

584. *Mr. Hoskins.*] Where do they sell the wheat? It has been nearly all sold locally, at Young, Bathurst, and Goulburn, but chiefly in Young. 7 Sept., 1897.

585. *Mr. Clarke.*] The farmers have to cart the wheat a considerable distance to the railway station? Yes; that is the great difficulty we are labouring under. We can only cultivate within a certain distance of the railway, otherwise the waggon carriage kills the profit.

586. If there were railway communication to any point near the land, is it likely that in the course of time that land would be cut up into smaller farms and sold to settlers? It is certain that it would be so—in fact, I should be prepared myself to part with a large amount, more than half of my holding, to the men who are at present cultivating it.

587. Would that be the case with other properties which are now under the share system? I have not the least doubt that that is the course which would be adopted.

588. Then the land if sold in that way would conduce to larger settlement and increase the population? Certainly.

589. The great drawback is want of communication by railway? Yes; that limits and is the only limit to the production of wheat and other cereals in that district.

590. Is the rainfall sufficient in ordinary seasons for carrying on farming? I think it is quite so. Our average rainfall is about 28 inches—that is taken from observations extending over from twenty-one to twenty-five years.

591. I presume that there are times when, as in other parts of the colonies, there is dry weather in that district, and a failure of the crops? Yes, we have had droughts; but we certainly suffer much less than they do further out west and north.

592. Would there be any other description of produce, such as wool, that would come to the railway as you have described there? A very large amount of traffic would be given to the railway, chiefly in fat stock and crossbred lambs. I myself sold every crossbred lamb I had last year, and sent them to Sydney, with very good results. I am prepared to state that there is scarcely an assignable limit to the work that I could carry on profitably on my own estate, if we had railway communication close enough. On different occasions statements have been made to Ministers with regard to what probably would be done in the district in the way of enlarging farming operations, improvements, and clearing, and I have now to say that those promises have not only been fulfilled, but a great deal more has been done in that direction than even those who made the promises ever contemplated, and that a greater impetus was given to this work by the Minister for Works last year, at Grenfell, when he promised to submit the Koorawatha-Grenfell line to Parliament. Thousands of acres have been cleared since.

593. But the Minister has not done so up to the present? The trial survey is not complete, but on the faith of that promise we are working, and hundreds of men can be seen now at work in all the operations attendant upon clearing. Of course farming is practically all over for this season, and the crops are all in, but there is a very large amount of clearing being done in every place which is within reach of the railway.

594. Do you know the nature of the country from Condobolin to Euabalong, both north and south of the proposed line? I know it in the way in which people used to know it before they looked so closely into the value of the land for agricultural purposes, and, to my mind, it is in every respect inferior, both as regards rainfall and being subject to severe periodical droughts, when nearly all the stock are lost. I can see nothing to warrant the construction of a line from Condobolin to Euabalong.

595. The chief articles to be shipped there would be wool? Yes, and, I should think, very little else.

596. The railway will soon be completed to Condobolin, and if there is any land fit for agricultural purposes in that district, would not the produce go to Condobolin? Yes, within any reasonable distance which it would pay the farmers to cart. Condobolin terminus would suit them fairly well. But I think that when you get 10 or 12 miles beyond Condobolin the rest of the country, with the exception of small frontages, would be very poor land for cultivation. I do not think that farmers could make a living out of it.

597. The Railway Commissioners say there would be a loss on the line of something like £3,800 a year;—do you think there would be any probability of that loss being reduced if the extension were carried out? I do not think it would be remunerative or pay working expenses for a large number of years.

598. Then the only justification for making this line would be to take it towards Broken Hill? Yes; that is the only object which I can see—viz., going out west.

599. You are of opinion that the proposed line would not pay? I am sure it would not.

600. And that it would not be as suitable for the general public as the line which you have sketched out in your evidence? I think not. I think that line would pass through infinitely better agricultural land.

601. *Mr. Lee.*] Would you be good enough to tell us about the locality of the suitable land for wheat-growing, starting (say) from Koorawatha, on the track that you have indicated? The whole of that land is good, and it could be seen by anyone who takes the trouble to ride over the route.

602. You are of opinion that the greater part of it is suitable for wheat-growing? Ninety-nine one-hundredths of it is. There is none of it unsuitable, except, possibly, some small stony spurs.

603. Is there any Crown land there? I do not think there is any Crown land between Koorawatha and Grenfell, except possibly some small reserves. Of late years all the Crown land has been alienated to small holders who are on their land, and who are prepared to clear it and go in for farming as soon as a railway is brought within such a distance that they can convey their produce to it.

604. What is the mileage from Koorawatha to Grenfell? I think it is about 34 miles by the line as surveyed.

605. What are the prospects of agriculture round about Grenfell? Immediately about Grenfell the country is a little bit rugged, but on the eastern side the agricultural country is sufficiently close to Grenfell on the route between Koorawatha and Grenfell.

606. Will you describe the country towards Wyalong? The line leaving Grenfell would pass over one barren spur, and that is the only barren place that it would pass over, and having passed that, which can be negotiated at a grade of 1 in 75, all the rest of the land to the Bland plains is held by farmers, a well-to-do class of men who are living on their own land. The whole of the land on the north side of the Weddin Mountain is suitable for cultivation.

- G. H. Greene, Esq., M.P.
7 Sept., 1897.
607. Do farmers from Bland Creek cultivate wheat? The Bland plains I do not consider would be suitable for cultivation, but they are amongst our richest pastoral lands, and interspersed with it are considerable areas of timber land which are fit for cultivation. You can lay down, as a rule, that timber land is fit for cultivation.
608. As you approach Wyalong you get into the mallee country? Yes. I have seen mallee land which I consider of an extremely superior class. I had considerable experience of the mallee country in Victoria, and the large area that Mr. Lascelles has been cultivating, but I have not seen any mallee land there as rich as this mallee on the east of Wyalong.
609. Could it be brought under cultivation? Without a shadow of a doubt.
610. Profitably? Yes, because there is a large local population there.
611. Are the capabilities of the soil such that it can be used for wheat-growing? Not all of it. There is some mallee country which is very poor.
612. I want to find out the limits of the wheat-growing country there;—could you give it from there to Hillston, showing where you get out of the wheat-growing country? I think we might look upon the whole of the country as far as Hillston, which is the limit in a westerly direction, as wheat-growing country—that is, where wheat can be grown with tolerable certainty.
613. I suppose the bulk would be produced somewhere between Wyalong and Koorawatha? Yes.
614. At present I suppose the wheat grown in the neighbourhood of Grenfell has to be carted to Young? They have a mill at Grenfell.
615. That would be only for local requirements. If all that land were brought under cultivation it would become a necessity to export a large quantity of wheat? Not the least doubt of it.
616. Therefore, the consuming power would not be in comparison with the producing power of the district? Oh no, we should soon outstrip local consumption.
617. Can they send their wheat by dray from Grenfell to the nearest railway and dispose of it at a price that will leave them a reasonable profit? Hardly in ordinary seasons.
618. What would be the carriage from Grenfell to the Western railway? It would have to go to Koorawatha or to Cowra, a distance of 34 or 35 miles.
619. What would be the rate per ton or per bushel? I think it would be about 4½d. or 5d. a bushel.
620. That would be equal to about 16s. 8d. a ton? That is a very low rate for carriage.
621. If grain can be carried in other parts of the country 26 miles for 2s. 6d. per ton, and if this line were made by way of Grenfell and for 34 miles 5s. a ton were charged, would that act as an inducement to the increase of agriculture? Yes, if it were reduced as you say.
622. If there were a railway and the carriage from Grenfell was 5s. a ton, would not that be considered a very low and satisfactory rate? I think it would be very satisfactory.
623. Would it admit of wheat being grown in the district and sent away by that means? Yes, no doubt.
624. At present you are paying 16s. 8d. a ton? Yes, it would make the difference between the practical abandonment of agriculture and an enormous output.
625. What other portion of that district is largely used or could be largely used for wheat-growing? Nearly the whole of the country that does not lie so far north and south of the line as to make the carriage too heavy. The railway would cause a large cultivation on each side of the line for a very considerable distance.
626. Is the land of such a character that it will admit of large areas being cultivated? Yes, unquestionably.
627. It is not too heavily timbered? We do not use any land for cultivation except the timbered land. We soon clear it. It is country that could be cleared cheaply.
- 627½. If the railway were taken across from the point you mention, towards Hillston, do you think it would capture a certain proportion of the wool traffic which it is estimated would go by the Euabalong line? It would take it nearly all. It would capture, I imagine, the whole of the trade which the extension to Euabalong would carry.
628. In that respect you think it would have precisely the same effect? I think it would serve the purpose of giving access from the southern districts to the market, quite as well as, or better than, the extension to Euabalong.
629. One of these routes is on one side of the river and the other route on the other? They are both on the river. Of course the produce would go to the nearest station. If the extension went from Wyalong to Hillston the produce would go by Hillston. That nearer Condobolin would of course go to Condobolin if there were no railway at all.
630. Briefly summarised, your argument is that if a line were made from Condobolin to Euabalong it will have to be dependent entirely on wool traffic from that district and goods going to that district? Yes.
631. But if it were taken from Koorawatha *via* Grenfell and Wyalong to Hillston it would open up a very large wheat-growing country, a country which is already producing large quantities, and which can be made capable of growing still larger quantities, and it would obtain the wool from the western country quite as well as the Euabalong line? Yes, that is exactly my argument.
632. Therefore you argue that in the interests of the country, a line of that character would serve a far better purpose although longer than the proposed line from Condobolin to Euabalong? I have no doubt whatever of that.
633. I suppose you hold that whether the Euabalong extension is made or not, sooner or later there will have to be an extension to Grenfell and that country? Certainly. I do not think the claims of that district could be resisted.
634. The people are there and the produce is there, and those are the attractions for a railway? Yes, our work is to be seen.
635. Therefore you say that that is the proper way to take the line, and that it would open up a large area of country which is waiting to be served? Yes.
636. *Mr. Wright.*] Do I understand you to say that you are familiar with the Lachlan country? I was some years ago; I have not been there for some years.
637. When you travelled through that country I presume that you travelled with your eyes open? Yes.
638. Are you aware that it is said to be very rich all the way from Forbes to Euabalong? For about 10 miles down the river from Condobolin there is some good land on the frontage, but I should not look upon it as an agricultural district like the country between Wyalong and Hillston.

639. Is it not all red soil back from the river? There is a great deal of plain country that dries up very much, and some forest. But I do not look upon it as the same class of country for agriculture as the country further south. G. H. Greene,
Esq., M.P.
7 Sept., 1897.
640. By reason of its less rainfall? Less rainfall and the nature of the soil. Things seem to burn up and wither there in a way in which they do not in the forest country.
641. Do you know the south side of the river? Yes, fairly well.
642. Have you crossed the country from Condobolin to Lake Cudgellico? I have not been there for ten or twelve years.
643. What class of country is that? There is some fine country about Lake Cudgellico, but I understand that of late years it has become overgrown with fine scrub.
644. Is there not some good land about Bygallorie? There is some very fine land there.
645. All that country from the Dundoo Ranges is fairly good country? Yes, there is some good country there.
646. That is where the line would cross from Wyalong, is it not? It is already surveyed.
647. The route is through Wyalong, Bygallorie, and the Dundoo Hills? Yes, so I understand.
648. What is the distance by road from Cowra to Grenfell, and from Young to Grenfell? From Cowra to Grenfell is about 35 miles. I think the distance from Young to Grenfell is about 32 miles.
649. You say it is 34 miles from Koorawatha to Grenfell? Yes, by the line as at present surveyed.
650. If you look at the map you will see that Grenfell, Cowra, and Young form three points of a triangle? Yes.
651. It must be less than 34 miles to Koorawatha? Yes; the railway line has been made to accommodate itself to the levels. If a railway line were constructed from Cowra to Grenfell it would be much longer than the mark on the map indicates.
652. Suppose there is a railway to be made through Grenfell, what amount of mountainous country would it have to go through? Scarcely any to speak of.
653. Would there be 5 or 6 miles of it? I do not think so. But that is a matter about which absolute evidence can be given by the surveyor.
654. Does that go through the Eualdrie run? No; that is to the west of the line several miles west or south-west of Grenfell.
655. Where does the survey come down to Bland country? Through Gibson's run, about 8 miles south of Marsden.
656. And it would cross at Marsden? No. It crosses the Bland, considerably south of Marsden.
657. It crosses the Bland somewhere near Chisholm's property? I suppose it would be to the north of Chisholm's property and it would go partly through the Oakhurst property.
658. Do you consider the Bland country suitable for wheat? Not the plain country.
659. What width is the plain country? I can scarcely say. The plains are irregular in shape and the timber juts in in places in long points.
660. Would it be 20 miles across? No, nothing approaching to that; perhaps about 5 or 6 miles.
661. How far is it from the Bland to the Weddin Mountains? I think it would be nearly 20 miles.
662. And about half that country is plain country is it not? No, not half.
663. Going west from the Bland what is the country immediately round Wyalong? It is chiefly mallee.
664. You are aware that there is a considerable extent of stone ridges in the neighbourhood of Wyalong? There is no doubt that about Wyalong there is some very poor, barren country.
665. About Hiawatha is very poor country? There is a great deal of good agricultural land when it is cleared of the scrub and timber.
666. After you leave Wollongough you have practically good land all the way to the lake and from the lake to Hillston? Yes, I think so.
667. Looking at this line from a productive point of view you are of opinion that a large area of country and a better area would be served by connecting Koorawatha and Hillston than by any other route taking Hillston as the objective point? Yes.
668. You think the country should be traversed between the Lachlan and the Murrumbidgee in the direction which you have indicated to serve a larger area of country and better country than on any other projected route? Yes.
669. Do you know the country from Temora to Wyalong? Yes.
670. A line along there would serve a good stretch of country? Yes; there is some very fair country there.
671. Picking up your route at Wyalong and connecting it at Temora instead of going through to Grenfell? Yes.
672. But that would have the objection that the land round Grenfell would be still isolated? Yes.
673. Do you think that Koorawatha is the best point of departure? I think so. It is the only possible point, from an engineering point of view, that can be got between Young and Cowra.
674. What difficulty is there about running a railway from Cowra to Grenfell? There is the Broula Range, which, at the lowest point, is about 800 feet high.
675. You think that Koorawatha is the best point of departure inasmuch as it is nearly the most direct route, and has the easiest grades? Unquestionably.
676. But the quality of the country is pretty much the same? The country about Koorawatha is unquestionably the best between Young and Cowra.
677. *Mr. Hassall.*] With regard to the country lying west from Koorawatha, *via* Grenfell and Wyalong to Hillston, how is it watered? The water in the neighbourhood of Koorawatha is very good. There are some natural springs between there and Grenfell, but the country is naturally very poorly watered; but it is now practically secure by a great number of tanks and dams. Grenfell has its own supply, which is just fairly good.
678. Where does that supply come from? Wells and springs which do not run over the ground, but are easily tapped. At Bogalong, 6 miles out of Grenfell, there is a permanently running creek, but only very small, rising from a spring. From that to the Bland there are some small creeks which appear to answer all that is required, but there is no large stream of any kind.
679. Is the Bland Creek permanent? It is permanent in places. There are some water-holes close to Lake Cowal never, I believe, known to fail.

- G. H. Greene, Esq., M.P.
7 Sept., 1897.
680. From Wyalong to Hillston there would only be an artificial water supply? I think that is all; it is a dry country.
681. The range shown on the map between Koorawatha and Grenfell;—is there any difficulty in getting over that? It has been got over. The line is surveyed for a distance considerably beyond Grenfell, and the steepest grade is only 1 in 75.
682. *Mr. Roberts.*] Do you reside in the neighbourhood of Grenfell? Yes; at Jandra.
683. Would that be on the road to Young? No; it is about 8 miles east of the direct road from Grenfell to Young.
684. Have you any land under cultivation? Yes.
685. How many acres? About 12,000 acres under cultivation this year; only about 9,300 under wheat, the rest is under lucerne.
686. What is the extent of your property altogether? About 31,000 acres.
687. Is that all freehold? It can all be made freehold. About half of it is freehold, and the rest is conditional purchase and conditional lease lands.
688. Have the returns from the land under cultivation realised your expectations? Quite; if we had had rain early enough this season I could have disposed of 13,000 acres on the share system.
689. Is that system largely in operation in the Grenfell district? Yes; amongst those who have large areas.
690. And has it worked with advantage to both landowners and agriculturists? Yes, it has given very great satisfaction; but I may mention that the only large holdings in that neighbourhood are Worrangong (Mr. Suttor), Jandra (my own), and Brundah (belonging to Mr. Wood). I should also mention that we are still going on with clearing, and on those three properties I think there are now about 33,000 acres cleared fit for the plough.
691. You think that if Grenfell had the advantage of railway communication a great impetus would be given to farming? A very great impetus; even the idea of a strong probability of our getting the line has put increased zest into the work which is going on now.
692. I should like your opinion on the three different routes for tapping Grenfell: according to the map which you see before you Grenfell could be reached by the construction of a line from Young, by a line from Koorawatha, or by a line from Cowra;—which in the interests of the country would you recommend? Unquestionably Koorawatha; the route from Cowra is simply impossible.
693. For what reason? On account of the range of hills and because the distance would be very much greater than by Koorawatha. The route was inspected by Mr. Jamieson, who was sent up by the Works Department, and it was at once abandoned, the cost being absolutely prohibitive.
694. What would be the grade on that line? I do not think the Department would sanction a grade steeper than 1 in 75, but it would have involved going a distance of some miles round to get it. There is a range which has to be crossed and, where the gap is, the road is 800 feet high.
695. The mountainous character of the country renders it unsuitable? Yes; and besides that the land north of the hills shown on the map is barren country, whilst on the southern side it is all good. From Young to Grenfell I do not think there are any engineering difficulties.
696. What would be the advantages of a route from Koorawatha to Grenfell, as against one from Young to Grenfell? It is supposed that the country is better on the Koorawatha line. It gives the best approach to the Southern and Western railways, and makes a better line than going to Grenfell and then turning almost at right angles to Wyalong, and it would serve more country.
697. And the distance is shorter from Koorawatha to Grenfell than from Young to Grenfell? It is by road, but I do not know how it would be by the line because it must follow the contour of the country.
698. Is the character of the country similar in each case? Fairly similar. The land about Koorawatha is superior to the land about Young. The land about Young, although pastoral, is not fit for cultivation on a large scale, and the land all the way from Koorawatha to Grenfell is very good except in some isolated spots.
699. Can you tell us anything as to the stability of Wyalong as a settled population? I have every reason to believe that the population will increase. I know men who have erected very large works there and spent a great many thousands, and from what they show me, and from the opinion I hold of them, I believe there is every promise of permanency. And so far as I can see, each year the prospects from deeper sinking have become more indicative of permanency.
700. Has the population shown any increase during the last two years? I do not think so. In new rushes there is always a nomadic class that comes at first and soon go away, but when they have left as in the case of Wyalong the population may be look upon as permanent.
701. Would it be a fair thing to say that it has been stationary during the last eighteen months? Yes, I think so. The population is about 5,000 now.
702. With a view of reaching Hillston would you recommend a line touching at Cudgellico, or could a line with advantage, be taken direct from Wyalong to Hillston? I could not give an opinion on that as it is some years since I went over the country, but I should very much like to see Cudgellico brought within the sphere of railway usefulness because there is splendid land there.
703. Have you heard that the land towards Cudgellico, or I might say Hillston, is better country than that from Barmedman to Hillston? I could not say. I do not know the line from Barmedman to Hillston. I have been all over that country electioneering, but never noticed any particular route laid down for the railway.
704. From what you know of Cudgellico, you would like it to have the advantage of railway communication? I should.
705. Is the land fairly fertile about there? There is some magnificent agricultural land about Lake Cudgellico.
706. Then it would be very good from Lake Cudgellico to Hillston? I do not know so much about that piece of country.
707. Then in the interests of the country you think the line over which I ventured to take you would be the best way of reaching Hillston. I am perfectly certain of it, and it would serve a greater portion of the country, a larger population, and induce more settlement than any other line that could be made.
708. You are altogether opposed to the extension of the line going westward from Condobolin? I am.
709. *Mr. Hoskins.*] Would not a railway constructed from Koorawatha to Grenfell cost more than the proposed line from Condobolin to Euabalong? I do not know; I have no doubt that it would be a cheap line from Condobolin to Euabalong, but that is a matter to be decided by expert evidence. 710.

710. Is nearly all the land between Koorawatha and Grenfell alienated from the Crown? Yes.
711. Are you aware that the land that would be affected by the proposed railway from Condobolin to Euabalong is Crown land and that they would have to pay nothing for it? I do not think they would have to pay anything for the land from Koorawatha to Grenfell.
712. Are you of opinion, from your knowledge of the people who are very anxious to have this railway constructed, that they would be prepared to give sufficient land to enable the Government to take the railway from Koorawatha? Yes, I have promised my land.
713. I know you have, but what about your neighbours? Some of them have thought that they might be given land from unused and unnecessary roads to make up for the land taken for the railway; but I am certain that if the choice were given to them whether the railway should be made and they should give the land, or they should give no land and have no railway, they would willingly give the land to get the railway.
714. I suppose you know that people petition to have railways made for the purpose of getting paid twice as much for their land by the Government as other people would pay them? I think I have got my constituents well in hand on that score. I knocked that out of their head. I have always scouted that from the beginning.
715. I suppose you know that the policy of the Government, and the opinion of Parliament and the people is in favour of constructing light lines of railway? Yes.
716. The proposed railway from Condobolin to Euabalong, you know, would be a light line? Yes.
717. Do you think that a light line, costing not more than £2,500 a mile, could be constructed from Koorawatha to Grenfell? Yes. I am told that there will be no cuttings worth mentioning, and that there is plenty of timber and ballast in the neighbourhood.
718. We have before us the propriety of constructing a railway from Condobolin to Euabalong, but now you have brought in another matter? I am sure the line which I recommend could be constructed at a very cheap rate on account of the nature of the ground, the supply of timber, and the ease with which the ballast could be got.
719. Are the majority of the farming population between Koorawatha and Grenfell persons who are cultivating on shares? Yes; but there are a large number of farmers irrespective of those men.
720. Is it not the intention of the large landowners to let their land out on the share system to get it cleared by cultivation, with the view of ultimately turning it into grazing land? They will make use of the land in the way that pays them best. If there is a demand for the land they will sell it, or a large portion of it.
721. Does it pay better to let the land on shares, in the way you have described, than to graze stock on it? It pays very much better to let it on shares.
722. I suppose you are aware that the selectors are continually complaining that the cultivation of wheat does not pay;—will it pay the farmers and landowners to sell wheat at 3s. a bushel? Yes. The best farmers that I have are men who own land adjoining the land that they have taken from me on the half system. I can explain the apparent strangeness of that. No farming will pay under the old conditions. A man must work on up-to-date conditions and upon large areas. The selector who has got land that is timbered cannot devote the necessary capital to the clearing of that land, and he will come to me and take 200, 300, 400, or 500 acres, and with my assistance he will put that into cultivation. Selectors who clear 30 or 40 acres, working badly with bad implements, cannot make it pay, and they will die out. One man that I have is putting in 800 acres, and last year he paid me £700 off his indebtedness to me out of his crops. He has been working on the half system for four years, and is going on again.
723. Then the cultivation of wheat really does pay? It does, with good workmen. But there are farmers under exactly similar conditions that I never could get to pay their store accounts, or to repay the advances which I made to them.
724. As a Member of the Legislature, do you think it would be better in the interests of the country to construct the railway from Koorawatha to Grenfell, instead of a railway from Condobolin to Euabalong? I have no doubt of it.

Percy Scarr, Principal Assistant Engineer, Roads Branch, Department of Public Works, sworn, and further examined:—

725. *Chairman.*] You have a statement to lay before the Committee with regard to the roads in the locality which has been specified by the Committee? Yes; a statement of the roads on which money has been expended since 1892 and the amounts. There is also a tracing showing the roads:—

P. Scarr.
7 Sept., 1897.

STATEMENT showing expenditure on certain roads.

726. *Mr. Lee.*] I suppose that on the line from Condobolin to Euabalong very little money has been spent in metalling the roads? Not a great deal.

727. It is not a country in which you can get metal is it? I do not think there is much metal there. Road making is very expensive there.

728. Have you personal knowledge of the country across from Euabalong to Hillston, Wyalong, and Grenfell? I know the country from Lake Cowal to Grenfell, from Lake Cowal to Koorawatha, from Lake Cowal to Barmedman and across to Junee.

729. Can you remember where, of late years, there has been any extra demand on your Department for roads in the neighbourhood of Grenfell in consequence of the increase in agriculture between Grenfell and Blayney and Murrumburrah? Not a very great deal.

730. Which is looked upon as the proper railway depôt for Grenfell? Cowra; that is by the main road from Cowra to Grenfell. We spent a large amount of money upon it.

731. I suppose that in consequence of the roads being good the traffic went that way? The roads were not good till we spent money on them.

732. But it is a better road than the Koorawatha road? Yes.

733. Although the Koorawatha road is shorter? It is apparently, but the saving is not very great and there are the Warrangong Mountains between Koorawatha and Grenfell.

734. What is the trend of your roads going west towards the Lachlan? There is a road from Grenfell to Forbes, and the road from Grenfell to Goolagong, and from Grenfell to Young. Then there are other roads going out to Lake Cowal and Marsden. There is a road from Bogalong to Marsden, that is one of the principal roads out there.

735. I suppose that your road will not give a very clear idea as to the settlement in the localities now? No.

736. Many of those roads have to be made for long distances and go from point to point with very little settlement between them? That country is pretty evenly settled from Grenfell out westward, though not thickly populated.

737. There is an agricultural population all over it? There is a great deal of agriculture there now, but when you get out to Lake Cowal and Marsden it is chiefly wool.

WEDNESDAY, 8 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).	
The Hon. FREDERICK THOMAS HUMPHERY,	CHARLES ALFRED LEE, Esq.,
The Hon. JAMES HOSKINS,	JOHN LIONEL FEGAN, Esq.,
The Hon. CHARLES JAMES ROBERTS, C.M.G.,	THOMAS HENRY HASSALL, Esq.,
The Hon. WILLIAM JOSEPH TRICKETT,	GEORGE BLACK, Esq.,
The Hon. DANIEL O'CONNOR,	FRANCIS AUGUSTUS WRIGHT, Esq.,
HENRY CLARKE, Esq.,	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

Charles Hursthouse Stanger, Out-door Superintendent, Chief Mechanical Engineer's Branch, Department of Railways, sworn, and examined:—

738. *Chairman.*] What are you? Out-door Superintendent, Chief Mechanical Engineer's Branch, C. H. Stanger. Department of Railways.

739. *Mr. Lee.*] You practically control the locomotive branch? Yes, the outdoor working on the ^{8 Sept., 1897.} northern and western sections, not on the southern.

740. I suppose you know the grades of the southern line pretty well? Pretty fairly.

741. There is a proposal before us to extend the line of railway from Condobolin to Euabalong;—do you know that country at all? I do not.

742. You will see it on the map? Yes.

743. Another question arises as to whether the traffic can be served by making an extension from Koorawatha on the Blayney line across to Grenfell, Wyalong, and Hillston? Yes.

744. Could you tell us what the great difficulty is between Blayney and Cowra? In the direction towards Sydney there are very heavy grades between Cowra and Blayney—grades of 1 in 40.

745. Have you got any tabulated statement? No; only a few notes.

746. Will you read them so as to give a fair idea of what information you have? I have a few notes which were made in anticipation of being asked questions. They show the alternative routes. I have shown certain train-loads through that would be the most economical for one engine. Between Condobolin and Parkes a small engine will bring a load of 297 tons; between Parkes and Molong a more powerful engine will bring almost the same load, 288 tons; from Molong to Penrith, over very heavy grades, one of our most powerful engines will bring 297 tons. From Penrith to Sydney a small engine will bring 315 tons. On the southern line from Koorawatha to Goulburn, one of our most powerful engines would bring 297 tons. An engine of less power will bring from Goulburn to Picton 333 tons; from Picton to Sydney a small engine will bring 315 tons. I worked that out as showing that the through loads will be about the same with similar engines. The ruling gradient by the western route between Condobolin and Parkes is 1 in 100. From Parkes to Molong, 1 in 60; from Molong to Penrith, 1 in 40; from Penrith to Sydney, 1 in 80. On the southern line the ruling gradient from Koorawatha to Goulburn is 1 in 40; between Goulburn and Picton, 1 in 66; between Picton and Sydney, 1 in 100.

747. All the gradients mentioned are those which will be against the up-traffic? Yes, the traffic to Sydney. The ruling gradient of 1 in 40 is very long.

748. Have you a trial survey to Grenfell? I do not know of anything beyond the lines that are opened or in course of construction.

749. On the up journey you have given the heaviest grades, but what would be the grade against the down traffic? Both southern and western lines have 1 in 30. The western line is a little heavier; it has numerous grades of 1 in 33 also.

750. If for the down grade, what would be the reduction in the load as compared with the up grade? On the western line the load that could be taken through would be 205 tons by the same heavy engine which I spoke of. On the southern line the heaviest load that could be taken would be about 210 tons.

751. When you say the heaviest load, do you mean the utmost limit the engine would be capable of hauling, or the quantity within the limits of safety to place behind it? Within the limits of the power of the engine.

752. That is its working power? Yes; exclusive of the weight of the engine itself.

753. Is the grade from Koorawatha against the up traffic or the down traffic? From Koorawatha to Blayney the grade is against the up traffic, but there is also a stiff piece of 1 in 40 against the down traffic after leaving Blayney.

754. Suppose it becomes a question of increasing your traffic on the western country by way of Parkes and Orange, or diverting a large portion of it, and bringing it in by way of Koorawatha on the Blayney line, and by Cowra;—which would be the most suitable line to work it from? From my point of view, which is one of convenience of working, I would rather see it come by the southern line, because there are times when we have all we can do to work the traffic on the western line.

755. It would be a question more of general traffic than of grade? Yes; at certain times in the wool season the western line is completely blocked about Eskbank by the Zigzag.

756. What the Committee would like to know is could the increasing traffic that we are led to believe is becoming greater on the western line be diverted in such a way as to be brought on to the southern line to relieve the western line? I would not advise taking the traffic from the western line to bring it round by the southern line, but if you could take traffic midway between two lines the southern line would be the better way to bring it.

757. Would there be any advantage in bringing it down from Cowra to Blayney rather than along the existing line from Condobolin? No.

758. Inasmuch as nearly all your heavy grades are against the down traffic, it would matter very little to the up traffic whether it continued down the main western line or a portion went by a side line? If it has to join the main western line at Blayney it is immaterial whether it comes off a branch or the main line. The Zigzag is the trouble.

759. If it is divided it will make no difference to the western line if it is brought in above Bathurst? No.

760. If a portion of that traffic could be diverted on the southern line it would make a difference? It would be a relief to us.

761.

- C. H. Stanger. 761. I suppose that on all these outside lines, where the traffic is not very heavy, you generally run them with small engines? Yes.
- 8 Sept., 1897. 762. As your loads become heavier nearer to the metropolis you attach more powerful engines? Yes.
763. How do you regulate the grain traffic which necessitates heavy trains? That comes principally from the south-western line, and if we are able to spare any of the very powerful engines from the western line we send them over, but if we are busy on the western line they have to work it with the two small engines.
764. In some districts the rates have been made lower to get large consignments;—does the Department recognise that under the circumstances heavy engines could be used to carry the stuff at low rates? I do not know about that matter.
765. Are the larger engines used? If we can spare them, but we generally want to use them on the western line.
766. If a line were constructed across from Koorawatha to Grenfell and Wyalong, within which district we are led to believe there would be a very large increase of grain growing, would it require any special arrangement on the part of the locomotive department to deal with that traffic? I do not know what the distance would be from Hillston to Koorawatha.
767. Grenfell is the centre around which the bulk of the grain will be grown;—supposing there is a large increase, would it necessitate special arrangements? We should probably have to establish a small engine-shed at Koorawatha or the terminus.
768. Nothing more than usual? Nothing more than we have to do with all new branches that are made.
769. Would that grade between Koorawatha and Blayney materially affect the large trains that would be necessary? I do not quite understand you.
770. Supposing the grain traffic were heavy from the new country, would it operate against the hauling power in having to bring it up the heavy gradients? Yes; the grade being so very stiff, we should have to use two engines to get the stuff away if there were a large traffic.
771. Or bring lighter trains? Yes; and that would mean a very great expense.
772. Suppose it were brought on the main line to Koorawatha, and sent down by way of Murrumburrah, would there be any extra distance to haul it? The distance from Koorawatha to Sydney by Harden is 277 miles; by Blayney it is 236 miles.
773. It is 41 miles further by the Murrumburrah line? Yes.
774. Would you be able to bring a large load by way of Murrumburrah? No; the through loads would be what I have stated, 297 tons either way by the most powerful engines that we have.
775. *Mr. Humphrey.*] How many miles of the 1 in 40 grade would there be between Koorawatha and Sydney by Blayney, as compared with the route by Murrumburrah? I can only tell you roughly. A little over 10 miles by the western route and 11 miles by the southern route.
776. There is no appreciable difference? No; but the western line has, in addition, the heavy grades of the Zigzag.
777. *Chairman.*] Taking the point between Young and Koorawatha equidistant from Sydney, it will cost the same expenditure of power to take a ton of goods through by the western as by the southern line? Yes.
778. Suppose that the Zigzag were cut out? Then the advantage would be quite on the side of the western line, because the grades are so situated that we can, by using assistant engines, get large through loads.
779. From the point where the distances are equal between Young and Koorawatha, if the Zigzag were taken out, it would require less expenditure of power to come by the western line than by the southern line? Yes; I think it would. If it came on to the existing line at Koorawatha, as regards cost, the western line would have the advantage; as regards expedition perhaps the southern line would.
780. If we could imagine the Zigzag cut out, the preference would be by the western line? Yes.
781. Going beyond that, and looking at the work which the railway will eventually have to do, would there be a larger amount of traffic coming down the western line than along the southern line, taking into consideration, of course, the territory which will be served by each? I can only answer that by looking at the map, and I see that there is a larger tract of country to the west to open up than to the south; therefore, we should get more traffic from the west.
782. And further south the traffic comes under the influence of Melbourne? Yes.
783. Can you tell the Committee the proportion or the comparison between the traffic coming on the western and southern lines at present? I could only roughly say that I think that the goods traffic on the western line must be double that on the southern line.
784. And what about the passenger traffic? The southern line has the advantage in that respect, having the Melbourne traffic.
785. Is the western line doing one and a half times more traffic than the southern line? Taking it all through, I think it must be.
786. You said that the western line in goods is doing twice as much as the southern line? Yes; in my opinion.
787. But the southern line is doing more passenger traffic? I think it is.
788. Speaking generally, the western line is doing considerably more at present than the southern line, and, as far as you can judge, it is likely to do more in the future? That is my opinion.
789. It follows that at the same cost for the same mileage that you can get by either line to Sydney it would be more convenient to the Department to send traffic by the line that is doing the least work? Yes.

Henry Chamberlaine Russell, C.M.G., Government Astronomer, sworn, and examined:—

- H. C. Russell, C.M.G. 790. *Chairman.*] You are the Government Astronomer? Yes.
- 8 Sept., 1897. 791. *Mr. Wright.*] Are you acquainted with the Lachlan country? Not by personal observation.
792. Can you tell the Committee the amount of the rainfall in the neighbourhood of Condobolin, the annual rainfall, and at what period of the year most of the rain falls? I have a table here showing all the rainfall records of Condobolin for every month in the year.
793. Can you give us the average? The average is 20½ inches per annum.
794. Is that sufficient for the cultivation of cereals? I have no personal experience in the matter, but the general observation is that it will not pay to grow wheat with an average rainfall of less than 20 inches.
795. Can you tell us the average rainfall of Euabalong? Nineteen and a half inches. 796.

796. Can you supplement that statement by telling us how the rainfall at Condobolin takes place, whether it is monthly or how? It is fairly well distributed over the months of the year, rather more falling in the second half of the year than in the first half. That is favourable for wheat growing.
797. You say that the rainfall at Euabalong is 19 inches? Yes.
798. Is that distributed in the same favourable manner as the rainfall at Condobolin? Yes.
799. And that might be considered fairly suitable for wheat-growing purposes? I dare say it might. I have no personal experience in the matter, but I know that with less than 20 inches of rain it is doubtful whether you will succeed.
800. What is the rainfall at Mount Hope? About 18½ inches.
801. In your belief that is outside the region where wheat can be successfully grown? Yes, but wheat has been grown about Hay, and the average rainfall there is 15½ inches, but I am told that it has been grown by taking virgin soil, and in favourable seasons.
802. Striking a line south from Mount Hope to Hillston, what is the rainfall at the latter place? The rainfall at Hillston is about 16 inches.
803. Can you give us the rainfall at any point west or south-west—say at Booligal? It is 14½ inches. The rainfall in this country falls off at the rate of 1 inch for every 30 miles that you go west.
804. Any country beyond Hillston would be unsuitable for cereals? That country has less rainfall than is generally supposed to be sufficient.
805. What is the rainfall at Lake Cudgellico? Nineteen and a half inches, about the same as that at Euabalong.
806. Have you got the rainfall at Euglo? The rainfall must be about 20 inches there.
807. And at Wyalong? At Wyalong, about 19 inches.
808. What is the rainfall at Marsden? Twenty and a half inches. The rainfall changes very little there, that is going south, and in that direction it does not change half an inch in 60 miles.
809. And at Temora it is about the same? Yes; in all that country.
810. Then coming further east to Grenfell, what is the average rainfall there? Twenty-eight and a half inches.
811. What is it at Young? About 28 inches.
812. What is the rainfall at Cowra? Twenty-nine inches.
813. And at Worrongong? At Worrongong it is 28 inches.
814. What is the rainfall at Koorawatha? There is no record kept at Koorawatha, but at the station adjoining Worrongong the rainfall is 28 inches.
815. You have told us that the rainfall goes from 20½ inches to 19 inches between Condobolin and Euabalong, and that it decreases gradually as you go out west, so that in the event of the construction of a railway from Condobolin to Euabalong we could not expect any successful cultivation west of that point? I do not like to answer that, because I do not know anything about the cultivation. According to the rule, wheat cannot be grown profitably where there is less than 20 inches of rain. That has been the experience of many years in South Australia and in this Colony also.
816. But at Wyalong, Grenfell, Marsden, and the whole of that belt of country there is a sufficient rainfall for the successful cultivation of wheat? Yes.
817. If it is proposed by the Government to build a railway from Condobolin to Euabalong, with Hillston as the objective point, a great length of it would pass through country where the rainfall is comparatively small? The rainfall decreases very gradually. There is no jump from a sufficient to an insufficient rainfall.
818. There is a gradual diminution of the quantity, and consequently a strong probability that the success of cereal growing will be decreased in proportion? Yes.
819. *Mr. Clarke.*] Does it not sometimes happen that a rainfall, if irregular, although it may amount to 20 inches in the year, not coming at certain seasons, is not suitable for wheat growing? Yes.
820. On the other hand, if it is regular, coming at proper seasons, a less rainfall might be sufficient? Yes.
821. With regard to the possibility of growing wheat at Hillston, which is the objective point of the line under consideration, what are your views? Although I consider the rainfall at Hillston, being a little under 16 inches, as dangerously close to an unsafe rainfall for the cultivation of cereals, still, since the rain falls there at a suitable time for the crops, I think it might be satisfactorily attempted; and there is another consideration that I think ought not to be lost sight of—when the farmers get wise enough to do it they will avoid dry seasons, and only grow wheat in good seasons. I may add that I herewith hand in a tabulated statement of the rainfall.

William Henry John Slee, Chief Inspector of Mines, Department of Mines, sworn, and examined:—

822. *Chairman.*] What is your position? Chief Inspector of Mines, Department of Mines.
823. *Mr. Egan.*] Do you know the country well in which it is proposed to make this railway? Yes.
824. The proposal is to construct a line from Condobolin to Euabalong? Yes.
825. Is there any mining between Condobolin and Euabalong? There is one small field called Cugong, but at present there are only two claims at work.
826. Is it a poor field or is too far from the railway communication? The field is not much—a railway would not help it.
827. Are there any mines between Euabalong and Cudgellico? There are prospectors out there. There is Price's party, who found some gold about eighteen months ago; but so far, no developments have taken place. That is on the north side of the river.
828. Then, of course, there is Mount Hope? That is still further on.
829. That is an extensive mining district, is it not? Mount Hope is the only mining district which would to a certain extent feed the railway.
830. What minerals are found there? Copper and gold. At Mount Allen there is gold.
831. Would railway communication assist that field at all? There is no railway communication at present.
832. Would the construction of a line to Euabalong from Condobolin give greater facilities to the mining industry at Mount Hope? It would to a certain extent.
833. Would it be the means of supplying a large working population there? It would be the means of enabling the mines to be worked at a cheaper rate, and consequently a larger number of men might be employed. At present there are only a few tributors there.

W. H. J. Stee.

8 Sept., 1897.

- W. H. J. Slee. 834. Is the gold found in fair quantities there? The only gold is at Mount Allen, about 12 miles from there.
- 8 Sept., 1897. 835. What minerals are there in the Mount Hope district? Copper. It has occurred in horizontal layers, and so far sulphide ore is missing; until they can obtain the sulphides the Mount Hope district will not be much.
836. In the absence of the discovery of sulphides it is almost worthless? Almost worthless.
837. Where did Price's party find gold? About 30 miles from Condobolin, not near Euabalong.
838. Did you report upon that? Yes.
839. Can the Committee see your report? Yes.
840. Then coming down from Euabalong to Cudgellico? There is no mining at Cudgellico. I went through the district last year and there were only two men at work on the Lachlan close to the lake between Euabalong and Condobolin; during last year there were not fifty men at work there.
841. Is there not a mine at Cudgellico? Well, yes; but it has never turned out any good to the shareholders.
842. What is your opinion as to the possibilities of that field? My opinion is that it will never be a good mining district. Whatever is obtained throughout that district will be in short shoots and small patches.
843. I suppose you met Mr. M'Ewan there? No.
844. You do not think much of that mine? No.
845. I suppose you know that some set a very high value on that mine at Lake Cudgellico? Yes, I know several districts where the outside public often think there is a great deal in it and public money is spent. We have two classes of mines, one class worth keeping and working, and another worth selling. I put this in the class worth selling.
846. Therefore, from Euabalong to Cudgellico there is no mining of any consequence? No.
847. Do you know the country from Cudgellico to Hillston? I have been only once there. There will be very little mining about Hillston.
848. Therefore, as far as the road from Cudgellico to Hillston as regards mining is concerned, it is of very little importance? Very little.
849. Do you know the country to the south of Hillston? I have been to Hillston from Mount Hope, and I have been to Hillston from Hay, and from Mossgiel, and from Ivanhoe. The Hillston country, as far as mining is concerned, I think will never be any good. No doubt it will be a good agricultural country.
850. You are well acquainted with Wyalong? Yes.
851. Do you think that will be a permanent field? I say now what I said in my report on the Wyalong-Temora line, that Wyalong might last for many years, but it will not carry such a population in the future as it has done. It might carry from 1,500 to 2,000 people, but if we had a new rush to-morrow a great deal of the population would leave Wyalong. Still it will be a permanent place for many years to come.
852. Does that apply to Yalgogrin? That is about 22 miles further on. The prospects of permanency are certainly not as good there as they are at Wyalong. I was there last April.
853. Have you been from Cudgellico across to Wyalong at any time? No; I have been part of the distance, but never all the way. I have certainly not been to within 20 miles of Cudgellico from Wyalong.
854. Are there any mining prospects there? No. I believe we shall get sooner or later a streak of mineral land across from Yalgogrin towards Hillston.
855. There has been some mining at Barmedman? Yes; Barmedman goldfields were open long before Wyalong. They were opened in 1870 or 1871, and there was a good deal of reefing, but latterly there has not been much mining carried on there. There is one mine called the Fiery Cross.
856. Is it all worked out? The water difficulty has always been against it. There is a probability that the Fiery Cross and other mines may carry gold at a greater depth.
857. How do they obtain their water there? There is no river, no running creek. They get water by sinking tanks. There is a great amount of underground water. They find it at a depth of 120 feet; it is brackish water, no good for stock, but it is good enough for a crushing machine. Barmedman is a good agricultural district.
858. And you say the reason why there is not more extensive mining carried on at Barmedman is because of the influx of water? When Barmedman was opened it was taken up by miner's right holders, there being no leasing in those days. I had a quartz-crushing machine, and did the first crushing from Barmedman.
859. Do you think that if more capital were expended there it would still be a fair field? I think it would still be a fair field with capital, provided that a proper system of mining was adopted; but the system hitherto has been to get so much for the shareholders and promoters, and nothing for working capital.
860. They could get water for working? Yes; they have plenty, but it is no good for boiler purposes.
861. Does it damage the machinery? Yes; there is a great deal of magnesia in it. It eats the iron, and the settlement on the boiler is very considerable in a short time.
862. What was the average return? I have known some to crush 4 ounces to the ton.
863. The only mine working there at present is the Fiery Cross? That is the principal mine.
864. What returns are they getting there? They are not working now; they are in difficulties; they formed a company, and the company got into difficulties.
865. So, even with a crushing of 4 ounces to the ton, they are in difficulties? I say that was the highest crushing.
866. Are you acquainted with the country about Grenfell and Young? Yes.
867. Is there much mining carried on there? Yes; Grenfell reefs were at one time as good as any in New South Wales, but of late they are again taken up by capital to be worked at a greater depth.
868. With better prospects? With fair prospects of continuing; Grenfell district is a great agricultural district.
869. Being well conversant with the prospects of various goldfields, would you say, from Temora on the one side to Condobolin on the other, what route you think would be the best for constructing a line where there would be permanency of employment and facilities for mining? If I only considered Wyalong, I should say from Temora. If I considered Hillston, I should say from Grenfell; but I do not think that any railway between Condobolin and Euabalong would ever pay anything like working expenses.
870. Did I understand you to say that Grenfell would be the best place? No; I said that considering Wyalong as a goldfield it would be better to make a railway from Temora; but taking a general view of the interests of the whole country, I believe Grenfell would be the best place, because it would pass through agricultural land.

871. You would construct a line from Young to Grenfell, from Grenfell to Wyalong, and from Wyalong to Hillston? Yes, from the Young to Cowra railway line. W. H. J. Slee.

872. Have you been over that country? Yes; I lived five years at Grenfell.

8 Sept., 1897.

873. You think that if it is to be a paying line that is the only route? I think it would be the best route.

874. If the idea was only to supply Wyalong with a railway you would say go from Temora to Wyalong? Yes.

875. But to get to Hillston you would construct a line from Young to Grenfell, from Grenfell to Wyalong, and from Wyalong to Hillston? Yes; that would be the best for the country at large.

876. *Mr. Hassall.*] You know the country pretty well between Condobolin and Wyalong? I have never been direct from Condobolin to Wyalong.

877. You have a very good knowledge of the country round Forbes, Wyalong, Barmedman, and Temora? Yes, and Hillston and Euabalong.

878. What do you think of the mining resources of that country;—are the discoveries which have been made at Wyalong, Barmedman, and Temora likely to be permanent? Yes; I believe that for many years to come the population will stand at from 1,500 to 2,000.

879. From your knowledge of the geological character of the country, do you think that the mineral deposits are likely to provide employment for many years to come for a large body of miners? Yes, say 1,500 to 2,000 miners.

880. Round Wyalong itself? Yes. Of course, the whole country between Grenfell, Barmedman, and Wyalong appears on the surface to be auriferous.

881. And I presume there is a probability of further deposits being discovered? I believe that sooner or later we shall have a field as large as Wyalong between Barmedman and Wyalong. I feel confident that we shall have a good-sized field between those places.

882. There are pretty good deposits of minerals around Temora, are there not? Yes.

883. Are they of a permanent character? They have proved to a great depth, but, like all the rest, capital is wanting.

884. In your opinion, gold is there? I believe it is there, and that it will be found again.

885. Are the characteristics much the same in each of the localities named? No; in the Grenfell and Wyalong districts, gold is mostly obtained in granite country; at Grenfell, some of the best reefs ever seen in New South Wales were in porphyry. No payable reefs were ever found in slate near Grenfell.

886. Payable seams were found in porphyry? Yes, at Grenfell; at Wyalong, it was in the hornblend granite; at Barmedman, the gold was found in porphyry and diorite.

887. The characteristics of Wyalong are different from those of Grenfell and Temora? Yes.

888. From your own knowledge, there is evidently a very extensive tract of mineral country lying within the area embraced by Grenfell, Wyalong, Barmedman, Temora, and Young? Yes; I think from Wyalong, past Lake Cowal, nearly up to Condobolin.

889. I should imagine also that the belt of mineral country extended from Wyalong towards Forbes? Yes.

890. So that the whole of that country is more or less auriferous? Yes.

891. And it is likely to be developed when capital and labour are available? Yes.

892. Do you think it would well repay prospecting? Yes; there are prospectors out there now.

893. So that minerals may be struck at any time? Yes.

894. Do you think it would assist in the development of that country if a railway were run from Koorawatha to Grenfell, and Grenfell to Wyalong, the object being to extend it to Hillston;—would there be much traffic between Wyalong and Koorawatha? Yes, I think there would be, because it is a part of the country which cannot be reached by any railway at present.

895. You think it would materially assist in the development of the mineral resources? Yes, and there is a great deal of wheat-growing country there.

896. So that if the mines were worked out, as eventually no doubt they will be, there would be the agricultural industry to fall back upon? Yes.

897. That is practically how the country has developed around Young? Yes, around Young and around Grenfell. At first it was thought that no wheat could be grown about Grenfell. Now they grow large quantities if there is anything like a season at all. The country about Creamy Hill, between Condobolin and Euabalong, was thought at one time to be a very promising field. I stated that I considered it would be very patchy if payable gold was ever got. I saw stone which would go 100 oz. to the ton if they could get enough of it, but they could not get a ton.

898. You do not depend upon that part of the country to provide much in the way of employment in the mining industry? No.

899. *Mr. Roberts.*] I think, in answer to a question asked by Mr. Fegan, you expressed the opinion that a line might with advantage be constructed from Young to Grenfell? Yes.

900. Would that be in preference to a line from Koorawatha to Grenfell? That is the same line from the Young to Cowra line; from any part of that line you would have to go on to Grenfell. When I said Young I meant the Young line.

901. You did not mean that Young was a more desirable place to connect with Grenfell than Koorawatha? No.

902. *Chairman.*] Is there any increase in the output at Wyalong? I do not think that the output from Wyalong is increasing; but the tailings which have been left behind in previous years are now being worked over, and this may account, possibly, for any increase, but it does not come from any legitimate increase in the mining industry. I believe that the returns will be good for years to come.

903. *Mr. Hoskins.*] Do you think that a railway from Condobolin to Euabalong would have a more beneficial result in supplying a larger number of residents, and intersecting a larger quantity of good land, than a railway from Koorawatha to Young and Grenfell? No; I do not think that a railway from Condobolin to Euabalong would be so beneficial either to population or the country at large, or would carry so much produce as a railway from Temora to Wyalong, or Grenfell, on to Hillston, *via* Wyalong.

904. Suppose that a railway were constructed from Condobolin to Euabalong, which would bring railway communication much nearer to Mount Hope than it is at present, do you think that the construction of the railway near to Mount Hope copper-mines would tend to greatly develop the copper? I inspected Mount Hope copper-mines about eighteen years ago, and they have done very little in way of development since

W. H. J. Slec. since. What they have done was to pick the eyes out of the mine, and to-day they are doing the same thing with their tributors. Unless the Mount Hope Company will go to work and prospect their mines at greater depth no one can tell whether they will get better copper or not.

8 Sept., 1897.

905. How far is the Mount Hope copper-mine from Euabalong? I could not say exactly. Euabalong is 48 miles from Condobolin. At one time all the copper used to come from Nymagee and Mount Hope, and go on to Euabalong, Forbes, and Orange; but since the railway has been extended to Cobar it goes to the Cobar line.

906. Mr. Clarke.] Has the population about Wyalong increased or decreased since you gave evidence here before? It is very much the same as it was two years ago.

907. What is the population at present? About 3,000.

908. Three thousand miners? No; 3,000 people.

FRIDAY, 10 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL PEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

William Henry Hall, Sub-Editor of Statistical Publications, Government Statistician's Department, sworn, and examined:—

W. H. Hall. 909. Chairman.] What is your position in the Public Service? I am Sub-Editor of Statistical Publications.

10 Sept., 1897. 910. Have you brought some information in connection with the proposed extension of the railway from Condobolin to Euabalong? Yes.

911. Mr. Farnell.] You have a statistical statement that you have been asked to bring in connection with it? Yes. The statement which I have prepared has reference to the area under cultivation within certain districts. The particular districts were referred to in the memorandum that was given to the Assistant Statistician. The statement shows a comparison between the area under cultivation in 1895 and in 1896 in particular localities covering the whole area west of Koorawatha, and extending right on to Hillston. Unfortunately we cannot give definite particulars with regard to these lands prior to 1895, because the police who collected them collect them in relation to the whole district, not in relation to any particular portion of the district. I hand in the following tabulated statement:—

Districts.	Number of holdings: from 1 acre upwards.	Cultivation.															
		Total area cultivated.	Wheat.		Maize.		Other grains.	Hay.		Green foot.	Area under—						
			Area.	Yield.	Area.	Yield.		Area cut.			Area cut.	Potatoes.	Sugar-cane.	Cmpe-vines.	Oranges.	Other fruit orchards.	All other crops.
								Wheaten, oaten, and barley.	Lucerne.

TUESDAY, 14 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

John Boyd Donkin, C.E., sworn, and examined:—

912. *Chairman.*] Have you a fair knowledge of the part of the country in which it is proposed to construct this railway? Some twenty-five years ago I was Government surveyor, and surveyed from Cootamundra to the Lachlan, and from the Lachlan to Euabalong. I laid out the township of Euabalong, and since then I have lived twenty years in that district, so that I know it very well. J. B. Donkin,
C.E.
14 Sept., 1897.
913. *Mr. Black.*] Have you formed any opinion in regard to the proposal now before the Committee? Yes; I have thought over it, and I would much prefer the money to be spent in weiring the river instead of making a railway line. It would open up no more agricultural country to make the railway, and it would be better if the line were taken further to the south.
914. You think the money would be better spent in putting locks on the river? Yes, in putting locks on the river, which would only come to the same expense as the railway, and the river could be made a feeder to the railways. The locks could be used not only for conserving water for stock and irrigation purposes, but also for maintaining the height of the river, so that it could be used as a water-way. The fall in the river from Condobolin to Euabalong, a distance of 90 miles, is about 90 feet. It would take twelve locks, at a cost of £10,000 each. The river flats are very rich and if water were provided immense crops could be grown on the river. The railway would have to keep wide of the river as it is now from Parkes to Condobolin. We were unable to carry the railway from Forbes to Condobolin on account of the flooded state of the country.
915. Locking the river would involve an expenditure of about £120,000? Yes.
916. What return would there be from that? The only return would be allowing irrigation to be carried on. As it is at present there is only one system of irrigation; last year at Condobolin the river went almost dry. If there had been two or three systems of irrigation the river would have been dried up altogether. I have no doubt that if water were provided a very large area would be put under cultivation and irrigation.
917. Is there much land there suitable for cultivation? Yes, on the river flats, but only to the extent of a few miles back from the river.
918. Is there sufficient good land to justify such a large expenditure? That I am hardly prepared to say; but we may take into consideration that a very large body of water would be conserved to the whole district for other purposes besides irrigation.
919. What do you anticipate that land would produce? Wheat, lucerne, and fodder crops. They are growing very rich crops of lucerne now by some small system of irrigation, but the great objection taken to that is that people complain of the water being taken out of the river.
920. Do you think it would pay to raise water from the river to grow lucerne? In view of the very severe droughts, and the enormous number of stock that perish, I have no doubt that it would. Under ordinary circumstances I do not think, owing to the lift from the river, that it would pay to irrigate to a great extent, but in times of very severe drought they would make use of it.
921. On which side of the river is the best land to be found? I do not think there is very much difference. The north is very much the same as the south side. Below Condobolin it is almost entirely grazing country.
922. Have you considered a railway connection with any other centre in connection with the contemplated route? I think a railway has been spoken of from the Blayney line through the Grenfell district to Wyalong; that will be a preferable route. A very large area of wheat is under cultivation at Grenfell, and I think that a very much larger area would be put under crop if they had a railway. The whole district from there to Young is a wheat-growing district.
923. Then you are of opinion that the conservation of water for purposes of irrigation on the river would only result in its use for producing crops for local consumption? For local consumption. It would also afford a water-way which would be a feeder to the railway. My idea is that the river should be locked in the same way as is being carried out on the Darling River.
924. You would recommend a connection by railway to Grenfell with the Blayney line, and the locking of the river? Yes; I would also point out that the locking of the river would involve very little expense in repairs and cost of maintenance as compared with the railway. The railway would have to pass through an area of flooded land, which would no doubt cause considerable expense in after years.
925. You think the railway would have to be kept some distance from the river? I think it would have to be kept 8 or 10 miles away from the river. If it is carried on the north side clear of the flood-water the people on the south side will be 15 or 20 miles away from it.
926. If it were carried on the southern side it would involve the construction of a good many bridges? Some of the anabranches around there are almost as large as the river, and the river itself runs 60 miles and fills Lake Cowal. I estimate that another 100,000 acres would be put under wheat in the Grenfell district if a railway were made there.
927. What the Grenfell district wants is railway communication? Yes.
928. Do you know of any case where they have used irrigation in connection with wheat growing? No; I have no experience except with regard to lucerne and fodder crops. I think that wheat can be grown under its natural conditions so much more cheaply in the Grenfell district that it would hardly pay to compete

J. B. Doukin, compete under a system of irrigation. In my experience during the last twenty-five years I think there has not been more than one season in which the crop has failed in the Grenfell district.

C.F.
14 Sept., 1897. 929. *Mr. Hoskins.*] Do you wish to make a statement in connection with the proposed railway from Condobolin to Euabalong? What I propose is, that instead of money being spent on the proposed railway the river should be canalised. It would be a better investment to the State than making a railway outside the flooded land, from 5 to 10 miles away from the river, practically shutting out the people on the south side of the river.

930. Are you of opinion that the proposal to construct a railway from Condobolin to Euabalong is one which would meet with acceptance on the part of a large number of residents in that part of the country? I do not think it would, except from those people whose property the railway would go through. I do not think it would open up any agricultural area, and I do not think it would benefit many people there. Those on the south side of the river would be too far away from it.

931. Are you of opinion that it would be more to the public interest to extend the railway from Condobolin in another direction, say, towards Grenfell or Wyalong? I do not think it would be any great advantage to take the railway south from Condobolin to Euabalong.

932. Do you think that the construction of a railway from the Blayney line, *via* Koorawatha, Grenfell, and Wyalong, would be productive of more advantage in the interests of settlement than the proposed line? I think it would be productive of very much more benefit than the proposed line.

933. Would it intersect better land and a district more settled than the district from Condobolin to Euabalong? It would.

934. Would a railway, constructed from Grenfell by Wyalong to Hillston, be productive of more advantage than the extension of the railway from Condobolin to Hillston? Yes.

935. Why do you think so? For one reason. From Koorawatha, for 40 miles, it would pass the whole way through wheat-growing country—a country which is only just now being developed, and which will be developed to ten times the extent that it has been already. It is specially adapted for wheat growing—and it would supply the large population at Wyalong, and from there towards Hillston and Gunbar, where there is another large area under wheat—and the line would meet with no engineering difficulties.

936. Is the country, comparatively speaking, from Koorawatha, Grenfell, Wyalong, and Hillston, country which offers great facilities in respect of good gradients? There are no difficulties whatever, except, perhaps, entering Grenfell; but I should say that 1 in 100 could be got all through.

937. *Mr. Trickett.*] Do you agree that Hillston is a fair wheat-growing centre that the Government should aim at? I think it is on the margin of the wheat-growing country.

938. You know Hillston and the surrounding country? Yes.

939. Is it really good wheat-growing country? North of Hillston, towards Gunbar, there is a large area that will produce immense quantities of wheat; but it cannot be compared with Grenfell on account of the climatic conditions. There is 10 inches less rainfall than there is at Grenfell.

940. What is the rainfall at Grenfell? I should say that about Grenfell the average rainfall is about 24 inches, and at Hillston about 16.

941. The dotted line on the map shows a projected railway line from Temora *via* Barmedman and Wyalong, then along to Lake Cudgellico and Hillston, and another line from Wyalong to Barmedman, and from there direct to Hillston. Could you give us any evidence with regard to those two routes? I might mention that I surveyed that dividing range between the Lachlan and the Murrumbidgee many years ago. There is some very rough country between Barmedman and Hillston. I should rather prefer the route by way of Lake Cudgellico. The other would be a shorter line, but it would go through inferior country.

942. And it would be an expensive line;—would there not be a lot of cuttings? There would in places. It would not be very expensive if they kept clear of the small ranges. But much of that country is absolutely barren.

943. By way of Barmedman, Wyalong, and Humbug Creek, how would it be supposing they broke off at Humbug Creek, and went from there to Hillston;—is it good country? The hills and falls to Lake Cudgellico are good country.

944. That would be a shorter route than going by way of Lake Cudgellico? Yes; but speaking generally I should prefer the route from Wyalong to Cudgellico as going through a great deal of good country.

945. You think that the Lake Cudgellico district is one which ought to be accommodated with a railway? Yes; there is a great deal of good country around Lake Cudgellico.

946. You mean that instead of going by Humbug Creek and over to Hillston it would be worth while to go further north and take in Lake Cudgellico? I think it would be.

947. But Lake Cudgellico at present is not prosperous agricultural country? I do not think it has been developed to a great extent, but I think there is a great deal of country that could be. It would depend upon the season. In a season like that of last year there would be no crop at all—the soil is rich enough.

948. Then, comparing the two lines, Temora to Wyalong, or Koorawatha to Wyalong, which do you think the better route? I think the line from Koorawatha to Grenfell would pass through a larger area of wheat-growing country.

949. Would you point out on the plan where this great field of agriculture lies? It is bounded on the north by a range north of Grenfell. Then there is the Weddin Mountain. Then from Koorawatha to Grenfell, in a direct line and about 10 miles north, and the whole way down to Young, is all good country, suitable for agriculture, with a good rainfall.

950. What is it like on the western side of Grenfell? It is good country on the western side of Grenfell for 10 miles; then it pans out into open plains, much the same as the country past Narrandera. You get on to box timber country towards Wyalong.

951. Between Grenfell and Wyalong what area is available for agriculture? To the west of Grenfell 10 miles; then it is open plain.

952. Is it good wheat country? No.

953. For how many miles? About 15 miles.

954. Till it reaches Bland Creek? Yes. Then from there to Wyalong it is box country, which is suitable for agriculture. The hills between Wyalong and Cudgellico are basaltic, and very rich soil; but

none

none of the country passing from Wyalong towards Cudgellico can be compared with the good country between Grenfell and Wyalong. Millions of acres there could be cultivated. The soil is rich enough to grow anything; but, in a season like last year, they would not get their seed back again. Just below Condobolin 25,000 skins were sent from a station last year. As soon as the Weddin Mountain is left it is practically a level country all the way. There is only the Bland Creek to cross.

955. The Government in submitting this line to us say that the line will cost £180,000, and the Railway Commissioners say that the loss per annum will be £3,300 upon the line,—do you think that instead of getting to Hillston by way of Euabalong and Lake Cudgellico it would be better to make a railway by way of Grenfell and Wyalong to Hillston;—would it be a better and more remunerative line than the one proposed? I would not undertake to say that from Wyalong there would be no loss on the railway; but I think it would supply a very much larger area, and there would be a much greater traffic. It would be as two to one as compared with what there would be on the other lines.

956. The line is submitted to us under these conditions:—It will form a direct line to Hillston; and, seeing that Hillston is the point to be ultimately reached, do you think that if we made a start by way of Grenfell to Wyalong we should have a paying instalment of the line to begin with? I am quite sure of it. I believe that the railway from Koorawatha to Grenfell would be a paying line.

957. You believe that it would be a paying line at the start, and that the other would be a losing line? The line from Molong to Forbes, which passes through 20 miles of ironbark country with cuttings 15 feet deep, Mr. Eddy told me, was one of the few branch lines which paid; and the traffic on this line you suggest would be quite equal to the traffic on that line.

958. With regard to your idea of putting weirs between Condobolin and Euabalong, will you give us a little more information on that point? I have brought a photograph of some weirs on the Darling, 200 feet wide; those on the Lachlan would require to be only 100 feet wide. Those on the Darling cost £20,000. The weirs on the Lachlan, I estimate, would cost £10,000 each. I think that the river affords special advantages for canalisation, and that it might be used as a feeder to the railway of Condobolin and Forbes. Between Forbes and Condobolin line, the richest part of the river is almost shut off from the railways. My idea is that the river should be locked all the way from Forbes down to Euabalong.

959. The weir erected near Bourke was regarded as an experiment? Yes.

960. Has it been successful in regard to throwing the water back? I believe it has; but I have not seen it.

961. If the river were made navigable to that extent, it would serve the people on both sides? Yes. Expensive bridges would have to be built here and there, to afford the people on the south side the means of getting to the railway line.

962. Otherwise the people on the south side would have no benefit from the railway at all? No.

963. Has this line from Condobolin to Euabalong anything to recommend it, without regarding it as part of a possible extension? Not unless it could be very cheaply made by keeping wide of the river; but I do not think there is any agricultural land on the river.

964. Are you engaged in farming at all? Yes; and I have an irrigation plant. That is for lucerne, and growing oats for fodder. On account of the distance from the railway, it would not pay to grow wheat. I put the oat crops in in October, and in the drought of 1888 I produced splendid crops by irrigation.

965. Has your experience in regard to irrigation experiments been satisfactory? Yes, decidedly so; especially in a district where it means the absolute devastation in a time of drought like last year.

966. To what extent do you think you could profitably engage in it? I think, with the means of communication, I could go into fruit-growing. Oranges do magnificently.

967. But with regard to providing fodder for stock, to what extent could you profitably engage in irrigation in dry seasons? To an almost unlimited extent. In one system that I spoke of they grew 5,000 tons of lucerne last year.

968. I have always understood that irrigation has only been carried on remuneratively for the purpose of sustaining small numbers of stock during dry weather and that it would not pay to engage in it to a large extent? No, I do not think it would; the price of stock is too low. I think it would have paid last year because many people throughout the country have been feeding their stock on molasses, carting it hundreds of miles. At Wyalong they had to cart lucerne 40 or 50 miles, it having come from Maitland. If that lucerne could have been got anywhere near Wyalong it would have been much cheaper. I do not think that any system of irrigation, where the water has to be lifted by steam power in a country like this, will ever pay. I have been using one of the largest plants in the Colony for the last ten years.

969. You are of opinion that if you had to pump water it would not be remunerative? For my garden alone I pumped 6,000 tons of water per diem.

970. What is the area? Three acres. The water has to flow through a channel a distance of half a mile before it reaches the garden, and owing to the heat and absorption 75 per cent. of it is lost.

971. With regard to the question of irrigation how would you deal with good and bad seasons? I keep my irrigation plant entirely as an insurance. In good seasons I lay it up.

972. That is all very well with regard to carrying it on in a small way, but if you attempt to use it for large crops a drought will be upon you before you can get the crops in? That is the difficulty. The drought comes upon you unawares, and when the country is absolutely bare it is almost useless to pump the water upon it. In the winter months you can produce nothing, and I have to give it up. I think that a large number of stock can be kept alive by the irrigation plant being kept going in summer for crops, then distributing the hay in bad times, because lucerne hay can be kept for twenty years, and a pound of hay will keep a sheep alive.

973. Then with regard to the question of irrigation and growing cereals, does it not resolve itself into this: that whether it is for pastoral occupation or different purposes of growing cereals the great thing you have to look for is a regular fair rainfall? Yes. No one would irrigate if he had a rainfall.

974. It necessarily largely increases the cost of production? Yes; and as it does that it must considerably handicap the producers? I do not think anyone would go in for irrigation if he could get into country with a fair rainfall. If water could be brought by gravitation they would have a great advantage. I am quite sure that those who have water could grow lucerne, store it for ten years or longer, and, if it has not been deteriorated by mice, use it and save their stock. If it pays to cart molasses and chaff as they have been doing it would pay better to grow stuff on the spot.

975. In that wheat-growing district in and around Grenfell could you say how many crops could be relied on

J. B. Donkin,
C.E.
14 Sept., 1897.

- J. B. Donkin,
C.E.
14 Sept., 1897.
- on according to your experience? I think that not more than 1 in 20 would fail as regards rainfall. I could not say how long the soil will hold out with continual stocking.
976. I suppose that in a doubtful season a farmer would have the opportunity of allowing his land to lie fallow as it is of no use trying to grow wheat without rainfall? Certainly not.
977. *Mr. Lee.*] What is the distance to Grenfell from Koorawatha? I should say from 30 to 35 miles.
978. Then your figures as to 45 miles would take in that piece of country? Yes.
979. You say that the proposed extension from Condobolin to Euabalong is 48 miles? Yes.
980. Do you know that country? Yes.
981. Do you know the Grenfell country? Yes.
982. In what district would it be most remunerative to the country to make the line from Condobolin to Euabalong, or Koorawatha to Grenfell? I do not think there could be any comparison; undoubtedly the line to Grenfell would be the most advantageous.
983. Presuming that it will be the policy of the country in years to come to extend that Condobolin to Euabalong line on to Broken Hill, do you hold the opinion that if that is extended it will still be necessary to make an extension into the Grenfell country? I think that sooner or later there must be a line of railway to Grenfell.
984. Do you think that the conditions of agriculture at present, and the prospective outlook are such that the railway freight in wheat would be so large as to demand an extension to Grenfell? I do; and I believe that the railway to Grenfell would pay expenses at once.
985. Supposing it is desirable to get by way of Euabalong to Broken Hill and the South Australian border, are you of opinion if that policy is adopted it will still be necessary to make a railway into the Grenfell country? I am.
986. You do not think the two projects would clash? No.
987. Supposing there is sufficient land between the two lines which would throw the natural trade of one side to one line, and of the other side to the other line, would there be enough trade for both? I think there would be.
988. As far as Grenfell is concerned, you are strongly of opinion that the railway will pay as far as Wyalong; then the question of the extension beyond Wyalong you are of opinion could be dealt with in the future? I believe, as far as the country is concerned, that it is richer between Wyalong and Hillston than on any other line going by Euabalong to Broken Hill.
989. Do you think there is any immediate necessity for the extension of the railway to Hillston? I do not.
990. Do you know that the immediate necessity is to reach the productive forces of the country near the main line? Yes.
991. Once you get beyond that point into a pastoral country, do you not think that the extension of the Condobolin line would give the pastoralists in that direction all the benefit it is possible to give them, so long as Victoria allows them that rebate? I do not think that Victoria gets the trade from Euabalong—the traffic comes to Condobolin.
992. A great deal goes to Victoria from Hillston and Willandra? The railway to Hay taps the traffic.
993. You say that is the proper way to reach Hillston? No, not a line from Hay. If an extension is taken to Hillston, I should prefer a line to Cudgellico; but I do not think the Victorian railways affect the country to any great extent as far as Hillston.
994. We are informed that it is within the rebate limit? The traffic must be carried by Hay and Juneec down to the border; they cannot get to Victoria without getting down the Hay railway. I fancy that, as a rule, a very large percentage of the traffic comes by rail to Sydney. I do not think that a railway in the Lachlan district would enter into competition with Victoria. At the same time, a railway to Hillston would open up a great deal of country, and would serve a large agricultural district near Gunbar.
995. If it is decided to take a line from Koorawatha to Hillston eventually, and from Grenfell to Wyalong at present, there would be no very grave mistake made in selecting that route? None whatever.
996. But you are of opinion that at present there is no immediate necessity for an extension to Hillston? I think not.
997. But you are of opinion that there is immediate necessity for an extension to Grenfell and Wyalong? Yes, I think so.
998. *Mr. Hassall.*] Do you know anything of the minerals in that part of the country? I think that Wyalong and Yalgogrin will be large mining centres, and the district around Lake Cudgellico. I do not think that part of the country is thoroughly developed yet.
999. Do you think there is room for a large mining population in that part of the Colony? Wyalong has a population of about 5,000, and I think it will go on increasing.
1000. Is there a probability of further discoveries in that locality? Payable reefs have been found round Wyalong.
1001. Do you think that if a railway were constructed there it would tend to its further development? I think it would.
1002. In all probability we should attract more capital? I think that richer mines will be found there than have been found up to the present.
1003. *Mr. Roberts.*] From a return placed before the Committee from the Statistician's Department, I find that the total number of bushels of wheat produced in the Grenfell district in 1895 was 23,603, and in 1896 213,000? Yes; in 1895 they had a considerable area under crop, but last year they had a magnificent crop.
1004. Could you explain the reason of the difference? 23,000 bushels looks a very small production, but I have known it to be 70 per cent. less than what it was last year. At the end of 1895 many of the farmers did not get their seed back. Last season was a very good season indeed. The crop of 1895 failed through the absence of rain in July and August.
1005. I thought you said that the rainfall at Grenfell was remarkably regular? So it is. I have never known the crops to fail there before.
1006. It was an exceptional year? Yes.
1007. I notice also that there were 6,000 acres more under wheat in 1896 than in 1895? Yes.
1008. And that the total area cultivated in 1895 was 21,000 acres as against 25,000 acres in 1896;—are you aware of that? I was not. I think there will be an increase of 10,000 acres this year.

1009. Do you think that if Grenfell had the advantage of railway communication there would be a still further increase in the area of wheat land under crop? I think it would be more than doubled. J. B. Donkin,
C E.
1010. Is there much maize grown about Grenfell? Very little.
1011. For 1895 the yield of maize amounted to 5,320 bushels;—in 1896 it suddenly fell to 2,556 bushels? 14 Sept., 1897.
- The maize crop is put in in December, and in 1895 it was a very dry time.
1012. The area under maize was 999 acres in 1895, and only 590 in 1896? Yes; it is a wheat-growing district, not a maize-growing district.
1013. From your knowledge of the country, if the railway is ultimately taken to Hillston it does not matter whether it goes by Wyalong or Euabalong? No.
1014. Do you think it is desirable that Hillston should have railway communication in the near future? I think it would be the best point on the river, because south of Hillston there is a large wheat-growing area.
1015. Would not New South Wales get a large quantity of wool by that route which now goes to Melbourne? I do not think so. I think it must come by railway now.
1016. Does not a large quantity of Hillston traffic find its way to another colony? I do not think so. It would have to pass along the Hay line and come down to Albury. The wool would have to come by our railway under any circumstances.
1017. *Chairman.*] Nearly all the wool goes to Melbourne from there? It may be shipped to Melbourne, but it must come down on our railways.
1018. Willandra sends wool to Melbourne and the Mount Hope wool goes to Melbourne? Then there would have to be sufficient river to take it down from Hay.
1019. *Mr. Roberts.*] If it is found desirable to make a line from Koorawatha to Grenfell and from Grenfell to Wyalong, would you think it an advantage to go by way of Bimbi, or would you go direct from Grenfell to Wyalong? I think the route from Grenfell to Wyalong is a very easy route. Coming down by the south end of the mountain you would make it very much longer.
1020. Is there much settlement about Bimbi? Not a great deal. They would not be a great way off a railway even then.
1021. How far off would they be? About 10 miles.
1022. *Chairman.*] With regard to the traffic which would be obtained on the line from Wyalong to Hillston, is it your opinion that some of the western wool would be obtained? I have no doubt that it would all come that way. They would have to go 80 or 100 miles to Hay by land carriage, and I do not think they would ever do that.
1023. From Wyalong to Hillston, although the country is subject to periodical droughts, you think that cultivation would be fairly successful? Yes.
1024. Do you think that if a railway were made farms could be obtained? Yes.
1025. And that the land from which the State is getting nothing, and which is a breeding place for dogs, rabbits, and vermin, would become an area that would produce a reasonable return? Yes. I think a very large area could be taken up and cultivated.
1026. Then you believe it would be unwise for the State to build a railway? I was speaking of the conditions existing now. Of course I think if inducements are given in the shape of railway communication many people would take up land. I would not absolutely say that it would be a success, because so much would depend upon the seasons. We might have ten good seasons, and it would be a great success; we might have four or five bad seasons, and the farmers would be ruined.
1027. Would a railway to Wyalong intercept more western trade than a line to Euabalong, and thus redeem some hundreds of thousands of acres of land fit for growing cereals, which must remain useless to the country unless a railway is built? I feel certain that the land will remain as it is unless a railway is taken through there.

Ebenezer Glencross Grant, sworn, and examined:—

1028. *Mr. Hoskins.*] We are considering a proposal to make a railway from Condobolin to Euabalong;— do you wish to express your views as to the propriety of the construction of this proposed line? I should prefer to answer any questions. I was asked to come and give evidence from my knowledge of the country. E. G. Grant.
14 Sept., 1897.
1029. What do you think of the proposal to make a railway from Condobolin to Euabalong? I do not know what object it is going to serve. The country beyond Condobolin is not country that will bring much traffic to the railway unless it goes further; it is mostly pastoral country. I do not think that it would be conducive to the making of anything like a paying line.
1030. Do you think that such a line should be part of any other line? It might be part of an overland system if the intention were to reach the far west, but I should prefer to see a line on the south side of the river; it is better land there, land that would bring more traffic to the railway.
1031. That would necessitate making a bridge across the Lachlan, would it not? Yes. If the railway were to be made on the south side of the river it might cross anywhere beyond Condobolin, but I do not believe in the proposal. You can take it through better country by another route that would tap the good land.
1032. In which direction would you like to see the railway constructed? The railway might be extended from Temora, or any point on the Blayney and Harden line south of Cowra, after you cross the river.
1033. Then you might take it further west afterwards? It ought to be taken as far as Hillston.
1034. Is it your opinion that if a railway were extended to Hillston there would be a large trade from Hillston? Yes; I think a very fair trade.
1035. What would be the character of the trade? Almost entirely farm produce; there is a large farming centre round Hillston. The line would gather traffic right along from the very start. There is no question about the amount of agriculture there would be at the end of the line if Hillston were made the destination, *via* Grenfell and Wyalong.
1036. Are there many persons settled about Hillston? There are about 15,000 acres of cultivation at present between Hillston and Gunbar.
1037. Where do they find a market for their produce? A great deal of their wheat goes to Carrathool, on the southern line.
1038. How far is that from Hillston? Seventy-two miles. It is a bad road. I do not think an adjective strong enough to express it has been invented. 1039.

- E. G. Grant. 1039. Then you are of opinion that if it is considered desirable to have railway construction carried down the western districts, Hillston is the principal place to go to, and that it should not be in the direction of Euabalong but *via* Grenfell and Wyalong? Yes; there is good country all the way on that route.
- 14 Sept., 1897. 1040. Are there many people settled in that tract of country between Grenfell, Wyalong, and Hillston? There is a great number settled on the Grenfell and Wyalong route, and there is a great deal of farming going on. It has sprung up there during the last three or four years.
1041. Is there much land to be taken up between Wyalong and Hillston? Yes; there are millions of acres of good agricultural land.
1042. Do you think there would be an inclination if a railway were constructed to take up the land? I am certain of it.
1043. I suppose the land is all occupied for grazing? There is a great deal of abandoned country.
1044. Why is it abandoned? Rabbits have taken possession of some of it. There have been bad seasons, but rabbits have been the principal trouble.
1045. Would not that trouble exist even if the land were taken up by farmers? No.
1046. Do not farmers complain of the devastation of rabbits? Practical farmers are not afraid of rabbits.
1047. Is there not a great deal of scrub country between Wyalong and Hillston? Yes, scrub and mallee; but that is the best country.
1048. Are there many people taking up that land and utilising it for agricultural purposes? Some of it.
1049. How does it answer? They are getting first-rate results from the mallee land that has been taken up.
1050. Then you express the opinion of the people in that locality when you say they will be glad to see the extension of the railway *via* Wyalong down to Hillston? Yes, undoubtedly; I speak from local knowledge obtained in the district. I am a resident of Sydney, but I make frequent visits to that district; my business takes me among the farmers.
1051. Have you been there lately? I was there in the first week of August.
1052. Do you do business there? Yes.
1053. Do you receive consignments from there? No; the wheat which they grow is taken to Carrathool. The farmers are shut out from any market on account of the expensive carriage; they only grow supplies for local consumption.
1054. We have been told that the country between Wyalong and Hillston is so very dry that farming cannot pay? The rainfall is small, but I do not hold the view that a great many do in regard to rainfall. We have to take into consideration the nature of the country as well as the quantity of the rainfall. Hillston last year had 13½ inches of rain, and they had an average of 13 bushels of wheat to the acre, whilst Condobolin, with 20 inches of annual rainfall, had practically a failure of the crops. At Cudgellico the crops were worse than they were at Hillston, and they had a greater rainfall.
1055. Is there a flour-mill at Hillston? Yes; it is running nearly all the year round.
1056. You think that the proposed railway from Condobolin to Euabalong will not accommodate a very large population, whilst if a railway is constructed from Grenfell by Wyalong to Hillston it will provide railway accommodation for a much larger number of settlers, and will attract settlement? Yes. If the railway is made to Euabalong it will serve very little country which the Condobolin line at present does not serve. Then there are only about three men interested. They are going in for farming around Euabalong and towards Cudgellico. It will not serve the Hillston country, because they are as far from it as they are from Carrathool. They would as soon go to Carrathool as to Euabalong, as they have the advantage of water carriage to Melbourne and railway carriage to Sydney from there.
1057. *Mr. Humphrey.*] What is your business? I am manager for Massey, Harris & Co., Limited, Canada.
1058. Have you travelled over the country between Koorawatha and Wyalong? Yes; I know the whole of that country fairly well. I have gone to Wyalong *via* Temora and Barmedman.
1059. Has your business at Hillston increased since 1895? Yes; it has increased all the time.
1060. Did you visit that district in 1895, in 1896, and this year? Yes.
1061. Have you observed the area under cultivation? Yes. I was told that a larger area is going under cultivation this season.
1062. How did you arrive at that 15,000 acres? I know a gentleman who collects the statistics, and he gave them as 14,600 acres for this year.
1063. You think that there has been an increase of 100 per cent.? No; I think there must be something wrong in the figures for 1896 if they stand at 8,000, because they ought to be much higher.
1064. Do you know the country between Grenfell and Wyalong? Not very well. I have a fair idea of the nature of the country. I have travelled through from Grenfell to Forbes, but I have never been from Grenfell by way of Marsden or Wyalong.
1065. How far from Grenfell does the agricultural area cease? In travelling towards Forbes we go through good agricultural country for 10 miles.
1066. And due west? I have not been right through to Wyalong by that route.
1067. You do not know the distance that the good land extends from Grenfell? No. I have always been given to understand that it was fair country right through. It is better country at Wyalong and Grenfell, but fair country right through, and what in a few years we shall call good country.
1068. Have you travelled from Wyalong to Hillston? I have travelled to Cudgellico.
1069. Can you tell us where is the good land? I would call it all good from Wyalong to Cudgellico, and fair agricultural country right through. There are places where there is scrub, but I should call it good right through.
1070. You said that from Temora to Hillston would be a good route for a line? Yes; I meant by Barmedman and Wyalong.
1071. You did not propose to take the southern line indicated by the red dotted line on the map? No; if the line were going west at all it ought to be somewhere near Cudgellico.
1072. Is there not a large area of land available between Wyalong and any of the points you mentioned? Yes; large quantities of land from Wyalong to Condobolin and between Wyalong and Temora; but there are greater facilities for taking it up further west.
1073. Have you estimated what the probable cost would be for carriage to Hillston direct to Sydney, and by team to Carrathool down the river? It would be largely in favour of the railway, because wheat

- is carried at such a low rate. The rate from Hillston would be about 16s. a ton to Sydney. They cannot carry it for anything like that by road and rail to Sydney or Melbourne, or by road, river, and rail. E. G. Grant.
1074. Can you say whether there is any increase in agriculture at Cudgellico? There is very little there. 14 Sept., 1897.
1075. You have been to Condobolin? Yes.
1076. Can you say whether there has been a large increase at Condobolin? There is not any increase this year, but Condobolin has been passing through three very unfortunate seasons, and has suffered severely from drought. Yet Condobolin has 6 inches more rainfall than Hillston.
1077. Is the district round Condobolin better adapted for agriculture than the district round Euabalong? It is excellent agricultural land, but it wants more rain. It is not as retentive of moisture as the land further west. In considering rainfall, you have to take into account the nature of the soil.
1078. You say that at Hillston, with less rainfall, the land is equally adapted for wheat cultivation? Yes; because the soil is more retentive of moisture.
1079. Will you explain why a less rainfall at Hillston would produce as good a result as a greater rainfall at Condobolin? Perhaps because the land at Hillston is peculiarly retentive of moisture, so that cereal crops can thrive at Hillston on a less rainfall than they would require at Condobolin. At Condobolin the water gets away more freely than it does at Hillston. At Hillston last year they grew a large crop with 9 inches of rain, getting 13 bushels to the acre. In other places, with a 9-inch rainfall, there would have been no crop at all.
1080. You say that round Hillston the land can be used for agricultural purposes with a very small rainfall? Yes; very small rainfall.
1081. That is your reason for advocating a railway to Hillston? Yes.
1082. That the crops there would be more certain, even with an apparently insufficient rainfall? Yes; even in the last three seasons, which have been admittedly bad seasons, they have had crops that paid them, and when they had practically no rain at all they got 9 bushels to the acre.
1083. *Mr. Clarke.*] You say that at Hillston they had good crops in comparison with Condobolin, where the rainfall was larger? Yes.
1084. You attribute that chiefly to the retentive soil? Yes.
1085. Does it not sometimes happen that rain falling at regular periods is more conducive to the growth of cereals in one district than in another? Yes; but they had a very small rainfall in the growing portion of the year, from May to November.
1086. You heard what Mr. Donkin said? Yes; he approved of the line of railway from Koorawatha to Hillston.
1087. Do you approve of that, or do you prefer one to come from Young and on to Grenfell and Wyalong? No; I approve of it going on from any point south of the river at Cowra, or south of Koorawatha. It is a little nearer, and will serve all interests.
1088. I understand that the land under cultivation at Grenfell is on the share system? Yes; the large areas.
1089. That seems to suit both the landlord and the tenant? Yes.
1090. But if land were available towards Hillston, would it be taken up by farmers? Yes; by a class of people who would farm on the halves system.
1091. You think there would be a large settlement all over that country? Yes.
1092. You think it would be to the interest of the public to have a line of railway to enable the present settlers to get their produce to market? I do.
1093. I suppose there are no great engineering difficulties in the way? None at all.
1094. You stated that the country at present is not very much occupied by squatters in consequence of rabbits and other pests? A great many runs have been abandoned.
1095. Was that the sole reason? I should not like to say that.
1096. *Mr. Fegan.*] Do you represent the same company that you represented when you were here before? No; I represent another company.
1097. Do you know much about Cudgellico? Yes; I know it fairly well.
1098. But for the rabbit pest, that is very good country? Yes; very good country.
1099. Is it not a fact that in dry seasons they take cattle down to Cudgellico, where there is plenty of grass? There is generally a fair quantity of grass.
1100. And as a rule, a fair quantity of water? Yes; but the Lachlan there last year was practically a string of water-holes.
1101. Would it surprise you to hear that they have not only grown 13 bushels to the acre, but that we have had in evidence that they have had 28 bushels to the acre in that district? I should not be at all surprised. Mr. Campbell has a farm near Euabalong, and he has a fair crop every year.
1102. Were it not for the rabbits, that country would be good agricultural country? Yes.
1103. Do you know Merri Merrigal station? Yes.
1104. Is it good country? Yes; most of it.
1105. Which would be the better route on which to construct the line to deal with the traffic from Hillston and Cudgellico? A line from some point on the Blayney line.
1106. Do you know Wyalong very well? I have been there three or four times.
1107. There is not much agricultural country about there? There is quite a large area now.
1108. Between Hillston and Wyalong, what kind of country is it? Good agricultural country nearly all the way. There are patches not very good, but taking it all through it is fair agricultural country.
1109. Do you think there is any prospect of the proposed line from Condobolin to Euabalong paying? I do not.

WEDNESDAY, 15 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. JAMES HOSKINS.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WEIGHT, Esq.
 FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

Charles Edward Rennie, Chief Draftsman, Department of Lands, sworn, and examined:—

C. E. Rennie. 1110. *Chairman.*] What are you? Chief Draftsman in the Department of Lands.

15 Sept., 1897. 1111. *Mr. Humphery.*] Have you brought a map showing the character of the land between Condobolin and Euabalong, between Koorawatha and Hillston *via* Grenfell, and between Young and Hillston? You mean the tenures.

1112. The tenures and the character of the country? I have not sufficient information to show all that.

1113. Are you able to distinguish the pastoral lands from the agricultural lands? Hardly that. I can give you the different classes of tenure; but we could not distinguish on our maps the pastoral and agricultural tenure.

1114. Will you explain your map? Yes. The map shows the lands for 20 miles on either side of the northern line from Koorawatha *via* Grenfell to Wyalong; the same with regard to a southern line from Koorawatha to Wyalong; the same with regard to a line from Condobolin to Euabalong, from Temora to Hillston, and from Temora to Cudgellico.

1115. Commence by stating the tenure of the holdings for 20 miles on either side of the line between Condobolin and Euabalong? The alienated land within 20 miles on either side of the trial line from Condobolin to Euabalong is 450,030 acres. The area held under settlement and improvement leases is 190,500 acres. There are 173,270 acres of reserves, and 741,460 acres of Crown lands.

1116. Can you say how many holdings there are? I can give the tenure, but have not the number of holdings. Of holdings under leasehold, the leases of which will expire between now and the year 1900, there are in the Central Division 122,030 acres. The area held under leasehold, the leases of which will not expire until 1918, in the Western Division is 236,470 acres; 142,180 acres are held under occupation license, and 240,780 acres are untenanted.

1117. Can you say why it is untenanted? Probably on account of its being found unprofitable, in consequence of scrub, rabbits, and low rainfall.

1118. Is there any power of resumption in the Western Division? There is within a radius of 10 miles of any township of 50 inhabitants or over.

1119. Can you tell us how many holdings there are within 15 or 20 miles of Condobolin to the west? It is practically impossible for us to say.

1120. You have no means of obtaining that information? Not accurately.

1121. Is that all the information you can offer to the Committee in regard to the extension from Condobolin to Euabalong? That is all the information that I have with regard to the tenures of the land.

1122. Will you give the Committee similar information as to the tenure between Euabalong and Hillston? I have not got that prepared; that is not one of the lines for which information was asked.

1123. Have you information upon that subject within 20 miles of Hillston? I have information respecting the tenures within 20 miles on each side of the line from Temora to Hillston.

1124. I was speaking of Hillston as the objective point? I have the information only in the totals for the whole route across from Temora to Hillston. From Temora, *via* Barmedman, straight across to Hillston: within 20 miles of each side of that line there are 1,098,030 acres of alienated land; of land held under settlement and improvement lease, 269,470 acres; of reserved land, 727,930 acres; and of Crown land, 1,783,360 acres. The particulars of that Crown land are as follows:—In the Central Division, 816,100 acres under pastoral leases; in the Western Division, 133,930 acres held under pastoral leases, the former being available between now and the year 1900, and the latter not until 1918; the area held under occupation license is 292,090 acres, and the area untenanted, 541,240 acres.

1125. Now, will you give us the tenures of the line *via* Wyalong? Within 20 miles of each side of the line from Temora *via* Barmedman and Wyalong, and across to Cudgellico, there are of alienated land, 1,029,360 acres; land held under settlement and improvement leases, 147,490 acres; reserved land, 515,490 acres; Crown lands, 1,259,470 acres. That Crown land is made up as follows:—In the Central Division, under pastoral lease, 656,410 acres; in the Western Division under pastoral lease, 81,370 acres; the former becoming available between now and the year 1900, and the latter not till the year 1918. The area held under occupation license is 226,850 acres; the area untenanted is 294,840 acres.

1126. What proportion of the land which you have described would be included in the route previously dealt with? I could not tell you without figuring it out.

1127. Would a very large proportion of it be served by a railway between Barmedman and Hillston? Roughly speaking, about two-thirds of it.

1128. Will you describe the line and the tenure of the lands from Koorawatha, *via* Grenfell and Wyalong to Hillston? There are two lines *via* Grenfell to Wyalong, from Koorawatha. I have information only respecting the line from Koorawatha to Wyalong, *via* Grenfell, but not going on to Hillston. My information does not extend more than 20 miles to the west of Wyalong. The figures are as follows:—Alienated land, 1,186,230 acres; land held under settlement and improvement leases, 58,440 acres; reserved land, 400,680 acres; Crown lands, 68,890 acres. Between Grenfell and Wyalong there is another line deviating to about 12 miles south at its furthest point from the one I have referred to—it goes from Grenfell to Wyalong. We got this from the railway authorities, who showed us these trial lines. I have got the information respecting both. For the southern line, that is a line from Koorawatha to Grenfell, and then south to Wyalong, the figures are as follows:—Alienated land, 1,156,460 acres; land held under

under settlement and improvement leases, 55,420 acres; reserved land, 386,980 acres; Crown lands, 450,170 acres. That Crown land along these two lines is held as follows:—Northern line under pastoral lease, 380,460 acres; occupation license, 65,580 acres; untenanted, 22,850 acres. Along the southern line under pastoral lease, 365,030 acres; occupation license, 62,290 acres; untenanted land, 22,850 acres. That is all the information that I have got out as regards the tenure of land along these lines.

C. E. Rennie.
15 Sept., 1897.

1129. That is all the information that you are prepared to give the Committee? Yes; I might mention that there is a very large area of abandoned holdings.

1130. Can you say approximately the area of the abandoned holdings? Between 700,000 and 800,000 acres. That is in the country between 20 miles north of the line from Condobolin to Euabalong and 20 miles south of the line from Temora to Hillston, and between Wyalong on the east and Hillston and Euabalong on the west. Between those limits there are between 700,000 and 800,000 acres of abandoned country.

1131. Can you say why that country has been abandoned? I believe largely on account of scrub and rabbits.

1132. How many miles of the route that you first described between Barmedman and Hillston would run through untenanted country? I do not know what the length of the line is. I should have to find that out.*

1133. You could not give that information with regard to any of the indicated lines? Not without a great deal of trouble.

1134. *Chairman.*] What area of land is there running west from a line running north and south to Wyalong to the Lachlan and Cudgellico and Hillston? I should have to find that out.†

THURSDAY, 30 SEPTEMBER, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Euabalong.

Joseph Clarke, Inland Mail Clerk, Postal and Electric Telegraph Department, sworn, and examined:—

1135. *Mr. Lec.*] How many mail services have you running on the route of the proposed extension from Condobolin to Euabalong? We have two services, one on each side of the river.

J. Clarke.

1136. Take the one on the north side first? That goes from Condobolin to Cugong, and Euabalong along the north side of the Lachlan River *via* Kiakato. It is 45 miles, twice a week; two-horse coach; cost, £58 10s.

30 Sept., 1897.

1137. What is the route of the service on the south side of the river? From Condobolin and Wardry to Euabalong, 45 miles; twice a week; two-horse coach, £70. These are the only two lines going from Condobolin to that point.

1138. Are there portions of the service going beyond Euabalong? There are services beyond Euabalong, going to Hillston, but Euabalong is the terminus of these two contracts.

1139. It is proposed to make the line on the north side of the river, so I presume that the service would have to be discontinued on that side if the railway were made? Yes.

1140. Do you think that the one on the south side would have to be discontinued? It is just possible that it would, because they might get their mails more conveniently from the railway.

1141. What is the object in having a service on each side of the river? It affords Euabalong a mail four times a week. If they had platforms on the railway, people might prefer to get their correspondence from there.

1142. You would have to provide some branch mail service? It might be continued in some way, but it would not be if you could possibly help it if there were a railway.

1143. You are not in a position to give a definite opinion as to whether the southern line would be discontinued? No.

1144. You are quite certain about the northern service? Yes.

1145. Then as the railway charge would be £540, you would practically be paying an additional £481 10s. a year to take the mails? Yes.

1146. Is there any movement in your Department to have these mails concentrated, so that one service will do all the work instead of two? I am not aware of any.

1147. If there is not, the inference would be that there is a necessity to keep up both these lines, and if the railway usurps the coach traffic in the north, you will still have to keep up your coach line on the south? It is just possible.

1148. Is there much mail matter carried on these lines? It is not a very heavy mail; it is a fair mail, because it goes from Euabalong towards Nymagee and Lake Cudgellico once a week, and to Hillston twice a week.

1149. Euabalong is an unimportant place? Comparatively so, I think.

1150. What is the revenue of the Euabalong Post Office? £180 a year.

1151. Do you know whether settlement has been increasing in that direction to necessitate the establishment of a post office during the last few years? Not out of Euabalong.

1152. Are the mails frequently delayed between Condobolin and Euabalong? After heavy rains they are delayed, not otherwise.

1153. Taking the year round, the mail service is carried out very regularly? Yes.

* NOTE (on revision):—For about 60 miles east of Hillston there are along the route, and within 20 miles of each side, a total area of approximately 500,000 acres of untenanted country.

† NOTE (on revision):—The area of Crown land within 20 miles north of the line Wyalong to Cudgellico, and 20 miles south of the line Barmedman to Hillston, and between a line north and south through Wyalong and the Lachlan River, is approximately 2,490,700 acres, of which about 575,900 acres are reserved.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Condobolin to Euabalong.

APPENDIX.

A.

[To Evidence of H. Deane, Engineer-in-Chief for Railway Construction.]

ESTIMATED COST AND LENGTH OF LINES TO HILLSTON.

Railway Construction Branch, Public Works Department, Sydney, 29 September, 1897.

Condobolin to Euabalong Line.

I AM directed by the Engineer-in-Chief to forward herewith a statement giving the information asked for in questions 70 and 71 of his evidence before the Public Works Committee.

E. HUNGERFORD.

The Secretary, Public Works Committee.

APPROXIMATE estimated cost of lines to Hillston.

Name of line.	Length, miles.	Estimated cost	Average per mile.
		£	£
Temora to Barmedman	23	52,900	2,300
Temora to Wyalong	40	92,000	2,300
Barmedman to Hillston direct*	130	299,000	2,300
Wyalong to Cudgellico	69	158,700	2,300
Cudgellico to Hillston	54	124,200	2,300
Cudgellico to Condobolin	59	135,700	2,300
Wyalong to Grenfell	58	145,000	2,500
Grenfell to Koorawatha	29	72,500	2,500

* Additional length of 8 miles allowed to get an easy line, as per Mr. T. Kennedy's report, 23rd December, 1893.

Distances.

Orange to Hillston, <i>via</i> Molong and Parkes, Euabalong	251 miles.
Sydney to Hillston <i>via</i> Temora, Southern route	449 "
Sydney to Hillston <i>via</i> Temora, Western route	506 "

Blayney, Koorawatha, Wyalong direct is the shortest and probably through the best country, but *via* Condobolin and Cudgellico nearly as short. Grades of new line about the same in both cases.

H. D., 29/9/97.

A1.

OFFICIAL DESCRIPTION OF THE PROPOSED LINE.

Railway Construction Branch, Public Works Department, Sydney, 25 October, 1897.

Condobolin-Euabalong Railway.

I AM directed by the Engineer-in-Chief to forward herewith a description of the above line, which was inadvertently omitted to be handed in when he was giving his evidence.

E. HUNGERFORD.

The Secretary, Public Works Committee.

Condobolin to Euabalong Railway.

(Length, 48 miles 8 chains. Estimated cost, £108,225, or £2,250 per mile, exclusive of land and compensation.)

THIS line is an extension westward of the Parkes to Condobolin railway, now under construction. It begins at 320 miles 62.50 chains from Sydney, and skirts to the north the maximum flood area of the Lachlan River, bearing slightly northwards for that purpose up to 355 miles. The Cugong Range is crossed at 359 miles, when the line takes a slightly southerly course towards Euabalong, terminating at the Mount Hope-road at 377 miles 70.50 chains.

The country is flat almost throughout, 1-in-100 grades being used.

H. DEANE.

18 June, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM CONDOBOLIN TO EUABALONG.

REPORT.

THE Sectional Committee appointed on Friday, 17th September, 1897, to inspect, take evidence, and report with reference to the proposed Railway from Condobolin to Euabalong, have the honor to report to the Parliamentary Standing Committee on Public Works that they left Sydney by train at 8 p.m. on Friday, the 24th September, and arrived at Condobolin at 3.30 p.m. on the following day.

The Committee opened their inquiry at the Royal Hall, Condobolin, at 10 a.m. on the morning of the 27th September, and, proceeding westward by coach on the 28th, inspected the route of the proposed Railway to Euabalong.

They examined witnesses at Cugong and Euabalong and proceeded on the 1st October to investigate the practicability of extending the proposed line from the projected terminal point to Hillston. In the course of their inspection beyond Euabalong the Committee examined witnesses at Cudgellico, on October 1st and 2nd; at Uabba, on October 4th; at Hunthawong, on October 5th; at Hillston, on October 6th and 7th; at Rankin's Springs, on October 9th; at Yalgogrin, on October 11th and 12th; at Ungarie, on October 12th; at Wyalong, on October 14th and 15th; at Barmedman, on October 16th; at Morangarell, on October 18th; at Bimbi, on October 19th; and at Grenfell, on October 20th and 21st.

PROPOSED RAILWAY FROM CONDOBOLIN TO EUABALONG, WITH PROSPECTIVE
EXTENSION TO HILLSTON VIA LAKE CUDGELLICO.

The proposed railway traverses alienated and reserved lands to Cugong, a distance of 29 miles; thence to Euabalong, a further distance of 19 miles, the land is in the Western Division and is partially reserved. The pastoral holdings on which the line is located are Gulgo, Micabel, Kiagarthur, Kalinga, and Booberoi. The line has been run as close to the river as possible, having regard to the flood limit, and the extent of the area liable to flood may be gathered from the fact that at a point 18 miles from Condobolin the railway would be fully 8 miles from the Lachlan, and that it has also been found necessary to run the line about 4½ miles north of Euabalong. The river-flats, which within this area run back from 7 to 8 miles, are composed almost entirely of black clay intersected by strips of light sandy loam. They are generally pastoral land. The better portions are adapted to the growth of lucerne; but the country, as a whole, excepting a limited area in the vicinity of Cugong, is not suitable for agriculture. A very small acreage within the influence of the proposed railway is at present cultivated. Droughts have been attended by such disastrous results, and the depredations of vermin have been so serious that many holdings which were at one time regarded as fair fattening country in average seasons are now either abandoned or are poorly stocked. The tract which will be more immediately served by the railway is timbered, where red soil occurs, with box and pine. To the westward of Booberoi is the fringe of a great mallee belt stretching from the westward of Mount Hope to the north of Cugong. The belt

belt encroaches upon the northern 20-mile limit of the projected railway to the extent approximately of one-fourth of the area. This mallee country is not only waterless, but, from the loose nature of the soil, tank-sinking is difficult and generally profitless. For a distance of 5 miles out of Euabalong, on the north side of the river, the country is open, being lightly timbered with box in a sandy chocolate soil. Thence to the river crossing—the probable route of an extension to Hillston *via* Lake Cudgellico—it opens out into extensive plains of heavy black soil of a clayey nature. Up to the crossing the land traversed is more suited to pasture than to agriculture; but from this point for a considerable distance it has been alienated. Taking a direct line from the river crossing to Lake Cudgellico, and thence westward to Uabba Gap, the country is timbered with box, pine, and oak, and comprises large areas of fair agricultural land. From the westward of the Range to Merri Merrigal and the Willanthra Weir, black clayey soil, with occasional stretches of sandy loam occurs. The road afterwards passes through red sandy loam, timbered with box and oak, to a point 5 miles beyond Munthawong; thence to Hillston good agricultural land is met with. Taken as a whole the description of country traversed from Lake Cudgellico on to Hillston offers better opportunities for close settlement than does the country between Condobolin and Euabalong on the northern side of the river, the flats being invariably backed by red soil, whereas a great extent of the flats on the opposite bank runs into mallee.

The residents of Condobolin and the surrounding districts do not view with favour railway extension in the direction of Euabalong, and it is evident that their interests would in many cases conflict with any proposal to remove the existing terminus. The Committee were impressed with the fact that Condobolin is at present the depôt for an increasing volume of traffic which formerly found its way to Sydney *via* Nyngan, and, according to many witnesses, the small quantity of new freight attracted to the railway system by the proposed extension, would not justify the outlay. The railway from Parkes to Condobolin has stimulated agriculture within a considerable area; but it was pointed out that blocks available to the eastward of Cugong were too small in extent, local conditions rendering mixed farming an essential to profitable occupation by agriculturists. The waterless condition of, and the expense of clearing the back country, would also discourage small settlement. Some witnesses were of opinion that the projected railway would be a means of introducing much settlement upon the halves system; but 1,000 acres of Borambil, through which holding the railway from Parkes to Condobolin passes, were cleared with a view to this class of settlement two years ago, and up to the present season only one application has been received. A few references were made to mining enterprise on the north of the river. Small parcels of ore had recently been despatched to the Clyde works; but there is at present no prospect of considerable freight from this source. Although the recent drought has largely reduced the rabbit pest, wallaby and wild dog, breeding upon abandoned holdings and upon reserves, are very destructive. The witnesses did not think it probable that the extension would intercept much traffic having a tendency to Victoria. In their judgment a line constructed partly with that object should proceed to Hillston, as nearly as possible in the centre of the country, between the Lachlan and the South-western Railway.

On the southern side of the Lachlan, at Cugong, several settlement leases have been occupied since January last. The settlers are preparing for cultivation in association with dairy-farming. In the district generally there are no indications of agricultural settlement. A number of selections on the frontage have been abandoned, and have been secured to adjacent runs. Mining operations, with fair results, are in progress in the back country.

The population of Euabalong has lately decreased. The most active agency in this result has been the drought. Increased economy in the management of station properties is said to have been another cause. The rabbit pest alone has rendered some of the poorer holdings almost valueless. It was suggested to the Committee that the choicest frontage blocks being alienated, the Government should accompany the construction of a railway by resumption, with a view to close settlement. Unless this were done, or the lessees could be induced to introduce the halves system, very little freight from agriculture could be expected pending the termination of the existing leases. Wool traffic is in process of diversion from the South-western and
Western

Western Railways, especially from the latter, to the Parkes-Condobolin extension. The Committee were unable to visit Mount Hope, and the residents, therefore, sent several representatives to tender evidence at Euabalong. The active copper-mines of the district are, the New Mount Hope and Great Central mines. The Mount Allen and Erribendery gold mines are under suspension, pending the introduction of new machinery. The New Mount Hope mine is worked on tribute, and at present forty men are employed. Operations were suspended eight years ago owing to the then current price of copper; but the Committee were assured that a reduction of haulage charges would admit of the treatment of a vast quantity of ore which is at present unpayable. The output of the mine is sent to Sydney *via* Cobar, but would be taken to a railway at a reasonable distance on either side of the Lachlan. The Great Central mine has recently undergone a change in proprietorship; the new proprietors commenced operations in May last, and it is expected that when these are in full swing the output will be 8 tons of copper per week. The soil in the immediate neighbourhood of Mount Hope has been tested for fruit-growing with excellent results. Grape-vines especially have thriven, and wine-making is regarded as probably the most lucrative of future local industries. Victorians with experiences of mallee country describe portions of the belt surrounding Mount Hope as the best land of the class which has come under their observation.

The Committee opened the branch of their inquiry having reference to an extension of the proposed line to Hillston *via* Lake Cudgellico, Merri Merrigal, and Hunthawong, by the examination of witnesses at the Lake township, which would be the only considerable centre of population along the route. The present population of the police district extending 60 miles to the north, 35 miles to the east, 30 miles to the west, and 10 miles to the north of the township, is 580; there has been a decrease of 150 within the past two years. The area under crop within these boundaries is 800 acres. The mining industry of the district is now at a standstill. A number of improvement leases situated to the south, south-east, and south-west of the town, have been offered, but only three or four have been taken up. Two settlement lease areas containing ten farms, varying from 1,087 to 2,560 acres, and two homestead selection areas comprising thirteen blocks varying from 35 to 982 acres, have also been opened to settlers, but of these only three 40-acre blocks have been applied for. These unsatisfactory results are said to be due to the expense of preparing the land for the plough, and to the stringent conditions imposed by the Crown; but it is evident that improved land can be very profitably farmed. Great value is attached to a railway as a means of removing stock in time of drought. It is asserted that in the summers of 1895 and 1896, particularly, severe losses might have been averted, had means been at hand for the transportation of stock eastward, and that the knowledge that in unpromising seasons, fats could be sent away at short notice would induce landholders to stock with greater confidence. In an average spring there would be a large fat-stock traffic upon any railway within a fair driving distance. A quantity of stock now leave the district fat, and frequently lose condition before reaching the nearest railway point. Here, as on the opposite side of the river, the recent drought has greatly reduced the rabbits; but the large areas of Crown lands scattered among the freeholds are still a fertile source of trouble to those who adopt stringent measures to rid themselves of the pest. It seems probable that in the absence of concerted action on the part of the Crown and landholders, in fencing and poisoning, many additional holdings will be abandoned. It is estimated that if steps were taken to secure a permanent water level in the lake by means of the Lake Creek, and if facilities for rapid transit were afforded, a livelihood would be opened-up to a large number of fishermen. There has been no appreciable rise in the Lachlan for three years, and the maximum depth of water in the lake is now 3 feet. A small party of fishermen have within three months despatched 13 tons of cod, perch, bream, and cat-fish, to such distant centres as Newcastle, Sydney, Young, Grenfell, and Wyalong. There being no handy railway carriage, the industry is necessarily confined to the colder months of the year. It is held that the lake and district present attractions to tourists, and those in search of a sanatorium, and that this circumstance would considerably augment the returns of a railway. Most of the residents favour a line from Wyalong to Hillston, *via* Lake Cudgellico. It is claimed that such a railway would traverse the Wollongough country which, as the Committee ascertained from subsequent inspection, comprises first-class agricultural land. The

The witnesses examined by your Committee upon the pastoral holdings of Uabba and Hunthawong were strong advocates of a railway to Hillston from either Temora or from Koorawatha *via* Grenfell and Wyalong. In their opinion the line would be used chiefly for the trucking of fat stock and for wool; with existing facilities the best stock is sent to Melbourne, where as a rule, it is said to command higher prices. The average cost of transit to Melbourne would be 4s. 3d. per head, including commission, trainage, droving, duty and yard dues, the cost of conveyance to Sydney being 2s. 9d. per head. The time occupied in getting the sheep to the Melbourne market favours their arrival in a condition which is a great factor in determining the higher price generally realised. A railway would divert almost the whole of this traffic to Sydney. Although the rabbits have been kept in check by the recent drought and systematic poisoning by phosphorised pollard, the depredations by wild dogs upon Merri Merrigal account for losses of sheep to the extent of $3\frac{1}{2}$ per cent. and the abandoned resumed areas of Naradhan, Merri Merrigal, Cowl Cowl, Conapaira, Belandry, and Hunthawong, embracing 700,000 or 800,000 acres are breeding grounds for these pests. In the month of August, the Merri Merrigal leasehold and resumed areas were both offered under improvement lease, but the conditions attaching to that form of holding are so stringent that no applications were forthcoming. It is suggested that the abandoned areas should be cleared by the Crown, and should be offered in 640-acre blocks upon the assumption that the ensuing close settlement will practically exterminate both rabbits and wild dogs. At Hunthawong the Committee examined the acting Director of Agriculture, who has completed a careful inspection of the Hillston district with a view to the establishment there of an experimental farm. Mr. Campbell was surprised at the uniform richness of the soil and its suitability to agriculture and fruit-growing. He anticipates a large fruit-growing and fruit-drying industry among the many possibilities of the district. The local lessees, having regard to present conditions of transit, have not prepared any areas with a view to farming upon the halves system. The tract of country immediately to the south of the river is fitted almost exclusively for pastoral pursuits, and except for station purposes there has been no cultivation.

RAILWAY FROM KOORAWATHA TO HILLSTON *via* GRENFELL AND WYALONG.

At Hillston, Mr. Thomas Kennedy, of the Railway Construction Department, submitted to the Committee a report dealing with a route—the result of a recent exploration—from Hillston *via* Rankin's Springs, and Yalgogrin to Wyalong, where it would join the survey from Temora to Wyalong, and also the survey now approaching completion from Koorawatha *via* Grenfell to the same point. The length of line as located by Mr. Kennedy, would be about 112 miles, making the total length between Hillston and Koorawatha approximately 200 miles, the distance from Hillston to Sydney *via* Blayney, being 436 miles, and *via* Harden, 477 miles. The cost of the section from Hillston to Wyalong is estimated to be £262,700, or about 2,300 per mile; this amount, added to the estimated cost of the section from Wyalong to Koorawatha, £217,500, gives a total expenditure of £480,200 or an average cost of £4,287 per mile from Koorawatha to Hillston. Leaving Hillston, the line takes a course almost due east, passing to the south of the Lachlan Range, and along the stock-route to Rankin's Springs, and in a north-easterly direction to Malonga homestead; thence to a point a mile to the north of the township of Yalgogrin and in a direct line to Wyalong. A deviation is suggested to serve the Lake Cudgellico district, bringing the line to a distance of 28 miles from the Lake township. Commencing at a point 4 miles to the eastward of Rankin's Springs, it runs in a north-easterly direction and joins the original trial survey from Wyalong to Lake Cudgellico at Youngara Creek, and follows that survey thence to Wyalong; it would add about 4 miles to the more direct route which Mr. Kennedy has explored, making the length about 118 miles. The section of 45 miles from Hillston to the commencement of the rough country adjacent to Rankin's Springs traverses land presenting no engineering difficulties. Of this length 34 miles are fit for close settlement being timbered with box, pine, and yarran, the remaining 11 miles of the section is through comparatively inferior mallee land. The line for a distance of 12 miles then passes through broken country, less than one-half of which is fit for cultivation. Here the only engineering difficulties upon the whole route are met with. The grade obtained is 1 in 100 with an allowance of £700 per mile

mile above the average cost of light line construction. The rough country is left at a point 57 miles from Hillston. The line would then pass along a level stretch of 20 miles to the foot of the range dividing the waters of the Mirrool and Humbug Creeks. The land is here timbered with box, pine, and yarran, and is suited to agricultural settlement. In crossing the range a belt of 3 miles of inferior stony ground is passed; the following 19 miles is good agricultural land with occasional ironbark ridges in which construction would be moderately easy. This embraces the area between the Dividing Range, the Yalgogrin township, and Wyalong homestead; thence into the township the land is inferior with a dense growth of small mallee. From Wyalong to Bimbi, the line goes through a level stretch of country, the first 8 miles of which is densely scrubbed with mallee and pine. This is succeeded by fairly open forest land, and from that point to the Bland by open plains. Open country is passed for some distance on the eastern side of the creek when thin belts of pine again occur. A large area of the undulating country thence to Grenfell is improved; the intervening country between this point and Koorawatha is also undulating. Several creeks are crossed but none would involve expensive construction. Officers of the Railway Construction Department who are engaged upon alternative surveys between Grenfell and Wyalong to the north and south of the Weddin Range informed the Committee that no engineering difficulties had been met with, the flood waters of the Bland having a maximum depth of 2 feet, and being without current. Ballast is obtainable at several points, and the ironbark forest on the lower slopes of the Weddin would furnish a good supply of sleepers.

The municipal district of Hillston was incorporated in December, 1888; it comprises an area of 50 square miles; the population according to the census of 1891 was 741, it is now 794. The smallness of the apparent increase is attributed chiefly to the largely decreased employment afforded by surrounding pastoralists; this decrease is estimated generally at one-third. The estimated capital value of the freehold of improved property is £106,133 and the capital value of the freehold of unimproved property £18,024, or a total of £124,157. The municipal revenues from all sources for the past year was £589. The approximate receipts of the Post and Telegraph Office for the same period were £1,387. The Hillston sheep district extends on the south to Gunbar; on the north to the northern boundary of Wirlong; eastward to the boundary of Uabba, and westward to the western boundary of Willandra. It is about 170 miles long by 120 miles wide. It is estimated that on the basis of present stocking—900,000 sheep and 4,000 cattle—there would be 2,000 tons of wool contributed to a railway at Hillston by the sheep district, and that the annual output of fat stock would be 100,000. In 1895, 120,000 fat stock were sent to Sydney and Melbourne, the greater portion being trucked at Carrathool. In the same district there are about 10,000 acres under wheat crop, the average yield being 14 bushels to the acre with an average rainfall of 17 inches. The chief sources of railway traffic would be wool, a relatively small percentage of which would be diverted from Victoria, and fat stock. The stations now sending their wool to the Melbourne market, which it is represented would be induced to send it to Sydney, if there were a railway at Hillston, are among others, Roto, Coombie, Yathong, North Marowie, Willandra, Hunthawong, Little Willandra, Moolbong, and Trida. A local estimate credits these holdings with a total of 3,700 bales for the present season, and it is thought that this would represent about one-half of the new wool traffic from the north and west of Hillston which would be brought to the New South Wales railway system. It appeared from the evidence that a railway through the district would be extensively used for the transportation of starving stock from the westward of Hillston. Experience has shown that during severe droughts in the Lower Lachlan, stock could have been removed to well-grassed country on the higher reaches of the river had railway facilities existed. The Committee examined several settlers in the neighbourhood of Hillston who have had experience both in South Australia and Victoria, and who are unanimous in thinking that the agricultural prospects of the district are superior to those of the localities with which they are familiar in the adjoining colonies. The demand for land in the absence of railway communication certainly justifies the belief that with improved means of transit available land would be rapidly occupied. Experiments have been made in both fruit-growing and dairying with satisfactory results. The soil of the district seems especially adapted to viticulture. There is ample testimony to the high quality of the
the

the wheat grown in the district. Last year 55,000 bushels of this wheat were milled at Hillston, the flour being distributed westward 140 miles, northward 120 miles, southward 20 miles, and eastward 65 miles. The graziers and farmers of Hillston, in common with their neighbours, have suffered severely from the rabbit pest, and more recently from destruction to sheep by wild dogs. They regard close settlement as the sole means of relief.

Proceeding eastward to Wyalong by way of Monia Gap, Rankin's Springs, Yalgogrin, and Ungarie, the Committee had an opportunity to inspect the character of the country, and to examine a large number of witnesses as to the capability of the soil. From the tenor of the evidence it would appear that the cost of clearing, when green, the most thickly timbered areas fit for the plough, would be from 35s. to £2 per acre. In the case of open forest and pine scrub the cost would average from 12s. 6d. to 25s.; where pine scrub exists without any heavy timber the cost would be about 3s. per acre. The mallee country would require special treatment. While there are considerable areas of small mallee which could be rolled and burnt, there are also belts of big mallee, the grubbing of which would be an expensive item. The Committee passed enormous areas of land which had been ringbarked and scrubbed, the cost of clearing which, ready for the plough, would be comparatively small. Excepting the hilly country, subdivision would generally include an area which could be cultivated at very small cost, and, given reasonable prices for produce and transit facilities, it may be assumed that the remaining area could be readily cleared by settlers with small means. The Committee, on their journey to Wyalong, inspected several wells. In a large tract of country directly eastward of Hillston, permanent water is found at a depth of from 100 to 150 feet; in exceptional cases it has been found necessary to sink 200 feet; in no case is sinking difficult. The water is slightly brackish, but it is fit for stock. The Committee learned at Tin Hut, an outstation of Naradhan, that during the recent drought one of these wells, at the average depth, and containing the average quantity of water, supplied 5,000 sheep. The Committee also inspected several springs in the neighbourhood of Rankin's Springs, some of which are said to be permanent. One spring on Naradhan after fairly heavy rains floods an extensive flat, and sometimes runs for twelve months. In the event of railway construction it would be necessary to supplement these sources of stock supply by the sinking of tanks at suitable intervals on the route; this would not only meet the pressing requirements of settlers in a new district devoid of natural surface water, but the tanks would also be indispensable for railway purposes. As bearing upon the foregoing remarks as to water supply, and illustrating the fitness of the climate for agricultural pursuits, it may be noted that the average rainfall from Hillston to Rankin's Springs for the past 12 years has been approximately 17½ inches, and upon the area from the Springs to Wyalong in the same period, 21 inches. A striking example of the advantages of close settlement in a district which has suffered severely from the rapid growth of scrub, and from noxious vermin, is afforded by the experiences of a selector upon Naradhan, who, for six years, has held an area of 1,800 acres, only 5 acres of which is under cultivation. His present stocking is on the basis of a sheep to two and a half acres. On the surrounding pastoral leasehold the stocking is on the basis of a sheep to four and a quarter acres, and in both instances the properties are considered to be stocked to their present capabilities. The disproportionate results of the two forms of occupation are emphasised by a comparison with the adjoining holding Conapaira, the rent per acre of which is nearly double that of Naradhan, and the stocking of which is now equal to a sheep to six and a half acres. Prior to the advent of the rabbit and the growth of scrub, the runs traversed by the suggested railway, not having a frontage to the Lachlan between Hillston and Wyalong, carried, approximately, 356,000 sheep. They now carry a little under 100,000. Their carrying capacity has therefore decreased to the extent of 72 per cent. It would therefore seem that close settlement may be relied upon to restore the country to its capability prior to the advent of the unfavourable conditions with which the lessees have had to contend during the last ten years. The majority of the leases which would be affected by the proposed railway expire in 1900, and judging from the failure of the recent attempt to secure occupation of both abandoned and resumed areas by means of improvement leases, and the diminishing profits from pastoral pursuits under the stress of local circumstances, it is evident that the Government will shortly have to undertake the reclamation of a very large area of abandoned country.

Yalgogrin

Yalgogrin has within the past three years made some progress in mineral development. Within a radius of 5 miles of the township there is now a population of 300. Of the fifteen or twenty mining claims which are being worked, twelve are payable. The average return is 3 oz. per ton. The stone generally is refractory, and is sent to Wyalong or Sydney for special treatment. The road carriage to Temora, a distance of about 70 miles, is £2 10s. per ton; the shorter distance (23 miles) to Wyalong is therefore taken advantage of for the despatch of the stone. A quantity of ore is at grass the returns from which would not warrant the expense of road carriage at existing rates; and the Committee were informed that a railway would ensure an increased output of low grade ores which cannot now be profitably mined. The want of a railway has also been felt by those who have upon a small scale attempted mixed farming. The quality of the soil and the rainfall are such as to ensure payable wheat crops, with reasonable transit facilities.

The Committee inspected and took evidence concerning a large area of excellent agricultural land lying to the north and north-east of Yalgogrin, to which their attention had been specially directed by witnesses who were examined at Lake Cudgellico. This area extends from Yalgogrin northwards to Bygalorie, and thence in an easterly direction through Wollongough and Hiawatha to within about 4 miles of Wyalong. Some witnesses who are well acquainted with the Brookong estate were of opinion that the soil is superior to that of Riverina. Almost the whole of the land referred to has been alienated. The township of Ungarie, which is on the extreme northern border of the described area, is in a direct line, 17 miles from the recently explored route from Pillston to Wyalong *via* Rankin's Springs. It is alleged that communications from settlers who are now working on the halves system in other districts of the Colony show that they would at once abandon their present holdings and settle in this neighbourhood, if a railway were brought within 20 or 25 miles, and in the opinion of experienced farmers, 320 acres would be ample to provide a livelihood. The rainfall exceeds that of the major portion of Riverina, and the records show that the fall occurs at a period of the year most beneficial to wheat crops. As illustrating the fertility of the soil, it was mentioned that a paddock near the Wollongough homestead had been cropped continuously from 1872 to 1894, and that it had in the latter year yielded 3 tons of hay per acre. Adjoining land has an average carrying capability of a sheep to 1½ acre. Most of the paddocks under cultivation were ringbarked and scrubbed from seven to ten years ago at a cost of about 5s. per acre, the subsequent cost of clearing being approximately 10s. per acre. The total expenditure to render the land fit for the plough has averaged 15s. per acre. This mode of preparation is preferred in the district to the removal of the green timber, the cost of which, as in districts further to the westward, is from £1 10s. to £2 per acre. In the course of their journey from Wollongough to Wyalong the Committee passed through one of the belts of ironbark to which reference is made in Mr. Kennedy's report. The appearance of the crops fully warranted the statements of witnesses as to the fitness of the district for agriculture.

The evidence tendered to the Committee at Wyalong pointed to a decided improvement in the field. The present population is 4,250; 395 claims are at work, of which 200 have been declared payable, the number of miners employed being 2,100. The output of gold for the current year has reached the value of £156,000, but this amount by no means represents the total yield, the results of treatment of the tailings and concentrates by the cyanide and chlorination processes being unknown. The evidence tendered to the Committee would seem to show that the returns upon these processes are highly satisfactory; one company has paid £6 per ton for tailings, and have been perfectly satisfied, according to their representative, with the result obtained. The aggregate yield for 1897 will probably place Wyalong in the position of the premier gold-field of the Colony. The general impression of mining experts on the ground is that with greater depth prospects of permanency will improve. The results obtained, for instance, from a 320-feet level are said to be superior to those from any stone yet raised, and a trial shaft has now reached a depth of 470 feet. The value of the machinery on the field is estimated at £70,000, and large investments recently made in improved machinery and winding-plant may be accepted as an indication of confidence in future development. It is stated that many claims, chiefly from the want of capital, are not being systematically worked, but even with the largely improved output which may be shortly looked for, it is pointed out that
the

the field would not contribute any great quantity of mineral freight to a railway. One company has within the last six months expended £20,000 in the erection of machinery for the local treatment of ore, and it is anticipated by some witnesses that outward ore traffic will have practically ceased within twelve months. On the other hand, it is asserted that ore of a certain grade can be more profitably hauled to the source of supply of fuel and flux. The traffic in coal and coke and chemicals required for the local treatment of ore would, however, be large, and stone would be despatched to Wyalong instead of to the seaboard from Yalgogrin, Grenfell, and other mining centres. The expense of road carriage has proved fatal to agriculture. In one instance, a local farmer, whose railway station was at Temora, obtained a yield of 15 bushels per acre from 42 acres, and sold at 2s. 11d. per bushel. At that rate the crop was unremunerative. The local demand for hay has led to the cultivation of small areas, and quite recently as high a price as £9 per ton has been paid in Wyalong for chaff. Victorian farmers describe the land as equal to any in the Goulburn Valley. Paddocks have been cleared with a view to cultivation when wheat can be conveyed to market upon more favourable terms.

The residents of the Barmedman district favour the selection of Temora as the point of departure for the western country. The advantages claimed for the Temora-Wyalong section as compared with the Koorawatha section are chiefly economy in construction and maintenance, combined with more direct access to Victorian markets. It was also contended that the line would afford a valuable outlet for starving stock, and that traffic such as might be anticipated from a trunk line to the extreme west could be more advantageously worked upon the main Southern than upon the main Western railway.

At Morangarell, the Committee obtained reliable information as to the liability of the Bland country to flood. At the point where the lines of alternative survey are supposed to cross the creek there is said to be a flooded area of 6 or 7 miles. In an average flood the first mile on each side would have a depth of 2 feet; from that point to the flood limit the depth would vary from 1 foot to 3 inches. The drainage is towards Lake Cowal, but there is no appreciable current. Flood records show that with saturated ground, from 1½ to 2 inches and under normal conditions, from 4 inches to 6 inches of rain will flood the creek. The flood-waters generally drain away in from a week to a fortnight. At no time has there been serious delay to the mail upon the Marsden Road. Bimbi, a thriving settlement on the south-eastern edge of the Bland country, affords striking testimony to the capabilities of the soil. According to present returns, the Bimbi district within a radius of 8 miles of the township, would contribute to a railway 2,631 bales of wool, 37,950 fat sheep, and 1,700 head of fat cattle annually. In the same radius 5,642 acres have been prepared for cultivation, and there are 74,000 acres of Crown land.

Your Committee obtained ample evidence that agriculture is seriously impeded in the Grenfell district by the want of railway communication. Producers have sustained severe losses through their inability to take advantage of a favourable market. Road carriage rates are frequently prohibitive. At the close of last season teams were unobtainable, and local buyers and producers still hold a large quantity of the yield. In the case of machinery, road carriage from Young or Cowra, a distance of 50 miles, has been known often to exceed the railway charges from Sydney. The area under cultivation in the police district in 1895 was 27,248 acres. Several thousand acres have since been added, and from their inspection of the land which has been prepared for the plough, the Committee do not doubt the assurance of several witnesses that, on the advent of a railway, the total cultivated area would at once be doubled. The larger landholders have introduced the halves system with highly remunerative results. The system has, in fact, become so general, as to be responsible for almost the whole of the annual increase of tillage.

RECOMMENDATION.

The local considerations which affect the proposed extension from Condobolin to Euabalong are subordinate to its importance, as committing the Colony to a point of departure in a scheme having the objects of establishing railway communication with the extreme western districts, at the same time developing a tract of country in course of rapid abandonment and securing to the New South Wales railway system some proportion of the traffic now attracted to Victoria and South Australia.

The

The new traffic likely to be secured by the comparatively short length of line between Condobolin and Euabalong, may be gauged by the inferior country traversed, by the circumstance that a great portion of it will be under pastoral lease, and therefore not available for small settlement until 1918, and by local climatic conditions. Accepting the traffic upon the Parkes-Condobolin extension as the basis of receipts upon the new length of railway, it may be predicted that a large portion of the earnings of the latter would be represented by leakage from the main Western line and the Cobar branch. Condobolin is already the depôt for a large quantity of this traffic. The frontages in the Central Division upon which agriculture could be prosecuted with the best results, have been secured by the adjacent leaseholders; and the presence of vermin and expensive clearing render it doubtful whether the available back country to the north and within the influence of a railway, could be profitably occupied by agriculturists. It is therefore evident that the occasional carriage of fat stock and passenger and mail receipts must almost exclusively be depended upon to recoup working expenses, and the fluctuations of season are so great that no reliance can be placed upon traffic derived from the chief of these sources. The chief centres of activity in the mining industry which are already fairly served by the Cobar branch are not likely to become large contributors to freight. Present rates of road carriage would apparently render it impracticable to impose remunerative local rates. These considerations would seem to justify the conclusion that if Euabalong were to be regarded as the terminus of the proposed extension the annual loss upon the line would, if anything, exceed that put forward by the Department, namely £2,500 per annum. If the line were regarded as the first section of an extension *via* Mossgiel to Menindie, the proposal would be utterly unjustifiable in the light of the conclusions arrived at by a Sectional Committee of your Committee which inspected and reported upon that route so recently as October, 1896. There are also strong objections to it considered as the first section of a railway to Hillston. For some distance on the northern side of the river the line would pass through land which would not be available for settlement until 1918, and any railway from this point through Lake Cudgellico to Hillston must inevitably traverse a large extent of flooded country, entailing not only a heavy first cost, but also burdening the work with maintenance charges quite out of proportion to the service rendered. It must also be borne in mind that a very large area served by such a railway would be equally benefited by a line which, having the same objective point, would more equally divide the tract of superior country lying between the Lachlan and Murrumbidgee rivers, at present in course of abandonment mainly from the absence of railway communication.

It appears to your Committee that a railway to Hillston must be viewed as a section of a trunk line to the western limits of the Colony. It therefore follows that directness of route, easy grades and curves, and the avoidance of country likely to involve expensive maintenance are primary considerations. The Committee believe that these conditions are supplied, as nearly as practicable, by the recently explored route from Hillston to Koorawatha which they have inspected. The local aspect of the proposed work involves several minor requirements, Hillston, an important distributing centre with great pastoral and agricultural resources; Wyalong, a mining field of increasing activity and rapidly improving prospects—the centre of a large auriferous and agricultural area, and Grenfell, already one of the greatest grain-producing districts in the Colony, can establish distinct claims to railway communication. A line serving these centres would also develop and advantageously divide the tract of country lying between the influences of the Parkes-Condobolin and Narrandera-Hay extensions, and the Lachlan and Murrumbidgee Rivers. A large portion of this area has already been abandoned consequent upon the incursions of vermin, and the rapid growth of scrub, and the process has probably been accelerated by the early expiry of the leases. The acreage falling into disuse under present conditions is increasing annually. Assuming subdivision with blocks of a maximum area of 2,560 acres, the cost of clearing would be relatively small. Where ringbarking and scrubbing date back a few years, an average expenditure of 12s. 6d. per acre would fit the land for the plough. The enhanced cost of clearing the more thickly scrubbed and timbered areas including the mallee belts would necessitate occupation under special conditions. Generally a considerable acreage of an ordinary block might be relied upon to yield an immediate return from pasture and tillage.

Experimental

Experimental farming, of which the Committee had abundant evidence between Hillston and Wyalong, demonstrates beyond doubt the fertility of the soil, which will bear favourable comparison with the most productive in Riverina. The rainfall over a large area is even more conducive to successful wheat cultivation than is the rainfall in that part of the Colony. The settlers are mostly Victorian and South Australian, and they are unanimous in pronouncing their holdings superior to those they have vacated in the adjoining colonies. Inquiries for land on the part of those who are now farming in Riverina on the halves system, and by Victorian and South Australian agents point to the fact that an assurance of railway construction would be immediately followed by extensive settlement. The area which will become available in three years hence may be roughly set down at nearly 2,000,000 acres; at least one and a half million acres of this quantity may be classed as adapted for cultivation, the remainder being good pastoral land. This estimate does not take account of the stony inferior land on the ridges, or of the mallee scrub. No natural water exists, but from Hillston to Rankin's Springs—an underground supply—slightly brackish, but most suitable for stock, is procurable; otherwise water would have to be conserved. The opinion formed by the Committee, as to the general capabilities of the soil, is fortified by the information to which reference has already been made, which was conveyed to them by an officer of the Department of Agriculture, who has recently examined the Hillston district, with a view to the establishment there of an experimental farm. Railway freight would consist mainly of wool, fat stock, and cereals. It is difficult to estimate, even approximately, the quantity of wool and fat stock which would be diverted from Victoria, but those most conversant with the present conditions of intercolonial trade make the number of bales from 8,000 to 10,000. Fat stock traffic would be diverted in a still greater ratio under the influence of direct railway carriage. The proportion of new wool, and fat stock traffic, which would be obtained from close settlement may be expected to represent quite as large a factor in the total earnings as the traffic diverted from the neighbouring colonies. If, as seems likely, close settlement will have the effect of restoring grazing capabilities to their normal standard prior to the advent of rabbits, and the growth of scrub—generally estimated to be three times greater than present stocking, and if account be taken of a wheat-yield averaging 14 bushels—a low estimate, it seems highly probable that, excepting the Departmental estimate of the cost of construction, the earnings upon the Hillston-Wyalong section to which the foregoing observations specially refer, would not only recoup interest and working expenses, but would shortly convert the line into one of the most payable in the railway system. The mineral traffic of Wyalong and Yalgogrin, owing to the increasing quantities of ore treated locally, might not be considerable. On the other hand, advantage would be taken of railway facilities to obtain from the western collieries a quantity of coal and coke, in view of the rapidly diminishing supply of wood fuel within a payable distance. This traffic, with the conveyance of goods incidental to the cyanide and chlorination processes, may be expected to contribute largely to the earnings of the Koorawatha-Wyalong section. The extent of agriculture in the neighbourhood of Grenfell, and the well-known pastoral capabilities of the Bland, assure a return which, with the traffic induced by mineral enterprise, will, in the course of a few years, render the total length of line from Koorawatha to Wyalong an important source of railway revenue. The uncertainty of season which obtains on the lower Lachlan and to the west of Hillston renders it probable that the entire length of the projected railway will be of material service in the transportation of starving stock.

The attention of the Committee was directed at Wyalong and Barmedman to an alternative point of departure, namely, from Temora *via* the surveyed route to Wyalong. It being conceded that the capabilities of the country served by the Koorawatha and Temora routes were in all respects equal, the facts relied upon by advocates of the Temora route are the larger area of Crown lands available for settlement in that direction, cheaper construction, absence of engineering difficulties, and convenience in the transportation of starving stock. It may be pointed out, however, that the whole area of Crown land available would be well within the influence of a railway from Grenfell to Wyalong. The Departmental estimate of the cost of construction being, in the case of the Koorawatha-Wyalong section, only £200 per mile in excess of the estimated cost of the section from Temora to Wyalong,
it

it is to be assumed that engineering difficulties are inconsiderable upon the former route. This view of the case was confirmed by the inspection made by your Committee. Moreover, the tendency of agricultural settlement is in a north-easterly rather than in a southerly direction, as shown by the comparatively small increase of land under crop within the influence of the Temora terminus, and the rapidly-increasing tillage in the neighbourhood of Grenfell. The chief considerations which weigh with your Committee in selecting Koorawatha as the point of departure for the projected railway are, the extensive agricultural settlement which would be served, the volume of immediate and prospective freight, and accessibility to both the western and southern railway systems. In the opinion of the Committee the advantages attaching to a junction from which traffic from a trunk line to the far west could be distributed upon two main lines cannot be over-estimated.

Your Committee have the honor to recommend—

1. That the proposed railway from Condobolin to Euabalong be not carried out.
2. That a permanent survey be at once undertaken of the explored route from Koorawatha to Hillston, inspected by your Committee, with a view to its consideration in conjunction with existing surveys; and also with a view to the early consideration by Parliament, of the expediency of extending railway communication to the several important centres of population affected, and to the reclamation and settlement of a valuable tract of land now in course of abandonment.

T. H. HASSALL,
Chairman.

26th October, 1897.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM CONDOBOLIN TO EUABALONG.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 27 SEPTEMBER, 1897.

[The Sectional Committee met at the Royal Hotel, Condobolin, at 10 a.m.]

Present:

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR, M.L.C.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee proceeded to consider the expediency of constructing a line of Railway from Condobolin to Euabalong.

David Henry Tasker, Mayor of Condobolin, sworn, and examined:—

1. *Chairman.*] You have heard of the proposal submitted to the Committee for inquiry? Yes.
2. You are well acquainted with the country through which the proposed line will pass? Yes.
3. Are you in favour of or against the proposal? I am against it.
4. Perhaps it will simplify matters if you would as concisely as possible give the Committee the reasons for your objection to an extension of the railway? In the first place I do not think an extension from Condobolin to Euabalong would pay. The land along the river is first-class land, but when you get beyond the river flats there is nothing but dense mallee and pine scrub. The country is also very sparsely populated. To my knowledge there are only two or three farms on the road. The land may be described as good grazing country, but I do not think the returns would be sufficient to pay the working expenses of a railway. In my opinion the only centres which would benefit by the proposed extension to Euabalong would be the Mount Hope and Mount Allen mines. The Mount Allen mine is closed down, and I understand the Mount Hope mine is next door to it. I am positive that agriculture in that country would not pay.
5. What sort of soil do you find in the country back from the river? It is sandy soil with gravelly ridges. A great part of the country, as I have said, is covered with scrub. There is some good soil in places.
6. There are occasional patches of what you would call forest country? Yes; but the bulk of it is densely scrubbed.
7. There is no natural water? No; of course in flood time the water extends a good way back from the river. You will notice that the railway is kept a good bit back from the river in order to avoid the flood waters.
8. I suppose the flood waters would fill the Gilgai holes at the back and provide a supply for a few months? Yes; but there is no permanent supply.
9. I believe a great deal of the country is infested with dogs and rabbits? Dogs, rabbits, and wallabies.
10. Would you call it badly infested? Very badly. I have been informed that some of the selectors a little to the right of the proposed line have erected a dog-proof fence to protect their sheep.
11. Are any of these selectors in scrubby country? Yes; several of them, but I do not think they have done any good.
12. How is the bulk of the country held? It is chiefly under pastoral occupation.
13. Has any of it been thrown up? There is a good deal of abandoned land 15 or 20 miles to the north of the proposed line. It is thickly infested with vermin of all descriptions.
14. That would be the country running through Mount Hope to Cobar? Yes. It runs north towards the Bogan country.
15. The population consists practically of the lessees? Yes. There are very few selectors. They are very scattered.
16. Have you any idea of their number? I have not. The frontage land was originally taken up by selectors, but they have now all sold out to the lessces.
17. And there are very few left either on the frontage or out back? There are very few. Many have not been able to sell; there are no buyers.
18. You think they would sell if they could find purchasers? I feel quite certain they would.
19. Have you any idea of the mining which has been carried on at Mount Hope and Mount Allen? It is copper mining at Mount Hope, and gold and copper at Mount Allen.
20. Do the mines employ any great number of men? Seven or eight years ago they did, but latterly very little work has been going on, and the Mount Allen mine has been completely closed down.
21. What is the reason advanced for the decline of mining at Mount Hope? I cannot say.
22. But the fact remains that the mines referred to are going from bad to worse? Yes.

D. H. Tasker.

27 Sept., 1897.

- D. H. Tasker. 23. Do you think railway extension in that direction will have the effect of encouraging or developing mining industry? There would be a possibility of it if there were cheap freight.
- 27 Sept., 1897. 24. The heavy cost of carriage has been one of the reasons why mining has gone backward? I should think it very likely.
25. There is not much likelihood of agriculture in that direction? I do not think so. The country is densely scrubbed, and the rainfall is light, varying according to the statistics from 18 to 19 inches. Condobolin is given 20 inches in statistics, and Euabalong 19. Taking the general run of seasons, there would be about 18 inches between the two points.
26. Is there much agriculture carried on round about Condobolin? It is principally to the north.
27. To the north and east, I presume? Yes.
28. Has the country through which the railway passes from Parkes been devoted more to agriculture since the opening of the railway? Yes; the land was thrown open only a few weeks ago; a considerable number then balloted for it. I am referring now to land on the Burrawang run. I believe that the whole of it will one day be under cultivation. It is first-class agricultural country.
29. The railway runs practically through it? Yes; the land fronts the line.
30. Are they erecting a platform or station at Burrawang which will be available for the farmers? Yes; they are also erecting a platform at Derrawang; that is on this side of Burrawang.
31. Have you any idea of the area of agricultural country there? Nearly all the country there is agricultural.
32. With sufficient rainfall for the profitable growth of crops? I think so.
33. To where do you look for a market for this agricultural produce? There is no market except Condobolin.
34. Is it supposed that railway extension to Condobolin will provide a market towards Sydney? Yes; as far as wheat-growing is concerned, the farmers look to a railway to enable them to send their wheat to Parkes, Orange, and Bathurst.
35. I presume a certain portion would be turned into flour here? Yes; we have a flour-mill here, but they only buy the wheat to suit the demand.
36. Is there any market for flour to the west? A lot of flour is sent by team to the west. I could not say how much.
37. Where does it go to? Mount Hope, Mount Allen, Gilgunnia, and Bobedah. Flour has also been sent from here to Wyalong.
38. Do you think railway extension to Euabalong would increase the prospect of a market west for produce? Not much, I think. The population down there is so very sparse that there would not be very much of a market.
39. I suppose that in any case you could not look further west than Mossgiel? No.
40. The Hillston farmers would cut you out there? Certainly.
41. Your market then for flour and produce would be limited to an area extending how many miles westward? About 100 miles.
42. That would be due north of Hillston? Yes; out Mount Hope way. It would be about 95 miles.
43. And beyond that you think you would not be justified in looking for a market? I do not think so.
44. How is the country held round about Condobolin? It is principally freehold in the vicinity of the town.
45. What are the pastoral properties? Condobolin, North and South; Gulga, North and South; Borambil; Mowabla, Burrawang, and Melrose.
46. Upon these holdings, I presume, there is a large area of agricultural country? Yes.
47. Has it been taken up? Every inch of Burrawang which has been thrown open has been taken up.
48. Is there much land available on the other runs to which you have alluded? None open to selection.
49. But it is in the Central Division, and the leases will shortly expire? Yes, in a short time.
50. Do you think there will be any great demand for the land when it is made available? Not for the scrub land, but the river flats and frontage will be snapped up whenever there is a chance.
51. And land, I suppose, within a reasonable distance of the town? Yes; anything within a reasonable distance of a town would certainly be balloted for.
52. As far as agriculture is concerned, there is more than sufficient land in the vicinity of the line between here and Bogan Gate to meet requirements for many years to come? I think so.
53. Is there much traffic between here and Euabalong at the present time? Very little, I think.
54. Have you any idea how many carriers there are on the road in that direction? Four or five, I think.
55. Has the town of Condobolin increased to any extent since the advent of the railway? It has not had time to do so yet. The railway has not yet been taken over by the Government. I think there is an improvement, but it has not gone to any great extent so far.
56. Is the extension of a railway to Condobolin likely to bring traffic from the west which did not previously come in this direction? Yes, from the Mount Hope country, from Lake Cudgellico, and Ungarie; and all the Bobedah traffic is coming this way now.
57. Where did that traffic go to previously? Every bit of the Melrose traffic which went to Nevertire before is coming this way now. The other went to Nyngan.
58. The extension of this line to Condobolin then has set up competition with the Bourke line? Yes.
59. Has it intercepted any traffic which formerly went south? Traffic which used to go from Lake Cudgellico to Whitton is being attracted in this direction.
60. Do you think a further extension to Euabalong would intercept more traffic of that kind? Certainly; the further the line goes the more traffic will be intercepted. The country generally, as I have already told you, is so sparsely populated that I do not think very much new traffic would be created, at all events not for some time.
61. Do you think an extension to Euabalong would intercept any traffic which now goes to Victoria? I am not in a position to say. I do not know very much of the country below Euabalong.
62. Then, under all the circumstances, you think extension hardly justifiable? Exactly; I do not think it would pay working expenses.
63. In view of the character of the country through which the line will pass, the sparse settlement, and the difficulties surrounding the pursuit of agriculture in this direction, you think it would be unwise to construct a line? Yes. Agriculture, in the bulk of the country which would be served by this railway, would be too expensive. In the first place there is clearing to be considered; and then again the rainfall is not sufficient to guarantee crops.
- 64.

64. Does much wool come in this direction for the Sydney market? In consequence of the bad season the clip is very light this year, so that one can hardly form a correct estimate as to what the annual quantity would be; but I have seen wool coming here which did not previously go through Condobolin. D. H. Tasker.
27 Sept., 1897
65. And that you say is due to the extension from Parkes? Yes. There is no doubt that the line will be a good paying line.
66. There has always been a fair amount of traffic from Condobolin to Forbes and Parkes? Yes, and I think traffic will make the line pay well.
67. Has there been much increase of settlement following upon the extension? Yes.
68. *Mr. Farnell.*] You gave evidence before the Sectional Committee which inquired into the Parkes-Condobolin extension? Yes.
69. You know that at one time it was anticipated that the line would not pay interest and working expenses? That may have been so.
70. Do you commit yourself to the policy of not constructing a railway unless it can be shown that it will pay immediately? I think no line should be constructed unless it can clearly be shown that it will pay.
71. Then from that point of view you would not have been entitled to a railway from Parkes to Condobolin? I have always been under the impression that that would be a payable line.
72. You have large interests here? Yes.
73. Do you not think it is well to take into consideration in railway construction the fact that although an extension between particular points may not in itself be payable it will add a certain volume of new traffic to the main line, the whole railway system deriving benefit? To a certain extent that should be considered; but I do not think it is sufficient to warrant the construction of a railway at considerable expense under circumstances which make it evident that there will be very little traffic.
74. Do you know of any case in which a railway has at once paid interest and working expenses? No; I have never gone into that matter. I have never studied that question sufficiently.
75. Do you know that many lines are dependent for the payment of interest upon the earnings of the suburban lines, and of the sections between Bathurst and Sydney and Goulburn and Sydney? I daresay that is to some extent true.
76. There is not much difference in the rainfall in Euabalong and Condobolin? Not very much difference.
77. What do you consider a fair average rainfall, admitting of the carrying on of agricultural pursuits? Nothing less than 20 inches.
78. Do you not think that if the Government were prepared to allow the occupation of scrub land upon very favourable and liberal terms that occupation would be a means of opening up and developing this part of the country? As far as some parts are concerned the terms offered would be very favourable indeed before anyone could be induced to take up the land.
79. The chief drawback to the occupation of a great deal of the land which would be served by this railway is that it is covered with pine and mallee scrub? Yes.
80. Do you not think it likely that would be removed under liberal conditions of tenure? I think the expenditure would be too great. I would not take a 1,000 acres of that country if it were made a present to me, upon the condition that I improved it.
81. In giving your evidence you are not influenced by the consideration that you do not want to see the terminus removed from Condobolin? Personally, I would rather see the railway stop here.
82. At the present time is much wheat sent from this district to other towns? Not a great deal; the cost of transit is too great.
83. Can you tell us what the yield per acre has been here? About 15 bushels.
84. Does it pay to grow wheat at that rate? It pays to grow wheat here in good seasons, but of late the seasons have been so bad that you could grow scarcely anything.
85. What is the average price you obtain for your wheat? The prices range from 4s. 6d. to 1s. 8d.
86. Do they grow nothing but wheat? Very little else. I have a large orchard myself, but it has not yet got into bearing.
87. Do you know what the yield of wheat has been here for the last five years? I could not give you that average.
88. Have you suffered much from rust? Very little.
89. I should say from what you are doing with your own property that the soil is capable of producing anything under proper treatment? That is certainly so, in the neighbourhood of Condobolin.
90. But you say that those conditions do not apply further on towards Euabalong? Not when you get into the scrub country.
91. You think that that as a rule is a poor class of land for agriculture? Some of it will grow crops very well, but the cost of clearing would be very great.
92. What do you think would be a fair amount to pay for the clearing of that land per acre? You could get it cleared for the stump-jump plough for 10s. per acre; but if you were to get it thoroughly cleared it would cost about £2 10s. per acre.
93. Are you yourself engaged in farming pursuits? Yes.
94. What do you consider a fair payable price for wheat? I have only grown hay.
95. What is considered a fair payable price for wheat in the district? Half a crown.
96. What is a fair price for oats? Oats are not grown here.
97. Those who took up land between Condobolin and Euabalong, according to your evidence, must be possessed of considerable capital, and must be prepared to spend about £2 10s. per acre in rendering the land fit for agriculture? It would cost that to thoroughly clear it, but as a rule the farmers do not go in for thoroughly clearing, they go in for Yankee-grubbing. The stumps are left in the ground to rot, and they are taken out by degrees.
98. And you think land can be prepared in that way for 10s. per acre? Yes.
99. *Mr. Fegan.*] Things have changed considerably since the Sectional Committee took evidence here in reference to the construction of a line from Condobolin to Broken Hill? They have changed for the worse. We have had nothing but drought ever since.
100. As Mayor of Condobolin you think that there would be a risk attaching to the extension of the railway beyond this point? Yes. I feel confident that the line to Euabalong would not pay.
101. Do you think it would be well to take the line beyond Euabalong? If it went beyond Euabalong it might be a better paying line.
102. How far would you extend it beyond Euabalong to make it pay? I could not say. I do not know the country beyond Euabalong.
- 103.

- D. H. Tasker.** 103. Then upon what ground do you say that if the line were taken further it would probably pay? It might pass through better country, but I do not know definitely that it would.
- 27 Sept., 1837. 104. You say you are getting trade from the Lake Cudgellico district;—what does it consist of? Wool.
105. Where would that wool come from? From Brotheronery and Wooyeo; all stations between here and those points will fetch their wool here. I could not say whether or not the wool would come from any point lower than Wooyeo.
106. You know Euabalong well? Yes.
107. Are there any stations of importance there? Booberoi is the principal one.
108. Is there not good country round about Euabalong? The river frontages are good land.
109. How far back does that land extend? Eight or 10 miles, perhaps 12 miles in places.
110. Is it occupied chiefly by small settlers? There are hardly any settlers there at all now. They have sold out to the lessees.
111. What is the road carriage from here to Euabalong? About £2 a ton.
112. Do you think a railway would be the means of settling more people on the land in that direction? It might, but I hardly think so.
113. Do you think railway extension to Condobolin has had the effect of settling more people here? So far it has not had that effect, but it has induced a certain amount of settlement between here and Parkes.
114. Was not some land recently thrown open between here and Bogan Gate? Yes; it was all balloted for.
115. Would not the same thing be likely to happen in regard to available land if the line were extended to Euabalong? Yes; so far as the river frontages are concerned.
116. And do you not think that that settlement would be the means of making the line pay? I do not think so; there would not be enough of it.
117. You say that less than 20 inches of rain will not grow wheat; but do they not grow wheat at Hillston with a much less rainfall? I believe they do grow wheat there with a smaller rainfall.
118. But is there not much less rainfall at Hillston than at Condobolin, and do they not grow wheat there? Yes.
119. What is the comparison in the matter of wheat-growing between Condobolin and Hillston? I should say that the Condobolin climate was far superior for wheat-growing.
120. And yet you say you have not been successful in growing wheat here? We have grown it very well, but we have no market.
121. You have had a mill here for some time? Yes; but they only buy a certain amount.
122. I suppose they please themselves whether they buy or not, and they have it in their power to make the crops profitable or unprofitable? It sometimes happens that the prices they offer have that effect.
123. Do they ever refuse to buy? When they have bought enough to supply the demand they do not buy any more.
124. Have you ever known them refuse to buy wheat? I could not say personally; but they have cut prices down to 1s. 8d. and 1s. 10d., and they have refused to buy any after that. They have quite a monopoly.
125. Do you not think it would be good enough to start another mill? I do not think it would pay.
126. You say your average wheat yield here is 15 bushels an acre,—would you be surprised to know that the average in the Hillston district is higher? At certain seasons it may be.
127. But have not both districts the same seasons? Practically.
128. Therefore if they can grow wheat to advantage at Hillston, ought you not to be able to grow it to greater advantage here, seeing that you have a railway? No doubt we shall.
129. Do you know whether there is a greater acreage under wheat here than formerly? I believe there is. I might say that had it not been for the severe drought we have gone through there would have been a greater amount of cultivation than we now have, but the rain came too late for cultivation.
130. You say that the mill here has a monopoly;—could you not overcome it by sending your wheat by train to Parkes, Orange, and Bathurst? Yes. I daresay we could.
131. What would the rate of carriage be? The railway is not yet taken over to Condobolin; no rates are yet fixed.
132. *Mr. Farnell.*] Was it not understood that there was to be a local rate? I think so.
133. Did not the residents express themselves satisfied with the establishment of local rates? It is very likely.
134. *Mr. Fegan.*] Then you think it quite possible that the opening of a railway may be the means of obtaining better prices for your farmers at the local mill? Yes.
135. What price would they have to pay to Forbes, per ton? It would vary from £1 to £2, according to the season.
136. Therefore it would be a great deal better for the farmers to leave their wheat here than to take it so far? Yes; and to sell it at a reduced rate.
137. *Mr. O'Connor.*] What is the distance from here to the Mount Allen and Mount Hope mines? About 100 miles—they are equi-distant from Condobolin.
138. Would they be served by the proposed line? Yes.
139. What are the principal towns near you? Euabalong would be the nearest town.
140. You said that if the river-frontage land were thrown open it would be readily taken up;—under what conditions is it now held? Under lease.
141. How long have the leases to run? In many cases, about eighteen months in this division.
142. *Mr. Fegan.*] Who are the millers here? Nicholas and Reymond, of Forbes.

John Coppock White, general commission agent, Condobolin, sworn, and examined:—

- J. C. White.** 143. *Chairman.*] How long have you been in the district? My knowledge of the district extends over twenty-two years.
- 27 Oct., 1897. 144. Then you are pretty well acquainted with the district in all directions outside Condobolin? Yes.
145. *Mr. O'Connor.*] You have heard of the proposed line from Condobolin to Euabalong? Yes; and I would like to say at the outset that I am quite an independent witness; I have no interest in any particular line.
- 146.

146. What do you think of the proposed line paying? I do not think there is any necessity for the line. J. C. White.
147. Upon what do you base that opinion? All the land fit for agriculture between here and Euabalong which is available has been taken up. Some land upon Kiacatoo has been surveyed and will be thrown open directly; a number of people are waiting for it, but Condobolin would catch the whole of the traffic from that direction. 27 Sept., 1897.
148. By whom has the land to which you have referred been taken up? All the land worth taking up has been taken up by selectors.
149. Would not that be an additional reason for the construction of a railway to Euabalong? I do not think they want railway communication—they have it already at Condobolin.
150. You yourselves had railway communication at Parkes at one time, but you were not satisfied with that? That was 60 odd miles away.
151. What is the distance to Bogan Gate? Forty miles.
152. You would not have been satisfied had the line stopped at Bogan Gate, and since it has been extended to Condobolin, why should it not be taken from Condobolin to Euabalong? There is settlement all the way between here and Bogan Gate. If you take the length between here and Euabalong the principal part of the settlement is from 2 to 25 miles from Condobolin.
153. From your long experience do you not know that railway facilities induce settlement? But in the case of the railway into which you are inquiring there is very little land to take up. Most of the river frontage has been secured, and out back settlement is not practicable.
154. Will not a large area of land between here and Euabalong be thrown open within the next eighteen months? Some land will be thrown open, and a number of people are waiting for it. If you were going to take the railway westward, however, I think it should be constructed in a direction in which it would serve more people, and open up better country. You might at the same time serve Euabalong.
155. In which direction do you think such a line should go? I do not know much about the Grenfell country, but I do know Wyalong, and I think that a line might be taken from Wyalong to the lake, and from the lake to Hillston. Such a line would open up a vast area of country which could be settled upon, whereas the proposed line would open up comparatively none.
156. Are you well acquainted with the country between Wyalong and Hillston? Yes.
157. Do you consider that land in that direction is better adapted for settlement than is the land between Euabalong and Hillston? Between Euabalong and Hillston, the river land is, of course, the best; but the bulk of that land is secured. People will have no chance of settling there.
158. Do you say that the land generally between Wyalong and Hillston is good agricultural land? It is some of the best country in New South Wales for wheat growing.
159. How is it held? Most of it is under lease. I do not quite know when the leases will expire, but I should think in a few years. There is a large area of first-class country between Wyalong and Lake Cudgellico, and from the lake to Hillston it is all good country.
160. Do you know the North Condobolin run? Yes.
161. Is it a fact that there is an intention on the part of the management to cultivate a large area of it now that the railway has been opened to Condobolin? It is the intention of Mr. Officer and of several others to do so. Had it not been for the drought there would have been a large area of Borambil under wheat this year—that is, 10 miles up the river on the other side. They had a regiment of men clearing the land for cultivation, but it was of no use in the present season to put the wheat in.
162. You mean they thought it of no use to grow wheat until the railway was here? No; of course, the selectors who were dependent upon wheat put it in.
163. Now that the railway is open I suppose every man who has land fit for wheat-growing will cultivate? Yes; a large quantity is being grown in the district now.
164. You ascribe that to the existence of railway facilities? Yes.
165. Mr. Fegan.] You gave evidence twelve months ago against the extension of a line from here to Menindie? Yes.
166. You then spoke of the proposed extension to Euabalong? Yes.
167. You said that most of the land had been secured? I think I said that most of the river frontage had been secured by auction purchase and selection.
168. But the leaseholds will be thrown open to selection shortly? In the course of a few years; but the leaseholds are not on the frontage.
169. The land at the back is poor? Very poor; all the eyes of that part of the country have been picked out. Any land worth taking up has been taken up there years ago.
170. Therefore, while a certain area will be thrown open to settlement, it is not likely that intending settlers will run after that inferior country? No; I do not think it will be taken up. It is too thickly infested with vermin.
171. Are there many rabbits about here? Yes; they are getting pretty thick.
172. You were inspector at one time? Yes.
173. The rabbits have increased considerably in numbers of late years? Yes.
174. Are there any reserves between here and Euabalong? Yes.
175. Do those reserves contain good land? Yes; on the river frontage.
176. Is there any possibility of their being thrown open? They are of no great extent; but there is some good land on Kiacatoo to be thrown open shortly, and a number of people are waiting for it.
177. You think there will be a rush for that land? Undoubtedly.
178. What distance would it be from Condobolin? From 20 to 30 miles—about half the distance to Euabalong.
179. How many acres are to be thrown open? From 7,000 to 8,000, I think.
180. Are the rabbits numerous there? Yes; they are bad on all the stations about here. The dogs are also bad in the mallee and pine country.
181. Do you think the throwing open of this land to selection will aid considerably in getting rid of the rabbits? No doubt it will. As the land is at present held it is a very difficult job to keep them in check.
182. A settler would be put to considerable expense in rabbit destruction? He would have no chance unless he fenced in his holding. If he fenced he might be able to deal with the pest.
183. Can you speak as to the price of rabbit-proof fencing? Not definitely. I know that it is regarded as being too costly for the majority of selectors.

- J. C. White. 184. You say you cannot favour the construction of a line from Condobolin to Euabalong? I could not conscientiously do so.
- 27 Sept., 1897. 185. I suppose it is not that you do not want the terminus to leave Condobolin? No, not at all; that does not affect me in any way.
186. Do you think the extension of the line from here to Hillston would pay? I do not think it would for a number of years. All the river frontage land is secured, and at the back of the river there is nothing but mallee and inferior land.
187. You said a number of reserves were held by the Crown? Yes; but they are very small; the average would be about 640 acres. There are six of those reserves between Condobolin and Euabalong, and if the whole of them were thrown open it would not amount to much settlement, because 640 acres is not area enough.
188. Is there any good timber out there? On the river there is some gum, but the best of it has been cleared.
189. The remaining timber is rather poor? There is some good timber left. There is plenty of pine in the back country, and there is some good gum along the river.
190. Therefore, what you would have to rely upon to make a railway pay would be agricultural produce and wool? Yes.
191. And at present the position is that there can be very little new settlement with river frontage? Very little. There are a good many settlers on the back of Kiacatoo, but they have taken all the best of the land, and have cut the poor land out.
192. *Mr. Farnell.*] There are a number of stations between here and Hillston which at present send to Condobolin? Yes, as far as Uabba, below Wooyeo. Previously, a lot of this wool was sent to Whitton and Carrathool; now Condobolin will get it.
193. So that Condobolin is actually robbing the south-western line of traffic? If you like to put it in that way. Of course, all the freight goes to the railways.
194. In the event of this line being extended to Euabalong, would it not be the means of inducing these persons to send their wool to that section instead of it coming on to Condobolin? Unquestionably.
195. So that we might rely upon a great deal of traffic which now comes to Condobolin going to the new section? Yes; all the wool and wheat.
196. Would you say that no railway should be constructed unless it is absolutely certain that it will pay from the start? I think that if that policy were adhered to very few railways, indeed, would be made.
197. You know that it is anticipated that upon the proposed new railway there will be a loss of about £2,000 a year? Yes.
198. But that a certain amount of new traffic will be brought on to the main line, which will help to balance the loss? Of course, that is true to some extent.
199. *Chairman.*] You say that the river frontage between here and Euabalong is nearly all purchased land? It is for the most part. There are a few selectors who have been fortunate enough to get river frontages.
200. Is the purchased land suitable for agriculture? Yes; but I do not know that it would be so suitable for wheat-growing as is some of the back country.
201. Would it not be possible for some of this land to be worked on the halves system, as is done further south? There seems to be a disposition on the part of the squatters to go for that system of cultivation since the advent of the railway.
202. Do you not think that the extension of the line to Euabalong might induce further cultivation upon that system? No doubt it would.
203. Do you not think it probable that intending selectors, finding they could not get land of first-class quality, would enter into an arrangement with the lessees to occupy land on the share system? Many of them no doubt would do so.
204. You think it would be more practicable to do that than to take up the inferior land, and make it ready for the plough? Quite so. Many selectors have been kept so long waiting for land to be thrown open that they have gone away in despair.
205. You think, therefore, that the construction of a line to Euabalong might have the effect of putting under cultivation a considerable area of land which is now used for grazing purposes only? No doubt it would to a certain extent.
206. The bulk of the land you have spoken of on the suggested line from Wyalong to Lake Cudgellico is first-class land, but I suppose there are some bad patches? Yes; there are some stony hills.
207. And, I suppose, that, from the lake to Hillston, the line would mainly follow the river flats? Yes; and all the frontage is secured.
208. Is not a good deal of that land liable to inundation? Some of it is; but not so much so as is the land between here and Euabalong. There is a lot of flooded land between here and Euabalong, and it goes a good way back.
209. How far back at the time of high flood? Three or 4 miles in some places.
210. All the plain country is liable to inundations until you get a good way back from the river? Yes.
211. What water supply is there in that back country? None, except station tanks here and there.
212. It is all artificial? Yes.
213. So that the difficulty and expense in the way of selectors in that part of the country would be very great, and, independently of railway construction, you do not think settlement would be likely to take place? That is my opinion. Selectors with a limited amount of capital could not afford to settle in the back country.
214. The only prospect of agricultural settlement would be from persons entering into some arrangement with the owners of the land upon the halves system? That would be the main prospect; but, as I have said, the land shortly to be thrown open on Kiacatoo will be rushed.
215. You think that all the good land between here and Euabalong, as well as between here and Hillston, will be taken up immediately it is available? Yes.
216. So that after all there is a prospect of largely increased settlement in the district? I would not say largely increased settlement.
217. The present conditions attaching to settlement will not enable persons to deal with the land as they have done in years gone by? No; they will have to make homes upon the land.

218. Whatever land is taken up will have to be occupied? Yes; but sometimes the original occupier cannot stop. J. C. White.
27 Sept., 1897.
219. Do you think the proposed extension to Euabalong would intercept any traffic which now goes to Victoria? I have no doubt it would. I think the Hay line intercepts a lot of traffic which formerly went to Victoria. A number of squatters beyond Hillston formerly sent to Melbourne, but of late years they have sent their wool to Sydney.
220. You think the construction of the Hay line intercepted that traffic to a certain extent? Yes.
221. And that an extension to Euabalong from Condobolin would have a still further effect in that direction? Yes.
222. If the line were taken still further to Hillston you think the volume of traffic intercepted would be very considerable? Yes.
223. There would then be a large quantity of entirely new traffic upon a line to Hillston? Yes.
224. You think that if a line were extended to Euabalong it would be advisable to take it still further and tap the Hillston country? It would, but at the same time I do not think the wool traffic of itself would pay, and passing along the river from Euabalong to Hillston there is no scope for settlement.
225. Do you think the probable development of the country, and the new traffic attracted in this direction would warrant the construction of a railway, although for a few years it might not be a paying concern? Yes; there is no comparison between the lines from Condobolin to Hillston, and Wyalong to Hillston. A line from Wyalong to Hillston would serve a large number of persons who are already settled, and would at the same time open up a large area of country which is practically closed to settlement at the present time.
226. Having a good knowledge of the country, you think that that would be the better point of connection? Yes. I was managing a station out there for seven years, and I am intimately acquainted with the capabilities of the country. There is a large number of selectors already settled upon the land I speak of, and there would be more if we could get the railway.
227. Have they had much difficulty with the rabbits? Yes, they have been pretty bad; they are continually increasing. I had it on the authority of Mr. Strahorn, the superintending rabbit inspector, ten years ago, that at a place where about two years previously they counted 12,000 scalps a month, they are now counting them at the rate of 150,000 a month.
228. *Mr. Farnell.* Do you know of any development in the mining industry near Cugong? No; Cugong is practically deserted. I am told that there is only one mine at work.
229. How many people are there working? One of the tributors told me that there were only three or four working in the mine.
230. You do not know of any mining centre where there is a large number of miners at work? No; unless it be at Bobedah—that would be north-west from here.
231. How far from Cugong would that be? Forty or 50 miles.
232. Do you think that any mining settlement on Bobedah should be taken into consideration as likely to contribute a quantity of traffic to the proposed railway? No; the Bobedah traffic will eventually come here.

Arthur James Taylor, selector, Cugong, sworn, and examined:—

233. *Chairman.* You are a selector at Wheatacre Farm, near Cugong? Yes. A. J. Taylor.
27 Sept., 1897.
234. Have you resided long in that locality? Since 1890.
235. You settled in this district in that year? Yes.
236. Where did you come from? From Victoria.
237. What is the area of your selection? 2,560 acres.
238. Have you any under cultivation? 200 acres; 180 acres of wheat, and 20 acres of barley.
239. Is this the first year in which you have grown wheat? No; I have been growing it for five years.
240. What has been your average rainfall? About 20 inches.
241. Have you been successful in growing wheat? Yes; I have not had a failure since I put it in. In the last two seasons it has not been good, on account of the drought, but in 1894 off 120 acres I got 500 bags.
242. How many bushels to the acre? Twenty-six bushels.
243. Your only other crop is barley? Yes.*
244. You have some sheep? Yes, 1,000.
245. Where is your market for wheat? In 1894 I had to send it to Forbes by team.
246. What did you have to pay for it? Sixpence a bushel, or 2s. a bag.
247. What price did you get? 2s. 2½d. was the biggest price I ever got in Forbes, and that was in 1894.
248. What did you get last year? 4s. 7d. in Condobolin.
249. Are you much troubled by rabbits? There are hardly any rabbits, but I have to wire-net my property against other vermin.
250. What does your fencing cost you? The netting cost me £25 a mile in addition to the ordinary fencing which would cost me £30 a mile.
251. What would your fencing cost altogether per mile? I could not tell you at this moment, but I should think about £55.
252. What is generally the price of road carriage from your place to Condobolin? Wheat is generally 1s. a bag.
253. What do you pay for wool? About £1 a ton.
254. Do you find the extension of the railway to Condobolin of much assistance to you? Yes.
255. To what extent will it reduce your carriage? It will not reduce the cost in the case of wheat, because it will be our market. Of course if the market were oversupplied the wheat would have to go to Sydney as it did in 1894.
256. How far are you from Forbes? Eighty miles; and I am 25 miles from Condobolin.
257. What is your opinion in reference to the construction of a railway from Condobolin to Euabalong? I think it would open up a lot of country and cause a great deal more farming.
258. What country will it open up chiefly? Land on Kiacatoo; but there is a number of leaseholds to be thrown open shortly, and altogether I think the railway would cause a lot of settlement. There is a lot of open country on Melrose which would be taken up; I am referring now to the resumed area.
- 259.

* NOTE (on revision):—I am stripping the wheat and barley, wheat yielding 6 bags to the acre and barley 8 bags.

- A. J. Taylor. 259. Do you know how much there will be? I could not say precisely, but there is an enormous quantity of land there to be taken up, and land would also be taken up on Mowabla.
- 27 Sept., 1897. 260. That is the full extent of country you think that the line to Euabalong would serve? Yes; on this side of the Western Division line.
261. What sort of soil is it? Red loamy soil.
262. Is it the kind of soil that you have? Yes.
263. You said you had an average of 26 bushels? That was in 1894, but that would not be my general average; the average in the district would be about 15 bushels.
264. At what price would a yield of 15 bushels pay? At about 3s.
265. You think that when the price goes below that it would not pay? No.
266. In how many years has the price been less than 3s.? I fancy that 1894 was the only year when it was less. I got 2s. 2½d. in that year.
267. In five out of the six years you have been here wheat has been more than 3s. a bushel? Yes.
268. How do you get your water? By tank. There is no river frontage; my place is about 8 miles from the river and about 1 mile from the proposed line.
269. To what extent would the line improve your position? I should be able to put in 1,000 acres of wheat if the line were constructed.
270. You would be able to get your wheat to market more cheaply? Yes; I should regard Sydney as our market.
271. I suppose you are aware that when it was proposed to construct a line from Parkes to Condobolin the Railway Commissioners proposed to charge 1d. per bushel over that length? Yes.
272. Would your carriage be much cheaper if, in the event of a line being constructed to Euabalong, you had to pay 2d. a bushel? Yes.
273. You think it would give an impetus to agriculture out your way? The existing railway has already done so. There would have been a great deal more wheat in this year but for the season.
274. Could you give us an approximate idea of how much more wheat has been put in consequent upon the railway to Condobolin? No, I could not; but I know that in 1894 1,000 bags of wheat were stripped on my own and my father's selection. We have 500 acres under wheat this season.
275. How much more than last season? About 70 acres more.
276. *Mr. O'Connor.*] And you say that if a railway were constructed to Euabalong you would make the area 1,000 acres? Yes.
277. *Mr. Fegan.*] Do you grow fruit and vegetables? No; but I was about to say that I think we could do a good business in breeding early lambs for the Sydney market if there were a railway. We have grown cabbages, peas, beans, and potatoes.
278. Do you think that if a man gave up his time to it he would be able to grow sufficient vegetables to serve the district instead of their being obtained from Sydney? I think so.
279. Is the soil fitted for the growth of vegetables and fruit? Yes.
280. Have you any fruit trees? I have a few trees in. Wherever I have seen trees here they have always appeared to be doing well. Certain fruits do splendidly, especially peaches, apples, plums, figs, and grapes. I have seen better fruit grown here than I have seen grown in Victoria under irrigation.
281. The Euabalong district is not very thickly populated? No.
282. But you think that with the prospect of railway extension from Condobolin to Euabalong land will be thrown open, with the result that a greater population will settle there? On this side of the Western Division line I think an enormous quantity of wheat will be put in.
283. On account of the cheaper carriage? Yes.
284. *Mr. Farnell.*] You are on the Kiacatoo holding? Yes.
285. Do you think that the land there which will shortly be available for settlement will be put to the use to which you have put your land? Yes.
286. Do you know of any other leases which will shortly fall in, and whether the land is likely to be put to similar use? Yes; on Mowabba there are some 34,000 acres of land which will be put to similar use.
287. What should you say would be the area upon which a man in your district could get a decent living from wheat-growing? 1,280 acres.
288. He would combine sheep-farming with wheat-growing? Yes; and he would require grass for his stock.
289. Have you rested any portion of your land during your six years' cultivation? No; I have my fifth crop in now. I intend to leave out a portion next year.
290. Do you propose to sow any other crop on that land? Yes; I am trying ambercane.
291. You keep it as fodder for cattle in drought? Yes.
292. Do you think there is any possibility of dairy-farming in your district? Yes; I am sure that if there were a railway dairying would be started on the river flats.
293. You and those who are likely to take up land on Kiacatoo would use without doubt a railway from Condobolin to Euabalong? Yes.
294. *Mr. O'Connor.*] How long were you in Victoria farming before you came here? Thirty years.
295. You considered the inducements offered in this Colony were such as to warrant you in coming here to farm? Yes.
296. You are well satisfied with the change you have made? Yes.
297. And with your future prospects? Yes.
298. Farming is more remunerative here than in Victoria? Yes.
299. *Chairman.*] You learnt your farming in Victoria? Yes.
300. I presume your family outgrew the area you could obtain there, and you had to come to this Colony to obtain a larger area? Yes; our area was too small.
301. Having heard that there was good country here you came over and looked round until you found something to suit you? Yes; I travelled all through the Temora, Wyalong, and Young districts, and I liked the country here better than any I saw there for farming purposes. I was up here four or five times altogether in the course of ten years.
302. Have you induced any friends to come over from Victoria? Yes; my father and brother hold selections near me.
303. What area of selection is held jointly by your family? 5,120 acres.

304. Have you any other settlers near you? Yes; all the country round me is taken up by selectors.
305. Have they all the full area? No; they have from 1,000 acres upwards.
306. They will have an opportunity to get their full area when the leasehold of Kiacatoo falls in? There are quite enough looking for that land without present selectors looking for it.
307. You think that when the leaseholds of Kiacatoo and Melrose fall in there will be a strong demand for the land? Yes.
308. You think that the combination of agricultural and pastoral pursuits is suited to the district? Yes; by working the two together you can keep the ground clean, and obtain a better return.
309. I suppose that you and your neighbours all farm on the same system? Yes; we all go in for mixed farming. The last two seasons have been a great drawback to everyone in the district; they have lost most of their stock. I got through without any great loss.
310. I suppose your cultivation helped you through your difficulty? Yes.
311. Was the line from Parkes in course of construction when you first thought of settling here? No; my nearest railway was at Cowra. It cost me £9 a ton for road carriage; but that was an exceptionally bad year.
312. The construction of the railway to Condobolin has improved your position materially? Yes.
313. Do you think that if a railway were extended further to the westward a lot of the country there would be farmed on the share system? Yes.
314. Even if a line were not constructed I suppose that is likely to be done? Yes.
315. The land being, in your opinion, eminently suitable for agricultural pursuits? Yes.
316. You think the demand for land being so great the owners of freehold will enter into an agreement with those desirous of settling to work their land on the share system? Yes.
317. You think that can be done with advantage to each party? Yes.
318. Have you had any experience of the share system? No.
319. But you have met farmers who have? Yes; I have been in the Riverina country, and the farmers there express themselves as being highly satisfied with the system.
320. Do you wish to add anything to your evidence? I think the mineral traffic on a railway to Euabalong would be considerable. There is a number of mines working all along the route from here to Mount Hope. I think, with a lower rate of carriage, mining would increase considerably. A parcel of 11 tons of ore left here last week for the Clyde Works.
321. Where did it come from? About 15 miles out—4 miles on the north of the line.
322. Was it gold-bearing stone? Yes.
323. What is the name of the place? I think they call it Mowabla.

A. J. Taylor.
27 Sept., 1897.

John Whittaker, carrier, Condobolin, sworn, and examined:—

324. *Chairman.*] You are a carrier, residing at Condobolin? Yes.
325. How long have you lived there? I shall have been here sixteen years on the 15th January next.
326. *Mr. Farnell.*] How many teams have you? Three.
327. Are they ten-horse teams? Sometimes ten, sometimes twelve, sometimes fourteen, according to the road.
328. What is the average load you take? It depends entirely upon the weather; generally about 4 tons. I might have 7 or 8 tons on, but that would be when the roads are good.
329. You do not combine carrying with free selection? No.
330. Between what parts do you carry? I have carried from here to Nymagee, Errimeran, The Overflow, Nangybone, Melrose, Tara, Methumble, and other places.
331. You bring goods from these points to Condobolin? It has been coming to Condobolin since the line opened. Errimeran used to get return traffic through here up to the last two years, but not the whole of it. The same thing applies to Nangybone. A great deal depends upon the price of carriage either way.
332. To what stations have you been recently carrying? I am carrying for Melrose now. I am bringing the wool clip in here.
333. What number do they shear? They are shearing, I think, about 45,000.
334. Do you think the traffic to which you are now referring would go towards Euabalong if there were a railway there, or would it come on to Condobolin? I think it would come on to Condobolin; it would be shorter, and there would be less freight to pay.
335. I suppose other carriers are bringing produce from the different stations to the terminus here? Yes.
336. Do you think any of those stations would use a railway from Condobolin to Euabalong? I think not, unless it were Tara. They would prefer Condobolin, because they would have more freight to pay if they went to the westward. Here they would have less freight and the same road carriage.
337. Do you know the district towards Euabalong? Yes; I have been up and down it during the last fifteen years.
338. Has much settlement taken place there within the last three or four years? Yes; within the last five years.
339. Do you think the construction of the railway to Condobolin has been an incentive to settlement in this district? I think it has.
340. Are you aware that large areas of land will become available for settlement in the district within a reasonable time? I believe so; but I cannot speak as to the areas.
341. Assuming that a large area of that land is suitable for wheat production, do you think the construction of a railway to Euabalong would bring about much *bona fide* settlement? I daresay it would.
342. The construction of the proposed railway is asked for on the ground that the district is good wheat-producing country;—is not the soil capable of producing many other things? I have been here for fifteen years, and have seen one or two crops since I have been here. They have had, at the outside, three of what I should call crops.
343. What would you call a crop? About 20 bushels to the acre.
344. It is said that with a fair price 16 bushels would pay handsomely? I think there is room for difference of opinion on that point.
345. Do you carry much wheat? No; I carry no wheat. Reymond was giving 1s. 3d. for it. They came to me on several occasions, and wanted me to cart wheat from here to Forbes—60 miles—for 10s. a ton.

J. Whittaker.
27 Oct., 1897.

- J. Whittaker. ton. I would not take it, as I reckoned that if I did I should be only making a rod for my own back. I said, "If I cart your wheat to Forbes for 10s. in the wool season they will say that if I can cart wheat for 10s. a ton I can cart wool for 10s. a ton." They pointed out that they wanted to leave an amount which would pay them. A lot of the wheat was taken to Forbes for 12s. a ton, and that left them 1s. 9d. in Sydney. Raymond raised the price here to 1s. 10d., but it was through the carrier taking it away at 12s. a ton that they got their 1s. 10d.
- 27 Sept., 1897.
346. Means of transit not being at the disposal of the farmers, they were in the hands of the miller, who could practically give them what he liked? Yes.
347. But now that railway communication has been established, and there are facilities for getting the wheat to market, is it not possible that a greater area will be put under crop? I believe so; still I would not depend upon the district for wheat. If you get a decent season the land will grow anything.
348. Has the soil ever been examined? No; but I know that in a fair season you could not beat it. In a dry season you could flog a flea from here to Euabalong, and not miss it once. Most of the landowners here have too much land; they do not want any more.
349. You mean they have a certain amount of land idle? Yes; and they have to contend with the scrub, and with rabbits and wallabies. I think that 5s. an acre is quite enough to give for some of the back-country land.
350. Your opinion of the district is not a good one? It is not as far as agriculture goes, but every year I have been here the seasons have been improving. For the first two years I thought the grass would never grow in the back country, and I was wondering how the sheep kept alive.
351. You do not want a railway beyond Condobolin? I should not care whether the railway were made to-morrow; it would make no difference to me; but if you went to much expense to put it down, I do not think it would pay, although it might do so in years to come. When they are getting road-carriage as cheaply as they are getting it now, there is no reason to sing out for a railway. The rate to Forbes is from 12s. 6d. to 25s., yet they are asking for a railway. They are charging 25s. on the railway from Bogan Gate to Condobolin. That, however, is an arrangement with the contractors, and has nothing to do with the railway authorities. It is the contractors' rate for general goods.
352. Do you think it was a mistake to construct a line from Condobolin, and that it ought not to go any further? Yes; and I think a good many people in Condobolin are of the same opinion by this time.
353. Where a charge of 12s. a ton was made to Forbes, I suppose return carriage was guaranteed? No; we had to chance back loading.
354. *Mr. O'Connor.*] What is the distance between Nymagee and Condobolin? About 101 miles.
355. How far off is Tara? About 80 miles. It would be nearly as far from Euabalong as from here.
356. Do you know the country between Euabalong and Hillston? No; but I know it between Euabalong and Mount Hope, and that is about the worst country you ever put your foot upon. The scrub is full of rabbits, wallabies, and wild dog, and there is any a quantity of porcupine grass. If you want to know what the back country is like, you want to go into it after a fall of rain. What will carry you is fit to cultivate, and what will not is no good.
357. You do not think there is much chance of people taking up the land for agricultural purposes out there? Not if they knew what the land is like.

David Scott, grazier, near Condobolin, sworn, and examined:—

- D. Scott. 358. *Chairman.*] You are a grazier? Yes.
- 27 Sept., 1897. 359. How long have you been in this district? Seventeen years.
360. What are your stations? Mowabla and Gulgo North.
361. What do you carry? From 20,000 to 25,000 sheep on the two stations.
362. What is your average clip? From 250 to 300 bales.
363. What is the area of the stations? Gulgo North is 12,000 acres, and Mowabla 32,000 acres. There is some conditional purchase and conditional lease land which is not included in that area. There are about 6,000 acres of that.
364. What is the average carrying capacity of the land? In its natural state, about a sheep to 8 acres.
365. I presume that in a good season it would carry a few more? Not in its natural state. In its improved state it is equal to about 3 acres.
366. Where is your water supply? The river frontage. We have 6 miles of river frontage.
367. Is it good holding ground? Yes.
368. Does the proposed railway pass through any of your holding? It passes through Gulgo North, about 2½ miles back from the river.
369. Does it pass through good country? Through good agricultural land.
370. What is the country like further back? It is yarran and box, with patches of mallee. There are also some low-growing scrubs, such as gooma; that is an edible scrub.
371. What is the country like at the back of your run? To the north and west it is rough country until you come to Melrose.
372. Is it occupied? A good part of it is under conditional purchase and conditional lease, and the other part is abandoned areas.
373. What are the abandoned areas like? There is mallee and some timbered country, which, if cleared, would be fair agricultural land.
374. Do you think there is any prospect of agricultural settlement there? Only on condition that the land is put up at a fair price and railway communication is afforded.
375. Is the land in that direction much infested with rabbits? It has been, but rabbits are now nearly a thing of the past; you see a few here and there.
376. Is that due to the drought? Yes; and the measures which have been taken to exterminate them. My own place is wire-netted, and I have been keeping them down to a considerable extent for some years past; but even outside my wire-netting now it is very hard to find them.
377. Are the abandoned areas also free of rabbits? They are at the present moment, but the rabbits will soon be back again.
378. Are not the neglected abandoned areas a menace to the surrounding property? Undoubtedly.

D. Scott.
27 Sept., 1897.

379. Do you not think something might be done to get these lands occupied;—do you not think people would settle upon them if the conditions were liberal? That is a hard question to answer. The land is left in such peculiar shapes and areas that it would be rather a bold man who would tackle it.
380. You think it would be almost impossible to deal with these abandoned areas properly? Some of it is fairly good land, and might be profitably taken up again. I know of one area of 4,500 acres which was part of my holding at one time. You will have to give a bonus to anyone to induce them to take some of it up.
381. Do you think there is no possibility of dealing with the land under a scheme under which it would be held for a long term at a peppercorn rental with improved conditions? If the Government could see their way to give an extended tenure of this inferior country at a peppercorn rate, the isolated blocks might be taken up by the adjoining lessees; but I do not think any man would take them up by themselves.
382. Do you think the proposed line to Euabalong would be a profitable undertaking? Not in the immediate future, but it would benefit the country to a large extent. It seems to me necessary to bear in mind, in connection with railway extension, that besides inducing settlement it is necessary to keep men on the land. There is a large number of men on the land now who ought to receive consideration, and if they do not get railway facilities many of them will be unable to stay where they are.
383. Past experience shows that? It is being demonstrated every day.
384. The original selectors have not been able to fight against the adverse conditions, and they are selling out to those in a position to purchase? Yes; there has been an inducement to make large estates.
385. With regard to the freehold land, do you think the construction of a railway might have the effect of putting some of it under cultivation on the share system? I can only speak for myself. Since the railway came to Condobolin I have been clearing as fast as I can. My intention is to put 3,000 acres under crop, and I think others will very likely follow suit. I know that many others are clearing with the intention of putting in crops. Without railway facilities that would be impossible. The extension of the railway beyond Condobolin does not affect my own case at all, because Condobolin would be my station. I have no personal interest whatever in the matter. The extension would not benefit me in the smallest degree.
386. Do you think the extension of the railway to Euabalong would attract more traffic in this direction than has come here up to the present? Decidedly. I know the country from Condobolin to Hillston, and I know that for a distance of from 20 to 30 miles from the river it is all good agricultural country. When you get further back, towards Mount Hope, you have a light, sandy soil, which is not good for anything. Without a railway this land would never be taken up.
387. You are in favour of the proposal then? Yes. I heard a former witness speaking of the crops which could be obtained in this district. I have been growing crops here for fourteen or fifteen years—sometimes for hay, but latterly for wheat—and my lowest return, last year, was 14 bushels to the acre. Before that I never had under 20 bushels. Last year was an exceptionally bad year. I was about the only one who had a crop last year, and I had about 14 bushels to the acre. I was the first in the district to send wheat away when the railway came to Forbes; that was in 1894. The price was very low that year. The wheat returned me 1s. 9d. a bushel net, and even at that low price I was left with a clear profit of 4s. 6d. an acre. It was a small profit, but it showed that even at that small price wheat-growing will pay. At 2s. 6d. a bushel it will pay well. The land in this direction is also suitable for malting barley. Cape barley is not worth growing.
388. You have had some experience in agriculture? I had an experience in the old country for thirty years. I farmed in Scotland long before I came to this Colony. I might add I am a little interested in mining at Mowabla. Some ore was sent to Sydney the other day. It is all highly auriferous country, away back from the river. Between the river and the ridges there is what I should call good agricultural country; beyond that you come on to auriferous country, which extends to Mount Hope. It is good grazing land, but it is not suitable for agriculture. I am interested in gold-mining, but there are also silver and copper, and the country is as new as are many parts of West Australia. It has never been prospected.
389. It is comparatively untried? Yes.
390. You think a visit by fully-equipped prospecting parties might result in discoveries? Yes. Mr. Sleco was out there not long ago. He thought highly of the country, and recommended that it should be tried for alluvial, but no one has tried it yet. The fact is, no one has the money with which to make the experiment.
391. *Mr. Farnell.*] You are badly off for water? There is no reason why we should be badly off for water. The catchment is good, and the holding ground is good. As to the rainfall, on my station, taking the last fourteen years, it has averaged 19 inches 40 points. The following are the particulars:—1882, 16·05; 1883, 12·51; 1884, 13·78; 1885, 19·37; 1886, 21·31; 1887, 32·62; 1888, 9·89; 1889, 21·99; 1890, 31·65; 1891, 21·34; 1892, 19·44; 1893, 16·50; 1894, 30·89; 1895, 11·28; 1896, 15·27;—or an average for 5 years of 19·59. Mr. Russell puts the rainfall for Condobolin at 23 inches, but according to the figures I have given it is 19 inches.
392. *Mr. Fegan.*] If a line were constructed from Wyalong, *via* Lake Cudgellico, would that be better for the people of Euabalong than the proposed railway? No; the proposed line would be nearer to them, and they would have a shorter haulage to Sydney.
393. What is the distance from Euabalong to Cudgellico? Twenty miles.
394. What is the distance from Euabalong to Condobolin? It is 40 miles, I believe.
395. But if there were a line to Cudgellico, would it not suit the people of Euabalong better than the terminus here? Yes.
396. For what distance would the proposed line to Euabalong go through your land? For 3 miles.
397. Would you be willing to give any land which might be required for a railway? It would be leasehold land; the line would not touch my freehold.

James Brown Milne, wool-scourer, Condobolin, sworn, and examined:—

398. *Chairman.*] You are a wool-scourer at Condobolin? Yes.
399. *Mr. Fegan.*] How many men do you employ? About eighteen during the season.
400. Where do you chiefly get your wool from? From the Condobolin district—north, south, and west.
401. They only give you a small percentage of the wool? The percentage usually scoured would be about 15 per cent. I should say we scour about 15 per cent. of the clip every year.

J. B. Milne.
27 Sept., 1897.

- J. B. Milne. 402. You are acquainted with the proposal before the Committee for the construction of a line from Condobolin to Euabalong? Yes.
- 27 Sept., 1897. 403. In which direction do you live? About 6 miles up the river from Condobolin.
404. Do you know the country there? I know it all round about Condobolin very well.
405. Do you think there is any prospect of a line from Condobolin paying? I do not think it would pay in the immediate future. Ultimately I dare say it might pay.
406. The river frontages having been secured, there would not be much land to throw open for settlement? There would be a lot of land open for settlement. All the resumed areas have been abandoned.
407. Is it good arable land? Yes; I have lived for several years in the Western Division, and I have seen quite as good crops there as I have seen round about Condobolin. I am talking of the country to the north of Euabalong, in the Western Division.
408. You think that if the proposed railway were constructed, a large area of land, which is now unoccupied, would be taken up? I believe so. I think the line would assist the Government in getting rid of the abandoned resumed areas in the Western Division.
409. Do you think the people would be willing to pay local rates—that is, rates higher than the usual rates—so that there might be some prospect of the line paying? It would be a question with them whether they could get their produce carried more cheaply by team or by railway. Once a railway is constructed people naturally like to get their produce carried at the lowest rates. They do not like to be handicapped as against other lines.
410. Have you had any experience of teams competing successfully with the railway for any length of time? No.
411. Have you heard of such a thing? I have heard of teams running against the railway; but I do not think they have been able to do so for any length of time.
412. A railway gives certainty of carriage? Yes; and with teams there is no certainty.
413. In the case of a railway you can rely upon your produce being at a certain place on the date named? Yes; and in the case of teams that would depend very much upon the season and upon the state of the roads.
414. With teams a great deal of produce is lost or wasted? I would not say that; but you cannot rely upon your getting your produce brought forward on any specified date.
415. If the roads become impassable it depends upon what goods are being carried whether there will be a loss or not; take general goods, for instance? I have known loads of potatoes go bad; that was at a time when we had to cart from Orange.
416. The roads in this district are in a fair condition? Yes, in good weather; in bad weather they are very bad. In flood time the river roads are quite impassable.
417. Do you think the people of Euabalong would be willing to contribute what might be called a local rate, with a view to the railway paying working expenses? It would all depend upon the difference between the railway and team rates.
418. It is estimated that there will be a considerable loss on the line;—do you think that under such circumstances its construction would be warranted? If the railway were going to stop at Euabalong I should say it would not be justifiable; but if the Euabalong section is regarded as part of a national line, I should be in favour of it. The proper course would, no doubt, be to extend the line to Hillston from Euabalong. One reason for a line in that direction is that it tends to divide the country in halves. It seems to me to be about midway between the Hay and the Bourke lines. Any line on the southern side of the river would give an undue preponderance of railway communication to the people living there.
419. If a line were constructed to Hillston, *via* Lake Cudgellico, do you think it would supply local wants? I still think that in the future something will have to be done with that enormous area of country to the north-west of Condobolin, which would be without railway communication.
420. Would not a line through Cudgellico meet all requirements? You must remember that those using it would have to get across the river.
421. Where are the crossings? There are two crossings. There is one bridge at Euabalong, and another 10 miles further down.
422. Neither of them are good enough to take a railway over? I think not.
423. In your opinion, the best way to serve the people of Euabalong and to induce settlement upon a large area of land would be to construct the proposed railway? I think so, as a step in a line further westward.
424. Do you not think the people would be willing to pay local rates? It is quite certain that they will not send their goods by railway if they can get them carried more cheaply by team.
425. Where would be the market for general produce if the railway were constructed? I suppose the market for wheat will very soon be where our market for wool is—Sydney.

George Daniel Woodall, postmaster, Condobolin, sworn, and examined:—

- G. D. Woodall. 426. *Chairman.*] How long have you been stationed here? Two years next Christmas.
427. *Mr. O'Connor.*] You are acquainted with the proposal to extend the railway to Euabalong? Yes.
- 27 Sept., 1897. 428. Have you formed an opinion in regard to the proposed extension? The evidence I can give you relates only to mail matters.
429. You send mails to Euabalong? Yes.
430. What is the amount of mail matter passing between Condobolin and Euabalong? About 400 letters weekly, 250 newspapers, and twenty parcels. We receive from Euabalong 200 letters, twenty-five papers, and six parcels.
431. You have telegraphic communication with Euabalong? Very little.
432. What do you pay yearly for the mail between Condobolin and Euabalong? On the north side of the river, £58 for a bi-weekly mail; on the south side, £78 for a bi-weekly mail; in all, £136 annually.
433. Have you noticed any appreciable increase in the postal business since you came here? Yes; in Condobolin.
434. To what extent has it increased? I think that during the last twelve months there must have been an increase of 20 per cent.
435. I suppose that if the population increases your business would also increase? Yes.

436. *Mr. Farnell.*] Can you give us any information as to the quantity of traffic now going to Victoria which would be intercepted by the continuation of the proposed railway to Hillston? The tendency of the Hillston trade, as a whole, is to go to Victoria, because the stations there are largely held by Victorian companies, but there are places situated between Euabalong and Hillston which would sooner come here. They would rather drive here and go by train to Sydney than go to Carathool and take the Southern line. The road in this direction is better for stock.

G. D.
Woodall.
27 Sept., 1897.

437. From your experience in the district, and your knowledge of its trade, do you think it likely that a railway to Hillston would divert much traffic now going to Victoria, and bring it to Sydney? I think that if a railway were constructed to Hillston the trade of the district would come to Sydney.

438. *Mr. O'Connor.*] Do you know the character of the land between Euabalong and Hillston? There is not much agriculture on the river between Euabalong and Hillston. Agriculture is carried on more to the south, towards Gunbar.

439. I understand that you were in the Hillston office at one time? Yes; eight years.

440. During your eight years at Hillston what quantity of trade was done in this direction? All the trade then went to Hay and Carathool.

Lachlan McLean, grazier, Boona West, sworn, and examined:—

441. *Chairman.*] Have you been long in the locality? Twenty years. I am situated about 25 miles north of Condobolin. L. McLean.

442. *Mr. Farnell.*] To what railway station do you send your produce? Until this year we had to do business with Trangie, on the Western line. Last year we sent to Parkes. 27 Sept., 1897.

443. And immediately the railway is opened to Condobolin you will use that section? Yes.

444. Will the proposed extension from Condobolin to Euabalong benefit you to any extent? Not at all.

445. It will not offer you further facilities than those you already have? No.

446. Have you a pretty good knowledge of the country between here and Euabalong? I have.

447. Do you carry on agriculture at Boona? I merely grow hay for local consumption.

448. Do you think the country between Euabalong and Condobolin is suitable for close settlement? A great portion of it is.

449. You think it would be worth while to clear the land of scrub and put it under cultivation? Yes; if the land were under certain conditions. Of course, some scrub land is the best of agricultural land when cleared.

450. Which scrub land would you say would be the best for agriculture? The yarran and gooma country.

451. Would you consider pine scrub land when cleared inferior? No; in some cases the pine country is the best agricultural land; there is generally a good depth of soil.

452. You think, then, that the proposed railway would be an incentive to a large number of persons to engage in agricultural pursuits? I think it would.

453. Have you considered the question from a broader standpoint than that of affording railway communication to Euabalong;—have you considered the question, for instance, of railway extension to Hillston? Yes; in my opinion the railway should go further than Hillston—right through to the Darling and Broken Hill.

454. Having a knowledge of the Hillston district, do you think a railway in that direction would be a means of diverting a good deal of traffic from Victoria to Sydney and intermediate stations? I think it would; I can only speak of the matter as it affects myself. I know that if I were there, I would not send my produce to Melbourne if I could send it to Sydney.

455. You think, then, that confining ourselves to this particular section, if the obstacles to settlement were removed, it would have the effect of putting a number of agriculturists on the soil? Yes.

456. What is the land capable of producing besides wheat? It would produce anything at all with irrigation. The seasons here are a great drawback and no railway will alter them; we shall always be subject to dry seasons.

457. Do you think the average rainfall is suitable for the growth of wheat? Yes; we have an average of about 22 inches.

458. I suppose your idea is that those who go on to the soil in this district must combine farming with pastoral pursuits? Yes; a good portion of the land between here and Euabalong, on the northern side of the river, would be suitable for settlement only in comparatively large areas.

459. What do you regard as the minimum area upon which an agriculturist could support himself and family? If the land is really good, a man might do with 640 acres; in other parts he would want 6,000 acres. But taking a radius of 10 or 12 miles from the river all the land is pretty good.

460. But is it available for settlement? A great portion of it is.

461. Where land is not available, do you think freeholders would be likely to prepare their land for the halves system if a railway were constructed? I think they would do so. Many of them will have to do something; wool-growing does not pay now; they must turn their attention to something else.

462. On the whole, do you think the line is a necessity? It would be a great advantage; In fact, I think it would benefit the whole country.

463. You do not think the fact that the line will not pay interest and working expense would be a justification for refusing to construct it? I do not think so.

464. You think the advantage derived by the main line from the traffic which would pass over this section would be sufficient compensation? That, and the settlement which would follow railway construction.

465. Can you speak as to the quality of the wheat grown in this district? Yes; and I had some experience in wheat-growing. I have seen cultivation carried on here for a number of years, and have watched the result.

466. Is the quality of the wheat considered good? Yes.

467. Is it equal to the Molong wheat? I would not say that it was; in some years it would be as good.

468. Have you known the crops to be attacked by rust? I have seen rust here; but it has been only in very wet seasons.

469. Have you tried growing lucerne, or ensilage? Yes; I am growing lucerne.

470. Have you made it a success? Yes; I put in some 12 acres by way of experiment some three years ago. It was put in in only a primitive way; but it grew very satisfactorily, and it is now as thick as it was the first year.

- L. McLean. 471. Had the land upon which you grew lucerne been previously under wheat? I have been growing hay crops upon the land for nearly ten years.
- 27 Sept., 1897. 472. Is your experience in the production of barley and oats as satisfactory as in the case of wheat? I have never tried barley; but I have grown oats successfully. I have seen them 6 feet high.
473. I take it then that you are in favour of the construction of this railway, although it will not materially benefit you, seeing that you have already railway facilities? Yes; the construction of the line would not benefit me. Condobolin is the nearest point at which I should touch the railway.
474. *Chairman.*] What is the size of your holding? My leasehold is 38,000 acres.
475. What number of stock do you carry? I had as many as 45,000, but this year the number is very much reduced.
476. You have had a rough time of it with the drought? Yes.
477. What area have you under cultivation? Somewhere about 50 acres. I am preparing 300 or 400 acres for the plough.
478. You intend to increase the area now that the railway is at Condobolin? Yes; I intend to put in some more lucerne.
479. The advent of the railway has induced you to put a considerably larger area of land under cultivation? Yes.
480. *Mr. Farnell.*] Do you think dairy-farming could be carried on successfully here? Dairy-farming could be carried on very successfully on the river, because you could always irrigate, and have green food for your cattle.
481. In a fair season the natural grasses and herbs are splendid for dairy purposes? Yes; but they very soon dry up, and you want green food for milking cattle.

John Henry Pears, Bookkeeper to the Railway Contractors, Railway Extension from Bogan Gate to Condobolin, sworn, and examined:—

- J. H. Pears. 482. *Chairman.*] I believe you have some figures to give the Committee with reference to the traffic of that line? Yes; up to the present we have carried about 150 tons of wool from Condobolin to Bogan Gate in about three weeks. During the last three weeks we have carried 900 bales. That is greasy wool; it would average about six bales to the ton. Since April last we have been carrying goods. In the six months we have carried between 600 and 800 tons of goods; that would be inward.
- 27 Sept., 1897. 483. Could you give us an idea where the bulk of those goods would go to;—within what radius of Condobolin would they go, for instance? The bulk of the goods would come into Condobolin.
484. It is practically a distributing centre? Yes; and it is only within the last few weeks that the stations have been getting in there shearing supply.
485. It is a particularly busy time of the year with them? Yes.
486. What extent of passenger traffic have you? The passenger traffic has been pretty fair.
487. What number of passengers have you carried during the six months to which you have referred? We have carried between 600 and 700.
488. An average of about 100 a month? Yes; judging from the amount we have collected for fares.
489. *Mr. Farnell.*] Do you carry any stock? Our stock-yards are not yet completed, so that we have very little stock traffic. We have had about fifteen or twenty truck loads from Orange and Melbourne. Persons here have been getting cattle from Orange, and stud rams from Melbourne.
490. Do you think you will have considerable traffic in stock when your yards are completed? Yes, because the stations out towards Nymagee will bring their stock this way.
491. You think the construction of a line to Condobolin will divert traffic from the Western line? Yes; they prefer coming this way.
492. Is that on account of the better road or the shorter distance? I think it is on account of the better road, from what I can gather.
493. What would be the effect of railway extension to Euabalong do you suppose? I do not know the district well enough to say. There is a portion of Mr. Whittaker's evidence which should be corrected. He spoke of Melrose shearing on 40,000 sheep. Four years ago they shored 130,000. It is a property of a quarter of a million acres.

James Rabinowitch, storekeeper, Condobolin, sworn, and examined:—

- J. Rabinowitch. 494. *Chairman.*] How long have you been resident here? Fourteen years.
- 27 Sept., 1897. 495. *Mr. O'Connor.*] I suppose you do an extensive business? I do a fair business; it is slack at times.
496. With what portion of the district do you do business chiefly? With the floating population.
497. You are well acquainted with the proposal to extend the railway to Euabalong? Yes.
498. Do you know the country in that direction? Pretty well.
499. Has it increased in population since you have been here? Not a great deal, and it is not likely to.
500. Are you any judge of the quality of land? I know good land when I see it.
501. Have you any land of your own? Yes; I have 1,870 acres within 4 miles of the town, and I also rent some paddocks.
502. Is your holding freehold? Yes; with the exception of the selections.
503. Have you any land towards Euabalong? No; and I should not like to have any either. It is rabbit-infested country. The rabbits died out considerably during the drought, but they are now increasing again.
504. Would you join a syndicate for the construction of a railway between Condobolin and Euabalong? No.
505. And you do not think it would be a good thing for the State to make a railway in that direction? No.
506. You do not think a railway to Euabalong would induce much settlement? No; in my opinion it would be a decided failure.
507. What was the condition of Condobolin when you came here first? There was more population before we ever saw the railway. Now it is decidedly decreasing. Ten years ago there was more money in the place, more population, and more traffic.
508. How do you account for the decline? In the first place the railway was extended from Dubbo to Bourke, and a number of stations such as Melrose sent traffic in that direction. Then Wyalong broke out, and we lost the entire trade that way. People who formerly did business with us now go to Wyalong, Barmedman, and Temora.
- 509.

MINUTES OF EVIDENCE—RAILWAY FROM CONDOBOLIN TO EUABALONG.

509. Before the discovery of the Wyalong field you did a large trade in that direction? Yes.
510. You attribute the decline of trade in Condobolin, then, to a variety of circumstances? Yes.
511. You do not think the railway has done the district of Condobolin any good? In my judgment it will not do so. It is a mode of easy transit, but it does not contribute to the welfare of the country from a practical point of view. I regard it as a waste of public expenditure. The line from here to Molong will never pay, and the proposal to construct a line to Euabalong is simply outrageous.
512. Do you know the country from Euabalong to Hillston? No; but I know that some selectors out that way have not been able to make their holdings pay. It is right enough in a moist season, but as a rule it is anything but an agricultural district.
513. You get your supplies from Sydney direct? Yes.
514. What is the rate from Sydney to Bogan Gate? The rate for third-class goods would be about £6 15s. per ton.
515. What would they comprise? Sugar, tea, general groceries, rock salt, fencing-wire, and other things of that sort.
516. I suppose that when the Government take over the line from Bogan Gate to Condobolin the total charges will be about £7? Yes.
517. What do you consider that the land near Condobolin is best suited for? Grazing. Until a few years ago the district was never dreamt of in connection with anything but sheep.
518. Do you think that the existence of the railway would induce graziers to plant wheat? I think not.

J.
Habinowitch.
27 Sept., 1897

Richard Whitehead, station manager, Borambil, sworn, and examined;—

519. *Chairman.*] How long have you been resident in this locality? Eleven years.
520. How many years have you been engaged in managing stations? Twenty-one years.
521. What is the acreage of the run you are now managing? 80,000.
522. What is the freehold? 36,000.
523. How many sheep have you? This year we shorn 35,000; but we have shorn 70,000.
524. Does the present line go through your freehold? It just touches the freehold land.
525. Have you any land under cultivation? Yes; with lucerne and hay.
526. You have never tried wheat-growing? Yes; we tried it on the halves system last year. I had 1,000 acres prepared for the plough, but there were no applications for the land.
527. Had you any applications this year? I put in 100 acres this year myself.
528. But had you any applications on the share system? Yes; one man from Corowa has taken 400 acres.
529. What are the terms? I prepare the land and get ready for the plough, and find all the seed. The farmer puts it in and takes it off, and gets the first 4 bushels. After that we halve it; if there were 10 bushels, there would be 5 bushels for each of us.
530. How far are you from the river frontage? The river goes right through the run.
531. Where is your cultivated land? On the river frontage.
532. Do you think there is a probability of the share system being generally adopted in this district? I do not think so; I do not think it would pay very far off the river.
533. So that really you are cultivating under the most favourable conditions? Yes.
534. Do you think a line from Condobolin to Euabalong would benefit the district very much? It would benefit the few settlers who are here, no doubt.
535. Do you think they would object to pay local rates? You may be sure they will get their produce carried in the cheapest way possible.
536. Do you think that if local rates were charged competition would set in between the carriers and the railway? Yes.
537. Therefore you cannot look to local rates as helping to recoup working expenses? No.
538. You think the rates would have to be ordinary rates? Yes.
539. Are you troubled with rabbits on your run? No; we are fenced in.
540. Could you give the Committee any idea of the cost per mile of rabbit-proof fencing? It would be £60 or £70 per mile.
541. What water have you on your run besides the river frontage? There are creeks; we have weirs on the river which turn the water into the creeks.
542. Have you any tanks? A few.
543. It wants a fair amount of capital to cope successfully with the rabbits on the big holdings here? Yes; our run was fenced in ten years.
544. You made yourself secure from the rabbits to a great extent? Yes; there were very few rabbits when we fenced in.
545. You do not think there is any likelihood of the settlers who would be served by the railway agreeing to pay local rates? I think it would be a mistake to rely upon that.
546. Have you any cattle? 400 cattle and 100 horses.
547. Have you any cultivation at the homestead? About 1,200 acres of lucerne.
548. You do not think there is much possibility of a line to Euabalong paying for some years? No.
549. You think the line goes far enough west now? Yes.
550. You are on the right side of Condobolin, so far as railway communication is concerned? Yes.
551. The extension to Euabalong would not benefit you in any shape or form? No, not a bit.
552. You are acquainted with the country towards Euabalong? I know it well.
553. Do you think railway extension to Hillston would be beneficial? It would divert a lot of wool which now goes to Victoria. I do not say which way such a line should go, whether *via* Euabalong or some other point.
554. As a resident of the Hay district before you came here, you are able to speak with authority in regard to the diversion of traffic? Yes.

R.
Whitehead.
27 Sept., 1897.

James Dunn, butcher, Condobolin, sworn, and examined:—

555. *Mr. Farnell.*] You have been here, how long? Four and a half years.
556. Have you noticed any development in the district since you came here? In a few odd places. The mineral resources are not developed; it would require capital to do that.

J. Dunn.
557. 27 Sept., 1897.

- J. Dunn.
27 Sept., 1897.
557. Have you noticed that consequent upon the extension of the railway the cultivated area has increased? The season has been so bad that you can scarcely say what the effect of a railway would be. We shall have to wait a year or two before we know what the result will be. No doubt more wheat will be grown here than has been grown before. Between here and Euabalong I know of only one or two persons who have any crop in. I suppose there might be 200 acres cultivated between here and Euabalong. Outside of a radius of 5 miles of Condobolin, no increased area has been put under cultivation towards Euabalong. The Taylors are the only two I know of who have any crop in.
558. But within a radius of 5 miles of Condobolin the cultivated area has been increased? Yes.
559. And you think that that is owing to railway extension? Yes.
560. Is it not natural to suppose that further cultivation will ensue if the line be extended to Euabalong? No doubt that would be the case if they could get the land, but all the land suitable for agriculture has been secured.
561. You do not think sufficient land will be available for agriculture to afford a reasonable prospect of the line paying? No.
562. Have you any practical knowledge of farming? Yes; I was brought up to it in the old country.
563. From your knowledge of the district, then, you think a railway between Euabalong and Condobolin would be unjustifiable? I cannot see how it would pay. There are very few settlers between those two points.
564. Do you think that if a railway were taken on to Hillston it would be likely to pay? Not if it were taken down on the northern side of the river. The land beyond Euabalong is very poor until you get about 20 miles from Hillston; then it is good country. On the southern side the land is much better.
565. I suppose the persons settled between here and Euabalong are mostly graziers? Yes; with two exceptions they are all graziers.
566. Are the selectors dependent entirely upon what they make from their selections? Not many of them work for the stations; they make their living on the land. I am always moving about them, buying stock; so that I am able to say pretty well what they do.
567. Do you think that if a railway were taken to Hillston, *via* Lake Cudgellico, the people of Euabalong would be likely to use the line? Yes; it would be only 18 miles away.
568. *Chairman.*] From your knowledge of the country do you think there is any prospect of stock traffic increasing if a railway be constructed? The plain country here is good fattening country, and the back country, when improved, is very passable; but it is of no use whatever before it is improved. It is not worth 1s. a section; it is infested with vermin. If you go through the scrub you can see rabbits and wallabies by the thousand; and they will continue to be a nuisance as long as the scrub remains. I have about 300 acres for a home and for business purposes. No one would take up the land, it was so badly scrubbed and infested with vermin. I have applied for it as a scrub lease, but have received no answer.
569. *Mr. O'Connor.*] You would improve the holding if you obtained a scrub lease? Yes; I should destroy the vermin to begin with.
570. You think the cost of putting the back land in order, and making it fit for the plough, is too great for ordinary settlers? Yes.
571. Therefore, the only country you could depend upon to return freight to the railway would be river-flats and patches of open country? Yes; the open country, after it has been improved about five years is very fair country.
572. You have a fairly good stock route to Condobolin along the river? Yes.
573. Do you think the construction of a line to Euabalong would bring any more stock in this direction than comes now? It would not bring more stock; but it might induce a little more settlement, although the available areas are rather small. In this part of the country a man cannot make a living on a small area; he must combine agriculture with grazing.

Richard Volkman, brewer, Condobolin, sworn, and examined:—

- R. Volkman.
27 Sept., 1897.
574. *Chairman.*] You have some knowledge of the proposal before the Committee? Yes; I have been travelling about the district between Cudgellico, Mount Hope, and Condobolin for about fifteen years, but for the last twenty-one months I have been resident in Condobolin.
575. Do you favour the construction of the proposed railway? I do;—I think it would induce settlement in that direction wherever land was available, and that it would be beneficial to the country generally.
576. Do you think it would attract any more traffic than comes in this direction at the present time? It would not attract more traffic here, but it would bring traffic to Euabalong, and might induce people to settle on the land in that direction.
577. Do you think it would be justifiable to construct the line in view of the probable loss of nearly £4,000 a year? There would be a great loss for a considerable time, but it would be recouped after a certain number of years, when people were settled upon the land. It would take a considerable time.
578. Do you think the extension to Condobolin will induce people to settle in the district, and thereby set up a claim to further extension as time goes on? Yes.
579. If the line is extended beyond Condobolin you think it should be taken as far as Hillston? Yes; there is plenty of good soil down there, which, with a rainfall of 20 inches, will grow anything; but there is an average rainfall of only 18 or 19 inches. In my experience, if the sandy red loam you find there is looked after in a proper manner, it will grow anything in the fodder line. The same observation applies to the country between Mount Hope and Condobolin. I know of a crop of 10 acres out at Mount Hope which averaged in one year 3 tons to the acre and 40 bushels of wheat. That was an exceptional season, but with a rainfall of about 20 inches you might expect a yield of from 25 to 30 bushels.
580. How far back from Euabalong would that be? About 40 miles. I am speaking now of the country at Mount Hope. The surrounding country is patchy; it is heavily timbered with fine scrub, yarran, and box. The land must be good to carry the timber it does.
581. Is there much mining being carried on at Mount Hope at the present time? It is improving, and I think that if a railway line went anywhere near the place further employment would be given on account of the reduced rates of haulage. If they paid less carriage they would also be able to give better wages.
582. But the land you are speaking of at Mount Hope is in the Western Division, and will not be available for settlement until the year 1918? It is so.

TUESDAY, 28 SEPTEMBER, 1897.

[The Sectional Committee met at "Byrne's Hotel," Cugong, at 8 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq., M.P. (CHAIRMAN).

The Hon. DANIEL O'CONNOR. | JOHN LIONEL FEGAN, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Edward Byrne, farmer and hotel-keeper, Cugong, sworn, and examined:—

583. *Chairman.*] How long have you been here? It is seven years since I took up the hotel here.
584. Have you been carrying on farming operations all that time? Yes; in a small way.
585. What area of land have you here? I have only 40 acres of purchased land. I have no leased land.
586. Have you a pretty good knowledge of the country through which the proposed railway would pass? Yes.
587. You know the surveyed route? To a certain extent, as far as Hillston; I also know it all the way to Condobolin.
588. What sort of country is it? The soil is principally sandy red loam.
589. Is it chiefly freehold or leasehold land, or how is it held? I cannot speak as to that, but from here to Condobolin it is all good country, it is sandy soil, and it is in the Central Division.
590. Is there much settlement? There is a good bit of Crown land going back a bit from the river.
591. Are there many settlers here besides yourself? There are not many handy; but there are a good many on the back of Kiacatoo, about 12 miles from here.
592. Do you know of some selectors named Taylor? Yes; they are 12 miles from here to the north of the surveyed line. There are the father and two sons. They combine grazing with farming.
593. Do they farm on a fairly large scale? Not very large. I think they have about 200 acres each under cultivation; they are increasing the area under crop every year.
594. Do you think the construction of a railway would lead to more settlement of that kind? I think so.
595. Is there any great demand for land about here? Yes. There is a good demand.
596. Do you know of other settlers besides those to whom you have referred? Yes; there is a settler named Austin a little further north, and another named Waite. There are a good few settlers about there, but I forget their names.
597. They are all in the Central Division? Yes.
598. The line passes from here to Hillston through the Western Division? Yes; the boundaries of Kiacatoo and Booberoi are the boundaries of the Western Division.
599. The land between this point and Euabalong being in the Western Division would not be available for settlement until 1918? A portion of it would not be.
600. So that even if a railway were made from Condobolin to Euabalong there would be no land available for settlement beyond Cugong? The lessees further back towards Mount Hope have abandoned portions of their runs.
601. Has anyone taken up any of the abandoned land? No; the leases are too big for small holders. They would not take up 10,000 acres; that is where the difficulty comes in.
602. Then there is very little prospect of close settlement between here and Euabalong for some years to come? Not unless the land law is altered.
603. Is the land about here fit for agriculture? Yes.
604. You have an exceptionally good patch? Yes; it is a very good patch.
605. How did you acquire your 40 acres? It was an old selection before the divisions were proclaimed. I think it was taken up under the Act of 1861.
606. Is there much cultivation between here and Condobolin outside of the settlements you have named? Not until you get further north. There are not many settlers between here and Condobolin.
607. Is that owing to the nature of the country, to the want of railway communication, or what? I suppose the distance from market has something to do with it. There is a difficulty in getting produce away.
608. Do you think the construction of a line would increase settlement in any way? It would increase where land is available in the Central Division.
609. The river frontages are practically freehold land, are they not? Yes.
610. They have been bought up by the lessees? Yes.
611. The selectors have sold out? Yes; but a lot of land is to be thrown open upon Kiacatoo shortly.
612. Do you think that, from what you have heard, there will be much demand for it? Yes.
613. Is the land far back from the river? Some of it fronts the river, but it is not surveyed yet. I do not know the exact location.
614. What crops do you principally grow? I have been growing only hay.
615. Do you think a line through this country would pay? I think it would.
616. Do you think it would be of any advantage to remove the terminus from Condobolin to Euabalong? Yes; it would benefit the mining at Mount Hope.
617. In what way? It would give them a chance to get their copper away; they have now to cart it 100 miles, and they can only send away the best of the ore.
618. Is there no machinery for treating it at the mine? I do not think so. They turn it into copper matte and it is then sent away for treatment. I do not know where it is treated.
619. Have you any idea of the extent of the mineral deposit at Mount Hope? No.
620. You do not know how many men are employed there? No.
621. It is questionable whether the construction of a railway would be justified, having regard to the freight it is likely to receive from mining? Quite so.
622. Do you think a railway to Hillston would intercept much traffic that now goes to Victoria? Yes; I think a lot of it would come this way instead of going to Carathool.
623. You think that if the railway is extended beyond Condobolin it would be advisable to go a little further than to Euabalong? Yes.

E. Byrnes.
28 Sept., 1897.

- E. Byrnes. 624. You do not think it will be advisable to leave the terminus at Euabalong? No, certainly not. I think the line should be extended to Hillston.
- 28 Sept., 1897. 625. Has the opening of the railway to Condobolin increased the traffic along this road? Not much yet, because the wool season is only just starting. I have heard that there are two or three sheds further along which formerly sent wool in the other direction which are sending it to Condobolin this year. They seem to think there may be some difficulty in getting it away from Condobolin, in consequence of the line not having been handed over by the contractors.
626. You think then that when it is generally known that the line has been handed over by the contractors there will be a general increase in traffic? Yes.
627. Do you think a terminus at Euabalong would secure more traffic than the terminus at Condobolin is likely to secure? It would get a little more.
628. Do you not think there would be a great increase? I do not suppose it would make very much difference.
629. But if the line were extended towards Hillston, you think there would be a big increase of new traffic? Yes.
630. I suppose it would attract traffic from Ivanhoe and Mossgiel that now goes to Victoria? Yes. This would be the more direct route.
631. *Mr. O'Connor.*] Do you know anything at all of mineral development at Cugong? I have heard a lot about it, but I do not take much interest in it. As far as gold is concerned, there is nothing very striking going on.
632. There is nothing to indicate a likelihood of much mineral development? There has not been up to the present. There is one mine working here—the Yellow Streak. It is being worked on tribute, but there have been only three working there for the last five months.
633. Is that the mine known as Winter's mine? That is further back still.
634. Is that a recent discovery? It has been discovered for some time, but being on private property it has not been possible to work it until lately.
635. What kind of land is it between here and Hillston—agricultural or pastoral? It is all good land for cultivation from here to Hillston, until you get within a few miles of the town, then a portion is grazing country.
636. Do you think that, with railway communication in that direction, there would be much increased settlement? Yes.
637. Is the country between here and Hillston settled? There are not many small holdings. It is principally under pastoral occupation.

Herbert Evans, miner, Cugong, sworn, and examined:—

- H. Evans. 638. *Chairman.*] You are a miner, resident at Cugong? Yes; I have been here for the last twenty-four years.
- 28 Sept., 1897. 639. *Mr. Fegan.*] You were examined by the Sectional Committee which took evidence here with reference to railway extension from Condobolin to Broken Hill? Yes.
640. There has been no alteration in mining prospects here for some time? No; things have been very slack; nothing has been tried for. There has been some mining at Bobedab, some 60 miles north from here; they have had a very good show there, and it promises to be a rich field.
641. *Mr. O'Connor.*] Whose mine is it? Tyndall, I think, was the original prospector; but I cannot be sure; I have not been out there since it started. I know they have been getting working appliances.
642. *Mr. Fegan.*] You know the route by which it is proposed to take the railway to Euabalong? Yes.
643. Do you think there is any prospect of that line paying? Yes. It might not do so at first; but it would be a means of opening up a lot of country for agriculture which is now used for pastoral purposes.
644. Have you noticed any difference in the traffic passing towards Condobolin since the line was opened there? I have not seen much difference. It has not been there long enough yet to make any difference; besides, it has not been taken over by the Government yet. There is nothing but wool to be sent that way, and one half of the wool is not yet off.
645. What do you mean, then, when you say the line will pay in the near future? I think wheat will be grown.
646. Have you any interest in mining about here? None whatever.
647. Have you much faith in the mines here? I have. There is the Cugong mine, four miles from here. There is gold to be got in leaders running parallel with the Yellow Streak; they have been getting gold, but not in payable quantities.
648. You were working there for some years? Two or three years.
649. You found it useless to go on? I gave up working there because I had not the means to prospect. I believe the gold is there.
650. You think that if prospecting were carried on there payable gold would be found? Yes.
651. What is the extent of the mineral country? It extends nearly to the Darling.
652. You do not think mineral freight would be a factor worth thinking of in any railway returns? I do not think so.
653. Is there any land about here which could be thrown open for close settlement? Well, there would be the river frontage, which has been locked up on the travelling stock reserve. Of course, the best land has been secured by the stations.
654. Is not a large portion of the river frontage freehold? It is now.
655. The remaining land will not be available before 1918? I do not think so; but homestead leases could be taken up.
656. What area would be enough to support a man with a family? 2,560 acres.
657. There would not be many leases taken up if everyone were compelled to take 10,240 acres? There is a tremendous area of country open now to homestead leases, which has not been taken up. The area is too big.
658. You do not think the absence of a railway is the cause of its not being taken up? That may have something to do with it. You cannot expect people to start growing wheat without a market.
659. You know that the Taylors are growing wheat without a railway here? Yes; but they would be all the better off if they had one.

660. What is there to hinder other persons from showing their *bond fides* in the same way;—has there been any cultivation here during the last twelve months? At Euabalong station, but not in this neighbourhood. At Booberoi they are growing some wheat; but there is none grown just at Cugong. H. Evans.
28 Sept., 1897.
661. *Mr. O'Connor.*] Have you a lease? No; I am a selector. I have 140 acres on the river.
662. What portion of it is under cultivation? I have only about 2 acres now; but I have 10 acres ready for next year.
663. Do you think, from the little cultivation you have done, that the land is fit for agriculture? Yes; it is good soil as far as I have tried it in the garden.
664. Do you think that soil is a fair specimen of the soil in the district? Yes.
665. You regard the land as valuable, then? Yes; I think it is worth £2 per acre.

William Hezekiah Crouch, Cugong, sworn, and examined:—

666. *Chairman.*] You are a resident here? Yes; I have a settlement lease on the southern side of the river, about half a mile from Cugong. W. H.
Crouch.
28 Sept., 1897.
667. What is your area? 1,957 acres.
668. How long have you been here? Since January last.
669. *Mr. Farnell.*] Do you know the route of the proposed railway? Between here and Condobolin, but not further down.
670. I suppose you would use the railway? Yes.
671. What is your nearest station? Condobolin.
672. What area have you under cultivation? None at present. I have only just fenced the land in.
673. Do you propose to put any land under cultivation? I certainly should if I had the railway near me; but in the present state of matters I cannot carry out much cultivation, because I could not get my produce to Condobolin in a wet season.
674. How would you get across from the southern side to the railway? Until a bridge was made we should have to cross by boat; but it would pay me better to do that than to haul the produce to Condobolin by team.
675. Are there any settlement leases adjoining you? Yes; three.
676. Have they the same area as yourself? One has 3,200 acres, and another 1,920 acres.
677. Have either of those lessees any land under cultivation? Not at the present time. They are newcomers.
678. Do you know of any other areas in the district likely to be thrown open to settlement within a reasonable time? I do not.
679. You are in the Central Division? Yes; the Central Division goes further down the river on the south side than on this side.
680. Do you know of any leases within the Central Division falling in within the next year or two? No.
681. Then, supposing a railway were constructed here, what chance would there be of farmers taking up land for cultivation? I should put in 200 or 300 acres, and I daresay others would do the same.
682. Are you a practical farmer? Yes; I have been farming all my life. I have been on Milby, about 30 miles from here in a south-easterly direction.
683. Would that district be served by this railway? No; Condobolin would be the nearer station.
684. I suppose that if there were a railway here you would not confine yourself to wheat-growing? No; I think the soil is good enough to produce almost anything with a regular rainfall. Oats and barley, and oven corn, will grow.
685. At what price would wheat pay you? At from 2s. 10d. to 3s. 6d. per acre.
686. You regard 2s. 10d. as the lowest paying price? Yes.
687. Do you think the land here would be suitable for dairying purposes? No doubt it would on the river frontage, on account of the green feed.
688. What would you call the river frontage;—how far would the land go back on each side? Say 5 or 6 miles.
689. You think that within that distance the land could be utilised for dairy farming? Yes.
690. Supposing there were a railway to Euabalong,—upon what would it have to depend for traffic? I cannot say; but as I pointed out, there would be a large area put under wheat. I myself would put in 200 or 300 acres.
691. You yourself would send away about 120 tons of wheat? Yes.
692. You propose to go in for mixed farming? Yes.
693. What run are you on? Brothertonery.
694. Supposing there were a railway station just about here, how far would you have to come with your produce? One and a half mile, because I do not propose to build on the river; I should be back a short distance.
695. How far are you from Condobolin? Thirty miles.
696. Supposing wheat-growing failed, to what use could you put the land? I should go in for dairying. I think the land is suitable for that within certain limits.
697. Is there any land near you which could be settled upon at the present time? No.
698. How many settlers within a radius of 10 miles of you would be likely to use the railway if it were cleared? Perhaps half a dozen.
699. They are settlers who have recently come here? Yes.

WEDNESDAY, 29 SEPTEMBER, 1897.

[The Sectional Committee met at the Court-house, Euabalong, at 4 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

FRANK FARNELL, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Henry Cabot, storckeeper and hotel-keeper, Euabalong, sworn, and examined:—

- H. Cabot.
29 Sept., 1897.
700. You have some knowledge of the proposal before the Committee? Yes.
701. How long have you been residing in the district? Twenty-one years.
702. You have been carrying on business here during the whole of that period? Yes.
703. Then you can give the Committee some idea as to the progress or otherwise of the district? Yes; business has gone back during the last few years.
704. Are you in favour of the proposed railway? I am.
705. Will you give your reasons for thinking that the railway should be constructed? It will, no doubt, promote settlement. A lot of traffic will come in this direction from Mount Hope, Errimeran, and Tara.
706. Do you think the proposed railway would bring any traffic in this direction which now goes to Victoria? I think the traffic from Errimeran, which has gone to Nyngan, would come this way, and, in my opinion, wool between here and Hillston would also be attracted.
707. Where does that wool go to now? Across to Whitton.
708. One effect of the proposed railway, I gather, would be merely to bring traffic on to our railways at a different point from that to which it now goes? Yes.
709. Has the extension to Condobolin had any appreciable effect in bringing traffic in this direction? It is bringing more wool this way.
710. Clips are coming this way now which did not come here before? Yes.
711. You think that is a direct result of the extension to Condobolin? Yes.
712. You do not know the quantity, I suppose? No; I do not think the line has been long enough opened to enable us to form an opinion as to the traffic yet.
713. Being at the commencement of the shearing season, you have not an opportunity to form an opinion as to the points from which the principal increase would come? No.
714. How do you account for business going back here during the last few years? Most of the selectors have left the district.
715. From force of circumstances they have sold out and left? Yes.
716. The result of attempted settlement in this part of the country has been, therefore, to increase large estates? That is so.
717. Do you think there is any prospect of the land here being worked under the share system? If the railway comes here I think persons will prefer to go on to the land on their own account to entering into an agreement of that sort.
718. Where are they going to get the land? Of course, if the Government do not resume they cannot get it at present, because the leases do not expire until 1918. Of course, the law might be amended, or the Government might resume within a certain distance of the railway-line. If land could not be obtained there might be a certain amount of settlement on the share system.
719. Do you think the land is fitted for agriculture? I think so.
720. Up to Cugong the line would run through the Central Division? Yes; but we were led to suppose the Government would resume land in this direction on each side of any railway which might be constructed. It is all Crown land this way.
721. Does any traffic come in this direction from Lake Cudgellico now that the railway is at Condobolin? Yes; a small portion of it.
722. Then the extension to Condobolin has been of some advantage to the district? Well, it seems to be drawing a little traffic from the South-western line.

Donald Cameron, station manager, North Wooyeo, sworn, and examined:—

- D. Cameron.
29 Sept., 1897.
723. *Chairman.*] How long have you been in the district? About seven years.
724. You have a pretty fair knowledge of it? Yes.
725. *Mr. O'Connor.*] Do you know the country between Condobolin and Euabalong? Not a great deal of it.
726. Are you in a position to form an opinion in regard to the proposed railway? I am in favour of the line. I think it would benefit the district, although I do not suppose it would increase settlement very much in the present state of the land law. It would certainly be of advantage to station-owners in assisting them to get their produce to market.
727. There are not many settlers about here? No.
728. Supposing a railway was constructed from Condobolin and Euabalong and on to Hillston, do you think any of the stations would put under cultivation such of their lands as might be fit for that purpose? I have no doubt they would.
729. What is the area of the run with which you are connected? There are about 70,000 acres of leasehold.
730. And you will have a lease of that for the next twenty-one years? Yes; the station belongs to a company.
731. You think that if they had a railway they would certainly cultivate? Yes.
732. You know the country between Euabalong and Hillston? Pretty well. Most of the country through which the line would pass is fit for agriculture.
733. Where do you send your wool at the present time? To Whitton, on the South-western line.
734. Would the construction of a railway from Euabalong to Hillston intercept any wool which now goes to Victoria? No doubt it would. A good deal of wool from the Hillston district now goes to the Murrumbidgee.

735. How many sheep do you shear? In good seasons from 20,000 to 30,000, but within the last two or three years we have been shearing down to about 17,000. In good seasons we send away from 400 to 500 bales of wool. D. Cameron.
29 Sept., 1897.
736. If the present season had been more promising you would have increased your number of sheep? Yes.
737. What is the carrying capacity of your run? About one sheep to 5 acres.
738. Your wool goes to Sydney? Yes; the firm to which the station belongs is established in Sydney as well as in Melbourne.
739. *Chairman.*] You think that with railway facilities the stations hereabouts would be able to grow wheat to greater profit than they could grow wool? Yes.
740. And, of course, cultivation would mean increased employment, and more money would be circulated in the district than is circulated here now, to the advantage of both property-owners and the State? Yes.

Frederick Small, post and telegraph master, Euabalong, sworn, and examined:—

741. *Chairman.*] How long have you been here? Seventeen years. F. Small.
29 Sept., 1897.
742. Have you any particulars as to the revenue of the Post and Telegraph Office? The gross total for the year ending the 29th September, 1897, was £2,431 17s. 11d. Of this amount, £2,377 16s. 5d., was for money orders and postal notes issued and stamps sold, and Savings Bank deposits; and the amount for telegrams, £54 1s. 6d.
743. Having been seventeen years in the district, you know a little about the business done here? Yes.
744. Is the district progressing or otherwise? It has gone back rather during the last five or six years.
745. How do you account for that? I attribute it to the general depression as much as anything, and the want of settlement.
746. A number of people have gone away? Yes; small holders. I think the rabbit pest has had a lot to do with it.
747. I suppose when the district was flourishing, a large number of men were employed in erecting rabbit-proof fencing, and so on? Yes; there was more money in circulation while that sort of thing was going on.
748. And, I suppose, more business was done through your office? Yes.
749. Have many old-established settlers left the district? Not in the immediate district, but some have gone away from outside. The place has been, as it were, at a standstill.
750. And you attribute it almost entirely to the general depression and to the rabbits? Yes.
751. Could you furnish us with particulars of the rainfall? The following are the particulars from 1884 up to the present date:—In 1884, 9·7; 1885, 16·88; 1886, 19·25; 1887, 32·33; 1888, 8·41; 1889, 22·57; 1890, 24·9; 1891, 23·47; 1892, 14·86; 1893, 13·91; 1894, 27·10; 1895, 12·7; 1896, 13·67; 1897, 11·12.
752. Have you heard of many persons inquiring for land about here? Frequent inquiries have been made, and if better means of transit existed, all the available land would be very quickly taken up.
753. You think railway extension would assist the district very much? Yes.
754. Your nearest railway station, prior to the extension from Parkes to Condobolin, was at Forbes? The greater part of our business was done at Whitton. The road made railway carriage to Whitton cheaper than to Forbes. I think you might say that Whitton drains this part of the Lachlan.
755. You know that a great portion of the station business hereabouts has been done with Victoria? It used to be so years ago, but that has not been the case during late years. During the last few years a greater part of the produce has gone to Sydney.
756. You think, then, that Sydney is gradually capturing trade which formerly went to Melbourne? Yes.
757. Do you think railway extension here would assist in that direction? I do not think so. At the present time Sydney has the principal part of the business.
758. Then, how do you suppose a railway would benefit people here materially? Large areas of land, not only in the vicinity of Euabalong, but down the river, and in the district generally, would be immediately taken up if there were a railway.
759. The land on this side being in the Western Division, you must be referring to land on the southern side of the river;—do you know what the area of available land is? I cannot tell you what the area is; but I have no doubt that any land available on the other side would be immediately taken up if there were a railway here.
760. You know the route over which it is proposed to bring the line from Condobolin? I have a very fair knowledge of it.
761. Would you be surprised to hear that it is estimated that the loss upon the line would be £3,726 a year? I should imagine that it would be run at a loss for some time, owing to the very small population likely to be served by it.
762. You come into contact with business people here;—do you think they would be willing to pay local rates? That I could not say.
763. Do you think it likely that if local rates were imposed the teams would come into competition with the railway to any extent? Yes; I think that if a special charge were made for the railway it might not be so largely used. People generally would object to it.
764. Within what radius of Euabalong do you think people would be served by a railway here? I think you might reckon that persons due west and north-west, and away beyond Mount Hope, within (say) 50 miles, would be served, and you might also reckon upon an equal distance on the other side of the river. That, of course, is only a rough estimate.
765. I suppose you do not know what land is available within that radius? No.
766. Would the land be sufficiently productive to pay the working expenses of the line? For some time I do not think it would. I should imagine that in four or five years it would be likely to do so.
767. Do you think the line would pay in ten years? I should not like to say positively that it would.
768. The effect of your evidence is that railway facilities would open up a large tract of country, settling unoccupied areas, and giving a great impetus to trade? Exactly.

William McLean, hotel-keeper, Euabalong, sworn, and examined :—

- W. McLean. 769. *Chairman.*] You are a hotel-keeper at Euabalong? Yes; I have been in the district twenty-eight years.
- 29 Sept., 1897. 770. *Mr. Farnell.*] You gave evidence before a Sectional Committee in connection with the Condobolin-Broken Hill proposal? Yes.
771. May that evidence be taken as expressing your opinion with regard to the present proposal? Yes, I think so.
772. During the time you have been here you have watched the progress of the district, and have had an opportunity to form an opinion as to the quantity of traffic which the railway to Condobolin is likely to receive from this way? Yes.
773. Suppose there were a railway at Euabalong, taking a radius of 20 miles, what quantity would go to the South-western line, what quantity to the Western line, and what quantity would come here? It would all come here.
774. Do you think any new traffic would be created here independently of the traffic which would be taken from the South-western and Western lines? To-day three loads of wool went over the bridge here from stations which never sent this way before. There were two loads of Uabba wool and one load from Erribenderry.
775. Where does that traffic usually go to? Usually to Whittou.
776. I was referring more particularly to traffic diverted from Victoria, not from other portions of our own railway system; do you know of any traffic of that nature which would come this way? No; I cannot say that I do.
777. Do you know the country between here and Hillston? Fairly well.
778. Do you think that if the line were taken on to Hillston much new traffic would be brought to our railway system? I do not know much about the traffic that way. I could not say whether it goes to Victoria or not.
779. I suppose the trading relations of the Hillston district are mostly with Victoria? I could not say.
780. Then what justification do you think there would be for the extension of the railway from Condobolin to Euabalong? I think it would induce settlement in this district.
781. Providing the land were available? There is available land on the resumed areas.
782. But that land would be in the Western Division; some of the runs here have been abandoned, have they not? Yes.
783. Do you know the cause of abandonment? I think the rabbit nuisance has had something to do with it.
784. What is the condition of the country at the present time in respect to rabbits and other vermin? In this district the rabbits are very few compared with what they originally were.
785. They have been reduced by the drought? Yes; and some have been destroyed or poisoned.
786. Do you know of any mineral deposits in this district which are likely to be developed to an extent likely to bring traffic to a railway? Yes; there is the Mount Hope copper mine.
787. Do you know whether the country hereabouts has been thoroughly prospected? It has not been prospected to any great extent.
788. Do you think such development as is possible in this district would be likely to bring traffic to a railway which would be worth consideration? Yes.
789. Take land of the best quality here, what acreage would be enough to enable a man to earn a living? If he went in for wheat-growing he would do very well off 300 or 400 acres; of course, if he went in for mixed farming he would want a much larger area.
790. During what period of the year is the road passable between here and Condobolin? It is trafficable with the exception of the winter months; if the weather is then wet the road is pretty bad.
791. You are closer to Lake Cudgellico than to Condobolin? Yes.
792. Supposing a line were constructed *via* Lake Cudgellico, would the traffic from this district go that way? Certainly it would.
793. Have you seen much wheat produced here since you have been here? No.
794. But you think the district is quite capable of wheat production, and that wheat would be produced if there were a railway? I do.
795. Do you think the land would be put to any other use besides wheat-growing in the way of agriculture? I think it would grow anything.
796. Would it be suitable for dairying? Yes.
797. Have you experimented in fruit-growing? Fruit grows very well in this district.
798. Is the fruit of good quality? Yes.
799. I suppose the remoteness of railway communication has retarded experiments of that kind? Yes.
800. Have you made any calculation as to what it would cost you to grow wheat here, and as to whether it would be profitable to engage in wheat-growing? No. I think the line would induce settlement, and where there is settlement there must be traffic.
801. Do you think the fact of the railway not having been extended to Euabalong has been the cause of a good many homestead leases being abandoned? I think so to a certain extent. Wheat-growing would have been carried on on a larger scale if there were facilities for getting the wheat away; but road carriage between the nearest railway station and Euabalong has been too costly.
802. You have a considerable quantity of goods at times coming along the road? Yes.
803. Where do you get them from? Sydney.
804. What do you pay per ton? The last goods I had carried cost me £14 per ton from Sydney to Euabalong.
805. What would be the rate between the railway terminus and Euabalong? £2 10s. a ton.
806. For all classes of goods? Yes.
807. Since the line has been extended to Condobolin the cost of carriage has very much lessened? No; it has been increased.
808. How do you account for that? I do not know what the cause has been, but it was a lot less than it is now.
809. Do you think it has been due to the drought and difficulties in the way of carriers? Possibly that has had something to do with it. I remember that in one year £7 a ton was charged.

810. Have you any idea of the quantity of stock which goes from this district to the Sydney market? Very few fat stock go away from the district now; but if there were a railway there would be a large number going. W. McLean.
29 Sept., 1897.
811. And I suppose a railway would also be used for the transportation of starving stock? I presume that in dry season when it was impossible to drive them the railway would be very largely used, if the stock were worth the transportation. Last year it was a case of letting them die; there was no means of getting them away.
812. *Chairman.*] You have noticed that during the years you have been here the district has suffered from periodical droughts? Yes.
813. They come at regular intervals of years? They have been pretty regular.
814. You suffer from drought a little more than do some parts of the Colony? Yes, I suppose so.
815. Do you know whether the late drought killed off any number of stock? Yes; thousands of sheep.
816. You are only just recovering from its effects? That is all.
817. I suppose the recent rains will enable lesses to stock up again? Yes; things were looking very badly before the late rains.

Albert Henry Conrad Volkman, farmer, Euabalong, sworn, and examined:—

818. *Chairman.*] What area do you hold? 1,245 acres, under conditional lease and conditional purchase. As I explained, when giving evidence on a former occasion, I have been making experiments as well as circumstances have admitted to obtain a knowledge of what cereals can be best grown in the district. My experiments have shown me that, with proper tillage of the soil, cereals can be grown with satisfactory results. We have had an average rainfall of 19 inches for thirteen years, the results being taken from nine stations. A. H. C.
Volkman.
29 Sept., 1897.
819. You think the rainfall is sufficient for the profitable growth of crops? It has been ample, and it has not been necessary to incur any great expenditure for drainage, the natural drainage being quite sufficient. I may mention that fruit cannot be grown here at a profit unless some outlet be afforded for it, the local consumption being practically *nil*.
820. You gave some evidence in connection with railway extension in this district about a year ago? Yes.
821. You confirm the evidence you then gave? Yes.
822. Is there anything you desire to add to the evidence you gave to the Sectional Committee on a former occasion? Yes; I think the construction of a line to Euabalong would cause a great deal of land to be taken up. Some land is available, and if further land were required no doubt settlement could be facilitated by resumption or some other means.
823. Land on the other side of the river is available for settlement? Yes; and it has not been taken up on account of there being no outlet for the produce which can be raised from it. Some of the areas have been abandoned, and have been taken up as scrub and improvement leases.
824. I suppose the nature of the country now necessitates that form of occupation? Yes.
825. The best of the country has been bought long ago? A great part of it; but I would not say the best of it. If any further land beyond that which is now available were required for settlement, there are the Crown reserves. Some, of course, are necessary, but others might be thrown open to selection.
826. The land available is lying back from the river, and it costs a considerable amount to clear it and put it under profitable occupation? Yes; and until an impetus is given to settlement by railway construction, I am afraid the land will remain as it is.
827. Have you travelled west from here? I have been acquainted with Mount Hope district since my boyhood. I was there for twelve years. My father has a small area of land there; 40 acres. Experiments which have been made there show that fruit of nearly every description can be grown, with the exception of the citrus family, without artificial manure. The grape-vine grows just as luxuriantly there as it does in this direction. Cereals will also grow well with proper tillage, and not the mere scratching of the soil which you often see carried out. The hay crops there are, perhaps, superior to those here.
828. Do you think there is a prospect of any large population settling at Mount Hope? I do not see why they should not. The country surrounding Mount Hope is good agricultural land. The tract of mallee country there is superior to the mallee in Victoria. People settle on the malleeland in that colony where there is only an average rainfall of 9 or 10 inches, whereas in the Mount Hope district the average is 17½ inches.
829. It is of no use to grow cereals there, because there is so little local consumption? Men are working in the mines there in preference to tilling the soil on account of the risk attached to the getting rid of the produce.
830. Even if the railway were extended to Euabalong, the Mount Hope people would not be benefited very much;—they would still be a considerable distance away? The chief benefit to that district would be that pastoral areas which are now abandoned would be taken up. The mining resources of the district would also be developed to a greater extent.
831. You think that with the development of the mining resources of the district there would be a certain amount of cultivation arising from the local demand for produce? Yes.
832. Mining at Mount Hope has been carried on for a considerable number of years, with fluctuating results;—do you think there is much prospect of mineral development? From surface indications I should say there would be considerable development. Very satisfactory trials have been made of certain parts of the country, but the prospecting has not been thorough.
833. Do you think that traffic in the direction of Ivanhoe and Mossgiel would be attracted here if there were a railway? I do not think it would. That would go to Carrathool. Last year a great deal of traffic went down the Murrumbidgee from Whitton, through the river being up. It is a question of the cost of road-carriage. Competition amongst the teamsters creates a low rate.

THURSDAY, 30 SEPTEMBER, 1897.

[The Sectional Committee met at the Court-house, Euabalong, at 10 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN.)

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Michael Wyer, senior-constable, Euabalong, sworn, and examined:—

- M. Wyer. 834. *Chairman.*] How long have you been in this locality? About five years.
- 30 Sept., 1897. 835. *Mr O'Connor.*] How far does the district of which you have charge extend? Fifteen miles up the river and 30 miles down.
836. What is the population? Of the township and district,—about 300.
837. How are the people occupied generally? On stations.
838. It is principally pastoral country? Yes.
839. During the five years you have been here has the district increased or otherwise? It has gone back since I came here.
840. Have you formed any opinion as to the cause of this retrogression? A variety of opinions are held as to the cause.
841. Do you think the financial depression has affected the district? Decidedly; we suffered in common with the whole of the Colony.
842. This is a pretty healthy climate, is it not? Yes.
843. You would be able to express an opinion as to whether the district is, or is not, fitted for agricultural pursuits? I have heard the opinion generally expressed that with a moderate rainfall it is suited to agriculture.
844. One of the things which has retarded agriculture, I suppose, has been the difficulty of sending the produce to market? I think that has had quite as much as anything else to do with it.
845. The growth of both wool and cereals is affected by the enormous expense of road carriage at certain periods of the year? Undoubtedly.
846. Have you any idea of the number of stock in your district? I keep no record of the stock, but there are 990 acres under cultivation this year.
847. How many acres were under cultivation last year? 945. There would have been a bigger acreage under wheat this year, but on account of the drought people would not cultivate.
848. Are there many cattle in this district? No, the stocking is principally sheep. With regard to the land, I may mention that there are 58,366 acres of freehold, including conditional purchases, and 635,860 acres of Crown lands. The 990 acres cultivated are principally under hay. I have heard that one man is starting 200 acres under wheat, on the chance of a good season.
849. *Chairman.*] Have you a return as to the wheat grown here during the last twelve months? Last year there were 840 bushels taken off 112 acres; that was a very light crop.
850. Have you observed whether the railway extension to Condobolin has brought much new traffic in this direction? Yes. I noticed wool from Uabba, 30 miles down the river, coming this way. Previously it went to Whitton.
851. Do you think the extension of the line to Euabalong would intercept any traffic which now goes to Victoria? I think it would do so to a considerable extent. It would take wool between here and Hillston, and I fancy traffic would come from Mount Hope instead of going to Cobar.
852. What the Committee wish to know is whether a line to Euabalong would intercept any traffic which now goes down the Murrumbidgee to Victoria and South Australia? I do not think it would.
853. The proposed extension would not be far enough west to intercept that traffic? No.
854. It would be necessary to take the railway very much further west to intercept that traffic? Yes.

Charles Light Cawse, manager, New Mount Hope Mine, sworn, and examined:—

- C. L. Cawse. 855. *Chairman.*] Have you been stationed there long? I have lived there fifteen and a half-years. I have been there and at the Central mine, which is from $3\frac{1}{2}$ to 4 miles away. I have been engaged in mining operations all the time.
- 30 Sept., 1897. 856. *Mr. Fegan.*] You have been managing copper-mines, then? Yes.
857. How many men are you employing? The mine is let on tribute. The number of men engaged in mining, wood-cutting, and carting and smelting would be about forty, with six boys. That is about the average.
858. Have you employed more than that number? Yes; some years ago.
859. What is the largest number of men that has been employed in the mine? I should think it would be about 200; but the mine was then under other management.
860. Where is the mineral taken? It is turned into copper on the spot, and sent away as copper at present to Cobar.
861. What is the area of the mine? We have a 40-acre block; I believe it is under mineral lease.
862. You are not paying a royalty to private owners? No.
863. Have you good prospects? They are not so good as they have been. The bulk of the lode was worked out some nine years ago, and since then we have been working in poorer ground which did not pay at that time, the price of copper being much lower, and the expense of working higher.
864. The price of copper has gone down during the last few years? Yes; and the deposit has been partially worked out. The New Mount Hope mine is not a lode. It is merely a deposit; we are getting patches of ore, but at greater cost than we used formerly to do.
865. To what depth did the richer portion go? The richer portion ceased at about 170 feet.
866. How deep are you now? 340 feet.

867. And speaking from your own experience as a practical man, you think there is not the same prospect of successful operations at Mount Hope as formerly? There is a large block of ore between the 170 and 340-foot levels which has not been worked. We know that it is full of mineral, but it is scattered through the ground to such an extent that it does not pay to work it at present. C. L. Cawse.
30 Sept., 1897.
868. Do you think the construction of a railway would assist in the development of the mining industry at Mount Hope? It would be of advantage in this way—if the expense of sending copper to Sydney were reduced, we could work the low-grade ore at a profit.
869. You could not give the Committee any idea of the extent of the lode? No; it is not a lode in the ordinary sense of the word.
870. You do not think the New Mount Hope mine could guarantee any considerable quantity of freight in this direction? The output of the field is now from 300 to 320 tons of copper a year, and it is likely to last at that for a considerable time. There is always a possibility of our finding an extension of payable ground.
871. Of course, you do not limit your mining operations in copper even to your 40 acres? No; the whole of that part of the country is mineralised. I have no doubt plenty of other mines will be found there yet.
872. You think that with railway communication there would be more prospecting, and that other companies would probably come in? I believe so.
873. You send your mineral to Cobar at present;—what is the distance? It is 110 miles. We pay £2 5s. per ton.
874. Why do you send to Cobar? In the first place it is the best road for the carriers;—it is the hardest and firmest road, and the best for feed. In the second place, when the Cobar mine was restarted the Railway Commissioners made a concession to them in respect of copper, of which we also get the benefit. I believe the trainage from Cobar to Sydney is £2 9s. a ton. For 25-ton lots it is £2 3s. 11d.
875. Do you do your own smelting at Mount Hope? Yes; and it is also done at the Central.
876. Do you use the water-jacket smelters? No; a reverberatory furnace; the ore is not adapted to the water-jacket smelter.
877. What is the reason? It does not contain sufficient iron to flux the silica;—in fact, we are obliged to obtain iron away from the mine for use as a flux.
878. It would be much better for you to use the water-jacket smelter if you could; the process would be much less expensive? Much less.
879. Are there any other mines in the vicinity of yours? Only the Central.
880. And you say you have ore which could be worked at a profit if carriage were cheaper? Yes.
881. Do you know how that ore would run? It would average, if concentrated, about 12 per cent.
882. That would not pay? Yes; if we could get it carried cheaply enough; the concentrates and ore we are now working average from 10 to 15 per cent.
883. Have you any sulphides? Yes; that is the poorer portion; we are not working that at present.
884. What are the rates of carriage, apart from ore, from Mount Hope to Sydney? There is very little sent away but the copper. The carriage inwards is the same as outwards from Cobar—£2 5s. But the storekeepers are at a great disadvantage, because most of their goods cost from £9 to £10 per ton from Sydney to Cobar, whereas if they get them at truck-rates at Carrathool they pay only £6. It is estimated by the storekeepers that the import of stores is about the same as the output of copper—that is, from 300 to 350 tons a year. A great deal of the traffic would, no doubt, come to Euabalong, especially the flour, which we get chiefly from Hillston.
885. What is the distance from Mount Hope to Hillston? Sixty-five miles.
886. And from Mount Hope to Condobolin? Eighty-eight miles.
887. So that really the extension from Parkes to Condobolin will be of little benefit to you? I do not yet know what the rate for copper is; and the carriers would rather go the longer distance to Cobar for the sake of the better road.
888. What distance are you from Euabalong? Forty-two miles.
889. So that a line here would reduce your road-carriage by about one-half? Yes; I believe the surveyed line is taken some miles to the north of Euabalong.
890. How far are you from Lake Cudgellico? I think about 52 or 53 miles.
891. So that as far as Mount Hope is concerned, a line to Euabalong or to Cudgellico would serve you equally well? Yes. The distance to Cudgellico would not be very much greater.
892. What do your workmen do for stores? There are two storekeepers at Mount Hope.
893. Your workmen are not forced to buy from any particular storekeeper? No; they are free to buy where they like.
894. What fuel do they use? Wood.
895. Do you find it any disadvantage to use wood for smelting? No, except that it takes more tonnage than coal.
896. Coal would be dearer? Yes; the cost of coal brought here would be too great. A ton of coal is equal to about 4 tons of wood in smelting with the reverberatory furnace.
897. You have an inexhaustible supply of wood, I suppose? The men are going from 7 to 10 miles for wood now; all the wood at the nearer distance has been used up.
898. Has it added to the expense? No; the men go the greater distance for about the same rate. We are paying the same rate which we paid when they had to go about 4 miles away.
899. What is the nature of the country round about Mount Hope? It is generally level. There are a few low ranges, but there is a great extent of agricultural country. We are right in the middle of the resumed area of Coan Downs and Roto station. I have a letter from Mr. Moore, the manager of Coan Down station, who was asked to attend here to-day. He says he could not do so, because they were shearing, but he has sent in a return of the annual tonnage to and from the station; it would be from 50 to 80 tons inwards, and from 70 to 100 tons outwards per annum.
900. Is all your carting done by contract? Yes.
901. Can you give us an approximate idea of the highest and lowest charges for carting during the last two or three years? There has been a uniform charge of 6s. 6d. per ton for firewood.
902. The drought did not make any difference then? Not to us.
903. The carriers had entered into an agreement to cart your fuel and they had to continue? Yes.
904. So that, even if there were a railway here, your fuel would not be any cheaper? No.

- C. L. Cawse. 905. Have you anything to add to your evidence? There is a lot of land between here and Mount Hope which is suitable for settlement, and there is no doubt that with railway communication the land would be settled.
- 30 Sept., 1897. 906. But Mount Hope is in the Western Division? There is an immense tract of resumed area available; it had been nothing but a rabbit warren, but the drought has killed off the rabbits.
907. Do you know anything of the capabilities of the soil? It will grow splendid wheat or hay if there is enough rain at the proper season. I have not seen any wheat stripped, so that I cannot say what it would run. They always grow wheat for hay here.
908. What is the timber near Mount Hope? Principally box and pine. It is a red chocolate soil; a great deal of it is a rich quick soil. If you get sufficient rain it is wonderfully quick. I have grown vegetables there with great success in good years.
909. Without irrigation? Yes.
910. Do you know anyone who grows fruit there? Mr. Volkman has grown peaches, apricots, and grapes to perfection.
911. In a usual season? Yes; they had more fruit down here last year than they had at Parkes. I was passing through Parkes and Forbes, and noticed that the fruit was not so successful there as it was here.
912. Can you give us any information about the Mount Allen mine? I know that at the present time it is shut down.
913. You do not know the reason why? No; but I am satisfied that it will go on again; it is a payable mine.
914. It is a gold-mine? Yes.

Walter Henry Twine, accountant and surveyor, South Mount Hope, sworn, and examined:—

- W. H. Twine. 915. *Chairman.*] Where do you reside? South Mount Hope. I am accountant and mining surveyor to the Great Central Copper-mining Company.
- 30 Sept., 1897. 916. You have been deputed by the residents of South Mount Hope to attend here and give evidence concerning this railway proposal? Yes; and also by the proprietary of the mine.
917. *Mr. Farnell.*] How long have you been resident at Mount Hope? It is six months since the present proprietary took the mine over. Apart from that, I served my time as field-assistant to the surveyor in this district for a period of over two years. I was with Mr. Scott.
918. With what range of country are you acquainted? We took in the counties of Moramba and Blaxland.
919. That would include the whole of this district? Yes.
920. Your two years' experience as surveyor's assistant has given you a pretty good idea of the condition of the country, and its suitability for settlement? Yes.
921. Will you point out to us the advantages which you think the district round Mount Hope would derive from railway extension to Euabalong? The distinct advantage, in my opinion, would be in the shortening of the road distance to a railway.
922. To what extent do you think the mine would promote settlement? In my opinion, railway extension to Euabalong would induce a good deal.
923. Do you know whether there are any areas available for settlement? There are.
924. Are you not aware that areas have been abandoned during the last twelve months? I am not.
925. Can you say whether homestead lease settlement has increased or decreased in this district during the last two years? I cannot answer that question, because in the immediate district of Mount Hope there are no homestead leases; and it has been since my experience here as a surveyor that homestead leases have been brought into existence. I cannot give you any information about them.
926. You have not watched the progress of settlement in this district since 1884? No.
927. Can you speak of the suitability of the soil for cultivation? Only from observation.
928. Have you been in the Mount Hope district long enough to be able to judge of the area required to enable a man to earn a living here? I have only been here six months, and no crops have matured during that period.
929. Do you know of your own knowledge in which direction traffic from Mount Hope goes? To Cobar principally.
930. It is much further from Mount Hope than Euabalong would be? Yes; Cobar is about 110 miles, and Euabalong 40 miles.
931. Can you give us any idea as to the new traffic likely to be obtained by means of railway extension to Euabalong;—I mean traffic which does not at present reach the railway system at Cobar or any other point;—do you think much traffic would be diverted from Victoria? I cannot speak as to the new traffic generally. The Mount Hope traffic would, of course, come here. Apart from that I think the railway would be an incentive to settlement.
932. The mineral deposits are pretty extensive at Mount Hope? Yes; I can speak as to the South Mount Hope mine.
933. Have you any indications of silver or lead? There are slight indications of silver and gold.
934. Have there been any recent developments in the mining industry? Yes; our mine was taken over recently by a new proprietary, who are making extensive arrangements for treating the low-grade ores which have not hitherto been treated.
935. Is that on the account of the cost of the carriage between Mount Hope and the nearest railway station? Yes; road carriage has been a great obstacle in the way of development.
936. You think that if a railway were constructed low-grade ores would be treated, which cannot now be profitably treated? Yes; a railway would be a distinct advantage to the mine in that way.
937. Can you speak as to the permanence of the mine with which you are connected? I made a survey of the whole of the workings which have been proved at present to a depth of 300 feet, but, in my opinion, the greatest test has yet to come in connection with the mine.
938. What is that? The test is this: that the lode has been very much disturbed through an intrusion of rock. The whole of the reefs trend in one particular direction, and the real test would be to sink in that particular bearing to connect the main deposit; but apart from that, altogether, the proprietary intend dealing with ore stowed away in stopes, which it will pay to concentrate, and are treating extensive deposits of sulphide ores already proved. At different positions in the mine there is also a very extensive outcrop of lode formation proved to be of considerable dimensions both in width and depth, composed of carbonate and grey ores (which will average from 6 to 8 per cent.), which it is intended to treat when the concentrating plant is complete.
- 939.

939. I understand that you have no defined reef? We have in one particular part. Of course the strikes are defined in their bearings, but they are scattered. W. H. Twine.
940. You think there is enough then to warrant the supposition that the company will be working for some considerable time? Yes. 30 Sept., 1897.
941. How many men are employed? Between forty and fifty at present. They are only making preparations now; the mine has been idle more or less for a considerable time. The workings have got very much out of order, and the mine is now being put into trim as it were.
942. You are making use of the old workings, but at the same time new developments are taking place with fresh copper? Yes.
943. You think the company will devote their capital to thoroughly testing the mine? Yes.
944. What area do you hold? 400 acres under mineral conditional purchase, 120 acres of which is freehold.
945. Have you seen indications of mineral deposits throughout that area? No; they are confined principally to a length of 60 chains, with a mean width of, I should say, 10 chains.
946. What is the output per annum of the mine? We have just got a start; but I could tell you what we expect for some years, making a reasonable estimate. The proprietary expect, when their machinery is completed at the end of the year, an output of from 8 to 10 tons.
947. About 500 tons a year? Yes.
948. Have you had an assay made to test the different deposits? Yes.
949. How do the ores go? There are a variety of grades. Some go as high as 40 per cent., others are down as low as 3, 4, and 5 per cent.; but I should think the mean of what we term the concentrating ores would be about 6 or 7 per cent.
950. That would pay for treatment? Yes, with the body that is there.
951. Do you think it at all possible, if the permanency of the field is established, that machinery, independently of what is now there, will be erected for the treatment of ore? Yes; I think the present proprietary have an idea of putting water-jackets there apart from the concentrating machinery.
952. Is the ore you mine different in character from that mined at the New Mount Hope? Yes; iron is present in a greater quantity.
953. How far are you from the New Mount Hope Mine? About $3\frac{1}{4}$ miles.
954. What about the water supply? The supply at present is not sufficient for mining operations on a more extensive scale. That has been taken into consideration by the proprietary, and I think they intend to make arrangements for the conservation of an additional supply.
955. Suppose a large population is settled there, what provision could be made for a water supply for domestic purposes? We have a Government tank within 2 miles; but there is no provision whatever in the immediate vicinity of the town.
956. What is your nearest water-course? I think the Booberoi Creek; it is 30 miles from us.
957. Do you think that Lake Cudgellico, being a shorter distance from Mount Hope than is Cobar, the people at Mount Hope would use a railway at the Lake? Yes; I think so.
958. Over what period of the year are the roads trafficable to Cobar? With the exception of the heavy rainfalls, which generally occur about February, they are trafficable all the year.
959. What is the average rainfall at Mount Hope? The rainfall of last year was 18.52 inches.
960. Would that be the average? I think so.
961. Have you any areas under cultivation near Mount Hope? Yes; to meet local demands.
962. You think that if persons could get their produce to market easily, there would be much additional cultivation? I do.
963. You would know the value of the different timbered areas;—take, for instance, the box country and the mallee country—do you think the mallee country could be put under profitable cultivation? If there were railway facilities, I think much of that land would be cleared. It would be splendid land for cereals.
964. Would it produce anything else? I have seen lucerne grown there.
965. Upon what area could a man earn a living in the district? I should think 1,000 acres. If he depended upon the crops for a living he could do with less than that, but he would probably require to combine grazing with agriculture.

Henry McCook, farmer, South Mount Hope, sworn, and examined:—

966. *Chairman.*] You have been requested by the residents to attend and give evidence with regard to this proposal? Yes. H. McCook.
967. Have you been long resident in the locality? I have been at Mount Hope since 1880. 30 Sept., 1897.
968. In what part of the country were you before that? I am a native of the Nepean.
969. And you went from there to Mount Hope? Yes.
970. Upon what grounds do the residents of Mount Hope advocate the construction of a line from Condobolin to Euabalong? The Nepean land is supposed to be good land, and I have seen just as good vegetables and fruit grown at the Great Central Mine as I ever saw grown on the Nepean. The fertility of the soil would be one ground for the construction of a railway.
971. What area of land have you? I have only about 13 acres cultivated this year, but I have a selection of about 250 acres. I was an hotel-keeper for about five years out there, but I was farming on the Nepean nearly half my life.
972. You have proved the capabilities of the district, from the point of view of agriculture, to be equal to those of the Nepean? Yes, stock will fatten there in a month or six weeks—either horses or cattle.
973. What description of country do they fatten on? The general run of the country is not poor. The pine does not grow so well on the ridges as on the flats; there are all sorts of different scrubs.
974. It is not heavily timbered country? The pine is very thick and small—what you would call brushy pine. It was particularly thick upon Coan Downs Station, 10 miles from Mount Hope. I am often in and out there. I was out there last Monday, and I saw a paddock of 25 acres of lucerne, put in eleven years ago by the man who was managing there at that time. The crop when I was there last Monday was about 2 feet high. No doubt the soil out there is splendid; it is a red chocolate, and is easily cultivated.
975. It is almost as easy to deal with as the river flats near Penrith? Yes; I think that if a line were constructed to Euabalong miles and miles of country upon Coan Downs and Roto Stations, which are now abandoned, would be settled. 976.

- H. McCook. 976. It would take a fair amount of capital to prepare that country for the plough, would it not? Yes; it would take money to scrub it; then there are tanks on the resumed areas which intending selectors would have to pay for; but the water supply would be there.
- 30 Sept., 1897. 977. You could do nothing with that country until you had scrubbed it? No; you could not go about through it. Coan Downs is all scrubbed.
978. So that 40 acres would be of no use to make a living on;—you would want a much larger area than that? Yes. I may mention that grapes grow splendidly. There are two Chinese gardens at the Great Central and two at Mount Hope. Peaches and apricots grow particularly well, and all sorts of vegetables grow without watering.
979. How did you get on during the late drought? There was grass on the Great Coan Downs. It was the only station in this part that had grass; it stood the drought splendidly; everything was in good condition all the year round.
980. Was that because it was lightly stocked? No; it was fairly well stocked.
981. The station carried its own stock and others as well? Yes; I had horses there myself. The stock on the resumed area were fat all through the year.
982. It speaks well for the fattening character of the country? Yes; if the scrub were off it would fatten as well as any land you could put a beast on to.
983. It is estimated that there will be a loss of over £3,000 per annum;—do you think that if the Commissioners charge special rates the carriers would be able to compete successfully with the railway? I think that even if local rates were charged the Mount Hope people would come here in preference to going to Cobar, in order to save time and distance.
984. Do you know the trend of the traffic from Ivanhoe and Mossgiel? The whole of that traffic goes to Carrathool and Hay.
985. Would the proposed railway divert any of that traffic? No; you would have to take it much further on.
986. So that the Euabalong line would be of service to residents between here and Condobolin, to new settlers who might come into the district in consequence of railway construction, and also to the people of Mount Hope? Yes; I do not think you could rely upon it to intercept any traffic going towards Victoria.
987. Do you think it would be justifiable on the part of the Government to construct this line to Euabalong, in view of the small amount of traffic which could be created, or do you think the line should be taken further on? I think it would be a good line to construct to Euabalong, and it might afterwards be extended. I think it would be a good thing to run light lines through this back country to open it up. In most of the good farming districts the whole of the available land has been taken up, and the rising generation must have an outlet somewhere. If you do not have light railways in these districts the farmers will find themselves in the position of having to carry their produce too far by road. So far as the land round about Mount Hope is concerned, it is some of the finest land a plough was ever put into.
988. Failing markets near Mount Hope, a railway to Euabalong would provide markets elsewhere? Yes; and I reckon that, as far as minerals are concerned, the Mount Hope district is only in its infancy.
989. You think there are prospects of great development in the mining industry? Yes.
990. What is the extent of the Mount Hope field? There is a belt of mineral country running right through to Cobar; commencing at Mount Hope, the distance would be over 100 miles.
991. What would be the width of that belt? I could not say. Mount Allen is only 12 miles from Mount Hope. Gilgunnia is 25 miles from Mount Allen, and Nymagee is 35 miles from Gilgunnia.
992. It is a line of mineral-bearing country all through? Yes.
993. Does the mineral country come in this direction from Mount Hope? Yes. There is a mine only 11 miles out called Creamy Hills; they are prospecting there on a small scale now.
994. And is there a similar character of country between that point and Mount Hope? Yes; it is all mineralised.

Frederick Millthorpe, homestead lessee, Hyandra, sworn, and examined:—

- F. Millthorpe. 995. *Chairman.*] What is the extent of your lease? 8,820 acres.
- 30 Sept., 1897. 996. *Mr. O'Connor.*] How long have you been in this district? Seven years.
997. Your lease will hold good for the next twenty-one years? Yes.
998. How are you utilising it? I have sheep and cattle, and I have gone in for a little agriculture.
999. Is any portion of your lease fit for agriculture? About 5,000 acres out of 8,000.
1000. But up to the present you have not utilised that portion? Only 50 acres.
1001. How is it that you have not put a bigger area under cultivation? There is no way or getting the wheat to market. Whitton is our nearest railway station.
1002. If you could reach, without undue expense, the best markets between here and Sydney, you would put a considerable area under cultivation? Yes; from 300 to 500 acres.
1003. Upon what grounds do you favour the construction of a railway to Euabalong? I think it would open up the country, and do a lot of good to those who are already settled. I also think the line would pay expenses.
1004. How far are you from Lake Cudgellico? About 15 miles from Lake Cudgellico. I should only be 10 miles away if I could cross the river in a straight line.
1005. Are there any settlers near you? Not on this side, because it is in the Western Division.
1006. Taking a radius of 20 miles, what settlement would there be? There are nine or ten stations.
1007. The settlers to whom you refer hold considerable areas of country? Yes, one of them has between 500 and 600 acres under crop this year.
1008. What would be the aggregate area under cultivation on the nine or ten stations? I could not say.
1009. I suppose they are equally desirous with yourself of obtaining railway communication? Yes.
1010. Do you wish to add anything to your evidence? I think that if a railway were brought to Euabalong, a lot of the country would be put under viticulture. It is admitted that grapes can be grown equal to those grown in the Albury district. I have been in the district a long time, and I can see there is more sugar in the grape here than in the Albury district. The grapes are more adapted for wine-making.

1011. How long were you in the Albury district? I was there for nearly forty years. I also think, that if a railway were constructed here a large population would come from Victoria to cultivate the mallee country, if they could get it at a reasonable rate. I saw six men from Victoria here a short time ago. They represented a lot of people over there, and they said the mallee country about here was the finest country they had seen for wheat growing if they could get it at a reasonable rate. F. Millthorpe.
30 Sept., 1897.
1012. At present it is abandoned? Yes, it is merely a breeding-place for rabbits.
1013. You think that if railway facilities existed, people would come from Victoria and take up land? I am confident they would.
1014. Have you a knowledge of the country between Euabalong and Hillston? Yes.
1015. Do you think that if the railway were continued to Hillston the traffic which now goes to Victoria would be retained in this Colony? I do; and I also think there would be a great deal more wheat grown there. I have 5,120 acres about 14 miles from Hillston, and I grow there 200 acres of wheat.
1016. The rest of the area you use for pastoral purposes? Yes. The land is in a south-easterly direction towards Whitton and Carrathool.
1017. Would the extension of the proposed railway benefit you to any extent? Yes; because we have to cart 50 odd miles to the railway at Carrathool.
1018. Therefore, a railway to Hillston would mean a great saving to all the farmers in that district? Yes.
1019. At the present time where do you send your produce? It is sold in Hillston, or taken *via* Carrathool to Sydney? If it is taken to Carrathool when the river is up, we can get it taken down the other way by water carriage cheaper than it can be carried by rail to Sydney.
1020. If there were a railway at Hillston you would not send any of your produce to Melbourne? Quite so; we could not do so on account of the 50 miles of road carriage.
1021. What is the carrying capacity of your land there? I think in an average season about 5 acres to the sheep.
1022. What is the average weight of your fleeces? From 7lb. to 8lb.
1023. It is, therefore, good wool growing country? Yes.

FRIDAY, 1 OCTOBER, 1897.

[The Sectional Committee met at the Court House, Lake Cudgellico, at 4:30 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further consider edthe proposed Railway from Condobolin to Euabalong.

Christopher Davis, farmer, Windmill Farm, sworn, and examined:—

1024. *Chairman.*] You are a farmer at Windmill Farm, on the Lachlan River? Yes; I am about the same distance from Euabalong as I am from Cudgellico. C. Davis.
Oct., 1897
1025. Are you on the northern or on the southern side of the river? On the northern side.
1026. How long have you been residing in this district? About thirty-two years.
1027. Have you been settled on the river all that time? I have been settled where I now am since 1871.
1028. You selected under the Land Act of 1861? Yes.
1029. What is the extent of your area? I have two 640-acre blocks, and 151 acres. It is all conditionally purchased land.
1030. Have you any conditional lease land? No.
1031. What do you generally do with the land; do you cultivate it or graze it? I cultivate a good deal and graze the remainder. This year I have between 400 and 500 acres under wheat.
1032. *Mr. Fegan.*] I suppose you also grow wool? Yes.
1033. How many sheep have you? At the present time I have only about 700, but I have had as many as 2,000.
1034. What is the reason you have such a small number this year? The bad season.
1035. What is the largest crop you have under cultivation? I have the largest area under wheat this year. I had 400 acres last year, and 400 the year before.
1036. Where is your market? Mount Hope, principally. I take my hay and chaff there.
1037. Where do you take your wheat? I only stripped one year. I stripped last year.
1038. Where did you send it then? I sent it to Condobolin. It was milled there.
1039. Where is your market for flour? Principally the Mount Hope Copper Mine.
1040. Do you do anything besides farming and carting? No; I have been carting ten years to Mount Hope.
1041. You combine carting with farming? Yes.
1042. You had 400 acres under hay last year? Yes; I got about 140 tons of hay.
1043. Have you a contract to supply the Mount Hope district? I generally supply Mount Hope.
1044. Do you supply any particular company there? I supply the whole township; I have done so for the last sixteen years.
1045. How far are you from Lake Cudgellico? The nearest point would be about 8½ miles across the river from my place.
1046. What are your views with reference to the extension of railway communication to Lake Cudgellico? I should like to see the railway here. I do not care whether it comes to Lake Cudgellico or Euabalong, because I am the same distance from either place.
1047. Why do you want a railway here? I have a good deal of wheat in this year, and I hope to be able to put in still more, for dispatch to Sydney and other markets. In a good season I should strip it all, and I ought to get about 3,000 bags.
1048. As matters now stand, if you are fortunate with your wheat, how do you intend to dispose of it? If I cannot sell it locally, I shall have to hold it. 1049.

- C. Davis.
1 Oct., 1897.
1049. Your idea is to take it to Condobolin for milling? I do not care for that; there is too much cartage attached to it.
1050. What did it cost you to take your wheat to Condobolin before? It was three years ago; it cost me 1s. a bag there, and 1s. a bag back to my own place.
1051. From your place to Mount Hope what would it cost you? 2s. 4d. a bag.
1052. That would be about 3s. 6d. a bag for cartage alone? Yes.
1053. Having regard to the rates at which the Railway Commissioners carry wheat in other places, do you think it would be a great advantage to the people in this district, in the matter of wheat-production, to have a railway here? Yes; because in other years I could not get wheat carted over the same route for 5s. a bag; that was in consequence of the bad season.
1054. Do you grow anything besides wheat? I grow a lot of fruit. I used to make a good deal out of fruit; but I had to give up growing some of it on account of depredations by vermin.
1055. What fruit can you grow? Nearly every kind.
1056. Without artificial water? Water is impounded in a dam round my garden.
1057. What distance of river frontage have you? I might have a mile.
1058. You have a fair opportunity to grow fruit through being near the river? Yes.
1059. If you were away from the river, could you grow fruit successfully? I have a good orchard 3 miles from the river.
1060. Had you not an opportunity to get water? I used to catch all the water that fell round it. It used to grow very good fruit.
1061. Where is your market for the fruit? Mount Hope, principally.
1062. If there were a railway at Euabalong or Cudgellico, you could send your surplus elsewhere? Yes.
1063. Under the circumstances, a railway would not be of much use to you? A railway would be of use to me. Many times I grow more stuff than I can sell locally, and it is too expensive to send it away by team.
1064. Where do you send your fat sheep? They are sent to Mount Hope, chiefly. A railway would enable many small mobs of fat sheep to be got away. It does not pay at present to send them to Melbourne or Sydney, and they have to be sold locally.
1065. Which would be the best route by which to bring the railway into this district;—do you think it should come from Euabalong? A line from Euabalong would be more convenient to me, I think.
1066. Is there any other information you have to give the Committee? I have been farming here for the last twenty-five years, and with a little care, and with an ordinary rainfall, we can grow anything.
1067. *Mr. O'Connor.*] A railway would be an inducement to you to cultivate more land? Yes.
1068. *Mr. Farnell.*] If a railway were constructed from Lake Cudgellico, would it suit you if it came from any point beside Euabalong? Yes; providing it went through Lake Cudgellico.
1069. *Mr. Fegan.*] In the event of a railway being constructed from Grenfell to Wyalong, coming within a reasonable distance of Lake Cudgellico, even if it did not come quite close to the lake, it would suit you, being the shorter route to Sydney? I do not think it would suit me better than the present line at Condobolin. If a line came from Grenfell I do not suppose it would pass within 40 miles from this place.
1070. Supposing it came within 25 miles? I would rather cart it the few extra miles to Condobolin, on account of having the river for the teams. Even in sending stock away I would rather send them in that direction.
1071. You think, then, that a railway from Euabalong to Condobolin would be of great benefit to you? I think so. It would also benefit the district, because it would induce many more persons to go into farming. I would be prepared now, if I had means of getting the produce away, to put in 1,500 acres of wheat every year.
1072. And are there many farmers similarly situated to yourself who would have increased cultivation? I think many would put in more wheat; but it is of no use to grow more for local consumption, because we cannot get rid of it.
1073. How often can you depend on the crop? I have had wheat in since 1872, and I have missed three crops. I cannot say I missed a crop, because I got 140 tons off 400 acres.

Robert George Jamieson, senior constable, Lake Cudgellico, sworn, and examined:—

- R. G. Jamieson.
1 Oct., 1897.
1074. *Chairman.*] How long have you been stationed here? About twenty-two months.
1075. What is the area of your district? It extends about 60 miles south towards the Murrumbidgee; about 25 miles to the west, including Murrumbidgee; 30 miles to the east, including Dundoo Hills station; and it is bounded on the north by the Lachlan River.
1076. Have you any record of the population within that area, or the acreage of land under crop? There would be about 600 within that area, and 1,800 acres under crop.
1077. It is cultivated principally for wheat? Principally for hay.
1078. Is it used for local consumption mainly? Yes.
1079. During your twenty-two months here, has the population increased or decreased? It has decreased.
1080. To any appreciable extent? There are about 150 persons less than there were when I took charge of the district.
1081. Can you give the Committee any reasons for that decrease;—is it due to dearth of employment, or to what? Poor seasons would be one reason for a number of persons leaving the district.
1082. Were the people who have left part of the floating population, or were they residents of the district? They were residents of the district; but they have left their farms.
1083. Have they had to abandon them from the uncertainty of season, or from what cause? I do not suppose it would be the fault of the seasons altogether; but there is no market for anything they can grow on selections here. The reason so many farms were taken up here at the start was that a number of men were working in the district. When the mines went down there was no market for produce: no doubt if the mines were working to-day many farmers would continue in occupation.
1084. While the mining industry was flourishing here there was a certain market for produce? Yes; for a few farms.
1085. In the present state of the mining industry the farmers have no alternative but to abandon their farms? Quite so.

R. G.
Jamieson.
1 Oct., 1897.

1086. Mount Hope is the principal market for produce from this district? It was our market.
1087. But the Mount Hope mines, like all the other mining centres here, have gone down lately? Yes.
1088. You know the country between here and Condobolin, and also between here and Hillston? Yes.
1089. Supposing the line were taken from here to Hillston, some distance along the northern bank of the river, would there be any cultivation in that direction? Not to any great extent, I think.
1090. Would there be enough traffic along that line to pay expenses? I cannot say.
1091. In view of the estimated loss upon the line and the necessity for local rates, do you think the railway would be used to any extent in competition with the teams? I should not like to say what effect local rates would have; I am not acquainted with the country about Euabalong. I know the country fairly well between this point and Hillston, and also between here and Wyalong. The country between this point and Hillston is good country. A great part of it is under lease, but there are some resumed areas available.
1092. Is the land, on the frontage where farming operations could be carried on successfully, leasehold? It is mostly leasehold, I think.
1093. Do you think it would be justifiable to bring a railway only as far as Euabalong? I do not think so.
1094. You think it would be necessary to extend it further? Yes.
1095. You do not think the line to Euabalong would intercept any traffic that goes to Victoria by river? I do not think so.
1096. If the object of the Railway Commissioners be to attract traffic to our railway system they would have to take this line further west? Yes; to intercept Victorian traffic.
1097. The construction of a line, even as far as Cudgellico, would not bring new traffic on to the New South Wales Railways—that is to say, the main traffic on the line would be traffic which now goes either to Condobolin or to Whitton? Yes.
1098. Is the country between here and Hillston suitable for farming? Yes, on this side of the river.
1099. You do not know much about the other side? No; the country between here and Whitton is also good for farming.
1100. How far is it from here to Whitton? 110 miles.
1101. And to Wyalong? Eighty miles.
1102. What do you make the distance from here to Rankin's Springs? About 40 miles.
1103. And from here to Yalgogrin? About 60 miles; the surveyed line passes close to Yalgogrin.
1104. Rankin's Spring is in a direct line from here to Whitton? Yes.
1105. What sort of country is it about Rankin's Springs? There are barren hills about there; but the land in between them is splendid for cultivation.
1106. What is the country like between here and Rankin's Springs? It is really good country.
1107. How is it occupied? By selectors. There are about ten selectors between here and Rankin's Springs.
1108. What do they do with their produce? They send it to Yalgogrin. I know that one man has 110 acres under crop, and he sells the produce locally.
1109. The settlers are apparently doing well? They are not doing well, because they have no market here in a good season for their hay. They would do well if they always had a market for their crops.
1110. You think there would be a considerable area put under cultivation if the farmers could get away their produce? I am sure there would.
1111. Is the land equally good near Yalgogrin? No; it is not good land about Yalgogrin until you get about 20 miles out, coming this way.
1112. Have you any idea of the country between Rankin's Springs and Hillston? Of a portion of it. There are about 12 or 13 miles I do not know much about from Rankin's Springs to Tin Hut, but going past that it is good land; you get on towards the river.
1113. The good land from Lake Cudgellico in the direction of Hillston extends right on to Merri Merrigal Range? Yes.
1114. That range comes in close to the river? Yes; a railway in that direction would have to go close to the river to get round the end of the range. If you took the line to the westward further down it would have to go through Monia Gap; that is about 40 miles from here.

Alexander Gordon Huie, carpenter, and secretary to the Progress Committee, Cudgellico, sworn, and examined:—

1115. *Mr. Farnell.*] Did you give evidence before the Sectional Committee which inquired into the proposed line to Broken Hill last year? Yes.
1116. Did you give it in your capacity of secretary to the Progress Committee? Yes.
1117. You are aware of the proposal to extend the railway from Condobolin to Euabalong? Yes.
1118. Have you collected any statistics which would show the Committee that there is any justification for that extension? I have collected no general statistics.
1119. Have any been collected by any member of the Progress Committee? The senior constable could give you information about the population, the area of crop that is in, and the storekeepers could give you evidence as to the stores which come into the place.
1120. How many members has your Progress Committee? I think nine this year, but several of them are away just now.
1121. Since you last gave evidence before a Sectional Committee has the district progressed so far as settlement is concerned? No.
1122. Can you give us any reason for the decrease in settlement? The reasons for the decrease have been working for a number of years past; twenty or thirty years ago this part of the country was in a very different state. There was practically no scrub, and a number of sheep were run. When the gold-field broke out, still more people were drawn here, and a good many improvements in the way of tank-sinking and fencing were carried out. When the land was thrown open a good many selections were also taken up. Up to the time of the financial crisis the district got on well enough; after that date it went back, and pastoral occupation did not give the same employment. Mining has also gone down, and there has been nothing to take its place. If the railway had been constructed at that time the district would not have gone back at all; but the farmers, being at such a distance from market, could not grow wheat at a profit. There has been nothing to take the place of the sources of employment before the district went back.

A. G. Huie.
1 Oct., 1897.

- A. G. Huie. 1124. Do I understand that the area under cultivation has also decreased? I think there is less than there was three or four years ago. I know of one selector who had several hundred of acres 14 miles down the river, and he has hardly anything in now.
- 1 Oct., 1897. 1125. You attribute the decrease in cultivation, and the slow progress of the district, to the absence of proper facilities for getting produce to market? That is it.
1126. With what railway station is the trade of the district done, taking a radius of 10 miles of Cudgellico? Up to the present it has been done chiefly with Whitton. Occasional loads have come from Forbes and Parkes, and some from Condobolin. The trade of Naradhan, and Merri Merrigal, would go to Whitton this year; it might go to Condobolin next year.
1127. Do you anticipate any new traffic at Euabalong if the line were extended to that point? There would be a greater area of land put under cultivation, and in the winter months there would be a great quantity of fish and rabbits sent from a station anywhere near here. I do not think any wool which goes to Victoria would be intercepted. A line to Euabalong would not be far enough for that purpose. The North Wooyeo wool, which went to Melbourne one year, would be intercepted, but I do not know of any beyond that.
1128. The railway would gain to that extent? Yes, but that is a trifle. The other increase of traffic would be altogether new. It would not be traffic going at present to any railway. It would be traffic mainly incidental to new cultivation.
1129. You think that in order to divert Victorian traffic it would be necessary to take the railway on to Hillston? Yes.
1130. Any extension to Hillston would probably have the effect of diverting some of that traffic? It would divert a large quantity of it. The traffic as far as Ivanhoe would come to a station at Hillston.
1131. Supposing a line were constructed through to Hillston at a convenient distance from Lake Cudgellico, it would suit the convenience of this district as well as an extension to Euabalong? It all depends upon what you call a convenient distance.
1132. Supposing the railway were 10 miles distant? In that case, I daresay, it would serve the district right enough; but I question whether it would be possible to take a line 10 miles to the south of Lake Cudgellico, on account of the nature of the country to be traversed.
1133. *Mr. O'Connor.*] What would be the difficulty? There are two ranges—the Cudgellico Range, and the Merri Merrigal Range further down.
1134. You say that the settlers have only produced wheat for local consumption? There has been very little wheat production at all. There are only two or three farmers who have gone in for making a living by cultivation.
1135. Do you know what the average yield per acre has been? I can only guess at it. It has been from 12 to 16 bushels, I think.
1136. Have you taken the average rainfall? I have not taken it; but I know that it is from 17 to 18 inches. I believe a record has been kept at Wooyeo, and that would apply to Lake Cudgellico; the rainfall has been as high as 30 inches and as low as from 10 to 12 inches. Probably there will not be much more than that this year unless we have heavy rain towards the end of the year.
1137. Is there plenty of land available for settlement in this district? There is a large area of land available now. A number of improvement leases from the south-east to the south-west have been put up at auction; only four have been taken up. There have been two settlement lease areas comprising ten blocks, varying in extent from 1,087 acres to 2,560 acres, also put up, and not one of them has been occupied. Two were applied for, but the applicants did not go on with their applications. Two homestead selection areas have also been open, and three blocks of 40 acres each have been taken up. It was mainly through my efforts that three of these areas were thrown open. I thought the liberal provisions of the new Act would induce people to take up the land; but that hope has not been realised. A considerable expenditure of money is required to deal with land in this district. There is a good deal of pine scrub, and then there is the rabbit pest to be dealt with. A considerable amount of capital is required to do this, and people cannot make a living on a small area from pastoral products alone—they must combine agriculture with pastoral pursuits. Until farmers can get away their produce quickly, and without much expense, the land will not be taken up.
1138. What does it cost per acre to scrub and clear the land fit for the plough? I could not say; but I believe it was stated in evidence twelve months ago that it would cost from 35s. to £2 an acre.
1139. What area do you think would be sufficient for a person to take up in this district combining pastoral pursuits with agriculture? It depends entirely upon the land. A man might do well with 640 acres in one place and a few miles further on he might require considerably more. The land is surveyed in blocks of varying sizes according to its capabilities. I think these blocks are a fair size with the exception of the 40-acre blocks, which are too small.
1140. Are there any large areas of freehold land in the district suitable for the growth of cereals? On Wooyeo station there is a good deal of land which would be fit for wheat growing, but it is scattered about the station.
1141. Do you think, that if a railway were constructed to Euabalong, it would be an inducement to freeholders to farm their land on the halves system? I think it would be some years before anything of the kind were done here.
1142. Do you know the rate of carriage between here and Condobolin at the present time? It is about £3 per ton, but that is high, and it would be for small lots; the bearings of the traffic between here and Condobolin have not properly settled down, and they will not do so until the railway is taken over by the Government. Probably the rate will be as low as £1 or 30s. The rate is £3 in bad weather, or for stuff which has to come through quickly.
1143. You know it is anticipated that there will be a loss of something like £3,500 a year on the extension to Euabalong? Yes.
1144. You know that it is also proposed by the Railway Commissioners to charge local rates;—do you think there would be any objection to them? Providing they did not come to more than road carriage there would be no objection. I think that if the carriage were as high as by team the traffic would still come by rail on account of the expedition and security.
1145. Do you know of anything else besides wheat which would be produced in the district which would add traffic to a railway? Wheat would be the main thing. There would be a large quantity of rabbits, fish, and wild fowl carried in the winter months.

1146. How many persons are engaged in the fishing industry here? A little while ago there were two men and three boys; but some fishermen will be able to give you evidence on that point. A. G. Haie.
1 Oct., 1897.
1147. Are there any mineral resources in the district likely to be developed? The mine here might be worked again, but to that I have no definite knowledge. The Erribenderry mine, about 8 miles from here, may also be worked again.

SATURDAY, 2 OCTOBER, 1897.

[The Sectional Committee met at the Court House, Lake Cudgellico, at 10 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The HON. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Joseph Blacker, saddler, Lake Cudgellico, sworn, and examined:—

1148. *Chairman.*] Have you resided long in the district? Twenty-five years. J. Blacker.
2 Oct., 1897.
1149. You have heard of the proposal to extend the railway from Euabalong to Condobolin? Yes.
1150. Do you favour that proposal? Yes.
1151. Are you yourself the holder of any land here? I have an allotment in the township.
1152. You have no pastoral or agricultural land? No.
1153. Are you well acquainted with the district? Yes.
1154. On what extent can you speak authoritatively? I have been to a distance of 50 or 60 miles all round Lake Cudgellico.
1155. Have you been to Hillston? Yes; I have been to Hillston for the last seven or eight years.
1156. Do you know the country there? Yes; I know all that country well.
1157. Will you tell the Committee why you favour the proposed railway? I believe the line would be the means of settling a number of people in the district; it would be a great convenience in the getting away of stock. I have known farmers here to have had 500 or 600 fat sheep and unable to get them away. A railway would enable them to get their fat stock to market. I have also known of men who have grown wheat similarly situated. They have had a thousand bags of wheat, and have been unable to sell it on account of there being no means of getting it away. It would not pay them to engage carriers on account of the road charges. I have known cattle and sheep, which have been fattened here, kept until they have actually got into store condition again; it has been impossible to get them away.
1158. You know the country from here to Condobolin? Yes; a great deal of it is very good land.
1159. What is the quality of the land from here to Hillston along the surveyed route? Some of it is very good, but there is a lot of mallee country. I am not an experienced farmer, but I am told that the mallee country is very good for wheat growing when it has been cleared.
1160. Is there good pastoral land in that direction? Yes. Of course, the land on this side of the river is better than is the land on the other side.
1161. Do you know of any areas of Crown land in that direction which would be at the disposal of the settlers? There are a number of blocks which can be taken up. One man took up a large block the other day; there is a lot of mallee country which can be taken up.
1162. Has this place advanced or receded during the past four or five years? It has receded.
1163. To any great extent? A good bit.
1164. To what do you attribute it? I attribute it to the growth of rabbits and to the growth of pine scrub, and also to the fact that the farmers have had no market for their produce. Land will not be taken up unless a market is provided for produce.
1165. What is the quality of the land within a radius of 10 miles of Lake Cudgellico? It is all good land; it is all fit for the plough.
1166. Is there any available there? A lot of it.
1167. Is it your opinion that if a railway were taken as far as Euabalong it would facilitate settlement? Decidedly.
1168. What is your rainfall? About 17 inches.
1169. Would that be sufficient for the growth of wheat? Yes; it would be plenty if it came at the right time of the year—in fact, we could do with less than that.
1170. You think the district has gone back not only on account of the pine scrub and the rabbits, but also through the want of a market for produce? Yes.
1171. You think that all the difficulties incidental to settlement would be surmounted if the district had railway communication? Yes.
1172. And that in course of time a railway would pay? Yes. Of course it would not pay at the present time.

George Albert Pillinger, selector, Corrawong, Lake Cudgellico, sworn, and examined:—

1173. *Chairman.*] Where is your holding situated? About 12 miles in the south-westerly direction.
1174. *Mr Fegan.*] What is your area? I have 2,560 acres of conditional purchase and conditional lease, and 2,560 acres of annual lease. G. A. Pillinger.
2 Oct., 1897.
1175. Have you any freehold? No; but all the members of my family are settled on contiguous blocks.
1176. How long have you occupied them? The first block was taken up in 1891. Four of us occupy 2,560 acres each; my youngest son has 1,280 acres.
1177. You said that first holding was taken up in 1891? Yes.
1178. Since then to what purpose have you chiefly put you holding? It has been used chiefly for grazing.
1179. Where did you come from before you occupied this land? From Corowa.
1180. Then you have been resident in the district for a considerable time? Yes; I was resident there for about ten years.

G. A.
Pillinger.
2 Oct., 1897.

1181. You have had a fair experience of pastoral and farming pursuits? Yes; I have followed them all my life.
1182. Is any portion of your area under cultivation? I grew sorghum last year; it was too dry a season for wheat.
1183. You have not tried to grow wheat at all? Yes; in 1894 I had about 16 acres of wheat, and it was a remarkably good crop. I put it in for hay.
1184. So that really you have had very little experience of wheat growing on your present holding? Not on my own place.
1185. Do you know there is a proposal to construct a line from Condobolin to Euabalong? Yes.
1186. Do you know the route taken? I do not; but I suppose the line would come within a few miles of the river all the way down.
1187. Do you think it is suitable for settlement? The land is suitable if it is available, but I do not know that it is.
1188. Considering that all the river frontage has been secured to stations, and that there is not much more land to be thrown open, do you think there is much prospect of a line paying working expenses? I do not know about a line paying, but I know the district wants one badly enough.
1189. But you think there should be some prospect of a line paying before it is undertaken? Yes; my own idea is that the railway ought to come in this direction from Wyalong.
1190. You know the country between Euabalong and Cudgellico? Yes.
1191. The greater part of it is alienated, is it not? I could not say.
1192. What would that land grow? Within 10 miles of Cudgellico I do not consider that it is agricultural soil; there is too much small ironstone gravel in it. On the other side of the bridge the land is almost equally unsuitable for cultivation.
1193. Then you cannot look for any great settlement between here and Euabalong? Not agricultural settlement.
1194. It would be fit for pastoral pursuits, but that is all, you think? That is my idea.
1195. How far are you from the proposed terminus at Euabalong? Twenty-six miles, as nearly as I can say.
1196. How far are you from this point? My nearest fence would be about 7 miles, and the furthest from 14 to 15. The average distance would be, say, 10 miles.
1197. You do not see any prospect of much greater settlement than at present exists between Euabalong and Cudgellico? No, I do not.
1198. If there were a railway anywhere near Cudgellico, would you increase your cultivation? If there were a railway within any reasonable distance I would put in five or six hundred acres.
1199. Your cultivation, then, would not bring much freight to a railway? The country out here is all open for settlement; it very suitable for settlement. Although it is heavily timbered, it is pretty well watered. If we had a railway it would soon all be settled.
1200. Even if the railway were brought to Euabalong it would induce settlement near you? Yes.
1201. Where do you get your stores from now? From Sydney, *via* Whitton. They have been usually three months on the road; since the drought set in we have never been sure when we should get them.
1202. And I suppose some of the stores are not fit for very much when you do get them? A good deal of damage is done.
1203. What is the road carriage? About £2 5s. a ton from Whitton.
1204. What is the railway rate to Sydney? We have to pay £8 a ton on most things; the rate altogether would be over £10 a ton.
1205. You live nearer to Cudgellico than to Euabalong? Yes.
1206. Do you know the country between here and Wyalong, and between here and Hillston? Yes.
1207. There has been some agitation for a railway from Wyalong to Hillston? Yes.
1208. The route has been surveyed? Yes.
1209. Do you know the route proposed to be taken? Pretty well.
1210. How far will it be from Cudgellico? Between 30 and 40 miles.
1211. That would not serve the people at Cudgellico? It would be useless for them. It will be a little better than going to Whitton, but very little, because when once things are loaded a little extra distance does not make much difference. A railway passing about 30 or 40 miles from Cudgellico would not induce much settlement in this district.
1212. At what distance from Cudgellico would a railway suit people here? It would pass through all the best land if it ran about 10 miles to the south.
1213. But would it be possible to bring a railway so near to Cudgellico as that? Yes; the country is all level.
1214. Would it pass through good agricultural country? Yes; it would be all agricultural country.
1215. I suppose you do not know the rainfall there? According to the average of the past 10 or 12 years it would be about 18 inches.
1216. I suppose very little of the land between here and Wyalong is under cultivation? Comparatively little.
1217. How do you think it would do to take a railway from Wyalong to Hillston, *via* Cudgellico? I think it would answer all purposes. People on the south side of the river would be as well satisfied with that as if they had the line right through their land.
1218. Do you think there would be any greater prospect of that line paying than a line to Hillston, *via* Euabalong? My impression is that there would be 500 or 600 square miles settled in a short time, if a line came to Lake Cudgellico from the south.
1219. You will see from the map that there is a large area of Crown land unoccupied in the direction of your holding? Yes; it is very good land. It is certainly above the average; it is heavily timbered with scrub, but when cleared it is suitable for agriculture.
1220. There seems to be also between Wyalong and Condobolin a large area of unoccupied Crown land? Yes.
1221. Do you know that land fairly well? Yes; I have been over that a number of times. It is all the same class of country—very heavily timbered, and worthless unless improved; but much more suitable for settlement than the plain open country, upon which there is no timber.

G. A.
Pillinge.,

2 Oct., 1897.

1222. What kind of soil is there in that direction? It is a heavier soil near Wyalong—more sticky. It is a chocolate soil.

1223. If a line were constructed to Rankin's Spring, passing 40 miles from Cudgellico, that would be better than anything you have at present? Of course it would, but it would not bring about any settlement. People would not be attracted to this district by a railway at that distance.

1224. You think a railway 40 miles away would not induce any more settlement here? To a certain extent it might.

1225. How far away would the proposed terminus at Euabalong be? I think about 26 miles.

1226. So that if the roads were good there would not be so very much difference? There would be a difference of 14 miles, and it is easier to cart in the direction of Euabalong than it is the other way. There are a lot of boggy holes when you get away some distance in the direction of Rankin's Springs, but the road to Euabalong is pretty hard and firm. You can cart there in almost any season; but you cannot always get to Rankin's Springs.

1227. There would be more engineering difficulties in the construction of a line from Wyalong than from Condobolin? Yes; if you are referring to the line from Wyalong to Rankin's Springs.

1228. Is there any other information you can give the Committee? I only desire to say that we are at a great disadvantage with farmers in districts where there is railway communication. Under present circumstances we cannot carry on a system of agriculture and grazing combined. We have to rely upon grazing solely now, whereas if we had a railway we could go in for agriculture. No doubt the country is suitable for it.

1229. If you had railway facilities you would have cheaper carriage, and it would therefore be an inducement to put larger areas under cultivation. The receipts from agriculture would materially assist you in your pastoral pursuits? Yes. I am of opinion that a line ought to come from Wyalong to Cudgellico.

John Knight, storekeeper, Lake Cudgellico, sworn, and examined:—

1230. *Mr. Farnell.*] How long have you been resident here? Close upon twenty years.

1231. So that you have an intimate knowledge of the district and its surroundings? Yes.

1232. With what railway station have you been dealing? Whitton.

1233. What quantity of goods have you been getting up on an average per month for the last two or three years? Five tons a month—some months more and some less.

1234. What is the road carriage from Whitton? £3 a ton was the last rate we paid.

1235. What is the railway carriage from Sydney? The goods come through at truck rates—we pay £30 for a 6-ton truck.

1236. Then it would cost you £25 a month for railway carriage? Yes; and £3 per ton from here to Whitton.

1237. If the railway were extended from Condobolin to Euabalong, would you use that terminus? Yes.

1238. Have you had to do with the purchase of any produce in the district? Yes, a little.

1239. How do you dispose of it? I have bought wheat, and have had it milled at Condobolin. I have disposed of it locally.

1240. You have not sent any of it to Sydney? No; it would not pay under the conditions under which we would have to send it away.

1241. You are not engaged in agricultural pursuits? No; I confine myself to storekeeping.

1242. Has the district made any progress lately? Not during the last few months; but during the last few years people have gone in more for agriculture than they used to do. The drought has been against us for the last year or two.

1243. Is the drought the only thing which has militated against the progress of the district? Of course, if the people had railway communication they would go in more for farming pursuits than they have done. As matters stand they have no outlet for their produce.

1244. Have you any idea of the quantity of land available within a radius of 10 miles of Lake Cudgellico? I cannot say that I have.

1245. You think that if a railway were constructed to Euabalong people would cultivate much more than they do now? Yes.

1246. Have you any idea of the average return per acre from the cultivation of wheat here? I think it has been about 18 bushels.

1247. Do you know anything about the quality of it? It has been of very good quality.

1248. What would be a profitable return from the growth of wheat? I could not say to a certainty; it would depend upon where the farmer bought his seed, and the kind of seed he put in.

1249. Do you know what it costs to clear and scrub the land here ready for the plough? I suppose about £2 an acre.

1250. I suppose that if the railway were extended to Euabalong, plenty of persons would be willing to take up land, spend £2 an acre for clearing, and go in for wheat-cultivation? Plenty of people would do so.

1251. You are bearing in mind that £2 would be an addition to the cost of the land? Yes.

1252. Can you speak as to the quality of the soil in the district? I believe it is as good as it is in most parts—above the average, I think.

1253. There would appear to be only one thing lacking—a good rainfall? Yes.

1254. Do you know whether experiments have been made in putting in other crops besides wheat? I do not think it has been done.

1255. Has there been any lucerne or fruit growing here? Very little. Fruit has grown well, especially grapes, and all kinds of stone-fruit.

1256. But the people have not gone into it to any extent? No.

1257. Do you think the dairying industry could be carried on successfully here? On the river frontage.

1258. Do you know of any other source of revenue besides wheat for a railway in this district? I have no doubt persons would make experiments in other directions.

1259. Suppose a railway were constructed within a reasonable distance of Cudgellico, independently of the proposed extension to Euabalong, would it be used by the people of the district? Yes. I think, for instance, that if a line came across from Wyalong it would be a good paying line; it would open up a lot of country which is now lying idle.

1260.

J. Knight.

2 Oct., 1897.

- J. Knight.
2 Oct., 1897.
1260. You do not think the proposed line would divert any traffic from Melbourne to Sydney? I think not.
1261. How long has the local mine been shut down? About twelve years.
1262. Is there any probability of it being reopened? Not at present, I think.
1263. Do you know to whom it belongs? I think it belongs to the Crown. There is a good reef there if it were opened up and worked, but operations were stopped for the want of money. There was too much water to contend with; that was one of the principal reasons. They got down some 212 feet.
1264. Is there anything else that you can suggest as a justification for the construction of a line to Euabalong, or a line to touch Cudgellico? I think this would be a great health resort for persons in towns and cities.
1265. You think it would be a sanitorium? Yes; many persons who have been here have taken a fancy to the place, and wish there were a better means of reaching it.
1266. During the twenty years you have been here, has the lake ever been dry? Yes; in 1880, I think, but I could not say for certain.
1267. It is fed from the Lachlan? Yes.
1268. What is its depth at the present time? About 3 feet. I suppose that would be the maximum depth.
1269. What is the greatest depth you have known in the lake? Sixteen feet, I suppose.
1270. Do you think anything could be done by which the lake could be fed and kept at a permanent level? Yes, if a weir were put across the river it could be done; you might have flood-gates.
1271. Are there not flood-gates at the entrance to the lake now? Yes; in the creek, but not in the river; the river is down below the level of the creek entrance. You would want a weir on the river to divert the water.
1272. I believe the lake is pretty full of fish life at the present time? Yes. There is a good opening for the fishing industry here. A couple of parties here have been doing pretty well out of it.
1273. You think that any railway within a reasonable distance of Cudgellico would lead to great development in the district? Yes; if the railway were anywhere within 20 miles.
1274. Although the line might not pay in the immediate future, you think it would ultimately do so? Yes.
1275. *Chairman.*] Is the district progressing or retrogressing? It has not been progressing for the last two years.
1276. Is it going backwards, or is it at a standstill? It has not gone back any further during the last twelve months; it is practically at a standstill now; but if better seasons come I have no doubt things will improve again.
1277. I presume that tank-sinking, fencing, and other things incidental to station management employ a number of people in the district? Yes.
1278. That work having been practically stopped the district is at a standstill, and wants something to give it another start? Yes.
1279. When station work was going on there was also some mining here? Yes.
1280. The mining is also now in a state of stagnation? Yes.
1281. And these two causes combined have left the district in a moribund condition? Yes.
1282. I notice that in the evidence you gave before a former Sectional Committee, you said that if a railway came within 20 miles of Cudgellico it would do a great deal of good? Yes.
1283. As a man who has been here twenty years, and who has some knowledge of the business of the district, which would you prefer—a line on the north side of the river 3 or 4 miles back from Euabalong, and perhaps extended on the same side towards Hillston, meaning that Lake Cudgellico would be 20 miles from a railway; or a railway coming from Wyalong and going through the Uabba Gap to Hillston, meaning that Lake Cudgellico would be within 25 miles of a line? I think the line you have last mentioned would do.
1284. Do you know the distance of Uabba Gap from Cudgellico? It is about 12 miles.
1285. Then a railway from the direction I have indicated would be even closer than 25 miles from you? Yes.
1286. Having regard to the capabilities of the country to the south, and the possibilities of increased settlement, if a railway were constructed in that direction would it suit the town and district of Cudgellico better than a line on the northern side of the river? It would suit as well, and it would open up more country.

Alexander Huie, carrier, Lake Cudgellico, sworn, and examined:—

- A. Huie.
2 Oct., 1897.
1287. *Chairman.*] How long have you resided here? About fourteen years.
1288. You have had a good opportunity during that time of becoming practically acquainted with the country round about Cudgellico? Yes; I know the country through which it is proposed to take the railway, also the country between here and Whitton, and as far as Hillston.
1289. What sort of country is it through which a railway would have to be constructed to Hillston on the northern side of the river? There is a tract of good farming country there. It is good sandy loam; back from the river there is some mallee. There is also some good country on Booberoi. Lower down towards Hillston the land is in the Western Division.
1290. Do you think that country would be suitable for close settlement even if it were available? I do not think the river frontage would be good for agriculture.
1291. The bulk of the land is alienated? To the eastward of Cugong it is.
1292. Have you a pretty good knowledge of the country between Lake Cudgellico and Wyalong? Yes; there is some very good land between Wyalong and Wollongough, but it is not all good right through until you get within a mile or 2 of Wollongough, which would be about 50 miles from here.
1293. Do you know the country between Wollongough and Uabba? You would have to go through a lot of hilly country. If you took a railway that way to Hillston you would have to miss Wollongough and all that good country; you would have to go to the southward of that, and the railway would pass through a series of wide flats intersected by ranges.
1294. You are referring to the route *via* Yalgogrin and Rankin's Springs? Yes; there you are practically on the dividing line between the two watersheds.

1295. Would the country within a few miles of that railway be suitable for settlement? The best country would be towards Woollongough and the lake. I think a railway should be brought from Wyalong here through Woollongough. It might go through Willanthry and thence to Hillston. Such a railway would be fed by a large area of good country on each side. It would have the effect of settling more persons than would any other line in this direction; at the same time it would help persons who are already settled in different centres.

A. Huie.
2 Oct., 1897.

1296. How far would the good country extend back from here? It is first-class country from here until you get to Naradhan station, about 25 miles from here.

1297. Is there any way of getting through the Merri Merrigal range instead of taking the railway right up on to the river flats? If you did not go there you would have to go through Monia Gap, and you would then run into poor country. It is the land between Monia Gap and the river through which a railway ought to go.

1298. Supposing the railway went through Monia Gap, how would it affect this district? It would be too far away to be of any use to us. Besides that, you have to consider the other side of the river. If the railway went towards Willanthry all the Mount Hope traffic would go there.

1299. How far is it from Willanthry to Mount Hope? About 40 miles.

1300. But it is impossible to take up land on the other side of the river? There is a lot of forfeited land which the Government could sell.

1301. You think the route you have given would be preferable to an extension from Condobolin? Yes; it would serve a larger tract of country, and would pass through the best land.

Robert Orr, pastoral tenant, Lake Cudgellico, sworn, and examined:—

1302. *Chairman.*] You are a pastoral tenant in the Lake Cudgellico district? Yes; at Wargambegal.

1303. What is your area? About 20,000 acres.

1304. *Mr. O'Connor.*] You know the proposed line from Condobolin to Euabalong? Yes.

1305. And you are also acquainted with the proposed alternative from Wyalong? Yes.

1306. Which scheme do you think best in the interests of Lake Cudgellico, and also in the interests of the Colony? I think in the interests of the Colony a railway should be taken down the Lachlan; the land here is quite equal to any in New South Wales, both for pasture and agriculture.

1307. You are favourable then to the extension from Condobolin? Yes.

1308. You would bring the railway through to Lake Cudgellico, and continue to Hillston? Yes; opening up the valley of the Lachlan.

1309. Are you aware that most of the land that would be served is within the Western Division? Yes; the boundary line comes in about half-way between Condobolin and Euabalong. Euabalong is in the Western Division.

1310. The land between Condobolin and Cugong would be in the Central Division? Yes; my idea would be to bring the extension across the river to the south side, and that would take the railway out of the Western into the Central Division.

1311. Is the land as good here as on the northern side? It is better for agricultural purposes.

1312. There is land available for settlement? Any quantity; a lot of it has been abandoned through the want of a railway.

1313. You think that if there were an opportunity afforded to producers to get their produce to market, this abandoned land would readily be taken up again? Yes; judging from what has occurred in other places where good land has been thrown open near a railway;—there will be hundreds of applicants for the land to which I am now referring. We are at some disadvantage in the matter of rainfall. In the neighbourhood of Wyalong and Naradhan they have about 20 inches, in this district the average is about 17½ inches; that would be for the thirteen years ending 1896. 1896 and 1897 have been the two worst years recorded.

1314. The drought has reduced the rabbit pest? It has; I regard the rabbit question as a national question. I think that if we had a railway here the rabbits could be turned to profitable account. In Victoria they have a rabbit-preserving factory; there they make a profit of about 50 to 75 per cent. per annum, and thousands of men have been employed.

1315. You mean that the men are employed in killing the rabbits and preserving them? Yes; I regard the Lake Cudgellico district as the rabbit depôt for Riverina. I could show you more rabbits here in half an hour than you have ever seen in your life, and I think if a rabbit-preserving factory were erected here there would be a large export trade. I know of one man in Victoria who, with his family, was left destitute; they are making now £8 or £9 a week by killing rabbits. They get 2s. a dozen for them; the collector goes round every morning, picks the rabbits up, and sends them on to market. Rabbits have been a great boon to many persons in Victoria, having regard to the price of agricultural produce.

1316. Has this district receded within the last few years? Yes; I attribute it to bad land legislation.

1317. In what way? If we had had the present land law twenty years ago New South Wales would have been £20,000,000 richer. If men take up land now they have to reside upon it; under the former law there was no fixed settlement.

1318. You think the law compelling residence is a good one? Yes; under the present law the settler can neither sell nor mortgage.

1319. You would not advocate the construction of a railway to stop at Euabalong? No; the line should be taken on to Hillston, on the southern side of the river; it would go within a few miles of Euabalong.

1320. You think that would be a better route than *via* Wyalong? I do not say it would be a better route; but it would be an equally good one, and it would be less expensive to the country.

1321. In what way? You would not have the same number of miles to construct.

1322. But would it open up as much country? If you get a railway within 20 miles you may say that it would open up country.

1323. Is there anything else you would like to add to your evidence? Yes; we can grow lucerne enough in the district to supply New South Wales, and there is also good timber equal for building purposes to any American pine you can import.

1324. Do you think the dairying industry could be established here? You could not find better country for a creamery or dairy factory than about Lake Cudgellico.

R. Orr.
2 Oct., 1897.

- R. Orr.
2 Oct., 1897.
1325. You think that if you had facilities for reaching a great market like Sydney any quantity of dairy produce would be turned out here? Yes; it would develop into a large industry. I can show you a crop on land which has been cropped for seventeen years continuously, and you can see that the present crop is a very good one. I do not grow any wheat; but I grow hay for my own use.
1326. Have you seen the proposed Rabbit Bill? No; but I may say that I do not believe in fencing.
1327. Why? It is levying a tax on unfortunate people who are ruined by the rabbits; the man who gets all the profit—the business man—has to pay nothing.
1328. Have you fenced in your run? It is only partly fenced with rabbit-proof fencing.
1329. Is there not a clause in the proposed Bill in which it is provided that the Government should do this work at a moderate cost to the tenant? There is a clause in the Bill providing for the supply of netting at a certain percentage, but that clause is over-ridden by another clause; and you will find that the landowner is totally at the mercy of the rabbit inspector.
1330. How is that? He can order us to put on a certain number of men, and we may not have the means to pay them.
1331. Is it not a matter for the Board whom you assist to appoint? While one man is keeping the rabbits down, another will let them go wild through his holding. Again, supposing you are complying with the law, and you are employing five men every day, the inspector may ask you to put on an increased number if he chooses.
1332. Is it not a fact that for a long time you never put rabbit-proof fencing on your run? Yes.
1333. You allowed the rabbits to have their full fling? Yes.
1334. Where you not in favour of some legislation dealing with the rabbit pest? Yes.
1335. You are in favour of employing persons to kill rabbits? Yes.
1336. Who is going to pay for the work? You would levy a national tax.
1337. The rabbits are not so numerous as formerly? No.
1338. You have found lately that it is wise, after all, to erect rabbit-proof fencing? Yes.
1339. That it is easier to cope with them if you have fencing? It is the only way to cope with them on small holdings.
1340. If it is necessary for small holdings to be fenced, is it not equally necessary for large holdings to be fenced? If you let a holding of 50,000 acres, you are keeping the rabbits in that particular place. On a small holding you may cope with them by fencing; on a large holding you cannot.
1341. What is the area of your holding? 20,000 acres.
1342. How long has your lease to run? Twenty-seven years yet.
1343. How do you utilise your land? Principally for grazing. I have a little agriculture for my own use.

Ewan MacRae, selector, Lake Cudgellico, sworn, and examined:—

- E. MacRae.
2 Oct., 1897.
1344. *Mr. Fegan.*] You are a resident of the Lake Cudgellico district? Yes; I am a selector.
1345. Where is your holding? About 4 miles up the head of the lake, to the south.
1346. What is your acreage? 1,400 acres.
1347. What do you use the land for? For farming and grazing.
1348. How many acres have you under cultivation? About 14 acres. I have put in wheat for hay.
1349. How long have you been on your holding? About three years.
1350. So that you have had no opportunity of fully testing the capabilities of the soil? No; but I have resided in the district a long time, and have held other land here which has been transferred to my sons.
1351. How many years altogether have you been in the district? Sixteen years.
1352. Have you made experiments with crops during that time? Yes; in the way of growing hay.
1353. Have you put in any lucerne? I have put in a trial patch of lucerne, and it was splendid; we could grow any quantity of lucerne, I think.
1354. Does it pay you better to grow sheep than to grow lucerne? If we had a market in which we could get rid of our lucerne it would pay.
1355. Would not lucerne be as good as hay, less costly to grow, and more productive? I should prefer hay, it would be better for stock.
1356. Have you any idea of the proposed route from Euabalong to Condobolin? Yes. I do not know the other side of the river, near Euabalong, very well; but I have been on this side.*
1357. Have you anything to add to what other witnesses have said as to this side of the river? I consider that the land between here and Euabalong is really good for agriculture purposes.
1358. Do you know the country between here and Wyalong? Yes.
1359. Is it to be compared with the country between here and Euabalong? Yes; there is some country as fine as any in the district between here and Wyalong—in fact, I think it is the best part of the district.
1360. I suppose you are in favour of railway communication to Cudgellico? Yes.
1361. What line would serve the place best? I think the route which would serve the country best, and also this portion of it, is that from Temora or Grenfell: that route would open up the most country. It is a matter of indifference to this district whether the line comes from Temora or Grenfell.
1362. You are speaking now from a resident's point of view? And also from a national point of view. I know that such a line would serve good wheat country. They say that the Wyalong land is better than the land here, but I doubt it.
1363. You think that, from a national standpoint, a railway should go from Temora or Grenfell through Cudgellico to Hillston? I think that would be by far the best line.
1364. Have you anything to add to your evidence? I think it would be far better to take the line down the river than to take it through Yalgogrin. If you take it through Yalgogrin you will go through a lot of rough hilly country upon which people will not settle. If it passes through this good open country the land will be taken up, settlement will ensue, and there will be a better chance of getting rid of the rabbits. I believe that if we had a railway we should not require to do so much netting. Settlement would very soon get rid of the rabbits. It is of no use for a man to fence in 640 or 1,000 acres as things are now. He might just as well leave it alone.
1365. Have you fenced in any land? I have put up about 12 or 15 miles of wire-netting fence.

1367.

* NOTE (on revision):—I do not know the country, on the north side of the Lachlan River, further than Euabalong. The land from Cudgellico to Euabalong is really good land. I have been to Condobolin, on the south side of the river, and it is nearly all good agricultural land.

1366. What does it cost you a mile? Some of the netting alone costs me £34 a mile, and some a little less, but it is dear at present. The netting is a check, but you must be continually killing the rabbits within the wire netting, or they will become a great nuisance.

E. MacRae.
2 Oct., 1897.

1367. The recent drought has almost exterminated them? When I was coming in last night I saw a good many. Unless we get a railway I believe most settlers will leave the district; the rabbits alone will be quite enough to drive them out of it.

1368. With railway facilities you think there will be much additional settlement? Yes; a man came up from Berrigan the other day looking for land. He said he liked the look of the country as well as any he had seen; and that if there were means of getting the wheat to market he would settle down here at once. He also said that dozens of persons would follow him from the Berrigan district, but you cannot expect them to come into this back country to contend with the rabbits unless they have some means of getting their produce to market.

John William Denny, fisherman, Lake Cudgellico, sworn, and examined:—

1369. *Mr. Farnell.*] How long have you been engaged in your present occupation? This will have been my fourth winter; I spent three winters at Lake Cowal; this winter I have spent at Lake Cudgellico, not fishing so much as taking the fish to market.

J. W. Denny.
2 Oct., 1897.

1370. You are not a practical fisherman? No.

1371. How many fishermen are there at the lake now? Only five now. There were seven in all fishing, but not regularly.

1372. Are they all under your supervision? There are five working in one boat, three men and two boys.

1373. Are you licensed? One fisherman holds the license.

1374. But you all fish? Yes; we all draw the line.

1375. What is the mode of capture? We use a trawling net.

1376. What is the length of it? About 500 yards.

1377. What is the mesh? Four and a quarter and 4 $\frac{1}{4}$.

1378. Four and a quarter in the bunt? Yes.

1379. Four and three quarters in the wings? Yes; 4 $\frac{1}{4}$ was the mesh in the old net; the bunt is a new net.

1380. How much bunt have you? About 350 yards.

1381. Do you weight your ropes? Yes; we have a lead line.

1382. What is the area of the lake? I think it is about 2 miles by 3 $\frac{1}{2}$; the lake is very low now.

1383. You have not any knowledge of its having been greater in area? It has not been so within my own knowledge. I have been here only a trifle over three months. During that time I have taken away 13 tons of fish.

1384. How is the lake fed? It appears to be fed from the river.

1385. When there is a rise in the Lachlan, the lake is fed from the overflow? Yes.

1386. Can you explain to us what kind of bottom there is? There is a silty bottom, and there is a very hard bottom below that again. The silty bottom is of blue clay.

1387. It is that which gives the colour to the water? Yes.

1388. Have you noticed any patches of vegetable matter growing on the bottom? Not in the middle of the lake, but on the side of the lake there is some grass.

1389. Is there any portion gravelly? A little near the bluff.

1390. As to the mode of capture, do you trawl right on to the shore? We have done that, but we generally trawl right into the boat.

1391. Do many of your fish get meshed? A great many.

1392. What kinds of fish do you catch? Cod-fish or perch—some call them yellow-belly—silver bream and catfish; that is about all.

1393. Have you caught any fresh-water lobster or shrimps? No; I believe there are a few prawns, but they are not worth netting. There are any quantity of turtles.

1394. Do you make any use of them? No.

1395. You have caught no eels? No; there are never eels where there are codfish.

1396. What is the size of the fish? The largest cod we have would be about 28 lb. There is one fish I have not mentioned—the black bream; but they are very scarce. The size of the largest perch would be about 8 lb., and 10 lb. the size of the largest bream.

1397. All the fish you mentioned are edible and are sent to market? All but the silver bream; they are a bony fish. They are all very well for drying and salting, but it would not do to eat them fresh.

1398. You are sure you are not talking of a fish called the fresh-water herring? No; the fish to which I am referring is not at all like the fresh-water herring.

1399. In hauling your net into the boat as well as on to the shore, have you brought a number of fry in as well as the fish? No.

1400. They have escaped through the mesh? A 2 $\frac{1}{2}$ -lb. fish would pass through a 4 $\frac{1}{4}$ -inch mesh.

1401. Have you any idea when the cod-fish spawn? No.

1402. Have you ever seen any of the fry of the cod or bream in the lake? No; but I have seen them in Lake Cowal.

1403. It is quite likely they are there? No doubt they are there; but we are troubled by hordes of pelicans.

1404. I suppose you do not know at what time of the year the fish spawn? No; but it must be very shortly.

1405. What quantity of fish have you caught since you have been here? Thirteen tons.

1406. How have you disposed of them? We have sent them from here to Condobolin, Bogan Gate, Parkes, Orange, Blayney, Bathurst, Sydney, Young. When I first came here I had orders to send to the Fresh Food and Ice Company in Sydney, and also to the Ice Company in Newcastle.

1407. What is the average price obtained? £1 2s. 6d. per cwt.

1408. Is that net? No; I pay the freight. They travel at second-class rates—half parcel rates for breakable goods, or over 2 cwt. second-class goods to travel by mail train.

1409. How do you send them to Parkes, Blayney, Orange, and those places? I drive them to Condobolin, about 62 miles, and they are there put on to the contractors' train. They are transferred at Bogan Gate to the Government railway.

1410. How do you pack them? Some in cases, some in bags. For the longer journeys they are packed in cases. The cases are of an ordinary make; they are nailed down firmly, and the fish are packed in gum leaves, which are cool.

1411.

- J. W. Denny. 1411. Do you leave any apertures for fresh air to get through? We have not done so, but it should have been done.
- 2 Oct., 1897. 1412. What has been the condition in which the fish have arrived at market;—have you had any complaints? On one occasion some fish were sent in open trucks from Condobolin to Bogan Gate; they were lying in the sun for a time, and some of them on the following morning were not very good. But we have taken fish out on Tuesday morning, and we have received letters from Young on the following Friday stating they had arrived in splendid condition.
1413. Do you clean your fish before sending them away? No; we send them away just as they are.
1414. Would cleaning not materially assist in keeping them in sound condition? No doubt it would; but some of the fish will live eighteen hours after they have been taken out of the water. I have known codfish to live thirty-two hours out of the water, but codfish are the best of the fresh-water fish in this Colony. They are very firm.
1415. When you catch your fish by trawling do you send them straight away, or do you impound them? We impound them in a cage.
1416. How is it constructed? It is merely a frame with wire netting round it to allow the water to pass through.
1417. You find that answers your purpose, and that the fish will keep alive for a week? For a fortnight easily. I have had 210 fish in a cage 3 feet by 3 feet by 10 feet.
1418. You do not attempt to feed them? No.
1419. Have you caught any gravid fish while you have been here? Last week there were a few.
1420. Do you think it would be possible to transfer them to some water where there is at present no fish? That is a matter I do not understand.
1421. There can be no doubt that if fry were collected here they could be transferred to waters elsewhere on account of their tenacity of life? Yes.
1422. What natural enemies of the fish have you here? Principally pelican. There are very few black divers. Pelican will swallow a 5-lb. perch; they will come up and take fish out of the net.
1423. They are protected under the Game Act, are they not? I hope not, because we have been shooting them.
1424. Do you think it would be possible to devise a means of feeding the lake and maintaining a certain level all the year round? I think so, by constructing a weir on the river.
1425. Would it be an expensive piece of work? I should not think so, but I could not go into that matter.
1426. Have you noticed the lake becoming stagnant while you have been here? No.
1427. Have you noticed any disease in the fish since you have been here? No; I may have noticed a few parasites, but very few. You will not find them on more than about 1 in 150.
1428. Have you used those fish? Yes, certainly.
1429. Have you a copy of the Fisheries Act? I have.
1430. Have you studied it? A part of it.
1431. You know something of the Lake Cowal fisheries? Yes; I was there three winters. I was fishing a little, but I was chiefly engaged in taking fish away. I used to handle 23 cwt. a week.
1432. Where did you send them? To Cootamundra, Harden, Young, Grenfell, Parkes, Condobolin, Wyalong, Barmedman, and some went to Sydney.
1433. It is a much larger lake than this? It was.
1434. But owing to the drought it has diminished? Yes.
1435. How is it fed? Principally from the Bland Creek.
1436. What fish are found there? Black bream, perch, cod, and cat-fish.
1437. What means have you adopted for catching fish there? Trawling nets, drag nets, and gill nets; also lines for catching big cod-fish, called Jacob lines.
1438. What do you bait with? Frogs and swan gut.
1439. Have you noticed any fry in Lake Cowal? I have noticed small fish coming up near the edge of the creek.
1440. Have you ever known a fishery inspector to visit Lake Cowal or Lake Cudgellico? No; the police have authority at Lake Cowal.
1441. Were they specially appointed inspectors? No; they just examined the nets.
1442. While you were there did any of the Commissioners visit the place? No one came from the head office.
1443. No one made any inquiry of you while you were there as to the fishery? No; the police inquired about the nets on one or two occasions. If this lake were flooded from the river it would be a wonderful breeding-ground for fish, and if there were reasonable facilities for getting them away, instead of their being kept twenty-four hours in a dray, there would be work for 150 men on this lake and the neighbouring lakes in the catching of fish.
1444. For how long? They could be sent from here at any time if there were railway communication to Sydney or to Melbourne.
1445. You fish only in the winter months? That is the only time we can carry them. They can be carried to Wyalong or Condobolin, but from Condobolin they have their own supply in the summer, although not in the winter.
1446. You catch them more readily in the summer time with a line than in the winter? Catching them with a line is waste of time.
1447. Do they not hibernate? No; but it is more satisfactory to use the net. This is a beautiful lake to fish in—there is scarcely a snag; it is not at all like Lake Cowal.
1448. What is the depth of your net? About 8 feet.
1449. Can you tell the Committee anything which would justify a railway from Condobolin to Euabalong? I think the fishing industry alone will be a great source of railway revenue. It would employ a number of men who will be sending fish away to all parts. The place would also be a sanatorium, and there is no doubt about there being good agricultural country here.
1450. But if the lake is to be recognised and appreciated as a sanatorium it will be necessary to construct a weir across the Lachlan to keep a permanent level in the lake? Yes.
1451. You think the lake would be a good breeding ground for fish? Yes; I have been struck by the exceptionally good quality of the fish.

MONDAY, 4 OCTOBER, 1897.

[The Sectional Committee met at the Homestead, Uabba, at 3 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

THE HON. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

George Logne Dickson, pastoralist, Uabba, sworn, and examined:—

1452. *Chairman.*] You are the owner of Uabba station? Yes.
1453. How long have you been resident here? Off and on I have been resident here for twenty-five years.
1454. So that you would have a good knowledge of the district and its capabilities? Yes.
1455. You are aware that the Committee are inquiring into the proposed extension of the railway from Condobolin to Euabalong? Yes.
1456. Are you in favour of the proposed extension? I am in favour of it.
1457. But I suppose you are not of opinion that the railway should stop at Euabalong? No.
1458. You do not think the Government would be justified in constructing the line to stop at Euabalong? No; there would be no object in having the terminus there; the benefit accruing would not be sufficient to justify the construction.
1459. You know that it is estimated that there would be a loss upon the extension of about £3,500 per annum? Yes; I am certainly of opinion that the extension could not stop at Euabalong.
1460. What is your idea of the country through which the line would pass? For the first 25 miles the country is fairly good; and from that point it is only good immediately on the banks of the Lachlan. The back country is bad; it is mallee scrub, and is infested with rabbits and dogs.
1461. Is that country still held under pastoral lease? Yes.
1462. Do you know what is being done with the resumed areas? I think there are some homestead lessees on the resumed area of Gunniguldrie. I fancy a considerable area of the country out that way has been abandoned.
1463. You know, so far as the leasehold areas in the western divisions are concerned, there will be no possibility of close settlement upon them for twenty-one years? Quite so; not until the termination of the present leases.
1464. As to the country on the southern side of the river coming from Euabalong, the suggestion has been made that the railway should cross the river at Erribenderry? It would be more expensive in construction, owing to the flooded country and the bridges which would have to be made.
1465. You think that would be an expensive line to construct? Yes.
1466. Although the country might be better back from the river? Yes; it would open up country in the Central Division.
1467. Where considerable areas of land would be available for settlement within the next two or three years? Yes.
1468. Have you any idea as to the best route for a line to follow on the southern side of the river with a view to the development of the country? I should say that the line ought to cross at Condobolin; that it ought not to come down on the other side of the river at all. It should be in the Central Division all the way; it would open up more country. There would be a few creeks to be crossed, but you would have to keep well out from the river. The lakes extend a good way out; in fact, there would be a good deal of difficulty in connection with the lakes. You would either have to keep wide out from the lakes or well on to the river. I think you would have a good deal of engineering difficulty in getting down to Hillston owing to the flooded country and the creeks. I do not know that there would be any very great extent of country open for occupation.
1469. Most of the land is freehold? Yes.
1470. Assuming Hillston to be the objective point, should it be approached from Koorawatha or from Temora? A line through Koorawatha would, I think, be the most direct line to Sydney. It would shorten the route and open up a lot of Bland country, which is really very good. It would also open up a lot of unoccupied country at Cowl Cowl, Naradhan, and Conapaira, which is all arable land if it were cleared.
1471. The quality of the land is good? Yes.
1472. Do you think that if that land were made available for settlement it would be occupied within a reasonable period? Yes. The only drawback to occupation would be the small rainfall. I think it is doubtful whether a railway would pay for many years to come.
1473. What has been your experience of settlement in this district? It has ended in disaster almost invariably to every one, with the exception of some small holders who have gone in for wheat cultivation alone. They supply local wants up to a certain point, but they are at a loss to know what to do with the surplus wheat. There is a number of selectors round about Hillston who have grown wheat and who have supplied the local mill, but beyond a certain point the mill of course cannot take the wheat.
1474. And they do not know what to do with the surplus? Quite so. It is not every year that they have surplus wheat. When they have, of course it would find its way to the seaboard by the cheapest route.
1475. Have you any idea of how many crops they could rely upon in a period of, say, seven years? They could rely upon, say, five.
1476. So that even if they missed a couple of years, if they had a good surplus and means of getting it away at a reasonable rate of carriage, they would still be in a good position? Yes.
1477. I suppose a railway from Koorawatha, through Grenfell and Wyalong, and Monia Gap to Hillston, would serve a tract of country at least 25 miles on each side? I think it would serve 25 miles on the south side and fully 50 miles on the north side.
1478. Do you think the construction of a railway as far as Hillston would secure any traffic which now goes to Victoria? I do not know of any traffic in the way of wool between here and Hillston which goes to Victoria.

G. L.
Dickson.
4 Oct., 1897.

G. L.
Dickson.
4 Oct., 1897.

1479. Do you know the country west of Hillston? I know a good many settlers down there. I think that nearly all the wool from 25 to 30 miles below Hillston would go to Sydney, but when you get as far as Mossgiel the wool would generally go to Melbourne.
1480. The traffic from Mossgiel and Ivanhoe has generally gone to Victoria? The goods, so far as I know, generally come from Sydney. The rebate which applies to wool does not apply to goods.
1481. Do you think there would be a possibility of diverting a good deal of wool traffic to a line at Hillston, providing the Government offered advantages to wool-growers corresponding to those which are offered to them by the Victorian Government? Certainly.
1482. Traffic will naturally gravitate to the point where the cheapest mode of conveyance exists? Quite so, and differential rates would ensure that in this case.
1483. Have you any knowledge of the mineral resources of the country upon the route you mention? No; but all the country between here and Wyalong is more or less auriferous. As to whether the ground is payable or not, I cannot of course say.
1484. What would it cost to clear the country fit for the plough, as a rule? From 10s. to £1 an acre on the average.
1485. Are you including the mallee? I am taking the general average.
1486. You do not think the share system is likely to be adopted by freeholders in bringing the land under cultivation? No, the share system can be applied with advantage only in cases where all the land is alienated, and where land is not available in large areas.
1487. You think that where Crown land is available the share system will not be resorted to? Yes, and for cultivation under the share system you want a regular rainfall.
1488. Do you think there is much probability of settlement in this district by Victorians and South Australians when it is known that a railway is to be constructed? If the land were offered by the Government on fairly advantageous terms I am sure a number of South Australians and Victorians would come to the Colony.
1489. For the reason, I suppose, that they have worn out their own holdings? Yes.
1490. Having followed the occupation of farming so long they would not care to embark in anything else? Quite so; and being accustomed to a dry country they know what they have to face.
1491. Having had experience of a similar climate in their own colonies they will not be at a disadvantage in dealing with the land here under similar conditions? Yes; as long as the ground would stand the working.
1492. I suppose one advantage to them here would be that they would be able to obtain land in larger areas, and would therefore be able to crop certain areas in succession? Yes; there is no doubt that large areas of land here could be cleared, and worked at a profit, if the Government would lease it on reasonable terms. In that case it would be worth while to develop and improve it.
1493. Having regard to the growing importance of Hillston as a distributing centre in the Lower Lachlan, and the probability of the development of the district year by year, you think the construction of a line by the route you have suggested would be justifiable? Yes; it would help to develop an enormous area of land which is now valueless. It would be of advantage to the country in this way—that it would open up a large area of unoccupied country and promote settlement; but it would not immediately pay.
1494. You think the chances are in favour of the line paying ultimately? Yes; I think it would eventually pay on account of the settlement that would follow.
1495. What is the cost of rabbit-proof fencing? You would want 1½-inch mesh, 42 inches in depth, and 17 gauge. The cost would depend upon the price of netting in Sydney.
1496. What does your netting cost? I am erecting a fence with posts 14 feet apart, three wires, netting 1½-inch mesh, 42 inches in depth, and 17 gauge at, say, £55 a mile.
1497. What is the size of your holding? I have altogether 112,000 acres of leasehold and 40,000 acres of resumed area. The resumed area on Uranaway, my holding on the north side, is thrown up. The 40,000 acres is on Uabba. We carry 20,000 sheep now; we used to carry 70,000.
1498. What is the cause of the reduced carrying capacity? Rabbits, pine scrub, and bad seasons.
1499. If you got a few good seasons, I suppose you could stock up again? Certainly; we are not much more than half stocked.
1500. What would be your carrying capacity in a succession of fair seasons? About 50,000, if we had fair seasons and no rabbits.
1501. You have been in the habit of sending produce to Sydney for some years, and getting stores back;—what do you pay? Thirty shillings a ton to Condobolin, road carriage; and the railway carriage just now is, I think, £3 18s. 6d. That includes the contractor's rates from Condobolin to Bogan Gate.
1502. Where did you send your wool previous to sending it to Condobolin? To Whitton. The cost of road carriage that way was £3 a ton, and the railway carriage £3 4s. 8d. a ton. That is the greasy rate in both cases. The scoured rate is about 19s. a ton higher.
1503. You sell your fat stock locally? Yes.
1504. If there were a railway here you would send a quantity of it away? Yes.
1505. But at present your operations are confined to wool-growing? Yes.
1506. Do you think a railway would be of any service to you in getting stock away in dry seasons? No; I do not think so.
1507. What is your average rainfall? About 17 inches. It has been as high as 24 inches, and as low as 8 inches.
1508. Your experience extending over a considerable period has proved that you cannot grow fruit and vegetables successfully without irrigation? Quite so.
1509. What expenditure do you incur annually in your endeavour to cope with the rabbit pest? From £200 to £400 a year. In five years I expended over £4,000 in rabbit destruction. That was in the early period of the rabbit invasion. We killed as many as 25,000 rabbits in a 600-acre paddock in three weeks. That was in the year 1891.
1510. Is the pest decreasing now? Yes; owing principally to the drought. You can hold them in check; you cannot exterminate them.
1511. So many having died during the late drought you think you will be able to hold them in check for some time to come? Yes.
1512. Do you think small holders will be able to cope successfully with the pest? Yes; and there will be this advantage—that they would take up unoccupied areas, which in the winter time are breeding grounds.

Closer

Closer settlement would be a national benefit from that point of view. There are large unoccupied areas here, which at the present time are simply breeding grounds for rabbits and dogs. G. L. Dickson.

1513. Taking the average of the country right through from Wyalong to Hillston, what would be a fair area for a man to hold? You cannot make a living unless you have a pretty considerable area, and then you must not owe any money upon it. You must have the land free and keep it free. I should say that with a thousand acres, a man ought to be able to make a very good living. 4 Oct., 1897.

1514. You think a thousand acres would support a man and his family comfortably? Yes.

TUESDAY, 5 OCTOBER, 1897.

[The Sectional Committee met at the Hunthawong Homestead, at 8 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condooblin to Euabalong.

Alfred William McPherson, manager, Hunthawong and Willandra Stations, sworn, and examined:—

1515. *Chairman.*] You are the manager of Hunthawong and Willandra? Yes. A. W. McPherson.

1516. What is your area? 155,000 acres. 5 Oct., 1897.

1517. You gave evidence before the Sectional Committee which inquired into the question of railway extension from Condooblin to Broken Hill? Yes.

1518. You confirm the evidence you gave on that occasion? Yes.

1519. *Mr. O'Connor.*] How long have you been managing these stations? Nearly seven years.

1520. Do you know the route from Condooblin to Euabalong and the route from Wyalong to Hillston? I only partially know the Wyalong route.

1521. By which route do you think the railway should be taken to Hillston? I am of the opinion I expressed before. I consider that a line should come from the direction of Grenfell through Wyalong straight to Hillston. That line would divide up one of the best grain-growing districts in the Colony. From what I know of this end and from what I can learn of the capabilities of the land at the other end I should say it was as good a tract of country as there is in the Colony. I do not at all approve of the other route. To the north of Euabalong there is no land to speak of. You might get a thousand acres of agricultural land here and there. The rest is all granite ranges—that is towards Erimeran, and in fact right through to Nymagee.

1522. You are well acquainted with that country? I have been through it.

1523. And your practical knowledge in these matters enables you to arrive at a fair conclusion? Yes.

1524. How long have you been engaged in pastoral pursuits? I was born on a station.

1525. You know the route by way of Wyalong? I know this end from Merrigal and Naradham; right down to Hillston it is all fine agricultural land.

1526. A line by that route would open up very valuable country, and would induce a large amount of settlement? I have no doubt of it.

1527. It would also lead to the further improvement of existing holdings? Yes.

1528. Have you, on your holding, land suited for agriculture? Yes.

1529. If a railway were constructed to Hillston would you be inclined to grow cereals? Yes; on this side it would be better than growing wool. It is decidedly a grain-growing, and not a wool-growing, country.

1530. Is not the land on the northern side suited to agriculture? Not so much on the northern side. I have about 130 acres of crop; you require a good deal of rain to grow a crop here.

1531. What is your rainfall? Sixteen inches.

1532. It would be enough for cereals? Yes; they grow splendidly on this red soil on the southern side.

1533. *Mr. Farnell.*] I suppose you have not grown for wheat but simply for hay? Yes; just for station use.

1534. Are you much troubled by rabbits? We have been, but there are hardly any now.

1535. You are gradually getting rid of them? Yes; but the keeping of them down requires constant attention. If you follow a certain system you can keep them in check.

1536. To what market do you send your wool? To London *via* Melbourne.

1537. If a railway were constructed to Hillston, would you be inclined to send your wool to Sydney? It would go to Sydney. All our fat stock would go there also. The railway would also be a valuable outlet for sheep in bad seasons.

1538. A railway would be the means of saving thousands of stock, which, under present conditions, would die here in time of drought? Yes; we should use a railway for that purpose if it were here, as would a good many men to the north of us.

1539. The land on the route you have described to the south is all Crown lands? Yes, I think so.

1540. How far would a line passing through Monia Gap be from you? About 15 miles.

1541. It would bring a good many properties along the river within a convenient distance of railway communication? Yes; we should all be in touch with it.

1542. Do you think the construction of a line to Hillston would divert any of the traffic further west which now goes to Melbourne? Yes, I think so. You would get a lot of traffic from Ivanhoe and Mossgiel. Beyond Mossgiel it would go to the Darling.

1543. Where does the traffic coming through Ivanhoe and Mossgiel go to now? Some to Hay and some to Balranald. All to the north of Ivanhoe goes to the Darling at Wilcannia.

1544. That portion of the traffic which now goes to Hay would come in this direction? Yes; I think the traffic which the Euabalong line is supposed to attract would all come to the line I have suggested. The Mount Hope and Coan Downs traffic would all come this way. I do not see where else it could go to.

A. W.
McPherson.
5 Oct., 1897.

1545. What sheep does your station carry? We have shorn an average for the past four years of 43,000, including lambs.
1546. What is your average clip? We have averaged 618 bales for four years—1893, 1894, 1895, and 1896—that is, greasy wool.
1547. What is the rate of carriage through to Melbourne? £5 a ton.
1548. You cannot tell us what the Victorian railway charges are? We go to the Murrumbidgee at Carrathool and we touch the railway at Echuca. I cannot tell you what rate is charged from Echuca, because we pay a lump sum.
1549. You think a line *via* Monia Gap would be the best from every point of view? Yes; it would be a straight cut to Sydney. During the past four years we have sold in Sydney and Melbourne 9,500 fat wethers. If there were a railway here they would all go to Sydney.
1550. One advantage of a railway would be that you would be able to send away small lots of stock? Yes.
1551. Where do you get your stores? From Hillston.
1552. What do you think of the district as a fruit-producing district? We can grow fruit here readily enough.
1553. Is it a good district for hay? It will produce splendid crops of hay and lucerne.
1554. Do you grow grapes? Yes, in a small way, and they do very well.
1555. Is the district a good dairying district? I have had no experience in dairying. All this red soil will grow lucerne splendidly, and that would be good for dairying purposes.
1556. What do you think it would cost per acre here to put land in order for the plough? It is hard to say—the timber varies very much. As a rule, the country could be easily cleared.
1557. Is there anything you can add to your evidence? In February last, if we had had railway communication here, we could have got 7,000 fat wethers to market profitably, whereas we had to sell them as stores locally, and I suppose it meant a difference of £400 or £500.

Alexander Cumming, homestead lessee, Tocabihl, sworn, and examined:—

A. Cumming.
5 Oct., 1897.

1558. *Chairman.*] You are a homestead lessee at Tocabihl? Yes; that is the name of my holding.
1559. What is your area? 10,240 acres.
1560. What is the total area held by yourself and family? In the Western Division 14,000 acres, and in the Central Division 2,300 acres.
1561. You have resided in this district for a considerable time? Since 1871.
1562. *Mr. Fegan.*] You gave evidence some time since before the Sectional Committee which inquired into the construction of a railway from Condobolin? I did.
1563. Have you anything to add to that evidence? Very little, except that I agree with Mr. McPherson that we do not think so much of the rabbit difficulty as we did. We can see our way clear to keep them down if everyone will keep at them. When you were here last they were a serious trouble, but good work has since been done by Mr. McPherson and other residents of the district. They have set an example to others, and to a certain extent the pest has been got under.
1564. What about the resumed areas? I cannot say much of the Crown as a neighbour.
1565. You think that if the Crown kept its land clear there would not be much difficulty in connection with the rabbits? Not the slightest, if the Crown did its share of the work.
1566. What timber have you? It is pine and yarran country with box on frontage.
1567. The soil is fairly good, I suppose? Fairly good. About a third is black soil, and the rest is red. The red soil is better for agriculture. I like the black better for pasturage.
1568. You think the red soil is better for agriculture? Wherever the country is timbered with pine, as a rule, you may say that the land is good for agriculture; that has been my experience.
1569. Have you any land under crop? I have 20 or 30 acres in for hay.
1570. What number of sheep have you? Seven hundred now. I have been dealing with cattle, and I have only just commenced with sheep again.
1571. Have you any cattle now? I have 200 head of large stock.
1572. We know you have been passing through a severe drought;—I suppose if the seasons were more regular you would farm more? Undoubtedly. The effects of the drought were intensified by the scourge of rabbits. What would have been a fairly good season was turned into practically a drought by the ravages of the rabbits.
1573. You felt the drought more severely than you otherwise would have done on account of the destruction by rabbits? Certainly.
1574. Has the price of wool increased since you were here? It might have been 5 or 10 per cent. better.
1575. You know the proposal before the Committee is to construct a line from Condobolin to Euabalong? Yes.
1576. Do you approve of that proposal? It is better than having no railway at all. Every mile nearer the railway gets the better.
1577. Do you think it would be wise to retain the terminus at Euabalong? That would be absurd; the railway cannot stop there; it must come on.
1578. Are you acquainted with the surveyed routes from Condobolin to Euabalong, and from Wyalong to Hillston? I know the country through from Condobolin to Euabalong, and from Hillston as far as 20 miles on the other side of the lake. I know the country about Rankin's Springs well.
1579. What is your opinion of the merits of the two routes? I certainly think the southern route would traverse the best agricultural land if it went from Wyalong to Hillston, *via* Yalgogrin.
1580. You know the country at Rankin's Springs, you say? Yes; Rankin's Springs is too far to the south for a line, because you would get towards the rough country. I think the line should come more into the valley of the Lachlan, and closer to Cudgellico.
1581. You do not think an extension from Euabalong would best serve the district? It would help the people of Cudgellico, but if you left the line at Euabalong it would be a great mistake. There is the Hillston district to be considered.
1582. Do you think there is any prospect of a line to Hillston by the route you suggest paying? Yes, it would open up an altogether new wheat-growing province.
1583. Where do you sell your stock? I sell them locally. I have 120 lambs now, and I cannot send them away because they are too small a lot; if I had a railway within 20 miles I could, of course, send them

- them away. As matters stand, I shall have to wait until some neighbour is sending stock to market. If we had a railway within a reasonable distance I would cater for the lamb trade; I would try growing early lambs. At this time of year you could put more stock on; there would be plenty of grass to fatten them. At present the grass is simply going to waste. There is another consideration—we are cut off entirely from any market to Sydney in time of drought. Some of the homestead lessees in the late drought were well off and had fat stock, but they had to keep them; they could not get them away.
1584. Stock having to travel so much of late in dry seasons when there has been so little feed they have depreciated in value? Yes.
1585. It has not been worth your while to send them away? We could not if we wanted to. If you could get them on to a truck within 20 miles matters would be altogether different.
1586. You think then that the construction of a line to Hillston would develop a trade in fat stock which does not now exist. Yes.
1587. There is almost invariably a good market in Sydney and Melbourne for fat stock? Yes. Whenever the Sydney market was good I should take advantage of it.
1588. Do you know whether the route you have suggested is through Crown land or through alienated land? Nearly all of it would be through Crown land.
1589. Do you think that if such a railway passed through alienated land the owners would give the land required for the line? I should think so; they would be fools if they did not.
1590. You also think that a railway would induce settlers in this district to increase the area under cultivation? Yes; if I were sure of a railway coming within 30 miles of me I would put at least 500 acres under wheat; at the present time the road carriage would kill the profit.
1591. What would be a reasonable price for you to expect from wheat? Anything over 2s. would be profitable; 3s. would give a handsome return; in fact, I do not know of any better investment at that price. At the price at which wheat is selling now it would be a very good investment.
1592. What would it cost to get the land ready for the plough? From what I can hear from farmers the average cost would be about 3s. 6d. Of course, many of them would put in their own labour, and then the cost would be still less.
1593. How much would it take to sow and to strip with the latest machinery? With stump-jumping ploughs and strippers the cost would be about 8s. an acre; that would include seed; of course, if you grow your own seed you could do it for less.
1594. You think that under those circumstances railway construction would add largely to wheat growing in the district? I consider that it would become one of the finest wheat growing districts in Australia.
1595. We should soon supply our own market? Yes; and do very much more.
1596. Do you know of any cultivation on the halves system in this district? I know of none nearer than Berrigan.
1597. I suppose there is no probability of that system being resorted to as long as there is so much Crown land available? With railway communication, and with land as cheap as it is, no man would be content with a half, seeing that he could get the whole.
1598. You, therefore, look forward to close settlement in this district? Yes, all the halves men would leave the districts where they are now farming and farm here on their own account. I had a conversation with one of them the other day who came up here to look at the land. He came from Berrigan, and he said that if he were sure of a railway to Euabalong, and if he could get within 20 miles of it, he would settle down here; he considers this land superior to the mallee land in Victoria, where the wheat is the staple product.
1599. You have 16 inches of rain? Yes, an inch more than in the mallee country in Victoria.
1600. You have been here all your life-time? Twenty-six years.
1601. You can speak with regard to the whole district? Yes; I do not like the river-flats for agriculture. Farming would succeed very much better on the red soil.
1602. *Mr. Farnell.* Can you tell us whether the construction of a series of weirs on the Lachlan would be of any advantage to settlement in this district? I cannot see that any advantage would result, except to those on the creeks, and then weirs would not do much permanent good unless a regular flow in the river was maintained. The weir up here had not 4 miles of standing water behind it last year. The weir, 4 miles above any place, turns water down the Willandra Billabong, and while the river is running does an immense amount of good; but last year the river stopped running, and it was only backed up by the weir for about 4 miles, which would only water from 2,000 to 3,000 sheep.
1603. Would the weirs not back the water in the Lachlan as well as in the tributaries? A succession of weirs would do so, but that would be too costly; I suppose the weirs would cost an average of £8,000 each.
1604. You know that a good deal of traffic goes from Hillston towards Victoria? Yes.
1605. Do you think much of that traffic would be diverted to Sydney if there were a railway to Hillston? Certainly. People would send the traffic wherever it could be sent most cheaply; for instance, 2s. 6d. a ton would sway them; I am sure that from 4,000 to 5,000 bales of wool per annum would be diverted from this district to Sydney.
1606. What is the average return from wheat in this district? I think about 14 bushels.
1607. Do you think that at the price of 2s. 6d. or 3s. a bushel, and a return of 14 bushels to the acre, the crop would pay well with railway facilities? Yes; I do not think you could find any better investment.
1608. What is the quality of the wheat? It is very well spoken of; it is small wheat, but it is very thin skinned, and the millers say there is very little offal in it.
1609. Can you suggest any other crop which could be profitably grown here, and which would be a source of revenue to the railway? I have been advocating that experiments should be made. Mr. Campbell, of the Department of Agriculture, is now here making inquiries. I think that if there were an experimental farm upon this red country, it would be found that plenty of other things besides wheat could be grown; but we want to be shown how to grow them. The Wagga Wagga Farm has been a great object lesson; but Wagga Wagga has 23 inches of rain, and here we have only 16. I think if a series of experiments were carried out here on a farm, they would teach us a great deal. The Wagga Wagga Farm has shown, among other things, how it is possible to use less wheat for seed, and get as good a return; and you will see at once that in an important matter of that kind it is highly desirable to avoid waste.
1610. You think traffic would be created in hay and straw if it could be shown to be a profitable growth? Yes; if it could be carried to the seaboard to a market like Sydney.

A. Cumming.
5 Oct., 1897.

- A. Cumming. 1611. Have you made any experiments in fruit-growing? I do not think fruit-growing could be carried on without irrigation, unless in very favourable spots.
- 5 Oct., 1897. 1612. With what results have you grown vegetables? They will grow; but they have to be well watered.
1613. Upon what area do you think a man could make a living from agricultural pursuits? From not less than 640 acres.
1614. It would be necessary for him to combine pastoral pursuits with agriculture? I do not think so; he would want nothing beyond the plough here.
1615. You do not seem to think that mixed farming could be carried on here successfully? Yes, it could, because on a large station they could profitably grow wheat and use up the straw; there would be two classes of country.
1616. To what station does your produce go now? The little wool I have goes to Sydney *via* Carrathool; but it is nothing worth speaking of yet.
1617. Supposing it were anticipated that a great loss would accrue from the construction of a railway by the route you suggest, do you think there would be any objection to local rates to meet the loss? No; I think not. The loss upon the railway would exist only for a year or two, until the country got settled.
1618. Even during that time the main lines would derive such benefit from the extra traffic that you think that the temporary loss ought not to be considered? I think not.

Walter Scott Campbell, Chief Clerk, Department of Agriculture, sworn, and examined:—

- W. S. Campbell. 1619. *Chairman*] You are Chief Clerk in the Department of Agriculture? Yes.
- 5 Oct., 1897. 1620. You have recently come from the Hillston district? Yes; I have passed through it in coming from Hay.
1621. You have had an opportunity to examine the soil through that district? Yes.
1622. You have also an extensive knowledge of the different soils of New South Wales and the adjoining colony? Yes.
1623. For how many years does your experience extend over? I have been reporting for the Department for about eleven years.
1624. As to the establishment of experimental farms? Yes, and on the state of the farming industry in various districts.
1625. Will you give the Committee an opinion as to the soil round about Hillston, and the possibility of the land being profitably occupied by agricultural settlement? From careful inquiries I have made about Hillston, and also at Hay, I have come to the conclusion that Hillston will become a very important centre, particularly for wheat-farming. My idea is that wheat can be very profitably grown in the district—that the soil is very suitable for it. The average rainfall here is about 16 inches, I think, and under those circumstances wheat ought to succeed very well, provided rain falls at suitable periods. I am also under the impression that fruits could be grown here if they were properly attended to. I have not seen a single orchard in which any attempt has been made to cultivate it properly. I think in many parts fruit could be grown without irrigation if it were worked on the same principle as are the fruit trees in the orchard at Wagga Wagga. That is what we call a dry district, although they have had much more rain there than here. Notwithstanding that, I think a great many fruits would grow well; for instance, figs, apricots, peaches, and grapes. I also think that fruit drying might become a very important industry here.
1626. What do you think about wine-making here? I think it is rather warm for wine-making.
1627. Do you think grapes could be grown here and dried for raisins? I think they would do admirably. They do not seem to be cultivating the land about here, from inquiries I have made, in the best way in which it could be cultivated; and when this is understood, I think the farms might be made much more profitable than they are at present. I also think that on a 640-acre selection they could combine a certain amount of sheep-farming with cultivation. There seems to be a good deal of land taken up now about Hillston and round about Gunbar. A great deal of wheat-growing is carried on there, and the farmers seem to be doing very well indeed, especially this last year. Of course, the price of wheat has been rather higher than usual, and higher than we might expect it to be in the future.
1628. You think the soil is of such a nature that they will be able to cultivate it properly for many years to come? Yes; they seem to be only scratching the surface with stump-jump ploughs now. In many instances they have not taken out the roots; they merely cut the trees down level with the surface of the ground and use stump-jump ploughs, and this is, of course, a very primitive means of cultivation. Of course, many men go on to the land without sufficient capital, and they do the best they can under the circumstances; but that state of things will improve in future.
1629. Do you think that if better means of communication were afforded the district, largely increased settlement would ensue? I have no doubt whatever about it.
1630. You think the possibilities of the district are of such a nature that many persons will be induced to settle here? Unquestionably.
1631. Do you think the opening up of this country would attract a farming population from South Australia and Victoria? Yes.
1632. More especially if the farmers were assured of railway communication? Of course; that is a very important consideration.
1633. Do you know whether, as a matter of fact, the farm land in South Australia is becoming poorer through continual cropping? I believe the returns are very poor indeed. Of course, they have had dry seasons. I think the returns have run as low as 5 bushels per acre for some time.
1634. And you think it likely that persons would get away from land of that description if they thought they could get land which would give them a much better return in this Colony? Yes; I do not think they have any idea of what a beautiful district this is. I must say that I am very much pleased with it; it is much better than I thought it was. This is the first time I have been here.
1635. You are so favourably impressed with it that you think its prospects of advancement are remarkably good? Yes.
1636. You think from what you have seen of the district that the Government would be justified in extending the railway to Hillston? Most undoubtedly.
1637. Although the line might not pay at the outset, you think it might pay in a few years? I imagine it would.
- 1638.

W. S.
Campbell.
5 Oct., 1897.

1638. Does the district remind you in any way of the Moree district? A good deal in some parts.
1639. *Mr. Farnell.*] In your opinion, the settlement of people upon the soil would to a large extent compensate for any loss which might accrue for a few years after the construction of a railway? Yes.
1640. Have you taken any interest in the question of water conservation? A good deal.
1641. Do you think the construction of a series of weirs on the Lachlan would be of much use in assisting settlement? Yes, I think so. A lot of the red soil runs pretty close to the river, and it might be advantageous to run water on to it. Of course pumping would be an expensive work, and if you could obtain the water by gravitation it would be an immense saving. Still, I think it might be profitable to make use of the water. At Mildura, where pumping is far more expensive than it would be here, they have three sets of pumps, one above the other. Here you would not need more than one, if the weirs brought up the level of the river pretty high. I think fruit-growing by irrigation could be carried on profitably. This would be an admirable district for the growth of the citrous fruits.
1642. Given the advantage of railway communication, you think it would pay to cultivate fruit, and to use some fertiliser, perhaps? I do not think there would be any occasion to use any fertiliser for many years to come. It might be advantageous to use it at some future time, perhaps.
1643. Have you any idea what it would cost per acre to clear the land fit for the plough? I have been making inquiries about that. If the work were done systematically I believe it would cost from 8s. to 12s. per acre. I do not say that all of it could be done at that cost, but a good deal of it certainly could.
1644. With regard to the pine country, what would that cost? I should think it might be done from £1 to £2 per acre. The price I gave you just now would be for the box country.
1645. Even with that outlay, you think that, having regard to the liberal provisions under which the land could be taken up, fruit-growing might be made a profitable industry? Yes; even supposing the expenditure for the thorough clearing of the land were a little higher than that which I have given. A lot of land is wasted at present by the leaving in of the stumps—especially in the thickly-timbered pine country.
1646. I suppose that in the course of your investigations you inquired whether wheat would be subject to rust here? I do not think it would be in this dry district. It is not at all like rust country; but there are wheats which are rust-resisting which could be grown well here even if rust did come. There are certain kinds of wheat which are very much in vogue now, and which millers are very anxious to obtain. I think experiments might be made to test the varieties of wheat, which might be grown as they are doing at Wagga Wagga now. We have some hundred kinds of wheat under test there, and the kinds most suitable for the climate are being selected and grown on a very large scale, and distributed. We have a great demand for seed-wheat there—even at the rate of 7s. 6d. per bushel the whole of it goes off without any difficulty. In the year before last we had orders for seed wheat amounting to £15,000.
1647. Did you execute the order? No; we had not the necessary area under cultivation.
1648. Would your remarks as to the growth of wheat here apply equally to oats and barley? No; oats are not likely to succeed well. It is too hot; barley could be profitably grown, but it would require very good and careful farming.
1649. Do you think lucerne could be profitably grown? I think in some places it could be cultivated very profitably.
1650. You think the growth of fodder for ensilage might be carried on? Yes. I think sorghum would grow well if it were properly looked after; and that makes splendid ensilage.
1651. Your opinion is that without the advantages of a railway these developments would not be likely to take place? That is my opinion.
1652. *Chairman.*] Judging from the observations you have made, you think your Department would be justified in establishing an experimental farm in this district, with a view to the education of the people here as to what they can most profitably grow? Most decidedly.
1653. You think the resources of the district are so great that the Government would be quite justified in going to the expense of establishing an experimental farm? Yes; it is my intention to recommend a site here.

WEDNESDAY, 6 OCTOBER, 1897.

[The Sectional Committee met at the Court-house, Hillston, at 3 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Thomas Kennedy, Surveyor, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1654. *Chairman.*] You have recently examined the country lying between Wyalong and Hillston? Yes. T. Kennedy.
1655. You have prepared a report dealing with your exploration? Yes; I have a report dealing with the nature of the country and the probable cost of the line. I have marked the explored line in red pencil upon the plan before you. You will see that it runs almost due west to Hillston from Wyalong, via Rankin's Springs. My report is as follows:—

DIRECT LINE OF PROPOSED RAILWAY FROM WYALONG TO HILLSTON.

Direction of line and description of the route.

Commencing from the centre of the township of Wyalong east, running slightly to the north of a due west line passing Wyalong homestead at 14 miles; thence in the same direction passing 2 miles to the north of Yalgogrin station at 23 miles; thence bearing almost south-west and running to the north of Yalgogrin township at 26 miles; thence bearing nearly north-west and crossing the range at 32 miles dividing the waters of Humberg and Mirrool Creeks; thence bearing a little to the south of west at 44 miles, being about 3 miles south of Malongla station; thence on to Rankin's Springs at 58 miles. From here the line follows the stock route in a north-easterly direction to about 67 miles; thence along the same route in a westerly direction to the Tin Hut or Milbergen Range at 77 miles; turning thence to the northern end of that range and to the south of the Lachlan Range which dies out; thence on to a low gap in the Waverly Hills at 85 miles; from thence in a north-westerly direction into the town of Hillston at 112 miles from Wyalong.

Probable

6 Oct., 1897.

T. Kennedy.

6 Oct., 1897.

Probable cost and nature of works.

From Wyalong to Yalgogrin homestead 23 miles of easy country could be constructed as surface line. Twenty-three miles at £2,200 per mile.

From 23 miles to 35 miles crossing the Dividing Range the country is slightly undulating, and a few cuttings would be required, also one creek to cross requiring about ten 14-foot openings. The range is crossed at an easy gap and would not require a cutting more than 3 or 4 feet. The probable cost of the 12 miles at £2,300 per mile.

From 35 miles to 55 miles the country is almost dead level, and could be constructed as a surface line. Distance 20 miles at £2,200 per mile.

From 55 miles to 67 miles is the most difficult portion of the whole line and would entail considerably more cuttings than any other portion of the whole route, there being a continuous grade of $\frac{1}{100}$ for 6 miles crossing the range to the west of Rankin Springs, then the same fall $\frac{1}{100}$ for 6 miles on the other side of that range, making a total in all of 12 miles $\frac{1}{100}$ gradient. I would estimate the cost of this 12 miles at £3,000 per mile.

I have, however, shown a deviation to the south crossing a gap (on Conapaira Run) which is 125 feet lower than the summit reached on the line to the north. A survey should be made of this deviation with a view to reducing the long pull of 6 miles of $\frac{1}{100}$.

From 67 miles to 85 miles the country is moderately easy, and could be constructed for about £2,250 per mile, 18 miles.

From 75 miles I have proposed a deviation round the southern end of the Lachlan Range and through a gap in the Waverly hills; by this route an almost level line right into Hillston can be obtained, avoiding the rough hills at the Monument Gap, besides being slightly shorter; the height above sea-level of Waverly Gap is 520 feet, thence there is a slight fall to Hillston.

From 85 miles to 112 miles the line is surface-forming and could be constructed for about £2,200 per mile, distance 27 miles. A small amount of flood-waters would be crossed close to Hillston, but not of any consequence. On the whole route the absence of creeks and watercourses is remarkable.

Details of distance and probable cost.

Distances.	Description.	Cost per mile.	Total cost.
		£	£
00 miles to 23 miles—23 miles	Easy	2,200	50,600
23 " 35 " 12 "	Undulating	2,300	27,600
35 " 55 " 20 "	Easy	2,200	44,000
55 " 67 " 12 "	Heavy	3,000	36,000
67 " 85 " 18 "	Moderately easy	2,250	40,500
85 " 112 " 27 "	Easy	2,200	59,400
			£258,100

The average cost per mile of the whole line is £2,300.

To the total of £258,100 there would have to be added an addition of about 2 miles to allow for curvature and small deviations, making the total cost of the line £262,700. There would hardly be any resumption of land, perhaps under 3 miles. The sharpest curve would be 20 chains radius, the ruling gradient 1 in 100.

Timber.—About 10 miles from Wyalong a belt of ironbark suitable for sleepers and small timber openings is crossed; it is about 1 mile wide, and runs in a N.E. and S.W. direction on both sides of the line for about 7 miles. Again at 20 miles from Wyalong another patch of ironbark suitable for sleepers and openings; area about 5 miles by 1 mile wide. To the north of Yalgogrin township another belt of ironbark exists, 3 miles by $\frac{1}{2}$ mile wide. From the information generally received the ironbark timber is fairly plentiful from Wyalong to 30 miles on the proposed line. About Rankin's Springs, both to the north and south, ironbark exists, but is not to be found in large quantities, although on the ranges some good trees can be seen, and several culverts and small timber openings have been built on the Whetton-road from Rankin's Springs to Naradhan with ironbark. Further west than Rankin's Springs no timber suitable for railway purposes can be obtained, except perhaps on the Lachlan River, where a poor class of timber may be found.

Ballast is plentiful at a point 20 miles from Wyalong to the Waverly Hills at 85 miles.

Water.—No permanent water can be found along the route, but west of Rankin's Springs an underground supply can be obtained by sinking about 150 to 200 feet. A plentiful supply may be seen at the Tin Hut and Monia Gap; the water is slightly brackish, and, perhaps, would not be suitable for a railway supply.

Nature of the country passed through and the quality of the soil.

The country immediately surrounding Wyalong township for about 5 miles is poor mallee land; towards the north, however, the land quickly begins to improve, and is bright red soil timbered with box, pine, and oak is suitable for cultivation. Proceeding west from Wyalong, after 5 miles the soil gradually improves, passing from poor dark-coloured ground to light-red or chocolate, suitable for cultivation. The country between Wyalong township and Wyalong station, about 13 miles from the town, may be classed as fair land; being so close to the town a considerable portion of this land has been selected. Six miles to the north of this portion of the line the country is fine agricultural land, and is being cultivated. From Wyalong sheep station to Yalgogrin township, and on the Dividing Range at 32 miles, with the exception of several small patches of ironbark ranges, the formation is granite, the soil bright red loam, suitable for cultivation. Some portions of this land at Wyalong and Yalgogrin homesteads have been continuously cultivated for a number of years with only an occasional failure.

At about 20 miles from Wyalong, on the northern side of the line towards the Humbug Creek, splendid cultivation land exists; in fact, from 13 miles from Wyalong to 32 miles, a distance of 19 miles, the country for a distance of 15 miles on each side of the line, with the exception of the range, is all cultivation land of a good quality. Portions of this land have been tried for a number of years with excellent results.

From 32 miles to 35 miles immediately on the summit of the Dividing Range the soil is inferior, being stony and timbered with mallee. It, however, immediately changes to fair agricultural land on the western slope, being timbered with box, pine, and wattle, and gradually improving to good bright red soil suitable for cultivation. At 35 miles to 55 miles, a stretch of 20 miles, 15 miles on each side of the line, is suitable for the growth of wheat. Close to Molonga station, and to the north and south, cultivation has been successful. These are not good patches picked out, but similar to the whole country. From 55 miles to 67 miles the country is broken by high mountain ranges, the extent of agricultural land is less than half the total area, although in the flats and gullies between the ranges the soil is excellent both towards the north on Naradhan and to the south on Conipara. At both these homesteads cultivation for hay has been going on for years with scarcely a failure.

From Rankin's Springs, after leaving the ranges right on the Lachlan range, from 67 miles to 82 miles, there is good agricultural land, at present covered with dense pine, wattle, and yarran scrubs, with the exception of a small area near the Tin Hut. This is some of the finest land on the whole route extending right down to Monia Gap. The good land runs almost to the summit of the ranges; even the ranges grow good grass suitable for pastoral purposes, and have been leased for that on Merri Merigal station; the soil is the same for 20 miles on each side of the line, in fact, right in to within 4 or 5 miles of the Lachlan River, with an occasional belt of mallee or currawang on the ridges.

From 82 to 85 miles a narrow belt of excellent land is crossed; this runs down to the west of Monia Gap, and is partly improved. After leaving the Waverly Hills at 85 miles from Wyalong, the soil is of a red sandy nature, timbered with mallee, sifton bush, and porcupine grass to about 88 miles. After that pine, box, and wattle, with occasional belts of mallee; this soil is fairly good agricultural land to about 92 miles. From thence to 100 miles a belt of mallee is crossed; this is a light sandy loam, and cannot be considered good agricultural land, although on the south of this belt of mallee good land exists at present under cultivation.

The extent of the mallee is, approximately, 8 miles by 10 miles.

From

The average rainfall registered by the gauges kept at the various homesteads is, from Wyalong to Rankin's Springs, 21 inches. Thence into Hillston the average is 17½ inches. Therefore 39 miles of the good cultivation land has an average rainfall of 21 inches, the balance of the cultivation land—34 miles—an average of 17½ inches. This embraces the land adjacent to Hillston, where it has been proved that good crops may be grown with that amount of rainfall. T. Kennedy, 6 Oct., 1897.

From 100 miles to 112 miles the soil is good agricultural land right into Hillston. Taking the line as 112 miles, approximately, the land passed through may be classed as follows:—

Distance	Inferior.	Fair.	Good.	Distance	Inferior.	Fair.	Good.
0 to 5 miles ..	5	82 to 85 miles...	3
5 to 13 ,,	...	8	...	85 to 88 ,,	3
13 to 32 ,,	19	88 to 92 ,,	4
32 to 35 ,,	3	92 to 100 ,,	8
35 to 55 ,,	20	100 to 112 ,,	12
55 to 67 ,,	...	12	...				
67 to 82 ,,	15	Total	19	20	73

This gives 19 miles inferior land, 20 miles fair land, and 73 miles as good agricultural land. Taking 70 miles and a width of 20 miles on each side, would give an area 1,500,000 acres of land fit for settlement, and all Crown land with the exception of a small area, probably not more than 30 or 40 thousand acres that have been selected. The leasehold areas of the holdings passed through will, in a few years, fall due, and the land revert back to the Crown. From experience of similar country in the Parkes, Bogan Gate and Trundle districts, this land would be readily taken up if railway communication existed.

1656. You have given a description of the country and the probable cost of a line between Wyalong and Hillston, *via* Rankin's Springs;—do you know the country from Wyalong to Cudgellico, and from there to Hillston? Yes, I have also explored that. My observations are as follows:—

WYALONG TO CUDGELICO; THENCE TO HILLSTON.

The nature of the country passed through on this line may be classed as good agricultural land generally, but the greater portion of it would be served by a direct line from Wyalong to Hillston, with the exception of that immediately surrounding the lake. From the lake to Rankin's Springs the distance by the Whitton road is 38 miles. That would be the greatest distance of the line, *via* Lake Cudgellico, from the direct route; whilst the two lines are gradually converging to the same points at Wyalong and Hillston. From Cudgellico to Hillston the greater portion of the land after crossing Ualiba Gap to Willanthry Weir is black soil, more suitable for pastoral than agricultural purposes, and in places subject to overflows from the Lachlan River. From Willanthry into Hillston the soil is good agricultural land, with occasional strips of black soil, subject to floods. In comparing the route direct from Wyalong to Hillston with that *via* the lake, there would be a greater extent of wheat-land on the direct route, for no black soil is passed through. The land also would be available on both sides of the line, whilst the lake route has the Lachlan River on the north from the lake to Hillston, which would interfere with settlement on that side on account of having to cross the river. Having no black soil or flooded land on the direct route, there would be no likelihood of any serious damage to the line through flood-water or heavy rains, and consequently much easier to maintain. The resources of the district are almost wholly pastoral, wool, and stock. Very little agricultural produce leaves the district. Towards the south of Hillston, at Cunbar, some wheat has been sent away to Carrathool, but only a small quantity. Almost the whole of the wheat grown is used locally.

1657. What is the difference in distance between the route from Wyalong to Hillston *via* Cudgellico, and the more direct route? By the direct route it would be about 112 miles, and by the route *via* Cudgellico 123, a difference of 11 miles. On the direct route I have allowed 2 miles extra, so that there might be a difference of 9 miles.

1658. Does your surveyed route *via* Cudgellico go near the lake? It goes right into the town.

1659. The line would then pass along the river to Hillston? No; it goes to Ualiba Gap, which is about 6 miles to the south of the river; it does not go down the river.

1660. That route is not shown on the map? No.

1661. Do you think a deviation from Wyalong a little to the north would serve the lake country fairly well? I think it would perhaps embrace more good land than does the direct route.

1662. How far would you propose to go north of the line you have explored? Between 8 and 9 miles.

1663. It would make the line, approximately, how much longer? About 3 miles.

1664. By taking the line 10 miles to the north of the more direct route it would develop a large area of good country, and also bring a railway within reasonable distance of Lake Cudgellico? Yes.

1665. At a cost of what? About £2,300 a mile; it is the same class of country.

1666. There are no engineering difficulties in the way? I do not think so; I have not explored that route minutely.

1667. Is there much settlement upon the route you have explored? Very little. It is hardly settled at all, with the exception of station holders.

1668. The land is principally under pastoral occupation? Mostly.

1669. Would the line pass through any abandoned land? I could not say, but I think some of the resumed areas have been abandoned.

1670. Will you give us the approximate distance of the suggested deviation from Lake Cudgellico? About 30 miles, right to the centre of the township; the nearest point would be at the head of the Humbug Creek; the line would be further away from Cudgellico at Rankin's Springs. It is about 38 miles from Cudgellico to Rankin's Springs.

1671. Is the country through which the deviation would pass settled? Yes; some of it is settled just at the commencement of the deviation. I believe they are growing wheat there now. There is a good deal of cultivation just about there.

1672. Could you give us an approximate estimate of the cost of clearing that country? Only from hearsay.

1673. The first 5 miles from Wyalong is comparatively poor country? Yes, it is small mallee.

1674. Is there any mining within that 5-miles radius? There is auriferous country round about Wyalong. I did not inquire into the mining resources of the district; but the mallee land, being so close to the township, is being taken up and cultivated. The value of the land is increased on account of its proximity to the town. The belt does not extend so far to the north as to the west.

1675. You think that, although the country is comparatively poor, it would be occupied and utilised in consequence of its proximity to Wyalong? Yes.

1676. Did you take any notice of the timber with a view to determine its suitability for railway sleepers? Yes; from a point about 10 miles from Wyalong, going across to Hiawatha, there is some timber which would be suitable for sleepers and for small waterways. I have described it in my report.

1677. Ballast is fairly plentiful along the route for a considerable distance? To within 30 miles of Hillston.

1678. The construction would be comparatively cheap, on account of timber and ballast being available within a reasonable distance? Yes.

- T. Kennedy. 1679. An artificial water supply would have to be provided for railway purposes? Yes; it would be necessary to sink tanks.
 6 Oct., 1897. 1680. Is it good holding ground for water? I saw places where tanks have been formed along the route, and they seemed to hold very well. All the red-soil country is good holding ground.
 1681. There would be no difficulty on that score? No.
 1682. Is the country infested, to any great extent, with rabbits now? I should say it was, although I did not see many. The holdings seem to be all wire-netted going through towards Wyalong.
 1683. The drought has not cleared the rabbits all out? No.
 1684. You think that the occupation of the country would lead to the keeping down of the wild-dog pest? Decidedly.
 1685. Do you think men of comparatively small means would take up the country along the route you have explored? I think so.
 1686. From what holding could a man make a decent livelihood? I should say from 1,000 to 1,500 acres if the land were close to a railway.
 1687. Enabling him to put a certain area under cultivation year by year? Yes.
 1688. He could clear as he went along, giving himself a sufficient area for grassed land for his working stock? Yes.
 1689. You think we would be able to combine wool-growing with agriculture? Yes, I certainly think so.
 1690. Judging from your observation of the country through which the railway would pass, you think that in the absence of railway communication it would remain idle and be comparatively valueless? Yes; some of it might be occupied under pastoral lease.
 1691. You think the construction of a line would bring it into much more beneficial occupation? Yes; I have no doubt that a great deal of it would be put under cultivation.

Thomas Cadell, Inspector of Stock, Hillston, sworn, and examined:—

- [T. Cadell. 1692. *Mr. Fegan.*] Do you hold any other offices? I am also overseer of public watering places and inspector of rabbits.
 6 Oct., 1897. 1693. What stock are there depastured in your district? Last year the return showed 734,000 sheep; but my district extends pretty well up to Nymagge. From a lot of that country the wool would go to Cobar. If you take the area from which the wool would be likely to come to Hillston if a railway were here, I think you might reckon upon about 600,000 sheep.
 1694. What is the extent of your district? It starts at the southern end of Gunbar, and extends north to the northern boundary of Wirlong. On the east it goes to the eastern boundary of Uabba, and on the west to the western boundary of Willandra. The district is about 170 miles long by 120 miles wide.
 1695. What number of cattle have you on that area? About 4,000 cattle and 3,000 horses.
 1696. How many lambs? This year there are about 118,000 lambs.
 1697. How many sheep will the land carry on the average? The southern part of the district carries about one to 2½ acres. The northern part, the pine country, carries about one sheep to 4½ or 5 acres.
 1698. I suppose you are well acquainted with the district? Yes.
 1699. From what direction do you think the traffic would come? On the northern side of the river, in the Western Division, the stations would be likely to send their wool to a railway at Hillston. There are 1,000,000 acres unoccupied, or in such a state that the land is not more than one-fifth settled, through the pine scrub and the rabbits.
 1700. Has the drought had anything to do with that? The drought would have nothing to do with that now, because the rain has fallen equally over the timbered country and the other country; but the rabbits and pine scrub prevent quite 1,000,000 acres of country from being more than one-fifth settled. Country which would carry 180,000 sheep at the present time is not stocked to more than 30,000.
 1701. What is the average clip this year? About 7 lb. in the southern part of the district, and 6 lb. in the northern part; lambs fleeces would be about 2 lb.
 1702. Do you send any fat stock to the market from your district? The greatest number of fat stock sent away was in 1895. We then sent 120,000 fatts to Sydney and Melbourne.
 1703. Were any sent away last year? Yes, but not nearly so many; the drought prevented many sheep from leaving here.
 1704. I suppose the greater portion of those sheep would be trucked at Carrathool? Yes.
 1705. Are you acquainted with the route from Condobolin to Enabalong? I do not know it at all.
 1706. Do you know the route from Wyalong to Hillston? Only as far as my district on this side of Rankin's Springs.
 1707. What kind of country is it? Part of it is dense mallee, but most of the mallee land in this district is suitable for agriculture, it is only a matter of clearing. The rest of the country is good pine country; all of that would be good for agriculture.
 1708. You gave evidence before the Sectional Committee which inquired into the proposed railway from Condobolin to Broken Hill; have you anything to add to that evidence? I do not think so.
 1709. Could you describe to us the portion of the country served by a railway from here to Wyalong which would be wheat-producing? The whole of the country on the south of the Lachlan as far as Rankin's Springs is wheat-growing country, except the ridges. The whole of the flat country is arable land.
 1710. I suppose the northern side of the river does not bear favourable comparison with the southern portion? The northern side of the river is in the Western Division, where the land cannot be taken up in small areas. Some of the country there is quite as good as the country on the southern side.
 1711. What proportion of it? Right through from here, as far as I know, to Cobar, the whole of the flat country is good arable land; the ridges, of course, are too stony for agriculture.
 1712. From what distance beyond Hillston do you think the railway would divert traffic which now goes to Melbourne? I think the wool off the sheep 40 miles to the south of this would come to a railway at Hillston. To the westward the wool would come from a distance of 130 to 140 miles in preference to going to Hay.
 1713. There would also be a considerable quantity of traffic from the north? From the north it would come in this direction as far as Mount Hope; beyond that it would go to Cobar. The Railway Commissioners have given concessions upon that line to induce the squatters to send their wool there instead of sending it down to the railway at Hay.

T. Cadell.
6 Oct., 1897.

1714. You have no doubt, then, that a railway at Hillston would compete for a great deal of the trade which now goes to Melbourne? Yes; I think it would cut off a large quantity of wool which now goes to Melbourne.

1715. Have you a number of abandoned areas in your district? I gave the Sectional Committee who were here last year some account of them. Not an acre has been taken up since. Some of the lessees are trying to get the Government to add them to their leaseholds.

1716. What is the extent of the resumed areas? They are as follows:—Cowl Cowl, 161,622; Coan Downs, 232,174; Huithawong, 110,113; Merri Merrigal, 110,953; Roto, 151,690; Yathong, 123,100; and Merri Merriwa, leasehold and resumed, 46,860; Marooa, resumed area, 31,320; Willandra, 27,000; Wangaroo, 16,100; Wangorong, 50,160; South Merowie, 6,206; making a total of 932,298 acres.

1717. Do you think that with railway communication a lot of these resumed areas would soon come under occupation? I think the whole of them would if a railway were brought into the district.

1718. The rabbit pest is not such an anxiety to you as it formerly was? No; people know how to get rid of the rabbits now. They require continuous attention; but you hear very few persons talking of the pest now.

1719. To a great extent you have mastered it? Yes.

1720. The great objection in your district in dealing with the rabbits is due to the fact that the Government do not take the same precautions as do private individuals? The Government do nothing. The abandoned resumed areas and other Crown lands are only breeding-grounds for the pest.

1721. The pests bred on the Crown lands are exceedingly destructive to those who are trying to rid themselves of them? Yes; that is the general opinion here.

1722. And you think that in any legislation the Government should take upon itself the responsibility of trying to get rid of these pests on Crown lands? Yes; the Crown lands should be made available for closer settlement, by the construction of a railway. If there were a railway here the land would very soon be taken up, and there would be no necessity for the Crown to take action in getting rid of the pest.

1723. You think that the railway should be constructed, even although there might be no prospect of its paying immediately? It would be to the interests of the country to bring a railway here, even if it did not pay at once, owing to the large area which it would place under occupation.

1724. Even if the railway did not pay, the Government would receive considerable revenue from the disposal of these resumed areas? Just so.

1725. And you think that that circumstance should be taken into consideration by them? Yes.

1726. *Chairman.*] You know, of course, that this inquiry is in regard to the proposed extension from Condobolin to Euabalong? Yes.

1727. Do you think that line would be of any benefit to the district? Not at all. It would not take one bale of wool away from the country west of Euabalong, which now goes to Victoria.

1728. You do not think it would attract much more traffic than now goes to Condobolin? I do not think so. The country out of Condobolin to the west and north-west is very poor. A great deal of it is granite country, and the wool which now goes from that district, either to Condobolin or to the main western line, would go there still, even if the extension were made to Euabalong.

1729. You think that any extension from Condobolin should come as far as Hillston? I do not think an extension from Condobolin would be advisable in any case, because on the southern side of the river there is so much alienated land close to the river that there would be no room for settlement. The further away from the river the railway is taken the better for settlement.

1730. A railway passing down near the river would go almost entirely through alienated land? Yes; increasing the cost materially. At many points there would be no land at all open to settlement.

1731. Which do you think would be the best route by which to bring a railway into this district? I think it should come from some point to the south of Condobolin, either from the southern or from the cross line from Blayney to Murrumburrah. A railway running through Grenfell and Wyalong to Hillston would answer as well as an extension from Temora.

1732. You mean a line through the country described by Mr. Kennedy to-day? Yes.

1733. *Mr. Fegan.*] Can you give us any information as to the number of bales of wool which now go to Melbourne which would be brought to Hillston if there were a railway here? I have made an estimate in tonnage. I think about 2,000 tons of wool would come to Hillston out of my district. I do not know what would come out of the Mossiel district. I have no figures to go upon. Four-fifths of the wool in my district goes to Melbourne; and barely a fifth of it goes to Sydney. I am counting on that which would naturally come to Hillston if a railway were here. Wool from the northern part of my district goes to Cobar and Sydney, and is taken round to Melbourne by steamer.

1734. Do you think a greater number of fat stock would be sent to the Sydney market from this district if there were a railway here? Yes; considerably more fat stock than ever went away from here would go to Sydney. The road between here and Carrathool is often so bad that the stock lose condition before they can get to the railway. If they could be trucked within a reasonable distance of the runs a great many more would be sent to market.

1735. You think a greater number of sheep would be fattened in the district? Yes; the lessees would lay themselves out to fatten stock. But it very often happens that in dry seasons there is not a blade of grass between here and the railway.

1736. How many bad seasons have there been during the nine years you have been here? There have been five bad seasons out of nine.

1737. *Mr. Farnell.*] Have you had any practical acquaintance with agricultural pursuits? I have not had any here; but I had in my early days in the Mudgee country.

1738. What is your opinion of the capabilities of this district for wheat-production? I think it would be one of the finest districts in the Colony.

1739. Upon what do you base that statement? From going round among the farmers, and seeing what they are doing. For two years I acted as crop reporter for the Agricultural Department, and it was my duty to go round among the farmers and get all the information possible as to what they were doing and what they intended to do. I had also to make a personal inspection of the crops, and to see what grain they were getting, to inquire what wheat they were using, and everything connected with the matter.

1740. What has been the average yield per acre here? I think about 14 bushels to the acre.

1741. At what price do you think wheat could be profitably grown here? I cannot say definitely; but I should think at about 2s. 6d. a bushel.

1742.

- T. Cadell. 1742. That would be under present conditions? Yes. Under present conditions they have to cart the wheat to Carrathool, from 40 to 75 miles.
- 6 Oct., 1897. 1743. What would be the cost of cartage between here and Carrathool? From 4d. to 6d. a bushel, according to the distance.
1744. About £1 a ton? Yes.
1745. What has been the average yield for the last two years? The year before last the average yield was about 16 bushels; but last year it was about 12.
1746. What is the total production of the district in wheat? I think the year before last it was something like 150,000 bushels.
1747. How was that distributed? A certain quantity came to the local mill to be ground for local consumption, and the rest of it was sent to Carrathool. I think the Wagga and Cootamundra mills bought some of it; but the principal part went to Sydney.
1748. Can you speak as to the quality of the wheat? It is a very fair sample of wheat; it makes very good flour.
1749. Have you known the crop in this district to be affected by rust? I do not think there is much rust in this district.
1750. Do you think the land about here is capable of producing much beside cereals? Nothing much has been tried here. Oats might grow here, but only occasionally. I think wheat would be the chief product.
1751. Has fruit-growing been tried? It grows splendidly all over the district; but we suffer from bad seasons. You want a good supply of water for fruit. If you have water you can be certain of a good supply. Fruit does well enough here if it is properly looked after.
1752. Has lucerne been tried here? In small patches.
1753. Has it done well? It does not do well; the sub-soil is too stiff for lucerne.
1754. Do you think the kind of lucerne plant used has had anything to do with the results obtained? The lucerne tree will grow in the district, but from all I have heard from the Government Experimental Farm at Wagga, I should say it was not worth very much. They say that cattle will only eat it in a drought, when they can get nothing else.
1755. At what period of the year are the roads between here and Carrathool in such a condition as to render it difficult for you to get to the railway? They are sometimes bad in summer-time, but it does not last so long then. In the winter-time they are bad for weeks after heavy rain. The mail has sometimes been from twelve to fifteen hours late owing to the bad road.
1756. You say there are considerable areas of land here available for settlement, and that if a line were constructed to Hillston it would be an incentive to settlers to come here; what would be the cost of clearing this land ready for the plough? About 50s. per acre altogether. Some of it, of course, could be done for much less than that.
1757. What would be a suitable area for a person to take up for profitable occupation of the soil? From 1,280 to 2,560 acres if he wants to keep sheep as well as cultivate.
1758. Do you think persons would do well here to carry on mixed farming? I think that it would suit them best to carry on mixed farming. At the present time the back country through which the railway would come is so infested with wild dogs that people are afraid to keep sheep; but with closer settlement dogs would disappear.
1759. You think that the construction of a line to Hillston would bring a large amount of new traffic to the railways? I think that long before the railway reached this point, no land would be left to be taken up.
1760. I mean traffic which does not go to any railway stations at the present time? I think a lot of the wool which now goes to Melbourne *via* Hay and Carrathool would come on this line and go to Sydney.
1761. You are certain of that? Yes; I have spoken to persons who own runs, and they have said that they would gladly send their wool this way on account of the shorter road carriage.
1762. Suppose it were anticipated that a railway to Hillston would not pay in the immediate future, do you think those using the line would be prepared to pay local rates—that is, rates slightly in excess of those generally charged? I think they would, in consideration of the great convenience of a railway, and in the hope, of course, that as the traffic increased the special rates would be taken off.

Robert Walter Stewart, Mayor of Hillston, sworn, and examined.—

- R. W. Stewart. 1763. *Chairman.*] You are Mayor of Hillston, and you carry on the business of a commission agent here? Yes; I am a stock and station agent.
- 6 Oct., 1897. 1764. *Mr. O'Connor.*] How long have you been in the district? Since 1878.
1765. What is the population of your municipal district? About 500.
1766. You have a thorough knowledge of Hillston and the adjoining district? Yes.
1767. Is it a pastoral or agricultural country? On the south side of the river it is principally an agricultural country. Here and further south below Hillston it is pastoral. To the north of the river it is principally pastoral.
1768. What is the yield per acre of wheat? On the average from 12 to 15 bushels. Sometimes it is much higher, but that is the average.
1769. Is that payable? Yes, at a fair price.
1770. Where is your market? We sell a little locally; but we are obliged to take some to Carrathool and send it to Sydney and to Cootamundra or Narrandera, where there are mills.
1771. You must find that expensive? We find that the long haulage takes off a considerable amount of the profit.
1772. You have been fairly successful in your returns? Excepting in the year 1888, we have been always fairly successful. That has been the only failure; even then some was grown. There was something like 8 or 9 inches of rainfall.
1773. Is there any cultivation upon the halves system here? No.
1774. How do you account for that? Well, land can be got here very much easier than in Riverina, and it is far more profitable to take up land under the 1895 Act and work it on your own account. The halves system is gone into where all the land has been alienated, and where the land is also in proximity to a railway.

R. W.
Stewart.

6 Oct., 1897.

1775. This part of the country is well timbered? We have good colonial pine; and there is some pretty good gum on the Lachlan.

1776. Would that timber be marketable if you had a railway? The colonial pine would be, but I do not know so much about the gum.

1777. Looking at the question from a national standpoint, with what part of the existing railway system do you think Hillston should be connected? I am glad you mentioned the question from a national standpoint, because I have a clear and distinct idea that a railway ought to come by the route described by Mr. Kennedy. I should have no objection to a deviation to take in the Lake Cudgellico district, which, I think, is entitled to some consideration. That is the line which I think should be constructed, quite apart from self-interest or the interest of the people of this district.

1778. Will you describe the route yourself? I think the line should come from Wyalong almost due west to Hillston, allowing for a slight deviation of, say, 9 miles to the north to serve the Lake Cudgellico district to a certain extent. It will be seen, from the map before you, that the greater part of the land served would be unalienated. The line would serve over 1,500,000 acres, which has been proved, for some fifteen years, to be good agricultural land. The very worst of the land would be fit for pastoral purposes. The better class would be used for agriculture, and after agriculture has been carried on for some time the land improves considerably. I think the pastoral industry should be combined with agriculture.

1779. Do you know anything of the country between Condobolin and Euabalong? I have travelled over it often.

1780. You are familiar with the route of the proposed railway? Yes.

1781. What is your opinion of that route? I think that if the Government want to spend money for fun they will construct a railway at once from Condobolin to Euabalong. If they want to do the country any good they will leave that line severely alone.

1782. You think it should not be constructed, even though it might be intended ultimately to extend it to Hillston? I do not think it would be a desirable line, even if it came on to Hillston by that route.

1783. And you have a thorough knowledge of that route? Yes; I have ridden over it a good many times.

1784. For what distance out of Hillston are you acquainted with the country? Fifty miles west, as far as you like to go north: past Yalgogrin, say, 70 miles eastward, and down towards Hay to the south. A radius of 200 miles, if you except the easterly direction.

1785. If a railway were constructed to Hillston, would any quantity of the wool which now goes to Melbourne come in this direction? Most undoubtedly; the wool now going to Melbourne would come to Sydney. Directly I heard the Committee were coming here, I made it my business to make inquiry upon that point. Four-fifths of the wool in the Hillston sheep district goes to Melbourne, and about one-fifth to Sydney. The position would be just reversed if there were a railway to Hillston. Four-fifths of the wool would go to Sydney. A line by the route which has been suggested would be most centrally situated; it would serve both the pastoral country to the north and the agricultural country to the south.

1786. What land would be open to selection if you had a railway? A very large area has recently been made available under homestead selection, and that would be taken up. In fact, once the Government promised a railway, the land would very soon be taken up. It would all be gone long before the railway reached this point. I have commissions from both Victoria and South Australia. A man from South Australia and another man from Victoria have to-day applied for land here.

1787. Have you any statistics showing the probable freight for a line from Hillston? I gave those statistics to the last Sectional Committee which visited Hillston.

1788. And you do not desire to alter that evidence in any particular? No.

1789. Is your district retrogressing? I think that, notwithstanding all the difficulties with which it has had to contend, it is going ahead.

1790. What is your average rainfall? I think the record for seven years gave about 17 inches annually. Sometimes the rainfall has been as high as 25 inches, and it has been as low as 9 inches.

1791. Do you suffer very much now from the rabbit pest? The rabbits are fewer now than I have seen them since 1879. I attribute the decrease partly to the drought and partly to those who have had to deal with them using the best methods of keeping them in check—that is, by wire-netting and by phosphorised pollard.

1792. Are there any abandoned areas in the adjoining districts? There are a good many on the very route you have described. For instance, at Hunthawong and Merri Merrigal; the whole of those areas would be put under profitable occupation if there were a railway.

1793. Is this a great sheep and cattle district? It is a great sheep-growing district. I do not know of any better. I do not know of any more rapid fattening country than the Lachlan Valley, especially as you now see it.

1794. If there were a railway here do you think the meat-freezing industry would be entered into? I know that a gentleman is prepared to start it immediately a railway is undertaken. He told me so, and I have no reason to doubt him.

1795. Do you grow much fruit here? We grow good fruit, but we grow principally wheat. I do not think the country is suitable for fruit-growing away from the river.

1796. Can the fruit crop on the river be depended upon to any extent? I think so. I have seen good oranges and lemons growing there, also good grapes.

1797. Do you think the wine-making industry will ever become established here? Not to any extent.

1798. Have you formed any opinion as to the suitability of the district for the dairying industry? I think that dairying could be profitably associated with other industries. It would be necessary to preserve a supply of artificial feed.

1799. Suppose the holdings were 2,560 acres, do you think there would be much dairying in conjunction with other industries? Yes, I think I might say that there would. I think that in the country through which the suggested railway would pass even a smaller area than that which you mention would suffice. Of course, if the pastoral industry is to be associated with agriculture, the area would require to be bigger; but in country such as that which has been described between Wyalong and Hillston a smaller area than 1,000 acres would keep a family. Those who have worked smaller areas have, as a matter of fact, been more successful than those who have worked larger ones.

1800. Do you agree with what the Inspector of Stock has told us as to the diversion of traffic to this railway from other points? I concur in everything he said as to that matter.

1801. Do you know the land between Wyalong and Grenfell? I have not travelled by that route, but I know Grenfell very well. The country there is very good. There are 68,000 acres under cultivation this year. It is a very good wheat-growing country.

1802.

R. W.
Stewart.
6 Oct., 1897.

1802. Is there anything you would like to add to your evidence? I might add that some 5,000 acres of land immediately surrounding the township of Hillston have been exchanged, and have, therefore, become Crown lands. It is being measured in blocks of from 5 acres up to 275 acres, and they will be available shortly. The town was shut in, and an exchange was made with a lessee to consolidate his holding. It will be a very valuable estate.

1803. *Mr. Farnell.*] At what price do you think wheat can be profitably grown here? If there were a railway here I think 2s. 6d. a bushel would pay; but I should not care about 2s. 6d. a bushel if we had to drag the wheat 80 miles to a railway. To make certain of a fair profit I should say 3s. would be a payable price in those circumstances. I should be fairly satisfied with 2s. 6d. if I had a good lot of grain.

1804. Do you think the residents here would be prepared to pay local rates? I have no doubt they would be prepared to pay a fair thing. I should not like to commit myself to saying definitely what they should do; but you may rely upon their doing what would be fair in the circumstances. At the present time the cost of taking sheep from here to Sydney is about 2s. 2d. We have to pay £8 a truck from Carrathool, and I think people would be willing to pay £9 a truck from here.

1805. What do you mean when you describe the suggested railway to Hillston as a national line? By a national line I mean a line which would serve to the best advantage the whole of the people—the cost being borne by the whole of the people.

1806. You think that the distance of Hillston from a railway centre has acted as a deterrent to settlement and to the growth of cereals? I am quite certain of it. The land is suitable enough for settlement; but it is the distance to market which has proved the drawback.

1807. Have you knowledge of any other produce besides wool and wheat being grown in the district? Our staple products are fat stock, wheat, and wool. All that we want is access to market.

1808. If you had an experimental farm in the district, and it was demonstrated that other produce could be profitably grown, you think that, from the nature of the soil, there would be a great deal of cultivation here? I think an experimental farm might serve a good educational purpose.

1809. You admit that experimental farms in other portions of the Colony have afforded good object lessons? Yes.

1810. If fruit-drying could be profitably carried on here, do you not think the local farmers would take advantage of knowledge gained in that direction by means of an experimental farm? Certainly.

1811. What do you think it would cost to clear land here ready for the plough? It would depend entirely on circumstances. In some places it might cost only 2s. 6d. an acre, but if the timber were at all thick it would cost from 30s. to £2, and perhaps more.

1812. Do you think that having regard to that expenditure, and the original cost of the land, persons would be prepared to embark in agriculture with the prospect of 14 bushels to the acre and a price of, say, 2s. 6d. a bushel? It must not be supposed that the price would invariably be 2s. 6d. a bushel. Settlers would have to go to work gradually preparing the land for the plough. Most of the settlers hereabouts do a lot of hard work themselves.

1813. Upon what acreage do you suppose a man could live comfortably in this district? It depends upon the situation, but I should say from 500 acres to 1,500 acres. Round about the town a man could live well on 500 acres. I do not think you ought to allow him to have 2,560 acres anywhere near the town.

1814. Do you know whether any of the land through which a line from Koorawatha to Hillston would pass, is watered by creeks or tributaries of the Lachlan? There is no water of any consequence along that route.

1815. It would be of no advantage, therefore, to construct weirs along the Lachlan to conserve water in creeks or billabongs? There is one place where a weir might be of advantage, about 9 miles from here up the river. If water were conserved there a considerable area of low-lying land could be irrigated with advantage.

1816. What area would it irrigate? Certainly, 30,000 acres. A very large area is now covered in flood time. I have seen very good results from an overflow of the river in this country.

1817. You think a weir would afford a permanent supply for irrigation? There is not sufficient water in the Lachlan to irrigate to any great extent, except for perhaps a period of six months in the year. When the river goes dry it is quite a common thing to make little dams across it to keep water for the town.

1818. *Mr. O'Connor.*] You spoke a year ago of the probable returns to a railway to Hillston;—what would be the chief sources of traffic? If the railway were brought into this district, I think we should take wool off more than 1,000,000 sheep, although I take that number as the basis. Estimating that 100,000 of these sheep will be sent away as fat stock, and allowing 6½ lb. as an average fleece, there will be something like 2,600 tons of wool from the 900,000 sheep that are left. This wool at the present time costs us £6, £7, and £8 a ton to land in Sydney, according to the distance which it has to travel; but, supposing the freight by rail was £6 a ton, that would give a return to the railway of £13,000. Now we pay £8 per truck to send sheep from Carrathool, and it costs us £1 a hundred to send them to Carrathool. Instead of driving them over dry roads in hot weather we would rather pay £1 a hundred extra to the railway; that would mean for 100,000 fat sheep £9,000 revenue. In order to show the probable revenue that would be derived by the line, I have worked out certain figures which might be made larger, but which, even if they are decreased, will still show a handsome income. I take 1,000,000 acres of land as the area that could be made available for close settlement, and better land is not to be found in New South Wales. The exact area would be 1,600,000 acres. That is the area of land lying within 10 miles on each side of a line from Temora to Hillston, a distance of 130 miles. This country is valued by the Crown for homestead selections at from 7s. 6d. to 15s. an acre; but with a railway its value would be restored to £1 an acre. That would mean a revenue to the Crown of £12,500 in deposit money alone. After five years the Crown gives a certificate, and the payment is doubled, which would make the annual revenue £25,000. If from half this area 12 bushels of wheat an acre were obtained, there would be 6,000,000 bushels of wheat to send to the Sydney market. That, at 5d. a bushel, would give to the railways a return of £125,000.

1819. If a railway were constructed here you think that land which is now being sold by the Crown at 15s. an acre would be sold at £1 an acre? Yes.

1820. You think that if there were a railway here the deposits upon land of £12,500 would in five years be increased to £25,000;—the income to the Colony from the construction of a line being £125,000 a year? Yes; upon that basis.

William

William Thomas, farmer, Williams, sworn, and examined:—

1821. *Mr. Farnell.*] How long have you been resident in the district? About four years next February. W. Thomas.
1822. What is the extent of your holding? 5,000 acres.
1823. You are in the Western Division? In the Central Division.
1824. How much of your 5,000 acres have you under crop? Eighty acres.
1825. You were examined by the Select Committee which inquired into the construction of a railway from Condobolin to Broken Hill? Yes.
1826. You endorse the evidence you gave on that occasion? Yes.
1827. Had you any experience in farming before you came here? Yes; in South Australia.
1828. How long were you there? Forty years.
1829. What acreage did you hold there? From 5,000 to 10,000 acres.
1830. What area had you under cultivation? From 500 to 3,000 acres.
1831. What was your average yield? In the early days we averaged as high as 30 bushels; but latterly the average was somewhere about 4 bushels. When we got down to 4 bushels the land was exhausted—it was worn out.
1832. You have had a practical acquaintance with farming for a considerable time;—what is the value of the land here for wheat growing compared with the land in South Australia upon which you were located? The quality of the land here is quite equal to that of South Australia. Some of the land round about here is a great deal better. The whole of the land between here and Yalgogrin and Rankin's Springs is first-class agricultural land.
1833. You know it is proposed to construct a railway from Condobolin to Euabalong? Yes.
1834. Would that extension be of any benefit to you? It would not benefit me at all.
1835. If any incentive is to be offered to settlement in this district by reason of a railway, it would have to be brought much further to the westward than Euabalong? Yes.
1836. If the district is to progress at all the railway must be brought to Hillston? Yes.
1837. You would be prepared to put a much greater area under cultivation than you at present have if you had railway facilities? Yes.
1838. What did it cost you, per acre, to clear the land ready for the plough? The land I have worked, to the best of my recollection, has cost me nearly £3 an acre.
1839. It was thickly timbered, I suppose? It is a scrub lease; the timber was very heavy.
1840. Could that land be taken as a sample of the country round about here, or is it exceptional? It is exceptional, I think.
1841. Even supposing it costs £3 an acre to clear the land, having regard to the conditions under which the class of land to which you refer can be taken up, you think persons would be induced to take it up and to put it under wheat if there were railway facilities here? It would not pay a farmer to grub it as I have done. The proper way to clear the land here is to scrub and ring it, and to let the timber dry; if that is done the land can be cleared very much cheaper. In some cases it would cost from 1s. 6d. to 2s. an acre to scrub and ring; it depends upon the density of the scrub. When the timber has been ringed it must remain for three or four years; it can then be cleared easily by fire.
1842. *Chairman.*] So that, although the operation is a longer one than the green clearing, it is equally successful and much cheaper? Yes; it is better to let the roots die. The green roots suck the life out of the soil; the soil becomes sour, and it will take several years to sweeten it. If you scrub and ring, the land undergoes a process of sweetening while the roots are dying.
1843. What has been your average yield per acre? I have not yet been able to grow anything. The rabbits took my first crop, and last year I only got 3 tons off 30 acres. I was not wire-netted, and you cannot do anything in the way of cultivation here unless you wire-net. It is a very hard place in which to make a start. The rabbits keep the country bare of feed, and there is no railway communication. In poor seasons you cannot get your stock away from the district.
1844. Have you any stock on your holding? Only horses and a few cows. I have no sheep.
1845. Do you think it is possible for mixed farming to be carried on in the district? I am satisfied that it is.
1846. Do you think that if the district is proved to be all that it is represented to be in the way of wheat production, farmers will be induced to leave their exhausted areas in South Australia and Victoria and to come here? I am quite sure of it; it is only the isolated position of the district which keeps people away from it at the present time.
1847. Have you yourself been in communication with any people in the adjoining colonies who would come here if there were a railway? Yes; I know of several who would come over.
1848. Do you think persons here would be prepared to pay local rates? I feel sure they would; but in my opinion there would be no necessity for it. Even if we had to pay local rates we should be in a better position than we are in at the present time.
1849. Have you made any experiments in fruit-growing? I myself have not, but I know that it is first-class vine country. The country from Yalgogrin to Rankin's Springs will produce vines to perfection. That is after they are established; they want a little bit of nursing to give them a start.
1850. Do you think that raisins and currants could be profitably produced here? Yes; I am positive of it.
1851. At what distance from a railway could a person profitably engage in agricultural pursuits here? At from 15 to 20 miles. The road carriage would be rather a heavy tax beyond that distance.
1852. The cost of road carriage, between this point and the nearest railway point, prohibits agriculture? Yes.
1853. Are there any other reasons you can adduce why a line of railway should be constructed to Hillston? I think the close settlement which would follow would do away with the rabbits and wild dogs. I think a railway might be constructed from Temora to Hillston. There is a lot of unoccupied country between that point and Yalgogrin. If the land were occupied, each occupier would have to keep down his own vermin, and wild dogs would very soon become a thing of the past.
1854. *Mr. Fegan.*] Your cultivation is in a wire-netted paddock? Yes.
1855. Have you good prospects this season? Yes; the crop looks very well.
1856. How far were you from railway communication in South Australia? The railway went through Farrell's Flat, and some of my property was on the Flat.

- W. Thomas. 1857. How far were you from market? I was about 90 miles from Adelaide.
 1858. Your market was at Port Adelaide? Yes.
 6 Oct., 1897. 1859. Even if a railway were brought to Hillston, you would not be as near to railway communication as you were in South Australia? No.
 1860. But you would have a better market? Yes; and the soil is better.
 1861. Had you to deal with rabbits in South Australia? There were rabbits at Mount Bryan, another farm I had.
 1862. I suppose that £3 per acre would be the maximum cost of your clearing? Yes.
 1863. Do you think you have a prospect of making a better living than you could make in South Australia? Yes.
 1864. You would not have come here if you had thought the soil would be as unproductive as it is in South Australia? I was certain that it would be a great improvement.
 1865. You do not fear any of the obstacles in your way here;—you think you will be able to make a good living? Certainly.
 1866. Railway extension would make matters much easier for you? Yes; I could go in for mixed farming.
 1867. Are there many places in South Australia where the soil has been exhausted as in the district you have referred to? Yes; all the best lands in South Australia are worn out. They are going into vineyards and dairying.
 1868. What is the highest and lowest price you have received for wheat? Eight shillings and 1s. 10d.
 1869. What is the present price in South Australia? It is pretty high now.
 1870. I suppose you intend to fence the whole of your area? Yes: with rabbit-proof netting, and if I do not get any neighbours I shall have to make the fences dog-proof as well. I cannot keep the sheep there now; it is all abandoned country round about me. My nearest neighbour is 10 miles distant.
 1871. How far are you from Hillston? Forty miles south-east from here.
 1872. What is your nearest pastoral lease? I suppose Gunbar; that would be about 40 miles.
 1873. How far would Mr. Kennedy's line pass from your holding? Eighteen miles to the south.

THURSDAY, 7 OCTOBER, 1897.

[The Sectional Committee met at the Court House, Hillston, at 9.45 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Joseph Rowe Varcoe, farmer, Camp Plain, Hillston, sworn, and examined:—

- J. R. Varcoe. 1874. [Chairman.] You gave some evidence to a Sectional Committee here about twelve months ago in connection with the proposed extension of the railway from Condobolin to Broken Hill? Yes.
 7 Oct., 1897. 1875. You confirm now what you said on that occasion? Yes.
 1876. You are acquainted with the proposal to extend the railway from Condobolin to Euabalong? Yes.
 1877. Do you think that will be the best route to adopt? I am not personally acquainted with the country between Condobolin and Euabalong, but I know it from hearsay. I have travelled from Willanthry to Mount Hope, and I then passed through some very barren country, some of the worst I have seen in New South Wales.
 1878. You have a general knowledge of the country to the north of the river? Yes; I am told that a large extent of country east from One Eye track past Euabalong for some miles is worthless.
 1879. The great bulk of it is unoccupied at the present time? Yes; and in my opinion a railway would not bring it under occupation.
 1880. Do you think the proposed extension to Euabalong would benefit this district in any particular way? I do not think it would.
 1881. For what reasons? Euabalong is a good long way from here; it is too far to cart wheat.
 1882. You could not cart wheat from Euabalong to Hillston at a profit? No; we already have a line at Carrathool, as near to us as a railway at Euabalong would be.
 1883. How far is it from here to Carrathool? They call it 80 miles; but I think it would be something less than that in a direct line.
 1884. As a resident in this district engaged in farming operations, you do not think the proposed extension to Euabalong would benefit you or anyone else similarly situated? No. Another thing to be remembered is that the farming country is to the south of Hillston. We have to cart our wheat some distance to Hillston. I am 13 miles to the south of Hillston; I should be nearer Carrathool, of course, but further from Euabalong.
 1885. You would have to cart your wheat further to Euabalong, if there were a railway there, than you now have to cart it to Carrathool? Yes. Most of the wheat-growing land is further on towards Carrathool.
 1886. So that in reality the bulk of the farmers in this district would be at a very great disadvantage if they had to cart their wheat to Euabalong? Yes.
 1887. They would prefer to cart to Carrathool? Yes.
 1888. Is there much surplus wheat grown in this district? A great quantity.
 1889. And after supplying local requirements, the balance is sent to Sydney via Carrathool? Yes. Three years ago I sent my wheat to Sydney, and it cost me exactly 1s. a bushel from my paddock to Sydney.
 1890. You think the extension of a railway to Hillston would be of great benefit to this part of the country? Yes; it would have the effect of settling a great many farmers on the land. There is a large area of beautiful wheat-growing land which is now abandoned. It is scrubby, timbered country; but I think if it were tapped by a railway it would be all brought under occupation and cultivation.

1891. You think the cost of clearing the land and preparing it for the plough would not be so great as to preclude its profitable occupation? No; this year I cleared some of the heaviest timbered land in the district, and I did it within £1 an acre, including ringing and scrubbing. Of course, it had been lying five years since it was rung; but, including everything, I cleared it at within £1 an acre. J. R. Varcoe.
7 Oct., 1897.
1892. After ringing and scrubbing, you gave the timber five years to die, and then you started to burn off and make the land ready for the plough? Yes; it is now ploughed.
1893. You agree with previous witnesses that it is better to clear the land gradually in that way;—the land becomes sweetened in the process? Yes; it is very much easier to clear after the timber has been dead for some years. It is much better to clear the land then than to clear it when the timber is in its green state. It would cost you about £4 an acre to clear some of the land here when the timber is green. When the timber is dead, by using a team of bullocks and pulling the trees down you can very soon get it cleared. I have cleared a great deal of ground, and I engaged a man to grub it by hand. It cost me about 30s. an acre. This year I have adopted a different method, and I have got the land cleared under £1.
1894. By which route do you think a railway should come to the Hillston district? I think it should go as far to the south as practicable. Most of the wheat-growing country lies to the south of the proposed line.
1895. Would the route described yesterday by Mr. Kennedy run pretty well in the centre of the wheat-growing country? Yes; but there would be more wheat-growing land to the south of it than to the north.
1896. You prefer the route suggested in Mr. Kennedy's report to an extension *via* Euabalong to Hillston? Yes; a line to Euabalong would not tap the good agricultural country; it would keep to the north of it.
1897. It would be practically inaccessible to farmers in the Hillston district? Yes.
1898. By running a line to Wyalong you would traverse the wheat-growing country? Yes; Hillston is just on the margin of the wheat-growing country. The bulk of the land which would be taken up for agricultural purposes, and especially for wheat-growing, would lie to the south of the route described by Mr. Kennedy.
1899. In the event of that line being constructed in preference to the line to Euabalong, I suppose persons would adopt the method you have adopted of clearing, and, having taken up the land, they would, during the construction of the railway, ringbark and scrub it so as to have it ready for the plough shortly after the completion of the line? I have no doubt that immediately it were understood that the railway was to be constructed, the whole of the land would be taken up and prepared for cultivation where it was fit for that purpose.
1900. Do you think the railway would induce persons to come here and settle in any numbers? I am certain it would.
1901. Are you personally acquainted with any persons who would come here? Yes.
1902. What area do you hold yourself? 1,920 acres. I have 300 acres under crop this year. I have 700 acres which have been ploughed and cultivated. I cultivate blocks alternately, year in and year out.
1903. You do not crop one piece of land continuously for fear of wearing it out? No; I fallow in the spring and crop the blocks alternately.
1904. You have altogether 700 acres cleared and ready for the plough? Yes.
1905. Is the whole of your 1,920 acres suitable for wheat-growing? Yes.
1906. I suppose that if a railway were here, you would crop a larger area in rotation than you now do? Yes; I should like also to get a little more land.
1907. If persons were able to obtain areas of 2,560 acres, do you think they could profitably cultivate one-fourth of them year by year, working the blocks in rotation? Yes.
1908. How long would the land last, cultivated under such conditions? I have not been cropping long enough to ascertain that by experience; but I have not by any means worked out my own land yet.
1909. Land in South Australia and Victoria which has been under continuous cultivation for a series of years, has become gradually impoverished? Yes; and I have no doubt that in course of time the land here would wear out. If blocks were cropped alternately it would last much longer. This country, however, would be superior grazing country after it had been worn out for cropping. I gave an old cultivation paddock two years' spell some time ago, and I had my stock running on it. I found that it carried a great quantity, and that they got very fat. I killed a four-tooth merino wether which had been fattened there, and it weighed, when dressed, 90 lb. I am certain it would be impossible to get that weight on ordinary grassed land.
1910. Have you cropped that land since? Yes; I am cropping it now.
1911. Do you find that the rest did it any good? The ground was always growing good crops; it was not worn out when I gave it a spell.
1912. Is the present crop as good as the first crop you put into it? Not quite.
1913. Do you not think scientific farming might be pursued with advantage in a district like this? I have no doubt of it.
1914. You think a proper rotation of crops would keep the ground in good order for years? Yes.
1915. By continually cropping you gradually take away the elements required to bring the crops to perfection? Yes; I think it is a bad system.
1916. You think the establishment of an experimental farm in this district would be of immense advantage as an object lesson, showing the farmers here what they could most profitably grow? It might be of some use; but I am not very partial to experimental farms; I think the expense of them is hardly compensated for by the good they do.
1917. Do you not think they have done good where they have been established in other parts of the Colony? I know that they have done good.
1918. I suppose you know that persons who, as a rule, take up land have not had that extensive experience of farming which is desirable to enable them to carry on their operations to the best advantage? Quite so.
1919. Would not the establishment of a school of agriculture in this district, therefore, be of great advantage to such persons? No doubt it would be of some benefit; but in my experience they would learn more from their neighbours than they would from experimental farms.
1920. There can be no doubt the country you have described is most admirably suited for agriculture? Admirably.

- J. R. Varcoe.
7 Oct., 1897.
1921. And at the present time it is covered with scrub and abandoned to rabbits and native dogs? Yes.
1922. Looking at the matter commercially, would you be one of a syndicate to construct a line to Hillston as suggested? I certainly would if I owned the land.
1923. You would regard it as a profitable investment? Yes.
1924. What you as an individual would be prepared to do, you think the State might do? Certainly.
1925. Is the wheat grown here of good quality? Yes; it is fairly good; it is a quality of wheat which is very much sought after through its being so very dry.
1926. Is the flour of good keeping quality? Yes; very good.
1927. What is the average yield per acre? From 12 to 14 bushels.
1928. Would that be a payable crop? Yes; that would pay at, say, 2s. a bushel.
1929. Anything from that upwards would pay well? Yes; of course, the 2s. would be on the ground.
1930. Do you wish to add anything to your evidence? I have found that vines do well here. Grapes can be grown successfully, and either dried as raisins or turned into wine. I myself have some grapes growing, and they are doing very well. My fruit trees are also doing fairly well, but not as well as they would do in a more moist climate. They do very well in a wet season.
1931. I suppose they get stunted, and the fruit does not come to perfection? Yes.
1932. Do onions grow well here? Yes.
1933. And potatoes? No; vegetables generally require a great deal of water, and this climate is too dry for them.
1934. Do you think the dairying industry could be carried on profitably if there were a railway here to take away the produce? Yes; during the fifteen years I have been here I have had cows in milk and I found they do as well as they do in other places. I had experience in South Australia and Victoria, and I found cows as profitable here as anywhere.
1935. You think, then, that dairy-farming might be carried on in association with wheat-growing and other pursuits? Yes.
1936. Do you think the extension of a railway to Hillston would divert much traffic from Victoria? I think it would divert a good deal. I am not experienced in grazing pursuits, but I can see that a good deal of wool which now goes to Melbourne would go to Sydney if there were a railway here.
1937. Have you farmed in South Australia? Yes.
1938. You are as well satisfied with the capabilities of this district as with the capabilities of that in which you were farming in South Australia? Yes; I am doing better now than I was doing there.
1939. *Mr. Farnell.*] Is there a big area in the district cleared and ready for the plough? Almost everyone is clearing round about here this year. They plough the land as they clear it; I have cleared about 70 acres this year. It is all ploughed and ready for the crop next year.
1940. You think the Committee would be justified in recommending the railway on the score of the traffic which it would attract? Just so.
1941. You think that large areas would at once be brought into cultivation independently of an additional area which, under the process you have described, it would take five years to clear? Yes; I was referring to the thickly-timbered portions of the district. There is a great deal of land here which needs very little clearing, and it is still lying idle. There are thousands of acres which require hardly any clearing.
1942. You think that immediately the railway was in course of construction this land would be prepared for the plough? Yes; there would be a large increase in the area under cultivation immediately a railway was started.

Arthur Caldwell Sawtell, police-sergeant, Hillston, sworn, and examined:—

A. C. Sawtel
7 Oct., 1897

1943. *Chairman.*] You are a police-sergeant stationed at Hillston? Yes; I have been here thirteen months; I was previously at Jerilderie.
1944. You know the country from that point down to Toomwal? Yes.
1945. What are the boundaries of your district here? Our patrol district has a radius of 30 miles; the district over which I have authority under the Health Act is 200 miles by 170; it goes from Ivanhoe to Rankin's Springs, and from near Gunbar to The Hermitage railway station on the Bourke line.
1946. Your district includes Euabalong? Yes.
1947. What is the distance between Gunbar and Mount Hope? Roughly speaking, 100 miles.
1948. Do you know the population of the police district between these extreme points? The patrol district has a radius of 30 miles; that we give a population of between 1,300 and 1,400; the population of the town would be about 550.
1949. Do you know the country through which the proposed line would run? I know it as far as Wollongough.
1950. At what other places have you been stationed besides Jerilderie? I have been at Ivanhoe, Silvertown, Euabalong, Hillston, and Jerilderie during the last fifteen years.
1951. How long were you in the Jerilderie district? I was there for six years.
1952. What was the nature of the country there? I consider that, taking the country eastwards from here, it is superior to the country in the Berrigan district. It is rich loamy soil, and is superior to the soil in the Berrigan district.
1953. You know that the Berrigan district is very prosperous? It is; they have a slightly heavier rainfall—some 3 or 4 inches—than we have, and that I suppose is the cause.
1954. Do you think that railway communication here would bring about much increase of settlement? I do not hesitate to say it would. There is at present over-production, and wheat has to be sent to the metropolis, involving very expensive haulage.
1955. Have any farmers come from the adjoining colonies to this district in search of land? I know that persons have been here from the other colonies inquiring for land.
1956. What area of land would be sufficient to enable a man of limited means to get a living for himself and family? I think 320 acres of agricultural land in this district would be adequate for the maintenance of a family.
1957. You think a farmer here would also grow wool? Two acres would grow enough flour for his family for one year; 320 acres would give him a decent margin for the maintenance of a family. I might say that last year the returns were small; the actual returns of hay and grain were very poor. In our patrol district there were 5,064 acres under grain, and they had only 36,000 bushels; that would be under 8 bushels per acre.

1958. It was an exceptionally poor season? Yes; it came in very hot, and the grain soon shrivelled up. We had 3,840 acres under hay, yielding 2,600 tons, or not quite 1 ton per acre. There is in the pastoral district 222,913 acres of freehold, and 894,894 acres of Crown lands. Judging from the map before you there is a lot of alienated country round about Hillston, but going eastwards the unalienated area is greatly in excess of the alienated area. The quantity of Crown land would be four times that of the freehold land. A. C. Sawtell.
7 Oct., 1897.

1959. What is the quality of the land between here and Wyalong? I was a farmer in my young days, and I have a slight knowledge of good soil. I know that the soil between here and Wyalong is superior to the soil going west or north.

1960. Have you anything to add to your evidence? I have been in several places where a railway has been opened, and I know what a civilising effect it has had. I was here some thirteen years ago, and the district has since retrogressed. I suppose many persons have left the district, being heartily sick of asking for a railway. Nothing would give such an impetus to the place as a railway. The population has gone back since I was here thirteen years ago.

1961. You attribute the decrease in population to the fact that persons have become disheartened in not obtaining railway communication? I am quite certain that, together with rabbits, has had a serious effect.

Robert Stewart Varcoe, farmer, Newlyn, Hillston, sworn, and examined:—

1962. *Mr. Fegan.*] How long have you been in the district? Fifteen years. R. S. Varcoe.

1963. Where do you come from? From Deneliquin; I was farming there. 7 Oct., 1897.

1964. Do you know that proposal to construct a line from Condobolin to Euabalong? I have heard of it, but I do not know much of that part of the country.

1965. Do you know the country from here to Cudgellico? I know a good bit of the country for 30 miles north of the river, say—as far as Roto.

1966. Do you know anything of the country between Hillston and Wyalong? Not further than Monia Gap.

1967. How many acres have you? 1,280 acres; I have 400 acres under wheat, and I have been farming here for fourteen years.

1968. You have a selection? Yes.

1969. Are you in scrubby country? Some of it is open country, some of it is almost plain, some is thinly timbered, and other parts thickly timbered.

1970. What sort of country was the 400 acres you have now under cultivation? There were clumps of pine and yarran upon it; some of it was very thickly scrubbed, and on other parts there was scarcely any scrub at all.

1971. Why did you start there rather than in the plain country? The plain country was interspersed amongst clumps of timber.

1972. The portion you put under cultivation was not so thickly timbered as was the remaining portion? It was not so thick taking it all through.

1973. Your fifteen years' experience gives you a fair idea of the cost of ringbarking and preparing for the plough? Yes.

1974. Will you be good enough to give the Committee an approximate estimate? Most of my land could be cleared for about 5s. an acre, and the very thickest of it for 15s., but I do not mean to clear it straight away.

1975. You mean to ringbark the timber, to let it stand for four or five years, and then to burn it off? Yes.

1976. How long would it take you to get a crop in, dealing with the timber in its green state? I could have the land under crop next year; there is a lot of pine scrub, and you can pull that out with a team of horses after a shower of rain.

1977. The pine scrub can be pulled out in a green state? Yes.

1978. How much would it cost to clear the more thickly timbered portions of your holding in the green state? I do not think it could be done under £2 an acre.

1979. At the outside it would not cost more than £2 10s.? That would be the outside price.

1980. For how many years have you grown wheat? Fourteen years.

1981. And how many seasons out of the fourteen have you had failures? We had one in 1888, but that was as much through the rabbits as through the dry weather. But for the rabbits we should have had some crop.

1982. You lost that crop chiefly through the rabbits, you think? Yes.

1983. What is your average yield? From 12 to 13 bushels. Our best return would be about 24 bushels, and our lowest about 9 bushels.

1984. Do you grow wheat continuously, or in alternate years? Continuously.

1985. Do you not find that year by year the productive capacity of the land is decreasing? A little, but not a great deal. I have one paddock turned out this year for the first time. Last year it yielded three bags, and it was cropped for thirteen years continuously. The three bags was above my average all through.

1986. Taking the fourteen years, you have not found much difference in the productive capacity of the soil? No.

1987. But, as an experienced farmer, you know that ultimately a decrease must come if wheat is continuously grown upon the same area? Yes.

1988. Where do you send your wheat? To Sydney *via* Carrathool.

1989. Is any sent to the local mill? Very little.

1990. Why? Because they do not need it. There is more than enough wheat grown locally to supply the mill.

1991. Will you tell the Committee at what price you can grow wheat profitably? For about 2s. 3d. I should not care to grow it for less than that, although I have sold it for less.

1992. You have sold it for 1s. 8½d.? Yes.

1993. What has been your best price? Four and sixpence.

1994. What is your road carriage to Carrathool? About 6d. per bushel. It costs me about 11d. a bushel to get the wheat to Sydney. 1995.

- R. S. Varcoe. 1995. If a railway were constructed to Hillston, at what price do you think you would be able to get your wheat to Sydney? I do not know, but I should say it would be much cheaper than the price we have to pay now.
- 7 Oct., 1897. 1906. What would you expect to have to pay? I suppose we should be able to get our wheat to Sydney for 6d. per bushel, or a little over.
1997. Supposing that it were found that the railway would not pay working expenses and interest, do you think the farmers round about Hillston would be willing to pay local rates? I can only speak for myself; as long as the rates were not excessive I should not mind.
1998. You would not object if you could get the wheat carried cheaper than you now get it carried by road and rail? No.
1999. Do you grow anything else besides wheat? A neighbour of mine is growing barley, oats, and maize this year, and they seem to be all doing well.
2000. Do you know the number of acres he has under crop? No; it is only a small plot—an experiment. I am experimenting in a small way with lucerne.
2001. How have you succeeded? I was rather late in sowing; some of it is doing well, other parts are not doing well.
2002. Does lucerne generally do well in this district? It has never been tried, except in small plots.
2003. In what direction is your holding from Hillston? It is nearly due south, perhaps slightly to the west.
2004. How far would you be from the suggested railway? About 20 miles; Hillston would be my nearest point.
2005. No matter by what route a railway came to Hillston you would be within 20 miles of it? Yes.
2006. Have you your holding fenced? Yes; but the fencing is not all rabbit-proof—some of it is six-wire fencing, and some is wire-netted.
2007. How many acres have you which is fenced in with rabbit-proof fencing? 640 acres; my cultivation paddock is included in that.
2008. Have you many rabbits? No; they are very scarce now.
2009. Chiefly on account of the drought? Yes.
2010. I suppose, in view of your past experience, you would not put in any more wheat without having the paddock rabbit-proof fenced? No.
2011. I suppose it is your intention when you can afford it to fence the whole of your holding with rabbit-proof fencing? Yes.
2012. Do you think that by poisoning and rabbit-proof fencing you would be able to cope with the rabbits? Yes.
2013. They do not give you the same anxiety as they formerly gave you? No.
2014. And you believe that with rabbit-proof fencing you would be able to completely master them? Yes.
2015. Had you any cattle or sheep on your holding? I have a few cattle—about twenty head—but no sheep at present.
2016. Do you think you would increase your stock if there were a railway here? No; I should put more land under crop.
2017. You think that would pay much better than cattle or sheep? On small holdings, yes.
2018. How is your run watered? By wells and tanks.
2019. How far do you have to sink for water? About 100 feet.
2020. Did you do the sinking yourself? Yes. It costs me about 10s. a foot; we go through clay of all kinds.
2021. Do you get good water at that depth? It is brackish; but the stock will take it.
2022. It is of no use for irrigation purposes? I do not think so.
2023. I suppose you have not tried deeper than 100 feet? No; there seems to be the same level of water all through this country.
2024. Have you grown any fruit? I tried it; but it did not do well. I tried peaches, pears, apricots, oranges, quinces, and grapes. They did well at first, but in 1888 they seemed to get stunted; the white ant then started to eat them, and killed them off. I have not tried growing any since.
2025. Where do you buy your fruit? Most of it comes from Sydney; plenty of fruit is grown locally in the season.
2026. You think with closer settlement, such as would be induced by a railway, you would suffer less loss from dogs and rabbits? Yes.
2027. You think a line in this district would ultimately pay? I have not the slightest doubt of it.
2028. And that this would become a huge wheat-producing district? I am quite sure of it.
2029. Do you wish to add anything else to your evidence? I know a place in the mallee country, about 20 miles south-east from here. It was rolled down at about this time of the year, and was under crop in the following April, at a cost of about 4s. an acre.
2030. You think that if there were a railway here persons would be induced to take up abandoned resumed areas which contain mallee? I think that as soon as a definite promise of construction was given the land would be rushed.
2031. Where do you think the people would come from? A good many, I think, would come from Victoria. I know they are coming from Victoria now.
2032. Are any of your friends in South Australia making inquiries about land in this direction? One or two have done so.
2033. Where do you think the persons would come from who would settle in this district? I am going chiefly by what I have seen when railways have been thrown open in other parts of the Colony.
2034. You think that is a fair criterion of what is likely to happen here? I do.
2035. Do you think dairying operations could be carried on profitably? I do; I dairy myself, to a certain extent. We make our own butter, and we can do fairly well in cool weather.
2036. Do you think you would have a good market at Wyalong for dairy produce? From what I have heard of the Wyalong country I do not think it would be very long before they would produce all they required themselves.
2037. What sort of potatoes are you growing? They are called the "Federation."

2038. Are they a kind of Early Rose? Yes, I think so; I got them from Anderson, the seed merchant, R. S. Varcoe, in Sydney.
2039. This is the first time you have tried them? Yes. 7 Oct., 1897.
2040. What area have you under potatoes? About a quarter of an acre.
2041. And having regard to the small quantity of rain you have had, they are looking very well? Yes, quite as well as one could expect.

Alexander Cameron, homestead lessee, Murrumbong, Mossgiel, sworn, and examined:—

2042. *Mr. Farnell.*] What area have you? 10,240 acres. My brother is in partnership with me; he has another lease of equal extent adjoining mine. A. Cameron.
7 Oct., 1897.
2043. You gave rather lengthy evidence before the Sectional Committee at Mossgiel, which inquired into the proposed extension of the railway from Condobolin to Broken Hill? Yes.
2044. Do you adhere to the statements you made on that occasion? I think they were fairly correct.
2045. You know that this Committee is inquiring into a proposal to construct a line from Condobolin to Euabalong? Yes.
2046. Can you tell the Committee what bearing the construction of that line would have upon the development of the country in the Mossgiel district? I think the extension would, undoubtedly, have the effect of developing the country out west. It would afford us a means of getting our wool and produce to market at a cheaper rate. Persons would also be able to get fat stock away. I think the railway would have a good effect.
2047. Because it would lessen your road carriage to Condobolin by 48 miles? Yes; we should benefit to that extent.
2048. Do you think the Government would be justified in extending the railway to Euabalong without making Hillston the objective point? I do not think so.
2049. Why do you think the line should be extended to Hillston? It would have the effect of putting under cultivation a large area of country which is now comparatively worthless. The resumed areas which are now out of occupation would be occupied; and the closer settlement which would follow would be a means of keeping the rabbits in check. The railway would also afford facilities to persons far west of Hillston, not only to get fat stock to market, but—and that is sometimes of greater importance—to get them out of the district in the time of drought. In our district we consider that in the time of drought our stock are practically yarded. We cannot get them away. If a drought comes the stock must die. We can struggle on by cutting scrub for them; but as for getting them out of the district, that is impossible. I think that a railway would be extensively used in a time of drought for the conveyance of stock to country where there is feed.
2050. Do you know the country between Euabalong and Hillston? Yes.
2051. Which do you think would be the better country to go through—from Euabalong to Hillston, or from Wyalong to Hillston? You would pass through better country in coming from Wyalong to Hillston. A greater portion of land is alienated between Euabalong and Hillston than between Wyalong and Hillston.
2052. You think the land between Wyalong and Hillston is also superior—that it would be more easily worked and brought into use, and that more land would be available? Yes; there is more available land suitable for wheat-growing.
2053. But you would be prepared to support any railway providing you got it to Hillston? It would certainly be advantageous, so long as it connected us with Sydney. It would, of course, be better to have a railway from Condobolin to Hillston than to have no railway here at all.
2054. But on national grounds you advocate the Wyalong route? Yes.
2055. You think that Grenfell, in the near future, will be entitled to railway communication, and that Wyalong will also be entitled to it, and that a railway passing through both places to Hillston would meet all requirements from a national standpoint? Yes.
2056. What about the traffic on a line to Hillston? I think that if a line were constructed to Hillston, a large quantity of wool would go to Sydney by that line, which now goes down the Murrumbidgee to Melbourne—a very large quantity indeed.
2057. What quantity do you suppose there would be? I thought it out a little while ago. From the north side of the Lachlan I reckon that 10,000 bales would go.
2058. What is the average return of wool within 20 miles of Mossgiel? 4,000 bales, perhaps.
2059. Where does that wool now go to? Some of it to Melbourne, and some of it to Sydney.
2060. I suppose the major portion of it goes to Melbourne? I think so.
2061. Notwithstanding the inducements offered by the Victorian Government, you think it quite possible that if a railway were constructed here the Sydney market would be largely used? I think so. One large owner told me on the day on which I started to come here that he had 40,000 or 50,000 sheep, giving 500 or 600 bales of wool, which always goes to Melbourne; he said that if a line were constructed to Hillston he would send his wool to Sydney, because he would have only 60 miles of cartage against 180.
2062. Can you give me any particulars as to road carriage in your district? The road carriage to Hay varies from £3 to £5 10s.; the old union rate was £5 10s. Mossgiel is 100 miles from Hay.
2063. What do you estimate as being the chief drawback to settlement in your district? Insufficient means of transit, as regards agricultural settlement.
2064. Do you think it probable that within a reasonable time after the construction of a railway to Hillston, there would be rapid agricultural developments in your district? I think so.
2065. Have you had any experience in farming? Not a great deal. I have always grown a little stuff for my own use, but I am not a farmer.
2066. Do you think it likely that mixed farming could be carried on successfully in your district if you had facilities for reaching market? Yes; I think dairying, combined with wheat-growing, could be very successfully carried on.
2067. You have some idea of the cost of clearing land? I have.
2068. What would be the highest and lowest prices paid? It would vary from almost nothing up to £3 per acre.
2069. How long do you think it would be before the present area settled would be trebled or quadrupled if a railway were constructed? It would certainly, I think, be quadrupled in three or four years.
- 2070.

- A. Cameron,
7 Oct., 1897
2070. You think there is sufficient available land to ensure that a large volume of traffic would be brought to the proposed railway almost immediately after its construction? Not immediately, perhaps; but there would be a large increase of traffic immediately people had time to get to work upon the land.
2071. There would be no need to wait for five or ten years for the traffic? Certainly not.
2072. Supposing the Railway Commissioners thought it advisable to impose what is known as local rates upon the section between Koorawatha and Hillston, or upon whatever point the line might touch the railway system, do you think the people here would be prepared to pay them? Judging from my own feeling in the matter, I think they would be. I myself would be prepared to pay rates a little higher than usual.
2073. It would be a question whether the local rates were cheaper than road and railway carriage in another direction? Yes.
2074. Until a line proved itself fairly remunerative you think, then, there would be no objection to pay local rates to make up interest and working expenses? Judging from my own feeling in the matter, there would certainly be no objection.
2075. Where do you send your wool? I am sending it to Sydney; and some years I send it to Melbourne and others to Sydney.
2076. What would be a reasonable area to allow for the making of a living? Nothing less than 640 acres for agriculture.
2077. Are there any signs of mineral deposit in your district? I would not say that it is a mineral district; it is not prospected. A little to the north of us there is a little mineral-looking country—on towards the Mount Hope country. There is plenty of mineral land between Wyalong and Hillston.
2078. Do you think the establishment of an experimental farm in the district would be productive of much good? Yes, I think so. Having regard to what these farms have done in other places, I think one here would have a very beneficial effect.
2079. Do you think the putting of a series of weirs on the Lachlan would induce much settlement? It would be of advantage to those in the immediate vicinity of the weirs; but I have not a very great opinion of weirs. We have had a weir on the Willandra Billabong for about three years. About three months after it was constructed the water came past Mossgiel, but it has not since come there. That, of course, is not due to the weir, but to the fact that there has not been much rain.
2080. Is there anything you would wish to add to your evidence? I would like to impress upon the Committee the vast importance of a railway here to graziers out west, as regards getting away their stock in time of drought. It is a matter of much greater importance than many people suppose. We have already passed through a terrible drought in our district. You will remember that heavy rains fell in June in the Central Division; when there was plenty of grass there our sheep were absolutely dying, and did die in thousands. We had very little rain out our way; they got rain higher up the Lachlan months before we got it, and had we had the means of getting our stock away to places where rain had fallen, we should have saved tens of thousands of sheep which actually died on our holdings.
2081. *Chairman.*] Could you have got the sheep from where they were depastured to Hillston? Yes, we would have got them so far; we should have lost a few, of course, but a great many would have been saved.
2082. I suppose that the evidence you are now giving applies to the whole of your district? —
2083. Another advantage of a railway to Hillston would be that you would be able to send away small lots of fat stock which you cannot send away at the present time? Yes; that would be a great advantage. In the immediate vicinity of Hillston a very profitable trade would be done in fat lambs. Such a trade is out of the question without a railway.
2084. Do you think there is any probability of freezing or tinning works being started here if there were a railway? I think it quite possible.
2085. The district is not so much noted for fat stock as it is for wool? At times stock fatten here very well indeed. North-west from the Lachlan towards Mossgiel is all fattening country.
2086. *Mr. O'Connor.*] I suppose if settlers here went into it properly they could produce fat stock equal to those produced in any part of the Colony? Yes.
2087. *Chairman.*] And you think it quite possible that with railway facilities there would be a considerable traffic in chilled meat? Yes.

Bernard Wright Doyle, farmer, Gunbar, sworn, and examined:—

- B. W. Doyle,
7 Oct., 1897.
2088. *Chairman.*] I presume you have given the proposal before the Committee some consideration? Yes.
2089. Would a line from Condobolin to Euabalong be of any benefit to settlers in your locality? None whatever.
2090. Would the extension of that line to Hillston be of any use to them? That would be of great benefit.
2091. What is your holding? 3,200 acres.
2092. How much of that area have you cultivated? 500 acres.
2093. Are there many other farmers in your locality? There are a few, but they are scattered.
2094. What would be, approximately, the size of their holdings? They would average 1,000 acres.
2095. I presume you combine agriculture with grazing? No; I just run a few killing sheep. I confine myself principally to farming.
2096. Where do you get your market? We truck at Carrathool to Sydney.
2097. What is your distance by road to Carrathool? Fifty-three miles.
2098. At what distance would you be from the railway at Hillston? Twenty-two miles.
2099. I presume you find the road carriage to Carrathool a heavy handicap? Yes; it is 6d. per bushel. As matters now stand, we must send our wheat away direct out of the paddock, whether the market is good or not. With a railway here, we could store or send wheat away as we liked. The distance would not be so great, and there would be a means of getting the produce away.
2100. So that you could farm to better advantage? Yes.
2101. The construction of a railway would be an inducement to other persons to settle in your district? Yes.
2102. Do you think an extension from Hillston *via* Euabalong will be the best railway to construct in this district? No.
2103. What route would you suggest? I think a railway should take the route suggested by Mr. Kennedy.
2104. That would open up an enormous area of wheat-growing country? Yes. 2105.

2105. Have you resided long in the district? Fifteen years. B. W. Doyle.
 2106. You are very well satisfied with your prospects? Yes. 7 Oct., 1897
 2107. Notwithstanding the difficulties with which you have to contend, you manage to struggle along? Yes.
 2108. Your experience in farming is confined to this district? Yes.
 2109. At what distance from the railway line do you think an agriculturist could work a farm profitably? Twenty-five miles.
 2110. You corroborate the evidence of the previous witness as to the general resources of the district? Yes.

William Smith Arnott, post and telegraph master, Hillston, sworn, and examined:—

2111. *Mr. O'Connor.*] For how long have you been stationed here? A year and nine months. W. S. Arnott.
 2112. You know the object of our visit here? Yes. 7 Oct., 1897.
 2113. Have you prepared a return showing the business done in your office? I have prepared a return showing the business done during 1896. The letters posted were approximately, 87,626; the number of money orders issued was 929, and the number paid, 296; the number of deposits in the Government Savings Bank was 289, and the amount of the deposits £3,147 1s. 2d.; the number of telegrams sent was 5,520, and the number received, 5,302; the revenue received from all sources was approximately, £1,337.
 2114. And last year was a comparatively bad year on account of the drought? Yes.
 2115. Where were you before you came to the post-office here? I was in the head office in Park-street.
 2116. You have had an opportunity of observing strangers who have come into the district? Yes.
 2117. Have you heard them express any opinion as to settlement here? Yes. Our great want is a railway, and I do not think there will be much settlement until we get it.
 2118. If you had a railway you think the district would be much improved? Undoubtedly.
 2119. *Chairman.*] Has the district advanced or receded since you came here? I think it has slightly advanced. The business of the post-office this year is a little in excess of that of last year.
 2120. It shows that the district would be a progressive one, you think, if there were railway facilities? It is undoubtedly progressive.

Benjamin Varcoe, miller, Hillston, sworn, and examined:—

2121. *Chairman.*] You gave evidence as to the extension of the railway from Condobolin to Broken Hill? Yes. B. Varcoe.
 2122. You confirm that evidence, and you desire to express an opinion with regard to the proposed extension from Euabalong? Yes. 7 Oct., 1897.
 2123. *Mr. Fegan.*] I understand that you have been residing in the district twenty years? I have been fifteen years in this district.
 2124. And you are the owner of the local mill? Part owner.
 2125. Is it in the hands of a company? There are four of us—myself, my brother, Mr. Fullarton, and Mr. Lynn.
 2126. Have you carried on farming operations? Yes; I started here as a farmer.
 2127. Have you any land now? Yes; in conjunction with my son, Robert Varcoe, who was examined here to-day.
 2128. What was your return last year from milling? I think in the present year we have milled about 400 tons of flour.
 2129. You remember the evidence you gave before the previous Sectional Committee? Yes; I do not think I could add much to it.
 2130. Is your mill kept fully going during the wheat season? No; since we have had the mill we have not worked, on the average, four months a year. We have not the output; we do not send any away; we only put through what is sold locally. We do not send any to Sydney; the carriage would be too expensive.
 2131. You could not compete with other centres on account of the road carriage and the railway freight? No; the distance is too great.
 2132. Do you know the country between here and Euabalong? I have been over it; but I cannot say I am well acquainted with it.
 2133. You know the proposal before the Committee;—we should like your opinion in regard to it? I do not think the railway would be at all beneficial to this part of the country; it would not affect us in any way. We should still deal with Carrathool.
 2134. You know there is an agitation on foot for the extension of the railway from Wyalong to Hillston? Yes; I think it would be a very good line.
 2135. What would your machinery and plant turn out a year, if you had access to market by an inexpensive route? We could turn out 40 tons of flour a week, or 4 sacks an hour.
 2136. Your present market would be considerably enlarged if a railway were brought to Hillston? Yes; we should have the Sydney market to which to send all our surplus, and it would pay us better then to keep the mill constantly at work.
 2137. What are you paying the farmers now for their wheat? Ever since we had the mill, we have generally kept at 6d. below Sydney quotations. The farmers, of course, would like us to take all their wheat, but we are not in a position to do so.

David Gormly, Road Engineer and Council Clerk to the Municipal District of Hillston,
sworn, and examined:—

D. Gormly. 2138. *Chairman.*] You have collected some information for the Committee? Yes; I have the following particulars:—

7 Oct., 1897.

MUNICIPAL DISTRICT OF HILLSTON.

Incorporated, 11th December, 1888. Area, 50 square miles—32,000 acres, made up as follows:—

	Acres.
Alienated, and under lease.....	14,440
Lands reverted to the Crown through exchange, and now being surveyed for sale.....	5,728
Town lands mostly surveyed in $\frac{1}{4}$ acre allotments (sold).....	500
Other Crown lands, including temporary common, reserves, stock routes, roads, &c.....	11,312

Total..... 31,980

Number of buildings within a radius of 1 mile of the Post Office.

Dwellings and residences	113	Churches	3
Combined shops and dwellings	16	Hospital	1
Hotels	4	Convent	1
General stores	4	Council Chambers, including Free Public Library and Mechanics' Institute... ..	1
Other shops and business places	14		
Patent roller flourmill	1		
Brickmaking premises	1	Total number of buildings (town)	165
Public buildings—		No. buildings outside town boundaries—	
Court-house (including lands)		Dwellings	27
Office, &c.	1	Hotels	2
Gaol	1	Wool-scouring establishment	1
Police station	1		
Post office	1	Total number of buildings (Municipality)	195
Schools.....	2		

Population.

Estimated population 6th October, 1897. Town	661
Outskirts	133
	Total..... 794
As per census 1891.....	741

Number of electors on municipal roll.

No. of electors on the roll, 1st February, 1897	234
---	-----

Values.

Estimated capital value (on 2nd February, 1897) of the freehold of improved property.....	£106,133
Capital value of the freehold of unimproved property on the 2nd February, 1897	18,024
Estimated capital value of the freehold of all ratable property	£124,157

Assessment and rate, 1897-8.

Assessed annual value of buildings, &c.....	£4,832
Assessed value of unimproved lands (5 per cent. of capital).....	901
	Total..... £5,733
General rate (no special rates) 1s. in £	£286 13 0

Roads, streets, lanes, and footpaths.

Length and estimated value—

miles	chains		
...	20	Metalled	£225
7	0	Formed.....	840
15	0	Cleared	600
1	20	Footpaths.....	350
1	20	Kerbing and guttering	1,200
...	3	Bridges and culverts	710
27	60	Natural surface
Total	52 43	Total value	£3,925

Municipal revenue.

Municipal revenue for the past year from all sources.....	£589 6 1
---	----------

2139. *Mr. Farnell.*] You have given us your assets, but what about the debit side of the account? We have nothing to speak of on that side. We have no loans or other indebtedness. We have a very small current account.

2140. You have no debentures running? No.

2141. According to the figures you have given there has been an increase in your population of sixty in six years? Yes.

2142. How long have you been here? Seven years.

2143. From your knowledge of the district what would you say were the causes of its want of progress? I think the want of railway communication has been the main cause.

2144. You think that if there were railway communication there would be rapid agricultural developments? I am sure there would.

2145. You are suffering from the want of facilities to get your produce to market? Yes.

2146. Do you think a railway to Hillston would be largely used for the transfer of starving stock to districts where there is good feed? Yes.

2147. Would it also be a means of diverting to New South Wales traffic which now goes to Victoria? Yes; besides creating new traffic.

2148. Do you know the country between Wyalong and Hillston? I know it about Wyalong and Hillston, but that is all.

2149. You do not think that the proposed extension from Condobolin to Euabalong would materially benefit the Hillston district? I think not.

2150. Do you think that extension would divert any traffic from Victoria? No; it might take a little wool which now reaches the New South Wales railway system at other points, but that would be all.

2151.

2151. You think there might be some justification for the extension to Euabalong if Hillston were considered the objective point? Yes. D. Gormly.
2152. Has the entire district progressed during the seven years you have been here? It has progressed a good deal in agricultural settlement. 7 Oct., 1897.
2153. There is an indication that those who have settled here are satisfied with the returns they are obtaining from the soil? Yes; they appear to be well satisfied.
2154. Do you think that if a railway were constructed to Hillston there would be much increase in the settlement here from the other colonies? I believe that if there were a railway a great many persons would come here, especially from the Wagga district. During a recent visit to that district I drew the attention of persons there to the land on this side, and they said, "Wait till you get a railway, then we will very soon come across."
2155. Do you think the persons in this district would be prepared to pay local rates if they were not too excessive? I think they would be glad to pay a little extra in consideration of railway convenience.
2156. Is there anything you can add to your evidence? No; except that I think the dairying industry in fairly good years could be carried on here well. They might conserve fodder for bad years; any quantity of fodder plants will grow here. I have tried a small patch of lucerne, and it seemed to do very well. Mangel-wurzel, and kale, and other plants of the kind will do very well without irrigation. Grape-vines also seem to thrive here, and in a fair season fruit-trees generally do well. The great point, of course, is proper cultivation. If the soil here is properly cultivated it will produce almost anything.
2157. Do you think mixed farming could be successfully carried on in the district? Yes; I think if there were close settlement we should also have a better chance of getting rid of the rabbits and other vermin. Water can be got at a depth of 100 feet, and it is easy sinking—mostly through clay and drift. Close round about here water has been tapped at 35 and 40 feet, and the water has proved good for irrigation purposes.
2158. *Chairman.*] You think a large area of land along the route suggested by Mr. Kennedy would be admirably suited for agriculture? Yes, I believe it would all be taken up.

Alfred Bickford, farmer, Woodlands, near Hillston, sworn, and examined:—

2159. *Chairman.*] You have given some consideration to the proposal before us? Yes. A. Bickford.
2160. Do you think the railway would be of any benefit to the Hillston district? It would be of no use to the farming community here if it stopped at Euabalong. 7 Oct., 1897.
2161. You do not think the Government should extend the railway only to Euabalong? No.
2162. To be of any use it must come on to Hillston? Yes.
2163. Do you think it would be the best route to Hillston? From a national point of view I think the other route which has been suggested to you would be the better one.
2164. You have a good knowledge of the districts through which that line would pass? Yes; from reading reports, from inquiries I have made, and from my own observation.
2165. You think the land is more suitable for settlement on that route than on the other one? Yes; it is better agricultural land. When once it had been used for mixed farming it would be splendid grazing land.
2166. More productive, you think, than the land between Condobolin and Euabalong? I should say so, certainly.
2167. You have heard the evidence of previous witnesses? Yes; and I can corroborate it as regards this district.
2168. How long have you been resident here? About seven years.
2169. What is the size of your holding? I have had 320 acres, but I am taking up a larger area.
2170. Have your farming operations been successful? They have been better in this district than in any other; I have been farming all my life. I have been from Moama down to Swan Hill, and out by Moulamein on the Edwards. This country is quite as good as the Moama country, and far better than the Moulamein country.
2171. You are perfectly satisfied with your venture in this district? Yes; I am satisfied that if I get a good outlet to market I shall be able to make a comfortable living for myself and family.
2172. The want of cheap means of communication has retarded your progress? Yes; and the want of capital; I started with nothing, and I consider I am well off now. I have worked hard, and have done a great deal of the work myself. I find that it has paid me well to do so.
2173. What you have done you think others would do if inducements were held out to them to settle here? I am sure they would.
2174. Do you yourself know of any persons who would be willing to come here if there were a railway? Yes. Yesterday some men came into the town from Sandhurst and Ballarat. Some homestead selections were thrown open on South Marowie. I showed them the blocks, and they said they would apply for them. I said, "Why don't you see the country; why be in such a hurry?" They said, "We will apply for them, because we know before long the country will be rushed; there are others who are waiting to follow us up if there is any hope of a railway." They said they were sure that if there were a railway the whole of the blocks open to-day would be taken up—that many persons would not come here until they were satisfied that there would be railway communication. The men to whom I have referred have taken the land without seeing it; they were afraid if they waited until the next land day it would not be available.
2175. They took the land on your recommendation without inspection? Yes; one man came in and wanted the blocks which had been already taken; he was going to take them up to-day, but they had gone.
2176. What area do you think would keep a man comfortably? From 640 acres up to 2,560 acres; it depends upon his means.
2177. Have you anything further to add? When I came here the first thing I did was to dig up a little plot of ground for garden purposes. I put in a couple of dozen fruit-trees and half a dozen vines. I dig the ground once a year and I get splendid returns. Peaches, apricots, figs, grapes, and quinces have grown best. The flavour of the peaches is particularly good; they beat the peaches grown in the Chinamen's gardens, and they grow without irrigation. I find that Briggs' "Red May" is the best peach to grow; they ripen about the beginning of December. The cherry and plum trees I put in for trial did

- A. Bickford. not do well; the climate is also too dry for pears and apples. A mulberry-tree I have put in has grown exceedingly well. Last summer was a very trying summer; I had splendid grapes up to a certain point; but the hot wind came and dried them up. I have tried bird-seed of various kinds, and it has done very well.
- 7 Oct., 1897. 2178. Have you tried oranges and lemons? Yes; my brother-in-law has some orange-trees which have done splendidly; they were three years old last year, and were weighed to the ground with fruit. The only attention they get is the digging of the ground 8 inches deep once a year; they receive no watering. By picking localities, oranges, peaches, and apricots can be well grown. In connection with the cost of clearing, I should like to say that I let a contract to a man at 37s. an acre; it was heavy box country, and he made £2 a week clear of his expenses. He had to clear it to my satisfaction. As to green pine country, this last winter I cleared some of it at a cost of about 15s.
2179. There is no great difficulty in getting rid of the pine? No; as for the belar country, I had some on one side of a wire-netting fence, which was rung. I am quite sure it would feed one sheep to the acre. On the other side of the net there was not anything green to be seen. If the belar country is cleared, and the rabbits are kept down, it is just as good country as there is on the borders of Victoria.
2180. Do you think dairying might be carried on here? Yes; it is healthy country for cattle; I have seen no disease among them.
2181. Do you think dairy-farming will be a profitable industry? Yes; and sorghum will grow very well here. Last year some grew to a height of 9 feet with one rain; the only thing we want is the railway.
2182. How many of the fifty-one blocks of homestead selections to which you have referred have been taken up? Seven.
2183. Has the district progressed since you came to it? Yes; from my place to the south there was only one farm; now they are on both sides of the road for 6 miles out. If there were a railway here, people would only be too glad to take up the country, rough as it is.

James Macbeth Fullarton, storekeeper, Hillston, sworn, and examined:—

- J. M. Fullarton. 2184. *Mr. Fegan.*] You have been here how many years? Twenty years.
- 7 Oct., 1897. 2185. So that you have a fair knowledge of the capacity of the district and its prospects? I think so.
2186. You gave evidence before the Sectional Committee which visited Hillston last year? Yes.
2187. You endorse that evidence? Yes.
2188. Have you anything to add to it? I have since then cleared 100 acres at my farm; it was very heavy timber, and the clearing cost me £1 an acre.
2189. Was it ringbarked beforehand? I am including the cost of ringbarking, clearing the land, and making it fit for the plough.
2190. How long did you allow the timber to stand? About twelve months; it was principally pine.
2191. Have you ploughed the land? I am ploughing it now.
2192. You had some land under crop when the last Sectional Committee were here? Yes.
2193. How many acres have you under crop at present? 210 acres under wheat.
2194. For hay? I might cut some of it for hay.
2195. I suppose the cost of carriage to and from Carrathool which you gave to the former Committee applies to to-day? Yes, substantially; the rates are a little higher this year on account of the drought.
2196. Have you known the district to be more prosperous than it now is? Yes; prices have been better.
2197. Has the price of wheat been better? No; for the last two years the price has been good; but there has been no quantity on account of the drought.
2198. Is the population greater to-day? The population is at a standstill just now; I attribute it to bad seasons, and to the difficulty of getting produce away. We should have a much larger population here if produce could be got away.
2199. With what centres do you trade? Now that the river is stopped we trade entirely with Sydney.
2200. For many years you traded with Melbourne? Yes.
2201. Are there many business people here who, like yourself, have transferred their trade from Melbourne to Sydney? They have nearly all transferred it to Sydney now.
2202. Is it a better trading centre? I cannot say it is better. Of course, everything has to be bought in bond in Melbourne, and it is more convenient to trade with Sydney on account of the regularity of transit by rail.
2203. You find that river transit is irregular and that the time occupied is uncertain? That is the great disadvantage.
2204. Can you assign any other reason for the population being at a standstill? Those are the two principal reasons.
2205. A railway would make a big difference, you think? Yes; to the whole district, because the whole of the vacant land in it would be occupied.
2206. You are of opinion that the district would become closely settled if there were a railway here? Yes; if there were a railway here, Hillston, for the time being, would be the centre of a large amount of traffic from Mossiel and Ivanhoe, and those districts, which now goes to Melbourne.
2207. Do you know the country between Condobolin and Euabalong? No; but I know it well between Euabalong and this point.
2208. Do you think a line from Condobolin and Euabalong would serve this district as well as a line from Wyalong? It would not be such a good line, because there is not the same population to be served on that route, and the land is not agricultural land.
2209. You think it is not fit for close settlement? Certainly not.
2210. What would you call the major portion of the land between Euabalong and Hillston? It is fair grazing country; the best part of the land between here and Euabalong has been bought up.
2211. Do you know the country in the direction of Wyalong? As far as Rankin's Springs.
2212. What sort of country is it? With the exception of the ranges, it is all excellent agricultural land.
2213. Then I understand you favour railway extension to Hillston, but that you think the line ought not to come *via* Euabalong? Quite so.
2214. From what point would you take the line? From Wyalong; it would be more suitable for settlement; and there would be a better prospect of the line paying in course of time.
2215. You think there would be a greater volume of traffic in that direction? I certainly do.

J. M.
Fullarton,
7 Oct., 1897.

2216. How is that country watered? It is not well watered.
 2217. Not as well as the country on the line between Euabalong and Hillston? Certainly not.
 2218. Do you think that the shortness of water would be a drawback to railway construction by that route? I suppose they would get over the difficulty by conserving water as they do in other directions.
 2219. Do you know what the average rainfall is between here and Euabalong? No; only that the further east you go the rainfall is greater.
 2220. Have you grown any barley in this district? Yes.
 2221. How did you succeed? Splendidly. I have grown sorghum very well. I grew 10 or 15 acres for my own stock. I do not know what I should have done without it. I had 15 acres of it last year, and put forty head of stock upon it. It was a great saving. This year I am trying Hungarian millet.
 2222. You think that both wheat and barley will grow well here? Yes; I have had splendid crops of barley and wheat. Oats require a moister climate; the heat dries them up.
 2223. Have you anything to add to your evidence? Yes; I notice it has been stated in the newspapers that by the bringing of a railway to Euabalong a lot of trade which now goes to Melbourne would come to Sydney. To my own knowledge trade in that direction goes to Sydney, and has been doing so for years.
 2224. How far out west would it be necessary to construct a railway to take the Victorian trade? You would catch a lot of the trade if you came as far as Hillston. The trade of Roto goes to Melbourne now, also Coombie, Yathong, North Merowie, Willandra, Hunthawong, Little Willandra, Moolbong, and Trida. The whole of that wool goes to Melbourne now, and it would come to Sydney if there were a railway here.
 2225. Do you know if any of the farmers here have tried bees? Yes, and they seem to do very well; this part of the country is infested by wild bees.

Patrick Smith, grazier, Hay, sworn, and examined:—

2226. *Mr. O'Connor.*] How long have you been in the district? Ever since I was born, with the exception of the last ten years. P. Smith.
 2227. You know the proposal to construct a railway between Condobolin and Euabalong? Yes; I know the country well. 7 Oct., 1897.
 2228. You think the line ought not to be left at Euabalong? Certainly not.
 2229. You know that it is intended ultimately to extend the railway to Hillston, and that it is proposed as an alternative that the railway should be brought *via* Wyalong;—which do you consider the better route? I would certainly say the Wyalong route.
 2230. For what reason? In the first place, it would be running land which is unoccupied; in the second place, it would run on towards country which is settled by small settlers—that is, in the direction of Young. It would also create new traffic. Take Mr. Joseph Varcoe's holding as an example. He stated that he was running 300 sheep on two blocks of 2,000 acres, 30 head of cattle, and 20 head of horses. I understand that there is a million and a half acres of unoccupied land within a short distance of the proposed line between Wyalong and Hillston. We will suppose one million acres of that area to be fit for wheat, and assume each block, roughly, to be 2,000 acres; that would mean 500 blocks, which would run 150,000 sheep, taking 300 sheep to each block. We will suppose that a third of that number would be used for local consumption—say, 50,000; there would then be 100,000 sheep to be sent away by this line, for which at present there is no market, on account of the droving distance to a railway. Taking the rate at £8 per truck, it would mean a revenue of £8,000 which is not now in existence. Mr. Varcoe also stated that he was running thirty head of cattle on his place; on that basis there would be on the area I have named 15,000 head of cattle. There are no cattle there now. We will suppose that they kept two-thirds for their own use; they would then have 5,000 to send away. We will suppose that the freight would be £8 a truck, or 500 trucks, taking ten beasts to to the truck, or a revenue of £4,000. That would be £12,000 of traffic which is not now in existence for the railway. The railway would create that. We will suppose that twenty head of cattle would be run on each block; that would mean 10,000 head.
 2231. How far west of Hillston does your knowledge extend? To Menindie and Wentworth.
 2232. Taking 60 or 70 miles out of Hillston, what sort of country is it? It is all good grazing land.
 2233. Is there any good agricultural land within 20 miles in that direction? Yes; in isolated places.
 2234. What is the country like to the north and south of Hillston? It is just what could be desired, as far as my knowledge of the country goes.
 2235. It is grazing country to the north of the Lachlan, and agricultural country to the south, is it not? Yes.
 2236. Do you know the country between Temora and Wyalong? Yes.
 2237. What is your opinion of it? It is not bad country, but I do not think it is equal to the country in this district.
 2238. Do you know the country between Wyalong and Grenfell? Yes.
 2239. What is your opinion of that? It is good land for wheat-growing, with the exception of a little land to the east and west of the Bland Creek—that would be grazing land; but there is not very much of that.
 2240. The land between here and Wyalong is eminently fitted for wheat-growing? Yes; with the exception of the hills. I am only going by what I have seen of other wheat-growing districts, and comparing one paddock with another. I have seen a good bit of land in different parts of the Colony—for instance, I have seen the Berrigan district, also the land at Young, Cootamundra, and Coolamon, and I think the land at Hillston is as good as any I have seen in those districts.
 2241. And you think that the reason the Hillston district is not producing more is due to the want of a railway? Yes.
 2242. You think that if there were a railway here there would soon be flourishing farms where the rabbits now hold possession of the country? I have no doubt of it.
 2243. You think the Crown lands now lying idle would be immediately taken up? Yes.
 2244. Has the district been increasing or decreasing within the last few years? It has been increasing.
 2245. Notwithstanding the many disadvantages under which it has laboured? Notwithstanding many disadvantages.
 2246.

- P. Smith.
7 Oct., 1897.
2246. Showing that it is a progressive district, and that if it had those facilities before it which more favoured districts of the Colony have, it would very soon go ahead? Yes.
- 2246½. I suppose you know the principal holdings about here which are now sending their produce to Victoria? Yes.
2247. Do you think a railway to Hillston would induce them to send their produce to Sydney? I do think so.
2248. You think that if the lessees found that they could get their wool taken to Sydney for a little less than they could get it taken to Melbourne, New South Wales would get their trade? I think so.
2249. Have you anything to add to your evidence? Only with regard to stock movements. I think that if there were a railway here there would be a big revenue from fat stock alone. This stock is now sent to Melbourne; but if they had a railway at their door, instead of sending their stock 185 miles to the Deniliquin railway station as they do at present, they would put them on to the truck here, and send them to Sydney. There is a certain amount of loss incurred whether there be grass or not in travelling stock to market. I myself have done a good deal of droving.
2250. You would rather travel fat stock along the road if there were grass than put them on to a railway truck;—is that what you mean? No; where I live at Hay, I would very often drive my sheep to Carrathool, a distance of 45 miles, by which I could save 10s. a truck. Supposing there were 2,000 sheep—that would mean £10 to me. Generally speaking, of course, you would put the sheep on a truck if you had it at hand.
2251. You would gain in the condition of the sheep when they reached the sale-yard? Yes; I have come to this district and bought fat sheep on spec. I took them down to Hay and trucked them to Sydney. If there were a train here I should have saved the droving of that 100 miles. I suppose that within a distance of (say) 50 miles round here, in one year alone I bought for the Hay Boiling-down Company no less than 55,000 sheep. Had there been a railway here it is very likely that boiling-down works would have been started at Hillston, instead of the sheep being driven down to Hay, which would have meant a saving of at least £2 or £3 of tallow on each sheep. Besides, the country here is much better fattening country than it is where I live on the other side of Hay. I have no present interest in this district, but I should like to see a railway brought to my native town.

Robert Cooper, farmer, Bunda, near Hillston, sworn, and examined:—

- R. Cooper.
7 Oct., 1897.
2252. *Mr. Farnell.*] How long have you been here? Twelve years.
2253. What is the area you hold? My mother, brothers, and myself work the same place; the extent of our holding is 6,000 acres, and we cultivate 400 acres.
2254. What have you planted on the 400 acres? Wheat. Our average for twelve years would be about 10 bushels, our best crop being about 18.
2255. How did you dispose of your wheat? We sent it to the railway at Carrathool; if it is not sold at Carrathool it goes on to Sydney; some of it has been sold at the local mill.
2256. At what price will it pay you to grow wheat? It is difficult to say, because if it is a bad summer, the cartage to Carrathool is high; 2s. 6d. would pay well if we had 25 miles of cartage.
2257. Would the extension to Euabalong be of any advantage to you? No; we should be still as near to a railway at Carrathool, if not nearer.
2258. But you would use the railway at Hillston? Certainly; we should be only 20 miles off.
2259. If there were a railway brought to Hillston, would you put an additional area under cultivation? No doubt we should; there would be every encouragement to do so. We should know that we would get our produce away to market. In 1896 we had to keep our wheat the whole year stored at our place; we could not get it away at any price. It was a bad summer, and the teams would not take it away. The teams will not go off the road to pick up wheat at any price you can afford to pay. When there is back loading they sometimes do it.
2260. You have heard the evidence given to-day in regard to the district generally;—do you endorse it? Yes.
2261. Do you agree with what witnesses have said in regard to the railway here? I do in regard to settlement.
2262. Can you put any new features before the Committee in favour of the railway? I made some experiments in sorghum and Hungarian millet. I tried ½ an acre of each for an experiment.
2263. Do you think that mixed farming could be carried on in the district if there were a railway here? Yes.
2264. You have no doubt as to the suitability of the soil for wheat-growing? Yes. I have no doubt it will grow many other things which have not been tried here. I believe it will be a good dairying district. Several foddors will grow here.
2265. *Chairman.*] You have had experience in clearing here? Yes; I have had cleared about 350 acres out of 400, ploughing with a stump-jump plough. We estimate that it cost us 8s. an acre. They all use stump-jump ploughs out our way.
2266. Is there much land here available for settlement? We are surrounded by resumed areas. It is exactly the same class of country.
2267. Have you any rabbits? Yes.
2268. What do you think is the best way of dealing with them? Close settlement is the only effective way I know of.

James Brissenden, farmer, The Grove, near Hillston, sworn, and examined:—

- J. Brissenden.
7 Oct., 1897.
2269. *Chairman.*] How long have you been in the district? Thirty-two years.
2270. You have seen this place grow up? Yes.
2271. What did you start when you came here? I was blacksmithing; I afterwards took to butchering.
2272. For how many years have you been on the soil farming? About twenty years.
2273. What is your experience of farming in this district? My experience is, that if we have fair rains anything would grow.
2274. You have been fairly successful? I was at first. I used my place for stock; lately I have put in crops, and I have had as high a return as 26 bushels to the acre. This year I had 200 acres under crop. If there were a railway here I should put the whole of my land under crop—about 500 acres.

2275. You know the proposal to extend the railway to Euabalong? That would be of no use to Hillston; we might just as well go to Carrathool.

2276. You think the difficulties of railway construction between Euabalong and Hillston would be so great, owing to the flooded country, that the expenditure would be hardly warranted? Yes; there is too much flooded country in that direction.

2277. Which way do you think the railway should go? I favour the route which Mr. Kennedy has laid before you.

2278. Have you been to Wyalong? Yes.

2279. You can corroborate the evidence of previous witnesses as to the character of the country between here and Wyalong, and the possibilities of settlement in it? Yes.

2280. You endorse the evidence which has been given to-day in regard to the district generally? Yes.

2281. Do you think the Government would sustain any loss from the construction of a line of railway to Hillston? I believe a line would pay well ultimately, and it would certainly bring a lot of unoccupied land under occupation.

J.
Brissenden.
7 Oct., 1897.

Robert Hughes, Crown Lands Agent, Hillston, sworn, and examined:—

2282. *Chairman.*] How long have you been here? About eleven months.

2283. Have you prepared any information for the Committee? I have prepared a few figures. Since the Act of 1895 came into force, of course, the greater part of the land thrown open here has been under the settlement lease and homestead lease provisions of the law. In this district, up to date, including to-day's transactions, there have been about 57,000 acres thrown open under the homestead selection provisions, and out of that area about 13,000 acres have been selected by twenty-two men. To-day sixty-six blocks were available under the homestead selection provisions, and seven only were taken up, giving a total area of 5,589 acres; that is included in the 57,000 acres.

R. Hughes.
7 Oct., 1897.

2284. At what distance from Hillston would the land applied for to-day be? Some is 14 miles, and some 20 and 21 miles; 21 miles would be the furthest.

2285. What is the nearest? About 6 miles; the average would be about 10 miles.

2286. In what direction would the land be? All round the town in different directions. Under the settlement lease provisions of the Act there have been about 27,000 acres set apart, and only two blocks have been applied for, with a total of 4,857 acres; that would be since June, 1895. From 1893 up to the present date there have been only nine conditional purchases applied for, with a total of 1,315 acres, with twelve conditional leases, with a total of 5,884 acres.

2287. Would the conditional leases be taken up as conditional purchases? The tenure is as good as conditional purchase; they can be converted into conditional purchases. There have also been six homestead leases of 22,800 acres taken up from 1893 to date; thirty-nine blocks have been offered as improvement leases, representing an area of 320,000 acres. The term varies from fourteen to twenty-eight years. They were offered very recently, and two only went with an area of 16,400 acres. I endeavoured to ascertain approximately the area of available Crown lands in the district and the area which has been alienated. I communicated with the District Surveyor at Hay to obtain this information, and he wired to me to say that in so short a space of time it was impossible to give the figures definitely, but that he hoped to meet the Committee at Cootamundra with maps, from which he will be able to furnish you all particulars.

2288. I suppose particulars as to the alienated land in the district could be obtained from the head office in Sydney? Yes.

2289. In your capacity as Clerk of Petty Sessions, you come into contact with a number of men who are likely to take up land;—have you had conversations with persons who have told you they would be willing to take up land here if there were railway facilities? I have had numerous conversations with men who are anxious to settle in the district—in fact, I have made it my business to speak to them, and they all agree that the want of a railway prevents them from settling here. They say that the heavy cost of the transit of produce to market is a deterrent. That seems to be the general objection to settlement here.

2290. And it is your opinion that if Hillston were connected with the metropolis by railway the bulk of the land in the district now lying idle would be taken up? I am confident, from conversations I have had with men who have lived in the district for years, and who know the character of the country well, that the greater part of the land now available, or which might become available hereafter, would be settled.

SATURDAY, 9 OCTOBER, 1897.

[The Sectional Committee met at the "Rankin's Springs Hotel," at 8 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR. | JOHN LIONEL FEGAN, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

William Edward Turnbull, manager, Conapaira Station, sworn, and examined:—

2291. *Mr. Fegan.*] How long have you been here? Twenty months.

2292. Of course you have had other experience in pastoral pursuits? I have had nine years' experience.

2293. What is the area of your holding? 130,000 acres.

2294. What stock have you? 11,832 sheep; 40 head of horses, and 34 head of cattle.

2295. At what distance are you from here? Eight miles.

2296. What distance are you from Whitton? Fifty-six miles.

2297. You have heard of the proposal to extend the railway to Euabalong and Condobolin? I have read of it.

W. E.
Turnbull.
9 Oct., 1897.

W. E.
Turnbull.
9 Oct., 1897.

2298. How far do you know the country towards Hillston? Only as far as Naradhan.
2299. How far are you from Lake Cudgellico? About 42 miles.
2300. I suppose that none of your 130,000 acres is under cultivation? Yes; we have 22 acres under hay for station purposes.
2301. You are acquainted with the route suggested for a railway between Wyalong and Hillston? Only partly. I know it as far as Yalgogrin pretty well.
2302. What kind of country is it between here and Yalgogrin? It is for the most part red loamy soil; there is pine, scrub, mallee, and box forest. It is pretty thickly timbered.
2303. When cleared, what would it be fit for? Agriculture.
2304. What rainfall have you? Twenty inches. That has been our average for fifteen years.
2305. Would that average be good enough for wheat-growing? Yes; if we could get it every year; we get 12 inches in some years, and that is not good enough.
2306. Is this good grazing land? No.
2307. How many acres would go to the sheep? Taking one part of the country with another, I should say that it would take from 5 to 6 acres to carry a sheep.
2308. Do you think there is much prospect of a railway in this district paying? No; but I think it would conduce to closer settlement in the form of mixed farming.
2309. Grazing of itself would not pay, you think? It would pay under certain circumstances, with long leases and low rentals. Under present circumstances it does not pay.
2310. What is the land worth at present? Ten shillings an acre.
2311. Not more? No.
2312. Not for agricultural or grazing purposes? I do not think so.
2313. Has it depreciated in value lately? No; but it is so far from railway communication that it does not pay to grow crops from it. It would not pay you to give 7s. an acre for it to graze sheep.
2314. Has the land depreciated to any extent during the last few years? I cannot say. During the twenty months I have been here there have been no sales.
2315. Have you any rabbits? The rabbit pest has been very bad; but now from the drought and preventive measures they are not so bad.
2316. You have coped with them until you think you have the upper hand of them? Yes; it is phosphorised pollard, I think, which is keeping them down.
2317. What does it cost you annually to cope with them? £300.
2318. And for the 130,000 acres you pay how much? £800 a year, I think, roughly.
2319. Do you think closer settlement would be of much assistance to you in getting rid of the rabbits? Certainly; because every holder would have to net on his own account. He could not grow crops here unless he netted.
2320. What is the weight of the fleece here? Five and a half pounds. Of course, the drought helps to keep it down. This has been a bad year for wool; in some years the fleeces would be much heavier.
2321. Where do you send your wool? To Whitton for Sydney, at a cost of £4 7s. 6d., delivered by rail and road. I called for tenders; the railway charge is £3 from Whitton, and it costs me 27s. 6d. by road.
2322. What do you do with your fat stock? There is never any. In ten years only one small mob of fat stock has been sent off the place. When the sheep can get fat we have to starve them on account of the grass seed. We have to put the whole of our stock into one paddock until the grass seed is down.
2323. What do you estimate the cost of wire-netting for rabbits here? £75 a mile for the netting and fence, 1½ mesh.
2324. What does it cost per acre to get the land ready for cultivation? I think it could be done for about 35s. per acre.
2325. That would involve a big outlay? Yes; you want a fair amount of capital to take up land here.
2326. Would the price you have given be about the maximum? Yes; taking one acre with another it would cost that.
2327. Have you tried anything besides wheat here? Yes, fruit; grapes, figs, peaches and apricots all do very well in a fair season.
2328. I suppose that if there were a railway in this direction from Wyalong the abandoned areas would not be left unoccupied? I think the best of the land would very soon be taken up.
2329. I suppose the chief cause of the land being unoccupied is the want of means of transit? In a great measure, yes.
2330. Is the rent in this district high? We pay 1½d. The adjoining stations pay only half the rental per acre we pay—¾d.
2331. How is that? It is settled by the Land Board.
2332. Perhaps your holding is superior land? If anything it is worse land; they have been able to carry more sheep on 40,000 acres less than we have.
2333. You are referring now to Naradhan? Yes; I see the station is advertised to carry 23,000.
2334. Can you give us any further information? I do not think so. Of course, when I say it is bad country I speak from a pastoralist's point of view. There is not much growth of grass, and when it does grow it is seedy and unnutritious.
2335. *Mr. O'Connor.*] Does the grass seed depreciate the value of the wool? Yes; it causes a depreciation of fully 1d. in the pound.
2336. *Chairman.*] Could you not avoid that by shearing early? We do to a certain extent; if we did not shear early the wool would be altogether ruined.
2337. How is your run watered? By tanks and dams and by one well. There is sufficient water in it to water 60,000 sheep in an ordinary season.
2338. The small number of sheep you have on your holding this year is on account of your being short of feed? Yes.
2339. *Mr. Fegan.*] What is the highest number of sheep you have carried in one year? In one year they shored up to 70,000, but that was when the resumed area was held in conjunction with the present leasehold.
2340. What was the area of the resumed area? 145,000 acres.
2341. That is now abandoned? Yes.
2342. So that you had altogether 275,000 acres? Yes. But that would not be a test of the carrying capacity of the place.

W. E.
Turnbull.
9 Oct., 1897.

2343. You did not consider it worth while to pay the rent on the resumed area? No.
2344. How many sheep had you last year? 13,800.
2345. What is your average carrying capacity? 20,000 sheep, taking one season with another, or 6½ acres to a sheep.
2346. *Mr. O'Connor.*] When does your lease expire? In 1900; I think all the leases here expire in about three years.
2347. *Chairman.*] I suppose in a good season you have fat stock on the station? Yes, they get fat; sometimes they will fatten in a very short time.
2348. If a railway were within a reasonable distance you could send small lots away instead of putting them into seedy paddocks and allowing them to deteriorate? Yes.
2349. If the land were improved I suppose it would be fair grazing land? Properly improved it would be fair land.
2350. But improvement would entail a considerable expenditure? Yes.
2351. Would it not be possible to improve the land gradually instead of incurring an outlay of 35s. an acre to clear it right out;—would it not be better to scrub and ringbark it and let the timber gradually die? Yes.
2352. What would it cost to do that? It might cost you 2s. 6d. an acre to scrub and ringbark, but that would not include the burning off.

Thomas Shields, selector, Naradhan, sworn, and examined:—

T. Shields.
9 Oct., 1897.

2353. *Chairman.*] What is the area of your holding? 1,800 acres.
2354. *Mr. Farnell.*] How long have you been resident here? Six years last August.
2355. Have you improved your holding? Yes; I have ringbarked, scrubbed, and fenced.
2356. Have you any portion under cultivation? Only about 6 acres.
2357. What have you planted? Wheat and lucerne. I am seeing how they get on.
2358. What has been the result? Very good.
2359. You are very well satisfied with it? Yes.
2360. How much wheat did you get? I cut it for hay; in any case it would not be worth while to send it away, the cartage being so dear.
2361. Do you engage in any other occupation besides farming? I go out shearing; and I have between 700 and 800 sheep.
2362. That would be about one sheep to 2 acres? Yes; a little over 2 acres.
2363. For how long have you kept that average of stock? I bought the last lot only last December.
2364. Your land has been carrying 800 sheep since then? Yes; the 800 includes some lambs.
2365. Do you think your land would be more profitable if put under cultivation? Yes; it seems to grow everything well. I have tried pumpkins; the land will grow tons to the acre.
2366. Why have you not put more land under cultivation? The cost of carriage has been too great.
2367. What is your nearest railway station? At Whitton, about 75 or 76 miles away.
2368. You have not sent any of your produce away by rail? No; I did not think it would pay.
2369. If there were a railway within 20 miles of you you would use it? Yes.
2370. Is there plenty of land adjoining you available for settlement? There is.
2371. Is the land as good as your own? Yes.
2372. Supposing there were a railway here, what area would you put under cultivation? I should combine grazing with agriculture.
2373. But I suppose you would increase your area under the plough every year as your means allowed? Yes.
2374. Is it very difficult country to clear? No; it is very good.
2375. What would it cost per acre to clear? When the timber has been rung and is dead it would not cost more than 12s. or 14s. an acre. That would be to clear everything off, and leave the land ready for the plough.
2376. What is the cost of scrubbing and ringing? I have generally done my own, but I know it is being done here for 1s. 3d. and 1s. 4d.
2377. Have you then not to wait a certain time until the timber dies? It only takes a couple of years or so.
2378. You can commence to burn off two years after you have scrubbed and ringbarked? Yes.
2379. What is the nature of the country you occupy? Pine, yarran, box, and bull oak.
2380. You are satisfied that wheat-growing will be profitable? Yes.
2381. What has been your experience as to lucerne? It grows very well. Certain vegetables also grow very well in the garden—beetroot and turnips for example.
2382. How is your holding watered? By a tank.
2383. Did you put it down yourself? I got it from the station; it was there when I took up the land.
2384. Does it hold the water well? Yes, very well.
2385. Do you find that the land generally here holds the water pretty well throughout the year? Yes; about my own place it is very good; I have never been short of water. Even last summer my tank was full up to the top. It lasted all the summer.
2386. As to the land itself, does the soil hold the water well? Yes; everything seems to grow well in it.
2387. What is your average rainfall here? Something like 20 inches.
2388. Would a line from Condobolin to Euabalong be useful to this country? That would be rather far away. It would not bring me much nearer to a railway than I am at present.
2389. How far is it from here to Lake Cudgellico? A little over 30 miles, I think.
2390. So that if you had anything to send away, you would send it to Whitton? Yes; just the same as I do now.
2391. Supposing a line were constructed through here along to Hillston, would the farmers in the lake district send their produce this way? I think so, because it would not be so very far from Lake Cudgellico.
2392. You do not think the road-carriage would be too heavy for them? I do not think so; they have to go to Whitton at present, and that is 110 miles from the lake.

- T. Shields.
9 Oct., 1897.
2393. What is the nature of the country between your place and the lake? It is very good country all through; there are two or three selectors there. Landers and the Templeton Brothers have selected between here and the lake. They are about 9 miles from my place, and about 16 miles from here.
2394. Do you think a railway to Hillston would promote much settlement in this district? I am sure it would. I know plenty of families who would come over from Victoria. I came from Victoria myself six years ago.
2395. Had you any farming experience in Victoria? Yes.
2396. What is your opinion of the land here compared with the land you know in Victoria? It is every bit as good, from what I have seen of it.
2397. You can get a larger area here than you could get in Victoria? Yes; and the land here is much easier to work than is most of the Victorian land.
2398. Have the Templeton Brothers, or Landers, any land under cultivation? I think the Templeton Brothers have 120 acres.
2399. You do not think that under present conditions it would pay persons to settle down here and cultivate wheat? No.
2400. *Chairman.*] You are quite satisfied with your prospects here? Yes; at present it is a hard struggle, and we have to supplement our income by shearing as much as we can. With better means of transit to market things would be all right.
2401. You think that when the existing leases fall in there will be a large influx of population from Victoria, if there is any prospect of railway communication? Yes; persons have been asking me about land here from parts of New South Wales, besides Victoria; they have said they would take up the land if there were any chance of a railway.
2402. You think the land here would support a large number of persons? Yes; a large number of farmers.
2403. But do you think men of small means could settle, having regard to the difficulties they would have to contend with? They would do so if there were a railway.
2404. You think that in whatever area they would take up there would be sufficient land upon it clear of timber to enable them to make an immediate start? Yes; all Naradhan is country of that kind. It is very open.
2405. Is there much mallee land upon Naradhan? I could not say, but there would be some blocks of the same description as my own—box, pine and yarran. Mine is a conditional purchase and conditional lease.
2406. *Mr. O'Connor.*] What time have you within which to acquire your fee simple? I could acquire it in five years. The same thing, of course, applies to the conditional lease.
2407. What method of acquiring land do you think Victorians intending to settle here would prefer? Conditional purchase and conditional lease.

John Hannan, hotelkeeper, Rankin's Springs, sworn, and examined:—

- J. Hannan.
9 Oct., 1897.
2408. *Chairman.*] Do you do any farming? Yes; besides the hotel I have a hotel and a farm.
2409. How long have you resided in this locality? A little over five years at Rankin's Springs; I have been about twelve years in the Hillston district.
2410. You consequently have a good knowledge of the country? Yes.
2411. Do you think the proposed railway extension to Euabalong would be of any benefit to people in this part of the country? No; I do not think it would.
2412. Do you think an extension to Hillston, *via* Condobolin, would be of any benefit? It depends upon which way it went. If it went on the other side of the river the railway at Whitton would be as close.
2413. You do not think it would be justifiable to extend the railway to Euabalong alone? I do not know much about that district.
2414. You do not think there is settlement enough on that route to justify a railway? No.
2415. Do you think it will be justifiable to take a line to Hillston? Yes.
2416. Of course, a line from Wyalong to Hillston would benefit this part of the country? It would be of great benefit to the country all through.
2417. Is there much unoccupied land about here? From 10 to 12 miles on each side of the line there is a lot of unoccupied country.
2418. Is the land available for settlement? Yes.
2419. Do you think that land would be taken up and utilised if there were a railway line within a reasonable distance? I am sure most of it would.
2420. What is the land suitable for, in your opinion? It is more suited to agriculture than to grazing, I think.
2421. Have you any idea of the cost of clearing the land here? It depends upon the part of the country; but I should think it would take from 15s. to £1 an acre, taking the land all through. In some cases it might cost a little less, and in other cases a great deal more.
2422. Have you any idea of the carrying capacity of the land? For the last three years Naradhan has averaged only 20,000 sheep.
2423. What has Malonga carried? It has averaged from 20,000 to 30,000 sheep.
2424. And Conapaira? That has averaged from 12,000 to 15,000.
2425. They formerly carried many more, did they not? Yes; they all carried much more than they do at present.
2426. Have you any idea what is the biggest number they have carried? I think they shore 70,000 at Conapaira about eleven or twelve years ago.
2427. And what at Malongla and Naradhan? From 50,000 to 60,000 each.
2428. How do you account for the decrease? By the rabbits and dry seasons.
2429. If the rabbits were kept under, and the country were ringbarked and improved, I suppose the carrying capacity would be increased? Yes; I can tell by my own little paddock. When I came here it was full of rabbits, and there was hardly any grass growing. There are no rabbits there now, and you can see a great difference in the grass.
2430. Do you know the country between here and Wyalong? Only a little to the other side of Malongla.

J. Hannan.
9 Oct., 1897.

2431. Is the country you know suited for agriculture in that direction? A good deal of it.
2432. Do you know the land between here and Hillston? As far as Monia Gap.
2433. Do you consider the land suitable for agriculture? Yes, very suitable.
2434. What about the ranges? Of course, the hilly country would not be suitable for cultivation; but that is only a strip. Between the ranges there are big open flats with plenty of good land.
2435. Do you think the construction of a line through this district would result in the occupation of much land? I am almost sure it would.
2436. Do you know of any persons who would settle here? I have heard several persons say that if they thought there was any probability of a line being constructed here they would soon take up the land.
2437. Do you think agriculture could be profitably carried on in this country if there were a means of sending produce away? Yes; in anything like a fair season.
2438. Do you grow any wheat? I grew some in 1894. I got 28 bushels to the acre. I also grew from 45 to 50 bushels of oats, and I obtained 4 tons of potatoes off an acre down here on the flat.
2439. What kind of potatoes? I had three sorts—Early Rose, Brownhills, and Early Vermont; the Brownhills kept the best. The Early Rose grew the quickest, but they did not keep so well as the Brownhills. As to the Early Vermont, I sowed two crops; the one in the spring was not so good. I sowed again after Christmas, and in the autumn they were very good.
2440. You have proved that you can grow wheat, oats, and potatoes successfully? Yes; and as to lucerne I sowed a little over an acre two months ago, and it is now 18 inches high.
2441. You are on the main road from Cudgellico to Whitton? Yes.
2442. Is there much traffic coming this way? Not a great deal just now.
2443. Does much wool go past there? Not a great deal. The Naradhan, Wooyeo, and Uabba wool goes through here, also the Malongia wool; but I think the Uabba clip has gone to Condobolin this year.
2444. Is the country between here and Lake Cudgellico fit for settlement? Yes.
2445. All the way? Yes, most of the way. It is pretty scrubby from Naradhan to the head of the lake; there is a line of hills to the left between here and Naradhan; I think they call them the Ural Range.
2446. You think the country between here and the lake is well suited to agricultural settlement? Yes.
2447. It is of the same description of country as that between here and Monia Gap and Yalgogrin? It is not quite so open. Most of the people who travel along this road like the country between here and Monia Gap. A young fellow passed here the other day who had been to Berrigan, and he said he had never seen country suited to cultivation like that out Monia Gap way.
2448. Is there any mineral deposit on the range here? None close to here. They found some leaders on Malonga, but they did not strike a reef; the country has not been prospected properly. They applied to the Government for aid, but they did not get it. Stanley, 9 or 10 miles from Malonga, has a good reef. They are working at it now, but there are no returns.
2449. Is this district going ahead, or at a standstill? It is going backwards, I think.
2450. You think it is likely to continue to recede unless better means of communication are afforded? Yes.
2451. At what would it pay you to grow wheat? I should think from 3s. to 4s. ought to pay well.
2452. Carting it to Whitton? No; it would not pay to cart it to Whitton, but it would pay at 3s. or 4s. if you had means at hand to get it away.
2453. *Mr. Farnell.*] Is there any valuable timber between here and Hillston? There is a lot of good pine country.
2454. Is there any ironbark or box fit for use? There is plenty of box, and I think ironbark could be got through.
2455. *Chairman.*] There is a good road between here and the lake? In wet weather it is not good.
2456. Have any watertables been made? No; for miles it is only just cleared.
2457. What is the distance from here to Lake Cudgellico? Thirty-eight miles.

MONDAY, 11 OCTOBER, 1897.

[The Sectional Committee met at the "Yalgogrin Hotel," at 7:30 p.m.]

Present:—

THOMAS HENRY HASSALL (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Theophilus Frederick Smith, Warden's clerk, Yalgogrin, sworn, and examined:—

2458. *Mr. O'Connor.*] How long have you been here? Upwards of three years. I am a general T. F. Smith. storekeeper. 11 Oct., 1897.
2459. You are acquainted with the proposal to extend the railway from Condobolin to Euabalong? Yes.
2460. You know that the objective point of that railway is Hillston;—do you know the country round about there? Yes.
2461. Can you give us any particulars about this district? Yes; the population would be about 300. The number of claims on gold is twelve; there are others at work.
2462. Are the twelve on payable gold? It is questionable. The yield so far has tended to prove that the stone raised will be refractory, and will require special treatment, which cannot be got here at the present time.
2463. Do you know the country between Wyalong and Yalgogrin? Yes; it is all good agricultural land. I travel over it many times a year in my official capacity.
2464. And you have the advantage of meeting many men who are qualified to express an opinion with regard to the various resources of the district? Yes.
2465. You know from their opinion and from your own observance that there are thousands of acres of very fine agricultural land available for settlement in the vicinity of Yalgogrin? Yes; there are several resumed areas which are available, but I cannot tell you what the acreage would be.

- T. F. Smith. 2466. Apart from mining, is there much agriculture carried on in the district? Apart from mining, it is a pastoral district.
- 11 Oct., 1897. 2467. At what distance are you from Wyalong? Twenty-three miles by the new surveyed road.
2468. How is the country occupied between here and Wyalong? From here to the Wyalong boundary the land is all good pastoral land. The first 6 miles is held by Yalgogrin, and the rest by the Wyalong station under pastoral lease; it is all good agricultural land.
2469. How long has this township been established? It is three years since it was surveyed.
2470. You depend mainly upon mining? Yes.
2471. In what way would the town be benefited by a railway? It would mean increased settlement, and also development of the mining industry. The roads are untrafficable in wet weather; we cannot get any produce to market.
2472. What is the rate of carriage between here and Temora? The rate of loading now is £2 10s. per ton.
2473. What is the distance? Seventy miles; it is very difficult at times to get teams at the rate I have named. I know the country very well; I have travelled to Temora both ways, through Barmedman and through Broken Dam.
2474. What kind of country is there between Temora and Wyalong? It is all agricultural land on both routes. There are several selectors along the Broken Dam route about 14 miles from here.
2475. You say that the land between Temora and Wyalong is all fit for agriculture? It is very scrubby, but it would be good land when cleared; a lot of it is mallee.
2476. Do you think a railway between those two points would develop that country to any extent? I do certainly.
2477. Is it sparsely populated? I cannot say; I have travelled only along the road.
2478. How is the land held? About Barmedman there are several selectors, but I do not know of any anywhere else. Several conditional purchases have been taken up there recently.
2479. What are the prospects of this mining field? The field is only in its infancy.
2480. Does it give promise of permanency? The deeper they go down the better the prospects are.
2481. What kind of machinery have you? We have a battery in course of erection and almost completed, and we have an Otis machine.
2482. What is the extent of the area over which gold has been discovered? It is about 10 miles square.
2483. How many men are employed upon the claims? They average six to every claim; there are also leases; some forty leases have been applied for.
2484. If the labour conditions were fulfilled, how many men would they employ? About 200; after development one lease might employ that number.
2485. What is the area usually applied for? Ten acres; one man has to be employed on each acre, here and at Wyalong.
2486. Have you found it any drawback to be situated so far from the railway—I mean drawback to the development of the field? Certainly; a railway would benefit us all.
2487. You think it would promote greater activity in the mining industry? Yes.
2488. You want greater facilities to obtain appliances for the treatment of the stone? Yes.
2489. Is the country between Yalgogrin and Temora auriferous? Yes, right through.
2490. Has it been prospected? Not much.
2491. So that it is hard to say what the future of the field may be? Very hard; I know the route right through from here to Rankin's Springs, and that is mineral-bearing country.
2492. Do you consider it good agricultural country? Parts of it.
2493. *Mr. Farnell.*] Is it deep or shallow sinking here? The deepest claim here is at present upwards of 200 feet.
2494. Is it a payable reef? Yes; the owners are looking forward to big dividends.
2495. What is the highest return per ton? From stone containing free gold, over 10 oz.
2496. What has been the output from this field? In 1894, 348 oz.; in 1895, 804 oz.; and in 1896, 1,350 oz.—showing clearly an advancement in the output. Up to the present date, in 1897, the gold won exceeds that won in 1896. The deepest shaft here would be about 250 feet, and at that depth there is a well-defined reef highly mineralised.
2497. In what direction do the reefs trend? East and west.
2498. You think that with railway facilities a lot of the stone would be treated at Dapto or Cockle Creek? It is hard to say where it would be sent; but it would require special treatment; there are chlorination works at Wyalong.
2499. You have said you know the route pretty well between here and Rankin's Springs;—do you know the country 20 miles to the north, and 20 miles to the south of it? I have only been as far as Yarrandale going towards Ungarie; that is good country, and to the south of the route the country would be similar.
2500. Is it similar to the country we travelled through to-day—the travelling stock route? It is far superior land; it is red soil.
2501. Is there an absence of mallee scrub to the north and south of the route? You will find belts of mallee throughout the country, but not as extensive as the belt through which you passed on the stock route.
2502. You do not know of any large areas being put under cultivation in that direction? Not any large areas.
2503. You have no doubt as to the suitability of the soil for the production of cereals? No doubt whatever; the soil here would grow anything.
2504. What is the average tonnage per annum on the goods you obtain from Sydney? At the present time, 150 tons.
2505. Then a railway would be of considerable benefit to you? Yes; if the rates were reasonable.
2506. If the rates were similar to those in force upon the Government railways at the present time? Certainly.

William Thompson, selector, Caroon, sworn, and examined:—

2507. *Chairman.*] You are a selector residing at Caroon? Yes.
2508. At what distance from Yalgogrin? Twelve miles.
- W. Thompson. 2509. *Mr. Fegan.*] How long have you been in this district? Twenty-one years.
- 11 Oct., 1897. 2510. Did you come here as a selector? Yes.
- 2510½. And you have been in possession of your present holding for that number of years? Yes; ever since I came here. 2511.

75
W.
Thompson.
11 Oct., 1897.

2511. What is the area of your holding? 8,922 acres of conditional purchase and conditional lease.
2512. How many acres of freehold have you? 3,200; the rest is conditional lease.
2513. How are you using the land? For grazing chiefly; I grow a little hay for my own use.
2514. What stock have you upon it? I have about 1,500 at the present time; I generally carry between 6,000 and 7,000.
2515. How is it that you have such a small number of sheep on your holding at the present time? That is owing to the drought.
2516. Is your land fairly well watered? Yes.
2517. During the twenty years you have been here how many dry seasons have you had? I have had three dry seasons.
2518. Do you call that a big proportion? I think they have been as badly off in any other part of the Colony.
2519. You do not think you suffer more from drought here than do any other portions of New South Wales? I do not think so.
2520. What is your annual rainfall? About 20 inches.
2521. Have you any vermin to contend with? Rabbits and wild dogs.
2522. How are you coping with them? As far as the rabbits are concerned, with wire-netting, and destroying them by poison, digging out, and fumigating. We trap and shoot the wild dogs.
2523. What does it cost you per annum to cope with the rabbits? If I fenced in, say, 3,000-acre paddocks it would cost me about 3d. per acre to keep them down.
2524. I suppose the drought has assisted you materially in that direction? Yes, we have not many now; but they will soon be bad again if they are not kept down. We cannot deal with them by poison when there is good grass.
2525. You have had no experience in cultivation except as regards hay? That is all.
2526. Have you grown any fruit? Yes; apples, peaches, pears, and grapes grow splendidly. The other fruits grow better than the apples.
2527. How many acres have you under cultivation? About 20.
2528. What does it cost you to clear for the plough? I have an advantage in my own case, because some of the timber had been killed for many years. It would cost three or four times as much to clear green timber as to clear dry timber.
2529. What would it cost you, on the average, to clear land taken up with green timber? I should think about £2 per acre.
2530. Out of your 8,922 acres what area would be suitable for agriculture? About 6,000 out of the 8,922.
2531. I suppose that you know the proposal to extend the railway from Condobolin to Euabalong? Yes.
2532. Do you know that part of the country? I know it a little below Condobolin, but not in between there and Hillston.
2533. Would a line to Euabalong serve this portion of the country? No.
2534. At what distance are you from Condobolin? About 70 miles.
2535. How far are you from the nearest station to the south? About 70 miles; I am midway between Temora and Condobolin.
2536. You think the Euabalong line would not serve the people here, because you are almost as near to Condobolin as to Euabalong? Yes; it is about 80 miles from here to Euabalong.
2537. Condobolin then would be a better terminus for you than Euabalong? Yes.
2538. Are you acquainted with the lines of survey from Grenfell to Wyalong and from Temora to Wyalong? I know the route from Temora to Wyalong, but not the other.
2539. Do you know the country towards Grenfell? I have been once or twice across that country.
2540. And you know the country between here and Temora? Yes.
2541. Knowing both routes as well as you do, do you think the railway should be extended from Condobolin, from Koorawatha, or from Temora? I certainly think the line should come from Wyalong in this direction, but whether from Koorawatha or from Temora I cannot say.
2542. What timber have you upon your holding? Box, myall, gum, yellow-box, ironbark, pine, and yarran.
2543. How much ironbark is there? Very little.
2544. Where is the ironbark chiefly to be found? From here to the north.
2545. Do you think sufficient ironbark sleepers could be found here for a railway? Yes; there are some south from here, between here and Wyalong, and also to the north and west.
2546. What would be the chief freight supplied to the railway from the district? Agricultural and pastoral produce.
2547. Would you put any more land under cultivation than you now have if there were a railway at hand? I would put in 1,000 acres in two years if I thought a railway would be brought here.
2548. That would apply if a railway were within 20 miles of you? Yes.
2549. It would be principally wheat, I suppose? Yes; wheat and oats, or whatever would suit—lucerne, and so forth.
2550. Do you know the surveyed route? Yes, it runs through my holding.
2551. If it were determined to build a railway here, do you think the Government would have any difficulty in getting landholders to give the required land free of charge? If the Government would guarantee that they would not apply a betterment tax they might have some show of getting the land.
2552. You think that if the Government charge here the rates which are in force elsewhere, there would be a possibility of their getting the land free of charge? As far as I am concerned I get very little from the Government for nothing, and I think I should give them about as much.
2553. How far would the railway go through your property? Approximately, 2½ miles.
2554. How much land would you have on each side of the railway? I should have about 2,000 acres on the north-east side.
2555. How far would you be from the proposed line direct from Wyalong to Hillston? About 16 miles.
2556. Do you know the land through which the line runs? Yes.
2557. Is it private property or Crown land? It is chiefly Crown land.
2558. What does it cost you to erect rabbit-proof fencing? About £60 a mile.
2559. Do you know the land surrounding your holding? Yes; most of it is taken up on the resumed areas.

- W. Thompson.
11 Oct., 1897.
2560. What is the character of the land available? It is good land; good for agriculture and grazing.
2561. But the greater portion would be fit for agriculture? Yes.
2562. Do you think a railway would lead to much close settlement near you? Yes; and I should like to say one thing about close settlement—it would materially help to exterminate noxious animals.
2563. Do you know of anyone who, if there were a railway here, would take up the agricultural land to which you have referred? Yes.
2564. Where are the persons to whom you refer? In the Berrigan district.
2565. Have you let any of your wheat go to grain? Yes.
2566. What number of bushels would you get to the acre here? In one year when I saved an acre for seed there were 40 bushels to the acre.
2567. Was that an exceptionally good year? No; it was in 1882. I do not think it was exceptionally good.
2568. It is chocolate soil, somewhat similar to that we have passed through on the road to-day? It is better than that.
2569. *Mr. O'Connor.*] Do grapes grow particularly well here? Yes; I have had grapes for about twelve years, and they have done well in almost every year.
2570. Do you think grapes would be produced either for the table or for wine-making purposes? Yes.
2571. Have you been in Albury? Yes.
2572. How do you think this district compares with the Albury district for grape-growing? Albury has a slightly moister climate than this. It is many years since I was there, and the vineyards were then in their infancy; but I think this district would be quite as good a one for the production of grapes. Some persons who lived in Albury for many years are living to the north of Wyalong now, and they are very much taken with this part of the country for grape-growing.
2573. What height are you above the sea-level here? I do not know the exact altitude, but we are considerably higher than Wyalong.
2574. You think that if the Government constructed a railway here they would have to pay compensation for any land that they might resume? They would have to get it in the usual way. It is possible that the line might run through my place in such a way as to cut off a small acreage from the rest of the holding.
2575. *Mr. Farnell.*] I suppose you would be prepared to let the Government have the land at a reasonable price? Yes.
2576. As a matter of fact, if the line ran through your property for 2½ miles it would take 40 acres from you, and you would think it hard, after having expended labour and capital in improving that land, if you were expected to give it to the Government for nothing? I think it would be hard. For instance, I might have expended a large sum in making water, and it would be very hard to have the water cut off from the rest of the property.
2577. But you would be prepared to meet the Government in a reasonable way? Yes.
2578. What would your land be capable of carrying in a fair season? 6,000 sheep.
2579. A railway would enable you to stock with greater confidence, because it would enable you to get your sheep to well-grassed country in the time of drought? Yes.
2580. Where do you now send your clip? To Sydney, *via* Temora.
2581. If a railway were brought here from Wyalong it would go in that direction? Yes.
2582. Do you send any live-stock away? I send fat wethers to Temora sometimes.
2583. You would send them *via* Wyalong if there were a railway? Yes.
2584. Have you tried growing potatoes here? Yes; they grow very well. We grow vegetables of all descriptions for our own use.
2585. What kind of potatoes? Early Rose.
2586. Do you think it possible for mixed farming to be carried on here with railway facilities? Yes; that would be the way to make the most out of the land.

William Stanley, selector, Restdown, Nariah, sworn, and examined:—

- W. Stanley.
11 Oct., 1897.
2587. *Mr. Farnell.*] How long have you resided in the district? Seven years.
2588. What area do you hold? My son and I have 5,120 acres.
2589. What use are you making of it? We run sheep and cultivate.
2590. What is your cultivated area? 160 acres.
2591. What are you growing? Wheat, oats, and barley.
2592. Have your crops succeeded? They have succeeded very well.
2593. What has been your average yield per acre? About 20 bushels; we have had as high as 38 bushels.
2594. What has been your yield of barley and oats? This is the first year we have put them in.
2595. What has it cost you per acre to clear your land for the plough? My land was rung for years before I got it, so that it did not cost me so much. It must have been rung for fourteen or fifteen years. It would cost me from 10s. to 15s. an acre to burn off and clear.
2596. What would be the cost of ringing in the first instance? One shilling per acre. The total cost would be 16s. an acre, but the land had been rung for some time.
2597. Where do you send your wheat to? I have only stripped enough for flour and seed; I have cut it for hay principally, because we have been too far from a railway to cart the wheat away.
2598. You think the absence of railway facilities has been a great obstacle to agricultural developments here? Yes.
2599. You know the proposal to extend the railway from Condobolin to Euabalong? Yes.
2600. Would that extension be of any use to you? None whatever.
2601. What is your present station? Temora or Narrandera; they are about the same distance away—it is about 80 miles either way. I live about 13 miles west by south from here.
2602. From a national point of view, why is a line from Condobolin to Hillston *via* Euabalong not so good a line in your opinion as a line from Wyalong and Yalgogrin to Hillston? A line in this direction would be the means of settling a number of abandoned resumed areas. There are the resumed areas of Nariah, Binya, and Eurathra—about 40,000 acres on Nariah, 40,000 on Binya, and 20,000 on Eurathra.
2603. If there were a railway to Hillston *via* Yalgogrin would you be prepared to put a larger area under crop? Yes; I should have 600 or 700 acres every year. I would have 500 acres the year after next. I intend to have 300 acres under crop in any case. 2604.

2604. Do you think it likely that other persons would settle in the district, and do as you propose to do? I think that all the resumed areas that I have referred to would be taken up. It is red chocolate soil, and splendid agricultural land. W. Stanley.
11 Oct., 1897.
2605. Do you think mixed farming could be successfully carried on? Most decidedly; that would be the best form of settlement.
2606. You know the surveyed line from Wyalong to Yalgogrin, and on to Hillston? Yes.
2607. Does it pass through Crown lands? Yes; it follows the travelling-stock route for a great distance. I do not think there would be any need for resumption.
2608. Have you grown anything besides wheat, barley, and oats? I have grown vegetables of all sorts; onions do not do as well as other vegetables.
2609. Have you tried any citrous fruits? No; but I have tried apples, peaches, and apricots. Apples do not do quite so well as do the other fruits; but grapes have done very well with me during the last five years.
2610. What stock have you upon your holding? I have only 500 at the present time.
2611. What would it carry in a good season? It would carry about 3,000.
2612. Have you any knowledge of the mineral resources of the district? Not much.
2613. Do you think they are of a permanent nature? I think they would last a good while; the deeper they go down the better the returns they get. I have a reef being worked on my own place, and what I say has proved to be the case there; we are down 132 feet.
2614. What is the size of the reef? Three feet 6 inches now; it was about 10 inches on the surface.
2615. Which way does it trend? East and west; the underlay is a little south.
2616. Where do you get your stone crushed? We have done very little yet; it is all highly-mineralised stone, and requires special treatment.
2617. *Chairman.*] Have you any neighbours? Only three.
2618. What would be the area of their holdings? They are full selections of 2,560 acres each.
2619. What is the land chiefly used for? It is principally under sheep.
2620. But, like your own, it is suitable for agriculture? Yes.
2621. You are satisfied with your prospects? Yes; the only drawback is the distance to a railway.
2622. Do you know of any persons who would take up land here if there were railway facilities? I know of no one in particular; but I am sure all the land would be taken up for 20 or 30 miles on each side of the line.
2623. How long have you been occupied in trying to make a living off the soil? Twenty-eight years; I had been farming in Victoria; I have been twelve years in New South Wales. The land I am farming here is quite equal to any land I farmed in Victoria. We have obtained better returns from it in wheat.
2624. You think many settlers would come here from Victoria if there were a railway? Yes. One advantage of the railway would be to secure the settlement of areas which are now overrun with vermin.
2625. *Mr. Farnell.*] Have you tried the growth of fodder for ensilage? No; but I think it could be grown quite easily.
2626. What do you think of the capabilities of the district for dairying? I think it could be made a success.
2627. *Chairman.*] You think that any railway within 20 miles would be of great service to you? Yes.

William Hubert Waldron, grazier, Yalgogrin, sworn, and examined:—

2628. *Chairman.*] What is the extent of your holding? 2,560 acres.
2629. To what use do you put your holding? It is being mined upon at present.
2630. How many lines of reef are there running through it? There are four different lines of reef running east and west. W. H. Waldron.
11 Oct., 1897.
2631. Is each of the reefs being worked? Yes.
2632. How many parties are at work upon the different lines? Our party is on the first line, there are two parties on the next line, one on the next, and two on the next.
2633. Have they discovered anything payable on the different lines of reef? They have not been declared payable yet.
2634. But the indications are sufficiently promising to induce you to continue working? Yes.
2635. To what depth have you gone? 140 feet.
2636. What is the width of the reefs? They vary from 2 feet to 3 inches.
2637. Do you put the land to any other use? I take in stock on agistment.
2638. Is the town progressing? Yes.
2639. Rapidly? Lately.
2640. That is in consequence of discoveries in mining? Yes.
2641. Is mining your principal industry? Just round about Yalgogrin.
2642. Are there any other industries within a short distance? No; there are only a few selectors outside—about half a dozen, I think, in different directions.
2643. Do you think that with a railway there would be much prospect of the available land being settled upon? I should say so; it is good land.
2644. Is the land in your own paddock of good quality? Yes; it is quite equal to the Cootamundra land.
2645. Then if mining operations died out altogether your land would be turned to profitable use under agriculture? Yes.
2646. Is that the general characteristic of the mineral land here? Yes.
2647. Is there any large area of land in the district suitable for agriculture? A very large area. I think it would have been cultivated long ago if there had been facilities for getting the produce to market.
2648. Is the land as good as the land at Temora? Better than that.
2649. Is the land between here and Temora as good as it is here? It is hardly as good as the land north and west of it.
2650. Have you done any grazing? I had 1,500 sheep before the mining began.
2651. Will it carry 1,500 on the average? I only lost six in the year.
2652. Has your land been improved by scrubbing and ringbarking? Yes, previous to my occupying it.
2653. Have you done anything to keep the land in good order since you occupied it, or has the scrub grown up again? I have cleared part of it.
- 2654.

- W. H. Waldron.
11 Oct., 1897.
2654. What is the carrying capacity of the land scrubbed and ringbarked, generally? It is equal to about a sheep to 2 acres; I carried my 1,500 sheep in a good season. I never had sheep in a bad season, so that it is difficult to say what the average carrying capacity would be.
2655. In what particular way would the railway benefit the district? I think that people would go in for mixed farming; that is what is wanted here to make things pay.
2656. Do you know of any settlers who would come here if there were a railway? No; but I have heard many persons say that it is good country, and if a railway were here it would be worth while to take up the land. I myself have no doubt that if there were a railway almost all the available land would be immediately applied for.

TUESDAY, 12 OCTOBER, 1897.

[The Sectional Committee met at the "Yalgogrin Hotel," at 9:30 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN.)

The Hon. DANIEL O'CONNOR, | JOHN LIONEL FEGAN, Esq.
FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Walter Barnett, hotelkeeper, Yalgogrin, sworn, and examined:—

- W. Barnett.
12 Oct., 1897.
2657. *Chairman.*] You are largely interested in mining matters here, and can give us some information about the mining industry generally? I am interested in the mining here, at Temora, and at Wyalong.
2658. *Mr. O'Connor.*] How long have you been in the district? I have been to and fro in the district for four years in December next, but I have resided in Yalgogrin only twelve months.
2659. Where were you before you came here? I was at Wyalong; I was one of the first in the field.
2660. Were you interested in mining there? Yes.
2661. You have a good practical knowledge of mining? Yes; I have been a miner for forty years.
2662. What do you think of the future of this district from a mining standpoint? I think this field has as good a future before it as any field I have been on for many years, and I have been on all the fields in the Colony. As to the country round about here, it is the best looking country I have seen. The average being obtained from the reefs which are now being worked is one of the best averages of any field in the Colony. According to its age it is better than Wyalong, and Wyalong averaged 2 oz. to the ton for the first twelve months. In two years this field has averaged 3 oz. for the quantity of stone which has been crushed. It is one of the best fields I have ever seen.
2663. How many reefs are there here? There are about twelve or fourteen lines of reef here now being worked.
2664. Do you know how many claims are at work? I suppose there are about fifteen to twenty claims working now. Fully twelve of that number are upon payable gold.
2665. The development will require more labour? Yes; I consider that when we have the machinery we shall be getting after Christmas there will be at least 500 people here. There must be 200 wages men here now. Our deepest mine, the Adelaide, is 250 feet down.
2666. Who is interested in that mine? They are known as the Mossgiel syndicate. The last crushing went 6 oz.
2667. What is the area which has been tested? The place has been tested for about 8 miles round.
2668. And it has proved to have been auriferous within that radius? Yes. The field, however, is in its infancy yet; it has not been half prospected.
2669. You have some batteries erected? We have ten head up now, and we are providing for an additional five.
2670. How many tons would that fifteen head crush a week? We could go through about 130 tons a week. We do 100 a week now. We reckon about 10 tons to a stamper. Taking the poor with the good, we have about 800 tons to start upon.
2671. You think that mining developments here would inevitably lead to a large increase of population? Yes; the evidence which I gave before the Sectional Committee which examined witnesses at Wyalong has proved to be correct. I said at the time that I considered the field would carry from 4,000 to 5,000 people for five or six years, and perhaps twenty. I said I thought that for ten or twenty years it would settle many people there, and that has been proved to be correct. There are now from 2,000 to 3,000 people at Wyalong.
2672. Do you know the country from a pastoral or agricultural standpoint? I have been prospecting and going to and fro in it since 1869. It is good agricultural country for miles round, taking it in which direction you like.

Edward Carroll, miner, Yalgogrin, sworn, and examined:—

- E. Carroll.
12 Oct., 1897.
2673. *Mr. Fegan.*] How long have you been in the district? Nearly four years.
2674. What part of the Colony did you come from? From Condobolin.
2675. You are well acquainted with that district? No; I did not reside there long. I went there from Peak Hill.
2676. You have been following mining all your life? Yes.
2677. You are interested in mining here? No, I am bootmaking now.
2678. You have an idea as to what this field will become? Yes; I desire to direct the attention of the Committee to the reports of Mr. Slee and Father Curran as to its prospective capabilities. I think a railway should be considered in connection with the mining as well as in connection with the pastoral and agricultural interests of the country. You will see, on reference to the reports I have mentioned, that Yalgogrin is only in its infancy. Within 4 miles each way there is gold enough perhaps to keep thousands of persons profitably employed by and by. Cobar affords an illustration of the advantage of constructing

a railway to a mining field. If I had my way I would bring the line from Temora; by and by these Colonies will be amalgamated, and it will not be so difficult to reach the seaboard by railway.

E. Carroll.
12 Oct., 1897.

2679. Why do you mention Temora as the point of departure for a railway in this direction? Because it is the nearest route to the sea in Victoria. I have no particular liking for Melbourne, but when the whole of these Colonies are federated, the trade of the southern parts of New South Wales will go to Melbourne as its nearest seaport.

2680. Do you not think the Grenfell district is entitled to a railway? Yes.

2681. Putting aside the question of federation, you think the Grenfell route would be the better route? Yes, for the Colony itself. The Grenfell district has splendid agricultural country; there is none better in New South Wales. A railway in this direction would cause settlement upon country where there is nothing but rabbits now.

2682. Have you worked in any mines here? No; but I am interested in mines at Wyalong.

2683. You think the construction of a line through Grenfell would be the means of developing mining as well as the agricultural industry? Yes; probably the mining industry will pay eventually a larger proportion of interest and working expenses than will agriculture.

2684. Upon what fields have you had experience? My first experience in reefing was at Hill End in 1871, and since then I have been following mining pursuits; at the same time I cannot put myself forward as an expert in mining.

Samuel Hill, grazier, Yarrandale, sworn, and examined:—

2685. *Chairman.*] Have you been long resident in the locality? Thirty years.

S. Hill.

2686. You have a pretty good knowledge of the district? Yes.

12 Oct., 1897.

2687. *Mr. Farnell.*] Where is your holding? About 9 miles north-east from Yalgogrin. I have nearly 11,000 acres of conditional purchase.

2688. What is the carrying capacity of your holding? It all depends upon the year. It would take about a sheep to 2 acres.

2689. What stock have you on it now? Very few; not quite 1,000.

2690. What area have you under cultivation? I have 270 acres cleared, but I have only 12 acres under cultivation this year. I only cultivate for home consumption.

2691. What do you think of the soil? It will grow anything. I have one paddock under cultivation now which has been twenty-eight years under crop.

2692. What is the reason you have not put more land under cultivation? Because there is no way of getting our produce to market profitably. I should put 1,000 acres under crop if there were a railway, because the land is easily cleared.

2693. What does it cost per acre to clear? I believe the green timber would cost fully £2 per acre; but I have some timber which has been rung now for over twenty years, and all that you have to do in such a case is to burn it off. You could get it cleared for 7s. or 8s. per acre.

2694. What does it cost per acre to ringbark? About 1s. an acre.

2695. So that the total cost of clearing, including ringbarking, would be 10s. per acre? Yes.

2696. You would have to wait about four or five years after ringbarking? Yes, and perhaps longer than that.

2697. Are there any available areas which could be put under the plough almost immediately? Yes, it is good growing country.

2698. Have you experimented with different kinds of produce? Yes; I have grown potatoes and corn. I remember getting a middling crop off a 4-acre paddock one year. In another year I had 38½ bushels of wheat to the acre off a small paddock, but it was a good season. If we had from 12 to 14 bushels per acre of wheat it would pay.

2699. And with a railway I daresay less would pay? A great deal less.

2700. Where do you send your clip to now? To Sydney *via* Temora.

2701. Is that your nearest railway station? Yes.

2702. Do you send any live stock to Sydney market? Yes; about twelve months ago I sent from Temora nearly 900 fat sheep.

2703. And you would no doubt use a railway for that purpose within 20 miles of your holding? Certainly.

2704. Do you think a railway would promote much settlement here? Yes; there is no better growing land in the Colony than you will find on the Humbug Creek.

2705. Have you tried fruit-growing? I have tried a few vines, they did remarkably well. Two vines at my place cover an outbuilding, but they have been in a great number of years.

2706. Have you any vintage grapes? No.

2707. Do you think that mixed farming or dairying could be successfully carried on here? Yes.

2708. Have you tried growing fodder for cattle? I have tried lucerne; it grew very well for about three years; I happened to turn the sheep on to it when the crown was just coming above the ground; they ate it off, but it will grow again. I have 6 acres of lucerne in this year.

2709. Have you any knowledge of the mineral resources of the district? Yes; I believe it will turn out to be a permanent field. I am interested in some of the mines myself. I have a 20-acre lease on one of the selections, about 6 miles from here.

2710. Are you working it? Yes.

2711. What has been the return? We have not crushed any yet, but an assay gave 30 oz. to the ton. Our lowest stone gave 2 oz. 14 dwt., and our highest 30 oz.

2712. Did that stone carry free gold? Yes.

2713. Have you any pyrites? Yes; there are three different reefs running through the ground; one is a good mineral reef; they are not very far off from one another.

2714. What are the timber resources of the district like? There is some very good ironbark.

2715. There will be no difficulty in getting the necessary quantity of sleepers for a railway in this direction? Not the slightest.

2716. You know the proposed railway from Condobolin to Euabalong? Yes.

2717. That line would not benefit you in any way? No.

2718. In the event of the railway being constructed to Hillston, which would be the better route? I think the route which was surveyed some time ago from Wyalong; a portion of it comes through my place.

S. Hill.
12 Oct., 1897.

place. I think that with a little alteration, bringing the line further from the lake, you would find it the best route. It goes through about 3½ miles on my property.

2719. Is it all improved land? Yes; but I should be perfectly willing to give the portion required for a railway, provided the line did not cut off my dam. If it cut off the dam I should expect the Government to compensate me for severance.

2720. If the line were not fenced it would do you no great injury? No.

TUESDAY, 12 OCTOBER, 1897.

[The Sectional Committee met at the "Wollongough Hotel," Ungarie, at 8.15 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

FRANK FARNELL, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Digby Noy Johns, settlement lessee, Crown Camp, Wollongough, sworn, and examined:—

D. N. Johns.
12 Oct., 1897.

2721. *Chairman.*] What is the area of your lease? Three thousand two hundred acres; but I am interested also in the Wollongough pastoral holding, in conjunction with my brother.

2722. How long have you been a resident here? Four years.

2723. From what part of the world did you come here? From the Goulburn Valley, in Victoria, where I had been farming at Madowla Park. I was engaged in mixed farming—agricultural and sheep farming, breeding draught horses and cattle, fattening and breeding large quantities of pigs, and market gardening. Hearing that the Committee had come up here to investigate the desirableness of constructing a railway to Euabalong, and believing it to be essential that Hillston should be the objective point of any extension in this direction, I attended there, as Chairman of a railway league representing the Humbug Valley, to suggest that the Committee should examine the country lying between Hillston, Wyalong, and Grenfell, with a view to laying before them evidence which would conclusively show that very extensive areas of land suitable for close settlement and mixed farming would be traversed by a line in this direction for almost the entire route. I then prepared some evidence as to this district, bearing out the view I took, that this suggested line would be more suitable than an extension from Condobolin. I will submit to the Committee some particulars as to crops and rainfall, and will compare them with statistics from another wheat-growing district of the Colony, Green's Gonyah, where large areas of freehold are being taken up in small lots by farmers from all parts. The wheat-growing areas centre in Brookong, which was at one time proposed to be purchased by the Government, and which is now being sold for £2 10s. per acre freehold. I desire particularly to compare the two districts in regard to rainfall and soil. I have received a letter from Mr. J. B. Nutting, resident manager for the company owning Brookong, who has been well acquainted for many years with Wollongough. It is dated 16th July, 1897. He says:—"I have no doubt as to your being able to make a most valuable property of Wollongough. It is sure to be a great wheat-growing centre. The soil is quite equal to that of Brookong for wheat, although the grasses are not."

2724. Mr. Nutting has had a large experience of wheat-growing? Yes; he has about 3,000 acres under crop on the share system, on the portion of Brookong station surrounding Green's Gonyah.

2725. He has had experience in agricultural pursuits generally? Yes; he is able to make a comparison, having known both places very well for years. I will give you a comparison between spring rainfall at Urana and Wollongough from 1890 to 1896, taken from the Government Astronomer's reports. Urana is one mile from the Brookong boundary, and fairly in the centre of all the wheat country of South Riverina.

COMPARISON of the Spring Rainfall of Brookong and the Humbug Valley, 1890-1896.*

	August.	September.	October.	Annual total.	No. wet days in year.
1890 { Wollongough	0.59	2.14	1.50	22.96	64
{ Urana	1.12	1.56	1.71	17.93	60
1891 { Wollongough	1.56	3.57	1.52	28.90	68
{ Urana	1.55	1.65	0.95	22.50	56
1892 { Wollongough	1.10	2.48	2.91	17.75	53
{ Urana	2.39	2.04	3.00	19.77	50
1893 { Wollongough	1.24	1.78	1.58	19.09	61
{ Urana	1.57	1.59	0.88	17.61	59
1894 { Wollongough	1.93	1.60	3.58	29.36	63
{ Urana	1.71	1.22	3.12	29.29	83
1895 { Wollongough	1.32	1.08	1.53	12.15	55
{ Urana	1.19	0.20	0.70	13.14	39
1896 { Wollongough	1.39	0.77	0.64	12.36
{ Urana	0.52	1.05	0.16	14.90

I. Analysis of rainfall of Urana and Wollongough in relation to the growth of wheat in the most important spring months—August, September, and October:—Out of a total of twenty-one spring months in the seven consecutive years, Wollongough has fifteen wetter than Urana. This is especially marked in droughty years.

II. The number of wet days is almost the same, and a closer examination shows the wet usually occurs about the same period. The average annual totals are about the same, namely 20 inches.

The Humbug Valley embraces about 450,000 acres. The country is flat, and, with the exception of a few small areas, it is all suitable for agriculture. The runs embraced are Youngara Creek, Wollongough, Bolygamey,

* NOTE (on revision):—1897 { Wollongough 1.93 | 1.88 | 1.44 | |
 { Urana 1.50 | 1.27 | 0.85 | |

Bolygamey, Merringreen, Ungarie, Youngee Plains, Euglo, Bena, Crown Camp, and Bygoloree. The other runs, lower down the valley, are within the sphere of the Condobolin railway. The quality of the soil may be judged from the fact that when the runs were divided into resumed and leasehold areas, in 1884, almost the whole of Wollongough, all Bolygamey, the greater part of Merringreen, all Ungarie, and almost all Bygoloree were selected. As the resumed area is generally the inferior portion of a holding, you may infer that the quality of the soil is good. The geological formation on the hills surrounding the Upper Humbug Valley is slate; the soil is red, sandy loam, friable, and of great depth. It is well adapted to miscellaneous and continuous cultivation with rotation of crops, being readily fallowed even in summer. Miners who have sunk for alluvial have reached 140 feet without bottoming. This area includes Bolygamey, Merringreen, Youngara Creek, Wollongough, and Ungarie. On the Lower Humbug the geological formation is largely basalt, and the soil changes into a dark, loose chocolate loam of extraordinary fertility. This area includes Bygoloree, Crown Camp, Four Bob Camp, Euglo, and Bena. That basaltic area is the richest country I know anywhere south of the Lachlan. For crops it is by far the most prolific in all this district. It is outside the zone served by the Condobolin railway, and contains an enormous area of Crown lands. The basaltic area embraces Gorman's Hill and Dundoo Hills, where limestone also outcrops; all that soil is of equal fertility. With reference to the fertility of the country, I might refer the Committee to Mr. Inspector Slec's evidence before the Sectional Committee in 1894, page 14. He there describes the district as "a perfect Garden of Eden." All this country lies outside the zone served by the proposed railway from Wyalong to Hillston, *via* Yalgogrin. But were the alternative Humbug Valley route, through the Youngara Gap and thence to Hillston adopted, the whole of Humbug Valley south of Condobolin railway zone would be served, and also all this rich area, as the 25-mile zone of this alternative route would embrace all the country to within a few miles of Lake Cudgellico. This line would have this two-fold advantage—that it would reach and open up all the back country from Wyalong to Hillston; it also, if taken by the Humbug Valley route, has all the advantages and none of the drawbacks of the Lake Cudgellico route. The advantages of the route I suggest over the more direct route lie in the character of the country traversed. In spite of the line "*via* Lake Cudgellico" being 12 miles longer, and having engineering difficulties between the Lake and Hillston, it was judged by Mr. Kennedy—according to the evidence of Mr. Barling, in 1894, who quoted Mr. Kennedy's report—that in comparison with it, the direct route "*via* Rankin's Springs" must be dismissed from serious consideration. I would point out to the Committee that by adopting the Humbug Valley route the whole of the area referred to by Mr. Kennedy, almost as far as Lake Cudgellico, would be served, while all the advantages claimed by him for that route would be gained. The survey made to Hillston, *via* the Youngara Gap, by Mr. Gillett, C.E., has proved the practicability of this route which I am advocating, and I would strongly recommend it to the consideration of the Committee. I submit that there can be no comparison between the serviceableness to the country at large and the profitableness to a railway department of a line through 70 miles of the richest of agricultural country, as compared with a line of 67 miles, skirting a chain of barren hills, the only merit of which would be that it would be 3 miles shorter, and that it would serve the village of Yalgogrin, consisting of fifty working miners and their dependents. The Youngara Gap route, moreover, would afford abundance of convenience to them, as they would be within 10 miles of it. I think also that it would be a serious loss to dislocate the route of a main line depending wholly for its profit on the agricultural produce it gathers between Wyalong and Hillston—beyond Hillston the country will never be anything but pastoral—for the infinitesimal purpose of serving a small and hitherto unproved diggings at Yalgogrin. If the question be put to all witnesses, they will tell you that, from an agricultural point of view, the line from Wyalong *via* Yalgogrin to Rankin's Springs passes through the very worst class of country that could be chosen between those two places by any route whatever. The climate of the Humbug Valley is almost identical with that of Brookong and the great wheat-producing areas of southern Riverina. Mr. Russell's exhaustive tables of the temperature show that, compared with Urana, the Humbug Valley is, on the average, 2 degrees Fah. hotter—varying from $1\frac{1}{2}$ degree in summer to about 3 degrees in winter and spring, at which latter season the difference is greatest. The following crops have been grown on Wollongough:—Wheat, barley, oats, maize, corn, potatoes, fruit, and vines. As regards the inexhaustible fertility of the soil, I may mention that the old station cultivation paddock was continuously cropped for hay from 1872 or 1873 until 1894, and in that year yielded about 3 tons of hay per acre. It was then put under lucerne. At present, owing to the impossibility of making it pay to improve small areas for small quantities of sheep in such a way that they will withstand long droughts, and the impossibility of profitably growing wheat, owing to the great expense of carriage, selecting has been a failure. Any number of selections are for sale at low figures. The soil throughout the valley is in my opinion quite equal to that of Brookong and the Riverina wheat-growing district generally; and if a railway were to pass within accessible distance, I am confident an immense number of men would avail themselves of the opportunity to take up land, in preference to purchasing from private owners. I myself know a number of men in and around Brookong, some of whom are working on the share system, who would come into this district, and would, I believe, settle here permanently; in fact, the way in which the district was rushed in 1884 shows that the quality of the land is well known and appreciated by farmers. One great cause of the unprofitableness of selection has been the rabbits; but the greater part of the country is now netted, and is therefore protected from further incursions. I believe that with railway communication, settlement in blocks of 320 acres would take place with the same rapidity as on blocks of from 200 to 400 acres, situated on Brookong and the neighbouring districts, and these are being eagerly competed for by farmers from all parts of the country. I know the Brookong and surrounding country very well, being very often there.

2726. Do you think a railway from Condobolin to Hillston, *via* Eubalong, would be of as much national benefit as a line running from some point on the Southern railway system to Hillston, passing through or near the country you have described? Most certainly not. The country passed through between Condobolin and Hillston is largely inferior as compared with that of this district, and the rainfall is not nearly so good. Besides, a considerable portion of the land would be in the Western Division, and would not therefore be available for settlement for twenty-one years; on the other hand, a line in this direction would run through land in the Central Division, the whole of which could be made available, when the leases fall in as they shortly will, if necessary.

2727. Do you think the land round about Ungarie is equal in quality to that in the cultivation paddock which

D. N. Johns. which you tell us has been under cultivation from 1878 to 1894? Identical. Almost in an adjoining paddock in the same year a crop was sold by weight, and it went over 3 tons on the scales.

12 Oct., 1897.

2728. There is a considerable area of land here similar in quality? The most part is similar in quality, and I think it would be greedily snapped up as soon as the leases expired if there were railway communication.

2729. At what distance from a railway station could farming be profitably carried on in this district? It depends on what crops the farmer grows. Judging from what has been done I should say that wheat could be carted 20 miles; but I believe the Humbug Valley would develop into a dairy-farming district, and that it would produce immense quantities of green fodder and fruit, and I do not think the bulky produce could be profitably carted so great a distance as 20 miles.

2730. For what distance do you think it could be carted? Fifteen miles.

2731. What would be the cost of clearing land fit for the plough? Green timbered land can only be cleared for the plough by grubbing out the trees with the spade; old dead-timbered land can be cleared by using a fire-stick. There are so many descriptions of clearing to be done. In some cases you have land upon which the timber has been rung for many years, and is absolutely dead. In other cases you have land where timber has been rung, and where some of it has grown again—where it has not only grown again, but where the country has thrown up large quantities of seedlings and suckers. The prices would vary under all these conditions—according to the nature of the timber. I might say that the old ringbarked country here is exactly similar to a great deal of the country in the Brookong district which has been cleared for 3s. 6d. an acre, by the farmers taking it on the “halves” system.

2732. An enormous area of country along the route you suggest has been ringbarked for some years? On all the leasehold properties the country has been ringbarked, but a great deal of it has thrown up suckers and scrub, and requires to be ringbarked and scrubbed worse than ever.

2733. Still, there is a large area of good ringbarked country which will be available for settlement when the leases fall in? Yes, a large area fit for immediate settlement by men of small capital, given a railway.

2734. Do you know the country between Wyalong and Temora, and between Wyalong and Grenfell? I know the country between Wyalong and Temora. Looking at the map before me, I am struck by the fact that the whole of the Crown land round Temora, with the exception of the reserves, have been alienated; and knowing as I do how inferior the land is to the land in the Humbug Valley, I think the fact corroborates my statement that land here would be eagerly competed for if a railway were constructed to the district. I would like, however, to point out to the Committee what I consider to be the real secret of agricultural settlement in this part, and that is to have the timber and scrub thoroughly dead and dry before the farmer of small capital goes upon the land. That is why the usurious “halves” land is being fairly rushed by farmers. The very men who have failed when selecting green forest land for themselves are making rapid fortunes by taking up dead-timbered land on the “halves” system. Green forest land cannot be cleared for the plough under £1 10s. per acre. Dead-timbered land is being cleared for the plough wholesale on Brookong for 3s. 6d., and the farmer of small means can, with the aid of his family, clear this rapidly almost entirely by burning it off; children can do most of it, the work being light. The ground is already sweetened by years of pasturing, and the farmer getting in a good big area in his very first season has a large immediate return. Dealing with green timber means either very heavy expenditure in grubbing it when green, or if it is rung it means at least five years' delay while the trees are gradually and slowly becoming dry enough to burn out. Either of these courses ruins the farmer of to-day just as it has ruined nearly all the selectors under the 1884 Land Act. The farmer of small capital cannot wait for four years before getting his return. The timber must be dead on the land if he is to make a success of it, and to get much of the country from Wyalong to Hillston into this state can only be done—but it can be done well—by the issue of improvement leases at a very low rental, with a stringent condition for the killing of the timber. We have, even during the late drought, fed bullocks on belar which has been ringbarked eighteen months. I would therefore recommend, as the railway cannot pass through this country for a number of years, that the land should be disposed of under improvement leases on such terms as would ensure the destruction of the valueless descriptions of timber upon it. Then when it is thrown open in small areas it can be cleared at a small expense—at least, 5s. per acre. In its present state it would cost from 30s. an acre to clear it, and the land would not then be so sweet for cultivation as it would be after being ringbarked for a number of years. With regard to the area of 450,000 acres of the Humbug Valley, it is, in my opinion, the best land which could be traversed by a line passing from Wyalong to Hillston. By far the greater portion of it is Crown land, and it can only be adequately opened up by a line which, coming from Wyalong, would go through Youngara Gap to Rankin's Springs. Judging the value of this land by the present saleable price of similar land in Brookong, it would amount to over £1,000,000. This land would not be adequately served by a line from Wyalong *via* Yalgogrin to Rankin's Springs. This is important, having regard to the fact that the land will be ultimately occupied in small areas which will be largely under green fruit and fodder crops which cannot bear long cartage. I should also like to impress upon the Committee that 320 or 640 acres would be sufficient for a settler if a railway came within 10 miles of him, because he could then grow green produce and fruit crops; otherwise, 5,000 acres would be required, as pastoral pursuits would have to be followed. I think I said in a former part of my evidence that wheat could be carted 20 miles. I had in my mind the fact that the Brookong farmers cart that distance; but I think, on further consideration, that it is only the expectation of getting a railway line that induces them to go there, and it is only at the present high price of wheat that they could afford to cart that distance.

Charles Bailey Blyth, station manager, Wollongough, sworn, and examined :—

C. B. Blyth.

2735. *Mr. O'Connor.*] How long have you been upon the station? Four years.
2736. How were you occupied before you went to Wollongough? I was on a station out Bourke way for three years.
2737. How long have you been connected with pastoral pursuits? All my life, in various places. I was born in Tasmania; but I left the country when I was 17, and I have been engaged in pastoral pursuits in Queensland and New South Wales ever since. I have always been connected with pastoral and agricultural pursuits.
2738. Do you know the country round here pretty well? Yes; I have been over the whole of it.
2739. For what distance? 100 miles to the south, and 100 miles to the north-east and west.
2740. What is your opinion of the land in this district? I think it is as good as I have ever seen, and I suppose I have seen the best wheat-growing land in the Riverina.
2741. What portions of Riverina have you seen? I have seen the Berrigan and Brookong land.
2742. And you consider the land here quite equal to the land at either of those places for wheat-production? Yes.
2743. You can endorse the statements by Mr. Johns? I can.
2744. Is there anything you would like to add to his evidence? With regard to the railway route, my idea is that a line might come through from some place off the Southern system—say, from the Blayney-Murrumburrah line. I think it should go through Grenfell, Wyalong, and Lake Cudgellico, to Hillston. I think such a line would be of greater national advantage than a line from Condobolin to Hillston, *via* Euabalong; because I think the land on the route I have indicated is superior in every way. Not only that, but there is more chance of the land on that route being closely settled, owing to the leases falling in shortly. The leases on the other line have twenty-one years to run; but the leases down here have only three years to run. That would apply to the leases from Grenfell nearly to Hillston.

12 Oct., 1897.

Thomas Phelan, grazier, Ungarie, sworn, and examined :—

2745. *Mr. Fegan.*] How long have you been in this district? About thirty-seven years.
2746. During that time what have you been doing? I have been engaged in agricultural and pastoral pursuits.
2747. What is the area of your holding? 14,000 acres.
2748. How many sheep are you running at the present time? About 4,400.
2749. Have you carried more than that number at any time? Yes; I have carried 15,000 sheep—about a sheep to the acre.
2750. How long have you been in this immediate neighbourhood? Seven years.
2751. During those seven years how many droughts have you had? The seasons have not been good for the past three years.
2752. How many sheep, on the average, could you carry? A sheep to an acre and a half. You must remember that is after spending £10,000 on the 14,000 acres. It is conditional purchase land. There are about seven blocks of 640 acres, and the remainder would be conditional lease, with an annual lease of 2,400 acres.
2753. Have you improved the annual lease? Yes.
2754. What have you spent upon it? Over £100.
2755. Are you doing any farming? Yes; a little at the present time. I have 29 acres under wheat.
2756. Have you tried wheat-growing in any previous year? Yes. In any good season we get about 20 bushels to the acre.
2757. What are the best results you have obtained per acre? I could not very well say; I have been growing what I wanted for hay for my own use. I have not gone in for wheat-growing, because there has been no means of getting the wheat away.
2758. Do you know the land between here and Condobolin? Yes.
2759. Which do you think would be the best means of reaching Hillston from the present railway system? I think a line from Temora to Wyalong and through the Gap on the old survey to Hillston would be the best line. There would be less engineering difficulties; you would have a large freight of agricultural produce; it would open up a large area of country; it would support a great number of people; and it would be the shortest and cheapest line.
2760. How far would you be, at the nearest point, from the railway which you have suggested? As a matter of fact, the line would travel parallel to a portion of my land for 8 or 9 miles; but between Wyalong and this point the line would travel parallel with *bonâ-fide* settlement without a break.
2761. What is the distance between Wyalong and Temora? Forty-four miles.
2762. You heard Mr. Johns state that a farmer could profitably cart wheat 25 miles to a railway;—what would the distance be in your opinion? The distance would be what a horse can do in a fair day's stage—10 miles to a railway and 10 miles back.
2763. Do I understand you to say that a line which would not be within that distance to the majority of the settlers in a district would not be of much use? I do not say that. I should be very pleased to get a line within 30 miles.
2764. You think 30 miles would be a fair distance? Yes.
2765. Supposing there were a railway from Grenfell to Wyalong, do you not think the people between Barmedman and Wyalong would be well served, having regard to the fact that there is already a railway at Temora? Yes.
2766. Do you not think it would be well, therefore, to bring the railway to other centres in need of railway communication—Grenfell, for instance? I do not know the Grenfell district well enough to say; but you have a trunk line already open to Temora 40 miles in the direction of Wyalong. By continuing that trunk line another 40 miles you would serve a large number of people, and you would at the same time be approaching Hillston. My idea is that the line should be called the Great Western line. You might have a light line of railway from Cowra to Grenfell.
2767. Have you tried fruit-growing? Yes; the trees have not been a success, owing to the rabbits. I have grown barley and I have also grown turnips, carrots, potatoes, beans, peas, and cauliflowers. My garden

T. Phelan.

12 Oct., 1897.

- T. Phelan.
12 Oct., 1897.
- garden ground has not been specially picked for gardening; it happened to be at the homestead. It was at one time supposed that we could grow neither fruit nor wheat between here and Wagga Wagga.
2768. Have you tried the land for dairying to any extent? No; but this Humbug Valley country is well adapted to it. The soil is very deep; it has never been bottomed that I know of. Dairying has not been tried extensively, because there is no market to which we could send our produce. We make sufficient dairy produce for our own purposes.
2769. Do you find it keeps well? Yes.
2770. So if you were brought nearer to a centre of population by means of a railway you think the dairying industry here would be a success? I do, certainly.
2771. How is your run watered? By tanks and excavations.
2772. You have no wells? No.
2773. Do you know of any wells having been put down here? I know of one or two places where they have been started, but no water has been found.
2774. What timber is there on the land here? Pine, box, oak, dogwood, yarran, and many other scrubs. There is no ironbark.
2775. Do you know of any ironbark close at hand? I know of little belts 10 or 15 miles from here. There might also be some further on.
2776. Is there anything you would like to add to your evidence? I might qualify my statement as to the railway route by saying that on the northern side the land is all good, whereas on the southern side it is ridgy, ironbark, gravelly country. From Wyalong to Mandamah it is all bad country with the exception of small patches. I might also explain that several of the leases here will soon expire, and the lessees do not really want a railway.
2777. Why? They want to secure the other half of their runs.
2778. They think the Government might hold back the leases if a railway were on the point of construction? Yes; and I might add that, from my experience in farming, if there were a railway here a man could do as well wheat-growing on 640 acres as he could do on 14,000 acres with sheep.
2779. Would you put any greater area under cultivation if there were a railway here? Yes. I have just finished a contract of 176 acres.
2780. Are you going to put it under wheat? Yes.
2781. Do you know of any applications having been made for land in this neighbourhood? Yes; persons are passing through here from Victoria almost every day, and they ask me about the land in the district.
2782. You have no doubt that if there were a railway here the district would be thickly populated in a few years? Yes. I was in Riverina before I came here, and as soon as a railway in that district was opened people very soon went for the land.
2783. What did your fleeces run this year? I got fifty bales of wool. As a matter of fact, I have not quite finished shearing yet, and I cannot tell quite how the fleeces will go.
2784. Where do you send your wool? To Sydney.
2785. Do you know of any settlers hereabouts who are sending their wool to Melbourne? No.
2786. What would it cost you to prepare land for the plough? It would cost 10s. per acre including the burning off of the timber.
2787. What would it cost you to ringbark? I paid for ringbarking and having the land scrubbed and scrubbed again 4s. 9d.; that would be taking the timber in its green state and allowing it five or six years to decay.
2788. Then it would cost you about 16s. per acre to prepare the land for the plough? About that.
2789. About how many bushels of wheat to the acre have you got here? About 20 bushels.
2790. So that wheat-growing would undoubtedly pay here? No doubt it would if we had easy transit.
2791. As matters stand it would not pay you to cart the wheat to Temora? No.
2792. With a railway 20 miles distant at what price would wheat pay you? Two and ninepence.

Richard Jones, farmer, Wollongough Station, sworn, and examined.

- R. Jones.
12 Oct., 1897.
2793. *Mr. Farnell.*] What area do you hold? Over 2,000 acres. It is conditional purchase and additional conditional purchase.
2794. How long have you been in possession? Three years and ten months.
2795. During that period you have had an opportunity to test the capabilities of the soil? Yes; I have grown wheat, hay, and vegetables.
2796. What area have you had under wheat? Twenty acres, and 12 acres for hay.
2797. Have you tried oats? No.
2798. Is that the extent of your cultivation? Up to the present time. I have 25 acres more in this year than I had last.
2799. What has been your average yield of wheat per acre? About 17 bushels.
2800. How have you disposed of it? I have made it into flour for my own use; I send it to the mill.
2801. You have not grown any for market? No.
2802. Are you satisfied with the result of your experiment as far as wheat-growing is concerned? Yes.
2803. What has been the obstacle to your putting further areas under crop? It is too expensive to get the produce away.
2804. You know the prices which are realised in this Colony for wheat from time to time? Yes.
2805. With a yield of 17 bushels to the acre, and with proper facilities for getting the wheat to market, what area would you be prepared to put under cultivation? Between 400 and 500 acres. The seasons have been bad since I have been here, but I believe that in an ordinary good season the returns would be much greater.
2806. At all events a yield of 17 bushels per acre at a fair price would pay? Yes.
2807. What distance could you afford to cart wheat to a railway? About 20 miles. I think you might perhaps cart it 25 miles at a fair price.
2808. Have you seen any indications of rust in the crops you have grown? None whatever; and I have grown as fine crops as you could wish to see. I have also grown potatoes, cabbages, and maize.
2809. To what extent have you grown maize? I put in an acre as an experiment; it grew splendidly.
2810. You were satisfied with the result? Quite satisfied.
2811. Have you tried fruit-growing? The rabbits destroyed the fruit-trees I put in, but they were growing very well.
- 2812.

R. Jones.
12 Oct., 1897.

2812. Do potatoes do very well here? Yes, splendidly. I have tried the Early Rose, and also Brown Hills. I tried a white skin seed potato which grew very well indeed. Those which I grow gave from 30 cwt. to 2 tons per acre.
2813. Have you any doubt as to the success of lucerne here? No. I believe anything you put into the soil will grow.
2814. Have you tried ensilage? I have not made any ensilage since I have been here.
2815. But you think you could succeed? I have no doubt of it.
2816. Taking all these circumstances into consideration you think mixed farming could be carried on here? That is my firm belief.
2817. You also think the dairying industry could be developed here? Yes.
2818. Are you dependent here upon artificial water? Yes.
2819. Are you running any stock? None at present.
2820. What did it cost you to prepare your land for the plough? About 22s. per acre.
2821. What character of country is it? It is flat country; it is all agricultural ground. The timber was ringbarked some years before I took up the land.
2822. What would be a sufficient area here upon which to make a livelihood? I reckon a man could live upon from 200 to 400 acres if he had facilities for getting his produce away.
2823. Have you any idea of the population within a radius of 20 miles of this place? I cannot say definitely; but I should think there would be about 1,500. I think that number would be within the influence of a railway in this direction.
2824. I suppose you know it is proposed to extend the railway from Condobolin to Euabalong? Yes.
2825. Is the railway at Condobolin of any use to you at present? Not the slightest.
2826. Would the extension to Euabalong be of any use to you? No.
2827. You think that if it is decided to connect Hillston with the railway system of the Colony, the line should pass through this district? Yes.
2828. What railway station do you use? Temora was our nearest station until the railway was extended to Condobolin.
2829. What is the rate of road carriage between here and Condobolin, and between here and Temora? I do not think there is much difference. The rate is about 25s. per ton when there is back loading.
2830. Supposing you wanted to send a ton of wheat to Temora, what would it cost you, ordinarily? From £3 to £4 per ton.
2831. Are there any mineral deposits in this district? There are indications of gold in different places.
2832. You do not know of any prospecting having taken place? No.
2833. Have you had to fall back upon irrigation in connection with your cultivation? No; only for cabbages.
2834. Is there anything you wish to add to your evidence? I would like to say that the country here is more adapted to agriculture than anything else.

William Smith, selector, Ungarie, sworn, and examined:—

2835. *Chairman.*] What is the extent of your holding? 2,560 acres conditional purchase and conditional lease.
2836. Have you been settled here long? About eight years.
2837. You desire to mention some reasons why a railway should be constructed through this part of the country to Hillston instead of going through Euabalong? Yes; I think the land on this route is much better than on the other.
2838. You think a line to Euabalong would not benefit this part of the country? I think not. As regards the southern route, I may mention that I have tried growing wheat, and have found it a great success. I think that if we had a railway through here there would be a good deal of cultivation. It would pay us to grow it. So far we have had no market. We have been unable to sell when we did grow it.
2839. The road carriage is prohibitive? Yes.
2840. Therefore, you would have to confine your operations to wool-growing, with small crops for home use? Yes.
2841. You think you could farm more profitably if you could use your land partly for wool-growing and partly for agriculture. Yes; if you could get the produce away.
2842. Is the land all taken up in the vicinity of your holding? Yes.
2843. How is it held? By selectors.
2844. Do they grow wool? Yes; and they farm.
2845. I suppose they cultivate only for their own use? This year they have more in than they have had in former years.
2846. They are increasing their cultivated areas year by year? Yes.
2847. What area did you commence with? I had only 7 acres at first; that was about three years ago; now I have about 45 acres.
2848. Do you use the whole of the produce yourself? Last year I had only 40 acres in, and I used nearly all the produce off that.
2849. What area is held by the selectors who are near you? I think they have full blocks of 2,560 acres. There are selections pretty well all the way to Wyalong. There is settlement also at Lake Cowal to the east and still more to the north of us.
2850. But the bulk of the settlement is between your place and Wyalong? Yes.
2851. I presume you have a market for a certain quantity of produce in Wyalong? Yes.
2852. In what direction from you is the available land? North, east, and west.
2853. Do you find farming pays fairly well in the conditions under which you can carry it on? Yes.
2854. You are quite satisfied with your prospects? Yes.
2855. You think the land would carry a large population? Yes.
2856. And that it would be at once taken up if there were a prospect of a railway? Yes.
2857. Are you in a position to compare this land with the land at Berrigan? Yes; I think it is equally as good. There is a much larger area of good land here.

W. Smith.
12 Oct., 1897.

- W. Smith.
1 Oct., 1897.
2858. Are you able to cope successfully with the rabbits on your small holdings? If the whole of the settlers poison you can keep them down, but unless everyone endeavours to cope with the pest you cannot hope to be successful.
2859. You think that if the whole of this country were taken up in blocks of 2,560 acres you would gradually be able to exterminate the rabbits? Yes. That is the only way you can get rid of them.
2860. You have proved that you can get rid of them by fencing in holdings of 2,560 acres and poisoning? Yes. My father's holding adjoins mine; he had 60 acres under crop three years ago, from which he obtained 16 bushels per acre.
2861. Is that the average yield of the wheat-land about here? In better seasons the yield would improve, but that would be about the average.
2862. You think you could rely upon 16 bushels to the acre year in and year out? Yes.

THURSDAY, 14 OCTOBER, 1897.

[The Sectional Committee met at the Court-house, Wyalong, at 10 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

John Smethurst, architect, Wyalong, sworn, and examined:—

- J. Smethurst.
14 Oct., 1897.
2863. *Chairman.*] You are Chairman of the Progress Committee? Yes.
2864. You have heard of the proposal to extend the railway from Condobolin to Euabalong, with a view to its ultimate extension to Hillston? Yes. But the only evidence I can give with reference to that proposal would be of a negative character. A railway is required for this portion of the country, and if it be not possible to construct the two railways I am of opinion that the preference should be given to a line in this direction. A railway connecting Wyalong with the railway system of the Colony is necessary, to begin with, for the proper development of the mining industry here. Some of our ores are comparatively refractory, and expensive works have been erected here by capitalists for the purpose of treating them. At present the cost of treating them locally is so high that it is almost as cheap to send them to the smelting works on the seaboard. The cost of sending them there would be very much reduced if Wyalong were connected with the railway system of the Colony. You would have traffic in ore opened up from Wyalong over the whole railway system to Illawarra. If the cost of the local treatment of the refractory ores be reduced below the cost of treating them on the seaboard then there would be traffic in ores from mining districts connected with the railway to Wyalong. To a certainty there would be an inward and outward traffic in mineral ores to a considerable extent.
2865. Can you give the Committee an idea of the quantity of refractory ore which is raised here? It would be impossible to give a definite estimate of the refractory ore which is raised annually, as the production of ore is not constant in the different mines. There are periods when sinking operations are carried on, and when the output in some mines is almost suspended. Our mines are not being worked on the best system. In fact, I think they are being worked on the worst system in the world, and not until that system is done away with and a more modern system adopted will the field produce anything like its capacity. But I consider when the mines are opened up 500 tons a week would be a very fair estimate of the quantity of ore which would require to be treated otherwise than by a battery. That would be a moderate estimate of the production of refractory ore when the system of mining has been modernised.
2866. Do the mines show any indication of permanence? Yes.
2867. Are the lodes well defined, and are there foot and hanging walls? Yes.
2868. Do they improve with depth? Yes; they show every appearance of going down to an unlimited depth, and increasing in value as they get deeper.
2869. Have you any idea of the deepest mine on the field? The deepest shaft is 470 feet. It is a prospecting shaft. They are endeavouring to cut a lode which is not definitely known to exist on the property on which the shaft has been sunk.
2870. What is the deepest shaft at work where the lode is well defined? Three hundred and twenty feet. The lode was struck there a few days ago.
2871. Have they proved the width of it? It showed about a foot where they cut it, but you cannot say that that actually proves the size of it. They would require to drive along it for some little distance. The character of the stone is superior to any previously raised from the mine. It is highly mineralised, and carries a considerable quantity of arsenical pyrites. That shows through the lode from one side to the other.
2872. That stone will require special treatment? Yes.
2873. If it could not be treated locally it would be sent to the seaboard? They can treat ore here as well as it can be treated anywhere, but at the present time some is being sent to the seaboard, because it can be treated there more cheaply. On the other hand, if local prices are brought down, as I feel certain they will be, there will be traffic from mineral centres near Wyalong. I am in a position to state that the cost of treating refractory ores will be so reduced that it will be cheaper to treat them here than to send them to Dapto. I am surveyor for Duncans, Noyes & Co., who have large gold-extracting works at Wyalong, and also in several parts of Victoria, and I can authoritatively state that the cost of treating refractory ores will in the near future be less in Wyalong than it would cost to send them to any existing works in the Colony for treatment.
2874. Can you give us an idea of the extent of ground over which gold is being mined at the present time? The mines on the field proper are now being worked from Bartley's Tank to near the White Tank, a distance of about 5 miles; it might be a little more than that. The length from north to south would be about 4 miles. There may be other mines working of which I have no knowledge.

2875.

2875. Have you any idea whether the gold-bearing country continues westward? Further west, towards Yalgogrin, there is good development. I know that Father Curran, who is an expert, believes there will be a considerable development between here and Yalgogrin. J. Smethurst.
14 Oct., 1897
2876. You believe, then, that there is a belt of gold-mining land extending 30 miles westward? Yes, certainly that distance; and we do not know how much further it goes.
2877. Are there any gold-mining operations being carried on in an easterly direction? I do not know of any being carried on further than Bartley's Tank, with the exception of operations some 25 miles to the east at Billy's Lookout. Mining operations have been going on there for the last fifteen or twenty years in a small way.
2878. Is the mining industry here progressing, or is it going back? It is progressing in the sense that the mines are proving to be permanent. The output is not progressing just at present, because the system of mining is not of the best. The large sums which have been made as profit on many of the claims have been dissipated, and when the time has come for carrying on expensive works capital has not been available. Operations have been hampered by the want of capital on the part of many of those who now own the claims.
2879. Have you any idea of the average yield of gold per ton? The all-round yield is about 2 oz. to the ton. With reference to the suitability of the land for agricultural purposes, I am not an expert in such matters, but in many places round Wyalong, where the mallee has been cleared, everything planted has grown most luxuriantly. In some places vegetables are now flourishing where this time last year there was mallee scrub. It proves, therefore, that the mallee land is not unfit for agricultural purposes.
2880. What is the depth of the soil? It averages from 1 foot to 6 feet. In some cases there are 6 feet of soil before you come to the decomposed granite. I may also mention that fruit trees have been planted in Wyalong within 100 yards of where we are now. They have borne fruit, although they have been planted within the last three years.

Jeremiah Moriarty, dealer, Wyalong, sworn, and examined:—

2881. *Chairman.*] You have heard of the proposal to construct a railway through Wyalong to Hillston? Yes. I may state that I have had considerable experience in agriculture. J. Moriarty.
14 Oct., 1897.
2882. *Mr. O'Connor.*] You have travelled about the district and know it well? Yes.
2883. Would railway extension from Condobolin to Euabalong be of any use to this district? Not the slightest.
2884. You know the Wyalong district well? Yes.
2885. What are the chief resources of the district? In my opinion, Wyalong and the surrounding district has a great future before it. In ordinary seasons the land hereabouts would produce wheat splendidly. If we had access to market it would be a great agricultural district. There have been two or three hundred applicants for one block of good wheat-growing land, and I gather from that that agriculturists have every confidence in the district.
2886. Do you know the country from Wyalong to Temora? Yes.
2887. What is your opinion of it? For some years past we have been unfortunate in the seasons, but I have seen splendid crops growing along that route, 10 miles on this side of Temora. I have seen splendid crops taken off the land in the last two bad seasons. There are splendid crops about Barmedman this year. So far the country is undeveloped, but when cleared it would be capable of growing almost anything.
2888. You think it would contribute a large volume of freight to a railway? I am sure that agriculture would follow railway extension, and that there would be a great demand for land.
2889. Do you know the country between Wyalong and Grenfell? Yes; but I cannot speak so well of that as I could of the land between here and Hillston. In that direction the land is as good as any in New South Wales.
2890. Have you been to Lake Cudgellico? I have been near it.
2891. And you are acquainted with the surveyed railway route to Hillston in that direction? Yes.
2892. You think the land would justify railway construction? Most certainly.
2893. Do you understand anything about mining? I have lived in a great many mining centres, although I am not a practical miner. I think the country for fully 50 miles west is auriferous, and that great quantities of gold will be found there. I know that practical miners entertain a very high opinion of the prospects of the field.
2894. How far does your knowledge extend south of the proposed route? I daresay 20 or 30 miles; it is all good country.

James Plowee, hotel manager, Wyalong, sworn, and examined:—

2895. *Chairman.*] You know it is proposed to construct a line of railway from Condobolin to Hillston, *via* Euabalong? Yes. J. Plowee.
14 Oct., 1897.
2896. How long have you been in the district? For the greater part of my life.
2897. Therefore you are well acquainted with the country surrounding Wyalong? Yes.
2898. From what point do you think Wyalong should be connected with the railway system? We are not particular where the line comes from so that we get it.
2899. You are not proposing that the railway should stop at Wyalong? No; I certainly think it should go on to Hillston.
2900. Would a railway from Condobolin to Euabalong be of any service to the people of this district? It would not serve the people of Wyalong in any way. The distance from here to Condobolin is 75 miles. It is 42 to Temora and 75 to Grenfell.
2901. Do you know the country between here and Grenfell? The greater portion of it is good agricultural land.
2902. Is it watered by many creeks? The only creek is the Bland Creek.
2903. Does it run continually? It is not a permanent creek.
2904. Is it flat country? Generally, the country between here and Grenfell is flat. It is capable of growing almost anything. The Bland country cannot be surpassed as pastoral land.
2905. Have you had much experience upon the land? I have been all my life engaged in pastoral and farming pursuits. 2906.

- J. Plowes.
14 Oct., 1897.
2906. You can therefore speak with authority as to the capabilities of the Bland soil? Yes.
2907. Is there any mining between here and Grenfell? None.
2908. What is produced at Grenfell? Wheat, chiefly. I have seen corn growing well there also.
2909. What sort of country is it between here and Temora? Travelling along the road you do not see the pick of the country between here and Temora. The worst land borders the road.
2910. But, taking the country all through? The two routes are pretty much alike as regards country. There is good land all the way to Temora.
2911. How is it it is not good along the road? It is not improved, generally; but where it has been ringbarked and improved the land is first-class.
2912. Has the land been improved between here and Grenfell? It does not need it so much; it is plain country.
2913. It would be better for settlers with small means? I would not altogether say that. The land is all in large holdings.
2914. Is the greater part of the land taken up? Yes; and from here to Temora also.
2915. What kind of country is it between here and Temora as far as engineering difficulties go? The two routes are about equal in that respect.
2916. As far as distance is concerned it is some 30 miles in favour of Temora? Yes.
2917. You say you have followed pastoral and farming pursuits all your life? Yes.
2918. What is the outside distance over which it would be profitable for farmers to convey wheat to a railway station? From 20 to 25 miles is quite far enough.
2919. You think a railway 20 miles distant from a farm would serve all purposes? I think so.
2920. Have you done any ringbarking and clearing in country similar to this? Yes; I do not know what it would cost to clear the mallee country; but it would cost about from 9d. to 1s. per acre to ringbark the more open portions. I should think that from 15s. to 17s. 6d. per acre would clear the land for the plough—say, £1 per acre.
2921. What is the wheat yield in this district? It has been as high as 20 bushels to the acre. I have heard of a yield of 30 bushels to the acre between here and Grenfell; 16 or 17 would be the average in the district.
2922. Can you advance any other reasons why the township of Wyalong should be connected with the railway system? No; I think the principal reason is to be found in the agricultural capabilities of the district. Of course, the mining industry would also benefit.
2923. What is the rate of carriage between here and Sydney? I am unable to say what the rate is at the present moment.
2924. What is the highest freight you have paid for forage during the present year? I have paid as high as £9 and £9 10s. per ton for chaff.
2925. How long ago was that? Not more than three or four months ago.
2926. Is that the highest price you have paid for forage since you have been in the district? Yes.

Frederick Neeld, jun., miner, Wyalong, sworn, and examined:—

- F. Neeld,
jun.
14 Oct., 1897.
2927. *Chairman.*] You are one of the original discoverers of the Wyalong goldfield? Yes.
2928. *Mr. Farnell.*] How long have you been here? It is four years last September since we found the first gold.
2929. In 1894 you were a progressive township, with a population of 4,100 souls? Yes. The population has since decreased. The field was over-populated at the time, development was slow, and there were too many here. I have no doubt, however, that the population will increase again.
2930. What is the condition of Wyalong from a mining standpoint now as compared with 1894? There can be no doubt so far that the field is in its infancy. We have every confidence in the field being permanent. We have laid out a very large sum of money in machinery, and we should not do that unless we thought a good deal of the place.
2931. Have your mining operations been satisfactory? Yes; I think they compare favourably with those in any place—not only in New South Wales, but in the Colonies.
2932. What is the nature of the country? It is granite country. The reefs run in and out; that is characteristic of all granite country. When we were first on the field we did not like the reefs pinching out. We used to be afraid of their disappearing; but we think nothing now of losing and picking them up again. The same thing occurs at Charters Towers.
2933. Is the stone all treated locally? We have chlorination works of our own. We have been treating stone for the public as well as our own stone. Had our works been larger we should have been able to treat a great deal more refractory stone. The battery will save some of the gold, but not all of it. In some cases we got 2 oz. per ton by the battery, and by chlorination 5 or 6 oz. The amount of gold which was being lost in Wyalong is enormous. Since chlorination works have been started results have been much better.
2934. I take it that the majority of mines are dividend paying? Many mines are, and there is every prospect of their improving with depth. We are only down to 200 feet in our mine, but the shaft to the north of us is down 300 feet, and to the south they are down 250 feet. Our own reef looks more permanent at the deeper level than near the surface.
2935. What area do you hold? Nine acres.
2936. How many men do you employ? About forty-five at the present time. In three or four months we shall have more than double that number. In six or seven months' time there will be twice the number of men employed in the principal mines.
2937. What advantage would be gained to the railway system generally by railway extension *via* Wyalong? It would be of considerable advantage to us in connection with the chlorination works. The carriage of chemicals costs us about £500 a year. I suppose the chemicals and machinery would amount to about 150 tons. A railway would, therefore, involve a saving to us of from £200 to £300 a year, and other large works would be benefitted similarly by the doing away with road carriage.
2938. Do you know Yalgogrin? Yes; samples have come to us from Yalgogrin for treatment. We have a very good opinion of the stone. No doubt great developments will take place between here and Yalgogrin.

2939. You are satisfied from bulk assays that it will be a good field? If there were a railway here there would be very much more prospecting, and stone would be brought to our works from different mining centres.

F. Neeld,
jun.

14 Oct., 1897.

2940. You think that if the railway to Hillston passed through Yalgogrin there would be a certain amount of mineral traffic from that direction to Wyalong? Yes.

2941. What have you laid out on your chlorination works and machinery? £6,000 or £7,000.

2942. You know the country round Wyalong for a radius of 10 miles? Yes.

2943. Have you seen any indications of mineral which would lead you to suppose that the country within that radius is of the same character as the Wyalong country? Yes; it is all auriferous, and there are likely to be discoveries at any time. At Wyalong there were at first small indications. It is all auriferous country, and you may have a big discovery anywhere. We have no outcrop here such as they have in Western Australia. It was only from loose stones on the surface that the Wyalong field was discovered.

2944. You had something to do with the discovery? Yes; I and my father were the first to discover the Wyalong field. It was reported in December, 1893. We found gold in September, and prospected before we reported it.

2945. Was it free gold? Yes; but it was very fine. We had to use a glass to discern it. That makes it very difficult for prospectors. You may walk round and try for years and never come across the gold. I have every faith in the district for mining. In time to come I am certain that Wyalong will be a large mining centre.

John Ernest Eisenstaedter, manager, Wyalong Chlorination and Cyanide Works, sworn, and examined:—

2946. *Chairman.*] In view of the proposed railway extension to Hillston, can you give us any evidence showing which would be the better route to adopt—that *via* Condobolin and Euabalong, or that *via* Koorawatha and Grenfell and Wyalong? I should not care to express an opinion as to which route should be adopted; but there are numerous reasons why Wyalong should be connected with the railway system.

J. F.
Eisenstaedter.

14 Oct., 1897.

2947. Can you give us any information as to the extent of the field, and as to its probable permanence? I can only speak of the number of payable reefs here. I represent Mr. Sully, who has spent about £22,500 in the erection of machinery to treat the stone in Wyalong and the surrounding districts. He has so much faith in the field that he has, within the past six months, erected extra machinery, which has cost very nearly £2,000. Within that period we have added the cyanide plant, and have bought over 2,000 tons of tailings. So far we have treated upwards of 1,200 tons profitably. Our railway account has been pretty heavy. I estimate that in the ordinary course of trade we shall have about £40 or £50 a month of railway freight. It seems hard that we should be handicapped to the extent of having to pay, as far as Temora, £2 a ton for road carriage. In addition to that, I estimate that we shall get a quantity of stone from the surrounding mining centres. For instance, if a railway were brought here from Grenfell we should get stone from Grenfell, because it would be nearer than sending it to the metropolis, and the facilities for treating stone are as great here as they are at any other works in the Colony at the present time.

2948. You know the stone at Yalgogrin? Yes.

2949. Some of it is of a refractory character? Yes. There are some very good reefs there which have not yet been developed. I have lately seen one or two reefs there which, in my opinion, were very good.

2950. Do you know any of the mines at Yalgogrin? Yes; there are two or three that are payable.

2951. Have you received any stone from there for treatment? No; if the line went from Temora we should get the Temora and Reefton business. I suppose that the Railway Commissioners would give us the same facilities for bringing stone here as are given to take it to the seaboard. Machinery is being erected by other companies at the present time, and at the present rate at which wood is being used it will soon become pretty scarce within a few miles of Wyalong. There would be, therefore, freight in wood for a railway. In country like this the expense of putting down railway lines would be very cheap, and I presume they would have loop lines running right up to the different shafts, as they have at Charters Towers and other mining centres. There can be no doubt that railway facilities would allow us to treat very low grade ores. In Wyalong they depend very much upon getting stuff that will give 5 or 6 oz. to the ton, whereas in other places they get 1 oz. to the ton, and make £2 profit on a ton of ore.

2952. Is the bulk of the ore here of a refractory nature, requiring special treatment? Some of the stone here is free-milling stone, while in other cases the stone is of such a character that you do not get more than 40 per cent. out of it by a battery.

2953. I suppose the tailings are well worth treating? Yes. On the other hand, a lot of the tailings have not been worth buying, the batteries having extracted pretty well all the gold from them.

2954. What do you think of the prospects of permanency of this field? I think it has every prospect of permanency. I think the amount of money we have expended in putting up machinery is the strongest proof of our confidence in the place. I know of no place where mining is more active than it is at Wyalong. There is a considerable amount of prospecting going on here at the present time. New discoveries are being made every week.

2955. You think there is a wide belt of auriferous country round Wyalong? Yes; it has been proved to be so. You have to consider not only Wyalong, but Yalgogrin and Reefton. There is a number of good reefs at Yalgogrin which are not yet opened up.

2956. You think that a line from Koorawatha to Grenfell, Wyalong, and Hillston might be regarded as a national line? Yes; and I also think it would be one of the leading lines of the Colony from a mining standpoint. A great quantity of ore will come to Wyalong from different mining centres for treatment.

2957. You do not think the field will peter out? No.

2958. Do the leads invariably improve with depth? Some of the reefs improve with depth; others do not. It is just the same here as on other fields—you lose the gold and find it again. Yalgogrin is heavily handicapped from want of capital. Then the labour conditions are very hard upon those who have leases. I have no doubt in my own mind that if the railway be extended to Wyalong persons will spend large sums of money here. The Prince of Wales claim is just putting up big machinery, and other claims will

- J. E. Eisenstaedter.
14 Oct., 1897.
- do the same. A number of them have got machinery within the last eighteen months. Prior to that there was no machinery on the ground for winding. Now there are six mines with winding machinery.
2959. Those mines, at all events, have proved that the reefs as they go down are of a payable nature? Yes.
2960. Primitive appliances would not be sufficient for the depth at which they are now working? No.
2961. *Mr. Fegan.*] Well, how much stone can your machinery deal with in twenty-four hours? Well, about 150 tons by chlorination, and about 150 tons by cyanide.
2962. How much can you crush? About 35 tons a day.
2963. That is, with your new machinery? Yes.
2964. What could you crush with your old machinery? We did about 5 or 6 tons a day; that is all.
2965. What is the latest machinery you have imported on the field? The mill we have at present is a Krupp Ball mill.

Robert James Cullen, mining speculator, Wyalong, sworn, and examined:—

- R. J. Cullen.
14 Oct., 1897.
2966. *Mr. O'Connor.*] How long have you been here? About three and a half years.
2967. Where did you reside beforehand? I have been in the district for four years. I was at Cootamundra and Temora mining.
2968. Are you a practical miner? Yes; I have also been to Peak Hill, Yalgogrin, and other places.
2969. You are now interested in several mines to a considerable extent? In the New South Wales, the Lighthouse, and other mines.
2970. What, in your opinion, is the best route with which to connect Hillston with the railway system of the Colony? I do not know about the best route, but we certainly want a railway to Wyalong. As far as our claim is concerned—that is, the New South Wales—we have had to send the whole of the stone to Dapto and other places for chlorination. Our average output is about 40 tons per month. It has averaged about 7 oz. a ton.
2971. How far are you down? 200 feet, and the stone is improving.
2972. There are indications of permanency? Yes.
2973. You are personally acquainted with other mines outside of your own? Yes.
2974. Are the indications good in those places? Yes; I think the whole of the indications—and some of the reefs have been tested to something like 300 feet—show permanency.
2975. You have plenty of faith in the future of Wyalong? I certainly have; as far as the reefs have been tested they have been proved richer with depth.
2976. What are the labour conditions here? I think about two men to the acre.
2977. Is it in the power of the Warden to vary them, and to say how many men shall be employed? Yes.
2978. In your opinion, do the labour conditions interfere with the development of the mines here? Yes, I think so. In some cases the labour which has to be employed deters the investment of capital. It also hinders prospecting. Suppose you have a lease of 10 acres, for instance, you would have to put twenty men on to it, and that would mean great expense.
2979. This field is supposed to be a poor man's field, and you think the labour conditions are such as to seriously retard this development? Yes.
2980. Do you know the land between here and Yalgogrin? Every inch of it.
2981. Is it gold-bearing country? Yes; but there has been very little prospecting done.
2982. Do you yourself know Yalgogrin? Yes. I know every one of the mines there—the Black Coon, Picanniny, Eureka, Adelaide, and Shelly's. I think it will be a good field in time, but it requires capital.
2983. And railway communication will of course be of the greatest advantage? Yes.
2984. I suppose a railway will be of considerable benefit, quite apart from mining development? Yes; there is good agricultural land all round Yalgogrin, and right out to Lake Cudgellico and Bygalore. I think it is the finest country in Australia.
2985. Is there anything else you wish to say? Only that in a fair season the land is capable of growing anything.
2986. Do you think that if the field is to be developed by men of small capital the labour conditions must be modified? Yes; I might mention one instance. Some time ago on the Princess claim they had 16 acres of ground and wanted to sell it, but it was refused because the labour conditions were too severe. They would have involved the employment of thirty-four men. They said, "If you had lumps of gold as big as my thumb we could not buy, because the labour conditions are so severe."
2987. *Mr. Farnell.*] Are those labour conditions supplied by statute law, or by regulations? I do not know.
2988. *Mr. Fegan.*] Some men favour no labour conditions at all? Yes; I think some concession should be made to prospectors.
2989. *Mr. Farnell.*] They do not object to employ the labour if the mine proves dividend-paying? No.
2990. *Mr. Fegan.*] It is only where a mine proves payable that labour conditions are imposed? Yes; but in the cases to which I refer I do not think the mines are payable. I know of one case where thirty-two men had to be employed on a mine, and it is not a dividend-paying claim so far.
2991. *Chairman.*] It is in cases where mines are not paying that the labour conditions are found to be so oppressive; you think they hinder development? Yes.

James Joseph McDonnell, mine-owner, Wyalong, sworn, and examined:—

- J. J. McDonnell.
14 Oct., 1897.
2992. *Chairman.*] You have heard of the proposal to construct a railway from Condobolin to Euabalong? Yes.
2993. Do you think a better route might be adopted to reach Hillston? Certainly I think so.
2994. *Mr. Fegan.*] What mines do you own? I hold shares in the Currajong, Golden Fleece, White Reef, and others, but none of the others are paying. They are prospecting claims.
2995. What reasons can you advance for the adoption of this route in preference to the route from Condobolin? I think there is a better lot of country to open up on this route than on the other. There is no country to speak of worth occupying between Condobolin and Euabalong. The travelling stock reserve takes a good deal of the river frontage. There is no chance of getting any settlement close to the river.
2996. Is there much country in this direction fit for close settlement? Yes.

2997.

2997. And a railway having Hillston for its objective point would therefore be a paying line? Most decidedly.

J. J.
McDonnell.

2998. Are you acquainted with the route from Koorawatha through Grenfell to Wyalong? I have been all through the country from here to Grenfell. I do not know where the line is located, but I know the country across the Bland. I have not been all the way to Hillston by the suggested route, but I have been as far as Cudgellico and Naradhan.

14 Oct., 1897

2999. What kind of country is it from here to Temora? Pretty level country—box and yarran.

3000. What is the soil capable of producing? Near Barmedman a selector named Maher had a small paddock from which he obtained a little over 40 bushels to the acre of wheat. I think he said it was 42 bushels.

3001. It is fairly good agricultural country between here and Temora? Yes.

3002. What about the country between here and Grenfell? That is also good country.

3003. In what direction do you think a railway should be taken at Hillston in order to serve the greater number of people at a reasonable cost? Individually I should prefer the Temora route. I fancy that would be the best connection. There would be a larger population between here and Temora than between here and Grenfell.

3004. Is not the land on both routes taken up? Yes; but there are more selectors about Barmedman, and between here and Temora, than there are between here and Grenfell.

3005. Do you know of any engineering difficulties in either route? I do not think there would be any difficulty of that kind. The Bland Creek is the only creek of any significance on the Grenfell route.

3006. You are living here? Yes. I was living at Barmedman before Wyalong broke out.

3007. Have you seen any crops of hay here? Yes; oaten and wheaten hay, also lucerne.

3008. Are the mines you own permanent? I think they give pretty good prospects. The specimens I produce were obtained at the 220-foot level in the Golden Fleece. I estimate that the stuff will go about 10 oz. Similar stone I have seen go as high as 30 oz. per ton, assayed by Mr. Pittman, of the Department of Mines.

3009. Can you tell us the depth of some of the mines? The White Reef is 279 feet, and the Golden Fleece 220 feet.

3010. What would be the width of the reef at those depths? I cannot say—the reefs run in and out.

3011. You are not troubled with water in the mines? Very much so; some of the mines have knocked off now; it was impossible to work in them.

3012. To what depth do you go before you reach the water? 150 feet. Whips are not capable of coping with the water after you get down 150 feet; you want some kind of whim after that depth.

3013. You regard Wyalong as a permanent gold-field? Yes; but I think we want a new mining law. The present labour conditions are too severe. As regards a railway, we have sent stone to Dapto, the road carriage to Temora being £1 a ton. If there were a railway, and the same rates were charged as are charged from Temora to Dapto, the carriage over the distance from here to Temora would be 1s. 8d. instead of £1; that would be of great consideration.

3014. What does it cost to send to Dapto? £4 6d. per ton; the carriage from here to Temora is £1; from Temora to Dapto, 14s. 6d.; from Dapto to the works 1s., and £2 5s. for treatment. Mr. Howell, the manager of the Dapto works, told me that they would be able to treat the Wyalong ore cheaper, on account of the nature of the mineral in it. It would come in for flux, instead of the company having to buy it.

3015. The carriage from Temora to Dapto is cheaper than the road carriage from Wyalong to Temora? Yes.

3016. *Mr. Farnell.*] You think that if the labour conditions were amended the development of the district would be comparatively rapid? Yes; as regards certain claims. You have to put four men on for the first six months, and eight men afterwards, on a claim of 4 acres. When converted into a lease the conditions of lease do not say that the ground must be payable at all. It was held at one time that the ground had to be payable before you had to put on eight men, but the conditions of the lease say four men for the first six months, and eight afterwards, whether the claim be payable or not.

John Nicholas Penberty, miner, Wyalong, sworn, and examined:—

3017. *Mr. Farnell.*] How long have you been in the district? A little over three and a half years; I came here in March, 1894.

J. N.
Penberty.

3018. Had you any previous knowledge of the district? No.

3019. How long have you been engaged in mining operations? From my cradle.

14 Oct., 1897.

3020. You have had good practical experience? Yes; I went under the surface when I was 12 years of age.

3021. Where have you gained your experience? The first seven years in my native land; and thirty years in South Australia, Queensland, and New South Wales.

3022. You are in a position to arrive at a reliable conclusion as to whether this is likely to be a permanent field or not? It is a difficult matter to decide, because the field is yet in its infancy. The field, being a poor man's diggings, has had to rely upon itself for support without outside capital. I think that is a guarantee for its prosperity and progress.

3023. How do the reefs run here? Principally north and south. The majority of them are nearly vertical; they are from 1 foot to 9 feet in width. I have worked on one at from 9 inches to 1 foot, and on another out on the Barmedman-road 9 feet wide.

3024. As to the continuity of the reefs which you find running east and west, do they keep up their average pretty well? The reefs run north and south for a distance, and they then suddenly swerve, but eventually they come back again north and south.

3025. Do you think the stone is capable of being treated with the best results with the machinery on the field? Up to the present they have not obtained the best results; but since the chlorination works have been opened the results have been better; they are probably now as nearly perfect as possible. The fact that tailings have given 2 oz. to the ton shows that the miners had not received what they ought to have received.

3026. Are there many poor men's claims here? They are nearly all poor men's claims. They have put some of the men in a good position to-day.

3027.

J. N.
Penberly.
14 Oct., 1897.

3027. Have the labour conditions operated harshly in the development of the field? Yes; very harshly. I think a hard-and-fast rule in a case of a field like this is entirely out of place.
3028. You think the provisions of the law should be more elastic? Yes; for the simple reason that if three or four poor men come along and take up a piece of ground, having no money, it is six, eight, or twelve months before they can raise a quantity of ore which will produce cash. We have been entirely neglected by capitalists, and after the unfortunate men have developed the ground, and, from the want of money or food, a portion of them are compelled to go away to earn a little, other people rush on to the ground like a lot of vultures to take it, leading to lawsuit after lawsuit. Eventually the man with the longest purse wins the day, and the poor man who has partly developed the ground has to go elsewhere.
3029. In your opinion the labour conditions are not such as to lead to rapid development of the resources of the field? Certainly not.
3030. From your knowledge of mining fields in other colonies, what should you say would be the extent of the mineral deposits here? It is impossible to say. The country is auriferous from Temora through here to Yalgogrin. There are possibilities of half a dozen Wyalongs between Temora and Hillston.
3031. You think that this is not the only field likely to be developed in this direction? Quite so.
3032. What would you think would be the main advantages of a railway which would go from Wyalong to Hillston? It is quite evident that Wyalong needs a railway, and I have no doubt that a number of small townships would spring up on the route that has been suggested. I do not know the country from Condobolin and Euabalong, but from what I can learn of it, the soil there is not so productive as is the soil in this direction. Between Temora and Hillston you have from 150 and 160 miles of country which would be very rapidly developed. When men are engaged in prospecting, the price they have to pay for necessary articles of consumption is a very great consideration. If the articles are cheap, more money can be expended in developing the ground, and I do not think there can be any doubt as to a railway cheapening the prices of articles generally. If a railway were brought here, and the Government could throw open about 30,000 or 40,000 acres in the vicinity of Wyalong, the place would be a city in about ten years' time.
3033. You think that the development which would take place in and around Wyalong would of itself be sufficient to justify the construction of a railway? Yes; even if you took a line to Euabalong, you would have eventually to make a railway in this direction; the growth of this district is so palpable.
3034. You do not know the country between here and Hillston? No; not further than 10 or 12 miles beyond Yalgogrin.
3035. What is your opinion of Yalgogrin? I think it will become what Wyalong is to-day—a large mining centre. The ground is harder, and the reefs are consequently slower in developing, but there is a great deal of very rich ground there.
3036. Is not the formation there similar to the formation here? No, not exactly; they are only just getting to the better formation here. The rich gold which has been sent to the surface here points to the fact that at a greater depth the reefs will become very rich; they have yet to reach the richer stone.
3037. Do you anticipate that a considerable quantity of refractory stone will be sent to Sydney by railway for treatment? My impression is that, with the appliances on the field, there will be no need to send much stone to Sydney. If there were a railway from Temora, the probability is that with the number of works on this field a quantity of stone would be brought here from Albury, Gundagai, Temora and Barmedman. It would be a sort of depôt for the treatment of stone.
3038. Do you know the Grenfell district at all? Pretty well.
3039. Do you now think that the question of railway communication in that direction must one day force itself upon the attention of the Government? The question of railway construction to Grenfell is mixed up with the development of a large area of agricultural land. There is very hilly country between Koorawatha and Grenfell, and you will find that on the whole it will cost a great deal more to bring a railway from Koorawatha to Wyalong than to bring it here from Temora.
3040. Have you made up your mind as to which of the two lines it would be better to construct from a national standpoint? I think that the sooner we get railway communication here the better; the question of route I should prefer to leave to better judges than I am. I think a railway could be constructed from Temora almost as cheaply as a macadamised road. Wyalong, in my opinion, will eventually become the centre for a network of railways from Temora to Forbes and from Grenfell to Hillston.

James Stewart, grazier, Lake Cowal, sworn, and examined:—

J. Stewart.
14 Oct., 1897.

3041. *Chairman.*] You have a knowledge of the proposed railway extension from Condobolin to Euabalong? Yes.
3042. With a possible extension to Hillston? Yes, that would necessarily follow.
3043. You have been through that country? Yes; any extension in that direction must go to Hillston, unless you strike north and go to Mossgiel.
3044. Having Hillston in view as a terminus, do you think that some better route than that *via* Euabalong might be adopted? Yes; that line would go through a considerable area of the Western Division, which will not be open to settlement for twenty-one years. Moreover, the land on this side of the river is superior. My own opinion is, that the line should come from Temora.
3045. Upon what grounds do you base that opinion? In the first place, Temora is only 40 miles from here, and if you brought the line from Koorawatha you would have to cross the Bland, which would involve 7 miles of very difficult country. The soil on the Bland is black, of a sugary nature, and it crumbles very much in wet weather.
3046. But is it splendid pastoral country? Yes, it is not agricultural country. For some distance the railway would have to be built upon piles, not only to keep the permanent-way in order, but to allow flood-waters to pass through. For about 2 miles it would be very difficult to get along at all. At times it is almost impossible to do so. It has taken me an hour sometimes to go a mile with a buggy and pair.
3047. What is the extent of that black soil country? There are 12 miles of it.
3048. What is the soil on your holding? Red soil.
3049. Then it would be suitable for agriculture? Yes.
3050. Does the soil extend from that point into Grenfell? Yes.
3051. What is the soil from the Bland country to Wyalong? Red-soil plain; it is mostly alienated land. When you come over the Back Creek it is forest country.
- 3052.

3052. Of course, in railway extension to Hillston shortness of route would be a great consideration? J. Stewart. Yes.
3053. In constructing a line from Temora to Wyalong, 42 miles, you would only get 20 miles further westward;—the object of a railway in this direction being to extend facilities for traffic westward, do you not think construction by that route would be rather a mistake from a national standpoint? There is another consideration attaching to railway construction between Temora and Wyalong, and it is that pastoralists out this way in a bad season like the last two or three seasons would take advantage of the line to send their starving stock to the mountains; it would be much easier for them to send their stock by that route than *via* Koorawatha. 14 Oct., 1897.
3054. Have you suffered much from droughts in this district? Yes.
3055. Have you been able to get your stock away? We have taken them away, and have lost severely.
3056. Stock are left here until the very last moment? Yes.
3057. Under such circumstances I suppose they are too weak to travel any distance by road, but you could truck them without much difficulty? Yes.
3058. What is the extent of your holding? 180,000 acres.
3059. What is the average carrying capacity? Nine acres to the sheep, with the land in its natural state.
3060. In its improved state what would it be? About 2 acres to the sheep.
3061. Land of that description would be suitable for men of small means, provided railway facilities were afforded? Yes.
3062. Is there much settlement round you? Yes.
3063. Of what character? Selections taken up under the old Act; there was very little settlement there until the Act of 1884 was passed.
3064. What are the settlers doing? They are all graziers.
3065. Is settlement still proceeding in that direction? Yes.
3066. Is the country being fairly occupied between the Bland and Grenfell? Most of the settlement is in that direction; a good deal of agriculture is carried on for the first 30 miles out of Grenfell.
3067. Where do the settlers send their produce? Some goes to Young; but I think the bulk of it goes to Cowra; we send ours to Young.
3068. Is there a good road to Cowra? It is a good road after you leave Grenfell.
3069. Is the road to Grenfell difficult? It is very level, and in wet weather it is very bad.
3070. From what you have said I gather that the country between Grenfell and Wyalong is suitable for both agricultural and pastoral settlement? Yes; I think all the available land would be taken up if there were a railway; but there is not a great deal to be taken up, especially on the route to the north of the Weddin Mountains.
3071. The line passes almost entirely through alienated land? Yes.
3072. A considerable portion, however, between the Bland and Wyalong would be available? Yes; there would be a larger portion on this side.
3073. Have you had any experience of mining enterprise as a means of settling people on the land? Yes; a little on our own run.
3074. How long have you been here? Since 1879.
3075. You have seen Wyalong grow up? Yes; it has exceeded my expectations.
3076. It is evident that the mining industry is a great factor in settling people on the soil? There is no doubt of that.
3077. It is, perhaps, the most rapid means of promoting settlement? Yes.
3078. It invariably leads to a certain amount of permanent settlement? Yes.
3079. Considering the circumstances, and the large area of land available for settlement in this district, you think the Government would be justified in constructing the railway which has been suggested? Yes.
3080. Whether it comes from Temora or from Koorawatha to Grenfell? Yes; I think either line would be justifiable.
3081. Do you know the country between here and Hillston? Up to a little on the other side of Lake Cudgellico.
3082. Taking a distance of 25 miles on either side of the line would the land be good? At some points it would not be, and the further north you go the better. In my opinion any line a little to the north of Rankin's Springs would go through good land.
3083. Do you know the country at all? Yes; I have been there buying sheep.
3084. Do you know whether it is possible to get through from Naradhan to Monia Gap? I could not say.
3085. A line north of Rankin's Springs would serve Lake Cudgellico and settlement in that direction right out to Hillston? Yes.
3086. Have you any idea of the cost of clearing land in this district? We have not done much clearing, but we have done some ringbarking and scrubbing.
3087. What is the average cost per acre? The ringbarking cost on an average 1s. 3d., and the scrubbing 1s.
3088. And when the timber is cleared you say the improved country will carry one sheep to 2 acres? Yes.
3089. So that a man with comparatively small means taking up a couple of family selections would do fairly well? Yes, if he had fair seasons and a reasonable amount of money to start with.
3090. Have you had any experience in mixed farming? I have not done any myself.
3091. You do not know what results have been obtained by any settlers in your neighbourhood? No; they do not go in for mixed farming.
3092. A number of the resumed areas in your neighbourhood have been abandoned in consequence of the wild dogs, rabbits, and scrub? Yes. But the land would be taken up if there were a light line of railway constructed. A railway would have much the same effect here as it has had in other places.
3093. You think a railway would open up a lot of abandoned country, besides materially developing the mining industry? That is my opinion.
3094. Is there anything else you wish to say? If the Department were more lenient as to the conditions under which the country is taken up it would be in a different position. The expenses in connection with the working of these areas of abandoned land would cripple the selector at the very beginning. For instance, he would have to put up a rabbit-proof fence if he wished to save his crop.
3095. Mr. Farnell.] You have an intimate knowledge of Lake Cowal? Yes. 3096.

- J. Stewart.
14 Oct., 1897.
3096. What is the extent of the lake when full? It covers 40,000 acres.
3097. What is the extreme length? About 21 miles.
3098. What would it be at the widest portion? About 7 or 8 miles.
3099. How is the lake fed? By what is called the Bland Creek. The overflow from the Lachlan, at Jamalong Range, where it touches the Lachlan River.
3100. Have you known the lake to become dry? Yes; it dried up in the summer of 1883, in 1885, and in 1886, and it was dry on the 26th May last.
3101. What is its condition now? There is a little drop of water in the centre of it; perhaps an inch or two from local rains. The lake is now quite dry.
3102. What is its maximum depth when full? About 12 feet. That is the highest point at which I ever saw it.
3103. Are the creeks which feed the lake permanent? They only run while it rains.
3104. They are not fed from snowy mountains? No.
3105. Are there any creeks which form an outlet for the lake waters when they overflow? No; the creek flows over a level stretch of ground until the water reaches Manna Creek.
3106. Does that water ultimately find its way into the Lachlan? Yes.
3107. During the time you have been here, have you taken any notice of the fish which inhabit the lake waters? Yes.
3108. Are the fish indigenous to the Lachlan River? Yes; cod, perch, catfish, and bream.
3109. During the time prior to the lake drying up in 1883 did you notice any quantity of fish in the lake? Yes; when it dried up I saw a number of large cod; I presume they all went up the Bland Creek.
3110. Is there permanent water in the Bland Creek? Yes, for about 3 miles.
3111. What would be about the depth of it? I have never seen it lower than 3 feet.
3112. So that the fish have a means of escaping into the creek when the lake begins to dry up? Should a fresh come down the Bland all the small fish can go up against the stream, but the large fish cannot.
3113. Have you seen any quantity perish in that way? I must have seen a thousand or more large cod in 1883.
3114. Have you noticed a repetition of that state of things since? In 1886 there were no fish, and during the late drought they were taken out and carted away. A few died, but not many.
3115. Do you think the Bland Creek contains many at the present time? A few, of course, but not many; you could not catch any with a hook and line.
3116. Do you think it would be possible to keep the lake at a permanent level by the erection of a weir on the Lachlan? I do not think so.
3117. Is there anything you could suggest by which the lake could be kept permanently filled? If a large dam were placed across at the outlet where the waters run over this level country it might answer; but it would have to be a very wide one. The difficulty would be, if that were done, miles of country would be flooded from the eastern shore, where the banks are very low.
3118. Why do you think the lake could not be fed by water from the Lachlan? I did not intend to say that it could not be fed from the Lachlan. You could fill up the lake without water from the Lachlan, as far as that goes; it is a question of keeping the water there.
3119. What I desire to know is whether the lake could be kept at a permanent level by the erection of a weir over the Lachlan? There is no creek to convey the water to the lake; you would have to make a canal.
3120. Have you noticed fry in any quantities? Not in any quantities.
3121. There is no doubt as to the creek and lake being breeding-grounds? No.
3122. Where are the fish which are taken out of the lake sent? To Sydney, Forbes, Young, Wyalong, and other places; it lasted for a short time when the lake became 18 inches deep.
3123. Have you noticed the presence of many natural enemies of the fish when the lake has been full? All their natural enemies are there; there are thousands of pelicans.
3124. How many men were employed there fishing last season? About half-a-dozen.
3125. Can you tell us what kind of a net they used? The ordinary nets generally, about 3½-inch mesh.
3126. Did they haul the fish to the shore? In the creek they tied one end on to the bank, and went round with the net in a boat, taking a circle of 150 feet or more.
3127. Did you see any nets 500 yards long? No; I think that from 150 to 200 yards would be the longest.
3128. Have they a purse at the end of the net? No; they are just the ordinary seine.
3129. No one exercises any control or supervision? No; I wrote to the Department about the nets being small, and they instructed the police not to interfere with the fishermen on the lake, but to prosecute them on the creek. We pay for grazing-ground which is sometimes under water the same as we do for the other country; and that was the difficulty. The police told us we had our own remedy; they stopped them from using the small mesh on the creek.
3130. Have you any doubt as to a good supply of fish being obtainable from Lake Cowal if a permanent supply of water could be kept there? I do not think it could be done without an enormous expenditure. The eastern bank is very low, and you would flood an enormous area of low-lying country; a considerable amount would have to be expended in compensation.
3131. Is the land freehold? Yes; nearly all of it on the eastern side.

Robert Edwin Moore, selector, Wyalong, sworn, and examined:—

- R. E. Moore.
14 Oct., 1897.
3132. *Chairman.*] Do you desire to give evidence as to the best route for railway extension to Hillston? Yes.
3133. *Mr. O'Connor.*] What is your occupation at the present time? I am managing a produce store, but I have a selection out at Yonga Plains.
3134. How long have you been in the district? I selected on the 3rd April, 1890.
3135. Where were you residing before? Near Benalla, in Victoria; I was farming there; I have been farming for about twenty years. I was also in the Goulburn Valley and at Rochester, about 40 miles from Bendigo. The Goulburn Valley is regarded as the pick of Victoria for wheat-growing purposes.
3136. You can speak from personal knowledge of a large area of country round about Wyalong? I know the country from Wyalong to Grenfell, and also from Wyalong to Temora.

3137. What is the country between Wyalong and Temora best fitted for? With the exception of some little patches it is suitable for the growth of all kinds of cereals. It is particularly adapted for wheat-growing. R. E. Moore.
14 Oct., 1897.
3138. What is the quality of the land between Wyalong and Grenfell? It is very good.
3139. How does the land hereabout compare with the land in the Goulburn Valley in Victoria? The land between Grenfell and this point is as good as any land in the Goulburn Valley. The land on the Humbug Creek, towards Cudgellico, is all good agricultural land.
3140. There are tens of thousands of acres of the finest agricultural land available for settlement here? Yes.
3141. Why is that land lying idle now? Because there is no way of getting the produce to market. Until Wyalong broke out there was absolutely no market at all; the carriage in many cases would absorb all the profit.
3142. Do you think there would be much additional settlement here if the district were brought into railway communication with a market? If the country were cut up into small farms of 320 to 640 acres thousands of families could be settled here. I do not believe in the occupation of such good agricultural land in large areas—it is an absolute waste; one acre well cultivated is more profitable to the State than 10 acres poorly cultivated, or used simply for grazing. A number of Victorians have come here, and they are making inquiries every day as to whether land is available for settlement.
3143. Do you know of any Victorians who would come here to settle if the district had railway facilities? Yes.
3144. What did it cost you to prepare your land for the plough? From 12s. to 21s. per acre; there was dense scrub and very heavy timber. If the timber has been dry for some years you can clear for 12s. an acre, but to clear the timber in a green state would cost considerably more.
3145. Would £1 per acre pay for it except in rare cases? Yes.
3146. What would be the average yield of wheat here in a fair season? In ordinary seasons from 16 to 20 bushels.
3147. With a fair average, what price would it pay you to produce wheat in this district? It would pay well if at 3s. a bushel, but it would not pay to send it by bullock team to Temora at that rate.
3148. What is a reasonable distance to allow for the cartage of wheat? No farmer ought to grumble if he has a railway within 20 miles.
3149. Do you understand dairying? I kept a dairy at Benalla for nine years.
3150. Is this district suited to dairying? In a fair season.
3151. Is it a good fattening district? Yes; but there are not many cattle here; nearly all the country is under sheep.

Peter Neilsen, farmer, near Wyalong, sworn, and examined:—

3152. *Chairman.*] You are a farmer near Wyalong? Yes; my land comes to within about 8 miles of Wyalong—that is the nearest corner of it. P. Neilsen.
14 Oct., 1897.
3153. *Mr. Fegan.*] How long have you been in the district? I selected on the 18th September, 1890.
3154. What area have you? 2,560 acres, 640 of conditional purchase and 1,920 of conditional lease.
3155. Do you graze or do you cultivate your land? I cultivate and graze. I have about 170 acres under crop this year—that is, under wheat.
3156. Was your land ringbarked when you took it up? About half had been ringbarked, probably about eight or nine years previously; the other half was green timber.
3157. What does it cost you to ringbark? I had to pay about 1s. an acre.
3158. What was the average cost of preparing your 170 acres for the plough? It cost from 25s. to 30s. per acre, but there was a good number of big trees upon it; it was also heavily scrubbed.
3159. In what direction is your holding? North-west.
3160. You are here as an advocate of railway extension to Wyalong? Yes.
3161. Will you tell the Committee upon what you base your claim to railway construction, and from what point you think the railway should come? The price of wool has come down so low that we cannot live on 2,560 acres running sheep. If we combine wheat-growing with grazing we can do fairly well. It is over 50 miles from my place to Temora, and it costs me almost half-a-crown per bag to cart wheat; the bag would be another 6d., so that you may reckon 3s. per bag, and when wheat is very low you can understand that it will not pay with that road cartage. With a railway here it would pay.
3162. What would be the lowest price at which you could profitably grow wheat with a railway? From 2s. 6d. to 3s. a bushel; we could do fairly well at that.
3163. You are considering the cost of clearing the land? Yes.
3164. Have you had wheat in any other year? I have had a little in for the last five years. Before Wyalong broke out we put in very little, because there was no market for it. I sent the first waggon-load of wheat from this district to Temora four or five years ago, but it is too far to cart it.
3165. What does your crop average? I have had up to 28 bushels per acre; the lowest was 14; that was last year, when we had a very severe drought. We had good seasons up to three years since.
3166. What would be your average production? From sixteen to twenty bushels. You can safely calculate upon that and leave a margin.
3167. What is the lowest price you have received for your wheat? I believe it was four years ago when I sent it to Temora and got 2s. 11d.
3168. That would not pay you? No, not carting over 50 miles.
3169. Therefore you lost upon that crop? Yes; I did not strip it all; I cut some for hay.
3170. If there were no railway here you would not continue to grow wheat? No, we could not do so; we could not compete with people who are within 10 or 15 miles of a railway station.
3171. Therefore if this district is ever to become a wheat-growing district you must have railway facilities? Yes.
3172. Have you tried anything else besides wheat? I have tried oats; they succeeded fairly well in a comparatively moist year; oats require more rain than we generally get. I have also grown potatoes as fine as I have seen in any part of the Colony.
3173. What kinds have you grown? Generally some of the early varieties, such as Early Rose. Last year, on account of the drought, they only came to the size of big plums.

- P. Neilsen. 3174. Do you think any other kind of potatoes would grow here? Yes, if we had anything like a favourable season; I also grow corn.
- 14 Oct., 1897. 3175. Why do you particularise early potatoes? Because they come to maturity before the really dry weather sets in.
3176. What area have you under potatoes? I have never put in a large crop; I grow only for my own consumption.
3177. With railway communication you could grow them for market? We could; but I do not think you could rely upon the crop to add much revenue to a railway in dry seasons.
3178. How have you succeeded with corn? I have grown a little of it for green fodder; it has grown 8 or 9 feet high, but for the last two or three years it has been impossible to grow it without rabbit-proof netting.
3179. Then your holding is not netted? No; none of it.
3180. How have you coped with the rabbits then? They have not been so thick as to do a great deal of harm in this district. I suppose it would cost me about £500 to net in my holding. I should require 9½ miles of netting.
3181. How many sheep have you? At the present time only 300 sheep.
3182. Do you know the country between here and Grenfell? No; I have not been over most of it.
3183. Do you know the country between here and Temora? I have travelled on that road a great many times.
3184. You have heard other witnesses describe that country? Yes.
3185. Do you agree with their description of it? Yes.
3186. Do you believe Temora to be the best point from which to establish railway communication? I should like to see the route adopted which would do the greatest amount of good to the greatest number of people; but I am not certain which route that would be. I have never travelled over all the country between here and Grenfell, but I have always heard that it is first-class land.
3187. *Chairman.*] You produced a sample of wheat? Yes; it has been in three and a half months; it was not put in until a week after the rain we had at the end of June.
3188. In the event of a railway being constructed here, would you feel inclined to crop a large area of your holding;—about 500 acres at the very least? I should crop more and more as long as it continued to pay me.
3189. You think others in the locality would cultivate? Yes; they are all increasing their areas under crop every year.
3190. So that there would be the prospect of a fair amount of freight from agricultural produce alone? Yes; if a line were constructed to Hillston in a few years the whole of the land served which was at all suited to agriculture would be under wheat. It is quite as good wheat-producing land as the Riverina land.

William Dawson, miner, Wyalong, sworn, and examined:—

- W. Dawson. 3191. *Mr. Farnell.*] How long have you been resident in the district? Since the 6th January, 1894.
- 14 Oct., 1897. 3192. What experience have you had in mining? On and off I have had a good number of years at it. Sometimes I have been mining and sometimes working at blacksmithing. When Wyalong broke out I was at Condobolin blacksmithing.
3193. On what other fields have you been? On New Zealand and Victorian fields.
3194. You desire to give some evidence as to the probable permanence of the Wyalong field? Yes.
3195. You know that a proposal has been laid before the Committee for the construction of a railway between Koorawatha and Hillston, which it is considered would be more advantageous from a national standpoint than a line to Hillston *via* Euabalong? Yes; I think a line from Condobolin to Hillston would be of no use. I think it might come from Temora and Grenfell through Wyalong, and go to Hillston through Yalgogrin and Rankin's Springs. That would be the most beneficial line to the whole Colony, because there is so much good land available for settlement in that direction, and, quite apart from the mining industry, agricultural pursuits would make the line pay.
3196. You know that there are large areas of good agricultural land available for settlement along the route? Yes.
3197. It is only the absence of a railway which is retarding settlement? Quite so.
3198. Have you any knowledge of agriculture? I have worked on farms, but not in New South Wales.
3199. Where have you had experience in farming then? New Zealand and Victoria.
3200. Do you think the possibilities of development are as great here as in those Colonies? From what I have seen of the soil here I think it is as good as you will find in any part of the world.
3201. Have you come into contact with many persons who have a special desire to settle in this district? Yes. I know of many persons who would have settled here had there been a railway. My brother-in-law came up the other day from the Murray, and bought a farm here on the strength of a railway coming here shortly.
3202. Can you tell us anything of the mineral deposits between here and Hillston? From here right through to Hillston the country is gold-bearing.
3203. Do you know Yalgogrin? Yes, I have been over the field.
3204. Do you think it shows any signs of permanency? I think it has a great future before it. You might rely upon mineral development to bring a great deal of traffic to any railway through the district.
3205. Do you know the country between here and Grenfell? Yes; it is really good pastoral and agricultural land. I have been right through the Bland country.
3206. Can you think of any other reasons apart from those you have heard mentioned which would justify the construction of a railway here? Well, the chlorination works here are at present charging a good heavy price for the treatment of ore; they say it is through the heavy carriage they have to pay from Sydney. If there were a railway they could get their chemicals on to the field cheaper, and they would then charge a cheaper rate, so that all the mines on the field would benefit from railway construction.
3207. Do you know of any timber between here and Hillston which could be used for railway sleepers? There is a good lot of ironbark and box country between here and Hillston.
3208. There would be no difficulty in getting sleepers for a railway? None at all; you could get nearly enough 10 miles from here to lay a light line.
3209. The Wyalong people want a railway quite independently of the route? Yes; we want it to come the cheapest and quickest way.

Jacob Haub, farmer, Hiawatha, sworn, and examined :—

3210. *Chairman.*] You are a farmer? Yes, at Hiawatha. I have 2,560 acres. I have been farming there since Wyalong broke out; prior to that I was grazing.
3211. Do you graze any sheep now? Yes.
3212. And in addition to that you have started agriculture? Yes.
3213. What do you grow principally? Wheat for hay. I have done so all along. It would not do to grow it for grain, because we are at such a distance from market.
3214. Have you a fair demand for all you can grow? Just at present.
3215. In a bad season you have a good local demand, but in a good season you cannot give the produce away? Yes.
3216. You have heard of the proposal to extend the railway from Euabalong to Hillston? Yes; I do not know the proposed line from Condobolin to Euabalong, but I know the country to within 15 miles of Grenfell, and down to Temora.
3217. How would you describe the country between here and Grenfell? It is all good agricultural land excepting on the Bland.
3218. As to the land between here and Temora? It is good agricultural land with the exception of the ironbark ridges.
3219. Do you know the cultivated land between here and Temora? I have seen the wheat growing when passing along the road.
3220. Is the land equal to or superior to the land between here and Grenfell? I think the land between here and Grenfell is superior.
3221. What is the average yield of hay you have obtained? For the last two years it went only 12 cwt., but in a good season it would go from a ton to 25 cwt.; in an exceptionally good year it would go to 30 cwt.
3222. Does that crop pay you? Yes, sending it to Wyalong.
3223. How far is your farm from Wyalong? Ten miles.
3224. And you can carry your produce that distance profitably? Yes.
3225. You would be satisfied if a railway were within 20 miles of you? Yes; that would about serve us. I am satisfied that if there were a railway here there would be a great demand for land. As matters stand we are too far from market to grow wheat. It would not pay us to grow it and cart it to Temora. If there were a railway here I should soon increase my cultivated area. I am increasing it now on the chance of a railway coming here.
3226. Where is your holding? At Hiawatha, on the Wollongough road, 10 miles from Wyalong.
3227. *Mr. O'Connor.*] You know the Humberg Valley? Yes; it is as good agricultural land as I have ever seen.

J. Haub.
14 Oct., 1897.

John Charles Holmes, settler, near Wyalong, sworn, and examined :—

3228. *Mr. O'Connor.*] What are you doing upon the land? I have not done any farming upon my place as yet. I am a new comer; I have been here twelve months, and owing to the severe drought I have been unable to get any land cleared for cultivation. I originally came from Victoria, but I was in the Deniliquin district from 1874 to 1891.
3229. What is your opinion of the land here as compared with the land in that district and at Berrigan? The land is equal, if not superior, to the land there for agriculture.
3230. You know the district surrounding Wyalong? Yes, and from what I can hear I think the whole of the land here could be profitably cultivated with railway communication. The district also grows grape vines and fruit trees well.
3231. What area of land have you? 2,582 acres; I am a settlement lessee.
3232. You could live well upon that area if you had a railway to get away your produce? Yes; the land is fairly good; part of it is not fit for agriculture, but a great part is agricultural land.
3233. How do you utilise it now? I am grazing at present.
3234. Do you find that land pays fairly well? I have done fairly well considering the season. A great deal of the country has never been rung, and that which has been rung has been so neglected that it would be not of much use until the suckers have been cut out. A great many of the trees which had been rung were not killed.
3235. Can you speak as to the capabilities of the land between here and Temora? It would be better for cultivation and grazing if the timber were cleared off it.
3236. Do you know the land between here and Grenfell? I have heard it very favourably spoken of; but I only know a short distance along that route.
3237. Do you know Wollongough? I have been through Wollongough to Euabalong; that is all.
3238. Did you take any notice of the soil? I thought that if it were cleared it would be good agricultural land. In fact, when I was in Sydney, I mentioned the matter to one of the members of the Assembly, and I told him I thought it a great pity the Government did not give the district railway communication.
3239. What area of land would there be available for a settlement in the district if it had railway communication? Fully half a million acres; the only drawback here is the scrub and the timber.
3240. If there were a railway here do you think men of fair capital would be induced to take up the land and prepare it for cultivation, leading to the employment of a good deal of labour? Yes.
3241. Do you think the "halves" system would be adopted in this district? Yes.

FRIDAY, 15 OCTOBER, 1897.

[The Sectional Committee met at the Court-house, Wyalong, at 10 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Eaubalong.

William Clarke, police magistrate and mining warden, Wyalong, sworn, and examined:—

- W. Clarke. 3242. *Chairman.*] You are acquainted with the proposal into which the Committee are inquiring? Yes.
3243. Can you give us any information as to an alternative route to Hillston, which would also serve Wyalong and the district? I can give you some statistics as regards mining matters.
- 15 Oct., 1897. 3244. *Mr. Fegan.*] How long have you been police magistrate and mining warden at Wyalong? Since December, 1894. In that year the yield was 9,649 oz., valued at £35,946; in 1895 the gold was valued at £91,688; and in 1896, £130,000. For the present year the returns are not complete, but judging from the returns to date there will be very little short of 40,000 oz. for the year. These returns do not show the whole of the gold obtained, and it is impossible to obtain it, because a lot of it goes away privately. We cannot obtain the results of the treatment of the tailings and concentrates by the cyanide and chlorination processes; they will not disclose the information. In 1896 there were 395 claims at work, out of which 150 were declared payable. The number of miners' rights issued was 2,180, and of business licenses, 145; the revenue was £1,709 9s. 3d.; the population was estimated at about 4,200 within a radius of 5 miles; the number of miners employed was 2,361, and the value of the machinery, £50,000. In 1897 there were about the same number of claims at work; 200 were declared payable; 1,565 miners' rights were issued, and 70 business licenses. Up to the 30th September the revenue was £325 9s. 1d. The population is set down at 4,250, and the number of miners employed, 2,100, the value of the machinery being £70,000. The number of gold-leases granted and in force is 94, and the residence areas occupied in the Government town number 240; a number of the areas occupied in the other town are not residence areas. The whole of the returns given, except the last one I mentioned, include both divisions. At Yalgogrin the yield of gold for 1894 was 348 oz.; for 1895, 804 oz.; and for 1896, 1,250; 300 men were employed in 1896, and about the same number are employed there this year. I am unable to say what the yield will be this year; we have no returns yet. From Barmedman, in 1895, 117 oz. were obtained; in 1896 the only work of any importance done there was at the cyanide works. They treated a large quantity of tailings, but the yield cannot be obtained. Some work was done by a company called the Fiery Cross, which are now under suspension, otherwise mining is pretty well at a standstill at Barmedman. At Reefton, in 1895, the returns were 1,603 oz.; in 1896, 1,820 oz.; about 2,255 tons were crushed for an average of 1 oz.; in 1897 the yield has amounted to 1,150 oz. so far, but it will probably be more than that when the total returns come in. There are only 11 claims there now and 8 leases. The quartz crushed this year up to date is 1.227 tons. At Billy's Look-out, in 1895, about 100 men were employed; in 1896, about 200 men; and in 1897, about 40. At Temora, in 1895, 7,473 oz. were obtained, valued at £28,214, an increase of £20,000 upon the returns of the previous year. That increase was caused by the new finds at Scrubyards on the other side of Temora. In 1896 the yield was 4,066 oz. I do not know anything about the 1897 returns, because the district was taken out of my district. It is now in the Cootamundra district.
3245. It would appear from your returns that there has been a steady increase in the output of gold at Wyalong and in the number of men employed upon the field? There has been an increase in the quantity of gold, but a slight decrease in the number of men employed.
3246. Several witnesses, in speaking yesterday in reference to the development of the field, laid stress on the labour conditions as being entirely different on this field from those in force on any other field in the Colony;—can you explain them? The only reason I can give for the statement is that it was made a condition by the Department, when the leases were granted, that there should be the same labour as upon claims. The reason for that was that the country was considered to be more easily worked than were other places,—that the gold could be more easily obtained, but those conditions are altering now.
3247. You think that if it is proved to your satisfaction as warden that the ground is much harder and more difficult to work, the present regulations might be considerably altered or amended? I am not in a position to answer that question. In so far as the leases are affected it is a matter bearing upon the discretion of the Minister; it is not within my discretion at all. I have reported in some instances recommending a reduction of the labour conditions, but the matter has not yet been dealt with.
3248. When did you make the representations to which you now refer? Only about one month ago. The lessees can always get a partial suspension if they cannot profitably employ the number of men. I have power to reduce the number when the lease is issued.
3249. How many such representations have been made to you? Only three or four parties have applied.
3250. Very few representations have been made as to the severity of the conditions upon this field? There has been no complaints at all until the last month or so.
3251. It cannot be assumed then that the labour conditions applicable to the field retard its development? I do not think so; I think that if it had not been for the full labour conditions being insisted upon up to the present time, Wyalong would not be what it now is. The conditions have been the means of developing the field; the time may now have arrived to consider a reduction by reason of the greater depth obtained and the hardness of the country.
3252. You know Yalgogrin? Yes.
3253. Have you any doubt as to the permanency of that field or of Wyalong? Personally I have no doubt whatever about the permanency of the field.
3254. You think that, in considering railway construction, the Committee should bear in mind that this is not a field likely to be worked out within a few years? That certainly will not be the case; the number of men employed may decrease for a little while, but when a little outside capital is introduced the number is sure to increase again.
3255. You think that since the claims are meeting harder ground they will ultimately employ a larger number of men? Yes.

3256. What mines are there in what is known as the Government township? There are none exactly in the township; but in the Wyalong division there are forty-five claims and thirty-six gold-mining leases. In the other division there are 359 claims and sixty-six leases. W. Clarke.
15 Oct., 1897.
3257. You think that Yalgogrin is also likely to become a permanent field? I think it is likely to become a permanent field; the indications of that improve every day.
3258. There has been a steady increase in the output of gold there? Yes; a number of claims and leases have been taken up under the Mining on Private Lands Act. They have had great difficulties to contend with there. They have had no batteries for the treatment of the stone, and the ground there was much harder than it is here until a depth was reached. They have had to send everything away for treatment. I believe a new battery will be opened there next week.
3259. Have you had a long experience in mining districts? I have been a warden since February, 1891; and I was warden's clerk and mining registrar from 1876.
3260. So that you can form a pretty reliable idea as to the permanence of the field? Yes.
3261. You think that Wyalong and Yalgogrin have splendid prospects? Certainly.
3262. In considering railway communication the Committee, you think, should bear those prospects in mind? Yes. As regards Yalgogrin, I think it will be a permanent field, and that in the end it is likely to become a very large place.
3263. How far is Reefton from here? About 29 miles—between Barmedman and Temora.
3264. This year there is a decrease in the quantity of the gold contained;—the quantity given is 1,150 oz., as compared with 1,820 oz. last year? The present year's returns are not yet complete.
3265. Is it gold-bearing country? The country is nearly all auriferous between here and Barmedman.
3266. And also between here and Yalgogrin? The greater portion of it.
3267. Do you think a railway would lead to much mining development? Taking the district on the whole, certainly.
3268. You think there would be considerable mineral traffic? There would be traffic in goods; but I do not think much stone will go away, because the works will be so complete here presently that the stone will be treated on the spot.
3269. But the traffic in chemicals will be considerable if this field is as permanent as you think it is likely to be? Certainly; also the carriage of coke and coal for the use of machinery.
3270. *Chairman.*] You think the field is practically in its infancy? A vast area round Wyalong has not yet been prospected.
3271. Does that area show as good indications of gold as Wyalong itself? Yes.
3272. And in your opinion Yalgogrin is likely to become as important a mining centre as Wyalong itself? I would not like to say so at present; but the indications point that way.
3273. You think that a railway would lead to a considerable increase of population in all the mining centres here? Yes.
3274. Gold-mining has a greater tendency to settle people on the land than has any other industry in the Colony? Certainly.
3275. A certain amount of agricultural occupation must of necessity follow to supply the wants of the mining population? Yes; no doubt a large area of good land round about Yalgogrin and Wyalong, which is fit for settlement, will be taken up as the fields are developed.

Lawrence Daniel Mullane, commission agent, Wyalong, sworn, and examined:—

3276. *Mr. Farnell.*] How long have you been here? Three years and eight months.
3277. You have been engaged in pursuits which have given you a good knowledge of the district, and the capabilities of the soil? Yes. L. D. Mullane.
15 Oct., 1897.
3278. You know that it has been proposed to extend the railway from Condobolin to Euabalong, with a view of an ultimate extension to Hillston;—do you think a line passing through Wyalong to Hillston would follow a better route? I certainly think that a line passing through Wyalong is more required than is a line in the other direction. At the same time it would be more profitable.
3279. Do you know the country between Wyalong and Grenfell? Yes; I have been over it as a commission agent selling land, stock, and so forth.
3280. What is your opinion of the capabilities of that country? I should say it was very good; a lot of the country is not yet improved; but there can be no doubt as to the soil being good.
3281. Is there plenty of land available for settlement in that direction? A great deal.
3282. You think that with systematic cultivation it could be very profitably occupied? Yes; settlers could combine farming and grazing.
3283. You think mixed farming would pay best? Yes.
3284. What have been the obstacles to settlement in the district? Two things—bad seasons, and the want of proper facilities for getting produce to market.
3285. You think persons have been reluctant to settle here in the absence of some assurance that they would be able to get their produce profitably to market? Yes; I have, as a commission agent, sent particulars of land for sale to other districts, and the first question asked me has been, "What railway conveniences are there?"
3286. At what distance, in your opinion, could a railway be held to reasonably serve agricultural settlement? From 20 to 30 miles.
3287. Have you any doubt as to the superiority of the land between Wyalong and Grenfell over other land in the Colony for wheat-growing? Not the slightest. There are also several belts of country between here and Grenfell adapted to the growth of vines. From my experience in the Albury district I should say that the land between here and Grenfell was splendid vine-growing land; it would not be adapted to green crops, but it is splendid for wheat.
3288. You think the Government will shortly have to recognise the claims of Wyalong to railway communication quite independently of the claims of Grenfell and Hillston? That is certainly the case. I have no doubt that as the field is developed the land round about it will be closely occupied by farmers. I look upon this as the best market in Australia for farm produce and live stock. I have sold cattle here up to £16 a head, and some sheep I sold the other day went to close upon 10s. a head. The necessity for a railway here would be better known to me than it is to most other men, because there are few men upon this field who know the value of the stuff better than I do. 3289.

100
L. D.
Mullane.
15 Oct., 1897.

3289. Do you think there will be much live stock trucked from here? There might be after a time, but at present all the cattle come from Sydney, but that is due to the bad seasons through which we have gone.
3290. In good seasons you would supply the Sydney market, and in bad seasons a railway would enable you to obtain the stock you required at cheaper rates? Quite so.
3291. Are there many inquiries in this district for land? Yes; I have correspondence with other districts frequently on the subject of land here which is available for settlement.
3292. What is your opinion of the probable development of Wyalong as a mining centre? I have a good opinion of it as it at present stands, and also as regards its future.
3293. Do you think it is destined to be a permanent field? I do beyond all doubt.
3294. You are connected with a company which has a process of discovering the values of the different kinds of stone raised;—can you give us any idea of the results of their experiments? I am not allowed to give any information as to the returns; but the value of the stuff, both in the crude ore state, and after it has come from the battery, has been such as to give very satisfactory returns indeed.
3295. You are connected with the cyanide process? Yes.
3296. You think that in the immediate future works will be erected here which will dispense with the necessity for sending ore to Dapto and elsewhere for treatment? Yes; I can speak authoritatively upon that point.
3297. You think enterprise here will keep pace with the best machinery erected elsewhere? I do. I should also like to point out that the freight of the necessary material for the treatment of the ore would be a considerable item. The treatment costs about twenty times the amount it would if there were a railway. Almost all the chemicals used would come by railway—in fact, everything used in the works. The same observation would, of course, apply to chlorination.
3298. What is your opinion of the country between Wyalong and Hillston? There is some very good country in that direction; but it is not generally as good as it is between Euabalong and Hillston. Of course, the one route follows the Lachlan all the way, while the other is not so well supplied with water. The land between here and Hillston, however, is fairly good, although not so good as between this point and Grenfell.
3299. But the land between Euabalong and Hillston, on the southern bank of the Lachlan, is pretty well all secured? Yes.
3300. And on the opposite bank the land is in the Western Division, and will not be available for settlement for twenty years;—would you not consider that an obstacle to railway construction in that direction? Yes.
3301. Do you not think that if a railway were constructed, people would be likely to settle between Hillston and Wyalong? Yes. Mines and other things of that kind will not always keep people; the population is growing, and then there is only the land to fall back upon.
3302. What is your opinion of Yalgogrin? I have a slightly better opinion of that field than I at one time had; but it is not all prospected. The yield up to the present is better than the Wyalong yield. They have no facilities for treating the stuff; they have to cart it here or send it away. I think there is a very great future indeed before Yalgogrin.
3303. Do you think that if a line were taken to Hillston from this direction, the people in the intervening districts would utilise it to convey their stock, in time of drought, to well-grassed country? I do indeed think a line is very much wanted for that purpose.
3304. In your business capacity you have become aware of hundreds of thousands of sheep having perished in time of drought—sheep that might have been saved had there been a railway to convey them to well-grassed country? Yes; I have lived in the mountain country about Tumut, and I have known stock to be started from here to that country in a bad season; 70 per cent. of them died; the long drought killed them.
3305. You know Lake Cowal? Yes.
3306. Have you ever known it to be dry? No.
3307. You know that it is fed by the overflow of the Lachlan, principally? Yes.
3308. Do you think it would be possible to keep a permanent water level in the lake by erecting a weir across the Lachlan? Yes; it could be done quite easily.
3309. Would it be an expensive work? No; it would not be at all difficult.
3310. Is there anything you wish to add to your evidence? Only as to the value of the stuff at Wyalong. After the ordinary batteries have dealt with it we have given as high as £6 per ton for tailings, and as much as £28 a ton for concentrates.
3311. And at that rate you have obtained satisfactory returns? Yes.

John Richmond, mining surveyor, Wyalong, sworn, and examined:—

- J. Richmond
15 Oct., 1897.
3312. *Chairman.*] You have had considerable experience as a staff surveyor in the Lands Department? Yes; seventeen years.
3313. You are acquainted with the country through which a line of railway passing from the southern line would touch Hillston? Yes.
3314. You have inspected and reported upon the whole of that country? Yes.
3315. Will you describe the country between Grenfell and Wyalong? Yes; commencing from Grenfell, and coming towards Wyalong, it is not very hilly; there are some hills, principally granitic ridges; there are some other ridges in between, but there is no obstruction of consequence; there are good passages through them, one down by Bimby, and another to the north; it is country which can be easily got through.
3316. There are no engineering difficulties in the way? I do not know of any; little detours may be necessary here and there, but there are no serious difficulties.
3317. What are the capabilities of the country? About Grenfell it is really good agricultural and pastoral country; there is a fair rainfall there also. As you come westward the country becomes pastoral, and in certain seasons very wet.
3318. How far out from Grenfell would that be? About 20 miles. The soil I am speaking of would be suitable for agriculture, only that it is too moist in some seasons. In other seasons it is very dry. As a rule the country is fairly well watered; there are springs and one or two very fair creeks not far from Grenfell. Coming nearer to Wyalong, you get into the Bland country, with soil similar to that round about

about Condobolin; it is black clay; there are good patches of soil, but it would be difficult to work it with the plough. However, it is first-class pastoral country. It is especially good fattening country. The boree plains consist of, chemically, the richest soil which can be found in these parts. Between the Bland and the Back Creek it is all black soil, pastoral country; it is quite flat. From the Back Creek to Wyalong there is ordinary red soil, pine, box, and oak; it is fairly thickly timbered.

J. Richmond.
16 Oct., 1897.

3319. Is that country suitable for agriculture? Yes, it is good soil throughout; the granite outcrops from the ridges here and there, but generally the soil is good.

3320. How far does that land extend on each side of the suggested line? As far as I know it grows 20 or 30 miles to the north and south. For that distance there is no difference in the character of the country as far as I can remember. To the north and west of Grenfell, going towards Lake Cowal, it is somewhat hilly country, but there are nothing more than hills. Towards the Bland again in that direction there are plains. There is some country like the Bland country quite close to Grenfell; a strip of it runs in there.

3321. Do you know the country between here and Temora? From Temora to Barmedman there is a slate formation; it is red soil with occasional granite ridges. Except the ridges it is all good agricultural country. I have seen first-class fruit and vegetables grown there.

3322. I suppose the country on each side of the surveyed railway would be practically of the same character? The country is similar in character. As you get near to Barmedman the soil is of a more clayey nature.

3323. What is the country like between Barmedman and Wyalong? It is similar country. Red soil with ironbark ridges; there are also granite ridges, and some mallee and patches of boree. All through, the soil is good.

3324. The country on each side of the surveyed route is similar? Yes; going along the road you really see the whole country, it is so similar.

3325. Do you know the country between here and Hillston? Yes.

3326. What do you think of the route to Hillston *via* Yalgogrin? From here to Yalgogrin, going almost due west, the country is densely scrubbed; there are belts of mallee here and there. Excepting on the ridges it is all good soil; there are some ironbark ridges upon which some good timber has been left, although a great deal of it has been taken by sleeper-getters.

3327. A considerable number of sleepers have been obtained from these ridges? Yes, and they are still taking them. Proceeding from Yalgogrin to Hillston there is some rough country, but the ridges could be avoided by keeping to the northward. There is flat country between the ridges and Lake Cudgellico. There are no hills of any great consequence; they are very similar to those about Grenfell.

3328. What is the soil like? It is all good, suitable for agricultural or pastoral pursuits.

3329. That class of country extends for many miles on the explored route? Yes; as you get nearer to Lake Cudgellico you get into the clayey soil again.

3330. What is the country like on the south side of the route? Beyond Yalgogrin I do not know much about the south side of the route. I have only traversed the northern part.

3331. Do you think the rainfall in that district is sufficient for the growth of wheat? The annual average throughout the district would be 20 inches.

3332. And it has been proved that wheat can be successfully grown with that average of rainfall? Yes.

3333. Have you any knowledge of the Wyalong goldfield? Yes. I have not the slightest doubt as to its permanence; I said so in my evidence before the Sectional Committee four or five years ago. I know the mines. Having made underground surveys for many of them I know them well, and everything goes to show, in my opinion, that the field will be permanent.

3334. You anticipated the present position of the field five or six years ago in your evidence? Yes.

3335. Are the reefs fairly well defined? Yes; they are very continuous in some places.

3336. Do you think the quality of the stone is improving with depth? Yes; in nearly all the mines, as you go deeper, the stone improves.

3337. The owners consider themselves justified in going to the expense of erecting first-class winding plant? Yes.

3338. Do you think the Yalgogrin field is likely to be permanent? I feel certain of it.

3339. You think it will one day sustain a large population? Yes; I think it will be a very great place indeed.

3340. The character of the country there is different? The ground is somewhat harder, but the reefs are well defined, and in most cases bigger.

3341. There is a large area of Crown land available between Grenfell and Wyalong? From Grenfell to Wyalong there is comparatively very little Crown land left outside Back Creek. The Bland country was all taken up long ago in large estates. From Back Creek to Wyalong it is nearly all Crown land; a great deal has lately been taken up in homestead selections—in fact, almost all the available land has been taken up within the last year.

3342. And you think the further development of this field will result in more settlement of that nature? Certainly; between Wyalong and Yalgogrin it is nearly all Crown land.

3343. There are farms here and there? Yes; whenever land becomes available in the district it is nearly always taken up, excepting the worst and most scrubby parts.

3344. From Yalgogrin towards Hillston there is a great deal of Crown lands? Yes, great areas.

3345. You think a railway would assist in their development? Yes; people are looking for land everywhere.

3346. The principal reason why that land has not been taken up is the distance from market? A lot of it is in leasehold areas, and therefore not available.

3347. But there are many resumed areas? The best land in those areas has been taken up; some has been left towards Lake Cudgellico and Hillston.

3348. The difficulty of reaching a market has, you think, precluded settlement? Yes.

3349. Have you had inquiries from persons residing in other parts of the Colony as to the possibility of getting land in this district? Yes, at different times.

3350. You think the construction of a railway would induce them to come here and settle? Yes; from what I can hear I am certain of it.

George William Rose, senior-constable, Wyalong, sworn, and examined:—

- G. W. Rose. 3351. *Mr. O'Connor.*] How long have you been stationed here? I have been in this district nearly three years.
 15 Oct., 1897. 3352. You are acquainted with the proposal before the Committee? Yes.
 3353. You are prepared to give us some evidence in assisting us to arrive at a decision? Yes; as regards the wheat crop in the county of Gipps there are 2,358 acres under wheat, and in the county of Bland 25 acres. County Gipps is in the direction of Hiawatha, about 20 miles from here, a little to the north of the proposed line.
 3354. Is the district advancing, or is it stationary? It is advancing in both population and wealth.
 3355. Do you know Yalgogrin? Yes; that district is advancing also.
 3356. What is the radius of your patrol district? About 20 miles.

John Curtin McMahon, stock and share broker, Wyalong, sworn, and examined:—

- J. C. McMahon. 3357. *Mr. Farnell.*] How long have you been here? Nearly three years and four months.
 15 Oct., 1897. 3358. You have a good knowledge of the district from a pastoral, agricultural, and mining standpoint? Yes.
 3359. You have travelled through most of it? Yes.
 3360. What do think would be the main advantages resulting from railway extension to Hillston *via* Wyalong, instead of *via* Euabalong? No matter where a railway comes from, it will be a great benefit to this district in developing its mining, agricultural, and pastoral resources; it would open up a large tract of country for settlement.
 3361. You do not doubt the capacity of the soil to produce cereals? I have not the slightest doubt as to that; I may say that I am an agriculturist. I have spent a great portion of my life-time in Victoria, and from my knowledge of the place and its produce I should say that the district contains some of the finest land for wheat-growing in the Australian Colonies; it is only a matter of rainfall.
 3362. Would the average rainfall admit the successful growth of wheat? I should think so; no doubt you would have an odd year now and then which would be bad, but your good years would compensate for the bad ones, and all that would be required would be careful farming.
 3363. Have you any doubt as to the permanence of the mining-field here? Not the slightest doubt; in my opinion it would be a very extensive field. Up to six months ago we were in some doubt upon the point, but from what has transpired since I think there can be no longer any doubt. Some of the mines have gone down 300 feet, and are obtaining better gold at that level than they have yet obtained. The reefs are not only richer but larger.
 3364. Do you know Yalgogrin? Yes. In my opinion that will also be a permanent field. It is slightly different from Wyalong; the country is harder and more difficult to prospect, but the field is improving day by day. All that is required is capital to develop it.
 3365. You think there is a bright outlook for the district as far as mining development is concerned? Yes; I am confident of it; the returns from the field are in themselves sufficient guarantee of its permanence.
 3366. Knowing the district between here and Hillston, you think that when facilities are afforded to settlers to get their produce to market there will be extensive settlement in that direction? Yes; in the absence of a railway the cost of getting produce to market is now so great that it does not pay to grow it. I have seen as much as from 30 to 40 bushels to the acre here in a good season. I was speaking to a selector yesterday, and he said that bad as last year was he had 15 bushels to the acre.
 3367. What is your idea of the lowest yield which would pay with railway facilities? No doubt 10 bushels would pay.
 3368. Is there anything you wish to add to your evidence? I desire to say that the country between here and Temora is all good with the exception of a few stony ironbark ridges. The low-lying ground contains first-class agricultural soil, and the greater part of it would be available for settlement; very little resumption would be required. I think the freeholders whose land was required for a railway would be only too glad to give it free of charge.

SATURDAY, 16 OCTOBER, 1897.

[*The Sectional Committee met at the Court-house, Barmedman, at 2:30 p.m.*]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

FRANK FARNELL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Edwin Davis Donkin, grazier, Mandamah, near Barmedman, sworn, and examined:—

- E. D. Donkin. 3369. *Chairman.*] Have you resided long in this locality? Nearly eighteen years.
 16 Oct., 1897. 3370. What is the area of your holding? 10,000 acres.
 3371. Is it a pastoral lease? Yes.
 3372. Have you any cultivated land? Something over 100 acres.
 3373. Have you heard of the proposal to construct a line from Condobolin to Euabalong? Yes.
 3374. You have also heard that this Committee have traversed a suggested route from Hillston to Wyalong? Yes.
 3375. You are not favourable to the extension *via* Euabalong;—you are in favour of some other route? Yes; I am in favour of the route from Wyalong.
 3376. You have seen the route explored by Mr. Kennedy as marked on the plan? Yes.
 3377. You are acquainted with the country not only between Wyalong and Hillston, but also between Grenfell and Wyalong? Yes. 3378.

3378. Will you describe it to the Committee? The country about 10 miles or so out of Wyalong is ordinary forest land, all suitable for agriculture. After that, on the Bland, you come to open plains, which are not suited to agriculture. E. D. Donkin.
16 Oct., 1897.

3379. The country there is more suited to pastoral pursuits? Yes.

3380. Is the soil of good quality? Yes; but there is too much clay in it for agriculture. It is not at all suited for cultivation. It is difficult land to work. The same class of land continues for some distance on the eastern side of the Bland. The line would pass the Bland almost at right angles, and for a considerable distance on the eastern side of the Creek the land is subject to flood. It is heavy black soil, unsuitable for agriculture. I could not say exactly for what distance it extends, but it would be for perhaps 10 or 15 miles on the eastern side.

3381. There is a stretch, then, of about 30 miles unsuitable for agriculture on the Bland? Yes; but from that point on to Grenfell the land is all more or less suited to agriculture.

3382. Is the country between Barmodman and the route you have just described good country? It is all good agricultural land.

3383. You would have to cross the Bland in taking a railway from here to Grenfell? You would cross the creek about 10 or 15 miles above the point at which it is proposed to cross it with the railway to Wyalong.

3384. Your remarks would apply to a stretch of country within 30 or 40 miles of the surveyed route? Yes: it is practically the same on either side of the proposed line.

3385. What is the principal use to which land round about here is put? For grazing; hitherto the land has been worked at a great disadvantage; there is no natural food, no natural grasses; the whole of the land requires a heavy expenditure before it can be made of any use whatever.

3386. The country requires ringbarking and scrubbing? Yes; in its natural state it is absolutely worthless, although the soil is good.

3387. What would be the cost of improving the land? It is worth certainly 10s. an acre to scrub, ring-bark, and burn off. That is really a low estimate; I think you might estimate from 10s. to £1 an acre to prepare the land for the plough. When the land has been ringbarked for some years it is easier to clear it and make it ready for cultivation.

3388. Is there much ringbarked land in the district? Yes, a great deal of land has been rung, but it would require considerable expenditure to retain the advantage gained by ringing. It is of no use to ringbark the country and then leave it alone; you have to go on with the work. I have been ringing continuously ever since I have been at Mandamah. Some of the land is not yet cleared. It continues to sucker, and the scrub wants dealing with year by year.

3389. Has agriculture been tried in that locality? Yes, and with very good results, although our rainfall is comparatively light. I have kept the rainfall here for eighteen years, and the average for that time would be about 18 inches.

3390. It has been proved that crops can be grown here successfully? Undoubtedly.

3391. Where do you find the market? Locally.

3392. Would any crops grown here be too far from the railway at Temora? If wheat kept up the price at which it stood last year, it would pay to cart it; but last year the price was abnormal. If the price went down to 2s. 6d. or 3s. we could not cart it; the expense of carting would eat up all the profit.

3393. It cannot depend upon the seasons? I think I may say that ever since I have been here, with the exception of one or two seasons, wheat might have been grown.

3394. You have a statement showing the rainfall for eighteen years? Yes; in that period our highest rainfall was 31 inches, in 1890. Our lowest was 8 inches, in 1888. The average is a little over 18 inches—18½ inches.

3395. Have you any other statistics bearing upon the question? Yes, with regard to the traffic. The returns were taken officially by gangers on the road known as Donkin's Lane, where the traffic is concentrated. The figures were taken just after the wool season, so that the traffic escaped and was not taken. Again, they were taken from 6 in the morning to 6 in the evening during the hot months of the year, and for that reason also a lot of the traffic escaped, because many teams prefer to travel at night, and especially on moonlight nights; but the traffic averaged 512 tons a month.

3396. Is that both ways? Yes, or about 6,200 tons for twelve months. I calculate that they lost from 3,000 to 4,000 tons in the time I have named. I think they must have lost in the traffic, travelling at night, and in the wool, 4,000 tons. I think I may safely say that the traffic from Donkin's Lane would be equal to 10,000 tons a year.

3397. Where would the traffic go to principally? To Wyalong. A great deal of it consisted of heavy, expensive machinery, forage, and goods. In addition to that, during the four months, passengers passing averaged 750 a month by coach, horseback, or vehicle, or close upon 9,000 persons in twelve months. Of course, we may assume that in the hot months of the year a good many passed through at night. That passenger traffic alone would represent a large amount of money.

3398. And you say the bulk of it would be towards Wyalong? Yes.

3399. Do you think Wyalong is entitled to a railway? I do not think there is the shadow of a doubt about it. I think it is a great shame that the railway was not built here two years ago. I do not know what money has since been expended on the roads, but £6,000 or £7,000 has been expended along the road known as Donkin's lane. They are still expending money there, and will continue to do so. The material is not suitable for a road; it cuts up as fast as they make it. I look upon the road expenditure here as a terrible waste of money.

3400. Wyalong was totally unknown as a goldfield four years ago? Yes.

3401. Do you not think its development has been of an extraordinary character? I do; I think the field will, in all probability, be permanent; they have no idea of what is down below. Many prognosticate that the field will improve at a greater depth; in any case, I think there will be a large population there.

3402. You are well aware that nothing conduces to rapid settlement more than does the discovery of a payable goldfield? Nothing. I think there is every probability of Wyalong becoming a large city in the course of a few years.

3403. At all events you think the place is entitled to railway communication? I do. When the Secretary for Works was here a few months ago a deputation waited upon him in reference to this very matter, and he told us that when the Sectional Committee were here we did not pay any attention to their presence, and

E. D. Donkin. and would not come in to give evidence, and that the sort of evidence we gave was a sort of faint praise that damned the railway absolutely, it appearing that the people did not want one, and that they preferred a bullock team.

16 Oct., 1897.

3401. Do you think the country you have described in the vicinity of Wyalong is calculated to carry a large agricultural population? I do; I have not seen it myself. I believe there are crops close to Wyalong which have no superior in the district. One of these crops is growing on land which I remember years ago as about the most worthless you could see. It is in mallee country. We suffer from drought here; our normal condition is one of drought; if we get a good season it is exceptional; the rains, however, which fall in winter time is sufficient to grow wheat or other crops, provided they are put in in good time. If people put them in later on they cannot expect to get a crop.

3405. You think the country might be profitably occupied by a combination of agricultural with pastoral pursuits? Yes; there is no doubt about that.

3406. From your knowledge of the effect of railway construction in other districts, you think a great deal of vacant land here would be profitably settled? Yes; I hold that a railway must precede agriculture, and that agriculture cannot precede a railway. It is of no use to grow produce if you cannot get it away. Wyalong is in an exceptional position; there would be a certain local demand there, but it would be very soon overtaken.

3407. So that if settlers in this district went in extensively for agriculture they would have to look elsewhere for a market? Yes. Another matter which needs consideration is the amount of money which is now being expended upon roads. The Government run a railway in a certain direction, and they say it does not pay, but they forget the constant outlay upon roads from which there is no return.

3408. They are feeders to the nearest railway station? Until we get something better.

3409. You think money can be more advantageously expended upon a railway than upon a road? Yes; because if it does not pay directly it pays indirectly. If you save money you have more to expend upon improvements. In the absence of a railway here you cannot save money, and that is the long and short of it.

3410. Your roads are very bad? Yes; I passed through 4 miles of road here in 1894 or 1895 which I shall never forget.

3411. Would it not be as difficult to construct a railway as a road at that point? I should resume the road and construct upon the top of that.

3412. In that case the money would not be wasted? No; but I do not think the Government would do such a thing as that. If a railway came along, the road, of course, would be absolutely useless. There would not be one team a week upon it.

3413. You are strongly of opinion that Wyalong is entitled to railway communication? Yes.

3414. You think the construction of a railway would conduce to a great deal of settlement in this direction? Yes. There would not be a vacant acre to spare in the district if there were a railway.

3415. You think Wyalong has a prospect of becoming a permanent goldfield carrying a large population? Yes.

3416. The gold-bearing country extends on the one hand to Temora, and on the other hand to Yalgogrin, and it is hard to say how much further in the latter direction? Yes.

3417. What, in your opinion, would be absolutely the best point of connection with the present railway system of the Colony? Undoubtedly, Temora would be the best point of connection. I will mention another consideration which bears strongly upon the question and which affects pastoralists materially. A railway going to Wyalong and down to Hillston would afford an escape for starving stock in a time of drought. If we could get a railway within 20 miles in time of drought, we could send our sheep to the ranges at Tumut. Within the past six months thousands of stock might have been saved had we had a railway by which we could have got them away. I know of one station out west which bought 15,000 or 16,000 sheep to restock. The drought came upon them, and, in desperation, they tried to get a remnant of 6,000 or 7,000 away. They got about half-way to the mountains, when they all died. Had there been a railway, that stock might have been saved, and there are no doubt a number of similar cases.

3418. As to the rabbit-pest, do you think it likely that the construction of a railway would induce persons to take up land now lying vacant, and that by that means the pest might be materially decreased? Undoubtedly. Close settlement is the only means of dealing effectually with the pest. Every acre of Crown land which is abandoned is a breeding ground, and is a menace to surrounding properties. The Crown makes no effort to contend with the pest. Nothing but a railway will promote close settlement; railway conquers distance immediately. Farmers have their time too much occupied to cart their produce themselves any distance, and teams are too expensive.

3419. Do you think that Hillston is entitled to railway communication? I should not care to express an opinion with regard to any point beyond Wyalong.

Dennis Byrne, farmer, Barmedman, sworn, and examined:—

D. Byrne. 3420. *Mr. Fegan.* How long have you been in the district? Nearly six years. I have been engaged in farming since I was a boy—farming combined with grazing.

16 Oct., 1897.

3421. What is the area of your holding? 2,500 acres.

3422. How far is it from Barmedman? Between 7 and 8 miles. A mile or two south of west.

3423. Do you agree with what the last witness said with reference to the capabilities of the soil here? Yes; I think the capabilities of the soil here are quite equal to those of the soil in the Albury district with which I am familiar, and where the billabong country is considered very good. I have no doubt as to the capabilities of the soil in this district if it be properly worked.

3424. What acreage have you under cultivation? I have about 230 acres under crop this year. I have also about 10 acres of sorghum.

3425. What results have you attained? In one year I had a little better than 16 bushels of wheat. In the past two years I have had between 10 and 11 bushels. I have had three bad years to contend with, and I have only a small area under crop.

3426. Where do you send your wheat? To Temora. Cartage would be about 4d. per bushel. I paid at back loading 3d.

3427. Have you never paid more than 3d.? I only carted in that one year. The rest I sold locally

3428.

428. You paid 3d. on the understanding that there would be back loading, is that it? Yes.
3429. At what can you grow wheat profitably per bushel? I think it can be grown profitably at 3s., with reasonable facilities for getting it away.
3430. What did you get for your wheat in the year you sent it to Temora? Three shillings and five pence halfpenny. That was three years ago.
3431. That would be profitable now? Yes, so much so that I have recently cleared about 300 acres in readiness for next year, in anticipation of prices remaining nearly as they are.
3432. I understand you to say that wheat cannot be grown profitably here at any price under 3s.? Three shillings, I think, would return a good profit. In some years it could be grown profitably at 2s. 9d.; but the average price required would be about 3s.
3433. At that price it would be more profitable than sheep? Decidedly.
3434. Would sheep pay better than wheat at 2s. 3d. per bushel? It is very hard to say; prices for sheep and wool fluctuate so much. Sheep would not pay as well as farming at present prices on a small area.
3435. What has it cost you for clearing? The land I purchased had been ringbarked before I took it up. I paid for ringbarking 400 acres 1s. 3d. and for scrubbing 2s. 3d. per acre.
3436. What would it cost you to prepare your land for the plough? I am preparing it now at 7s. and 8s. If the timber is green you must allow 1s. for ringbarking.
3437. I suppose three-fourths of the trees would be green? You must understand there is a great deal of undergrowth.
3438. Your average price for clearing would be about 10s. an acre? I could clear very well at that price.
3439. Have you tried anything but wheat? No.
3440. How far are you from a railway? About 30 miles.
3441. What would you consider a reasonable distance to a railway for the conveyance of produce? I should say from 12 to 15 miles.
3442. At the outside 20 miles? At 20 miles you are a good way off for the cartage of wheat.
3443. Then you think that a railway within 20 miles would be of little value to anyone producing wheat? Of course it depends upon the nearest existing railway point.
3444. Once you go over the 20 miles it does not cost you so very much more if you have to go to 30? Quite so.
3445. But I suppose farmers would be assisted to a certain extent if they had a railway within 20 miles of their holdings? Yes; of course they would not go in so much for agriculture as they would if the line were closer.
3446. Has any other produce grown well with you? I grew corn on only one occasion. It did very well. I have tried pumpkins and all sorts of vegetables, and they also have grown splendidly.
3447. Have you tried fruit? Yes; fruit does very well.
3448. With railway communication you think this district would hold its own with any other portion of the Colony? Decidedly; the land is of first-class quality if it is worked properly.
3449. What does rabbit-proof fencing cost here? From £30 to £35 per mile with the fence erected.
3450. You heard the evidence of Mr. Doukin as to natural grasses? Yes; if you ringbark the natural grasses will follow at once.
3451. Supposing wheat-growing became unproductive by reason of a fall in price, do you think that the land could be used for dairying purposes? It would be quite good enough for that.
3452. Have you tried dairying? Only for home use. The man who had my place previously tried dairying for market, and made a profit out of it. If you spend from a shilling to half a crown an acre for ringbarking and scrubbing you get good grassed land.
3453. No matter for what purpose you use the land you have to ringbark and scrub to make it of any use? Yes.
3454. Even if you are going to run sheep you must do that? Certainly.
3455. Where do you send your wool? To Sydney.
3456. *Mr. Farnell.*] You are a member of the Land Board here? Yes.
3457. Do you think Wyalong is entitled to railway communication? Yes.
3458. Do you know the country between Wyalong and Hillston? Not a great extent of it. I have been down the Humbug to Bolygamy. There is a large area of fine country there.

James Stewart, farmer, Reefton, sworn, and examined:—

3459. *Mr. Farnell.*] Reefton is between Barmedman and Temora? Yes.
3460. How far from Temora? About 14 or 15 miles. I am to the south-west of Reefton, on the western side of the Barmedman-Temora Road.
3461. How far are you from a railway station? About 16 miles.
3462. You cannot speak as to the merits of the various alternative routes to Hillston? No; I am informed that there is good land between Condobolin and Euabalong, but I have never seen that part of the country.
3463. You know the country between Temora and Wyalong pretty well? Yes.
3464. Also the country between Wyalong and Grenfell? Yes.
- 3464½. Have you ever been on the Bland country? Yes.
3465. What sort of country is it? It is flat country, very liable to floods.
3466. Is it what they call gilgai country? A good deal of it.
3467. It would be unsuitable for railway construction? I think so.
3468. Somewhat similar to the road between Wyalong and Barmedman? There is no country between here and Wyalong like the country I have just described.
3469. There is a great extent of it on the Bland? Yes.
3470. And railway construction across that country would be very expensive? Yes.
3471. You think that Wyalong is entitled to a railway independently of the construction of a line to Hillston? Yes.
3472. From your knowledge of the country within the influence of a railway at Wyalong, do you think the line would pay well? I do.

- J. Stewart.
16 Oct., 1897.
3473. You think that within a radius of 20 miles of Wyalong the whole of the country at present unsettled and undeveloped would be put under cultivation? Yes; a great deal of it between here and Temora, and also between here and Wyalong.
3474. You are a practical farmer? Yes.
3475. What is the wheat yield in this district? I have never had less than 12 bushels.
3476. Is the soil suitable for oats and barley? I have never tried barley; but I have tried oats and have made hay of them. I got about a ton to the acre.
3477. What area did you put under cultivation? From 150 to 160 acres.
3478. What do you do with your produce? I sometimes send it to Sydney and sometimes sell it locally.
3479. What yield will pay well? If I could get 3s. a bushel I should be satisfied with the yield I have mentioned.
3480. What have you paid for clearing your land? I have paid £1 an acre to get it cleared for the plough, after paying 3s. and 4s. an acre for ringing and suckering. I never got the land cleared for less than 12s. an acre, and that was after spending 4s. or 5s. upon scrubbing and ringbarking.
3481. Does fruit do well with you? Very well.
3482. What kinds have you grown? Apples, pears, plums, apricots, peaches, oranges, and grapes—a little of all sorts.
3483. What has done best out of those fruits? Apricots, I think.
3484. Do you think it is a good district for vine growing? Yes.
3485. On what area could a man make a comfortable living in this district? He would want from 1,000 to 1,280 acres.
3486. I suppose he would have to carry on mixed farming? Yes.
3487. Have you made any ensilage? No.
3488. Do you think fodder could be grown in this district which would be suitable for ensilage? Yes; after a few years had elapsed to render the land more fit for cultivation.

Charles Leonard, carpenter, Barmedman, sworn, and examined:—

- O. Leonard.
16 Oct., 1897.
3489. *Chairman.*] You have heard of the proposal to extend the railway from Condobolin to Euabalong? Yes.
3490. Do you know that part of the country? Yes; I have travelled from Condobolin to Euabalong several times.
3491. How is the land settled there? It is mostly in large holdings.
3492. What are the river flats like? They are all good agricultural country.
3493. It is mostly purchased land? I think most of the frontage is purchased.
3494. What is the country like between Lake Cudgellico and this point? It is agricultural country pretty well all through.
3495. Is it as good as the country from Condobolin to Euabalong? It is hardly as good as that, I think.
3496. Do you know the country round about Wyalong? I know a little of the country between Wyalong and Wollongough; but I have not been much to the south.
3497. Do you know the country between Wyalong and Grenfell? Yes.
3498. You heard Mr. Donkin's evidence as to that country? Yes.
3499. Can you corroborate what he said? Yes; as to the plains consisting of heavy ground, and being liable to flood towards Wyalong. The Grenfell country is agricultural country; but the country on the Bland is too heavy for agriculture.
3500. You have some knowledge of timber? Yes.
3501. Do you know of any ironbark forests round about here? Yes; to the north and to the west of Barmedman there are ironbark ridges.
3502. Are they of any extent? They are not very large; but the timber that grows there is pretty good. It is also fairly thick.
3503. So that in the event of a railway being constructed to this district, there would be no difficulty in getting timber for sleepers? No. They are taking them from here at present; they are sent to the railway at Temora.
3504. You regard the Bland country as good grazing country, and the strips outside that are good agricultural country, similar to that between Wyalong and Barmedman? Yes. I have done some coach-driving in the Bland country; I know what it is like. I carried mails from Young *via* Marsden's to Forbes for three years, and again from Marsden to Forbes for another four years.
3505. It is difficult country to get over in a coach? Yes; I was four days getting from Young to Marsden, a distance of 80 miles.
3506. Does the water lie all over that country at flood-time? The plains are covered for miles to a depth of from 1 to 3 feet. There is a bridge crossing the creek; but it is difficult to reach it in flood-time.
3507. *Mr. O'Connor.*] It would be expensive to construct a railway there? Yes; it is very hard to get any stone there.
3508. How wide have you seen the water there in flood-time? I have seen it about 7 miles wide. The water runs from south and east to north and west.
3509. You have been travelling in a straight direction? Travelling the way the water runs.
3510. And you have found it 6 or 7 miles wide? Yes.
3511. Does the water remain on the plains for any time? The creeks go down pretty quickly. Except when the Lachlan flood-waters which fill Lake Cowal meet the Bland waters, causing them to take longer in running down. They all run into Lake Cowal.
3512. What is the longest time you have seen the water there so high that you could not get to the bridge? Eight weeks. I could not bring the mail-coach from Forbes to Marsden's for that length of time.
3513. Could you not cross the country during that time? You could cross it by swimming a short distance if you knew the country.
3514. Is the country often flooded? It is generally flooded in winter time.
3515. You consider it hard country to travel across? Yes.

Lewis Joseph Luke MacNamara, grazier, Barmedman, sworn, and examined:—

L. J. L.
MacNamara.
16 Oct., 1897.

3516. *Chairman.*] How long have you been in this district? All my lifetime. I have travelled about a good deal in it.
3517. Are you acquainted with the proposal to construct a railway from Condobolin to Euabalong? Yes.
3518. Do you know anything about that country? It must be about fifteen years since I was there. I could not say what the country is like now. It appeared to me at that time to be all grazing country.
3519. Do you know the proposed route from Euabalong to Hillston? I do not know where the line goes exactly; but my experience of the Lachlan Valley is that it is grazing country. It may have changed since I knew it.
3520. Do you know Hillston? I have never been nearer in that direction than the Humbug Valley.
3521. What kind of country is that? Grazing and agricultural country—mostly grazing.
3522. Where are you carrying on your business? About 9 miles from here—5 miles from the Bland Creek.
3523. You know the Bland country well? Yes.
3524. You know the country from here to Grenfell well? Yes.
3525. What is your opinion of it? Five or six miles from here towards Grenfell in a direct line is all agricultural country. After that it varies. There is some good agricultural land at Grenfell.
3526. What has been your experience of the condition of the Bland country in wet seasons? In wet seasons it is very difficult land to get over; with the exception of small patches which are fit for farming it is grazing country.
3527. What do you think of the proposal to construct a railway from Grenfell to Wyalong? I never was on the surveyed route; but from what I can hear of the route you would require 4 miles of bridge across the Bland Creek. That would be expensive on account of scarcity of timber. I have seen the Bland Creek 7 miles wide in flood time—a running flood.
3528. You think it would be dangerous to build a railway over the Bland? Yes; there are 6 feet of water in some places; the depth varies.
3529. You say there is some agricultural country there? When you get about from 10 to 15 miles on the other side of the Bland the country is good for agriculture. But you could not cultivate on the Bland country. I have had some experience of that, and I have not been very successful.
3530. You do not care to express an opinion whether it would be judicious or otherwise to construct a railway from Condobolin to Euabalong? I could not say that Euabalong is not entitled to a railway; but I think a line from Temora to Hillston *via* Wyalong is very much more urgently required.
3531. You corroborate the statements of previous witnesses as to the general productiveness of this district? Yes.

Edward O'Donnell, farmer, Barmedman, sworn, and examined:—

3532. *Mr. Pegan.*] How far do you live from Barmedman? About 2½ miles to the west. E. O'Donnell.
3533. How far are you from the Temora railway station? About 25 miles.
3534. What area do you hold? 1,672 acres conditional purchase and conditional lease. I have held it for ten years. 16 Oct., 1897.
3535. How do you use your land? I have been grazing chiefly, except during the last two or three years when I have started farming. I commenced farming when the agitation for a railway line commenced.
3536. How long have you had the railway at Temora? Four or five years.
3537. Has it not been an inducement to you to put land under cultivation? I put some land under crop one year and found it did not pay me too well. I therefore let the paddock alone for a time, and then when Wyalong broke out I started again.
3538. What have you grown? Wheat; I have cut it principally for hay. I got about 480 bushels of grain last year.
3539. Did the price pay you for your outlay? It paid me right enough last year; I got 4s. 4d. a bushel.
- 3540-1. You have heard various witnesses speak of the productiveness of the soil? Yes; I have had as high as 30 bushels to the acre and as low as 12 bushels. Last year was a bad season. I had 30 bushels one year. In another year I stripped 20, and in the year after that I stripped none at all, but cut it for hay. Last year I stripped some 38 acres, which went 12½ bushels to the acre.
3542. What is the largest area you have had under cultivation? The area I have at the present time—115 acres.
3543. What is the largest area you have stripped? Somewhere about 70 acres.
3544. Was that land superior to other portions of your holding? No; it was all about equal.
3545. The whole of your holding would be as capable of producing wheat? Yes; every inch I have is as good as the area I cultivate, except 100 acres of gilgai country.
3546. You corroborate the evidence of previous witnesses as to the productiveness of the district? Yes.
3547. What do you think would be a fair distance to cart agricultural produce to a railway? About 15 or 16 miles is a fair distance; anything over that would be a handicap.
3548. Apart from the goldfield at Wyalong, there are good agricultural resources in the district? Yes.
3549. You think the district is entitled to railway communication? If they do not get it it will be of no use to grow wheat there; the district should undoubtedly have a railway.
3550. At what point do you think Wyalong should be connected with the railway system? On national grounds I think it should be connected with Temora. It is the nearest and most direct route, and it would suit the pastoralists better than any other route for sending their stock to the mountains. It would be a direct line to Gundagai.
3551. Would the line from Wyalong serve the people in the Humbug Valley? Most undoubtedly.
3552. What distance would that country be from Wyalong? Some of it is from 15 to 20 miles; outside of that distance the settlers would be handicapped in sending their produce to the railway at Wyalong.

Duncan Cruikshank, farmer and contractor, Barmedman, sworn, and examined:—

D.
Cruikshank.
16 Oct., 1897.

3553. *Mr. Farnell.*] How long have you been in the district? I have been seventeen years or so in this and the surrounding district. I know the country north of Wyalong for about 15 miles, also 15 miles to the eastward.

3554. You know the country between Grenfell and Wyalong? Well.

3555. You know that it is proposed to extend the railway to Hillston *via* Euabalong? Yes.

3556. What is your opinion of an alternative route to Hillston which would serve Wyalong and Barmedman? The land between Temora and Wyalong, for some 15 miles to the westward, is highly suitable for agriculture, grazing, and fruit-growing. In fact, it has the best soil of any part of the country that I have been in.

3557. Do you endorse the statements of previous witnesses as to the capabilities of the soil? Yes.

3558. Do you also corroborate the statements which have been made as to the nature of the Bland country? Yes; it is impossible to cultivate that country except in small patches. At times it is under water for miles. In fact, a railway coming through that country would have to be carried on piles for some distance. It would be necessary to make a viaduct to carry the railway over that country. I should think it would require to be about 3 or 4 miles in length.

3559. Railway construction there would be difficult and expensive? Yes; if the route which I have heard described is intended to be followed by a railway I am not sure that you would not have to construct the railway on piles for 7 or 8 miles.

3560. You think that Wyalong is entitled to a railway independently of any project to afford railway communication to Hillston? I am sure it is. I have been mining for several years on the reef between here and Wyalong. The quantity of reefs found on the Wyalong field, and the increasing richness of the reefs as they sink to the lower levels, I think, entitles the place to a railway.

3561. You think that the more the district is prospected the more extensive the field would become? Yes; and the deeper they go down the better the gold becomes.

3562. What do you think of the mineral deposits at Yalgogrin? They are very rich, and they appear to be about the same as those at Wyalong? The deeper they go the better the gold becomes.

3563. You think that Wyalong and Yalgogrin show every indication of becoming permanent fields? Yes; some of the deeper shafts at Wyalong are becoming better with depth. There are also good agricultural prospects between Wyalong and Temora. The soil is a rich chocolate; north of Wyalong the soil is also very good. You must also bear in mind that the land between Temora and Wyalong is chiefly Crown land. Every block which has been thrown open under the present Land Act has been taken up. The effect of the settlement following upon railway construction will be to exterminate the rabbits. Several reefs have also been discovered between this point and Wyalong, and I should not be at all surprised if in a short time there were a continuation of gold mining between Wyalong and Temora.

3564. What part of the Colonies did you come from to this district? From New Zealand.

3565. What is your opinion of the land here as compared with the land in New Zealand for farming operations? I believe we have the best land here under the face of heaven. All that we want is the New Zealand rainfall. We can grow wheat crops here for seven successive years. In New Zealand they take one wheat crop, one oat crop, and then put the land under English grasses to give it a spell. I have been very much surprised at the quality of the land here.

3566. Do you know of any people who would take up land here, with a view to cultivation, if there were a railway? Yes. I know several persons who have taken up land here within the last few days, and who are recommending their friends to come from Victoria to select. The Victorians have asked to be told when land will be thrown open between here and Hiwathla, and further on.

3567. You can say from your own knowledge that many persons would settle in this district if it were afforded railway accommodation? Yes.

Thomas Steffani, miner, Barmedman, sworn, and examined:—

T. Steffani.
16 Oct., 1897.

3568. *Chairman.*] How long have you been mining? Over thirty years altogether. I have been here about fifteen years.

3569. Have you a claim here? Yes.

3570. Have you done much work upon it? Yes; I have been working for some time. We went down to the water level, which would be about 70 feet.

3571. Have you a well-defined reef, or is it broken country? Above the water level it is broken country. There have been some small well-defined reefs up to the surface.

3572. Is there much mining carried on here? Very little.

3573. Have many more men been employed here than are now employed? Yes, a great number of miners were employed here; but the ground is locked up in leases, and the labour conditions are not complied with. There is suspension after suspension.

3574. Is the ground of a payable nature? Yes; it has been a very fair field.

3575. Is it likely to develop into a larger field? We have not worked below the water level; we cannot do so without considerable capital.

3576. Outside capitalists must come in and assist you in developing? Yes.

3577. What is your opinion of Wyalong? I think it will turn out a permanent field.

3578. Is the country between here and Wyalong gold-bearing? Yes; we get gold in different places from here to Grenfell, and from here to Temora.

3579. Practically, the whole country round here is reefing country? Yes.

3580. Do you know the country from Wyalong towards Hillston? I have been down the river as far as Euabalong, but not further. I have travelled from Lake Cudgellico to this point.

3581. Is there a reefing country right through there? Yes.

3582. There are indications of gold between Lake Cudgellico and Wyalong? Yes.

3583. But no ground has been worked there? Not to my knowledge.

3584. You think there is a chance of gold being discovered there? I myself have got gold close to Wyalong, but it was not payable.

3585. What is the average yield here per ton? It differs; in the case of one claim we took out 1,100 oz. of gold in twelve months. We had it for twelve months on tribute from another party; they worked it and left it. I have the same ground now, and I got payable gold lately.

3586,

- 3586. You think the field would be likely to prove permanent if you could only cope with the water. I do. T. Steffani.
- 3587. Have you good foot and hanging walls? The reef I have now is not well defined. 16 Oct., 1897.
- 3588. But you are satisfied to follow it? Yes.
- 3589. Do you think the construction of a railway here will assist in the development of the mining industry? I do.
- 3590. You think it might induce capitalists to come here? Yes; there is a lot more prospecting to be done in the auriferous belt of country from here to Lake Cudgellico, and even further.
- 3591. If the field were made better known, through the advent of a railway, you think the country might be prospected with the probability of striking something good? Yes; the greatest drawback to the place has been that the ground which is the best to get the gold from has for the past ten years been under suspension.
- 3592. All applications for suspension are dealt with by the warden locally? Yes.

James Kerr, grazier and farmer, Temora, sworn, and examined:—

- 3593. *Mr. O'Connor.*] Where is your holding? On Kildary, about 23 miles from here, a little to the south-west. I have been living in the district for about six years, and I have been acquainted with it for ten years. J. Kerr.
- 3594. What business did you carry on before you came here? I was a publican in Wagga Wagga. 16 Oct., 1897.
- 3595. You have had ten years' experience as a farmer and grazier? Yes.
- 3596. You desire to give the Committee some evidence as to a route to Hillston alternative to that proposed from Condobolin? Yes; I think a good deal of the proposal to extend the line from Temora through Wyalong. As regards the line from Condobolin to Euabalong, there would not be more than 100 or 200 people upon the whole route within 20 miles of it, whereas within the same distance of a line from Temora to Hillston there would be 6,000.
- 3597. You would think a railway within 20 miles of you would be of substantial benefit? Most decidedly. I estimate that it would put 10s. an acre on to the value of my land.
- 3598. And it would help you better to develop its resources? Yes; as matters now stand I have to cart all my produce over 45 miles to Temora.
- 3599. You are clearly of opinion that Temora would be the best starting point to Hillston? Yes, I am, having regard not only to my own benefit but to the country at large. I am sure that if that line is not adopted now it will be in the near future. It would have been much better to construct the line years ago instead of spending so much money upon roads. Thousands of pounds would have been in the pockets of the Government if that had been done. I believe the Cootamundra extension has paid, and I think a continuation of the line from Temora to Wyalong would also be payable.
- 3600. What is your opinion of Wyalong? I was on the field at its inception, four years ago last March, and I have not been there since; but I have read and heard a great deal about it. I think it is a really good field. It was thought originally that when they got down to the hard rock the reefs would peter out, but they have not done so. If anything, the hard ground is paying quite as well as, if not better than, the surface ground. Wyalong to-day is a better gold-producing field than it ever was. In addition to Wyalong, there is Yalgogrin to be considered. I was also at the opening of that field. There are several very good claims upon it.
- 3601. Have you any interest in mining at Wyalong or Yalgogrin? I have no interest in mining anywhere.
- 3602. *Mr. Farnell.*] Supposing you were within 20 miles of a railway, how many acres would you put under the plough in addition to your present cultivated area? I have 300 acres cleared, and 250 acres under crop; but I should crop 2,000 or 3,000 acres if I could. I pay 1s. 6d. to 1s. 9d. a bag carriage from my place to Temora. It runs from 4½d. to 6d. a bushel; in fact, the road charges are quite as bad as the Yankee competition, not including 5d. for railway freight to Sydney which makes the total carriage about 11d. per bushel.
- 3603. Are there many settlers near you? I am surrounded by them.
- 3604. A railway would be as advantageous to them as to you? Yes.
- 3605. Do you know the country further west? Yes.
- 3606. Do you think railway communication would bring it under cultivation? All the land there is of a closer nature with loam on the surface, excepting some rocky hills. The land I know of between here and to the south of Yalgogrin is fit for wheat-growing, with the exception of the rocky country.
- 3607. How many bushels of wheat to the acre have you produced? Nine, 14, 16, 23, and 25 bushels.

MONDAY, 18 OCTOBER, 1897.

[The Sectional Committee met at the Morangarell homestead, at 4 p.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN.)
 The Hon. DANIEL O'CONNOR. | JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

George Allen McGregor, pastoralist, Morangarell, sworn, and examined:—

- 3608. *Mr. Fegan.*] What area have you? About 30,000 acres, including resumed and leasehold areas, conditional purchase, conditional lease, and freehold. G. A. McGregor.
- 3609. Have you any area under cultivation? Only for hay. 18 Oct., 1897.
- 3610. How long have you been here? All my lifetime. My family have been in occupation of this country for fifty-two years.
- 3611. Will you describe the country? It is boree and box forest with narrow sandy ridges.
- 3612. You are aware that the Committee are inquiring into a proposal to extend the railway from Condobolin to Euabalong? Yes.
- 3613. How far is it from Condobolin to this point? About 95 miles.
- 3614. And from Euabalong? Euabalong is nearer; but round by Lake Cudgellico would be about 120 miles.
- 3615. So that you would not be likely to use the proposed railway? No. 3610.

G. A.
McGregor.
18 Oct., 1897

3616. What is your nearest railway station? Combaning, on the Temora line.
3617. Do you know the country from here to Condobolin? Yes. It is boree country. There are hills on either side. I could not say what formation they are; they are not exactly granite. I think they call them the Manna hills. There are some ranges lower down also; but it is mostly boree country.
3618. Do you know the route of the surveyed line from Grenfell to Wyalong? Yes.
3619. How far is that from here? About 15 miles north.
3620. What kind of country does it run through? Through plain country. There is undulating country near Grenfell. The Bland country is level.
3621. Some witnesses at Barmedman spoke of the flooded nature of the country between here and Grenfell? I have known it at time of flood and also in season of drought; near the Bland it is all on a dead level. I do not know that it would be in any sense dangerous or difficult from the point of view of railway construction.
3622. What has been the depth of water in time of flood, and what has been the area covered? Just near the creek where the line crosses I suppose it would not average more than 2 feet for about a mile on each side of the creek.
3623. What is the total width of the flooded country? I think it would be about 7 miles, with a depth of water back from the creek varying from 3 inches to 1 foot. There would be some patches of dry land in the area, but the water spreads out roughly about 7 miles.
3624. Is there anything like a current? I could not say; I have never measured it. The water drifts along into Lake Cowal.
3625. How much rain would have to fall before such a flood would occur? From 4 to 6 inches; but a great deal would depend upon the state of the ground at the time of the rainfall. If the ground is thoroughly saturated with rain it would take from 1½ to 2 inches to make a flood. In a time of drought similar to this it would take from 4 to 6 inches.
3626. Are there any other creeks to be crossed by the line? There are several. There is the Back Creek on the west side of the Bland, and there is also the Wahway Creek, which spreads out in time of flood.
3627. Would the surveyed line cross the Wahway? I could not say. The Wahway Creek runs into Lake Cowal, and I think the surveyed line would run very close to that. The 5-chain roadway from Williams' Crossing to Bimbi runs with the creek, but I do not know that the railway would cross that.
3628. What is the country fit for? Very little of it has been tried for agriculture; but nearly all that could be taken up has been taken up.
3629. It is regarded as first-class grazing and fattening country? Yes.
3630. Almost the whole of the area between here and Grenfell which can be taken up has been taken up? Yes; with the exception of a little stretch of Mallee, near Wyalong. Every acre fit to fatten between there and Bimbi has been taken up. On the other side the country is not so good for fattening. It will fatten, of course, but it is better for agriculture.
3631. What is your opinion of the country about here for agriculture? I have not tried it; but similar country round about Berrigan is considered first-class for agriculture.
3632. What is your rainfall here? I think the average of 25·16 given in the official return is a little above the average. I think the average for the period from 1881 to 1894 is greater than the average for a similar number of years antecedent.
3633. You yourself put the average down at about 22 inches? Yes; in some years we have had 8 inches and 9 inches.
3634. You keep a record of the rainfall, and are therefore able to venture an opinion on the subject? Yes.
3635. Can you state for how many years the record has been kept by yourself? I could not say from memory, but I think from 1885.
3636. What stock do you carry? Principally sheep. We have some cattle and horses. In an average season we carry a sheep to the acre. We have carried 27,000 sheep, 150 to 200 head of cattle, and 100 head of horses, on 30,000 acres. That would be about a sheep to the acre.
3637. You know the country between Temora and Wyalong, and also between Grenfell and Wyalong? Yes.
3638. Having in view Hillston as the objective point, from which part of the existing railway system do you think the connection should be made? From a national point of view I think the line should come *via* Grenfell.
3639. You base that statement upon your knowledge of the country and the probability of its being occupied? Yes.
3640. You know that there is a large area of unoccupied country between Wyalong and Hillston? Yes; the land is superior in every way between Grenfell and Wyalong than between Temora and Wyalong. I am speaking, of course, from a grazier's standpoint.
3641. Is the country infested with rabbits and wild dogs? There is a wire-netting boundary-fence about 5 miles from here in a north-easterly direction, and that runs from Marsden right up round Gibson's run—that is, below where the proposed railway line crosses Coragabil. It goes thence along Burrett's Euroka station, and by Caldwell's station, to within a mile from here on Moonbucca. It is the line which runs from Mr. Dickson's Uabba station. All the country on the north-east side is said to be infested with rabbits, and the south-west side is also infested.
3642. In your experience, what has been the longest period during which the water has remained on a level near the Bland Creek, preventing traffic across the country? The traffic may have been suspended for about a fortnight at the outside. Down the eastern side of the creek from Marsden I have known the traffic stopped for a fortnight, but that would be on an exceptional occasion. No one knowing the run of the country would be stopped at all. Of course, travelling would be slow.
3643. The fortnight's suspension of traffic to which you refer would be on the main road from here to Marsden? Yes.
3644. So that if a witness said that it was impossible to get along the road for eight weeks he would be exaggerating? Yes; the mail from here to Marsden has not been delayed more than a week at any time.
3645. You think that a railway constructed across the country you have described would require a water-way to permit of the water getting through from Bland Creek and Back Creek? On the Bland Creek the water does not back out so much where the railway line would cross as it does lower down.

G. A. McGregor.
18 Oct., 1897.

- 3646. The Back Creek stretches out a good bit in time of flood? Yes; but it is shallow. It is more like a huge swamp than a creek.
- 3647. There is a pretty good demand for country which is thrown open here? It would be rushed in a week. The plain country was secured years ago at £1 per acre. They have since discovered that the timbered country, after being improved, is the best, and will carry more stock.
- 3648. The country in its natural state where it is heavily timbered you consider to be absolutely valueless in this district? Yes.
- 3649. But when improved its carrying capacity is better than that of the plain country? Yes.
- 3650. It stands the droughts better? It stands them, at all events, as well.
- 3651. You think that any timbered country that might be available within 20 or 25 miles of the railway line would be taken up? Yes, anything excepting the mallee, and some of that country has been taken up at Wyalong and cultivated.
- 3652. What do you consider a reasonable distance for a railway from an agricultural settlement? If a man had 250 acres he could do very well 25 miles away from a line, but if he had a smaller area he would require to be closer.
- 3653. Has any farming been carried on on the "halves" system in this district? Mr. Steel Caldwell is going in for it next year. It was too dry this year. I do not know what area they will be cultivating, but I should think it would be from 1,000 to 2,000 acres. I can only speak from taking a glance at the country which has been cleared.
- 3654. Do you find persons in this district view the system with favour? The persons who would adopt it would come chiefly from other districts. The people in this district go in more for grazing; they want educating up to farming.
- 3655. The old settlers here have not much knowledge of farming? No.
- 3656. The new arrivals are educating them up to the possibilities of mixed farming? Yes.
- 3657. Is the climate good here? Yes. It is a very healthy district.
- 3658. You send your wool to the Sydney market? Yes. Sometimes to England, but latterly to Sydney and Melbourne.
- 3659. If a line were constructed across the Bland country you would send your wool to Sydney that way? We should send our wool by Temora, and we should still truck our fat stock at Stockinbingal.
- 3660. That line is near enough to suit you? Yes.
- 3661. Do you think that lower down the country would be served by a line across the Bland? Yes; because I think they would go in extensively for farming if there were a railway.
- 3662. So that, practically, land lying to the north of a line from Grenfell to Wyalong would be better served by that railway than would land on the southern side? Yes.
- 3663. You think the land on that side is more suitable for cultivation? Yes; when you get off the flat level country in the direction of Lake Cowal. On the south-west side of Lake Cowal there is a number of selectors. At present they are only going in for grazing, and they are not doing very well at that. I am certain they would cultivate if they had a means of getting their produce away.
- 3664. What is the description of settlement about Bimbi? It is very mixed. There are large and small holdings.
- 3665. The holdings are not in one compact body, but are dotted about here and there? There is a number of settlers to the south of Bimbi, and there are a lot pretty well together on the north side some 10 or 15 miles out.
- 3666. What are the smaller settlers doing with their land? They are principally grazing, but some of them are farming.
- 3667. Is there any timber along the route of the proposed railway suitable for sleepers? I do not think any of it would be particularly good for sleepers. There is some ironbark on the Weddin Mountains, and there is some also out of Wyalong, but there is not much between those two points. There would be none going across the Bland unless they used the box.
- 3668. Is the Bland Creek fairly permanent? There are holes here and there which you can say are permanent. I think they call it permanent when the water lasts fifteen years. The creek below where the line crosses is not permanent. In any fairly dry summer it dries up to a point near Marsden. Below that the creek is fairly permanent, although the waterholes are some distance apart.
- 3669. Are there any dams across the creek? None at all.
- 3670. Would dams be of any service in impounding any body of water? They would be down there, and they could be erected at a reasonable cost.
- 3671. You have tried some small dams here? There is one at the Chinaman's garden which throws the water back about a mile.
- 3672. Dams at various points would impound large bodies of water? Yes.
- 3673. *Mr. O'Connor.*] For what distance on each side of the proposed railway would the flood-waters of the Bland affect the country? I should say about 7 miles.
- 3674. What would it cost per mile to build a railway through country like that? I think it would be very trifling. All that you would require would be culverts at different places along the line to let the water through. I do not think flood-waters would present any obstacle to railway construction.
- 3675. How is the land between Grenfell and here held? Some of it is leasehold and some freehold. The whole of the country on the Bland is purchased, and the Bland plains would be about 10 miles wide by about 16 miles long. There are little patches of timber here and there.

TUESDAY, 19 OCTOBER, 1897.

[The Sectional Committee met at the "Bimbi Hotel," Bimbi, at 11 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

Steel Caldwell, pastoralist, Lower Belabla, sworn, and examined:—

- S. Caldwell. 3676. *Chairman.*] How long have you been in this part of the country? About forty years.
3677. What is the area of your holding? Including Crown lands, about 20,000 acres.
- 19 Oct., 1897. 3678. You use it principally for grazing? It is principally under sheep, but we have some cattle and horses. I am carrying at the present time 12,000 sheep, 100 head of cattle, and about 40 horses.
3679. What is the average carrying capacity? The average, taking good and bad seasons together, would be about one sheep to the acre.
3680. You are acquainted with the proposal to construct a line of railway from Condobolin to Euabalong? Yes.
3681. You have formed an opinion as to the ultimate destination of that railway? Yes; I think that it must go on to Hillston.
3682. Do you think a better route to Hillston might be adopted? Yes; but I should say that I am not thoroughly acquainted with the Condobolin and Euabalong country.
3683. You wish to point out some advantages to be derived from the construction of a line in this direction to Hillston? Yes.
3684. Will you give the Committee some reasons for the construction of a railway in this direction? This district is now languishing from the want of a railway. We find it next to impossible to make grazing alone pay. All the landowners in this neighbourhood are anxious to embark in farming, and we are positive that fully 20,000 acres would be under crop here in the first season after the construction of the railway. I should like to direct the attention of the Committee to the fact that the line would pass through splendid wheat-growing land. Where alienated it is held by men who are anxious to turn their holdings into farms. In the next place there is an absence of all engineering difficulties, and the low cost at which the line could be constructed must also be considered. For instance, there is plenty of suitable timber available, and there is also an abundant supply of good water which would be easily obtainable along the line. The country is next to a dead level, and during a wet season the roads are impassable. It would cost as much to make them as to construct a railway. Then again, our position as producers and employers of labour cannot possibly advance in the absence of a railway. There are 74,000 acres of Crown land, including timber reserves, directly on the proposed line between Bimbi and Williams' crossing. There is a large area beyond that which would be thrown open. It is intended to crop 5,642 acres in the district during the present season, and, except under adverse conditions, there would be 2,631 bales of wool to go away from the district within a radius of 8 miles of the line. There would be also an annual out-put of 37,950 fat sheep and 1,700 head of fat cattle.
3685. Have you any of your land under cultivation? 100 acres.
3686. How long have you been cropping it? I have cropped only 40 acres within the last 10 years.
3687. Does your land grow good crops? It has grown as much as 13 or 14 bushels to the acre. I often stripped for grain and cut a portion for hay.
3688. Has the land been under continuous crop for 10 years? Not continuously.
3689. Can you rely upon a crop every year? I think so, if it is put in early. I have never been disappointed in a crop if it has been put in in April.
3690. The April rainfall may be relied upon to produce a crop? Yes.
3691. The seasons in which the crops fail would be exceptional? Yes.
3692. Are there any settlers in this locality? Yes. The majority of them have the maximum area allowed in the Central Division—2,560 acres.
3693. The land about here is exceptionally good for fattening? It is.
3694. And in your opinion it is also suitable for agriculture? Yes.
3695. Do you think the farmers in this locality could pursue mixed farming with benefit? Yes.
3696. I suppose that if there were a railway here they would also rear fat lambs and sheep for market? Yes.
- 3697-8. You have found it advisable to combine agriculture with pastoral pursuits? Yes.
3699. But your distance from market has prevented you from cultivating extensively? Yes.
3700. You think that any available land would be greedily snapped up if there were a railway here? Yes. I think every one who has not got land here would take some up. It is taken up already directly it is available. I know of several persons now who are anxious to obtain land here.
3701. Would a railway at Grenfell be of any service to this district? To a portion of it.
3702. How far is it from Grenfell? Twenty-two miles.
3703. And from Young? Thirty-two miles.
3704. Young is your nearest railway station? Yes.
3705. What kind of road is there? There is a bad road. It is dead-level country from here to Young. You may call the road bad up to within 7 miles of Young. From that point the road has been made.
3706. For what distance to a railway can produce be advantageously carted? I believe something over 20 miles.
3707. I suppose the settlers would be served by a railway through this district in proportion to the area they hold? Yes.
3708. What area would support a settler who followed farming alone? Not less than 640 acres.
3709. All the available land between here and Grenfell has been taken up and is fairly well stocked? Yes.
3710. Is the "halves" system followed at all in this district? It has been attempted, and it would have been carried out this year had the season been favourable. I intend myself to give out a number of acres on the "halves" system. The land has already been prepared.

3711. Do you think land here could be farmed profitably on the "halves" system if it were necessary to convey the produce by road to Young? I do not think so. S. Caldwell.
19 Oct., 1897.
3712. Is the whole of the land between here and Grenfell suitable for agriculture? It is.
3713. Is any of the Bland country suitable for agriculture? The higher portion would be.
3714. The soil upon the lower-lying portion would be too heavy? Yes; although I understand that a great portion of the country is similar to the Berrigan country.
3715. Do you know the surveyed country from Grenfell to Wyalong? As far as Bland Creek.
3716. How far from Bimbi would the line pass? It would pass through Bimbi.
3717. Is the country between this point and Back Creek liable to inundation? Not to an extent which would jeopardise a railway. The creek overflows its banks in places.
3718. Does the Back Creek also overflow? No; it is swampy in parts that is all. There is no serious overflow.
3719. You have not seen any flood in this district sweeping everything before it? Nothing except water-courses, which sometimes injure our fences.
3720. With a knowledge of the district extending over forty years, you can give us some information as to the floods on the Bland. For instance, how long has traffic been suspended in consequence of floods on the creek? The traffic would not be suspended except at the creek itself. It may have been suspended for three or four days while the water has been subsiding. I have not known it to be suspended a week.
3721. Is the creek bridged? At Morangarell, Grogan, and Marsden.
3722. Can the creek be crossed at time of flood? Yes.
3723. Can you get to the bridges? Yes; unless you are intercepted by watercourses.
3724. Sometimes the water prevents you from getting to the main creek, but in no case have you known traffic to be suspended for longer than a week? No, I have not.
3725. What does it cost you here to prepare the land for the plough? It would cost from 12s. 6d. to 15s. per acre to properly clear land which has been already ringbarked. It would cost £1 an acre to clear green country.
3726. A good deal of the country here is open plains? Yes.
3727. The bulk of the timber country is ringbarked? Yes.
3728. Is the district progressing? It is at a standstill at the present time, I think, for the want of railway communication. We want to embark in farming.
3729. From that point of view a railway would materially assist those who are already settled on the land? Yes; and it would have the effect of giving a vast amount of employment.
3730. There would be employment for a large number of men in clearing and fencing, and in doing what may be necessary to render the land fit for the plough? Yes; and there would also be employment in connection with the "halves" system.

Joseph Burrett, commission agent, Bimbi, sworn, and examined:—

3731. *Mr. O'Connor.*] How long have you resided here? Pretty well all my lifetime—forty years. J. Burrett.
19 Oct., 1897.
3732. You know the whole district well? Yes.
3733. You are acquainted with the proposal to construct a railway from Condobolin to Euabalong? Yes.
3734. You desire to give evidence in favour of an alternative route *via* Grenfell, Wyalong, and Yalgogrin, to Hillston? Yes.
3735. Have you prepared any statistics? We have collected statistics from all the farmers within a radius of 8 miles of Bimbi. I hand in the return collected. [*Vide Appendix.*]
3736. You know the route of the proposed line between Grenfell and Wyalong? Yes.
3737. The statistics you have collected are from farmers resident on the southern side of the proposed railway? There are two routes from Grenfell to Wyalong—one on the south side, which is known as the Weddin or Bimbi route, and the other on the north side, known as the Piney Range route. The Weddin or Bimbi route would serve the greatest number of people. With reference to the statistics which I have handed in, I might add that they have been collected from the holders themselves, and that in each case they say that if a railway were constructed they would cultivate a much larger area.
3738. What is your annual rainfall? I think we have had an average of 25 inches for the last ten years.
3739. During a wet season what is the condition of the Bland country close to the creek? It overflows for about 1 mile where the Bimbi route crosses; but there is no depth or force of water immediately where the surveyed line passes over it. The creek overflows in other places to a much greater extent.
3740. To what extent would the flood-waters extend in the other places? From 7 to 8 miles; but only to a very shallow depth.
3741. What is the extreme height to which the water rises above the banks of the creek? I have never known it to be above 15 inches at any distance from the creek. It is barely that in most places.
3742. You have been over the country repeatedly? Yes. The line which has been surveyed by Mr. Lloyd would avoid the worst of the flooded country. I was over the ground with Mr. Lloyd, and I showed him where the flood-waters came.
3743. How do you get your mails when the country is flooded? The country has never been so flooded as to stop our mails.
3744. How are your mails carried? By horseback from Grenfell; but generally by coach. They have been delayed sometimes a little through heavy roads, but never through floods.
3745. Are you certain that on the route which Mr. Lloyd has adopted, between Grenfell and Wyalong, there will not be 5 or 6 miles of country which would involve very heavy and expensive construction? On this side from Grenfell, at Yeo Yeo Creek, no special construction would be required. In a time of very heavy flood the creek might overflow for a mile to a depth of about 18 inches; but there is no force of water except at the crossing adopted by Mr. Lloyd.
3746. Do you know the country between Temora and Wyalong? I have been through it; but not for the last eight or nine years. It is fairly good land. There are some stony ridges at places, and there is also some mallee and other scrub.
3747. Is there not some very good agricultural land between Temora and Wyalong? I have only seen small areas when travelling through. There may be some good agricultural land far back from the route of the railway, but in no comparison to the Bland country.

- J. Burrett. 3748. *Mr. Fegan.*] What is the total area under crop between a radius of 8 miles of Bimbi, according to the return you have handed in? Most of the areas refer to an acreage which would have been under crop this year had the season been good. The areas referred to are the areas which it was proposed to put under crop this year.
3749. You cannot give us the area actually under crop at the present moment? No.
3750. Is this good grazing country? Yes, splendid.
3751. Do fruit-trees thrive here? Yes. On my brother's place, 10 miles from here, there is a large orchard; he grows almost every description of fruit.
3752. Do you think much dairying would be carried on here if there were a railway? Yes, I do; you cannot beat this country for fattening stock.
3753. You think the chilled-meat industry might be carried on here? I think it is more than likely that it would be.
3754. What will this country produce, per acre, in wheat? I have seen 27 bushels to the acre obtained from my brother's place; but the average would be about 12½ bushels.
3755. Do you think there would be much cultivation upon the "halves" system if there were a railway here? I am sure of it. Within the past week inquiries have been made whether my brother would let some of his land on the "halves" system.

Hugh Gault, farmer and grazier, and saw-mill proprietor, Bimbi, sworn, and examined:—

- H. Gault. 3756. *Chairman.*] You desire to give some evidence as to the timber resources of the district? Yes; I did not hear the other witnesses mention the timber industry here. There are 52 square miles of timber reserve on the Weddin Mountains. It was laid out, I think, as a State forest.
3757. Where do you send your timber? To Young; or I sell it locally.
3758. Is there any great quantity of timber upon the reserve you speak of? The colonial pine has been pretty well cut out of it, but there is a great quantity of iron bark along the foot of the Weddin Mountains.
3759. Would it be suitable for railway sleepers? Yes.
3760. Is it being cut out? Yes; a number of young trees which are easy to split have been cut out on the other side; but the trees on this side are, some of them, 5 and 6 feet through.
3761. They are practically too large to handle? Yes.
3762. Is this iron bark forest of any extent? Yes; it runs about 8 miles along the mountain on each side, and it is about 2 miles wide at the bottom.
3763. Then any quantity of timber would be available for sleepers? Yes; but the introduction of vertical saws would be necessary.
3764. Would a railway give you any additional market for your timber? Yes; hardwood is largely used in Young, and they can get it cheaper there than we can send it to them by road carriage—32 miles. Nearly all the hardwood used in Young is obtained from Sydney. I sent some timber from here to Wyalong when the field first broke out.
3765. You think that a railway would bring you additional business? Yes; I could sell timber a great deal cheaper than it is being sold at the present time at several places. I sent some timber last summer to within 8 miles of Wyalong, to the Back Creek station, cheaper than they could get it in Wyalong.

WEDNESDAY, 20 OCTOBER, 1897.

[The Sectional Committee met at the Court-house, Grenfell, at 10 a.m.]

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong.

- O. Lloyd. 3766. *Chairman.*] How long have you occupied your present position in the branch? Sixteen years—since July, 1881.
- 20 Oct., 1897. 3767. You have been constantly employed in the country districts? I have been only a very few months in the office.
3768. You are aware that a rough survey was made of the proposed line from Grenfell to Wyalong some time ago? Yes.
3769. That survey made the distance between the two places 58 miles? I imagine so.
3770. Are you now engaged upon a permanent survey? No; only upon a trial survey.
3771. Can you give the Committee the correct distance between the two places? It would be within a mile of 60 miles by the route to the south of the Weddin Mountains, *via* Bimbi.
3772. Are there any engineering difficulties on the road? None whatever, with the exception of the creeks. Those are the Back Creek and the Bland Creek. They show a considerable flood level. In January last there was a rainfall of 6 inches in forty-eight hours, and the two creeks were practically connected, giving an average depth of 18 inches over the flooded area.
3773. What is the distance between the two creeks? Between 5 and 6 miles.
3774. Would it be difficult to provide for the escape of the flood-waters there if you were constructing a railway? No; it would be all slack water; there is no current.
3775. There would be nothing to carry away any embankments? No.
3776. Railway construction there would not necessitate any heavy expenditure? I do not think so. I think that by raising the line 3 feet, as they generally do, they would carry it clear of the flood-waters.
3777. The country itself is practically level? It is nearly an absolute level. The difference of level between Wyalong, where I left the main line, and Bimbi is only 72 feet, the distance being 38 miles,—showing 2 feet to the mile.
3778. Between Wyalong and Grenfell there is a rise of 425 feet? Yes.

3779.

3779. The line would be a surface line all the distance? Yes.
3780. Is the cost of maintenance likely to be great? I do not think so.
3781. Is there plenty of ballast and timber for sleepers? You can get ballast 8 miles out from Wyalong, and then there is none at all until you come to a point between Bimbi and Grenfell close to the Weddin Mountains.
3782. Crossing the Bland country there will be no ballast available? No.
3783. It has been reported to the Committee that there is very fine timber at the foot of the Weddin Mountains? Splendid timber; it would be the only timber available here for railway purposes. There is no other timber between Wyalong and the Weddin. There are 8 or 9 miles of mallee, and the rest is box country.
3784. Is there not a considerable quantity of ironbark near Wyalong? I should not imagine there was much there; but I do not know sufficient of the district to give a definite answer to that question.
3785. Will you give the Committee a general idea of the country traversed by your survey? It is generally a loamy soil, and I should imagine that it would be eminently adapted to the growth of wheat under favourable conditions of rainfall. It is country which would grow anything. I was here at a time when there had been no rain at all for six months, and of course the country was looking very bad, but since then rain has fallen, and the difference is material. It is very much like the country from Condobolin towards Medindie.
3786. You know the line of country between Condobolin and Euabalong? Yes; I surveyed that line.
3787. You also know the country between Wyalong and Grenfell? Yes.
3788. Will you compare the character of the country on the two routes? I would certainly say that all the land from Condobolin to Euabalong is magnificent, and that it would be very productive under fair conditions of rainfall. It is very similar to the land here. It is all auriferous country. I think you would call it the Lower Silurian.
3789. There is a better rainfall in the neighbourhood of Grenfell than in the neighbourhood of Condobolin and Euabalong? I think so.
3790. Is the bulk of the land you have traversed upon this line Crown land, or how is it held? I have followed the travelling-stock reserve throughout with one or two exceptions where curves necessitated my going into private land.
3791. There would therefore be no land to be resumed upon this route? From the Bland nearly up to Grenfell, but from Wyalong to the Bland the line would pass through some alienated land.
3792. For what distance? Twelve and a half miles.
3793. How has the land been alienated? It is nearly all conditional purchase and conditional lease land, but there is going, I understand, to be an interchange of land on the Oakhurst station, and by deviating the line I have surveyed about a half a mile, I can throw it on to Crown lands. I am referring to the portion between the Bland and Back creeks. I know nothing of my own knowledge as to the interchange of land. I am merely repeating to you what the station-manager told me.
3794. The deviation would not affect the cost of construction in any way, the country being similar? Quite so; it would make a little difference in the length of the line, that is all.
3795. Is there much settlement upon the road? Scarcely any; the land is almost all in big pastoral holdings.
3796. Is the country suitable for close settlement? It would be but for the rabbits.
3797. And small settlers would be able to cope with them more successfully than the larger holders are able to do? Yes; and you may imagine how much they think of the land when I tell you that the manager of Back Creek station applied to the Union Bank to enable him to put in 1,000 acres of wheat this year. He believed he would be able to deal with the rabbits by wire-netting.
3798. Have you observed much land under cultivation in traversing the route? Not much.
3799. Do you think the landholders here would go in for much cultivation if there were a railway? Yes I am almost certain they would.
3800. The principal occupation here now is sheep-farming? Yes.
3801. You think the land might be more profitably occupied if mixed farming were resorted to? I have no doubt of that whatever.
3802. The country on the northern side of the river being close to a railway line, you think there would be no loss to the State if a railway were constructed on this side instead? I do not think so.
3803. You know that as far as a portion of the route on the northern side is concerned no settlement could occur there for over twenty years, the land being in the Western Division? Quite so.

Albert George Little, Surveyor, Railway Construction Branch, Department of Public Works,
sworn, and examined:—

3804. *Mr. O'Connor.*] How long have you occupied your present position? Fifteen years.
3805. How long have you been at work in this district? About nine months.
3806. You surveyed the line between Koorawatha and Grenfell? I did.
3807. You were engaged upon the survey from Grenfell to Wyalong towards the Bland? Yes; I am 18 or 20 miles from Grenfell out towards the Bland.
3808. You have some experience of the seasons here? When I was engaged upon the survey from Koorawatha to Grenfell I saw the country in a drought.
3809. What is the country like in that direction, within a radius of 10 miles of the proposed line? It is undulating country all through from Koorawatha to Grenfell. There are no serious difficulties as regards construction. The grades I have obtained are easy. The ruling grade is 1 in 75. The curves are also on an easy limit. There are various creeks to be crossed—the Crowther, Miller's Creek, the Tyagong, Bungabong, Brundah, and the Iron Pot. They are all between Koorawatha and Grenfell. There are minor water-courses upon which a small opening would suffice. There is an unlimited supply of ballast at Koorawatha which could be carried along the line when in progress. It could be very easily obtained. It is mostly in its present state small stone, and it could be easily broken to 2½ or 3 in. gauge as required. There are other points on the route where there is plenty of ballast. I should mention that there is some ironbark timber to the north of Brundah; I have not seen it, but I am told that there is some. From what I can hear, there would not be very much of it of really good quality, and we do not want timber which is piped for

O. Lloyd.
20 Oct., 1897.

A. G. Little.
20 Oct., 1897.

- A. G. Little. for sleepers. On other parts of the line, however, there is plenty of ironbark. Other timber is practically useless for railway purposes unless for fencing. There is no flooded country at all between Koorawatha and Grenfell; it is all well drained, and there is a splendid class of soil, most suitable, I should say, for agriculture. A water supply for railway purposes might be got by sinking. I had during the drought to sink for water. Splendid water is obtainable at a depth of from 10 to 14 feet.
- 20 Oct., 1897. 3810. You know the country between Grenfell and Wyalong? I have explored it to within 2 miles of the Bland. The country, after you cross the range, about 2 miles from the town, gradually falls on to the Bland; the ruling grade there is 1 in 75, but there is not much of it. The country would be suited to all classes of agriculture. I have never seen better country, and I have travelled a great deal. There is plenty of ironbark timber at from 1½ to 2 miles to the south of the line at the toe of the Weddin. There is a large forest reserve there with an unlimited supply of ironbark. I have been told that there are some very fine trees there; I have not seen them, but I make the statement on very good authority. On the west side of the range there are no engineering difficulties practically; there is only one creek to cross—the Weddin—and that will require a small timber opening. I have not yet crossed any flooded country. Of course, Mr. Lloyd has dealt with that.
3811. Do you touch Mr. Lloyd's survey? Yes; I am connected with it at the crossing at the Bland. I know of no reason why I should go beyond his survey.
3812. Will your survey shorten the distance? I should say that the distance from Grenfell to Wyalong, by the route north of the Weddin—I am speaking approximately—would shorten the distance by from 10 to 12 miles, as compared with the route *via* Bimbi.
3813. Have you any knowledge of the condition of the country in that direction in flood-time? I could not speak definitely about that. As far as I have gone I have crossed no flooded country at all. I am 18 miles or so from Mr. Lloyd's survey. He has crossed the flooded country on the Bland, and has taken levels to locate the position of the flood-marks.
3814. Is there any land under cultivation where you are camped? There is a good deal under cultivation, and a good deal is being prepared for it.
3815. What proportion is cultivated? I do not suppose there would be more than from 1,500 to 2,000 acres. That, of course, is a rough guess on my part.
3816. If a railway were constructed do you think that persons might be induced to take up land for the purpose of cultivation? There is no better land for agriculture in my opinion within the radius of many miles.
3817. What country would the northern route to Wyalong principally serve? The country known as Whceo.
3818. And what would be the principal district served by the southern route? The Bimbi country.
3819. What is your grade upon the range you traverse after leaving Grenfell? One in 75.
3820. Are there any cuttings? There is only one cutting just at the summit of the range which is unavoidable.
3821. Could you reduce the grade to 1 in 100? It could not be done between the station site here and the range without a great deal of extra expense. You would have to make the line considerably longer to give a grade of 1 in 100. As to the country between Koorawatha and Grenfell it would be impossible to get 1 in 100 there without very expensive works.
3822. What is the distance of the proposed line from Grenfell to Wyalong? I should say 50 miles by the route to the north of the Weddin.
3823. What is exactly the distance between Koorawatha and Grenfell? Twenty-nine and a half miles from station site to station site.
3824. Making the distance between Wyalong and Koorawatha about 80 miles? Yes; in giving you the distance over the latter part I have to approximate a great deal.
3825. Do you obtain any better grade by the southern route? Not that I know of.

Thomas Bembrick, storekeeper, Grenfell, sworn, and examined:—

- T. Bembrick. 3826. *Mr. Fegan.*] How long have you been in the district? About eighteen years.
- 20 Oct., 1897. 3827. You have watched its growth, and can speak as to the gradual increase in the area under cultivation? I was here when every ounce of flour had to be imported into the district.
3828. It was purely a grazing country? Yes.
3829. Now it is a large farming district? Yes.
3830. I suppose the population of the district has steadily progressed? Yes. I find from looking up some official returns that there was no material increase in the population between 1881 and 1891; the explanation given is that in 1881 we had a large percentage of mining population, which is usually shifting. In 1891 (ten years afterwards), although no great increase was shown, the actual increase represented a permanent population; the increased population represents settlement by farmers and selectors. I find, according to the last census, from 1891 to 1895 the increase was very considerable. That is accounted for largely by the discovery at Wyalong. I am taking now the electoral district of Grenfell.
3831. Can you speak as to the town of Grenfell? As far as the town is concerned, in 1891 the municipality numbered about 750, and there were within the population area 1,100. The estimated population of the municipality to-day is 900, and there are within the population area 1,700.
3832. So that there has been a gradual increase? Yes; taking the electoral district as a whole the population has increased considerably.
3833. Being a storekeeper, you can speak as to the quantity of goods which come into Grenfell, the cost of haulage, and so forth? So far as the business of Grenfell is concerned, I have some information which I think is fairly accurate. I have no particulars relating to the squatters and farmers who obtain goods, but as far as the storekeepers and those in business in Grenfell are concerned, I find from the figures which I have taken from them personally that the aggregate would be about \$50 per year. That is the gross tonnage inwards. I have no data as to what is sent out in the shape of milled flour and produce of one kind and another.
3834. What is your nearest railway station? Young is 32 miles away, and Cowra is also about 32 miles away. Our chief station is Cowra, and that is sometimes given as 34 miles from here.
3835. What is the rate of road carriage from Cowra here? It would range from 25s. to 27s. 6d. per ton. I have paid as high as 35s. and 40s. and as low as 21s. 3836.

T. Bembrick.

20 Oct., 1897.

3836. That would be in a fair season? Yes.
3837. Does the price increase in time of drought? It fluctuates from 10s. to 15s. per ton.
3838. The average would be about 30s. per ton? Yes.
3839. What do you have to pay on the railway? I got potatoes from Carcoar to Cowra at the rate of 4s. 4d. per ton by rail; for the same distance on to Grenfell I pay an average of 25s. a ton.
3840. Do you think the same proportion would obtain as regards other goods? Other goods would cost on the railway from 5s. to 10s. more. Potatoes can always be brought at a cheaper rate than case goods.
3841. That means a largely increased cost to the consumer? Yes.
3842. Are you well acquainted with the district between Koorawatha and Grenfell? Yes.
3843. What kind of road is there? It is a fair road in good weather.
3844. How many miles is it to Koorawatha? Twenty-four miles.
3845. And you say it is 34 miles to Cowra? Yes.
3846. Why do you take the longer road? Because it is a made road; and then there are the creeks to be considered; there are no bridges or crossing places made for teams to pass over.
3847. There is no town of importance at Koorawatha, that would be another reason? Yes.
3848. When carriers can be sure of back-loading they do not charge as much? Quite so.
3849. If you cart to Koorawatha you have to pay more? Yes; but of course a considerable amount of wheat has gone to Koorawatha from the farms round about here and adjacent to the platform.
3850. A great deal of agricultural produce leaves this district? Yes.
3851. I suppose it is chiefly wheat? Yes; and when we have our mills running here there is a considerable quantity of flour, bran, and pollard.
3852. Why have the mills been stopped, if wheat-production in this district is increasing? The only way in which I can account for it is, that one mill got into financial difficulties, and the other was in the hands of men who did not seem to progress with the time. We have mills in the adjoining towns with very complete plants, and for the time being the trade was drawn to them. One of our mills has now undergone a complete overhaul, and I am informed by those who know, that it will now be able to turn out flour equal to any plant in the Colony.
3853. Do I understand that both your mills are stopped? At present.
3854. Seeing that this is likely to be a permanent wheat-field, the mills are being put into working order again? Yes; and I hope at an early date to see others moving in the same direction.
3855. I suppose there was an idea at one time that wheat was simply put in as a trial crop? When I first came to the district it was debatable whether wheat would be successful here.
3856. It has been? Decidedly.
3857. Have you any idea of the area under cultivation? I have heard from reliable sources that last year it was 45,000 acres, and the area which has been given to me for this year is 60,000 acres.
3858. Do you buy wheat and sell it? I handled about 7,000 bags last year. I bought the greater portion of it as an agent. I bought 5,000 bags, extending over the period from the 25th January to the end of February, at 4s. 3½d. per bushel. I should like to mention that I bought the first parcel on the 5th January, and I could not move it until the 26th January, although I sought teams in every direction. Such enormous quantities were being moved in other directions that it was difficult to get a team. The teams had been secured earlier. I had to wait until after the 25th January before I could get a team. The team I then got came from near Murrumburrah.
3859. On account of your not having any facilities to get to market you were unable to lift your wheat? Yes. I lost 1½d. a bushel through not being able to get the first purchases of wheat away within the stipulated time. I should have got 4s. 5d. There were 900 bags in this lot.
3860. Then you sustained a considerable loss? Yes.
3861. Even if your flour-mills were fitted with the latest appliances they would be unable to take all your produce? Yes. It would take half a dozen mills to handle the grain in this district.
3862. Under present conditions you have to look further for a market? Yes.
3863. Where do you get it? In the metropolis or in towns in that direction.
3864. Chiefly in the metropolis, I suppose? Yes.
3865. You are under a great disadvantage in having to cart your wheat 34 miles? Yes. You may put down 4d. a bushel as an average rate of road carriage for the district. In some cases, the rate has been as high as 7½d. I have known wheat to be carted at 1s. and at 10d. a bag; but taking the district all round, 1s. 4d. or 1s. 3d. would be a fair amount to allow per bag.
3866. What are your rail charges to Sydney? Those charges are paid at the other end; we, as buying agents, have nothing to do with them.
3867. What has been the lowest price you have paid for wheat here? I cannot remember paying lower than 2s. 3d.; but I believe that at one time the price was below 2s.
3868. You do not know whether it pays the farmers here to grow it at that price? No.
3869. Will you give us the road carriage on the different classes of goods from here to Cowra, and from Cowra to Sydney? Wheat, 1s. 3d. per bag of 4 bushels; flour, bran, and pollard, 15s. per ton; wool, tallow, and skins, 20s. and 25s. per ton. To Sydney, I cannot say without reference to the rate-book.
3870. Seeing that the farmers here are prospering, they would be purchasing the best farming implements? Yes.
3871. Then the road carriage is a matter of great importance to the district? Yes. I represent one or two firms here—for instance, Massey Harris, of Toronto, Canada. They do a large business in binders and ploughs, and implements of that kind.
3872. Is there a steady demand in the district? There is. Five years ago, when I took up the agency, you could almost give away the implements. In the next year I sold one; and in the present year I have eight actual orders—two of them are only subject to approval of the principal. I am speaking now of reapers and binders. I had a letter from the company the other day, in which they say that they look upon Grenfell as becoming one of their best agencies in the Colony.
3873. Are you selling any other machinery? I am selling quite a number of their make of ploughs. This year I have sold five; I did not get any off last year or the year before.
3874. You are not the only agent for agricultural implements here? No, I am only one of a number.
3875. How many agents are there? I think all the stores in town have an agency. Quite a number of men went down to the exhibition in Sydney some months ago, and bought direct. I also represent

James

- T. Bembrick. James Martin & Co., of Gawler, South Australia. The output of their winnowers and strippers this year will be four times the output of last year.
- 20 Oct., 1897. 3876. Will you give the Committee an idea of the benefits accruing from the construction of a railway from Grenfell to Hillston *via* Wyalong? Speaking from an agriculturist's point of view, it would benefit us greatly in giving us cheaper carriage. There would be a trade in the direction of Hillston, as well as towards Sydney, if the market suited.
3877. You would then be able to send to the Sydney market under more favourable circumstances? Yes.
3878. And the Wyalong market would be open for a portion of your crop? That is so. In the first year Wyalong opened, ten or fifteen teams were going constantly, and the produce would be going again if we had easy transit.
3879. You think a railway would bring about closer settlement, which would mean that a greater volume of business would be done in Grenfell? Yes.
3880. The construction of a railway from Condobolin to Euabalong would not serve this district at all? Not at all.
3881. Do you think this district is a sound one? I believe it is.
3882. You think that farming has come here to stay? Yes; it is certainly beyond the experimental stage.
3883. You think mixed farming could be profitably carried on here? Yes.
3884. With a fair rainfall you could hold your own with any portion of New South Wales in wheat-growing? Yes; we can compete with any part of the country.

Patrick Alfred Madden, farmer and grazier, Piney Range, near Grenfell, sworn, and examined:—

- P. A. Madden. 3885. *Chairman.*] What is the distance from Grenfell to your property? I am 17½ miles to the west. My land is close to the surveyed route to the north of the Weddin.
- 20 Oct., 1897. 3886. What is the size of your holding? 2,520 acres. I am carrying on mixed farming.
3887. You are grazing sheep and cultivating? Yes.
3888. What is the carrying capacity of the land? About two sheep to the acre.
3889. You have improved that land by ringbarking and scrubbing? Yes; I can carry 3,000 sheep upon it year in and year out.
3890. What area have you under cultivation? 140 acres this year; I cultivate wheat principally.
3891. Are you able to get your wheat to market? I could not get it carted this year. I could have sold it at Forbes at 4s. a bushel, but on account of the season becoming so bad I could not get it carted. The wheat was left on my hands, and I have not sold it yet.
3892. Do you grow any feed for your sheep? After the crops are off we put them on the stubble.
3893. How long have you been farming? Twelve years.
3894. Cropping the same piece of land year by year? Until this year I cropped the same piece of land.
3895. Do you grow wheat all the time? Some years for hay and some years for grain.
3896. What has been your average yield? About 12 bushels. It was not a very suitable piece of land for wheat-growing. Being a stranger in the district, I took the land to be similar to that at Albury, where the low flat land is always the most productive; but here I found afterwards that the rising ground was the best.
3897. You had some farming experience in the Albury district? Yes.
3898. Have you found the timbered land here, when cleared, good land? It is the best, I think. I am only getting an average of 12 bushels to the acre off my piece of land.*
3899. It has been cultivated continuously, and it therefore offers good proof of the fertility of the soil? Yes.
3900. Does it show any signs of exhaustion? No.
3901. As a practical farmer, do you not think it would be advisable to give the land a rest occasionally. I intend to do so as soon as we can get enough land cleared to make up a certain output.
3902. Is all the timber on your land ringbarked? Yes.
3903. What did it cost you to get it ready for the plough? It cost me 15s. an acre. I have a contract let now for 100 acres.
3904. What land have you under crop this year? 140 acres.
3905. And you are clearing another 100 acres? Yes; it will be done before next summer. I am anticipating the construction of a railway to Grenfell.
3906. If you were certain of a railway to Grenfell what area would you cultivate? I intend to put in 1,000 acres in 1900 if a railway comes here.
3907. Are there many farmers in your locality who are similarly situated? Yes.
3908. What would be the average size of their holdings? They would be about the same size as my own.
3909. Do they, like yourself, carry on mixed farming? Yes.
3910. They are also anticipating the construction of a railway in the district? Yes. I am not the only one who is getting his land cleared.
3911. The area under cultivation is increasing in all directions? Yes, from year to year.
3912. How would a railway to Grenfell benefit you? I should have so much shorter road-carriage. It is over 51 miles from my place to Cowra, and a little further to Young. I send down a considerable quantity of fat stock every year to Sydney, and I have to drive them to Cowra, which takes eight days. If the railway were at Grenfell there would be only one day's driving, and the sheep would not go off in condition as they do. Besides, it is no use sending less than 300 sheep to truck at Cowra or Young; you have to send a man in charge of the stock. I very often have 200 fat sheep, and eight or ten head of cattle, but it would not pay me to drive them the distance I have named.
3913. If there were a railway here, a number, similarly situated to yourself, would assist in making up a load? Yes; I have spoken of it to several persons.
3914. Is your country good fattening country? Magnificent.

3915.

*NOTE (on revision) :—The 12 bushels per acre refers only to a piece of land under cultivation for twelve years; larger portions during the last three years have averaged over 20 bushels per acre.

P. A.
Madden.
20 Oct., 1897.

3915. Do you think that if there were a railway here there would be a big trade in lambs for the Sydney market? Yes. At the present time I have some as good as any in Australia; I do not think they could be fatter.
3916. A railway, then, would assist and encourage small holders of land? Yes.
3917. It would enable them to make more profit and to live more comfortably? I know it would in my case, and what a railway would do for me I suppose it would do for others.
3918. What do you think of this district as compared with the Albury district? It is far ahead of it in stock-carrying capabilities and for fattening, and it is quite equal to if not better than it for cultivation.
3919. Speaking of the locality to which you have referred, how much of it do you know? From 30 to 35 miles out from the town, running westerly.
3920. The country is all of a similar character? Yes, it is part of the Bland.
3921. You are on the edge of that country, and on the other side of the Weddin? Yes.
3922. All the country round about you is as good as yours? Every bit as good as mine.
3923. It amounts to this, that there is, in the district, a large area of grazing and fattening country of first-class quality, also a large area suitable for agriculture? Yes.
3924. Do you know anything about the timber along the route? Yes, I can speak with authority as to that. The ironbark referred to by the surveyors this morning is some of the finest ironbark you could find. I am referring now to the ironbark on the forest reserve about $1\frac{1}{2}$ mile south of the route surveyed to the north of the Weddin.
3925. How far does that ironbark country extend? It is about 5 miles square. There is good pine there, but the saw-mill has cut out a good deal of it.
3926. Is the pine large? Yes; I have some very fine pine on my land.
3927. Would it be marketable? Yes.
3928. Do you think that you and your fellow settlers would find a market for your produce in a westerly direction? We might do so at Wyalong. It was from this part, two or three years ago, that the principal supplies were sent there.
3929. You think there is every chance of Wyalong being a permanent field? Yes.
3930. And you would be able to send the population fat sheep and cattle? Yes. I am sure we could get a market there for stock.
3931. Do you think you would be able to send them further west than Wyalong? No; and I would not rely upon Wyalong as a fat stock market, because the country there is pretty well pastoral.
3932. You have confined your attention entirely to grazing and agriculture? Yes; I have grown a little lucerne and potatoes only for my own use.
3933. How did potatoes do? Fairly well. I know a number of men closer to the mountains who have grown splendid potatoes.
3934. Do root crops grow well here? Yes, and vegetables also.
3935. How does the fruit grow? Splendidly; we shall have a splendid fruit crop this year.
3936. What about grapes? Grapes grow splendidly; but you cannot get very much for them.
3937. At what distance from a railway line do you think an agriculturist can carry on his occupation? He should not be over 20 miles distant.
3938. You think the railway would materially increase the production of the district, and encourage many persons to go in for fruit-growing and dairying? Yes; this would be a splendid part of the country for dairying.
3939. Do you think there would be an opening for a butter factory here similar to that on the South Coast? Yes; I believe there would be, about 30 miles out from here, on the Bland country.
3940. The district is admirably situated for dairying operations? Yes.

Robert Matteson Vaughn, civil engineer, Grenfell, sworn, and examined:—

3941. *Mr. O'Connor.*] You represented the district in the Legislative Assembly for many years, and are an ex-Minister of the Crown? Yes.
3942. You represented the district in Parliament for fourteen years? Yes.
3943. You know the country here very well? Very well indeed.
3944. Do you know the proposed line between Condobolin and Euabalong? I have not been below Condobolin on that route.
3945. I suppose you know all the country between Koorawatha and Wyalong? Yes, well. I have resided in Grenfell thirty years this month. When I first came here there was no cultivation of any consequence in this district. About ten years ago they commenced to cultivate, and wheat-growing has progressed during those ten years very rapidly—more particularly between here and Koorawatha, and in the immediate vicinity of Grenfell. The whole district, in my opinion, is eminently suited to the growth of wheat. In one year we had a record yield per acre for the whole Colony—that is, 20 bushels to the acre average; the only other district which came near us was Corowa, which was slightly under our average. The climate here is adapted to wheat-growing. Cereals do not require a very extensive rainfall. The average rainfall in the district is $28\frac{1}{2}$ inches.
3946. Over how many years is that average taken? We have been taking the rainfall here for about seventeen years. I believe the rain-gauge is at the post-office. The greater part of the country here might be described as open box forest, and it is suitable for agriculture right up to the foot of the small ranges. There is no large area of poor land in the district that I know of.
3947. What is your opinion of the country between Koorawatha and Grenfell? The land from Koorawatha and Grenfell up as far as the Weddin Mountains is eminently suited for dairying, wheat-growing, and fruit-growing, to say nothing of the raising of stock. The country is principally open box forest. There is some ironbark, but very little. To the west of the Weddin there are the Bland Plains, which in my opinion would grow excellent wheat. My reason for thinking so is that I have seen wheat grown in similar soil near to Forbes, and with the rainfall we have here, I feel quite certain that the Bland Plains can be cultivated to advantage. The time will come when the land there will be in small holdings, and will support a large population. As you get on to Wyalong you meet a totally different country; it is pastoral; there is whipstick and other mallee country. Although the soil is good it is rather expensive country to clear; when cleared it is quite as good as any other country for agriculture, when there

R. M.
Vaughn.
20 Oct., 1897.

R. M.
Vaughn.
20 Oct., 1897.

there is a rainfall. I do not know what the rainfall is at Wyalong, but I should imagine that it would be at least 20 inches. There is similar country right on to the Humbug Creek, and beyond that point I do not know how the proposed line would run. Generally speaking, from the Humbug Creek westward the rainfall diminishes.

3948. What is your opinion of Ungarie as an agricultural district? It has very fine soil, but I do not know about the rainfall. On the right-hand side going from here to Hillston, in the neighbourhood of Bena, there is excellent country.

3949. Do you know the proposed route from Wyalong to Hillston? Yes, I have some idea of it. I think it will be found that the country in that direction will grow wheat to advantage. It is almost exclusively used for pastoral purposes now, although I am given to understand that there is some under cultivation.

3950. What is your opinion of this district as a fruit-growing district? I have a very high opinion of its capabilities in that direction, from the little I have had to do with it myself.

3951. Do grapes grow well here? All kinds of fruit grow well. There is an orchard down the creek which is in a very flourishing state—cherries, plums, peaches, apricots, grapes, and apples are grown there. Even apples and cold country fruit will grow here in abundance, and of good quality. The climate seems to suit the grape admirably.

3952. Would the district do for wine-making? There are one or two vigneron here, but they are far away from railway communication and the carriage eats up the profit. They have not grown so largely as they would have done if they had had cheap transit.

3953. Do you know the Bland country well? Yes.

3954. Do you know it under varying conditions of drought and flood? I was there in one of the wettest seasons in thirty years. Certainly the country was covered with water, but I found no difficulty in driving through it.

3955. Would that country present any insuperable obstacles to railway construction? Not at all. For about 4 or 5 inches the surface is soft, but the bottom is good and sound. The surface rolls up upon the wheels of buggies and waggons, but underneath the ground is sound enough.

3956. You do not think the flood-waters there would be likely to endanger a railway? Not if proper openings were made to let the water through.

3957. Would railway construction there be very expensive? No; I think it would be exceptionally easy. I presume they would leave openings for the flood-waters to pass through.

3958. Do you not think railway construction there would cost, say, an extra £5,000 per mile? No, certainly not. Speaking as a practical man, knowing the kind of work, I am perfectly certain that it would cost less than that.

3959. What do you think of this district as a mining district? I have been here from the first of it, and I have a very high opinion of its capabilities if the ground were properly developed. I was here when the first ton of quartz was crushed in 1867.

3960. Is mining carried on to any extent? The large reefs are all taken up by different companies, and they are being worked in a spasmodic manner; they are not being thoroughly explored as they should be. The reefs here were very rich, and very wide—I mean down to 300 to 400 feet. The gold in all the reefs varies. At the depth I have mentioned the gold did not run out, but the stone became poorer. Then a rush took place to Gulgong, and instead of developing the reefs to a greater depth, nearly all the mining population went away. Many of them never came back again. That is the reason why the reefs have not been developed to a greater depth.

3961. Are you yourself a practical miner? Yes. I believe as good stone as was ever crushed will be found in these reefs at a deeper level. I have always held that opinion.

3962. How many mines are working here now? About a dozen I suppose.

3963. Are they troubled with water? No; in some of the deepest of the mines there is a little water, but it is not a source of trouble. There is no difficulty in bailing it with a bucket.

3964. Do you know Bimbi? Yes.

3965. What kind of district is it? It is a fairly good district, particularly at the back of the Tyagong Creek.

3966. The district has made much progress since you first came here, but its progress lately has not been so satisfactory as you have anticipated? We have suffered from the drought in the same way as have other districts.

3967. Would railway construction accelerate the progress of the district? Undoubtedly; because it would afford selectors and farmers a chance to get their produce to market. If there were a railway constructed from here to Hillston they would be able to send a good deal of their wheat and flour into the western country where they are not so well able to grow wheat.

Ralph Halls, storekeeper, Grenfell, sworn, and examined:—

R. Halls.
20 Oct., 1897.

3968. *Mr. Fegan.*] How long have you been resident in the district? About fifty years.

3969. You have seen the district grow into a town? Yes.

3970. I suppose it was merely a gold-digging when you came here? Yes.

3971. You are well acquainted with the requirement of the town and district in the matter of carriage? Yes.

3972. What is the carriage in your own case? About 300 tons a year approximately—some years more, some years less. 800 tons of goods are brought to the town a year, to say nothing of the goods taken to people outside—pastoralists and others who get their goods direct from Sydney.

3973. You use the Cowra railway station? Yes.

3974. Why do you not take advantage of the railway station at Koorawatha? It is not much nearer, and there is a better road to Cowra. There is a difference in the trainage.

3975. I suppose also that Cowra being a fairly large town the teams can get back-loading more frequently than at Koorawatha? Quite so.

3976. Have the people of Grenfell ever requested that better road accommodation should be given them to Koorawatha? I do not think so.

3977. Do you buy wheat from the farmers? Yes; last year I bought nearly 2,000 bags for gristing and seed supply. We generally buy about that quantity every year. I have never sent any of it away from the district until this year.

3978. Do you think there is a good opening for an enterprising man to open a mill here? Yes; there is no better opening anywhere in the country.

R. Halls.
29 Oct., 1897.

3979. The area under cultivation is increasing every year? Yes; there will be more this year, and I have no doubt that if the producers had a railway the area would shortly be doubled. I know a number of landowners who are prepared to cultivate larger areas next year. If a farmer at a long distance from the railway puts 500 or 600 acres under wheat, it takes him a good part of the year to get the grain taken away; I am assuming that he has to draw it 30 or 40 miles.

3980. What would you, as a business man, consider a fair distance for a railway from agricultural settlement? I should say from 15 to 20 miles.

3981. The construction of a railway would induce many other persons to come to the district to settle? I am sure of it. I know of some land-owners who are preparing land for the plough for next year. They have little or no cultivation now, and they are 30 or 40 miles from a railway line. If they had a railway within a reasonable distance they would cultivate a great deal more than they are cultivating now. There is a great deal of trouble in getting the wheat taken away.

3982. Did you find any trouble in getting your 2,000 bags taken away last year? We have part of it this year. We buy the wheat and grind it, and sell it as flour.

3983. The greater part of the land in the district is freehold? A great portion is.

3984. Therefore, it would not be thrown open to settlers? Quite so. If the settlers have 2,560 acres they can combine pasture with agriculture. A number who are cultivating from 300 to 600 acres have as much as they can do to get their stuff away, they have to draw it so far.

3985. Cultivation would involve the employment of a larger number of men than are employed in grazing pursuits? Yes; and anyone who clears 15s. an acre from wheat is better paid than he would be by running stock.

3986. The settler must obtain a reasonable price for his wheat to do that? Farmers can profitably grow wheat here in ordinary seasons for 2s. 6d. a bushel. I know the circumstances of a good many farmers. They have to pay from 3d. to 4d. a bushel for the cartage of their wheat from the farm to the railway.

3987. Your evidence amounts to this:—that the bulk of the land being freehold, although a railway might bring a larger area under cultivation, it would not mean closer settlement? The whole of this district is agricultural. The climate, soil, and rainfall are all suited to the growth of wheat. The district has given the best averages in the Colony, taking fair seasons. The mining industry has gone down; still some gold is yet being obtained here.

3988. Has your business increased since 1891, or since wheat-growing was taken up so extensively in the district? Our business has not increased. The railway at Temora, Forbes, and Cowra takes away a certain portion of it. In mining matters nothing is being done through the want of capital. At the same time I feel certain that some of the mines will be as good as ever they were. Several large mines here are sure to be worked at some future time; but they require capital. They cannot be worked without machinery.

John Quayle Wood, pastoralist, Brundah, sworn, and examined:—

3989. *Chairman.*] You are distant how far from Grenfell? Twelve miles from Grenfell in an easterly J. Q. Wood. direction.

20 Oct., 1897.

3990. Your station lies between here and Koorawatha? Yes.

3991. What is the extent of your holding? 16,000 acres.

3992. You are running sheep? Yes; and I am also cultivating.

3993. You have heard of the proposed railway from Condobolin to Euabalong, and you are here to give evidence in favour of an alternative route? Yes.

3994. How long have you resided in this district? I was born in it, and I have lived in it ever since.

3995. You have practically seen the district grow up? Yes, from a wild bush. It was scarcely settled in my early days.

3996. I suppose settlement in those days was confined to pastoral occupation? Yes.

3997. You have devoted some attention to farming pursuits? Yes, of late years.

3998. Your areas have been restricted by the resumption of certain portions of the runs, and you now find it necessary to engage in agriculture in order to work your holdings profitably? Yes.

3999. What area have you under cultivation on Brundah? I have under actual crop 6,500 acres, and I have 2,500 acres prepared for cropping next season.

4000. You will then have 9,000 acres under crop? Yes.

4001. What has been your experience as to the success of agriculture on a large scale? Up to the present time we have had to contend with the worst drought ever experienced in the district; but notwithstanding droughty conditions, the crop last year paid better than the land would have paid under a pastoral occupation.

4002. Is it your intention to still further increase your area under crop? Yes; up to 14,000 acres.

4003. Out of your 16,000 acres you intend to have 14,000 under crop? Yes; I do not think I could say more than that. It would be necessary to save 2,000 acres for our working stock. I think I could be sure of keeping 14,000 acres under constant cultivation if we had the railway here.

4004. What is your difficulty at the present time? The want of railway facilities.

4005. How far are you from a railway? From our place, taking the homestead as the central point, it would be about 15 miles to Koorawatha; but there is difficulty in moving the produce. Last year the road carriage from the drought was very expensive. The cost of carrying the wheat over the 15 miles to Koorawatha was greater than the railway charges from Koorawatha to Sydney.

4006. Do you convey your produce by team? Yes; we had great difficulty last year in getting sufficient teams to take it away.

4007. What is your annual return per acre from wheat? The best return we have had from a crop has been 32s. 6d. per acre. The average last year would be about 9 bushels; it was a bad year.

4008. What has been the yield in a good year? The best yield we have had has been 42 bushels.

4009. Taking the whole of the crops since you started cultivation, what has the average been? About 16 bushels would be a fair average, balancing the bad years with the good.

4010. At what price could you afford to sell wheat profitably? It depends on where the railway is. I have calculated that with the railway close at hand we could make it pay at 1s. 6d.

- J. Q. Wood.
20 Oct., 1897.
4011. The market would have to be very low when you could not realise 1s. 6d. a bushel? Yes; we do not expect to see that for many years.
4012. Any price from 2s. upwards would be a good price? Anything above 2s. we should consider good.
4013. If there were a railway here many settlers would be induced to increase their areas under cultivation? Yes.
4014. Is your annual rainfall sufficient to enable you to rely upon the crop? Yes. I only know of two failures, and they would be in an experience extending over thirty-six years. The average rainfall, extending over a long series of years, has been 29 inches.
4015. That would be more than would be required for the successful production of grain? Yes. Our crops at the present time are the most promising I have ever seen, and we have not had 15 inches of rain, but it has come at the right time.
4016. The land you have put under crop was ringbarked for a number of years? Yes.
4017. What was the original cost of the ringbarking? The ringbarking, clearing, and suckering would average about 5s. per acre.
4018. After being ringbarked the land is allowed to lie idle for some few years? In our case we waited about fifteen years. The cost of clearing would not be more than 10s. an acre.
4019. The full cost would be 15s. an acre, spread over a good many years? Yes.
4020. The best course for a farmer of limited means, who could not well afford to clear the country right out, to adopt would be to clear the lightest timbered portions of the land and to ringbark and sucker the other portion as you have done, allowing nature to assist him? Yes.
4021. After a few years had elapsed he would be able to gradually increase his cultivated area every year? Yes, without being too heavily handicapped by expenses.
4022. Upon your holding of 16,000 acres, what is your expenditure in wages under cultivation as compared with pastoral pursuits? I formerly had two permanent hands at £1 per week, apart from the house servants; they were the only employees I had. You might put down £150 a year under the heading of wages. For the past three years my average payment in wages has been over £1,500 a year.
4023. In place of the two hands you formerly employed you are now employing how many? The average for three years would be seventy-two. That does not touch the share-farming.
4024. By putting land under cultivation and providing employment for people who would not otherwise obtain it, you put a certain amount of additional money into circulation in the district? Quite so.
4025. In addition to the area already farmed by yourself you are dealing with an area under the share system? Yes.
4026. Does the share system apply to the 7,000 acres you have already under cultivation, or to the 2,000 acres you are preparing for the plough? That applies to the whole of it. We find the system a most satisfactory way of working the land.
4027. What number of share farmers are there upon your land, and what number of men do they employ? The number on the land actually under crop is twenty, and they employ fifty-three hands, apart from their own labour.
4028. So that, in addition to your own seventy-two men, there are seventy-three employed in connection with the share system? Yes; that was last year, with a poor crop. With a better crop this year there will be a large addition to that number of men. There is a great deal of difference between dealing with a 20-bushel crop and an 8 or 9-bushel crop; this year it is all guess-work. We cannot tell now what number of labourers will be required.
4029. With regard to the share system, do you yourself prepare the land for cultivation? Yes; we clear it thoroughly and find the seed-wheat.
4030. You have the land ready for the plough? Yes.
4031. The division of profit is a matter between yourself and the farmers? Yes.
4032. Are the men working upon the "halves" system doing fairly well? Very well; they are all extending their areas under cultivation every year. Some of our men who two years ago had 200 acres under crop have arranged for 1,000 acres this year.
4033. Do the share farmers continuously take the one crop off the ground? Up to date we have done so, but we shall alter that later on. The land was heavily stocked with sheep for many years, and for another three years it will be quite strong enough for wheat; the first year it is too strong. In about six or seven years from the time the land was first put under wheat we propose to put it under lucerne for two years, and then put it back into wheat again; we shall practically be farming on the principle of rotation of crops. The margin of 2,000 acres which I mentioned before will admit of our doing that without reducing the area of 14,000 acres under actual cultivation.
4034. Can you give the Committee any idea of the total area of land under cultivation in this district? I can. I should like first of all to compare the area with the area in 1895. In that year there were 27,248 acres under crop in the whole police district of Grenfell. Last year the area under crop in the small portion which would be served by a railway from Koorawatha to Grenfell was 46,573 acres.
4035. So that there has been a large increase in two years? Yes.
4036. That would seem to prove that both soil and climate are eminently suited for the growth of wheat? Yes. My opinion is that if a railway were constructed through this district it would be one of the biggest wheat-growing centres in the Colony, if not in Australia.
4037. You know the land pretty well between here and Wyalong? Yes.
4038. Is it of similar quality to that you have described upon Brundah? Yes; it is much the same right through.
4039. Do you think the Bland country would be as suitable for agriculture as would the country on each side of it? Yes; I know the general opinion is that that would not be the case; but the best crop I ever saw in my life was at Oakhurst, on the Bland Plains, thirteen years ago. I saw the crop growing and I saw it cut. It yielded 4 tons to the acre on a black soil. Of course, it is difficult soil to work. The work is not done easily; you want proper appliances for it.
4040. The land must be thoroughly tilled before you can deal with it properly? Yes; but the potentialities are in the soil, and it would not be so quickly exhausted as would the soil in the timbered country.
4041. Can you give us an idea of the number of sheep and cattle depastured in the district? In 1895 there were 780,000 sheep, 11,000 cattle, and 3,927 horses. The production of butter in 1895 was 17,156 lb. I point that out to show you the extent to which the dairying industry would be likely to be developed if there were a railway here.
- 4042.

4042. Where was the butter principally manufactured? In the immediate neighbourhood of Grenfell. 13,000 lb. of it was produced principally on the Brundah Creek, within a few miles of the town.
4043. Was that butter despatched to the Sydney market? I think the bulk of it would be consumed locally. Dairying would be one of the most important industries of the district. There was a factory near Koorawatha, and they did a splendid business over there.
4044. As to fat stock cattle, can you give us an idea of the approximate number of sheep and cattle which would be available for transit every year? I should like first of all to refer to the probable development in agriculture which would accompany railway construction. Those who have 46,000 acres already under cultivation have promised to increase that area by an additional 61,702 acres in the event of a railway being constructed, making a total of 108,275 acres; in fat stock there would be 84,200 sheep and 2,156 cattle available.
4045. That would be the number trucked to the Sydney market annually if there were a railway at Grenfell? Yes.
4046. Do your returns embrace the land district of Grenfell? The returns apply to that particular part which would be served by a railway from Koorawatha to Grenfell. They do not cover the whole of the Grenfell district. The whole of the returns are not in from the district which would be served by the railway. I might give more, but have kept upon the safe side.
4047. The returns you have given practically deal with a railway from Koorawatha to Grenfell? Yes; about 15 miles to the west of Grenfell.
4048. They do not take account of the traffic which would be induced by the extension to Wyalong? No.
4049. Do you think that the fact of small farmers being able to get away small numbers of fat stock would bring about a large quantity of fat-stock traffic which does not now exist? Yes; I am perfectly sure of that. I know of one case this year where a small farmer had fat stock which he could not get away, and a number of them died upon his hands.
4050. Do you know what land will be available for settlement? Taking the route from Koorawatha to Wyalong, upon which Mr. Little is engaged, to the north of the Wedden, there are 400,680 acres of reserve and 468,890 acres of Crown land.
4051. Within what distance of the proposed railway? Within a radius of 20 miles. Upon the southern route, which Mr. Lloyd is surveying, there would be 386,980 acres of reserve and 450,170 acres of Crown land.
4052. That would not embrace any portion of the land affected by the route which Mr. Little has surveyed? I do not think so.
4053. If the figures apply to a distance 20 miles on each side of either route they would overlap at some point? Yes.
4054. Do you think a railway westward would open up an additional market to the producers of this district? Yes; I think that it would be almost equal to the connection with Sydney.
4055. Where would you look for a market out west? In the Darling country and the district round about Hillston. Wyalong has had large supplies from this district. From the west, in dry time, there has been a demand which could not be supplied in this way. Another great use for a railway in that direction would be to convey stock to this district in a time of drought. We have nearly always had grass here at such times.
4056. The railway would enable pastoralists in that direction to get their stock to the mountains? Yes; and at Koorawatha they would have the choice of the Western or Southern lines.
4057. Do you think that if a railway were constructed in this direction the large landowners would be induced to sell some portions of their holdings? I am sure they would. Only last week I was consulted by a big financial institution as to the possibility of a railway coming through the district, with a view to the sale of property which they had had to take over under mortgage. I know of other cases where there is a likelihood of that being done.
4058. Do you think the land would be sold on terms which would compare favourably with the terms offered by the Crown? As a matter of expediency the owners would have to bear in mind the terms the Crown was offering.
4059. They would be guided in their operations by the terms offered by the Crown? Yes; and I am sure many of them would be willing to sell.
4060. You think the payments for the land might be extended over a term of years? Yes; the occupiers would make money off the land with which to pay for it, although they might not have any money at the time of starting.
4061. Is there anything you desire to add to your evidence? Yes; a considerable quantity of potatoes has been grown in the district, and it is also suitable for fruit-growing, and for the wine industry.
4062. Is the district progressing or is it at a standstill? It has progressed wonderfully since the present agricultural development started.
4063. Until that development started the district was comparatively at a standstill? Yes; no one was doing well, and everything seemed going backwards.
4064. Since you have discovered the profit attaching to cultivation, every one has taken heart, and the district is going ahead again? Yes; from the top of any of the hills here you can see fires all round at night, showing that people are clearing the land in readiness for the plough.

William Jones, selector, Warradery, near Grenfell, sworn, and examined:—

4065. *Mr. O'Connor.*] How far are you from Grenfell? About 12 miles.
4066. How long have you been in the district? Twenty-three years next April, chiefly farming and cultivating.
4067. What area have you? Something like 2,000 acres.
4068. What area have you under crop? 500 acres—about 50 acres more than I had last year.
4069. Are you prepared to still further increase that area? If I receive encouragement I will do so. I could not increase it at present; there is no market for the produce.
4070. How would a railway between Koorawatha and Grenfell affect you? I should increase my farming.
4071. To what extent? I should put in three times the quantity of wheat. I should go up to 1,000 or 1,500 acres if it paid; but wheat-growing does not pay at present—there is no market here.

W. Jones.
20 Oct., 1897.

- W. Jones.
20 Oct., 1897.
4072. What yield have you? The lowest was last year, which I think was about $11\frac{1}{2}$ bushels. My highest yield has been 42 bushels. I have a piece of land which I put under corn this season, and which I shall put under wheat next season. It might produce 30 to 35 bushels if the season were good. I think I am very lucky if I get an average of 16 bushels; that is a paying crop.
4073. For what purposes do you use the other portion of your land? I have it for sheep, horses, and cattle.
4074. What is the carrying capacity of your land in a fair season? I carried three sheep to the acre in the last season; in fact, I have done so for the last five years. My land is well improved; it is all cleared. I think you might say that it would carry on the average two sheep to the acre.
4075. Is it good grazing country? Yes; and very good wheat-growing country.
4076. How many crops of wheat have you taken off the cultivated land? About nineteen off some of it. I took off nineteen crops in twenty-two years; the land had a two years' rest.
4077. Between the first and the nineteenth years? Yes; I expect this year it will go about 12 bushels to the acre. Of course, the soil is thoroughly ploughed.
4078. Are there many settlers where you are living? I and my brother have the biggest holdings; but there are several others there. My brother had 420 acres under crop, and a man named McGannon has, I think, as many acres as I have under crop.
4079. Have you had any conversation as to what you might do in the event of a railway being constructed in the district? I should cultivate very much more largely if there were a railway, and I know my brother would double the amount of wheat he has now in.
4080. I suppose your neighbours would act similarly? Yes.
4081. Is there anything you desire to add? Concerning a railway, I should like to mention that on some machinery from Sydney to Cowra I paid by rail 4s. 5d. per cwt., and from Cowra to Grenfell 5s. per cwt. If the farmer is to be handicapped in that way we shall have to go.

William Richardson, grazier, Bogolong, sworn, and examined:—

- W. Richardson.
20 Oct., 1897.
4082. *Chairman.*] You are a grazier, residing at Bogolong? Yes; 5 miles west of Grenfell.
4083. You are acquainted with the proposal to construct a line from Condobolin to Euabalong? Yes.
4084. Do you know that country? Yes. I have travelled from Condobolin, *via* Euabalong, to Hillston. I had a station at Dundoo Hills for 8 years. It is 50 miles south of Condobolin. It is very droughty country, generally speaking.
4085. Would the railway from Condobolin to Euabalong be of any assistance to this district? Certainly not.
4086. You have come here this afternoon to advocate a route to Hillston which would serve a greater number of people? Yes.
4087. You are merely grazing? Yes. Up to last year I had 13,083 acres of secured land and a lease of 10,000 acres of Crown land.
4088. Up to last year you used all your holding for grazing purposes? Yes, except a small portion upon which I grow hay, and which is not worth speaking about. Seeing the success which Mr. Greene and Mr. J. Q. Wood have made of farming upon the "halves" system, I made a trial of it last year in a small way. I put in 50 acres of wheat, and it gave me a return of 12 bushels to the acre. Encouraged by that, I put in this year 550 acres of wheat and corn, 350 acres of wheat and 200 of corn. I have already arranged for the clearing of 1,000 acres of land for wheat this year, and if there were a railway to Grenfell I should continue to increase the area, because I estimate that 10,000 acres of my holding are fit for growing wheat. I should like to say that commencing a mile and a half west from Grenfell, and following Mr. Little's routes for a distance of 30 miles, taking a radius 10 miles to the north and south of the line, you will have an area of 380,000 acres; allowing for 80,000 acres of inferior land which you could not cultivate, you would have close to Grenfell an area of 300,000 of wheat-land which, I am sure, would be put under crop if a railway were constructed.
4089. Why do you include such a large area of inferior land? I include the Weddin Mountains. The country through Bogolong and Melyra is splendid for the growth of all kinds of fruit and vegetables. I have 5 acres of vegetables, and I have been told by Chinamen that they have grown there as much as 14 tons of onions to the acre. I should also like to point out that for several years back I have had a small number of different kinds of fat stock. Owing to the dry summer it has been difficult to get them to market. The whole of that difficulty would be avoided if there were a railway at Grenfell. I consider I loose on the sheep quite a shilling a head by having to drove them to Young or Cowra. They are both 38 miles from my place. If there were a railway here, no doubt a lot of people would go in for poultry. I understand that already some people have as many as 2,000 fowls, and I see no reason why the number should not be increased to 5,000 or 6,000.
4090. How deep have you to sink for water? Eighteen feet; but we sink to 23 feet, allowing ourselves 5 feet of water.
4091. Is it brackish? No; it is good household water.
4092. How does this country compare with, say, Merrigal? That country is inferior to this for carrying stock.
4093. What stock can you carry to the acre? After the land in this district has been ringbarked for several years it will carry, in an ordinary season, from a sheep to a sheep and a half to the acre.
4094. Have you erected any rabbit-proof fencing? No.
4095. Have you gone to much trouble in dealing with the rabbits upon your holding? No; they are increasing, of course; but up to the present we have taken no steps to destroy them.
4096. Have you tried dairying? No; not at my place; but I know that the country is suitable for it.
4097. What vegetables have you grown? Peas, turnips, carrots, onions, raddishes, lettuce, beet, cabbage, cauliflower, and potatoes.
4098. And you find that they grow very well? Exceedingly well. They grow splendidly with sufficient moisture. Last year I had Swede turnips in my garden so big that you could put only one into a fair sized bucket.
4099. How many men have you employed on wages? I keep three men on the station the whole year—two for the purpose of boundary riding and to look after the sheep, and the other is a groom and milkman.

W.
Richardson.
20 Oct., 1897.

4100. If you carry out your idea of putting so many acres under cultivation it will mean the employment of a greater number of persons? So much so that when my 200 acres were planted with corn I had as many as seven men employed with double furrow ploughs. At the time of sowing the corn there were twenty men employed in ploughing, sowing, and harrowing. That number would be carried on proportionately as the acreage increased.

4101. What did it cost you to clear your land? In regard to the 200 acres to which I have referred, I first of all Yankee grubbed it. That is, I burnt all the timber off the ground and picked up all the sticks at a cost of 3s. an acre. After that was done I had to grub it fit for the plough to the depth of 10 inches. The total clearing cost me 9s. per acre. The timber was dead and had been so for a number of years. The contracts I am letting now have ranged from 10s. to 12s. an acre for 400 acres. As to the green timbered land, the ringbarking costs 1s. an acre; then every eighteen months it will cost you 9d. or 1s. an acre to remove the suckers and pine seedlings. If you cleared out the green timber at once it would cost you not less than £2 an acre.

4102. Have you adopted the "halves" system? My farming is entirely upon the "halves" system.

4103. You have seen that others in the district have made it a success and you are following in their footsteps? Yes.

4104. By the time you have your 10,000 acres under crop you will be employing a big staff of men? I must necessarily do so.

John Cleary, farmer and grazier, Piney Range, sworn, and examined:—

4105. *Chairman.*] How far is your property situated from Grenfell? Sixteen miles in a westerly direction. J. Cleary.

4106. What area have you? 2,500 acres.

4107. To what use do you put your land? Grazing principally. In the last two or three years I have gone in for a little bit of farming. I have 80 acres under crop this year. 20 Oct., 1897.

4108. Do you know the country between here and Wyalong? Yes, for 30 or 40 miles on each side of the surveyed line.

4109. What is it like—take the north side first? I consider that the land is well adapted for agriculture. I know that I had land under crop last year, and took 24 bushels to the acre off it. One particular piece which has been under crop for seven years—about 10 acres—gave that yield.

4110. Is the land on each side of the surveyed line equal to the land you are describing? Yes; there are thousands of acres on each side of the line equal to it.

4111. You find some difficulty in getting your produce to market? Yes.

4112. How far are you from the nearest railway station? Pretty well 50 miles.

4113. Does it pay you to draw that distance? You have to get a pretty good price for wheat to make it pay.

4114. It must be an exceptionally high price? Yes. We could not get teams to cart it last year. We had the wheat on our hands, and sold it the other day.

4115. Is forage very dear? They were paying £8 a ton for chaff.

4116. Consequently, carriers were hard to obtain? Yes.

4117. I presume that if you could obtain them under such circumstances they would want more money to cart your stuff to a railway station than you could afford to pay them? Yes; the bullock teams could not travel at all.

4118. Are there other settlers near you holding of 2,500 acres? Yes.

4119. How far would the surveyed line be from your land? It passes along it according to the plan; it goes through my brother's land.

4120. Supposing the railway is constructed, what do you intend to do with your land? I intend to go in for cultivation. I shall clear until I get 1,000 acres under crop.

4121. Has the land been ringbarked for some years? No, there is a good deal of green timber on it.

4122. What is your clearing costing you? Some of it cost us 1s. 6d. to ringbark it, and keeping down the seedlings and suckers would cost from 3s. to 4s. per acre. We could get it cleared now fit for the plough for 15s. an acre—that is, country which has been ringbarked for ten years.

4123. While the timber is dying off you are using the land for grazing? Yes.

4124. You are waiting for the construction of the railway before increasing your cultivated area? Yes; everyone is going in for cultivation now; they find they have to do so, because they cannot make grazing pay.

4125. What would your land carry? About one and a half sheep to the acre.

4126. You are on the edge of the Bland country? Yes.

4127. And that is first-class grazing land? It is good grazing country, but I would not say that it is first-class; it is splendid for cultivation. I have had twelve years' experience in the Albury district farming, and I consider that there are thousands of acres in the Grenfell district which are superior to the general run of land in the Albury district. Five crops is a good succession of crops in that district without manure.

4128. Do you know of any persons who would be likely to take up land here if there were a railway? Not of my own knowledge; but I dare say there are hundreds of persons who would be only too glad of a chance to come, especially on the northern side of the proposed line. There are thousands of acres there which will be rushed when the land is available, as it shortly will be.

4129. Is your land suitable for dairying? Yes, quite suitable.

4130. Do you think the dairying industry is likely to become a big industry in this district? Yes.

4131. You had some experience in dairying in the Albury district? Yes, a little experience.

4132. You find it necessary now to combine agriculture with grazing in order to work the land profitably? Yes.

4133. And you find it necessary to employ more men than you employed under the old system? Yes.

4134. Supposing you had 1,000 acres under cultivation, how many men would you have to employ to deal with it successfully? I think from twelve to fifteen men.

4135. Then the construction of a railway would mean the employment of a larger number of men in agricultural pursuits? Yes.

4136. Have you grown anything but wheat and hay? Yes; I have grown root crops; not for market, but for home consumption. I have grown pumpkins, turnips, and potatoes. They all grow fairly well. Cabbages and cauliflowers also grow splendidly. 4137.

- J. Cleary. 4137. Do you think all the land in your neighbourhood is suitable for mixed farming? I do not think it is all suitable. It might be made suitable at some expense. Some of the land is very stiff and clayey, and it would require drainage.
- 20 Oct., 1897. 4138. Have you anything further to add? With regard to the northern route, between Grenfell and Wyalong, I think it is the route which should be adopted. If the other route is adopted hundreds of tons of traffic will be lost to the railway. The northern route would attract a great deal of traffic from out Forbes way.
4139. You think that traffic outside the radius of the Forbes line would come to Grenfell by team, instead of striking a railway further west? Yes.
4140. There is considerable settlement at Bimbi? Yes.
4141. How far would you be from the southern route? About 16 miles.
4142. It would be almost as near for you to come to Grenfell? Yes; just about the same.

William Wells Priddle, farmer and grazier, near Grenfell, sworn, and examined:—

- W. W. Priddle. 4143. *Chairman.*] You are a farmer and grazier residing 12 miles from Grenfell? Yes.
- 20 Oct., 1897. 4144. How long have you been in the district? Twelve years, farming and grazing.
4145. What area of country have you? 10,000 acres.
4146. You are acquainted with the proposal to construct a line from Condobolin to Euabalong? Yes; I have been through that country several times.
4147. You know that that line would be continued to Hillston? Yes. The line would not benefit me in the least; we should be about 70 miles from Condobolin.
4148. What you require is a line from Koorawatha to Grenfell? Undoubtedly.
4149. You have been going in for mixed farming? Yes.
4150. How many acres have you under cultivation? About 500 acres every year; we grow wheat chiefly.
4151. What would be the distance of your holding from the suggested railway from Koorawatha to Grenfell? About 8 miles, if the line went on to Wyalong.
4152. In the event of that railway being constructed, what area would you have under cultivation? Where I have 100 acres now, I should have 1,000. I should cultivate every acre I hold which would be fit for cultivation, and I suppose I have about 6,000 acres which would be fit.
4153. What is your average yield? About 13 bushels, taking one year with another.
4154. What price would pay you? Three shillings a bushel, if the railway were 10 miles away. I have sold it under 2s.
4155. You have tried growing fruit of various kinds, and especially grapes? Yes; the grapes do very well here.
4156. Is your country a good grazing country? It is a very fair grazing country.
4157. Do you think the dairy industry would flourish here if there were railway facilities? Yes; Mr. Thompson considers it the best district he has yet visited for dairying.
4158. You are of the same opinion? Yes; I have seen corn grown here for ensilage, but not for cobs.
4159. What sheep have you? I run from 5,000 to 10,000.
4160. What will your land carry? Improved land would carry from 1½ to 2 sheep to the acre. It depends upon how you improve it. The land will carry 10 sheep to the acre if you like to expend the necessary money, especially if you go in for ensilage and green stuff, but it will not do that from the natural grasses. I have grown sorghum, flax, and hemp. I have also grown turnips 21 lb. in weight without irrigation. You do not want much rainfall to grow wheat. If you have 12 inches of rain at the proper time it is enough for wheat. This is a dry year, and I never saw the wheat crop looking better in this or any other district.
4161. Do you know the Bland country? Yes; there is no better fattening country in Australia.

James Casey, farmer and grazier, Weddin View, Grenfell, sworn, and examined:—

- J. Casey. 4162. *Mr. Fagan.*] How far are you out of Grenfell? About 14 miles to the west.
- 20 Oct., 1897. 4163. What is the area of your holding? I have very nearly 8,000 acres of secured land and 4,000 acres on annual lease.
4164. You endorse what other witnesses said as to the general productiveness of the soil for wheat? Yes.
4165. You know the northern route from Grenfell to Wyalong? Yes; it goes right through my cultivation for about 6 miles, I suppose.
4166. I suppose the construction of a railway from Condobolin to Euabalong would be of no assistance to you? It would not assist me in any way whatever.
4167. You favor the northern route to Wyalong? Yes; it would serve a larger number of people, and would pass through better country.
4168. Would the railway interfere much with your holding? It would cut it up in different places; but I do not very much care where the railway goes as long as it does some good to the district. I do not think any man would object to the railway on the ground of its cutting up his holding. He would still benefit by it.
4169. Does the surveyed line pass through your secured land or through your leased land? It passes through the secured land and through the conditional lease land also.
4170. Would you be prepared to give such land as might be required for the construction of a line? I should be prepared to give it, because the railway would be of more benefit to me than the land.
4171. How is your run watered? By tanks.
4172. You understand the growth of fruit? Yes; I had five years' experience in the Albury district.
4173. Do you think the country here is equal to the Albury country for the growth of grapes? I think it is much better.
4174. What distance are you from a railway station? Young, Forbes, or Cowra are each about 50 miles away from me.
4175. Therefore, the carting of your produce is costly? Yes.
4176. How many acres have you under cultivation? About 360; 260 under wheat and hay; and 100 under corn.

4177. How long have you been growing wheat? I have been growing it for 11 years upon some portions of my holding. I have had an average yield of from 16 to 19 bushels. In the year before last the average was very low. It was about 7 bushels. J. Casey.
20 Oct., 1897.
4178. A railway would do the district a great deal of good? I think the district was entitled to it twenty years ago.
4179. It would probably bring a larger area under cultivation? Yes; I know plenty of farmers who are not growing wheat at the present time on account of the expense of taking it away. On the Sandy Creek run, about 17 miles north from here, several leases have been taken up, but it is impossible for the lessees to cultivate, because there is no railway to take their produce to market.
4180. Have you tried bacon curing in this district? On a small scale. You can produce here anything which can be produced in most parts of the Colony.
4181. Do you think it would ever become an important industry here? Yes, but it is no use to go into it now because you could not sell the produce. I suppose a railway here would have much the same effect as the railway had in the Albury district, where land under pastoral occupation was at once brought under cultivation. There is a great rush for all land thrown open within a reasonable distance of a railway. I reckon that if you get a railway within 10 miles of you, you are pretty well served.

John Quigley, orchardist, Grenfell, sworn, and examined:—

4182. *Chairman.*] You are an orchardist? Yes, residing at Two Mile, Grenfell, on the Cowra-road. J. Quigley.
20 Oct., 1897.
4183. How long have you been in the district? I was here before payable gold was found, and I have been here ever since—over thirty years.
4184. You have heard of the suggestion to construct a railway through this district towards Hillston? Yes.
4185. You can speak as to the capabilities of the soil here for the growth of fruit? Yes.
4186. What area have you under cultivation? Between 50 and 60 acres.
4187. What fruit do you grow principally? Grapes; I have 25 acres of vines in full bearing.
4188. Is the soil here suitable for the production of grapes for wine making? Yes; Mr. Despeisis, of the Agricultural Department, was here, and sent me a copy of the *Agricultural Gazette*, in which he said that he had been upon my vineyard and it was not second to any in the Albury district, and that it was a great pity the whole of the 400 acres were not under grapes.
4189. Is the grape crop good here? It varies a good deal; the last two years have been dry, and the vines have not been so productive, but the wine has been of a better quality.
4190. What do you do with your grapes? I take them away in waggons to Wyalong, Parkes, and other places; and I do the same with the wine.
4191. You find a local market for your grapes and wine? Yes. I have about thirteen or fourteen first prizes for my wine. I got a prize this year against a Wagga Wagga man, and some other experts.
4192. Where have you exhibited your wine? Grenfell. I went to Cowra some years ago; but I did not get any prizes there. There was a large competition.
4193. Is there much land here as well adapted as your own to the growth of the grape? Yes; a large area.
4194. You think there is every probability of a wine-making industry being firmly established in this district? Yes; if we get a railway—not otherwise.
4195. Does your grape crop ripen early? Yes; about the 1st February the grapes are getting ripe.
4196. In the event of a railway being available, what use would you make of it? It would be of great benefit to me, because it would do away with all my carriage by waggon; and I should also put an additional acreage under vines.
4197. What do you get a dozen for your wine? I sell it at 6s., 7s., and 7s. 6d. a gallon.
4198. You endorse the evidence of previous witnesses as to the general capabilities of the soil? Yes.
4199. Do you know the country between here and Wyalong? Yes. I may mention that they have sent from Sydney to me for vine-cuttings, on account of the quality of my grapes.
4200. You have no disease in the vines? They require attention; I go by the instructions issued by the Agricultural Department.

THURSDAY, 21 OCTOBER, 1897.

The Sectional Committee met at the Court-house, Grenfell, at 10 a.m.

Present:—

THOMAS HENRY HASSALL, Esq. (CHAIRMAN).

The Hon. DANIEL O'CONNOR, Esq.

JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Euabalong

John Buckman, farmer, Brundah, sworn, and examined:—

4201. *Chairman.*] You are farming on the "halves" system at Brundah? Yes; on Mr. Wood's estate. J. Buckman.
21 Oct., 1897.
4202. *Mr. O'Connor.*] How far is your farm from here? Eleven miles.
4203. How long have you resided in this district? Over twenty years. I have been three years upon my present holding. I have been on Brundah during the whole time, but not farming. I had a farm of my own about 7 miles from here. I had 140 acres. I had to relinquish the land through borrowing money and through the bad seasons. I then came to Mr. Wood's estate, and am now farming there. When I came to him I had nothing—in fact, I had to borrow money to get plant for farming. Now the land is all pretty well cleared, and I have cleared off the advance which Mr. Wood made me. I started with 100 acres in the first year. The land was cleared for me, and I got the seed. If a bad season comes I am not very much out, and if there is a good season I make something out of it. I now have a plant of my own with which to work the land; my tenure is from year to year.
4204. Are there many other men like yourself upon the estate? Yes; and they are all satisfied with the conditions.
4205. They are satisfactory to both landlord and tenant? Yes; we are all doing well. Our only trouble is in the getting away of the produce when we have grown it.
4206. Your position would be much improved if you had railway facilities for getting your wheat to the best market? Yes. 4207.

- J. Buckman. 4207. You know the suggested line to Wyalong? Yes.
 4208. How far are you from it? It comes through part of my farm.
 21 Oct., 1897. 4209. Then the railway would be a distinct advantage to you? Yes.
 4210. What is your average yield? It will produce in a year like this between 20 and 30 bushels per acre. When I was farming on the estate twelve or thirteen years ago I had an average of 40 bushels to the acre.
 4211. How many acres have you under cultivation? The whole of the 260 acres is under wheat. Some of them go in for hay, but I go in for the grain. If we had to grow hay, and a line passed through here to the west, we might just as well send our produce westward as to Sydney.

Amos Southwell, farmer, Brundah, sworn, and examined:—

- A. Southwell. 4212. *Chairman.*] You are a farmer on the "halves" system on Brundah? Yes; I have also a small farm of 140 acres of my own adjoining Brundah.
 21 Oct., 1897. 4213. Do you work your own farm in conjunction with the farm on Brundah? Yes; I have about 40 acres under cultivation on my own farm, and I use the balance of the land for grazing.
 4214. What area are you farming on Brundah? I have 350 acres under wheat, and 80 acres under corn. I am preparing additional land for the plough.
 4215. What area have you taken from Mr. Wood? I had 350 acres, and I am now taking another 150 which I am preparing for next year.
 4216. What has been your experience on the share system? I have only had two years on the share system, but I like it very well. When I took up the land two years ago I was grubbing on the place. I had 200 acres in the first instance and it was under crop last year, which was considered a bad year. We put in our wheat at the end of June, and there was very little rainfall. It was one of the worst years in my recollection. The wheat went 7 bushels to the acre. Another crop on the station went 14 bushels, but it was sown earlier, and the ground had been prepared. My ground was perfectly new, and had never been farmed before. My crop this year, I should think, will go 30 bushels to the acre. It looks very promising.
 4217. How much capital had you when you started with Mr. Wood? I had very little capital when I started. Mr. Wood had the land prepared for the plough and found the seed.
 4218. You were able to keep yourself while the crop was growing? Yes.
 4219. When the crop was reaped you shared over a certain percentage? Yes; the return was very satisfactory. It paid me very well for the work I had done.
 4220. You think it is a satisfactory method of dealing with the land by men with small means? Yes.
 4221. You have not enough capital to take up and work land on your own account;—the expense of clearing and preparing the land for the plough would have been too heavy for you? Yes.
 4222. Do you employ any labour? Yes; generally two hands for putting in the crop, and more for harvesting.
 4223. Are there many men working the land on Brundah under similar conditions? I think there are about ten or fifteen on the place.
 4224. Is the system popular in the district generally? It is just starting.
 4225. Where do you send your produce? It was sent to Koorawatha last year.
 4226. How far had you to cart it? About 18 miles.
 4227. The expense of cartage, I suppose, was not very heavy over that distance? It was 1s. a bag. I happened to have a bullock team myself. A number could not cart at all, or were late in getting their produce away. They might, perhaps, have to wait three or four months.
 4228. You are not bound down to growing wheat alone? Wheat is the main thing. I am breaking up some land now for corn. The land will grow anything. We find that by growing a crop of corn we benefit in the following year, even if we do not get much corn.
 4229. You are going to rotate? We grow wheat principally; it is the best paying crop. I have grown corn in the district; but not up at Brundah. I have seen corn go 30 bushels to the acre. It just depends upon the season.
 4230. Do you think that a railway through this district would induce many other persons to farm upon the share system? If there were a railway the cultivated area would soon be doubled.
 4231. Is the country between here and Wyalong as suitable for farming as the country upon which you are located? Between here and Marsden there is splendid country. All the land between Grenfell and Pine Creek is suitable for farming.
 4232. Have you done any dairying? Yes; it is a good district for dairying.
 4233. It is good fattening country? Yes; the stock fatten very quickly. The cattle do fairly well in a time of drought. I have seen them fatten when there has been very little grass.
 4234. You think mixed farming, then, might be carried on here? Yes.
 4235. Fodder can be grown without any trouble? Yes; sorghum will grow well here.
 4236. As to the tenure of your land;—are you under a yearly agreement? We take the land upon a three-year term.
 4237. If you break up your land this year you will not lose it in the next year? No; we proceed upon the assumption that the system will last.
 4238. I presume you can renew your lease if you care to do so? Yes.
 4239. You have no agreement to purchase? No; but we understand that the system is to last—we take Mr. Wood's word for that. Of 18 bushels, Mr. Wood takes 9 and we take 9; if there is any over it goes to the farmer.
 4240. You divide equally any yield under 18 bushels? Yes.

William Henry Hazelton, Sheriff's officer, Grenfell, sworn, and examined:—

- W. H. Hazelton. 4241. *Chairman.*] You were, until 1896, Mining Registrar at Grenfell? Yes, from November, 1882.
 21 Oct., 1897. 4242. *Mr. Fegan.*] So that you would have a fair knowledge of the yield of gold, and the number of men employed. Yes. The returns are collected every year and sent down to the Department.
 4243. What was the number of mining leases in force last year? There were over thirty in and around the district. 4244.

4244. *Chairman.*] To what depth have the reefs here been worked? One is down over 400 feet. There are several reefs here which have been payable, and some are payable now. The Enterprise is payable, and would be a good reef, but their horse-power is not sufficient to contend with the flow of water. Machinery is being imported from Victoria now, and expensive cyanide works are being erected.

W. H.
Hazelton,
21 Oct., 1897.

4245. *Mr. Fegan.*] In what direction has gold-mining been carried on here? There has been some mining at Sandy Creek, between 18 and 20 miles from here. A great many claims were taken up there and worked. Some stone was raised and crushed by a battery which was erected there, and the miners whose reefs did not pay had to leave the place. Several of the reefs have now been taken up, and parties are erecting machinery to treat the stone. The machinery which was there previously did not treat it properly. I know from assays that as much as 5 dwt. was obtained from the tailings. Some of the crushing went over $\frac{1}{2}$ oz.

4246. A majority of the miners left the reef on account of there being rushes elsewhere? Yes; but some of the parties who were working there previously are back again.

4247. You think there is a prospect of the ground paying if it be properly worked? Yes. The drawback is that the ore has to be sent to Sydney for treatment, and the transit to the railway station is expensive. On thirty claims between 80 and 100 men were employed. On the Pinnacle also a great many were employed. In one of the mines at the present time there are forty miners working; they have a large crushing-plant and the latest appliances for treating the stone. They have not been working for some time; they are short of water, and that has been the drawback to mining in this division also.

4248. You think that with a better supply of water there would be a greater development? Yes; and also, if they could get the stone away at a cheaper rate. Silver also has been found here. For instance, there is the great Southern Silver Mining Company, 13 miles south-west, and Broula 22 miles in a north-easterly direction, where silver which is now being worked was worked some years ago. They also got copper and limestone there. This year a great quantity of stone will be raised. Last year, in consequence of want of water, it could not be dealt with. There are three crushing machines at Grenfell, one of them being 7 miles from here. At the Pinnacle and Ironbank there are also two large crushing machines. To the best of my knowledge there are thirty head of stampers at the Pinnacle.

4249. Do you think the connection of Grenfell with the railway system of the Colony would be the means of developing the mining industry? Yes; there are a number of lodes which they cannot treat locally. They may be able to treat it in a rough way, but it has to be forwarded to Sydney for final treatment, and the carriage to the nearest railway station at Young or Cowra would be an expensive item.

4250. Have not works been erected at Wyalong? Yes. That is 65 miles from here, and the road is bad.

4251. In the near future Wyalong must have railway communication? Of course, if there were a railway in that direction stone would go by it to Wyalong.

4252. You think, therefore, that railway communication would assist the development of the field? Yes; ore which could not be treated by the machinery here would be treated at Wyalong.

4253. I suppose that with railway communication and a further development of the mining industry works would be erected here? I think it is very likely they would.

4254. All things considered there is likely to be a revival of the mining industry in this district with railway communication? Of course capital is required.

George Cousins, secretary, Homeward Bound Gold-mining Company, Grenfell, sworn, and examined:—

4255. *Chairman.*] Have you been long engaged in the mining industry? I have been interested in it six years. G. Cousins

4256. You have a good knowledge of the Grenfell district? I have taken an interest in it ever since I have been here. 21 Oct., 1897.

4257. How long has the Homeward Bound Company been working? For the past six years.

4258. Your ground is payable, I presume? We had at the beginning of the year four men employed, and at the beginning of the month seventeen. We have paid them £2 10s. a week since the beginning of the year.

4259. Are you working the claim with wages men? Yes.

4260. The mine has paid wages and you have a small balance to the good? Yes, this year. We are finding gold now at the 450-ft. level. It goes 15 dwt.; the previous crushing gave 25 dwt. There is any quantity of stone.

4261. Is the reef well defined;—are there good foot and hanging walls? Yes.

4262. There is every prospect of permanence? Yes.

4263. Have you any idea of the mining leases held in Grenfell? Yes; in 1895 there were 15; in 1896, 25; and there are, in 1897, 30.

4264. Have you any idea of the number of men employed on the field in 1896 and 1897? There were 100 in 1896 and 120 in 1897. They were not fully employed on account of water being required for crushing purposes last year and at the beginning of this year.

4265. Can you tell us the yield of gold for the past few years? In 1895 the value of the gold was £3,578; in 1896, £6,978; and up to date in 1897, £6,656. The two first returns I obtained from the mining registrar, and last from the banks which purchased the gold.

4266. Do you know of any new developments in mining between here and Wyalong or between here and Koorawatha? Developments have been caused by the cyanide process; there are 750,000 tons of tailings awaiting treatment. One cyanide works are being erected, and the others are finished. The works just starting are on a very large scale. A company are just about to develop the Enterprise mine by working it in a more systematic manner than it has hitherto been worked. There has been hitherto a very primitive method of working the gold; there has been no machinery to develop the deep mines.

4267. Is the stone of a refractory nature? It is.

4268. The return of 25 dwt. which you have mentioned might be materially increased if you had the best method of treating the stone? I have no doubt that that would be the case. If we had improved machinery we should get a much larger yield from the Homeward Bound. We get 3,000 gallons a day, and we know that a great deal of gold goes away in the tailings. During the last year we supplied the whole of the cattle in the town with water.

- G. Cousins,
21 Oct., 1897.
4269. Are there any working outside the town of Grenfell? Yes; there is the Pinnacle Reef, 25 miles from here to the north-west. It is employing now 70 hands, and is putting through the 20-head stamper 200 tons a week.
4270. That is not the only other mine in the locality? No, there is the Ironbark; they have also a battery, and are employing 12 men; Sandy Creek is also being developed.
4271. That is in the same locality? Yes, it is in the same belt. It is only about 6 miles from Grenfell.
4272. Is the Pinnacle mine being worked by a company? Yes; but the Ironbark and Sandy Creek are being worked by miners on their own account.
4273. There is a belt of gold-bearing country running through there? Yes; the whole district is gold-bearing.
4274. What is retarding the development of the industry, do you think? The want of capital is undoubtedly one of the causes; it is perhaps the chief cause.
4275. You think the construction of a railway would perhaps assist the industry? It would help us a good deal. The claim I represent sent yesterday to Cowra 6 tons of concentrates; the road carriage cost us a great deal more than the railway carriage down to the Illawarra works. We could send down three times as much if we had cheaper transit.
4276. You think that if there were a railway here capitalists might be induced to pay the field a visit, and look round? Yes; the coaching is quite enough to drive any person away. I might also mention that lime is here in abundance, and in good quality. It is used locally now; but if there were a railway it might be used extensively. There is also some kaolin, which has been proved by the Mines Department to be the best in New South Wales. There are large deposits of that.
4277. I suppose that if there were a railway pottery works might be established here to advantage? Yes; on account of the good quality of kaolin. Our opinion of Grenfell is that it is similar to Adelong. It only requires capital to develop it; there is any quantity of stone in sight. There are large bodies of stone which are gold-bearing, and if it could be got out and crushed cheaply, I should say that from 8 to 9 dwt. would pay. With a 4-foot reef, which is the average width in Grenfell, it would pay handsomely. Now that the new cyanide process has come into use, we are hoping that speculators will turn their attention to Grenfell, and that something will be done to develop the field. If companies of that kind came here there would be a certain amount of coal and other mineral traffic upon a railway.

William Roberts, sergeant of police, Grenfell, sworn, and examined:—

- W. Roberts,
21 Oct., 1897.
4278. *Mr. O'Connor.*] How long have you been stationed here? For nearly twelve months. I came here on the 7th last November.
4279. How far does your district extend? I cannot give you the exact boundaries.
4280. How far have you been out? About 20 miles north and south.
4281. Do you collect statistics here? Yes; in portions of the counties of Monteagle, Forbes, Gipps, and Bland. In freehold land there are 144,922 acres; there are rented from private owners 3,738 acres; there are in Crown land 6,739 acres; under cultivation 25,078 acres; and under cultivation for wheat, 22,688 acres, yielding 207,294 bushels last year. Those figures apply to portions of the patrol district, which is about 40 miles square. The amount of land under cultivation that would be benefited by the railway would be 35,078 acres for a yield of 307,214 bushels of wheat.

George Henry Greene, Esq., M.P., sworn, and examined:—

- G. H. Greene,
Esq., M.P.,
21 Oct., 1897.
4282. *Chairman.*] You were examined on the 7th September last by the main Committee in reference to this proposal? Yes.
4283. Have you any additional evidence to give? I have evidence to show the extra amount of expenditure in wages and material and the extra results gained by working the share system as it is worked here, as contrasted with the working of properties under the old system.
4284. You were not in possession of particulars when you were last examined? No. Originally I was working the Iandra Estate as a pastoral property. I then employed about five men looking after the stock, and since we have had the partial assistance of a railway—because we are a long way from it, the nearest point being the Monteagle siding 12 miles distant—the average number engaged in ploughing, that is during the past four or five years, has been 120.
4285. How long would you be employing that 120? From the end of March until the end of July. During the harvesting, which you may say extends over about two months, there are 160 able-bodied men employed, representing forty families. On the share system on Iandra, there are forty families supported, and the station-hands and employes, instead of being five in number as under the old system, are twenty. The contractors employ on the average all the year round—at times the number is greater—fifty able-bodied men. During the drawing of the wheat and the carting to the railway there were employed last year sixty men with fifty waggons, and I trucked to Sydney 6,500 sheep; up to that date I trucked only a very small number, because I was not in a position to fatten them. This year I expect to truck, in spite of the disastrous drought, about 7,000 fats to Sydney. The amount I paid for cartage of wheat last year—I have not taken into consideration wool, or any other produce—was £1,015, sending to the nearest station. This year I expect it will cost from £1,500 to £2,000. During this time I had to keep and feed about 600 head of foreign horses and cattle belonging to the carriers, which was an enormous tax.
4286. Without any compensation? Yes; that is an expense in excess of the £1,015. Great injury was also done to the tanks on account of the low condition of the water, and the large number of stock to be watered. This year I would at this moment give a contractor £1,500, and take my chance, to cart my wheat to the nearest station, but I do not expect to get it done for £1,500. The work done between 1892 and this present year—say, five years—in clearing fit for the plough, amounts to the extent of 3,000 acres per annum. The amount of tonnage sent by me to the train, and upon which I paid freight for wheat alone, not counting anything brought up from Sydney, machinery or anything else, was between 2,500 and 2,600 tons; that was for train alone, irrespective of road-carriage, and the estimated value of the machinery and harness used in farming is £12,000, most of which, if I have not exactly supplied it myself, I have become security for; otherwise the men could not in many cases have purchased. I estimate that there are 500 farm horses at £15 a head, or £6,000. As showing the terrible loss we are put to in the face of this enormous expenditure, in not being able to utilise the straw (which, if we had a means

means of sending it away, would be cut with reapers and binders, and, the wheat having been thrashed, would be sent to Sydney), I may mention that we lost on that item alone £7,000—that would be the straw off 10,000 acres. Considering that some of my men who do cut with reapers and binders have sold their straw at as high a figure as £5 a ton, the £7,000 I have given is a low estimate. It would, of course, apply to an ordinary season and not to a season of drought. You will see that, in making my estimate, I have taken the straw at a low price. With regard to the pastoral aspect of the question, I may mention that I have proved beyond doubt now that land which has been cropped for four or five years is in a thorough condition for growing lucerne. I have spent hundreds of pounds in the purchase of lucerne seed, and have spent large sums in getting it put in. I have at this moment about 500 acres which has been recently sown with lucerne, and by the help of this system of utilising the ground after it has been cropped for some years, there is absolutely no waste period in the history of the ground. It is turned at once from a productive wheat paddock into an almost equally productive grazing paddock, with the results that, whereas two months ago stock were on the point of death, I have lambs now ready to go to Sydney—cross-bred lambs—which will average 45 lb.; they are being shorn to-day. Under these circumstances I claim that no fear need ever be felt of the farming industry being abandoned, and the country being allowed to go back to its natural waste condition, as it has been conclusively proved that the ground can be utilised in the way I have suggested. The area of improvement I should put down at the very least, if a line should be constructed from Koorawatha to Wyalong, at 15 miles on each side. Practically, the improvement would extend much further than that; but putting it down at that short mileage distance from the train, people would be enabled to send wheat to different places. Probably out west would be our best market in a time of drought. I calculate that the areas improved by a railway running from Koorawatha to Wyalong, and extending 15 miles on each side, would be 1,440,000 acres; and I should say probably nine-tenths would be fit for cultivation in some form or other. I give these figures to show that the holders of land, when they start upon this work, must go on, there is no stopping; it simply amounts to this: that whereas there are hundreds of capable men in this country who have not the means to till their own land, when they are put in possession of land cleared for the plough, and when they are supported by capital, become, I think, the most thriving class of farmers in this district. Where men are given the very best land, and have to work it without capital, they can never overtake the deficiency in their banking account; they live from hand to mouth a life of oppressive toil; perhaps they get in a small area each year; but the area they can deal with is so small that they become disheartened; whereas with a large area a man under the share system has no responsibility excepting that of work. All his pecuniary arrangements are made for him on a much more satisfactory basis than he himself could arrange them with the bank. It is said that figures can be made to prove anything; the figures I give, and the statements I am making, are derived from the facts; the facts have not been made to suit the figures, but are there, and can be seen. There are numbers of men who can give you similar evidence to that I am now giving. My argument in brief is this: that the statements made by myself and others with reference to the probable outcome of railway communication, and the efforts that would be made in the district to prove it worthy of the assistance of a railway, have been amply guaranteed. The work is there to show for itself; it will be permanent, and it will continue to increase. It must be left to the intelligence of those who have heard the evidence, and who can see for themselves what has been done, to decide the matter. We have now given hostages to the country for the due performance of everything which we have said can be done. If the results all through the district were only one-tenth of what can be shown to-day, the volume of traffic by rail would be larger than anyone would care to say.

4287. You have no doubt that railway extension to Grenfell would very soon pay? I am perfectly certain it would.

4288. But you think that, if anything, a line from Koorawatha would be the better paying line? Yes; but I shall be perfectly satisfied, now that our claim has been investigated, with any line the Government would choose to adopt. With regard to a question which was asked in Sydney, if I thought that the share system would lead to closer settlement on account of the large shareholders selling their land, I said then I thought it would. I have now to state that, having spoken to friends of mine who are in the same position as myself, the universal feeling seems to be that the holdings some of us have are too large, and that we should be willing to sell some of the land. I myself have for a long time past been in treaty with some of my own men, who came to me without one farthing, and whom I hope to see in a position to buy their own land in the course of a very short time.

George Theophilus Saunders Boileau, Crown Lands Agent, Grenfell, sworn, and examined:—

4289. *Chairman.*] What is the area of Crown lands in the district of Grenfell? Approximately, the area in the police district would be about 346,800 acres.

4290. Is any of it available for settlement now? About one-fourth of it would consist of water and travelling stock reserves. The rest of the land could be made available when the Government thinks fit; the leases are from time to time expiring.

4291. You have been in the Grenfell district three years? Yes, and I am in a position to state that whenever Crown lands have been opened for sale there has been heavy balloting. We can never keep an acre if the improvements are within the reach of the ordinary selector. The only land I have at present unsold is where the improvements are so high that the selectors have not had the means to take it up. To-day a small area was thrown open—the only piece I had available for selection—and it was gone at 10 o'clock.

4292. That has been your experience here? Yes; for areas of any size there have always been from twenty-five to thirty applicants.

4293. You have had an opportunity as Crown Lands Agent of forming an opinion in regard to the value of the land in various districts of the Colony;—what is your opinion of land in the Grenfell district? It is good agricultural country; it is not like land in many other districts which is taken up solely for grazing purposes. Here people take up land for agriculture, and make a good living out of it.

4294. Does the district appear to be a prosperous district as compared with other districts? It is as good as any other district as far as agricultural resources are concerned.

4295. The farmers appear to be a fairly prosperous class? Yes; they do very well if they have a decent season.

Boileau.
21 Oct., 1897.

4296. Have you had experience in any district which has been opened up by a railway;—has there been railway construction during your term of office? Yes; the Glen Innes district was opened up by railway when I was there.

4297. Did the railway result in a largely increased demand for land? It led to a very large influx of population.

4298. You think from what you have seen that similar results would follow here? Yes, decidedly.

4299. Do you know the land between Wyalong and Grenfell? I do not know it all, but I know that the farmers at Piny Range speak very highly of that country.

Mr. Albert George Little, surveyor, Railway Construction Branch, Department of Public Works	73
Mr. George Williamson, storekeeper, Ivanhoe.....	73-74

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

PROPOSED RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

REPORT.

THE PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS, appointed during the first Session of the present Parliament, under the Public Works Act of 1888, 51 Vic. No. 37, the Public Works Act Amendment Act of 1889, 52 Vic. No. 26, and the Public Works (Committees' Remuneration) Act of 1889, 53 Vic. No. 11, to whom was referred the duty of considering and reporting upon "the expediency of constructing a line of railway from Condobolin to Broken Hill," have, after due inquiry, resolved that it is not expedient the proposed railway should be constructed; and, in accordance with the provision of subsection (iv), of clause 13, of the Public Works Act, report their resolution to the Legislative Assembly:—

DEPARTMENTAL STATEMENT.

1. The first survey made with a view of connecting Broken Hill with the railway system was for a line *via* Condobolin and Euabalong to Wilcannia, and was completed in 1885. At that time Silverton was the chief centre of mining in the district, Broken Hill not having attained its present importance. A survey was afterwards made of a line *via* Cobar and Wilcannia to Cockburn, and a proposal to construct a railway in that direction was considered by a former Committee in 1891, it being then decided that it was expedient a line should be constructed as far as Broken Hill. The present proposal to proceed *via* Condobolin and Menindie appears to have originated during 1895. A deviation of the route between Condobolin and Mossgiel has been proposed, *viz.*, one crossing the Lachlan a little below Condobolin, and proceeding along the southern side of the river to Cudgellico, where it would meet the survey already made between Cudgellico and Hillston. From Hillston, westward, the route would proceed to Mossgiel, there joining the other survey. This route has advantages over the northern one on the other side of the river, the country on the southern side of the Lachlan lying wholly within the Central Division, whereas the greater part of that on the northern side lies in the Western Division, and is not so well adapted for settlement. It would also do away with the necessity of a branch line to Hillston from the northern route. The total distance would probably not be much exceeded. On 14th April last, Messrs. Thomas and Cann, M's.P., representing the inhabitants of Broken Hill and Menindie, waited upon the Minister for Public Works and urged that the line from Broken Hill to Menindie might be constructed prior to the construction of the line through from Condobolin. On 23rd June last, a petition from the Mayor, aldermen, and inhabitants of Broken Hill and Menindie in favour of a railway from Broken Hill to Menindie, in connection with the proposed line from Condobolin, was presented to Parliament, the number of signatures attached thereto being 3,760. The motion referring the proposed work to this Committee was passed by the Legislative Assembly on 1st July last.

History of the proposal to construct the railway.

OBJECTS

OBJECTS OF THE PROPOSED RAILWAY.

Objects of the proposed railway: Statement by the Department.

2. The Departmental statement made to the Committee pointed out that the objects sought by the construction of this line were similar to those advanced in favour of the line from Cobar to Broken Hill, but it was stated that the conditions of mining at Broken Hill had undergone some modification since that time. Although the more easily-treated ores had practically been worked out, satisfactory methods had been found for dealing with the refractory sulphide ores, which would, no doubt, give an impetus to the trade of the district; and it might be a question for consideration whether the ores could not be conveyed as economically over the railway to Lake Illawarra and elsewhere, where it was proposed to treat them, as by forwarding *via* Port Pirie. The coal and coke which might be required could also be conveyed from Lithgow and delivered at Broken Hill, possibly at as cheap a rate as they could be carried *via* South Australia. The line would also intercept the wool traffic along its route and to the north of it, some of which still finds its way into Victoria. It would afford the means for closer settlement along the Lachlan, the Willandra Billabong, and the Menindie Lake, serve the mineral traffic from the Mount Hope district, and effect a considerable saving of time in the transit of mails from the western portions of the Colony.

OFFICIAL DESCRIPTION.

Official description.

3. The proposed railway would commence at the termination of the Parkes to Condobolin Railway (now under construction) at about 329½ miles, and follow the general course of the Lachlan River, at a distance of about 3 to 5 miles to the north of it, as far as Euabalong; thence about west by south, crossing the Willandra Creek in the parish of Gunnagi, county of Blaxland; thence on the south bank of that creek to Mossgiel, and due west to the north-east corner of the pastoral holding known as "Kilfera A." Leaving this point the line would take a west-north-west course, heading for Menindie, and crossing the Darling River there; the north bank of the Menindie Lake would be then skirted, and the previous bearing resumed to the southern boundary of the parish of Moorkaie, county of Yankowinna, where Stephens' Creek would be crossed; thence the line would bend south-west to Broken Hill, ending at about 696 miles from Sydney. The works would be easy throughout, with the exception of the bridges over the Darling River, the Willandra Billabong, and Talyawalka and Stephens' Creeks. The ruling grade would be 1 in 100, and the minimum radius of curves, 14 chains.

ESTIMATED COST.

Estimated cost.

4. The estimated cost of the railway—the length of which would be 366½ miles—is £955,063, or an average of £2,606 per mile, exclusive of land and compensation. The details of the proposed expenditure are:—

Condobolin to Menindie and Broken Hill, via Mossgiel.

Condobolin, 329½ miles to 587½ miles—256 miles at £2,200	£563,200
Viaduct—10,560 lineal feet at 50s.	26,400
Permanent-way material—2 miles at £850	1,700
Laying permanent-way—3,520 lineal yards at 1s.	176
		£591,476
587½ miles to 623 miles—35½ miles at £2,500	88,750
623 miles to 630 miles—Crossing of Darling and station at Menindie	90,187
630 miles to 635 miles—5 miles at £2,500	12,500
635 miles to 683 miles—48 miles at £2,300	110,400
683 miles to 696 miles (Broken Hill)—13 miles at £3,750	48,750
Station, Broken Hill	6,000
Telegraph	7,000
Total	£955,063

REPORT OF THE RAILWAY COMMISSIONERS.

Railway Commissioners' report.

5. The Railway Commissioners, in their Report, quote the rough estimate of the cost of the line from Condobolin to Broken Hill, £955,000, and £100,000 for the rolling stock which would be needed for the proper working of the railway, making a total of £1,055,000; calculated upon this amount, they take the interest, at 3¼ per cent., at £34,287, and working expenses at £25,000, or a total annual cost of £59,287. Subsequently the Secretary to the Railway Commissioners informed the

the Committee that in the event of 300,000 tons of ore being carried annually on the line, the item of £100,000 for rolling stock would require to be increased to £400,000, making the total cost £1,355,000. If, eventually, it were found necessary to ballast the line, this total would be considerably increased.

The Commissioners state:—"When reporting upon the proposed extension of the railway from Parkes to Condobolin, under date 19th February, 1895, we stated that 'the line should be looked upon to a great extent as a part of a national line, ultimately being extended to serve the Lachlan district as far as Hillston, and later on by a further extension to Menindie on the Darling. * * * this, together with a future extension of the Cobar line to Wilcannia, would make an excellent division of the central and western districts of the Colony. Ultimately the line will be of enormous advantage to the settlers in these districts, and will also largely influence the question of the present abstraction of New South Wales wool into Victoria, as, if the pastoralists were able to put their traffic on the railway lines closely adjoining their runs, it would put a stop to the cartage that now goes on to the Murrumbidgee River, and thence *via* Echuca to Melbourne.'" Having reiterated this opinion, the Commissioners point out that the consideration of this question is so much affected by the scheme recently reported upon by them in connection with an extension of the Cobar line to Broken Hill *via* Wilcannia that they "feel obliged to refer to that scheme, and to assume the Government will not now proceed with the construction of that line." They believe it will be "a long time before two new routes to the Darling will be necessary; but as the Orange and Molong line has now been extended to Parkes and Forbes, and a further extension has been authorised to Condobolin," they are of opinion that "if the Government decide to construct a line to Broken Hill, the Lachlan River and Menindie route should be adopted, as it not only affords the through connection intended to be given to Broken Hill, but also gives it by means of the shortest route, and would enable the New South Wales railway system to conserve to itself a great deal of the traffic from the centre of New South Wales which is now obtained by adjoining colonics, and it will also be a great advantage to the district." The distance from Sydney to Broken Hill *via* Wilcannia would be 734 miles, and *via* Parkes, Condobolin, and Menindie, 696 miles. With respect to the probable traffic on the railway the Commissioners say, "the proposal for the construction of a line through to Broken Hill is of a most unique kind, and it is impossible to estimate the traffic." They likewise explain that the question of constructing the line "can only be dealt with from a national point of view, and until it is opened its effect upon Broken Hill and the direction in which that place will trade can only be a matter of opinion, and any figures that we might give could not be looked upon as reliable."

THE COMMITTEE'S INQUIRY.

6. The fullest inquiry has been made into the merits of the proposed line. There were examined before the Committee:—The Engineer-in-Chief for Railway Construction, who furnished detailed information as to the route, cost of the undertaking, and method of construction; the Secretary to the Railway Commissioners; the Draftsman-in-charge, Information Bureau, Department of Lands; the Railway Goods Superintendent; the Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works; the Chief Inspector of Mines and Superintendent of Diamond Drills, Department of Mines; the Chief Electoral Officer; the Chief Inspector of Stock; the Government Astronomer; the Officer-in-Charge, Rabbit Branch, Department of Lands; the Principal Assistant Engineer of the Water Conservation and Irrigation Branch, Department of Public Works; the Government Geologist; Mr. John Howell, Managing Director of The Smelting Company of Australia (Limited); Mr. George Skelton Yuill (Messrs. G. S. Yuill and Company, Limited); Mr. Ebenezer Glencross Grant, Representative in New South Wales and Queensland of the Walter A. Wood Mowing and Reaping Machine Company, New York; Mr. William Briggs, Chairman of the Lithgow Coal Association; Mr. James George Carroll, M.P.; the Hon. Charles Augustus Goodchap, M.L.C.; Mr. Richard Sleath, M.P.; Mr. Thomas Waddell, M.P.; Mr. Alexander Wilson; and the Chief Draftsman, Department of Lands. Subsequently a Sectional Committee inspected the route of the proposed railway, and took local evidence at the several centres between Condobolin and Broken Hill.

The Com-
mittee's
inquiry.

SUMMARY

SUMMARY OF THE SECTIONAL COMMITTEE'S REPORT.

Summary of
the Sectional
Committee's
Report.

7. The report of the Sectional Committee is unfavourable to the construction of the line, its main reasons (*vide* pp. 20 and 21) being :—

1. It will not be possible at quoted rates to obtain any portion of the main product of the Barrier mining field.
2. No great extent of agricultural settlement may be expected west of Hillston.
3. If the line be extended west from Hillston it will obtain but little freight which would not be secured if that place were made the terminus. The proposed extension would have a tendency to divert traffic west from Mossgiel to the Darling.
4. The competition possible from the river system, the railway systems of the Colonies of Victoria and South Australia, and the cheapness of water carriage from the South Australian ports to the eastern seaboard of New South Wales, would necessitate such low rates being charged on the proposed railway that any considerable traffic could be secured only at a heavy loss.
5. Although the distance from Broken Hill to Lithgow by the proposed line is considerably less than to the eastern coast, still the length of land carriage is too great to enable the New South Wales Railways to secure the trade. And, further, the companies owning the principal mines are already interested in smelting works in South Australia, and on the eastern coast of New South Wales.

The Sectional Committee, however, suggested that a line to Hillston, and a line to Menindie from Broken Hill, might receive further consideration.

COST OF PROPOSED LINE AND ANNUAL LOSS.

Cost of
proposed line
and annual
loss.

8. The estimated cost of construction and expenditure on rolling-stock was, at the opening of the inquiry, stated to be £1,055,000, and the total annual cost £59,287. The ore raised at Broken Hill may be estimated as likely to be for the immediate future not less than 600,000 tons per annum. The Railway Commissioners estimate that to provide sufficient rolling-stock to carry half that quantity would necessitate a further expenditure of £300,000, and also state that a line to carry this traffic would require to be ballasted and generally constructed in a more stable manner than that proposed, which would further increase the cost. The Engineer-in-Chief for Railway Construction is of opinion that the line proposed could carry the traffic, but believes that the Commissioners would gradually ballast it. The Railway Commissioners also regard the question of the working of so great an amount of traffic over the steep grades on the Western Line—in addition to the ordinary traffic—as one requiring very serious consideration, and which probably would involve its duplication for a considerable distance.

POSSIBILITY OF OBTAINING ORE AS FREIGHT FROM BROKEN HILL.

Possibility of
obtaining ore
as freight
from Broken
Hill.

9. The importance of Broken Hill and its trade is established beyond doubt; but the matter for the Committee to decide is not that of the stability or importance of Broken Hill alone, but whether it is possible for this Colony to give the town and district any means of communication which will be more beneficial to its enterprise and more advantageous to its inhabitants than those at present in existence. The question, therefore, is not the volume of trade, but the trend of freight.

Before entering into the consideration of this matter, which virtually controls the whole position as far as the Barrier district is concerned, it is well to point out that in the immediate future there is a great probability of a considerable change in the industry at present in existence at Broken Hill. The establishment upon the eastern coast of Australia of various smelting-works, able to deal not only with lead and silver, but also with zinc, makes it fairly certain that the difference in the cost of freight between Port Pirie and Europe, and between Port Pirie and our eastern seaboard, will cause all the ore raised in Broken Hill to be treated in Australia. (It is stated that 41 per cent. of the ore using the railway at present eventually reaches Europe.) Therefore, nearly all the product of Broken Hill, instead of going abroad for treatment, will, in some form or other, reach the smelting and concentrating works on the eastern coast. It is contended by some that there

there will be a complete abandonment of the system of treatment of ores on the Barrier locally; but the Committee are of opinion that this statement may be too sweeping, but that there will be a very considerable reduction of the amount of ore treated locally, which will remove the necessity for the importation of a large quantity of coal, and will almost completely destroy the demand for coke. Therefore, from the mining standpoint, the question to be decided will not be so materially affected by the freights of coal and coke as of ore. There appears to have been some misapprehension with regard to the amount of coal required to treat a ton of silver ore. It has been stated that approximately $3\frac{1}{2}$ tons of coal are required for that purpose. It was, however, stated by the Manager of the Proprietary Mine that approximately it takes 93 tons of coal to treat 100 tons of average silver ore raised from that mine. Of this, approximately 9 tons are required for extracting and dressing the ore and other operations connected therewith, and the balance for the recovery of the contained metals. The Manager of the Proprietary states that the $3\frac{1}{2}$ tons of coal mentioned might probably be required for the recovery of zinc from the residue of the ore. The Committee have no reason to doubt this information. If it be so, as far as the mines are concerned, it would appear to be immaterial to the enterprise whether the coal be brought to the ore for the first portion of its treatment, or the ore to the coal, and then the residue from which the zinc is to be extracted be sent to where the coal is mined, the quantities in the extracting of zinc being stated to be in the proportion of 3 to 1. There is a consensus of opinion that the operations in future at Broken Hill will be principally confined to the raising of ore, and that the principal ore-treating appliances will be on the eastern seaboard. The manager of the Central Silver-mining Company states that 75 per cent. of the ore raised would eventually reach the eastern seaboard. The Proprietary Company expect to raise about 320,000 tons next year. It is not possible to obtain in detail the amount of ore likely to be raised on the whole of the Barrier field. It is, however, probable that a large quantity will be raised; and if present conditions continue, a great demand is likely to be sustained which the field can supply for many years to come. But on this point it may again be emphasised that it is not a question of the quantity obtainable, but of the amount of freight which would be furnished by it to the railway. This is dependent upon the freight charges that can be offered by the railway system of this Colony in comparison with the charges of the Silverton tramway, and the South Australian railway to Port Pirie, added to the sea freight to the eastern seaboard.

In estimating the rates to be charged, only one basis can be taken—that laid down by the Railway Commissioners. It was stated that the rate for bringing crude ore 696 miles would be 29s. per ton. To land it at Eskbank would cost £1 5s. per ton; at Wollongong, £1 11s. 5d. per ton; at Newcastle, £1 12s. 6d. per ton. With regard to these rates, the Committee, although they feel bound to accept them in making their comparison, would point out that it is stated with sufficient definiteness to justify belief that the South Australian Government have decided to carry carbonate and lead concentrates at the same rate, 9s. per ton, as sulphides to Port Pirie, which is approximately $\frac{1}{2}$ d. per ton per mile. If South Australia, with a 3-ft. 6-in. gauge, and inferior rolling-stock, can afford to carry at this rate, it is clear that New South Wales should be able to make a considerable profit at the same rate, having infinitely superior rolling stock and a broader gauge. The Committee are, however, aware that the Railway Commissioners of Victoria state that on the Victorian system of railways the rate of 1d. per ton is scarcely remunerative. They have been unable to obtain any information as to the actual cost of the service rendered by South Australia. It is possible that the South Australian authorities regard it as wise to work the lesser length of line to reach their sea-board at the minimum of profit, or even at a loss, in order to secure the incidental advantages from the trade. The present rate from Broken Hill to Port Pirie for oxidised ore is 15s. 10d. per ton; sulphide ore, 13s. per ton,—being an average of 14s. 5d. per ton; 5s. 6d. per ton being added for carriage by sea to the eastern seaboard, gives 19s. 11d. per ton total freight. Comparing this with the rate to be charged on the proposed railway, a loss would be sustained of 11s. 6d. per ton to Wollongong, 12s. 7d. per ton to Newcastle, and 5s. 1d. to Lithgow. But the cost of freight from Broken Hill to Port Pirie after the end of the year will be 12s. 3d. per ton. Therefore, the total cost to reach the eastern seaboard in 1897 will

will be 17s. 9d. per ton, which will in each instance increase the loss. Taking the greatest of the three, viz., to Newcastle, where large works are being erected for the treatment of the ore, and taking 500,000 tons as the quantity to be sent, the loss on quoted rates by using the proposed railway would be about £368,000 to the mines. To Lithgow the loss would be approximately one-half. In figures of this magnitude it is immaterial which are taken; either prove conclusively that if the rates quoted by the Railway Commissioners be adhered to, the present opportunities of approaching Broken Hill are so much more advantageous than that offered by the proposed railway, that to secure as freight the main product of the district is impossible. This, however, does not complete the case, for if the railway were constructed Broken Hill would stand in this position: Taking Newcastle as the basis, there would be approximately 800 miles of land carriage. To Wollongong it would be a little less, and to Lithgow 200 miles less. Newcastle may, therefore be regarded as the extreme case. From Broken Hill to Port Pirie is a distance of 253 miles. It is stated that the country between Broken Hill and Port Pirie, *via* Silverton, offers no engineering difficulties whatever, and that Port Pirie is a secure port in all weather, at present able to accommodate a boat drawing 18 ft. 6 in. of water, and capable of being considerably deepened at a moderate cost. Therefore if a battle were fought for the trade of the Barrier district, South Australia would probably expedite the improvement of the grades now in process towards Port Pirie. The Sectional Committee were informed that for £50,000 a grade of 1 in 74 could be obtained right through, and this work is now in progress. The Silverton tramway, which is virtually an extension of the South Australian system, would fall in with the arrangement, and the railway from Broken Hill to Port Pirie could be constructed on easier grades than those generally prevailing on the New South Wales route. Still, further, if South Australia found herself handicapped by the narrow gauge, she has it in her power, at an expenditure stated to be about £300,000, to lay down a 4-ft. 8½-in. gauge to Port Pirie, equipped as thoroughly as the New South Wales competing line, and could therefore carry to Port Pirie as cheaply per mile as the New South Wales railway. Since this Colony would have to draw 800 miles to reach Newcastle, and South Australia would only have to draw 253 miles to reach the seaboard—New South Wales would be compelled to carry the difference in distance, 547 miles, at the same cost as the sea journey from Port Pirie to Newcastle. The sea freight has already been stated at 5s. 6d. per ton. Therefore, New South Wales would have to carry ore at about one-eighth of a penny per mile over 547 miles, or at one-fourth the rate quoted as the lowest by the Commissioners in order to secure the trade.

If the case of Lithgow be taken, the distance from the Barrier being 600 miles, we find that the sea carriage represents, on the basis referred to in comparison with Newcastle, 347 miles of land carriage. Therefore, the freight, in order to equalise matters, should be reduced to about one-fifth of a penny per mile.

It was stated that an agreement had been made by the Mining Companies on the Barrier to use the Silverton Tramway for a term of seven years for all ore going west; the Silverton Tramway Company apparently not fearing any competition to the east. It appears that this arrangement is almost complete; but some witnesses although individually sure of its existence, were not able to produce a copy of the agreement to give definite information to the Committee. There is, however, no reason to doubt its existence. That being so, if New South Wales, instead of stopping at Broken Hill, pushed on her line to Cockburn, even this length at present would not be used for the conveyance of the main product of the Barrier District.

Those most interested in the carriage of the ore, it may be inferred, are the large companies employed in raising it. If an unfair rate is being levied upon them it might be expected that they would protest against it. But instead of this being the case, with the exception of the Proprietary Mine, no evidence was forthcoming, and it was only by the exercise of the powers conferred upon the Committee by the Public Works Act, that the Sectional Committee were able to obtain any evidence at all from the mine managers. Those primarily interested in low freights treat the question of connection with Sydney with something more than indifference, and regard any possibility of relief as being so remote that it is more to their interest to propitiate the owners of the means of communication at present in existence, which they look upon as likely to be their only outlet for many years to come, and possibly to remain permanently their road to the seaboard.

Port

Port Pirie has been taken as the port of shipment; the depth of water there is stated to be 18 ft. 6 in., but the Committee have not lost sight of the fact that it is stated a boat drawing 24 ft. 6 in. can now trade to Port Augusta, the distance to it from Broken Hill being some 30 miles more than to Port Pirie.

CHARACTER OF COUNTRY AND FREIGHTS (OTHER THAN ORE) WHICH WOULD BE FURNISHED BY THE DISTRICT INTERSECTED BY THE RAILWAY.

10. A full description of the country traversed by, and adjacent to, the proposed railway will be found in the Sectional Committee's Report. It is not, therefore, necessary to again describe it in detail. It is sufficient to state that, irrespective of the quality of the soil, the amount of rainfall divides the country (in the absence of irrigation) where agricultural settlement is possible from that which, for the present, the State will be wise to regard as purely pastoral land. The rainfall, beyond which it is unwise to stimulate agricultural settlement at present, may be stated at a minimum of about 15 inches. The Committee do not absolutely condemn all agricultural occupation in localities with a less rainfall, but are of opinion that the State, being possessed of large areas of land where climatic advantages are more satisfactory, the maturing of crops more regular, and the return for the expenditure of labour more certain, should not offer inducements to the agriculturist to occupy lands subject to less satisfactory local conditions.

Character of country and freights (other than ore) which would be furnished by the district intersected by the railway.

Hillston, on the Lachlan, may be regarded as the furthest western limit which, with the present knowledge, can be considered suitable for the growth of cereals.

Therefore, from Hillston the country lying easterly between the Murrumbidgee and the Lachlan may be regarded as an area where fair results may attend on agricultural settlement. In this country farmers may be settled and traffic be expected from cereals, fat stock, wool, and such supplies as are required by a considerable farming population.

West from Hillston must be regarded as pastoral country. The freight to be obtained beyond that place will consist principally of wool, some fat stock, and station supplies. The population between the Lachlan and the Darling will in all probability remain sparse for many years to come.

COMPETITION TO BE EXPECTED IN OBTAINING FREIGHT ON THE PROPOSED RAILWAY.

11. The competition for the traffic of the country proposed to be secured by this railway would arise from:—

1. The railway at Hay.
2. River carriage on the Murrumbidgee.
3. Land carriage to the Murray and river carriage.
4. The Victorian railways.
5. River carriage on the Darling.
6. The South Australian railways.

Competition to be expected in obtaining freight on the proposed railway.

The details of cost of freights will be found in the Sectional Committee's Report. If a railway were constructed to Hillston it is probable that the cost of road carriage to the Murrumbidgee, or the Hay line, would enable all traffic to be secured to this point, and that of the country southwards towards Booligal, and west as far as Mossiel or Ivanhoe.

Beyond Hillston there is a great possibility, almost a certainty, that the wool would travel west in order to use the cheap carriage offered by the river system and thus reach the railways of the sister Colonies, using only a section of the New South Wales railways.

QUESTION

QUESTION OF FREIGHT.

Question of freight.

12. The question of freight may be summarised as follows :—

1. Little ore would be obtained as freight.
2. Agricultural produce could not be expected west from Hillston.
3. No wool could be obtained far west from Hillston.
4. Wool produced beyond Hillston would use only the line to Menindie.
5. West from Hillston there would be but a sparse population requiring stores or transit.

RAILWAY TO HILLSTON, AND RAILWAY FROM BROKEN HILL TO MENINDIE.

Railway to Hillston, and Railway from Broken Hill to Menindie.

13. These matters have received special consideration from the Sectional Committee.

The Parliamentary Standing Committee on Public Works are of opinion that it may be permissible to construct works not resting on a profitable freight basis if the advantage to Crown lands be such as to compensate for any immediate shortage of revenue if settlement is likely to become sufficiently extensive to convert the loss into a profit within a reasonable time. The suggestions made by the Sectional Committee are worthy of consideration; but the fullest investigation is necessary before the State finally binds itself to execute any works entailing large expenditure.

In such schemes there should be no great disproportion between the expenditure which the Government is called upon to undertake in comparison with the advantage to be gained by the localities to be benefited and the incidental advantage to the Colony.

NATIONAL ASPECT OF THE PROPOSED RAILWAY.

National aspect of the proposed railway.

14. It has been suggested that the whole project rests upon a national basis. What constitutes a national basis has not been explained by any witness, nor have the Committee, since the inception of the inquiry, been able to discover what the advocates of the line mean by the expression. Moreover, the Committee are specially enjoined by the Act under which they work to consider the profitableness of any proposed line. They, however, feel justified in making reference to some of the national aspects of the question which present themselves to them. They are :—

1. Should Sydney become the capital of Federated Australia, it would be well that she should be as closely connected as possible with the other parts of the Continent by means of railway communication.
2. When a Trans-Continental line is extended to Port Darwin, or a line constructed from Western Australia to South Australia, there will be stronger reasons than at present exist for the construction of a railway from the eastern seaboard to Broken Hill.
3. It is possible that the question of uniformity of gauge in the Australian Colonies may have to be determined and might be influenced by the proposed railway.
4. The effect which railway construction has in enhancing the value of lands in the possession of the State.
5. The creation of community of interest. Community of interest does not spring from the construction of a railway, but from the use of it; and no national purpose is served by the creation of inferior facilities when there are in existence cheaper opportunities for reaching the same place.
6. The time which would elapse in reaching the metropolis from a far distant centre, such as Broken Hill, becomes important if the volume of trade or the number of passengers is likely to be great. In this case there appears to be no probability of any great volume of traffic, nor would there be a sufficiently large passenger traffic to justify the expenditure.

CONCLUSION

CONCLUSION ARRIVED AT BY THE COMMITTEE.

15. After taking fully into consideration the national aspect of the case, the special claims which far distant localities have upon the State, and the advantages claimed as likely to arise from the construction of the line, the Committee cannot recommend Parliament to construct a line which at best could furnish but a more expensive means of transit than that which at present obtains over much of the country to be traversed, and which would entail an annual loss of about £60,000 upon the railway system of this Colony.

Conclusion
arrived at by
the Com-
mittee.

RESOLUTION OF THE COMMITTEE.

16. The following extract from the Minutes of Proceedings of 21st October, 1896, shows the resolution arrived at by the Committee:—

Resolution
of the
Committee.

Mr. Trickett moved,—“That, in the opinion of the Committee, it is not expedient the proposed railway from Condobolin to Broken Hill, as referred to the Committee by the Legislative Assembly, be carried out.”

Mr. Fegan seconded the motion, which, after discussion, was passed unanimously.

THOS. EWING,
Chairman.

Office of the Parliamentary Standing Committee on Public Works,
Sydney, 10th December, 1896.

137

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

REPORT.

THE Sectional Committee appointed to inspect and take evidence with reference to the proposed extension of the railway from Condobolin to Broken Hill beg to report that they have visited the district through which the survey for the line has been made; have, where possible, traversed its route; examined witnesses, and obtained information generally in regard to the project.

The Sectional Committee—consisting of T. F. Ewing, Esq., M.P., Chairman, the Hon. W. J. Trickett, M.L.C., J. L. Fegan, Esq., M.P., and T. H. Hassall, Esq., M.P.,—left the Redfern Railway Station at 10.15 a.m. on Saturday, 5th September. Upon arrival at Lithgow they were met by the Mayor and several of the prominent residents of the district, and forthwith paid a visit of inspection to the local iron-works, the smelting-works now in process of erection for the Cobar Copper-mining Co., and the cokeworks at the Vale Colliery. At 7.30 p.m. they met at the Council Chambers, when the following witnesses were examined:—Mr. Bracey, Mayor of Lithgow; Mr. Ryan, editor of the *Lithgow Mercury*; Mr. Sandford, proprietor of the Eskbank Colliery and Ironworks; Mr. Blackwell, A.M.I.C.E., manager of the Vale Colliery; Mr. Wilton, colliery proprietor; and Mr. Bragg, part proprietor of the Oakey Park Colliery.

The Committee left Lithgow at 12.50 a.m. on Monday, 7th September, and proceeded by train to Parkes, where they arrived at 11 o'clock. Continuing their journey by coach, they reached Bogan Gate at 3.45 p.m., and arrived at Condobolin at 4 p.m. the following day.

On Wednesday, 9th September, the Committee met at the Royal Hall, Condobolin, at 10 a.m., and examined Mr. Burnet, Mayor of Condobolin; Mr. Innes, Council Clerk; Mr. Rabinowitch, storekeeper; Mr. Cochrane, book-keeper for Messrs. Nicholson and Reymond, flour-mill and saw-mill proprietors; Mr. Bouffler, farmer; and Mr. White, general commission agent. They concluded their inquiry at 4.20 p.m., and left next morning at 9.30 a.m. for Euabalong, *via* Cugong. They met at Byrnes' Hotel, Cugong, at 7.15 p.m., when Mr. Byrnes, hotel-keeper and selector, and Mr. Evans, miner and selector, were sworn and examined.

The Committee left Cugong at 9.30 a.m. on Friday, 11th September, and arrived at Euabalong at noon. They met at Cabot's Hotel at 4 p.m., and examined Mr. Edgar, grazier; Mr. Small, post and telegraph master; Mr. Wyer, senior-constable of police; and Mr. McLean, storeman.

The Committee left Euabalong at 9.30 a.m. on Saturday, 12th September, and arrived at Lake Cudgellico at 12.15 p.m. During the afternoon they paid a visit of inspection to the Government weir and flood-gates in Lake Creek. At 7 p.m. they opened their inquiry at the School of Arts, when Mr. Brookes, farmer; Mr. Huie, secretary to the Progress Committee; Mr. MacInnes, selector; Mr. Edwards, postmaster; Mr. Knight, prospector; and Mr. M'Ewan, storekeeper, were sworn and examined. Continuing their inquiry at 9.30 a.m. on Monday, Mr. M'Kellar, Wooyeo Station; Mr. Orr, pastoralist; Mr. Campbell, Euabalong Station; and Mr. Volkman, farmer, were examined. At 2 p.m., the Committee resumed their journey, and arrived at Merri-Merrigal at 5.30 p.m. On Tuesday, 15th September, the Committee met at Merri-Merrigal at 8.30 a.m., and, having examined Mr. Broatch, manager of the station, they proceeded to Hillston, *via* Hunthawong. *En route* they inspected the weir in the Lachlan, below the entrance to the Willandra Billabong, and the weir now in course of construction at the Middle Billabong, and arrived

arrived at Hunthawong at 5:30 p.m. In the evening, Mr. Cummings, homestead lessee, was examined, and before leaving, on Wednesday, the evidence of Mr. M'Pherson, manager of Hunthawong and Willandra Stations, was taken.

The Committee arrived at Hillston at noon on Wednesday, 16th September, and opened their inquiry at the Court-house at 2:30 p.m., the witnesses being Mr. Varcoe, miller; Mr. Nixon, farmer, Gunbar; Mr. Thomas, farmer, Gunbar; Mr. J. R. Varcoe, farmer, Hillston; Mr. Cadell, inspector of stock; and Mr. Fullerton, storekeeper. The inquiry was continued on Thursday, 17th September, when Mr. Arnott, post and telegraph master; Mr. Stewart, commission agent and Mayor of Hillston; Mr. Cowley, land tax assessor; and Mr. Sawtell, sergeant of police, were examined. Mr. Nixon and Mr. Cadell were recalled, and further examined. During the afternoon the members of the Committee were driven round the district and inspected the wheat-fields in the locality. The inquiry was concluded, so far as Hillston was concerned, on Friday, 18th September, when Mr. Milthorpe, farmer, Lake Cudgellico; Mr. Marsh, acting Crown Lands agent; and Mr. Hook, farmer, Hillston, were examined, and Messrs. Stewart, Fullerton, and Cadell were recalled, and further examined. Later in the day the Committee inspected Mr. Varcoe's flour-mill.

The Committee left Hillston at 9:30 a.m. on Saturday, 19th September, their departure having been delayed by the heavy state of the roads, consequent upon wet weather; they arrived at Roto at 5 p.m., and in the evening examined Mr. Hyndman, book-keeper, Roto Station; next day they left Roto at 10 a.m., and arrived at Big Willandra at 6 p.m.; on Monday, 21st September, met at Big Willandra at 8:15 a.m., and examined Mr. Laird, manager of the station, and Mr. Cummings, the surveyor engaged upon that portion of the route lying between Mossgiel and Hillston. Leaving Big Willandra at 10 a.m., they arrived at Mossgiel at 6:45 p.m.

The Committee met at the Court-house, Mossgiel, at 10 a.m. on Tuesday, 22nd September. Mr. Cameron, grazier; Mr. Broughton, acting stock inspector; Mr. Cheriton, farmer; and Mr. Wilson, farmer and grazier, were examined. The Committee, at 1 p.m., adjourned for an hour, when Mr. Abrahams, storekeeper; Mr. M'Innes, storekeeper and homestead lessee; Mr. Parsons, grazier; Mr. Brush, grazier; and Mr. Capewell, senior-sergeant of police, were examined. Mr. Cameron was recalled, and further examined. The Committee left Mossgiel at 8:30 a.m. on the following day, and 8 miles from the township were met by Mr. Little, the surveyor engaged upon the route between Mossgiel and Menindie. Mr. Little was sworn and examined, and then accompanied the party as far as Kilfera, which was reached at 4:30 p.m. The Committee met at Kilfera at 8 p.m., it having been arranged that the Ivanhoe witnesses should give their evidence at Kilfera instead of at Ivanhoe, in order to save the Committee an unnecessary journey of 15 miles. In pursuance of this arrangement, Mr. Williamson, storekeeper, Ivanhoe; Mr. Villa, storekeeper, Ivanhoe; Mr. Cameron, manager of Marfield Station; and Mr. Herbert Lloyd, manager of Baden Park Station, attended, and were examined. Mr. Webb, part owner and manager of Kilfera Station, was also sworn and examined.

The Committee left Kilfera for Menindie at 12:30 p.m. on Thursday, arriving at Beelpajah at 5:30 p.m. the same afternoon. Next day they continued their journey as far as German Tank, where they stayed the night. Leaving German Tank at 7:30 a.m. on Saturday, 26th September, they arrived at Bulla Bulka at 4:30 p.m. Mr. Angus McCallum, overseer, Tolarno Station, and Mr. Jamieson, station employee, were sworn, and examined. The Committee left Bulla Bulka next day (Sunday) at 8:30 a.m. At 2 p.m. they stopped at the Toorincaca Bore, and obtained from Mr. Gardiner, who is in charge of the bore, a statement as to the strata passed through and of the work done up to date. Continuing their journey they reached Amphitheatre at 5:30 p.m., and stayed there until 1 a.m. on Monday, 28th September, arriving at Menindie at 8 a.m. the same morning. In the afternoon the Committee paid a visit of inspection to the Menindie Meat Preserving Company's Works, 4 miles from Menindie, and afterwards to Lake Pammamaroo, where an attempt is being made to permanently shut out the Darling water in order to allow of the cultivation and irrigation of the dry bed of the lake.

The Committee opened their inquiry at the Court-house, Menindie, at 10 a.m. on Tuesday, 29th September, when the following witnesses were examined:—Mr. Davies, accountant and secretary to the Menindie Boiling Down and Meat Preserving Co.

Co. (Limited); Mr. Besely, manager; Mr. Coates, meat expert; Mr. Klemm, storekeeper; Mr. Haines, manager, "Crown Hotel"; Mr. Maiden, grazier; and Mr. Scobie. Mr. Faust, storekeeper, made an affirmation and was examined.

The Committee left Menindie for Broken Hill at 3.15 p.m. on Wednesday, 30th September. They stayed the night at Kars, and arrived at Broken Hill at noon the next day.

The Committee met at the Town Hall, Broken Hill, at 10 a.m. on Friday, 2nd October (the previous day having been a public holiday), when the following witnesses were sworn and examined:—Mr. Souter, Mayor of Broken Hill; Mr. Eley, traffic manager, Silverton Tramway Co.; Mr. Oswald, mercantile agent and sharebroker; Mr. Isaac, auctioneer; Mr. Stewart, manager of the Broken Hill Proprietary Silver-mining Company (Limited); Mr. Boan, soft goods importer; Mr. Maddox, sub-collector of Customs; Mr. Sweetapple, mining contractor; Mr. Quinn, hotel-keeper; Mr. Maiden, grazier; Mr. Hyde, wood merchant; Mr. Alderman Wright; and Mr. Counsell, accountant. The Committee adjourned at 5 p.m., and afterwards inspected the surface as well as the underground workings on the Proprietary Company's property, returning to the hotel at midnight. Their inquiry was resumed at the Town Hall the following day at 10 a.m., when Mr. Eley and Mr. Maddox were further examined, together with Mr. Bryce, auctioneer; Mr. Whysall, post and telegraph master; Mr. Gluyass, general manager, Broken Hill South Gold-mining Company; Mr. Warren, manager, Block 10 Silver-mining Company; Mr. Adams, manager, Central Silver-mining Company; Mr. English, surveyor; Mr. Fielder, builder; Mr. Froman, produce merchant; and Mr. Wilks, inspector of stock. Subsequently the Committee, accompanied by the Mayor and Aldermen and other residents of Broken Hill, visited the water supply works at Stephen's Creek, about 13 miles from the town.

The Committee left Broken Hill at 7.15 p.m. on Sunday, 4th October, arriving at Adelaide next day at 10.40 a.m. In the afternoon they met at the Deputation Rooms, Department of Public Works, when Mr. Pendleton, Commissioner of Railways, made a statement with regard to grades, means of transit to Port Victor, Port Adelaide, Port Augusta, and Port Pirie, the supply of materials likely to be carried to and from the Barrier Field, and other matters pertaining to the inquiry. Mr. Alexander Moncrieff, Engineer-in-Chief, also submitted a statement. On Tuesday, 6th October, the Committee met at the "South Australian Club Hotel," Adelaide, at 10 a.m., to consider their report, and were engaged in its consideration until 9 p.m. Next day they interviewed Mr. W. R. Cave, merchant, of Adelaide, with regard to shipping freights and fares from the various South Australian ports at which the Broken Hill traffic can be dealt with. The Committee left Adelaide at 4.30 p.m. the same day, arriving in Melbourne at noon on Thursday, 8th October. At 2.30 p.m. they had an interview with Mr. Macnicol, secretary of the Silverton Tramway Company. On Friday, 9th October, the Committee obtained a statement from Mr. H. C. Mais, late Engineer-in-Chief of Railways, South Australia, and engineer for the construction of the Silverton tramway, leaving Melbourne by express train at 5.15 p.m., and arriving at Sydney at 12.30 p.m. on Saturday, 10th October.

On Wednesday, 14th October, the Committee met at the office of the Parliamentary Standing Committee on Public Works, and further considered their Draft Report. On Thursday, 15th October, the Report was adopted, and signed by the Chairman.

1. DESCRIPTION OF COUNTRY TRAVERSED BY THE COMMITTEE AND REMARKS WITH RESPECT TO MATTERS WHICH ARE OF IMPORTANCE WITH REGARD TO THE PRODUCTIVENESS OF THE AREA AFFECTED BY THE PROPOSED RAILWAY.

The road by which the Committee proceeded from Condobolin to Euabalong follows the north bank of the Lachlan River, passing through the pastoral properties of Kiacatoo and Booberoi.

The country traversed may be generally described as low-lying flats covered with box, open plain, and gravelly or sandy ridges, upon which grows chiefly pine and yarran. The Committee were informed that further back from the river the land was overgrown with mallee and pine scrub. The land on the south side of the river was said to be similar to that over which the Committee travelled.

From

From Euabalong to Cudgellico the road continues on the northern bank of the Lachlan for about 9 miles; then it crosses the river, and bears in a southerly direction to Cudgellico, a distance of 18 miles. The country traversed comprises open plains interspersed with belts of box, and, after crossing the river, gravelly ridges and loose soil, upon which grow box, pine, wilga, yarran, and a little mallee. A considerable portion of the soil is suitable for the growth of cereals; but there is little evidence of agricultural occupation, there being but one cultivation paddock of any importance in view of the road, that being near Cudgellico.

Cudgellico is a small township situated upon the southern side of the lake from which it takes its name. The lakes in the vicinity when full are said to have a circumference of nearly 60 miles. Cudgellico Lake is surrounded by low sloping hills, with long tongues of low-lying land covered with box, some of which serve to carry the flood-waters to lakes during dry seasons, separating their basins. The Committee were informed that on two occasions the whole of the lakes were absolutely dry. They are filled by the overflow of Lake Cudgellico, which in its turn derives its water from the Lachlan by a small creek known locally as Lake Creek. The Committee inspected the flood-gates erected in this creek, about 4 miles from the township, which were designed to prevent the outflow of water from Lake Cudgellico during times when the Lachlan is low. The construction is of a primitive description, calculated to seriously impede the flow into the lake, unless at times of high flood, and stated to be ineffective in preventing the outflow when the river is falling.

At Cudgellico the soil is red and loamy, the country consisting of open plains interspersed with belts of box and pine ridges. The pine scrub becomes dense as Uabba Gap is approached, where, for a few miles, the ground is broken and gravelly; but beyond the Gap, and right on to Hillston, except where the ridge approaches close to the river at one point above Willanthry, the land may be described as open plains interspersed with belts of box, with good flats on the river-bank running back into open plains, much of the land being more suitable for pastoral than for agricultural occupation. Behind these plains, and at times approaching more closely to the river, are large areas of light, loamy soil, suitable, when cleared, for agriculture.

The evidence taken at Cudgellico was to the effect that wheat could be grown in the district with reasonable certainty of a profitable crop; that the wool produced was of good quality, but that the district was suffering primarily from isolation and from the rabbit pest. There was, further, always some danger of drought.

There is no evidence of recent progress in the district, except adjacent to Hillston. Many years ago mining enterprise at Cudgellico was hopeful, but, although there are abundant evidences of auriferous deposits, they have not been profitably worked up to the present. Years ago, when the pastoralists were improving their properties, there was a considerable amount of work in the district; but these improvements having been made, there is depression amongst those who were accustomed to profit by the employment thus afforded.

From Cudgellico the road for the first few miles passes through Wooyco run, until it approaches the Gap in the Uabba Range, whence, to within a mile of the Merri Merrigal homestead, a distance of about 12 miles, it passes through Uabba Run. From the homestead it traverses Merri Merrigal and Hunthawong holdings for a distance of about 28 miles, and so to Hillston.

There has not been any extensive alienation of land lying back from the river; but large purchases have been made on the frontages, Merri Merrigal having 30,000 or 40,000 acres of purchased land within 4 miles of the river. There is also a large area of freehold upon Hunthawong. Towards Hillston, and here and there along the route, some land is in the occupation of selectors, but these holdings form but a small portion of the total area.

Between Merri Merrigal and Willanthry the Committee inspected the weir immediately below the junction of the Willandra Billabong—which weir has been erected to force the Lachlan water up the billabong—which reaches as far west as a point south from the track between Beelpajah and German Tank.

From Hillston, after crossing to the west bank of the Lachlan, about 8 miles from the town, the Committee followed the stock route running in a north-westerly direction to Roto. The

The country between the Willandra Billabong and the Lachlan is held partly by some half-dozen homestead lessees, and partly by the lessees of Big Willandra station. West from the stock route, the land forms part of North Marrowie pastoral holding, and there are also a few homestead lessees in occupation.

This part of the district may be described as consisting principally of open plains, intersected by low sand-hills, on which there is some pine scrub. The timber upon the plains is chiefly box, with some myall upon the low-lying land.

About two miles from the river is Marrowie Creek. A weir across the Lachlan is in course of construction, near the middle billabong, some distance below Hunthawong station. It is anticipated the weir will turn the water of the river into the creek, thence into Box Creek, and so into Lake Pitai Punga and Lake Paika, until it reaches the Murrumbidgee, some 20 miles north from Balranald. Marrowie Creek is, on the average (though the distance is less to the north), about 15 or 20 miles distant from the Lachlan and the Murrumbidgee.

Roto station is situated upon the Willandra Billabong, up which the flood-water from the Lachlan was running in a steady stream at the time of the visit of the Committee.

The line as located by the Department on the north side of the Lachlan, between Roto and Euabalong, was described by many witnesses as being on the edge of the good country, mallee being met with a short distance beyond the line north from Roto homestead. It is said that it covers an extent of country 50 miles by 20 miles, although broken here and there by better country. Going westward the mallee is said to cover a large part of Coombie and part of Trida and country to the north therefrom.

Generally speaking, the land adjacent to the proposed line is regarded as inferior for pastoral purposes, and not likely to be used for agriculture for a great many years. From Roto the Committee traversed the country adjacent to the proposed line, passing through North Narromine, Big Willandra, Moolbong, and Boondara holdings to Mossgiel. This country consists of level open plains, with a narrow belt of box along the Willandra billabong, and close to the shallow depressions in which water rests for a short time after rain. These plains are thickly covered with a white flowering plant locally known as daisy, which has taken the place of more valuable herbage, and is itself comparatively valueless for fodder, but trefoil and barley grass were growing wherever water was lying after a recent storm. Towards Mossgiel the herbage consists chiefly of silver grass and crow-foot. In parts considerable areas are covered with roly-poly, and the low-lying land with lignum. Close to the township blue bush is met with. A great portion of this land is unsuitable for wheat-growing, though there are large areas of suitable soil from which tolerable crops might at times be expected were the rainfall sufficient.

From Mossgiel the road passes through Mossgiel Holding for 28 miles, and then through Kilfera Holding, close to the homestead, 35 miles from Mossgiel. On Mossgiel Holding there are said to be four homestead leases. For the first 12 miles the country consists of open red and black soil plains. Blue-bush is then met with, the land upon which this shrub grows being suitable for wheat-growing with a sufficient rainfall. This country is succeeded by open plains, intersected with small belts of scrub, and, for some few miles near Kilfera Homestead, salt-bush occurs.

A considerable portion of the land traversed appeared to be inundated by flood-waters at times. After leaving Kilfera open plains and red sandy hills are crossed, until near Beelpajah, where the country becomes undulating, there are shallow depressions forming lakes after wet weather, but frequently they are but swamps or completely dry. Similar country continues on to German Tank. The principal timber is belar, with occasional belts of mallee, pine, and yarran, interspersed with leopard wood, currant-bush, and apple-bush. There are small patches of blue-bush, salt-bush, and cotton-bush, the principal grasses being barley grass, trefoil, and, in places, large quantities of silver grass and crowfoot. Considerable areas would be suitable for wheat if the rainfall were sufficient.

After leaving German Tank there is no material change in the character of the country until about 6 miles west of Bulla Bulka, when the soil becomes sandy, and stunted pine and sandalwood make their appearance, interspersed with belts of blue-bush and a little salt-bush. With the exception of a few box flats, the country remains unaltered until within a dozen miles of the Darling, where it is generally low

low lying and subject to inundation by the water of the river, this being clearly denoted by the presence of the lignum, which here covers a considerable area. Belts of box fringe the watercourses, and on the banks of the river a little red gum is met with. The whole of this district west from Bulla Bulka appears to be suffering from a very severe drought, and there is very little pasture.

Operations at the bore inspected between Bulla Bulka and Amphitheatre have been suspended since April through the breaking of the drill, portion of which is jammed in the bore. There was no information available which would enable an opinion to be formed with regard to the probability of the success of the work.

Going west from Menindie and adjacent to the Darling, the ordinary box flats and a little gum were passed; but back from the river the soil becomes sandy. The road then turns into Menindie Lake, which is nearly dry, and follows close to its northern bank for about 11 miles. It then passes out into sandy country, and so on to Lake Speculation, whence it may be generally described as open red soil country, with a little mulga and sandalwood. This country extends as far as Kars station, about 30 miles from Menindie. From Kars to Rockwell, about 12 miles from Broken Hill, the country is generally open salt-bush plains, with here and there some *nelia* bush. From Rockwell into Broken Hill it is rough and stony, and was originally thickly covered with mulga; but the country has now been completely denuded of timber.

2. THE TREND OF TRAFFIC IN THE AREA AFFECTED BY THE RAILWAY UNDER CONSIDERATION.

The extension of the railway to Condobolin will divert some traffic which now goes to Whitton; but to what extent that diversion will take place will depend upon the relative cheapness of carriage by rail from these places, their distance from the districts from which the traffic will come, and the abundance or scarcity of water and grass along the routes to either railway station. The residents of Euabalong are of opinion that traffic which previously went *via* Whitton will go to Condobolin from quite 40 miles down the Lachlan, below Euabalong.

The freight from Cudgellico to Whitton is £3 a ton. It is estimated that when the railway reaches Condobolin the road carriage to that place will be £1 5s. a ton. There will, however, still be 60 miles of road carriage to Condobolin from Cudgellico, and that appears to be a greater distance than agricultural produce can be profitably sent by teams.

The wool produced in the Hillston district makes either to Sydney *via* the Hay line, or by the Murrumbidgee and Murray Rivers, *via* Echuca, to Melbourne. The road carriage is stated to be about £3 per ton.

The cost by rail to Sydney, or by river and rail to Melbourne, appears to depend not upon a fair charge for the service performed, but upon the rates which can be obtained by pitting the offers of the rival railway systems against each other. Since wool goes to both capitals it is probable that there is not much difference in the cost. It would appear from the evidence that to Sydney the freight is a few shillings a ton cheaper; but when carriage is done at cut rates, which are continually varying, it is impossible to obtain a stable basis for comparison.

By means of these rates there can be little doubt that large producers of wool obtain advantages greater than those enjoyed by those engaged in the same industry for whom an equal service is rendered in parts of the Colony where there is an absence of competition.

Wheat for home consumption uses the New South Wales railway system. Wheat for export would eventually, no doubt, be subject to the same competitive rates as wool. The remarks with regard to wool may therefore be regarded as also likely to apply to the wheat traffic, if it became sufficient in volume as to merit the attention of the Victorian authorities.

The wool from Big Willandra is sent to Melbourne, *via* Hay, going down the Murrumbidgee and up the Murray to Echuca by steamer, and so on by railway. The road carriage from the station to Hay is £3 a ton, and to Hillston would probably be 25s. a ton. Therefore, unless the freight from Hay to Melbourne was less by 35s. a ton than the freight from Hillston to Sydney, this wool would be sent to Sydney.

Mossgiel

Mossgiel is situated 100 miles from Hay and 60 from Hillston. The present freight to Hay is stated to be about £3 a ton, and it has been as high as £6 a ton, when the travelling-stock route has been in a bad condition. It is reasonable to suppose that with a railway to Hillston, and a set of traffic in that direction, the rate of road carriage would be proportionate, and therefore about three-fifths of that charged to Hay.

If the railway were constructed to Hillston it appears probable that town would become the depôt for wool from the country as far west as Ivanhoe.

It is stated that most of the sheep depastured within 50 miles of the Darling are driven into the head stations on the river to be shorn, and that the wool can be sent from these places to Melbourne for £2 15s. a ton, taking the minimum cost, or for £3 a ton as an average rate. Therefore, west of Kilfera or Ivanhoe no railway is likely, at anything approaching fair rates, to obtain the wool trade.

Wool from some of the stations—Tolarno, for example—goes down the river to Murray Bridge, and thence by train to Port Adelaide. Since this is the route chosen it is reasonable to infer that the cost of transit to Port Adelaide is certainly no greater than the cost of transit to Melbourne.

The rate for greasy wool from Orange to Sydney, 192 miles, is £2 15s. a ton. The distance from Orange to Menindie (from whence to Melbourne it is stated the rate for wool is also £2 15s. per ton) is approximately 430 miles; therefore, if the proposed railway were constructed, and no other influences were at work, the traffic would split halfway between Orange and Menindie, or about Hillston, the traffic from Hillston west going to the Darling and from Hillston east going to Sydney. The western portion of the line would thus prove a strong competitor with other parts of the New South Wales system. If the railway had its terminus at Hillston, this competition would not be possible, and traffic, in all probability, would be drawn to Sydney from the country as far west as Ivanhoe, which, it is probable, if the through line were constructed, would make for the Darling.

Fat stock might at times be sent from the Darling stations to the Sydney market; but it is stated that Tolarno, with an area of 900,000 acres, sends away not more than 6,000 fat sheep in a good year (which may be taken to be of not frequent occurrence), and of these, only about one-half would come to Sydney. Therefore, it is clear that no advantage commensurate with the great outlay would come from such a traffic. This is possibly, although given in evidence, an understatement of the case; but it gives a substantial idea of the probable return.

At Menindie, the Darling would prove a serious competitor with the railway for the trade of the district. The sub-collector of Customs at Wentworth gives the registered tonnage of steamers and barges (197) trading up the river as 14,658 tons, and the freight carried as 5,053 tons. The number of steamers and barges trading down the river he states to be 182, the registered tonnage 12,882 tons, and the freight carried, 3,949 tons.

Rates of freight from Echuca and Morgan to Menindie are said to be 20s. and 30s. a ton to Wilcannia. Down freights vary from 20s. to 30s. a ton from either Menindie or Wilcannia to either Echuca or Morgan. Traffic on the Murray may be suspended from January or February to May inclusive.

The evidence taken at Menindie shows that navigation on the Darling has been known to be unimpeded for seven years up to that place, and that it has been unnavigable for as long a period as eight months.

River rates are quoted to Echuca, Morgan, Murray Bridge, and Goolwa, as low as 20s. a ton. This must be regarded as a special rate, and it is urged that it is being given by a strong company which desires to destroy competition, and thus secure a monopoly of the river trade. This rate is, however, an index to what might be obtained if the volume of trade were sufficiently large. The evidence discloses some discrepancy with regard to the through freight *via* the river ports to Adelaide; but £2 a ton seems a reasonable rate to allow. Upon the N.S.W. railway £2 would carry a ton of wool 130 miles (Rate Book, p. 38, Locksley), so that the main product of the district more than 600 miles from Sydney can be carried to market as cheaply, though not so expeditiously as wool can be sent from within 130 miles of the metropolis. Therefore it becomes a question from how far east the Darling will continue to draw traffic if the railway be constructed; and to those desiring to carry the main produce of this district to Sydney by rail, the contemplation of the river rates, combined with the opportunities given by rival railway systems, may be somewhat startling.

The

The outlets for traffic from Menindie are by road to Broken Hill, and thence to Port Adelaide, the quoted rate being £5 5s. a ton; or *via* Echuca to Melbourne; or *via* Murray Bridge or Morgan to Adelaide; or *via* Goolwa to Port Victor. For the last three, although only available while the river is navigable, the charges then are so much cheaper than any rate that the Commissioners could offer, that they furnish contrasts, not comparisons, as is apparent from the previous paragraph.

Importance was attached to the fact that a considerable market would be found in the west for produce grown between Condobolin and Hillston, but inasmuch as the population between Hillston and Menindie which would be affected by the construction of the proposed line is not more than 2,000, and as that population is not likely to largely increase, but a very small proportion of the products would be able to find a market there. With regard to Broken Hill, the main market of the west, it may be pointed out that while Condobolin—the starting point of the line if taken as a centre—is distant 366 miles from that place, there are large wheat-growing districts in South Australia within 200 miles, so that the South Australian farmers may successfully compete for the trade, unless the New South Wales wheat can be carried for 366 miles at the rate charged upon the South Australian lines for 200 miles.

3. DIVISION OF COUNTRY INTO AGRICULTURAL AND PASTORAL AREAS.

Nearly all the best country beyond Cugong, which place is practically on the border of the Central and Western Land Divisions, is practically locked up from settlement until 1918. It is difficult to estimate what effect the construction of this railway will have upon agricultural settlement in a locality where the best of the land is leased for twenty-two years. In order to explain how completely even the country lying comparatively close in is given over to pastoral occupation, it is sufficient to state that the Euabalong police patrol district comprises an area 46 miles long by about 35 miles wide, and within that area there are but 370 people, of whom possibly fewer than 100 are adults. This is significant of the population along the whole of the line submitted to the Committee. Beyond Hillston the character of the country, the appearance of the few crops that were seen, and the evidence of a scanty rainfall made it clear to the Committee that they were passing beyond the limits where agricultural settlement was possible according to present ideas. Crops are occasionally obtained in the vicinity of Mossgiel and, in fact, as far west as the Darling, and there is no doubt that with a larger rainfall fair returns might be obtained. At present it is not reasonable to expect more than one crop out of two at Mossgiel and less as the route proceeds inland. The Committee are of opinion that the State will do well not to encourage the settlement of a farming community in these dry belts until the large areas of more suitable land which are available in various parts of the colony are occupied.

In Victoria, wheat is stated to be successfully grown in the mallee country with a rainfall of 14·7 inches, at Swan Hill and at Hopetoun with a rainfall of 15·4 inches.

A map herewith shows the position and extent of the mallee country in Victoria, the area of which is stated to be 3,793,738 acres, and the approximate area under cultivation is 722,175 acres.

The information which the Committee gained in South Australia justifies them in expressing the opinion that farming operations with a less rainfall than 15 inches are more than precarious.

It is not wise to dogmatise as to the manner in which this western country may eventually be used. All that is necessary is to view the matter comparatively. The Committee do not regard the country west and north of Hillston as wholly unfit for agriculture; but they consider that the distance from a market, the unsuitability of a great part of the soil, and the scanty rainfall, combined with the fact that large areas of better land are available around and to the east of Hillston, make it unlikely that it will be settled by a farming community in the near future.

Therefore all agricultural settlement and grain returns must be looked for almost entirely for the present from the country between the Lachlan and Murrumbidgee Rivers. If the railway is to have much effect upon agricultural occupation, or to benefit from the carriage of grain, it will be from within these boundaries. This fact has not been adequately recognised in the location of the line.

Beyond Hillston, the returns to any railway will be almost entirely the result of pastoral occupation; and the proportion obtained will be subject to special rates from the competition of the Victorian and South Australian railways and the river system.

4. EFFECT OF RAILWAYS UPON PASTORAL COUNTRY LYING WEST FROM THE LACHLAN IN COMPARISON WITH THE EFFECT UPON COUNTRY SUITABLE FOR AGRICULTURAL OCCUPATION.

The effect of railway construction, where closer settlement is possible, is widely different from its influence upon pastoral lands. The benefit of a railway to pastoral property consists in—

- (1.) The cheap freight obtained for wool.
- (2.) Ready means of sending fat stock to market.
- (3.) Opportunity provided for moving starving stock in times of drought.

With reference to No. 1—Kilfera wool is now sent to Melbourne for £6 2s. 6d. a ton, and, taking the rates quoted by the Railway Commissioners, it is not likely that if the proposed line were constructed the saving by rail to Sydney would be more than £1 a ton. The area of this run is 832,000 acres, and 90,000 sheep may reasonably be taken as the average number depastured there. One sheep to 8 to 10 acres appears from the evidence to be a fair estimate of the carrying power of the country year by year. Taking 6½ lbs. as the average weight of a fleece (evidence of Hillston Inspector of Stock), the annual production of wool from this station may be put down as 270 tons. Allowing a saving of £1 a ton in freight, the net gain to holders of the run would be £270, or about $\frac{1}{13}$ th of a penny per acre. On this basis the saving to a homestead lessee with 10,000 acres, which is the recognised basis of closer settlement in the west, would be about £3, an unappreciable amount upon such an area.

No. 2.—Carriage of Fat Stock to Market.—Evidence was given to show that a flock of sheep driven from Mossgiel to Carrathool lost on the average 13 lbs. per head during the journey. This loss, of course, would be less where sheep were trucked to their destination. These remarks, with regard to loss, apply equally to every portion of the western district which is without railway communication. The railway would, therefore, be of advantage were the stock for disposal in the Sydney market, when the stock routes were closed during drought; but only a small proportion of the stock will be sent away as fat, and then the destination will, in many instances, be Victoria, Adelaide, and the refrigerating works which are being erected in various centres. Therefore, the amount of fat stock freight right through to Sydney would be a very small proportion indeed of stock depasturing in the district, and not even a conjecture can be offered as to what the proportion would be.

No. 3.—Moving Stock in times of Drought.—Continual reference was made to the advantage which would accrue to pastoralists if an opportunity were given for moving sheep during periods of drought. There can be little doubt that such facilities would be of some benefit to the pastoral industry and to the Colony generally. Still, it is well in matters of this description not to over-estimate the advantages which would result from better means of communication. It is therefore well to state the case plainly. A pastoralist, anticipating a drought, would no doubt make use of the railway to get a proportion of his sheep to market, and thus bring about a result which would be impossible were the stock roads closed owing to want of feed and water. Further, if the drought were but a partial one, it would at times be possible for him advantageously to move the stock from the drought-stricken country to another district, where food and water were obtainable. These two operations could at best be applied to but a small proportion of his stock, and only when the drought was partial, and must be considered purely as a commercial transaction. If the area suffering from drought extended for a considerable distance from his holding, possibly it would not pay him to disburse the amount required for carriage, for rent of paddocks, and for return expenses. There will also be a tendency on the part of any stockowner to keep his sheep upon his own property until the last moment. Therefore, generally speaking, the time would have passed when there would have been any possibility of getting rid of much of his stock as fats before he would have commenced operations for removal by train. Again, if paddocks could not be obtained contiguous to the railway, the stock would be compelled to travel the intervening distance in an impoverished condition. There is little doubt that a great number of pastoralists would rather risk the chance of rain

rain coming than incur the expense of moving their stock, paying agistment, and the certain loss that would be attendant upon the operation. Without entering more than generally into the question, it is apparent that nationally it would be some benefit to the State if it were possible to move stock from those districts which are frequently devastated by drought, but the operation must at best be limited to a small area of country, and although of some advantage, it is not likely the railway would be utilised for this purpose to the extent stated by some of the advocates of the line.

Having thus explained the advantages to pastoral occupation, it is sufficient to state that the saving of the road freight from Hillston to the Hay line (approximately 100 miles) appears on an average wheat crop to approach 6s. per acre. These remarks must be taken only in connection with the area under consideration, but are sufficient to demonstrate that while a railway may have a stimulating effect upon pastoral enterprise, it forms a great factor in the success of agricultural settlement.

5. RABBITS.

The question of the productiveness of the land is vital in connection with railway communication.

Since the rabbits have severely impaired the productiveness of the western country, the Committee feel justified in considering this question more fully than would appear at first justifiable.

It is universally stated that the advent of the rabbits has diminished the carrying capacity of the pastoral holdings between the Lachlan and the Murrumbidgee, and north and west from the Lachlan, by at least 30 per cent., and to a greater extent further west. The amount expended upon their destruction has been variously estimated; but in every instance where a vigorous attempt has been made to check them, it has been attended by very considerable expense. To deal with them with any hope of success renders it necessary to wire-net all boundary fences and cultivation enclosures, at a cost of from £25 to £30 per mile for the netting alone.

The rabbits eat out the natural herbage at times almost completely, and in its place spring up weeds, many of which are poisonous for stock.

The means taken to contend with the rabbits are trapping, shooting, digging out, hunting with dogs, poisoning the water (where only a few water-holes are available to the rabbits), and poisoning by laying pellets of phosphorised pollard or wheat close to their burrows. By these means the pest may be fairly well kept in check, but there seems to be very little hope of its complete eradication.

The manager of Big Willandra states that the average number of scalps paid for on that holding in the eight months, March–October, 1894, was 41,700, the highest number paid for in any one month being 87,077. Rabbits were killed also by poisoned wheat and poisoned water, and in other ways, by the proprietors of the run. The heat wave of last summer worked great havoc among the rabbits, and in some districts almost exterminated them, but with the advent of the cooler weather and good pasturage they rapidly increased. Still the efforts of the run-holders have been fairly effective in holding the rabbits in check. The number of scalps paid for on Big Willandra averaged 6,400 a month from March to September of the present year, the largest number obtained in one month being 13,745.

Evidence given at Mossgiel showed that where rabbits made an appearance upon country upon which edible shrubs were growing, they diminished its carrying capacity from 50 to 80 per cent. (these figures must be regarded as special cases); but in open plain country the depreciation is not more than 25 per cent., and after a spell of three or four years the country, if cleared of rabbits, would recover.

With regard to legislation, there is a strong feeling in the district that all occupiers of land should be compelled to destroy the rabbits. All attempts to get rid of the pest must, to be effective, be carried on simultaneously and persistently by all occupiers. With regard to the Crown land, there are millions of acres which are practically deserted, and the breeding places of rabbits and wild dogs. It is insisted that the Government should undertake the same obligation in regard to the destruction of rabbits upon this land as it is proposed to impose upon private individuals. In regard to this it may be pointed out—

- (1.) That the private owners of land can fairly well protect themselves by surrounding it with wire-proof fencing.
- (2.)

- (2.) That the private individual destroys the rabbits in order to obtain a better return from the land in its increased production; but the State is in a different position, inasmuch as it gets no return from the land, and would be in no better position if the rabbits were kept in check, if the land remain unleased. If it were possible to exterminate the pest, no doubt the value of the land would be increased; but it does not appear that there is any hope of their absolute extermination. Therefore, in dealing with the rabbits, the State would be under a continually recurring expense, for which it would obtain no return, and the areas are so vast that it is difficult to advise that the Government should accept the obligation. The deplorable condition of the country, however, justifies the Committee in offering the opinion that it might be wiser for the State to permit the occupation of these vast areas for almost any return at all, and with any reasonable tenure, than to endeavour to deal with the rabbits by any of the recognised methods. The Committee were informed in South Australia that lands were given for five years free in order to have the pest destroyed. Some equitable arrangement might be made whereby the State should discharge its obligation by bearing portion of the expense of wire-netting the division fences between its land and that of private individuals, it being recognised that although wire-fencing stops the rabbit-wave it permits leakage.

Closer settlement is recognised as the only certain cure for the pest; but how is closer settlement possible in a country visited periodically by heavy droughts, and with an average carrying capacity of one sheep to 10 acres? It is especially unwise to endeavour for any purpose to stimulate close settlement on such land in a colony yet possessed of vast areas more suited for close occupation.

6. THE RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

Having now described the present position of the country through which the proposed line would run, the use to which it will be put, and matters that are likely to interfere with its productiveness, we proceed to consider the main question submitted to the Committee, namely, the construction of a line from Condobolin to Broken Hill.

Broken Hill is a town of about 20,000 inhabitants. It appears to be in a stable and prosperous condition. The number of men employed in the mine and work incidental thereto is 5,000. The evidence with regard to its stability and permanence for a period of years fully verifies the statements made before the Parliamentary Standing Committee on Public Works.

The Manager of the Silverton Tramway states that the through passengers by rail from Sydney for the year ending 30 June, 1896, was 156; to Sydney, 122. These represent passengers using the railway for the entire route. There is no return of those who used the railway to Adelaide, and proceeded thence by steamer to Sydney. The railway and steamer fares from Broken Hill to Sydney, *via* Adelaide and Port Adelaide, are given in Mr. Cave's evidence. Taking 2nd-class single as an example: From Broken Hill to Sydney, *via* Adelaide, the present railway fare is £5 15s. 6d. The fare from Broken Hill by rail to Port Adelaide, and thence to Sydney by steamer, is £3 11s. 1d. The first-class and return fares are in the usual proportion.

The imports from South Australia for last year are stated to be of the value of £544,239, and the exports to South Australia to £1,917,354. 219,844 tons of bullion were carried over the South Australian railways in the same year. The value of rough timber imported in 1895 was £77,902, and dressed timber £999. The quantity of coke imported in 1895 was 55,251 tons, and coal 42,843 tons. The values of foodstuffs imported during 1895 were as follows:—Potatoes, £5,821; vegetables, £6,845; butter, £19,011; eggs, £6,950; bran, £9,958; hay and chaff, £20,458. It is probable that these figures are not absolutely correct, but the Mayor of Broken Hill stated that he believed them to be accurate; and, in the opinion of the Committee, they are sufficiently close to be regarded as a fair approximation.

It is therefore apparent that the importance of Broken Hill and its trade is established beyond doubt. But the matter for the Committee to decide is not the question of the stability or importance of Broken Hill alone, but whether it is possible

possible for this Colony to give the town and district any means of communication which will be more beneficial to its enterprise and more advantageous to its inhabitants than those at present in existence. The question, therefore, is not the volume of trade, but the cost of freight.

Before entering into the consideration of this matter, which virtually dominates the whole position as far as the Barrier district is concerned, it is well to point out that in the immediate future there is a great probability of a considerable change in the industry at present in existence at Broken Hill. The establishment upon the eastern coast of Australia of various smelting-works, able to deal not only with the lead and silver, but also with the zinc, makes it fairly certain that the difference in the cost of freight between Port Pirie and Europe, and between Port Pirie and our eastern seaboard, will, in the near future, cause all the ore raised in Broken Hill to be treated in Australia. (It is stated that 41 per cent. of the ore using the railway at present eventually reaches Europe.) Therefore, nearly all the product of Broken Hill, instead of going abroad for treatment, will in some form or other reach the smelting and concentrating works on the eastern coast. It is contended by some that there will be a complete abandonment of the system of treatment of the ores on the Barrier locally, but the Committee are of opinion, after hearing the evidence, that this statement may be too sweeping, and prefer to use the more moderate phrase—that there will be very considerable reduction of the amount of ore treated locally, which will remove the necessity for the importation of a large portion of the coal imported, and will almost completely destroy the demand for coke. Therefore, from the mining standpoint, the question to be decided will not be so materially affected by the freights of coal and coke as of that of ore. There appears to have been some misapprehension with regard to the amount of coal required to treat a ton of silver ore. It was stated before the Parliamentary Standing Committee on Public Works that approximately $3\frac{1}{2}$ tons of coal were required to treat a ton of ore. It was, however, stated by the Manager of the Proprietary Mine that approximately it takes 93 tons of coal to treat 100 tons of average silver ore raised from the Proprietary Mine. Of this, approximately 9 tons are required in the extraction and dressing of the ore and other operations* connected therewith, and the balance is required for the treatment of the ore for the recovery of the contained metals.

The Manager of the Proprietary Mine states that the $3\frac{1}{2}$ tons of coal mentioned might probably be required in the treatment of the residue of the ore for the recovery of the zinc; and that, generally speaking, a ton of coal may be regarded as sufficient to treat a ton of ore. The Committee have no reason to doubt this information. If it be so, as far as the mines are concerned, it would appear to be immaterial to the enterprise whether the coal be brought to the ore for the first portion of its treatment, or the ore to the coal, and then the residue from which the zinc is to be extracted be sent to where the coal is mined, the quantity required in the extracting of zinc being stated to be in the proportion of 3 to 1. If this procedure were adopted, it is not very easy to see the great advantage that is said to be obtained from the establishment, on the eastern seaboard, of smelting and extracting works for the whole of the ore. Without entering into any discussion with regard to the advantages to be obtained, there is a consensus of opinion that the operations in future at Broken Hill will be principally confined to the raising of ore, and that the principal ore-treating appliances will be on the eastern seaboard. The manager of the Central Silver-mining Company stated that in his opinion 75 per cent. of the ore raised would eventually reach the eastern seaboard. The Proprietary Company expect to raise about 320,000 tons next year. It is not possible to obtain in detail the amount of ore likely to be raised on the whole of the Barrier field. Even if the figures of the anticipated amounts were available for each mine, they would be little better than inferential, being dependent upon many other circumstances than the power of raising it. It is, however, probable that a large quantity of ore will be raised; and if present conditions continue, a great demand is likely to be sustained which the field can supply for many years to come. But on this point it may again be emphasised that it is not a question of the amount of ore obtainable, but of the amount of freight which will be furnished by it to the railway. This would be dependent upon the freight charges offered by the railway system of New South Wales comparing favourably with the rates charged on the Silverton tramway and the South Australian railway to Port Pirie, and the sea freight to the eastern seaboard.

The

The freight charges upon our railways are decided by the Commissioners. Under the Government Railways Act the railways are virtually held by the Commissioners as an estate in fee simple; their powers are supreme with reference to the rates charged. Therefore it is necessary, in making a comparison, to take the rate quoted by them. Parliament has always refrained from dictating to them with reference to rates. Therefore, in estimating the rate to be charged, only one basis can be taken—that laid down by the Commissioners before the Parliamentary Standing Committee on Public Works. It was stated that the rate for bringing crude ore 696 miles would be 29s. per ton. To land it at Eskbank would cost £1 5s. per ton; at Wollongong, £1 11s. 5d. per ton; at Newcastle, £1 12s. 6d. per ton. With regard to these rates, the Committee, although they feel bound to accept them in making their comparison, would point out that it is stated with sufficient definiteness to justify belief that the South Australian Government have decided to carry carbonate and lead concentrates at the same rate as sulphides to Port Pirie, viz., 9s. per ton, which is approximately $\frac{1}{2}$ d. per ton per mile. If South Australia, with a 3-ft. 6-in. gauge, and inferior rolling-stock, can afford to carry at this rate, it may be contended that New South Wales should be able to make a considerable profit at the same rate over at least a considerable portion of the line, having superior rolling stock and a broader gauge. The Committee have no definite information respecting the profit which can possibly be derived from the carriage of ore at this rate on the South Australian railways, and have already stated that Parliament has never attempted to exercise any right of control over the rates levied by the Railway Commissioners in this Colony. The present rate from Broken Hill to Port Pirie for oxidised ore is 15s. 10d. per ton; sulphide ore, 13s. per ton, being an average of 14s. 5d. per ton; 5s. 6d. per ton being added for carriage by sea to the eastern seaboard, gives 19s. 11d. per ton total freight. Comparing this with the rate to be charged on the proposed railway, a loss would be sustained of 11s. 6d. per ton to Wollongong, 12s. 7d. per ton to Newcastle, and 5s. 1d. to Lithgow. But it has been already stated that the cost of freight from Broken Hill to Port Pirie after the end of the year will be 12s. 3d. per ton. Therefore, the total cost to reach the eastern seaboard in 1897 will be 17s. 9d. per ton, which would in every instance increase the loss. Taking the greatest of the three, viz., to Newcastle, where large works are being erected for the treatment of the ore, and taking 500,000 tons as the amount to be sent as freight, the loss on quoted rates by using the proposed railway would be about £368,000 to the mines using it. To Lithgow the loss would be approximately one-half. Figures of this magnitude (it is immaterial which are taken) prove conclusively that with the present opportunities of approaching Broken Hill by another route it is so much more advantageous than that offered by the proposed railway, if the rate quoted by the Railway Commissioners be adhered to, that to secure the main product of the district as freight is impossible. This, however, does not complete the case, for if the railway were constructed Broken Hill would stand in this position: Taking Newcastle as the basis, there would be approximately 800 miles of land carriage. To Wollongong it would be a little less, and to Lithgow 200 miles less. Newcastle may, therefore, be regarded as the extreme case. From Broken Hill to Port Pirie is a distance of 253 miles. It is stated that the country between Broken Hill and Port Pirie, *via* Silverton, offers no engineering difficulties whatever, and that Port Pirie is a secure port in all weather at present able to accommodate a boat drawing 18 ft. 6 in. of water, and capable of being considerably deepened at a reasonable cost—the bottom of the harbour being soft material principally sand and mud. Therefore, if a battle were fought for the trade of the Barrier district the first step that South Australia would take, if she found she was likely to be worsted, would be to improve the grades to Port Pirie—in fact this is being done—the Committee were informed that for £50,000 a grade of 1 in 74 could be obtained right through, and this work is now in progress. The Silverton tramway, which is virtually an extension of the South Australian railway system, would fall in with the arrangement, and the railway from Broken Hill to Port Pirie could be constructed on easier grades than those in existence on much of the route to be travelled on the New South Wales system. Still further, if South Australia found herself handicapped by the narrow gauge she has it in her power at an expenditure stated to be about £300,000 to lay down a 4'8 $\frac{1}{2}$ " gauge to Port Pirie, and would be able to equip it as thoroughly as the New South Wales competing line, and could therefore carry the distance to Port Pirie as cheaply

cheaply per mile as the New South Wales railway. Since New South Wales would have to draw 800 miles to reach Newcastle, and South Australia would only have to draw 253 miles to reach the seaboard—New South Wales would require to carry the difference, viz., 547 miles, for the cost of the sea journey from Port Pirie to Newcastle. The sea freight has already been stated at 5s. 6d. per ton. Therefore, New South Wales, if fairly in the contest, would require to carry ore at about one-eighth of a penny per mile for that distance in order to secure the trade. In other words, New South Wales would require to carry ore 547 miles at one-quarter the rate quoted by the Commissioners as the lowest payable in order to secure the trade.

If we take the case of Lithgow, distant from the Barrier approximately 600 miles, we find that the sea carriage represents, on the basis referred to in comparison with Newcastle, 347 miles of land carriage. Therefore, the freight, in order to equalise matters, would require for that length to be about one-fifth of a penny per mile, an amount still so disproportionate that it is impossible, with the statement of the Commissioners before us, to offer any solution of the difficulty, but simply say that it is idle to expect it under such conditions. In the face of these figures it appears almost impossible that the proposed line can be expected under any circumstances to win for the railways of this Colony the main product of the Barrier district.

It was stated that an agreement had been made by the Mining Companies on the Barrier to use the Silverton Tramway for a term of seven years for all ore going west; the Silverton Tramway Company apparently not fearing any competition to the east. It appears that this arrangement is almost complete; but the witnesses although individually sure of its existence, and its certainty of completion, were not able to produce a copy of the agreement to give definite information to the Committee. There is, however, no reason to doubt its existence. That being so, if New South Wales, instead of stopping at Broken Hill, pushed on her line to Cockburn, even this length at present would not be used for the conveyance of the main product of the Barrier District.

Those most interested in the carriage of the ore, it may be inferred, are the large companies employed in raising it. If an unfair rate is being levied upon them it might be expected that they would protest against it. But instead of that being the case, with the exception of the Proprietary Mine, to the Manager of which the Committee feel under an obligation, no evidence was forthcoming, and it was only by the exercise of the powers conferred upon the Committee by the Public Works Act, that they were able to obtain any evidence at all from the mine managers. Therefore, those primarily interested in low freights to Broken Hill for its main product treat the question with something more than indifference. Heavy charges must first fall on the mining companies. They, if not satisfied with their present position, regard any possibility of relief from the length of land carriage to join the New South Wales lines as being so remote that it is more to their interest to propitiate the owners of the means of communication at present in existence, which they regard as likely to be their only outlet for many years to come, and possibly to remain permanently their road to the seaboard.

Port Pirie, as before stated, has been taken as the port of shipment. The depth there is 18 ft. 6 in. at low water; but the Committee have not lost sight of the fact that it is stated a boat drawing 24 ft. 6 in. can now trade to Port Augusta, the distance to it from Broken Hill being some 30 miles more than to Port Pirie.

Part of the food supplies used at Broken Hill are brought a distance of 200 or more miles from South Australia. The fuel used for domestic purposes costs from 16s. to 22s. per ton. The question whether it is possible for New South Wales, without unreasonable loss to herself, to alleviate the condition of her colonists living at Broken Hill with regard to their food supplies and fuel, will be found dealt with in that portion of the report referring to the construction of a line from Broken Hill to Menindie.

With reference to the question of ballast and the cheapness of construction of the proposed line, the Committee were informed by the Engineer-in-Chief for South Australia, and Mr. Mais, who previously held that position, that it would be impossible to carry any heavy traffic on the line as submitted by the Department, and that the experience in South Australia was such as caused the
 authorities

authorities to fully ballast any line required for heavy traffic. It is apparent that the proposed railway, if it were to carry the ore from Broken Hill, would be subjected to very heavy traffic indeed. A knowledge of what is taking place in other parts of the world—notably in the United States—with regard to the nature of cheap railway construction, causes the subject to be viewed from the following standpoint. The absence of ballast and cheap railway construction depend upon—

- (1) The nature of the country over which it is constructed, and
- (2) The work it is called upon to perform.

From evidence before the Committee, it appears that a line capable of carrying anything approaching the output of the Broken Hill mines, even if constructed without ballast, would not long remain in that condition. To ballast the line afterwards would mean an advance in the initial cost, and additional interest would have to be added to the yearly expenditure.

At the inception of the inquiry the Sectional Committee visited Lithgow and took evidence to the effect that there was an abundant supply of coal, limestone, and ironstone in that district. There is no doubt with regard to the quantity of coal available, which is confirmed by the evidence given before the Parliamentary Standing Committee on Public Works. With reference to the limestone and ironstone, although it appears probable that it is as stated by the witnesses, still the information either as to its quantity or quality is somewhat vague. These are matters which would require special consideration before deciding as to the importance of the future of Lithgow as a smelting centre. It is stated that the associated collieries are supplying coal to the Government railways at 3s. 9d. per ton, but this is regarded as a very low rate. Coal required in smaller quantities for private use is charged for at a much higher rate. The freight from Broken Hill to Lithgow at $\frac{1}{2}$ d. per ton per mile would equal 25s. per ton. It is contended that coke made at Lithgow could be delivered in the trucks for 15s. per ton. Adding freight at the above rate, the cost of Lithgow coke delivered at Broken Hill would be £2 per ton. The evidence given at Broken Hill was to the effect that the imported coke is superior to that locally made. These questions will, doubtless, be fully discussed in the Report of the Parliamentary Standing Committee on Public Works.

7. RAILWAY TO HILLSTON.

With the exception of the areas already alienated or in process of alienation, the Crown will in the course of a few years (upon the termination of the pastoral leases) be in possession of most of the land between the Lachlan and the Murrumbidgee. The land comprised within the resumed areas is very considerable, much of which is now wholly unused. As an instance, adjoining Merri Merrigal and Hunthawong Holdings alone, there are said to be 1,000,000 acres of unoccupied land.

On the northern side of the Lachlan, where the surveyed route of the proposed railway is located, the land has been described, almost unanimously by a number of witnesses, as inferior, and covered with great belts of mallee, and not likely to be used for close settlement even if available, for a very considerable time, and further the best of it is locked up as pastoral leases till the year 1918.

The country really requiring attention and suitable for settlement is a tract of land lying so far west and south from Condobolin and so far north from the Hay line, that the cost of carriage to a railway station renders profitable agriculture impossible; it is generally recognised that grain cannot be profitably carried by road for a greater distance than 30 miles. The question therefore arises, "What is the cheapest and readiest way to give this district access to a market?" The whole of this country has suffered materially from—

- (1.) The rapid growth of the pine scrub.
- (2.) The advent of the rabbits.

whereby its carrying capacity has been decreased to the extent of 25 per cent. some witnesses stated that in instances, 50 per cent. to 80 per cent. depreciation was nearer the mark. The Committee, however, regard the latter statement as a special case.

The

The resumed areas are not being taken up, and the State finds itself in possession of lands which are steadily deteriorating. It might be possible in some instances, by granting special consideration, to induce pastoralists to destroy the rabbits and the scrub.

The Committee are of opinion, from personal observation and the evidence put before them, that this land is valuable for wheat-growing, and it would therefore be wise to face the question of its reclamation at once, on the basis of agricultural occupation. Agriculture, as has already been said, is impossible without better means of communication; but before railway communication is given it will be necessary to determine where the land that is likely to carry the heaviest population lies, how it can be most cheaply approached, and where the extension should be made from the existing system.

The investigations of the Committee, although extended to the country east from Lake Cudgellico, have been, as to the country lying to the south-east, of a somewhat casual nature. The witnesses examined have been able to give definite information with regard to their immediate surroundings, but their evidence has been fragmentary and doubtful with regard to distant areas, while the Government officials have not been able to speak positively of the land beyond the confines of their own districts.

A line from Cowra (which would apparently be the best route in point of distance) *via* Grenfell, extending in a westerly direction through the Bland country, and thence *via* Wyalong to Hillston, would pass through a vast area now overgrown with pine scrub and infested by rabbits and dogs, but apparently suitable for wheat-growing. Such a line would pass through a territory now worse than waste land, returning no revenue to the State, but which might be advantageously occupied by agricultural settlement were a cheap means of transit in existence. The cost of the line would probably amount to something like £300,000. The advisableness of incurring so large an expenditure would require special consideration before the Committee could finally recommend it to Parliament.

The revenue of the line would depend primarily upon the amount of wool and wheat to be carried.

The cost of sending wool from Hillston, by present routes, to Melbourne is stated to be £7 10s. per ton, and to Sydney, about 10s. less. A railway to Hillston will, in all probability, intercept all wool which now goes to Melbourne from an area bounded by a line starting about 20 miles above the Willandra, and passing in a north-westerly direction for a distance of about 60 miles; thence west for about 40 miles; and thence south to Booligal. Upon this country 1,000,000 sheep are said to be depastured, producing about 2,500 tons of wool.

This wool, upon the basis of the rates quoted upon the Hay line, would give an annual gross return for freight of about £8,000.

A railway terminating at Hillston would not be subjected to the severe competition suffered by the Hay line through the close proximity of the Victorian system and the cheap water carriage afforded by the Murrumbidgee and Murray rivers. It might be pointed out that, notwithstanding this competition, the Hay railway appears to be passing out of the category of non-paying lines. This, however, is said to be attributable to special conditions.

The Committee are not in a position to say what amount of merchandise would be forwarded to such places as Wyalong and the adjoining goldfields, and other places along the line, but it would be considerable; while there would also be a large amount consigned to Hillston and the district of which it is, and must remain, the distributing centre.

With regard to the area that has already been described as partly tenantless and the stronghold of dogs, rabbits, and scrub, there is no doubt that a very great portion of it is suitable for the growth of cereals. The Committee have no definite information with respect to the rent which the State would be able to obtain from this land if a railway were constructed; but, judging from the rents obtainable for similar land in other parts of the country, it is reasonable to believe that land suitable for farming would bring in a rental of at least an average of 3d. per acre, and in this way the occupation of 2,000,000 acres would return a revenue of £25,000 per annum to the State.

State. Allowing 1,000 acres to each farmer, this would require a number of 2,000. It is impossible to say definitely that so many would immediately settle in the district. There is no reason to doubt, however, that, in the event of an extension to Hillston, large numbers of men would come into the district from Tasmania, Victoria, and South Australia, where the conditions under which land can be obtained are less favourable.

The Committee were so impressed with the undesirableness of leaving this vast area, a large portion of which might be transformed into a great wheat-field, in the occupation of scrub and vermin, that they feel that they will be justified in recommending Parliament to have a comprehensive investigation made of the whole of the land lying between the Lachlan and the Murrumbidgee Rivers, with a view to determining its agricultural possibilities, and of deciding in what direction an extension should be made from the main trunk system. In their opinion it is obligatory upon the State to take this action as early as possible. They are unable to suggest a route in detail, their investigations having been confined to the western portion of the area referred to, and to a line which has little connection with the eastern and southern portions of the country which they have described. They feel, however, that the case is so pressing that it should receive the attention of the Government at the earliest possible date, irrespective of any extension west of the Lachlan.

The construction of the line would not materially affect the wheat traffic upon the Hay line, the nearest distance between the two lines, from Hillston to Carrathool, being 80 miles, while 40 miles of land carriage is generally understood to prevent the profitable production of grain.

The map supplied to the Committee by the Railway Commissioners shows the country, of which Hillston is the centre, as contributing, so far as wool traffic is concerned, principally to the Victorian railway system, and therefore most of the wool, making Hillston as a centre, will not be leakage from our present railway system.

It will be understood that the information obtained by the Committee with regard to class of country has been compiled from plans and fragmentary evidence, and that the route suggested is only approximately laid down, and is subject to such deviations as may be necessary in obtaining easy grades and cheap construction. The Committee lean towards a line from Cowra (or thereabouts), *via* Grenfell and Wyalong, to Hillston--

1. Because it divides more satisfactorily the district lying between the Con-dobolin extension and the Hay line.
2. Because it appears probable, from evidence, that the country between Wyalong and Grenfell will carry a larger population than that between Temora and Wyalong.
3. Because it appears to be the shortest route to Broken Hill from Sydney should the through connection be made.

These matters could be considered in connection with the construction of a line from Temora, *via* Wyalong, to Hillston.

It will be possible for the State, if it reserves all the land along the route, to establish townships at each railway station and grade the rental or cost of the land by (a) its fertility, and (b) the distance of road carriage, first settling the land round each centre, and gradually extending the area, it will be possible to save the agriculturist from much of the disadvantages of isolation which usually beset them when scattered over a great territory.

If this railway be recognised as a means of developing the country, and a factor in giving value to Crown lands, and the settlement scheme be wisely designed, the Committee, after investigation into the rents paid, the return obtained, and the general surrounding of wheat-growers in Australia are convinced that any immediate loss on a railway to Hillston would be amply compensated for by the return which the State would receive from Crown lands at present deserted.

8. RAILWAY FROM BROKEN HILL TO MENINDIE.

It is apparent from the rates already quoted, and the general tenor of the Report, that produce from districts at a distance of over 600 miles from Sydney lying contiguous to rivers navigable for the greater portion of the year, flowing towards the railway systems of other colonies, will in all probability never reach Sydney by direct railway communication. It therefore becomes a question for consideration with regard to these distant places, where the railway ceases to be justifiable on a commercial basis, whether progress should be delayed by the State refusing to recognise the difficulties experienced in such localities, simply because it is impossible to bring them profitably in touch with the railway system. If a railway be constructed in one part of the Colony in order primarily to save expense to the producers adjacent to it, it is also the duty of the State, since she has undertaken the responsibility of transacting the greater part of the carrying trade of the country, to extend to outlying centres such facilities as are justified by their importance and the magnitude of their trade. If these far-distant portions of the Colony are to remain isolated until such time as it will pay to bring their produce 600 or 700 miles to Sydney, and the State recognises no obligation with regard to other means of communication, and no other interest save that of bringing produce to the metropolis, it is clear they must remain isolated for ever. With regard to that portion of the Darling country, at Menindie, it is well to take into consideration the possibilities of the place, and the results that would flow from railway communication with Broken Hill. It has been already stated that if a railway were constructed from the east, passing over the Darling at Menindie, the wool produced over a considerable area to the east would be forwarded to the Darling River, in order to take advantage of the cheap water transit furnished by that river and of the low railway rates provided by the adjoining colonies. On a direct line from Menindie to Broken Hill there would be a considerable amount of freight from carriage of wood for fuel, and also some for use in connection with the mines. The value of a ton of wood as fuel at Menindie is stated to be about 3s., while at Broken Hill its value is estimated as from 18s. to 22s. per ton. The railway carriage from Menindie to Broken Hill would be approximately 5s. per ton. Therefore it is apparent that a very much cheaper wood supply can be obtained for Broken Hill by this means than is possible in any other way. The amount required is stated to be about 15,000 tons annually; but at the cheaper rate this would be materially increased. The presence of large depressions, stated to embrace between 100,000 and 200,000 acres of land suitable for irrigation, to which water could be applied partly by gravitation by a system of locking the river, and where, if necessary to pump, the lift would be very much less than it would be on to the banks of any of our Western rivers, may suggest that if the Government intend to carry out any irrigation scheme it might be well to utilise these areas for such a purpose, and, possibly, to construct a railway from Menindie to Broken Hill in order to give producers speedy access to a fair market. It would therefore be wise on the part of the Government to have an accurate survey made of the lakes in the vicinity; also to obtain a comprehensive report by a thoroughly competent man with regard to the nature of the soil and the expense of preventing flood-waters entering the lakes from the river, and a scheme should also be devised by which the lakes would be saved from flooding from their own catchment areas—an occurrence which, however, would be rare. The report should take into consideration not only the feasibility and cost of the scheme, but also the probability of obtaining people willing to occupy the land for agricultural purposes. It might be possible by the construction of a railway from Menindie to Broken Hill to utilise a considerable area of land adjacent to the Darling which is at present in pastoral occupation and from which the State receives but a small return. Such a scheme as this, giving fair means of communication, and utilising an area of public land, is worthy of consideration by the Government. Those engaged in intense culture would have special advantages at Menindie by the presence of a market on the Barrier. It would be well if the whole question were placed in the hands of the irrigation expert now in the Colony.

The question of conserving water, or using the bed of any of our rivers as a storage reservoir for water for irrigation purposes, necessarily imposes a considerable amount of responsibility upon those recommending such a course. When at Cudgellico, at the small dam which has been erected to intercept the outflow from the
Lake,

Lake, the mud had filled up to the sill, on the Lachian side of the dam, and it appears that if there be a tendency to silt up to the full height of the obstruction in Lake Creek the same process might come into operation on the main river, and, therefore, it is possible that any obstruction placed in our rivers may gradually form a huge silt-bed, which would have a material effect upon the course of such waterways. The Committee visited the Willandra weir, in order to see whether the process of silting was in operation there, but the water at the time was flowing several feet over the weir and inspection was impossible. These matters will require the fullest investigation before the country is committed to any expense with regard to the Menindie scheme. The reason why the Committee view Menindie so favourably is that there is an area of land which could probably be kept free from inundation at an elevation lower than that obtainable on the banks of the Darling.

A line from Broken Hill to Menindie would also give a cheap means of communication with the seaboard by way of Morgan, Murray Bridge, or Goolwa, and thence to Adelaide or Port Victor. The cheapest of these routes, from Menindie to Port Victor, is estimated at about 25s. per ton.

It may not be out of place to point out that when the whole of the trade and produce of the Eastern Colonies of Australia takes the cheapest way to the seaboard, if the river systems be fully utilised for that purpose, it is probable that large portions of the trade of those lands lying a considerable distance up the Murray and Darling will reach the seaboard at Port Victor.

Port Victor, the Committee were informed by the Engineer-in-Chief for South Australia, is a good harbour. The railway connection with the Murray is but a few miles over easy country, and the Murray to Wentworth may be regarded as permanently navigable, or could be made so at very small expense.

If the produce can be taken to within a few miles of the sea by river, and the port be a fairly good one, there will only require to be a fair volume of trade to furnish cheap ocean freights.

The contiguity of Port Victor to the Murray should not be lost sight of in considering the eventual set of trade even beyond Menindie on the river Darling.

It appeared from the evidence given before the Committee at Broken Hill, and from the statements of other witnesses, that the requirements of Broken Hill would be fairly well met by the construction of a light line of railway from Broken Hill to Menindie.

9. NATIONAL ASPECT OF THE LINE.

It has been suggested that the whole line rests upon a national basis. What constitutes a national basis has not been explained by any witness, nor have the Committee, since the inception of the work, been able to discover what the advocates of the line mean by the expression. Moreover, the Committee are specially enjoined by the Act under which they work to consider the profitableness of any proposed line. The Committee, however, feel justified in making reference to some of the national aspects of the question which occur to them. They are as follows:—

- (1.) Should Sydney become the capital of the Federated Dominion or Commonwealth of Australia, it would be well that she should be as closely connected as possible with the other parts of the Continent by means of railway communication.
- (2.) When a transcontinental line is extended to Port Darwin, or a line constructed from Western Australia to South Australia, there will be stronger reasons than there are at present for the construction of a railway from the eastern seaboard to Broken Hill.
- (3.) It is possible that there will be a contest with regard to the various railway gauges in the Australian Colonies. If the New South Wales gauge were extended to South Australia the standard gauge of 4 ft. 8½ in. would then be in contact with the railway systems of Queensland, Victoria, and South Australia, which would give additional opportunities for the establishment of the standard gauge.
- (4.) The effect of railway construction upon lands in the possession of the State. This has already been dealt with.

(5.)

- (5.) The creation of community of interest. Community of interest does not spring from the construction of a railway, but from the use of it; and no national purpose is served by the creation of inferior facilities when there are in existence cheaper opportunities for reaching the same place.
- (6.) The time which will elapse in reaching the metropolis from a far distant centre, such as Broken Hill, becomes important if the volume of trade or the number of passengers is likely to be great. These points have already been dealt with in the report.

—————

Summary of Views of the Sectional Committee and Reasons for same.

1. It is not advisable to construct a line from Condobolin to Broken Hill as submitted to the Committee, because

- (a) It is not possible, at quoted rates, to obtain any portion of the main products of the Barrier mining field.
- (b) Since the communication offered for the carriage of ore would be more expensive than that at present available, it would be useless for the main portion of the traffic, and, therefore, the proposed railway would not confer advantages justifying a loss stated to be at the lowest estimate £40,000 per annum.
- (c) A more expensive mode of communication would not be used, and, therefore, confer little national advantage.
- (d) The residents of the district are apathetic with regard to an extension beyond Menindie, beyond that point it being regarded by them, apparently, only as a means by which the freights charged on the geographically more suitable route may be lessened.
- (e) The Colony has so large an area to develop that it is unwise to saddle her railway system with a heavy annual loss from a line which will be utilised not for the main body of traffic, but primarily as a menace to break down existing freights by admittedly cheaper routes.

2. Railway from Broken Hill to Menindie—A cheaply constructed line might be carried to Menindie, in conjunction with an irrigation scheme at that place, because—

- (a) There would be an immediate considerable return from the carriage of timber.
- (b) It would bring a large population, living in undesirable surroundings, in touch with the Darling River and with permanent water and wooded lands.
- (c) It appears probable that the opportunities for irrigation at Menindie are equal to any in the Colony.
- (d) The State would benefit by closer settlement on these lands.
- (e) Much of the food consumed at Broken Hill could be supplied by residents of this Colony.
- (f) It would furnish, in conjunction with the Darling River, which is usually available for traffic, a fairly cheap route to and from business centres outside the Colony.

It must be understood that a careful scheme to embrace the irrigable lands, test of soil, and cost of irrigation scheme, &c., must first be comprehensively inquired into.

3. Railway to Hillston.—A railway seems justifiable to Hillston because—

- (a) Hillston is the furthest western limit where there is sufficient rainfall, in accordance with present ideas, to permit of the growth of wheat with a fair prospect of success.
 - (b) A railway to Hillston will obtain as much wool traffic as would be obtained by a through line.
 - (c) There is danger that wool would travel westward, and use but a small portion of the New South Wales Railway system, if the railway be extended to the Darling.
 - (d) There appears to be a large area of land suitable for the growth of wheat steadily deteriorating from the growth of pine scrub, and which will remain, unless closer settlement be stimulated, a breeding ground for rabbits and wild dogs.
- (e)

- (e) A railway should be located so as to save road freight, and, therefore, through the country which will carry a population.
- (f) The State would obtain a large revenue for lands at present unoccupied and likely to remain so unless better means of communication be afforded.
- (g) The important centres of Grenfell and Wyalong could form part of the scheme.
- (h) It would not draw its main support by leakage from any parallel line.
- (i) If it be eventually determined to extend the line to Menindie or Broken Hill then it would apparently be no longer than the proposed route. The route east from Wyalong must depend upon the quality of land between Wyalong, Grenfell, and Cowra, and Wyalong and Temora, and the cost of railway construction.

CONCLUSION.

Better opportunity of access and reduction of fares to the metropolis, the supply to residents along the line of route of commodities now rarely procurable, the cheapening of freights on articles of consumption and general goods, and many minor reasons were also urged as grounds for the construction of the proposed railway, all of which have been fully considered by the Committee, and the exact position explained in the Report. While appreciating the views of those who advocate the construction of this line, the Sectional Committee regret that the responsibility imposed upon them by the Public Works Act renders it, after a full investigation into the question, impossible for them to recommend that such work be carried out; but trust that the remarks respecting a railway to Hillston and a railway from Broken Hill to Menindie, in conjunction with the question of the settlement of Crown lands, may receive the early consideration of Parliament.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

WEDNESDAY, 5 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.,

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee proceeded to consider the proposed Railway from Cobar to Broken Hill.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and examined:—

1. *Chairman.*] Have you a statement to make to the Committee? Yes; I will read it. It is as follows:—

PROPOSED RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

VARIOUS routes have been suggested for connecting Broken Hill with the railway system of the Colony. The first survey undertaken in that direction was for a line *via* Condobolin and Euabalong to Wilcannia, which was completed in 1885. This line was indeed so far proceeded with, that at one time it was proposed to call for tenders for sleepers, and for the delivery of rails *via* the river Darling to Wilcannia, but this intention was never carried into effect. At that time Silverton was the chief centre of mining in the district; Broken Hill not having risen into the important place it has since become. A survey was afterwards made of a line *via* Cobar and Wilcannia to Cockburn, and the proposal to construct a line in this direction was under the consideration of the Committee in 1891, the decision arrived at being that it was expedient that the line, as far as Broken Hill, should be carried out. It was proposed in June last year, at the close of the session, to introduce a Bill to sanction the construction of this line, and a motion was passed by the Legislative Assembly for the suspension of so much of the Standing Orders as would preclude the passing of the Bill through all its stages in one day, but the Bill was not further proceeded with. The present proposal to proceed *via* Condobolin and Menindie seems to have originated during last year. On the 21st May, 1895, this Committee presented a report to Parliament recommending the construction of a proposed extension from Parkes to Condobolin, and in clause 10 of their report the question of extending the line on to Menindie is referred to. The objects sought by the construction of this line are approximately the same as those advanced in favour of the line from Cobar to Broken Hill, but the conditions of mining at Broken Hill have undergone some modification since that time. The more easily-treated ores have now practically been worked out, but satisfactory methods have been found for dealing with the refractory sulphide ores, which will no doubt give an impetus to the trade of the district, and it may be a question for consideration whether the ores cannot be conveyed as economically over the railways to the places at Illawarra Lake and elsewhere, where it is proposed to treat them, as by sending them *via* Port Pirie and transshipping them there. On the other hand the coal and coke which may be required for Broken Hill can be conveyed from Lithgow and delivered at Broken Hill possibly at as cheap a rate as they could be carried *via* South Australia. The line would also intercept the wool traffic along its route and to the north of it, some of which still finds its way into Victoria. It would afford the means for closer settlement along the Lachlan, the Willandra Billabong, and the Menindie Lake. It would also serve the mineral traffic from the Mount Hope district, and effect a considerable saving of time in the transit of mails from the western portions of the Colony. The survey of the line is now being proceeded with. Between Condobolin and Euabalong the survey is completed, and two surveyors are pushing on from that point towards Mossgiel. From Menindie towards Mossgiel, about 40 miles have been finished; two surveyors being engaged on this portion. Between Broken Hill and Menindie the work has just been completed, and Mr. Cumming, the surveyor who was engaged on that length, has been instructed to proceed to Mossgiel with the view of working up the central portion of the survey. Although the survey has not been completed throughout, quite sufficient information has been obtained to enable a reliable estimate to be submitted. A deviation of the route between Condobolin and Mossgiel has been proposed, which is strongly recommended for the consideration of the Committee; that is, one crossing the river a little below Condobolin, and proceeding along the southern side of the river to Cudgellico, where it would meet the survey already made between Cudgellico and Hillston. From Hillston, westward, the route

H. Deane,
Esq.
5 Aug., 1896.

would proceed to Mossgiel, joining the other route at that place. This route has many advantages over the northern one on the other side of the river. The country on the southern side of the Lachlan lies wholly within the central division, whereas the greater part of that on the northern side lies in the western division, and is consequently not so well adapted for settlement. It also does away with the necessity of a branch line to Hillston from the northern route. The total distance will probably not be much exceeded. I expect to be able to submit a special report on this route to the Minister within a short period of time, and the information will then be available for the Committee. The residents of Broken Hill and Menindie are strongly in favour of the line, as may be gathered from the representations made on their behalf. On the 14th April last, Messrs. Thomas and Cann, M's.P., representing the residents of Broken Hill and Menindie, waited upon the Minister to urge that the Government might construct the line from Broken Hill to Menindie prior to the construction of the line through from Condobolin. At present, they said, Broken Hill was completely at the mercy of South Australia, and if the extension they asked for was constructed it would mean that with the water carriage the district would have another outlet. The Municipal Council of Broken Hill appointed a Committee to inquire into the subject on their behalf and in March last this Committee issued a report, which contains statistics and other information bearing on the subject of the trade of the district, which will no doubt be of value to the Committee, and a copy of the report is therefore now handed in. On the 23rd of June of this year, a petition from the Mayor, aldermen, and inhabitants of Broken Hill and Menindie in favour of a line from Broken Hill to Menindie, in connection with the proposed line from Condobolin, was presented to Parliament. The number of signatures attached to this petition was 3,760. The Collector of Customs has also supplied returns showing the value of imports and exports and collections of customs at Broken Hill from 1887 to 1895 inclusive, and also a report from the Sub-Collector of Customs at that place for 1895.

Official Description.

The official description of the proposed line is as follows:—Length, 366½ miles. Estimated cost, £955,063, or £2,606 per mile, exclusive of land and compensation.

This line begins at the termination of the Parkes to Condobolin railway, of which part is now under construction at about 329½ miles, and follows the general course of the Lachlan River at a distance of about 3 to 5 miles to the north of it as far as Euabalong; thence about west by south, crossing the Willandra Creek in the parish of Gunnagi, county of Blaxland; thence on the south bank of that creek to Mossgiel, and due west to the north-east corner of the pastoral holding "Kilfera A." The line now takes a west-north-west course, heading for Menindie, and crossing the Darling River there; the north bank of the Menindie Lake is then skirted, and the previous bearing is resumed to the south boundary of the parish of Moorakie, county of Yankowinna, where Stephens' Creek is crossed; the line then bends south-west to Broken Hill, ending at about 696 miles from Sydney. The line has easy works throughout, with the exception of the bridges over the Darling River, the Willandra Billabong, and the Talyawalka and Stephens' Creeks. The ruling grade is 1 in 100.

Railway Commissioners' Report.

The Railway Commissioners' report is as follows:—

Proposed Railway, Condobolin to Broken Hill, via Menindie, 366½ miles.

Office of the Railway Commissioners of New South Wales, Sydney, 29 May, 1896.

The Hon. G. H. Reid, M.P., Premier and Minister for Railways,—
With reference to our report on this line, dated 8th May, 1896, and the request of the Honorable the Premier that some estimate of traffic should be put forward, as previously expressed, there is great difficulty in giving any reliable estimate of the traffic. The uncertainty as to the development that may arise in connection with the Broken Hill traffic makes it almost impossible to give any definite information. It will be all a matter of surmise until the construction of the line has been definitely decided upon, and the mine-owners can make schemes for dealing with their ores, either in connection with the Darling River or elsewhere in New South Wales.

From a careful study of the local business, it would appear that a revenue, including the allowance for the conveyance of mails, of about £12,717 per annum would be realised. This is the purely local proportion to be allocated to the new line. The traffic that would be collected by the line would bring in a revenue to the existing railways of about £17,000 per annum, in addition to the local earning before referred to.

The Common Seal of the Railway Commissioners
of New South Wales was hereunto affixed
this 29th day of May, 1896, in the presence
of,—
H. McLACHLAN.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The report of the 8th May therein referred to is as follows:—

Proposed Railway, Condobolin to Broken Hill, via Menindie, 366½ miles.

Office of the Railway Commissioners of New South Wales, Sydney, 8 May, 1896.

The Honorable The Minister for Public Works,—

In accordance with the request of the Honorable the Minister, and under the provisions of section 13 of the "Public Works Act of 1888," we beg to report as under:—

Cost of construction—

The Engineer-in-Chief for Construction estimates the cost of constructing an unfenced single line of light railway (exclusive of land and compensation) at about.....	£955,000	
Rolling stock will be required to the value of about	100,000	
	£1,055,000	
Annual cost—		
Capital expenditure at 3½ per cent.....	£34,287	
Working expenses, all departments, about	25,000	
Total annual cost	59,287	

When reporting upon the proposed extension of the railway line from Parkes to Condobolin, under date the 19th February, 1895, we stated that,—

"..... the line should be looked upon to a great extent as a part of a national line, ultimately being extended to serve the Lachlan district as far as Hillston, and later on by a further extension to Menindie on the Darling. It will be observed by the map attached hereto that this, together with a future extension of the Cobar line to Wilcannia, would make an excellent division of the central and western districts of the Colony.

Ultimately

MINUTES OF EVIDENCE—RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

"Ultimately the line will be of enormous advantage to the settlers in these districts, and will also largely influence the question of the present abstraction of New South Wales wool into Victoria, as, if the pastoralists are able to put their traffic into the railway lines closely adjoining their runs, it would put a stop to the cartage that now goes on to the Murrumbidgee River, and thence *via* Echuca to Melbourne, particulars of which are shown in the attached papers."

H. Deane,
Esq.
5 Aug., 1896.

We are still of the same opinion.

The consideration of this question is, however, so much affected by the scheme recently reported upon by us in connection with an extension of the Cobar line to Broken Hill *via* Wilcannia that we feel obliged to refer to that scheme, and to assume that the Government will not now proceed with the construction of that line. It will be, in our opinion, a long time before two new routes to the Darling will be necessary; but as the Orange and Molong line has now been extended to Parkes and Forbes, and a further extension has been authorised to Condobolin, we are of the opinion that if the Government decide to construct a line to Broken Hill the Lachlan River and Menindie route should be adopted, as it not only affords the through connection intended to be given to Broken Hill, but also gives it by means of the shortest route, and would enable the New South Wales railway system to conserve to itself a great deal of the traffic from the centre of New South Wales which is now obtained by adjoining colonies, and it will also be a great advantage to the district.

In regard to distances, the distance from Sydney to Broken Hill *via* Wilcannia will be 734 miles, and *via* Parkes, Condobolin, and Menindie, 696 miles. This is of considerable moment in connection with the question of direct communication with Broken Hill, and also that of a direct route from Sydney to Adelaide.

As regards the probable traffic, no reliable information can be given.

The Common Seal of the Railway Commissioners
of New South Wales was hereunto affixed
this 8th day of May, 1896, in the presence
of,—
H. McLACHLAN.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The following was also received:—

Proposed Railway, Condobolin to Broken Hill, via Menindie, 366½ miles.

Office of the Railway Commissioners of New South Wales, Sydney, 8 May, 1896.

The Honorable The Minister for Public Works,—

With regard to the requirements of the "Public Works Act of 1888," section 13, as to the Railway Commissioners giving an estimate of the revenue to be derived from proposed railways, we beg to point out that the proposal for the construction of a line through to Broken Hill is of a most unique kind, and it is impossible to estimate the traffic.

The question, as we put it in our report, can only be dealt with from a national point of view, and until the line is opened its effect upon Broken Hill and the direction in which that place will trade can only be a matter of opinion, and any figures that we might give could not be looked upon as reliable, and it is therefore undesirable for us to put forward figures that we cannot justify.

E. M. G. EDDY,
Chief Commissioner.
CHARLES OLIVER,
Commissioner.
W. M. FEHON,
Commissioner.

The subjoined table of distances has been prepared, and will probably prove of interest to the Committee:—

Sydney to Condobolin	Miles. 329½	Sydney to Temora.....	Miles. 291
Condobolin to Menindie	300½	Temora to Wyalong.....	40
Menindie to Broken Hill.....	66	Wyalong to Cudgellico	69
			109
Sydney to Broken Hill.....	696	Sydney to Cudgellico	400
		Cudgellico to Hillston	54
Sydney to Condobolin	329½	Sydney to Hillston	454
Condobolin to Wilcannia.....	270	Sydney to Adelaide, <i>via</i> Melbourne	1,059
Wilcannia to Broken Hill	118½	Sydney to Broken Hill, <i>via</i> Cobar	734
Sydney to Broken Hill.....	718	Broken Hill to Adelaide	334
Sydney to Cobar.....	459	Sydney to Adelaide	1,068
Cobar to Wilcannia	156½	Sydney to Broken Hill, <i>via</i> Condobolin and Wilcannia	718
Wilcannia to Broken Hill	118½	Broken Hill to Adelaide	334
Sydney to Broken Hill.....	734	Sydney to Adelaide	1,052
Broken Hill to Cockburn.....	35	Sydney to Broken Hill, <i>via</i> Menindie	696
Cockburn to Adelaide	299	Broken Hill to Adelaide	334
Broken Hill to Adelaide	334	Sydney to Adelaide	1,030
Sydney to Adelaide, <i>via</i> Melbourne	1,059	Brisbane to Broken Hill, <i>via</i> Sydney and Melbourne	2,116
Adelaide to Broken Hill	334	Brisbane to Broken Hill, <i>via</i> Werris Creek, Dubbo, Parkes, and Menindie	1,134
Sydney to Broken Hill.....	1,393	Brisbane to Broken Hill, <i>via</i> Dubbo and Cobar	1,085
Sydney to Lithgow	96	Brisbane to Broken Hill, <i>via</i> Parkes, Condobolin, and Wilcannia	1,159
Sydney to Condobolin.....	329½	Brisbane to Adelaide, <i>via</i> Sydney and Melbourne	1,781
Condobolin to Euabalong.....	44	Brisbane to Adelaide, <i>via</i> Werris Creek, Parkes, and Menindie	1,468
Euabalong to point A	48½	Brisbane to Adelaide, <i>via</i> Dubbo and Cobar	1,419
Point A to Hillston	22	Brisbane to Adelaide, <i>via</i> Dubbo, Parkes, and Wilcannia	1,493
Sydney to Hillston	444		
Sydney to Condobolin	329½		
Condobolin to Euabalong	44		
Euabalong to Lake Cudgellico.....	19½		
Sydney to Lake Cudgellico.....	393		

The

H. Deane, Esq. The following is a detailed estimate of the cost of the line:—

5 Aug., 1896.

Condobolin to Menindie and Broken Hill, via Mossgiel.

Estimate.

Condobolin, 329½ miles to 587½ miles—256 miles at £2,200	£563,200
Viaduct—10,560 lineal feet at 50s.	26,400
Permanent-way material—2 miles at £850	1,700
Laying permanent-way—3,520 lineal yards at 1s.	176
		£591,476
587½ miles to 623 miles—35½ miles at £2,500	88,750
623 miles to 630 miles—Crossing of Darling and station at Menindie	90,187
630 miles to 635 miles—5 miles at £2,500	12,500
635 miles to 683 miles—48 miles at £2,300	110,400
683 miles to 696 miles (Broken Hill)—13 miles at £3,750	48,750
Station, Broken Hill	6,000
Telegraph	7,000
		£955,063

Condobolin to Broken Hill	366½ miles.
Average cost per mile	£2,606.
Ruling grade	1 in 100.
Minimum radius of curves	14 chains.
Fencing not included.		

Mr. Stawell's report is as follows:—

Exploration, Condobolin to Menindie and Broken Hill.

Sir,

Railway Construction Branch, 17 December, 1895.

I have the honor to forward the following report on the exploration of the route of the proposed extension Condobolin to Menindie and Broken Hill.

The trial survey, Condobolin to Wilcannia, would be adopted as far as the 400-mile peg, or thereabouts. My report will therefore be confined to the country beyond that point.

On leaving the Condobolin and Wilcannia line the Menindie and Broken Hill line would take a direct course for Ivanhoe, which township would be at about 487 miles; the line would then bear nearly due west, passing to the south of Bullabulka Lake, at about 555 miles; thence in a north-westerly direction, crossing the Talyawalka, at about 598 miles, and the Darling about 7 miles further on, the town of Menindie would be reached at about 605 miles. The route would now pass between Lakes Menindie and Pamamaroo, the line winding about somewhat for 7 or 8 miles, in order to avoid the large sand-hills. From this point there are two routes into Broken Hill—one on the north side of Stephens' Creek, and one crossing the creek near the Quandong, and thence *via* Rockwell into Broken Hill.

Taking the Stephens' Creek route, on clearing the sand-hills the line would run direct for the crossing of the Wilcannia Road and Stephens' Creek, and thence into Broken Hill along the trial line from Wilcannia.

By the Quandong route, the line, on clearing the sand-hills, would run slightly to the north of west for about 50 miles to the Rockwell; thence, by a winding course through low hills, it would pass to the east of South Broken Hill, and curving round would enter the town of Broken Hill at the north-east corner, near the Wilcannia Road.

The total distance would be about 675 miles from Sydney by the Stephens' Creek route, the distance being almost the same by the Quandong and Rockwell route.

A more direct line from Ivanhoe to Menindie would pass between Sayers' and Brummy's Lakes, and between Bullabulka and Ratcatcher's Lakes. The creeks joining these lakes are both wide and deep, running strongly in flood-time, and would together require over 1,000 lineal feet of viaduct. It would be better to adopt the slightly longer route described, and go to the south of Bullabulka Lake.

For the first 170 miles the country is very easy, and a surface line could be obtained for nearly the whole distance, open plains or gently undulating thinly-timbered country being passed through. A few sand-hills and swamps would be met with, but these could easily be avoided. The Gunnagi Creek, filled by the overflow of the Willandra, would be almost the only defined watercourse met with.

For the next 33 miles or so the route for a large portion of the distance would be over sand-hills, and it would probably be necessary to run into low banks and cuttings in places. These sand-hills are nearly all covered with scrub or coarse grass, and there would be very little trouble caused by drifting sand.

The next 7 miles is the stretch of flooded country between the Talyawalka and the Darling.

The line would cross the Talyawalka at "The Slip-rails," where high ground can be got right up to the eastern bank. The ground on the western side is low and intersected with ana-branches and lagoons. At least, 20 chains of viaduct would be required here. Flooded flats for about 3 miles are now met with, and then the Three-Mile Creek is crossed; then about 3 miles more of flooded flats up to the eastern bank of the Darling, which would be crossed near the north-east corner of the town of Menindie.

The river is here about 255 feet across from top to top of bank, the bottom being about 42 feet below the flood-mark of 1890.

The water is from 1 ft. 6 in. to 4 ft. deep over the flats, which are of black soil.

There are a few sand-hills in places, and by running the line from one to another the amount of flooded country might be reduced to about 6 miles.

Numerous openings would be required along the flats and a long viaduct on approaching the Darling.

On crossing the Darling high ground is got almost at once, and for the next 7 or 8 miles the country is a series of sand-hills, but the larger ones, which are likely to cause trouble from drifting sand, can nearly all be avoided.

On clearing the sand-hills the country is once more easy for the next 45 miles or so, and a surface line could be made nearly all the way, either by the Stephens' Creek route or the Quandong and Rockwell route, the country passed through being for the most part salt-bush and blue-bush plains.

The remaining distance into Broken Hill is undulating, and in places hilly and rocky.

This latter part is the only place where there would be any difficulty in getting a ruling grade as flat as 1 in 100.

The lengths of different kinds of country passed through beyond the 400-mile peg are approximately as follows:—

215 miles easy country, suitable for a surface line.

40 miles sand-hills; line would be in light bank and cutting and "forming."

7 miles flooded country.

13 miles rather hilly, near Broken Hill.

Total .. 275 miles,

For the most part the soil passed over is a red loam, in places rather sandy. The subsoil is either a red or yellow clay.

The surface ground is very friable, and is easily cut away by running water.

There would be very little trouble from the drifting sand, except from the large bare sand-hills, and even in these cases the drift could easily be dealt with.

No stone is met with until nearing Broken Hill.

The

The timber, except on the rivers, is useless. It would be difficult to procure any even suitable for fencing. The gum growing on the banks of the Darling is crooked, stunted, and of poor quality. It is quite unfit for bridge work, but some good enough for sleepers might be found.

The red gum on the Lachlan, near Enabalong, is good, and might be used in parts of the timber openings.

The route is, from an engineering point of view, decidedly the best. It is fairly direct, and is throughout on sound ground, with the exception of the flooded country between the Talyawalka and the Darling, which is unavoidable. For the first 100 miles the line is, however, on the extreme edge of the good country, a great deal of land to the north being scrubby, and in places ridgy and practically useless either for pasture or agriculture. The resumed areas of the runs about here are untenanted.

Towards the Willandra Creek, and more especially to the south, the land is very good, and nearly all the resumed areas of the runs have been taken up and settled as homestead leases.

A line to serve this country best would cross the Willandra Creek somewhere near Roto homestead, and keeping far enough south to avoid the flooded country, would run to Mossgiel; thence nearly due west for about 40 miles, passing to the south of the Ganarrumby Swamp, and thence in a north-westerly direction, joining the route via Ivanhoe at the south end of Bullabulka Lake.

This line would be about 7 miles longer than the one via Ivanhoe, and in addition would have to cross and afterwards recross the Willandra, and run through a considerable amount of flooded country, the Willandra at its western end running out into a series of lakes and swamps.

The line would, however, serve all the country to the north of the Willandra equally as well as the Ivanhoe line, and would in addition serve a large stretch of country to the south of the Willandra, which the latter line would be of little or no use to.

If the line were run to Mossgiel, and then on to Ivanhoe, even more flooded country would have to be crossed, the Willandra between these two towns being from 7 to 9 miles wide in flood, the water on the plains being about 3 feet deep. The length of the line would also be increased by about 13 miles.

I consider this would be the worst of the three routes.

On both these latter routes the country is very level, and a surface line could be made, except where it was necessary to keep the formation above flood-level.

The Engineer-in-Chief, Railway Construction Branch.

I have, &c.,

J. M. STAWELL.

I also produce the Book of Reference and a compilation of the county maps on a scale of 2 miles to the inch.

2. *Mr. Lee.*] Why did you decide to take the line by way of Menindie instead of going by way of Wilcannia from Cobar? It is a question of country more than anything else, I believe.

3. Country from an engineering point of view? No; country considered in its contributive value.

4. From an engineering point of view, would the other routes be equally as good? The cost per mile on the other routes would be higher, but the total cost would be less. The cheapest way of making the connection would be to go from Cobar through Wilcannia.

5. Why? Because the distance is less.

6. Would the cost of construction be greater or less per mile? It would be greater. The distance from Cobar to Broken Hill, *via* Wilcannia, is 275 miles, and the estimated total cost of constructing a railway along that route is £800,000 or £2,909 per mile.

7. What would be the cost of a line from Condobolin, *via* Wilcannia, to Broken Hill? Approximately, the same as the cost of the line submitted; but the distance is 388½ miles, as against 366½ miles.

8. So that the line would cost about £55,000 more? Yes; fully that.

9. Have the estimates for all these lines been computed on the same basis and on the same scale? Yes. If you refer to the Committee's report upon the Cobar line, you will find that my estimate was then higher; but I have since reduced it so as to bring that line into comparison with this.

10. How does the country in the vicinity of Wilcannia compare with the country in the vicinity of Menindie? In each case there are flats on the eastern side of the river, where the land is subject to inundation by the rising of the river and the Talyawalka Creek. At Menindie you have the advantage, whatever that may be—attention has often been called to it—of the Menindie Lake.

11. Both at Menindie and Wilcannia there is a series of ana-branches and billabongs to provide against? Yes.

12. In which place is the country, in your opinion, least liable to floods? The crossing at Menindie is very much the better of the two. The water-ways there are more contracted, and there is less flooded country to cross.

13. The difficulties to be contended with are met on approaching the river? Yes. The crossing at Menindie was assumed to be as costly as that at Wilcannia; but I have recently found that there would be much less trouble at Menindie, and consequently a reduction may be made in the estimates, as I propose to subsequently point out to the Committee.

14. A reduction upon the estimates already given to us? Yes. I am of opinion that the crossing at Menindie will cost £25,000 less than the crossing at Wilcannia.

15. Are you speaking of the bridge alone? Of the bridge and viaduct.

16. The cross section before the Committee will show the nature of the difficulties to be met in approaching the river at either Wilcannia or Menindie? The length of route subject to flooding near Menindie is 3 miles 72 chains, while near Wilcannia the length of route liable to be flooded is 5 miles 78 chains.

17. Then, of course, the approaches to the river at Wilcannia must be more expensive than the approaches to the river at Menindie? Yes.

18. Had that fact any weight in the determination to adopt the Menindie route? No; because I was not then aware that the approaches to the river at that point would be less expensive.

19. Do you propose to allow high floods to go over your viaduct? No. I would keep the railway above flood level.

20. To what height would it be necessary to raise it to do that? From 2 to 5 feet. Of course the construction of the main bridge across the river would necessitate a higher level at that point.

21. Once you cross the Darling at Menindie, there is very little flooded country on the other side? There is no flooded country on the other side, either at Menindie or Wilcannia.

22. Of what do you propose to construct the bridge at Menindie? Of steel, with timber approaches.

23. Are there any difficulties to be overcome between Menindie and Broken Hill? No.

24. It is all flat country, and not subject to floods? Yes. There is one little matter to which I directed Mr. Stawell to pay special attention. It was reported to me that the sand hills on the Menindie side of the river would be likely to give trouble, because the sand was constantly shifting; but Mr. Stawell points out that the portion of the line from Menindie to Broken Hill which was put down some time ago, has not been injured by the shifting of the sand, and he thinks that the sand would cause no trouble to the railway.

25. Do you propose that the middle part of your bridge should be movable, so as to allow of free navigation in the river? Yes.

H. Deane,
Esq.

5 Aug., 1896.

H. Deane,
Esq.
5 Aug., 1896.

26. Will that not interfere with the railway traffic? I do not think so. It seems scarcely worth while to put a high-level bridge in such a remote district. I have asked the Railway Commissioners their opinion upon the subject, and they agree that it would be undesirable to incur the extra expense which would be necessitated by the construction of a very high bridge.
27. The construction of a high-level bridge would mean the raising of the approaches? Yes, and that would be a very great element in the expense, because it would mean the use of steel in the approaches for some distance on each side. The height would be too great for timber.
28. You are aware that there is a large area of country there which is often covered with flood-water? Yes.
29. In making your calculations have you taken into consideration the periods of high flood as distinguished from those of ordinary floods? Yes.
30. Have you calculated the effect likely to be produced by *debris* passing down the stream in times of flood? Yes.
31. Have you bridges in other parts of the Colony subject to similar risks? Yes; there is the bridge over the Murrumbidgee at Wagga Wagga, the bridge at Narrandera, and the bridge over the Murray, at Albury.
32. These bridges have not suffered any injury from floods? No. Then there are the bridges over the larger rivers on the Western line.
33. Both the bridge and the viaduct will be above the highest known flood-level? Yes.
34. It is held by some people that the Wilcannia crossing is better than the Menindie crossing, inasmuch as the country at Wilcannia is less liable to be flooded than the Menindie country; do the reports of your staff support that contention? No; on the contrary, as you will see by the section before the Committee, there is less flooded country at Menindie than at Wilcannia.
35. Have you any reports in the office which would lead to the conclusion that the Wilcannia crossing is better than the Menindie crossing? I do not know of any.
36. You would know of them if there were any such reports in existence? I think so.
37. You look upon the proposed work as one of very great importance? Yes.
38. And no detail in connection with it has escaped your observation? I think not.
39. Is the proposed line to be fenced? No. I propose to make it a surface line, as far as possible, having earthworks, but no ballast, except in such places as it may be absolutely necessary. The experience we have had on the Moree line, and on the completed portion of the Berrigan line, leads me to believe that the proposed style of construction will prove very successful.
40. Neither of the lines you mention are actually open for traffic? No; but the contractors have been running over the Moree line for a number of months.
41. Carrying both goods and passengers? Yes.
42. That would subject the line to as much trial as ordinary traffic? Yes.
43. With an additional number of sleepers you can get the requisite amount of support for the rails? In black-soil country during wet weather there is some difficulty in packing; but even on the Moree line that difficulty has not proved very great.
44. It is of the first importance that the Committee should receive your assurance that the policy of constructing lines without ballast, recently adopted in this Colony, has, so far, met with your approval, and has been a success. Do you give the Committee that assurance? Yes. Of course I wish the Committee to understand that this style of construction, although very suitable for light lines, is more liable to be washed away during an unprecedentedly heavy fall of rain than a heavier construction; but the stoppage caused thereby is not so serious, because the damage can be more easily made good.
45. A heavier style of construction is more expensive, and, in the event of a washaway, causes a longer interruption of traffic? Yes. I do not think, however, that it is likely that the line will be washed away. There have been several reports—I suppose ill-natured reports—from people in the district—to the effect that miles of the Moree line have been washed away; but, although I have been over that line twice, I have been unable to find after careful inspection, that so much as a lineal foot has been washed away.
46. In all cases where you do without ballast, you make ample provision for the escape of water? Yes; I act on the best information I can get.
47. It is a somewhat difficult matter to make this provision in flat country? Yes.
48. The success of the two lines you have mentioned justifies you in adopting the same style of construction on the proposed route where the country is similar? Yes.
49. Do you propose to use your sleepers in the same way as you did on the Moree line? Yes.
50. You have found that there has been no displacement or subsidence of the bank? Yes.
51. How do you provide for crossings. Have you any cattle stops? At cross fences we shall put in cattle stops.
52. Do you think it will be necessary to use ballast in certain places? I think ballast will be required in some places.
53. Would it be easy to get ballast anywhere close to the line? After you pass Cugong there are really no hills, and there is no gravel.
54. Then, if in the future they require to strengthen the line, we should have to bring ballast from some distance? Yes, I think so.
55. That would make the work of ballasting somewhat expensive? Yes, but I do not think that ballasting would be necessary.
56. At what rate of speed will it be possible to run over the proposed line? About 20 miles an hour would be a fair speed.
57. That is very slow now-a-days? This sort of line is not suitable for express traffic.
58. Will rolling stock of any special kind be required for the proposed line? No. The ordinary rolling stock will be used.
59. Will any special kind of engine be required? No.
60. There will be no additional expense for rolling stock? The Commissioners have put down a sum for new rolling stock.
61. But they do not mean to convey the idea that rolling stock of a special description will be required? No.

H. Deane,
Esq.

5 Aug., 1896.

62. What about the construction of your railway stations? They will be of the most elementary kind.
63. Would it not be possible to have simply small earth platforms and galvanized iron sheds? I do not think that they would be much cheaper than the stations we are putting up now.
64. There are places where you would have to provide residences for the station masters? Yes.
65. But it is intended to have all platforms, sheds, and stations of the cheapest possible character? Yes.
66. The line is to be constructed with a view to cheapness from every point of view? Yes.
67. How long will the work of construction take? That is very difficult to say. It will depend upon the supply of sleepers more than upon anything else. The work could be tackled at three places at once. It could be tackled at each end, and at the Darling, and while the construction of the line is going on the bridge could be built.
68. Would it be possible to carry on the work in four sections simultaneously? Yes.
69. And what time would it take to complete it? The greatest distance from any starting point would be 150 miles, and allowing six months to give the earth-works a start and a month for each following section of 10 miles, you would require twenty-one months to complete the work. Altogether it might be done well under two years. Of course, the possibility of constructing the line in that time depends upon the supply of sleepers available. It is a great mistake to suppose that the supply of ironbark or of redgum is unlimited.
70. Do you propose to use squared or half-round sleepers? I would use round-topped sleepers of ironbark or other suitable timber. Redgum sleepers would probably be sawn.
71. Would you object to the redgum sleepers being sawn if you could get them at the same price as split sleepers? Redgum is more easily worked by sawing.
72. Is there not an abundant supply of redgum in the vicinity of the Darling? No.
73. Would you take other timber besides redgum or ironbark for sleepers? Yes, I would take box if I could get it, but I doubt if it can be got.
74. It would be very expensive to get ironbark out there? Yes; the sleepers would have to be carried from the districts nearer the coast.
75. Would you take other timber besides ironbark, redgum, and box? I do not know of any other suitable timber that could be got.
76. You will also require timber for your viaducts? Yes.
77. Have you provided for that in your estimate? Yes.
78. If it were not for that expensive portion of the line, which involves the construction of a bridge and viaduct, the railway would be a very cheap one? Yes; I have estimated that part of the line which goes through the flooded country at £13,000 a mile; while the cost of the other part of the line varies from £2,200 to £2,500. The smaller waterways would be expensive, because of the cost of getting timber for them. If you could get your materials cheaply, the construction would cost very little.
79. If you were as favourably situated as you are at Moree the cost could be reduced? Yes.
80. You are not providing a line to carry the maximum amount of traffic; you are simply providing for the requirements of the day? I have not provided a line for express traffic.
81. Inasmuch as probably only one train a day will be needed, you are not providing a track to carry half a dozen heavily loaded fast trains? No.
82. You leave it to the future to build up the line in accordance with the requirements of the traffic? Yes; if the traffic increased it would be worth while to put the line on a better footing. The work of ballasting could be commenced from the eastern end.
83. Without interrupting the traffic? Yes.
84. Why was not the line taken direct from Cobar to Menindie, or to Broken Hill? After leaving Cobar, the first object was to get to Wilcannia. From Wilcannia to Broken Hill the line will be pretty straight, but between Cobar and Wilcannia there would have to be several twists to avoid rough country, and to get round flooded land.
85. Is there an alternative scheme from Condobolin to Wilcannia? A line has been surveyed from Condobolin to Wilcannia; that line is shown by a dotted red line on the sketch map before the Committee.
86. Has a direct line been surveyed? That is not feasible, because of the Mount Hope ranges.
87. Why does not the line take a straight course from Condobolin to Menindie? If you went straight across you would have to traverse heavy ridgy country near Mount Hope, and within 60 miles of Menindie you would come upon country subject to floods. The shaded patches shown on the county map are shallow depressions which fill up in times of flood. They are due, I understand, to a breakaway from the Darling and the Talyawalka Creek, flowing in a southerly direction, and crossing the proposed line about 570 or 580 miles from Sydney.
88. Are the Mount Hope ranges very formidable? I believe that they are very troublesome. The third, and indeed the principal, reason for making the bend to the south, is to follow the good country near the river, and on the Willandra Billabong.
89. Have you taken the line out of its direct course in order to reach any centre of population? We go through more settled country.
90. Now as to the dotted red line showing a deviation by way of Cudgellico and Hillston, what class of country does it go through? I am having a report prepared upon that line, and I would like to defer an expression of opinion upon it until I get that report.
91. You have not been through the country from end to end? No, I have only seen bits of it.
92. Do you apprehend any serious danger from flooding in the neighbourhood of the Lachlan? No.
93. Is not part of the Lachlan country liable to floods? After leaving Condobolin we keep clear of the flooded country. I have taken a great deal of care to keep out of the reach of floods.
94. Are we right in supposing that none of the country traversed by the proposed line will be subject to floods, except that in the neighbourhood of Menindie? No, I do not say that. At the crossing of the Billabong, and in the neighbourhood of Mossiel, there is some country which is probably subject to floods, but I have allowed for 2 miles of viaduct to cross that country.
95. Will you have a bridge at Condobolin? No.
96. How will you provide water for the engine? We shall have to make tanks.
97. Are there any existing tanks or bores? There are some existing tanks. The roads throughout this country are provided with tanks, but I expect to have to provide more.
98. Is the cost of providing tanks included in the estimate? Yes, I have included it in the running cost.
99. Are there any artesian bores near the proposed line? No.

- H. Deane, Esq.
5 Aug., 1896.
100. Is that country outside the cretaceous belt? It is outside the water-bearing region. The formation underlying it is palæozoic.
101. When you obtain your report upon the Hillston deviation, will you be able to give the Committee an idea of its cost? Yes; I will do so. It will be seen that if you take into consideration the cost of the proposed line and a branch to Hillston, which the Railway Commissioners very much favour, it would probably be higher than the cost of carrying the line along the southern side of the river and through Hillston.
102. Does the country slope gradually towards the Darling from Condobolin? It is almost a dead level, except for a low range at Cugong, about 22 miles out from Condobolin.
103. The ruling grade is 1 in 100? Yes, and most of the line will be much flatter than that.
104. There are no engineering difficulties to be met? No. The only noticeable grades will be near Condobolin, at Cugong, and at Broken Hill.
105. Is there any special feature in connection with this proposed extension which deserves more than ordinary consideration. Does this line differ in any great respect from any other line? No; except in its distance from centres of population and the difficulty of getting materials.
106. And the large amount of piling to be done? Yes.
107. Will not the piling mean a very heavy expenditure upon maintenance? No.
108. Will not the timber be subject to dry rot, and the ravages of white ants? Timber will last very well.
109. What about the experience at Wagga? That timber was not at all suitable. As far as I remember the Wagga case, the best timber was not used there, and in fact was not even specified. I do not think that ironbark pilcs were specified. In this case I shall have ironbark or redgum.
110. You are determined to have none but the best timber? Yes.
111. Knowing that unless the best timber is used the future expense of maintenance will be very great? Yes.

THURSDAY, 6 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

- H. Deane, Esq.
6 Aug., 1896.
112. *Mr. Wright.*] Three routes have been proposed for reaching the Darling—one starting from Cobar, the route under consideration by the Committee, and the route starting from Temora? I do not remember any suggestion to extend the railway from Temora to the Darling. A line has been surveyed from Temora to Hillston, which could connect with an alternative line to Menindie.
113. Are you familiar with the route from Temora to Hillston and then on to the Darling? I have been over the route from Temora to Lake Cudgellico.
114. Is it easy country to traverse? Yes. There is a ridge near Hillston; but there is no difficulty about it.
115. Is the Cobar route easy from an engineering point of view? It is not so easy as that submitted to the Committee. There are several ridges to cross.
116. You think that the scheme before the Committee is the best from an engineering point of view? Yes.
117. You are not personally familiar with the country? No, I have not been further west than Lake Cudgellico.
118. What is the country between Condobolin and Euabalong like? It is good country. The river flats are extremely good.
119. Have you been beyond Euabalong? Only to cross to Lake Cudgellico.
120. Have you any report from your officers as to the nature of the country to be traversed? The report of Mr. Stawell, which I handed in yesterday, deals with it to some extent.
121. You can fairly well rely upon the report submitted by that gentleman? Yes, he is a very good officer.
122. Is the country between Condobolin and Lake Cudgellico good, with the exception of the Dundoo Hills? It was all good country that I went through. The only bit that might be said to be poor was about half a mile crossing the small range that runs out at Cugong.
123. Have you any report upon the country between Lake Cudgellico and Hillston? Yes, we have the surveyors' report.
124. That is fairly good country? Yes.
125. If you took the proposed line further south, it would go much nearer to Hillston? It would go through Hillston.
126. And the deviation would have the further advantage of passing through a portion of the central division suitable for settlement? Yes.
127. This deviation would only increase the total distance by about 6 miles? I do not think that it would increase the length of the line by more than 6 or 8 miles.
128. Do you not think that it is desirable, considering that nearly £1,000,000 is involved in the proposal before the Committee, that you should personally inspect the country traversed? The country is so easy in character, and would require so much time to traverse, that it is rather questionable.

129. Are you satisfied that the necessary attention has been given to the country to enable you to determine the best route for a railway? Yes. I get from time to time the reports of the surveyors, and I get plans and sections, so that I am able to judge of the nature of the country, and of the work to be done in constructing a line through it.

H. Deane,
Esq.

6 Aug., 1896.

130. Do the surveyors indicate the geological formation of the country in which they are working, the nature of the soil there, and so forth? They frequently do.

131. Have they done so in this instance? Yes; you will see that Mr. Stawell says a good deal about the nature of the country. The surveyors report that they are going through mallee country, or through sandy country, or whatever it may be.

132. Do you think that all necessary attention has been given to the exploration of this country? Yes; and the necessary surveys are now being proceeded with. The information will be complete when they are finished.

133. Coming now to the question of construction, you propose to use half round sleepers? Round-topped sleepers. The sleepers will be squared at the sides.

134. Do you propose to use hardwood? Yes.

135. Is there no chance of using the cypress pine which grows in the district? I do not think that the cypress pine is a suitable timber for sleepers. In the first place, it is brittle, and, in the second place, the spikes would not hold in it permanently; they would work loose.

136. It is said to be very durable wood when exposed to moisture? Yes; except for its brittleness, and the probability of the spikes getting loose, it would be a very good timber for the purpose.

137. How would its brittleness affect a sleeper? It might break in two, and that would be a source of danger.

138. Do you think that the rail would break the sleeper? It would work down into it, because of the soft nature of the wood.

139. You think there is no chance of utilising the timber grown in the district for construction purposes? No.

140. What about the ballast? I propose to do without ballast pretty well for the whole length.

141. There are a good many places where ballast could be easily obtained? Not on the line, except going over the ridge at Cugong. There would be some hard material there.

142. Do you think that it is cheaper to import extra hardwood sleepers than to get ballast? Yes.

143. And do you think it is better to do that? Yes; because I am of opinion that, even if the line had to be ballasted afterwards, the additional number of sleepers would lessen the cost of maintenance.

144. You think that it is not only cheaper, but provides a better service, to do without ballast? Yes; that is to substitute additional sleepers for ballast.

145. I understand that you propose to use a steel bridge at Menindie, with timber approaches? Yes.

146. What will be the length of the approaches? There is about 3 miles 72 chains of flooded country to be got over; but not more than 3 miles of viaduct would be required.

147. Is it best to make the viaduct of wood? I think so. Any other material would be unnecessarily expensive.

148. But, although more costly, steel would be more durable? Well, in the first place, we want to keep the cost down.

149. What would be the cost of the bridge at Menindie, apart from the approaches? Roughly, about £24,000.

150. Would you have a single-span bridge? No, I think not; because you would have to make an opening span. I propose two piers, with bascules.

151. Have any borings been taken to find out how deep you will have to go in order to get foundations for your piers? Not at Menindie. Borings have been taken at Wilcannia.

152. So that your estimate is only a rough approximate? No, I do not think so. I have very little doubt that we shall be able to get proper foundations at a comparatively shallow depth. The level of the bed is not liable to great alteration through scouring or otherwise.

153. But there may be a very bad bottom for the support of a heavy superstructure? I do not anticipate that, though it might make a little difference. If we had to go down a little further it would not mean an extra cost of more than £3,000 or £4,000.

154. I gather from your evidence that the line has been hurriedly brought forward;—has there been sufficient time to enable you to make a careful calculation of the cost? Yes.

155. You have had ample time for that purpose? Yes; I consider that the time has been ample.

156. You consider that your estimate is a fair approximation of the cost? Yes.

157. And not likely to be exceeded? I do not think that it is likely to be exceeded. Perhaps if I had more detail, I might be able to cut it down a little, but I should not like to do so now. I think that my estimate will be found to be a very fair one.

158. The chances are that the cost of the work will be something less, rather than something more than you estimate? Yes; I always try to keep on the safe side.

159. What is the greatest number of miles of permanent way ever laid by a contractor in New South Wales in a month? About 9 miles.

160. Is not that a very exceptional distance? It ought not to be. Under the old style of railway construction it was considered very good to make 9 miles a month; but now a good deal more can be made, if everything is to hand, and there is no impediment. Messrs. Smith and Finlayson have laid as much as 60 chains a day on the Moree line. That would mean 18 miles a month.

161. In the old days 2 miles a month was considered an extraordinary speed? No, the average rate was from 4 to 6 miles a month.

162. Does the estimate of £2,606 a mile include every appointment necessary for the working of the line, other than rolling stock? Yes.

163. Station buildings, office furniture, weighbridges, signals, and telegraphic communication? Yes.

164. All material, such as rails, bolts, fish-plates, &c.? Yes. There is no fencing. £7,000 is put down for a telegraphic service.

165. I do not see anything put down for station buildings or weighbridges? They are included in the running length.

166. Have you also made provision for sidings, platforms, loops, and everything of that kind? Yes.

167. Can you give the Committee any idea as to what land will have to be resumed? The Book of Reference

- H. Deane,
Esq.
6 Aug., 1896.
- Reference will tell that. Some land will have to be resumed at the Condobolin end.
168. There seems to be private land along the whole route? Only to a small extent.
169. You have no approximate idea of the area of private land which would have to be resumed? No, but I will try to have a return made out for the information of the Committee.
170. Will you have much difficulty in crossing the water-channels and depressions along the route? No, there will be no great difficulty.
171. Could you give the Committee any idea of the cost of the two bridges across the Lachlan which would be required if the deviation were carried out? I think it would not exceed £25,000 or £30,000. That is for the two.
172. Would the deviation add very much to the cost of the whole work? There would be the cost of the bridge, or about £15,000 including 6 extra miles of line.
173. That would bring the cost of the whole work up to £1,000,000? Yes.
174. Do you think that the country would be better served by a deviation to the south of the Lachlan? I think it is a matter for serious consideration.
175. Such a deviation would give direct communication with the town of Hillston? Yes. It was proposed by the Railway Commissioners that the Government should eventually consider a branch line to Hillston; but the deviation would obviate the necessity for such a line.
176. In going through Hillston you pass along the southern side of the Willandra Creek, where there is some of the most valuable land in the Colony? Yes.
177. Such a line as the proposed line will be likely to intercept the wool which now goes to Hay? Yes.
178. You think that the southern deviation would have a better effect in preventing the shipment of wool to Victoria than the proposed line? Yes.
179. You have no evidence to submit as to the probable amount of traffic? No.
180. When are you likely to have a full report upon this country from your officers? I shall have a report upon the country between Condobolin and Lake Cudgellico at the end of this week, or the beginning of next.
181. Is that the only report you are waiting for to complete your information? I am sending Mr. Cumming to Mossgiel; but it will be some days before he can get there. When he does get there it will only take him a short time to report on the country between Hillston and Mossgiel.
182. With the exception of that part of the route, and the southern deviation, have you all the information that you require? All that is necessary for the consideration of this work.
183. You do not appear to consider surveys necessary? I reported to the Minister exactly how matters stood, and he wished the line to be got ready for the Committee.
184. You are quite positive that in your estimate you have provided for everything requisite? Yes.
185. Have you calculated the cost of landing the necessary material at the three points from which you propose to start your work? Yes; I have taken all that into consideration.
186. Do you know anything of the country between the Darling and Broken Hill? I have been to Broken Hill, and I have followed along the route to Stephens' Creek.
187. That is a waterless tract of nearly 60 miles? Yes.
188. Do you propose to provide water there? I do not think that on a level line it will be absolutely necessary to make such provision. I think it is probable that the running of tanks will be found the more suitable way of dealing with the difficulty.
189. From Menindie, west of the Darling, you are in the cretaceous formation? Yes.
190. Would it not be possible to get water there by boring? I do not think that the country has been proved.
191. You think that it will not be necessary to provide watering places between the Darling and Broken Hill? No; water can be taken along the line by means of tanks placed in trucks. The grade is very slight, so that the haulage would be nothing serious.
192. Is that practice usually followed? It is very often done, especially in droughty seasons.
193. East of the Darling you have another dry stretch? Yes.
194. Have you made any provision for a supply of water between Condobolin and Menindie? I presume that we shall have to sink several large catchment tanks along there.
195. How many have you estimated for? On the level line you want water about every 40 miles; in ordinary country you want water about every 30 miles; and where you have steep gradients you want it every 20 miles.
196. Then you will require to have seven or eight tanks on this part of the route? Yes; at Condobolin we shall be able to get water from the river. Then, too, we are very close to the river at Cugong. We shall be able to get river water there.
197. In your estimate have you provided for these tanks? Yes, I have allowed for them. The cost is included in the running mileage. In the first section I have provided for water at four places, at a cost of £8,900, or about £80 a mile. The cost of stations and sidings on the same section is put down as £30 a mile.
198. Where do you propose to get the timber, other than for sleepers, which you will require to use? That will nearly all have to come forward over the line. Some redgum may be brought up the river.
199. What will you use for station buildings? Pine.
200. And iron for the roofs? Yes.
201. Is not pine good enough for platforms? The platforms will be low landing-stages.
202. Is it proposed to use carriages opening at the ends? I believe that that is what will be done. I have provided for the same style of platform as has been adopted on the Moree line, the Lismore line, and the Berrigan line.
203. You will have to import all the hardwood you require into the district? Yes, nearly all of it.
204. When the Cobar line was under consideration, it was pointed out that there was a splendid ironbark forest at Dubbo, and that coal could be obtained there for smelting purposes? I remember that the forest was mentioned.
205. Neither ironbark nor coal can be obtained on the proposed line? No.
206. Then the extension from Cobar would have an advantage over the proposed line in these respects? Yes: it would be nearer to Dubbo, and of course it would be an advantage to be able to get coal so close at hand; but that country has not been mined yet.

207. The proposed line intercepts a large portion of the traffic which now goes from our Colony to Victoria, and opens up new country which would not be affected by the Cobar extension? Yes.
208. *Mr. Fegan.*] What are the primary objects of this proposal? I think you will find that matter fully discussed in page 1 of my statement.
209. The objects of this extension are the same as the objects of the proposed extension from Cobar to Broken Hill which received strong opposition from a number of the leading men of this country, amongst them Wright, Heaton, & Co., the Hon. Alexander Brown, and others, on the ground that federation was at hand? I should have to look into the evidence before speaking on that matter.
210. The statement of the Railway Commissioners shows that the proposed line will not pay for a considerable time? The Railway Commissioners do not anticipate that it will pay at all.
211. They estimate that there will be an annual loss of nearly £30,000 a year upon it? Yes.
212. What advantage will the country receive from its construction to counterbalance that loss? I would rather that you examined the Railway Commissioners on this subject.
213. At the present time the traffic of Broken Hill goes to South Australia? Yes.
214. Do you know what revenue the South Australian Government derives from the Broken Hill line? No.
215. If the proposed line is constructed, will it induce settlement? It is supposed that it will induce closer settlement for some distance along the route.
216. According to your evidence, there is very good land there? Yes; the line will pass through very good land for a great part of the way.
217. Has that land been alienated, or is it Crown land? The county map before the Committee shows how the land has been dealt with. There has been a great deal of alienation along the river banks.
218. Mr. Stawell says that except upon the rivers there is no very good timber along the route? No.
219. Therefore, it will be expensive to get sleepers? Yes.
220. Where do you intend to get your sleepers? They will have to be brought from parts of the Colony to the eastward—from the ironbark forests between Molong and Parkes, or even from Dubbo.
221. You will carry the sleepers along with you as you construct the line? Yes, most of them. I also expect that a number of sleepers will be brought up the Darling.
222. I do not see any statement as to the number of stations to be erected? That is a matter which it is scarcely possible to decide at the present moment. This is an approximate estimate based upon previous experience.
223. Are there any mining lands along this route? There is the Mount Hope district, and there is also a mining district near Cugong.
224. The construction of the line may develop these fields and lead to new finds? Yes.
225. What is the present population of Broken Hill? I have not seen the latest returns.
226. *Mr. Hassall.*] The features of the country through which the proposed line will pass are such that you feel sure that your estimate will not be exceeded? Yes.
227. Do you think that it can be reduced in any way? No; I should not like to reduce it, except in regard to the crossing at Menindie.
228. There is no way of escaping the flooded country? No.
229. And there is no place where you could cross the river and pass through less flooded country than on the present route? No.
230. There would be nothing gained in taking a direct line from Condobolin? No. In the first place you get into rough country, and then you get into flooded country. Then, too, you would be going away from the settlement upon the rivers.
231. The only engineering difficulty arises from the flooded nature of the country? Yes.
232. What are the alternative routes in the vicinity of Condobolin shown upon the compilation of county maps? The red route was surveyed at the time it was proposed to take the line to Wilcannia, and might just as well be obliterated. The route marked purple is that recently selected, and is approximately the line that should be adopted.
233. What was your reason for making the deviation? To keep the line on higher ground, and to interfere as little as possible with private land. The main object was to get on higher ground, and to obtain a better grade.
234. Does the route generally go through Crown land? Yes, mostly through Crown land.
235. Is there much private land to be dealt with? I intend to deal with that question in a return.
236. In the event of its being considered undesirable to construct the whole line, would it be advisable to make a railway between Broken Hill and Menindie? I do not think that such a scheme is to be recommended. Isolated lines are very difficult and very costly to manage. I think that the proposal should be considered in its entirety.
237. The original proposal was to take the railway from some point on the western line to Silverton. That was before Broken Hill came into prominence? Yes.
238. Do you think that there was a reasonable prospect of that line paying, or that the discovery at Broken Hill has materially enhanced the revenue prospects of a line to the Darling? I think that the traffic returns will very largely depend upon the Broken Hill trade. The Commissioners estimate that they will derive £12,717 per annum from that source.
239. But the interest on the cost of construction and working expenses will exceed the estimated revenue? Yes.
240. *Mr. Roberts.*] Did not the Government in 1885 contemplate the construction of a line to Wilcannia by way of Condobolin and Euabalong? Yes.
241. Was the survey for that line completed? Yes.
242. Was the matter ever submitted to Parliament? I do not think it was ever submitted to Parliament after the survey was made. In 1884 a vote of, I think, £1,000,000 odd was obtained for the line. It was entitled "a line from Forbes to Wilcannia."
243. Why was it not proceeded with? I cannot tell you.
244. A little later a line was surveyed from Cobar to Cockburn? Yes.
245. Were you, at that time, Engineer-in-chief for Railway Construction? I was appointed to act for Mr. Whitton, in June, 1889, and the line you speak of was reported upon by the Public Works Committee in 1891.
246. Was an estimate prepared for each of these lines? An estimate was prepared for the line from Cobar; but I do not think a second estimate was prepared for the Forbes-Wilcannia line after the Parliamentary vote had been obtained.

H. Deane,
Esq.
6 Aug., 1896.

- H. Deane, Esq.
6 Aug., 1896.
247. The estimate of the line from Cobar was made before light railways were thought of in this country? Yes.
248. What was the estimate for that line? The estimate for the whole line was £1,168,000,—the portion between Broken Hill and Cockburn being estimated at £150,000. That would leave £1,018,000 for the balance of the line, or a little over £3,700 a mile.
249. That estimate was made for a more substantial line than the one proposed? Yes; for a fully ballasted line.
250. If a line were taken to Condobolin through Wilcannia to Broken Hill, what would it cost per mile? Not much more than the proposed line.
251. But it would be 22 miles longer? Yes.
252. Would there be any saving in connection with the bridge? No; the bridge at Wilcannia would be more expensive than the bridge at Menindie. It would cost more to cross the Darling at Wilcannia, than to cross it at Menindie. The total cost of a line through Wilcannia would be greater than the cost of a line through Menindie to Broken Hill.
253. Would the country to be traversed differ very much, apart from the flooded portions? No. On the Wilcannia route there would be one or two ridges to cross; but you could get over them without great difficulty. Still the country along that route is not so good. It is less suitable for settlement.
254. If the line is taken to Menindie, will not our trade be more likely to go to Victoria, than if the line is taken through Wilcannia? Upon that point I cannot give you any information.
255. How many miles of absolutely level country does the proposed route traverse? The country is what you might call level for nearly the whole distance. For about 330 miles you would only require mere surface forming.
256. What is the minimum amount per mile that you have allowed for any portion of the line? The cheapest portion of the line will be that near Condobolin, where freight and the cost of material will be lowest.
257. Your estimate for the Berrigan to Finley line was £2,000 per mile; but your lowest estimate for any part of this line is £2,200 a mile;—how do you account for the difference? The distance from Sydney is greater, and that increases the cost of material.
258. *Mr. O'Connor.*] It is not unusual in a great office of State, such as yours, for a proposal to be based upon the reports of experienced and trustworthy officers? No; though I always make it a point, if I possibly can, to go over the route of a proposed line before giving evidence to the Committee. In this particular case, however, the distance to be traversed is so great, and the country is so easy, that it is questionable whether it would be desirable that I should give up time to it which is required for the consideration of other matters.
259. You can rely thoroughly upon the ability and trustworthiness of the officers from whom you have received information? Yes.
260. *Mr. Black.*] Is it not a fact that if there had been no silver discoveries on the Barrier Range, there would be no town where Broken Hill now stands? That is so.
261. And it is fair to presume that if there were no such town as Broken Hill it would not be proposed to make a railway in that direction? No, it is not likely that any such proposal would be made.
262. It is also fair to presume that the Railway Commissioners have obtained satisfactory evidence of the likelihood of the silver workings of Broken Hill being of some permanence? I have no definite information on the subject of the permanence of Broken Hill to submit, though I have been there, and have heard the opinions of mining managers and others interested in the industry.
263. If the mines there petered out, the city would be deserted just as similar silver cities in America have been deserted? I have no doubt that it would.
264. The country through which the lower deviation would run is superior to the country to the north of it? Yes.
265. Is any large area of it suitable for agricultural purposes? I think this climate is too dry for agriculture, when you get any distance from Condobolin.
266. There is no land after you pass Mossgiel or Ivanhoe which would be of sufficiently good quality? I do not think that there is any deficiency in the quality of the land; it is the small rainfall that makes crops uncertain.
267. There is no suggestion that the line is necessary to open up the country for agricultural purposes? Scarcely; there is a great deal of good land on the south side of the Lachlan which is very suitable for agricultural purposes.
268. There will be little or no intermediate traffic between such points as Ivanhoe and Menindie? No, the intermediate traffic will not be very much.
269. Hillston and Menindie are the only towns to be served by the railway? Menindie is a very small place; but the crossing there is about as good as you can get. Lower down, beyond the entrance to the Talyawalka Creek, the river spreads out on the other side.
270. I suppose the crossing at Hillston is fairly good? Yes.
271. There is already a bridge at Hillston? I am not quite sure; but I believe that there is.
272. *Mr. Humphery.*] Is the distance from Sydney to Broken Hill, *via* Cobar and Wilcannia, 734 miles? Yes.
273. Can you explain how Mr. Goodchap makes the distance 720 miles? Mr. Goodchap seems to have taken his distances from those given in the Railway Commissioners' report, which are not quite correct. The distances shown in the table which I handed in yesterday are correct.
274. The distance from Cobar to Broken Hill, *via* Wilcannia, is 275 miles? Yes.
275. Has the line between Cobar and Broken Hill been surveyed? Yes.
276. So that you feel confident the distance given is correct? Yes.
277. But you are not sure that the distance from Condobolin to Broken Hill, as you have given it, is correct? Yes, it is quite correct. The mileage is marked off on the county compilation map.
278. Then there is a difference between the length of the proposed line and the distance between Cobar and Broken Hill of 91 miles? Yes; but the Cobar line would be the more expensive per mile.
279. Why? Because there is more ridgy country there.
280. Would it be much more expensive? The estimated cost of the line from Cobar to Broken Hill is £800,000. The previous estimate exceeded £1,000,000.

281. What would be the difference between the cost of an extension from Cobar to Broken Hill, and that of an extension from Condobolin to Broken Hill? £155,000. In the one case you have a number of cuttings and banks to make, while in the other case you have a surface line throughout.

H. Deane,
Esq.
6 Aug., 1896.

282. Would there be any difference in the grade? You could get a ruling grade of 1 in 100 in both cases; but, whereas on the Cobar extension you would have a good many miles of 1 in 100, on the Condobolin extension you would have scarcely any.

283. Then you are of opinion that the Condobolin extension is a better proposal than the Cobar extension? Looking at it from the point of view of economy of construction, I think so.

284. The character of the construction would be the same in each case? Yes.

285. Would material be more costly on the Cobar line? No, it would be about the same.

286. Would the river crossing be more costly than on the Cobar extension? Yes, it would cost about £25,000 more. The river crossing at Menindie would cost about £65,000.

FRIDAY, 7 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRUCKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

287. *Mr. Humphrey.*] Have you any explanation to offer in reply to Mr. Goodchap's letter addressed to the Chairman as to distance? Yes, I will read it:—

H. Deane,
Esq.

With reference to Mr. Goodchap's letter.—The distances mentioned are those quoted from the Railway Commissioners' report, and have been thus inserted in error instead of the revised figures.

7 Aug., 1896.

The revised distances given by me in the appendix to the statement are perfectly correct.

The distance from Sydney to Broken Hill *via* Cobar and Wilcannia is 734 miles, and the distance *via* Condobolin and Menindie is 696 miles, giving a difference of 38 miles.

The line to Condobolin does not, as Mr. Goodchap assumes, go round by Forbes, but leaves the present line at Parkes. This makes the distance of Condobolin 329½ miles from Sydney. If the length of the proposed line, 366½ miles is added, the total is 696 as above given.

The distances are liable to modification as they depend upon the location of the lines. That between Cobar and Wilcannia might be added too to the extent of several miles, if it is preferred to obtain the 1 in 100 grade by winding round the hills instead of cutting through.

I produce a section of a portion of the Cobar-Wilcannia line.

288. You say the line will be lengthened several miles in order to get a similar grade to that which can be obtained by a direct route from Condobolin to Menindie? Yes.

289. Are you referring to that portion of the line between Cobar and Wilcannia, or Wilcannia and Broken Hill? Cobar and Wilcannia. That between Wilcannia and Broken Hill is quite level.

290. So that the cost of constructing a line between Wilcannia and Broken Hill would not be greater than the cost of constructing that portion of the line between Menindie and Condobolin? No.

291. That is to say, £2,300 would be the average cost per mile between Wilcannia and Broken Hill? Yes. Putting the Cobar to Broken Hill line on the same footing as the other, I find it comes out in this way: Cobar to the east side of the Darling, 147 miles, £2,726 = £400,710. The crossing of the river, 2½ miles, I have put down at £96,210; from Wilcannia to 721 miles (that is 105½ miles) to Stephens' Creek, £,2300 per mile, or £242,650. Then, from the crossing of Stephens' Creek to Broken Hill, the same as on the other estimate—13 miles at £3,750, or £48,750. Station at Broken Hill, £6,000; telegraph, £5,680; total, £800,000.

292. Then the greater expense in constructing the line would be between Wilcannia and Cobar? Yes.

293. Taking the suggestion that the line might be constructed from Condobolin to Wilcannia and on to Broken Hill, instead of *via* Menindie, what advantage do you say the proposed route *via* Menindie offers over the suggested route *via* Wilcannia? There would be a saving in distance of 22 miles.

294. And what would be the total distance from Sydney? 718 miles, as compared with 696 miles.

295. Are you able to say that the cost of constructing the line will be greater between Wilcannia and Condobolin than between Menindie and Condobolin? Yes. There are several ridges which have to be passed over.

296. Can you state the additional cost per mile for that distance? I think the extra earthworks would, approximately, cost £30,000. That would mean a little over £110 per mile.

297. Therefore, besides being a longer line, it would be a more costly one? Yes.

298. I think the figures I gave you last night will enable you to admit that it will cost more to construct the 7 miles of expensive line at Menindie than to cross the Darling at Wilcannia? No; it is the reverse. It is more expensive at Wilcannia than at Menindie.

299. Will you show me in what way;—you said it would cost £90,000 for 7 miles of railway at Menindie? £96,000 for 9½ miles at Wilcannia, as against 7 miles. I pointed out yesterday or the day before that the estimate of the crossing of the river at Menindie had been put down at approximately the same cost as the crossing of the river at Wilcannia. Since that I have further information—sections across the river—from which these two comparative sections have been compiled, which shows that there is a considerable saving at Menindie, and that the cost of the crossing at Menindie (£90,187) can be reduced by £25,000.

300. Then the crossing at Menindie, instead of being £90,000, would be £65,000? Yes.

301. A substantial difference in favour of Menindie? Yes.

- H. Deane, Esq.
7 Aug., 1896.
302. Your evidence may be summed up in these words—that of all the routes which have been brought under the consideration of the Committee and the Department of Public Works, the proposal to construct a line from Condobolin *via* Euabalong and Mossgiel would be the cheaper per mile? Yes.
303. But in your opinion the better line would be by Cudgellico and Hillston, at a deviation which might lengthen the line 5 or 6 miles? Yes, 6 miles. What I stated was that that line was worthy of attention, and that I proposed to make a further report on the subject.
304. I gathered that you considered that was the better line of the two, although it might mean 5 or 6 miles of increased length? I am inclined to favour it. That is all I can say at present. Of course we have to take the cost into consideration, and there is the consideration of the traffic which would ensue, the country which would be served, and the country which would be opened up. I should like to add a little to my evidence on the subject. I have ascertained that there is a road bridge over the river at Hillston, and it is interesting to note that the Lachlan channel got reduced so far down at that part that the span of the bridge is only 70 feet. It is a very different thing from the crossing of the Lachlan by the railway at Cowra, which has three spans of 150 feet each, and I think four spans of 60 feet in addition.
305. You wish to convey that the cost of crossing the Lachlan at Hillston would not be appreciable? It would not be appreciable, and I have all the information which is necessary without further survey.
306. Therefore, that bridge would not very largely increase the total cost of the line if it were considered desirable to make the deviation you suggest? No, it is a small matter. I also have levels of the country beyond there towards Mossgiel, showing that it is quite a flat country, and that railway construction would be easy.
307. In fact, the physical features of the whole of the country between Condobolin and Menindie are favourable to railway construction? Yes. I have a rough estimate of the length traversed of Crown and private land between Condobolin and Broken Hill which I put in. I wish it to be understood that it is very rough indeed.
308. I suppose that land would only occur in the central districts;—there is not much privately-owned land in the western districts? No; the estimate is as follows:—

							Mls.	Chs.
Freehold & C.P. land	1,344	Chs. =	16 64

309. *Mr. Clarke.*] You stated yesterday that you proposed to use half-round sleepers? Round-topped sleepers.
310. Would they be split timber? If they were redgum they would probably be sawn.
311. Would the half-round timber be free from sap? It is a mistake to call it half-round—the sleepers are squared at the sides. There would be sap on the upper edges only; the rail would rest on the heart wood. If the sap all decays, as it invariably does, the support is still there.
312. Would that description of sleeper not be liable to rot quicker than a square sleeper? No; the sap would go, and that is all, but I do not mind about that. I am not reckoning on any support from the sap.
313. Would you put them closer together on this line than you do on ordinary lines? The same as I am doing at present on the light lines—fourteen to the rail length, instead of eleven.
314. You also propose not to ballast the line? Except in bad places.
315. Do you consider the line unballasted would be as safe as an ordinary line? Yes. Of course the line will want looking after like other lines, but the experience of the Narrabri to Moree and the Jerilderie to Berrigan lines shows that a very satisfactory job is obtained.
316. *Mr. Lee.*] Can you explain why the two Departments are now prepared to make a recommendation for the extension of the line from Condobolin to Broken Hill, when, in the year 1889, the Department recommended the extension of the line from Cobar? I do not think I can give you any information on that point. I might refer you to the Railway Commissioners' reports on the two lines, which would probably furnish some of the reasons you require.
317. It would appear strange that after all due precautions taken in 1889, the route from Cobar was the best, whereas now an altogether different proposal is offered;—has anything occurred in the shape of survey, further exploration, or anything else which has led to the change? I have simply taken instructions for survey and prepared estimates on the lines the Government have submitted.
318. So far as you are aware, then, no further exploration has contributed to the alteration of route? I am not prepared to say that; but undoubtedly the views of the Government have undergone modification.
319. Has anything occurred in your Department which has been of sufficient importance to induce the Government to alter the line of route? From an engineer's point of view, no.
320. Can you assign any reasons? I do not think I could give you any reasons.
321. I should like to refer you to a statement made in 1891, when the railway from Cobar to Cockburn was being considered; *Mr. Barling*, in opening the subject, said:—

The Minister, in introducing this proposal to Parliament in December last, made, *inter alia*, the following remarks:—
"I wish now to refer to the remarks of the Public Works Committee as to the necessity of this line, and I shall only quote from a few paragraphs of their Report. I should like to say in the first place—and I use the words of the Report—that 'the line from Nyngan to Cobar was referred to them in view of the probable extension of the railway from Cobar to Wilcannia and Silverton, and so on to the South Australian border.' I read that to show that the Public Works Committee, in approving of the line from Nyngan to Cobar, did not do so on the mere merits of the line *per se*, but on the merits of the line as part of an intercolonial line to South Australia."

That is such a strong statement that I think I am justified in asking you what has occurred to cause such a complete change of front? Nothing from an engineering point of view.

322. And the change in route is due entirely to the view taken by the Minister of the day? I think so.

323. To some extent governed by the report of the Railway Commissioners? No doubt.

324. Would the papers in your possession throw light upon the questions I am now asking? I do not think there is anything in the papers further than the suggestions that are made in the report of the Railway Commissioners.

325. You will admit that, if within so short time a different route could be proposed after so strong a statement as that, it now leaves it a very open matter for the Committee to say whether there should not be a still further deviation made? I should like to call your attention to that part of the Railway Commissioners' report of the 8th May last, on page 3 of my evidence. They say:—

H. Deane,
Esq.
7 Aug., 1896.

The consideration of this question is, however, so much affected by the scheme recently reported upon by us in connection with an extension of the Cobar line to Broken Hill *via* Wilcannia that we feel obliged to refer to that scheme, and to assume that the Government will not now proceed with the construction of that line. It will be, in our opinion, a long time before two new routes to the Darling will be necessary; but as the Orange and Molong line has now been extended to Parkes and Forbes, and a further extension has been authorised to Condobolin, we are of the opinion that if the Government decide to construct a line to Broken Hill, the Lachlan River and Menindie route should be adopted, as it not only affords the through connection intended to be given to Broken Hill, but also gives it by means of the shortest route, and would enable the New South Wales railway system to conserve to itself a great deal of the traffic from the centre of New South Wales which is now obtained by adjoining colonies, and it will also be a great advantage to the district.

Does not that meet the case altogether.

326. From the Railway Commissioners' point of view, yes;—but there is still something further the Committee desire to have; but you are not in a position to give it yourself? I do not think there is anything further in the papers.

327. The proposal is to construct the line to Broken Hill only;—how many miles is that from Cockburn? Thirty-five.

328. From Broken Hill to Cockburn there is a tramway with a gauge of 3 ft. 6 in.? It is really a railway. The through trains from South Australia run right over it without changing.

329. Is it not a gauge of 3 ft. 6 in.? Yes; but from Adelaide to Terowie, there is a 5-ft. 3-in. gauge. From there you have the change of gauge to 3 ft. 6 in.

330. As a matter of fact, then, there is not a continuous 3-ft. 6-in. gauge to Adelaide? No.

331. It is incorrect then to say that the trains run right through from Adelaide? They do not; you have to change.

332. Then there is no continuous 3-ft. 6-in. gauge from Broken Hill to Adelaide; but notwithstanding the break of gauge which occurs the traffic goes from Broken Hill? Yes.

333. Is there not an unbroken 3-ft. 6-in. gauge right through from Broken Hill to Port Pirie? I am not quite certain about that, but I will look it up.*

334. What is the ultimate intention so far as future extension from Broken Hill is concerned;—when you get there you meet a 3-ft. 6-in. gauge? I think it will be left as it is. No resumption of that line has been proposed that I know of. It was proposed at one time to run through to Cockburn *via* Thackaringa.

335. You are met within your own territory by an adverse gauge? Yes.

336. The policy of the Railway Commissioners is to rigidly adhere to the 4-ft. 8½-in. gauge? Yes.

337. Here, however, you meet a difficulty within your own territory? I do not say you would have any more difficulty by changing to get as far as Cockburn. You would be able to run from Silverton or from Cockburn to Sydney without breaking gauge, but you would still have to change if you were going to Adelaide.

338. If Broken Hill is the terminus of your gauge, you are practically at the mercy of the owners of the narrow-gauge railway there? No more than at present.

339. The country will either have to resume that line, and run it as a 3-ft. 6-in. gauge, or increase it to the same gauge as our own? I do not see that it is necessary to do anything with that line.

340. The contention is that this should be an intercolonial line, and yet you will be intercepted by a narrow-gauge line;—how is that difficulty to be got over in the future? You have the narrow gauge in any case. You have it in South Australia. In travelling from Sydney to Adelaide you will have three gauges in any case.

341. If you hold that the narrow gauge of South Australia is a justification for the continuation of the narrow gauge to Broken Hill, what objection can you raise if this proposed extension is to be on the 3-ft. 6-in. gauge? There would be a very serious objection to that. The bulk of the traffic that is expected would be picked up at Broken Hill. That would be carried through to Sydney or any point of New South Wales without any break of gauge. If you had a 3-ft. 6-in. gauge east of Broken Hill you would have to break, but otherwise you avoid it.

342. So far then as a connection with South Australia is concerned, it is not an absolutely complete proposal;—is it not only an extension towards the South Australian border? No; there will be actual railway communication although there will be different gauges—just the same as there is actual railway communication now *via* Melbourne. You have the change of gauge at Albury.

343. But this will be a competing gauge within our own territory, and if the Broken Hill tramway owners choose to compete with the railway there is an extreme probability of diverting a quantity of the traffic towards South Australia? I gather from what you say that your object in putting down the standard gauge between Broken Hill and the border would be to produce a block to prevent traffic going that way. Of course, that is a different question.

344. And if you do not extend it to the border there is the possibility of the danger of this tramway competing with you? Then you would have to resume the tramway.

345. That is the position, is it not? Yes; of course the act of making an independent line from Broken Hill to Cockburn, which was proposed some years ago, would not get over that difficulty. You would still have the competing line under very much worse conditions *via* Silverton.

346. *Mr. Trickett.*] When you were examined on a previous occasion, you seemed to attach considerable importance to the Nyngan *via* Wilcannia line by reason of its working in with the Werris Creek and Dubbo connection? Yes.

347. How will that connection suit the present line if carried out? Equally well, I think, if the connection from Parkes to Dubbo and Dubbo to Werris Creek is made.

348. When the former proposal was before the Committee, I think it was intended to ballast the line? Yes.

349–50. Does not the present cost seem to be very high compared with the then proposed cost, seeing that you do not propose to use ballast? The estimated cost per mile was then £2,560, which included the bridge over the Darling at Wilcannia. I gathered from your evidence at the time that it was proposed to

* NOTE (on revision):—The 3-ft. 6-in. gauge is continuous to Port Pirie.

H. Deane,
Esq.
7 Aug., 1896.

to use ballast; now it is proposed that this line should cost £2,606 per mile, and you propose to make it only a surface line? £2,560 per mile was the estimate for the Nyngan-Cobar line, not the Cobar-Wilcannia, which amounted to £3,702 per mile. I think the grades were worse on the original proposal—1 in 75. If that line were submitted in its original alignment, and with its original grades, it would still have to be increased for the cost of rails. I have added £150 per mile to these estimates on account of the increased cost of rails, the price of steel having gone up. The present estimates are lower than those previously submitted, in spite of the difference in the cost of steel.

351. In estimating the cost per mile of the Nyngan to Cobar line, you made a reduction of £470 per mile for the carriage of iron which would be required on the railway. Have you made that same allowance in the present instance? Yes, the Commissioners only charge 1d. per ton per mile for the conveyance of permanent-way materials.

352. That is knocking off 3d. per ton for what would be charged an ordinary person? That rate has been continued since that time. It is about half what is now charged to the public.

353. Does that apply to all railway extensions where material is conveyed? Yes, with the exception of the Berrigan line where, under special arrangement, it is cheaper still. I produce the report referred to on page 3 of my evidence of last Tuesday giving the reasons for the Railway Commissioners' abandoning the Wilcannia route:—

Office of the Railway Commissioners of New South Wales, Sydney, 1 November, 1895.

Proposed Line of Railway, Cobar to Broken Hill—277 miles.

In accordance with the provisions of section 13 of the "Public Works Act, 1888," we beg to report as under:—

Cost of construction—

The Engineer-in-Chief for Construction estimates the cost of construction of a single line of light railway (exclusive of land and compensation) at	£800,000
Rolling stock	75,000
Total	£875,000

Annual cost—

Construction and rolling stock—capital expenditure, at 3½ per cent.....	28,762
Cost of maintaining permanent-way, traffic, and locomotive expenses	25,000
Total working cost	£53,762

Since we previously reported upon the proposal to connect the main western system with Broken Hill and the South Australian Railways, the circumstances have altogether changed. At that time there was every prospect of a great future before Broken Hill, and in a comparatively short period the population rose from about 15,000 to 22,500. Then came the fall in the price of silver, and the difficulty in dealing with the sulphide ores, which had a most serious effect upon the prospects of the place as a large mining centre. As is well known, the population fell rapidly, and is now estimated at 19,000. This number does not approach the population which it was some years ago generally expected would be permanently settled there. However, we are informed by those interested in the matter that the question of the treatment of the sulphide ores—of which there is an enormous quantity in the district—has been practically solved, and many years of prosperity may be in store.

So far, however, as this question affects the prospects of a railway traffic, everything depends upon where works for the treatment of sulphide ores are erected. The only formulated scheme up to the present time is that in connection with the Illawarra works, to which considerable publicity has recently been given. This scheme, however, would not, except perhaps indirectly, create any traffic for a railway to Broken Hill. If works were established at Eskbank or Lithgow there would be a prospect of traffic, but to what extent it is impossible to say.

Against the adverse changes that have taken place during the last few years may be mentioned the fact that a cheaper system of construction has been adopted, together with a largely reduced scale of rates for conveyance of material for the construction of new lines, which will permit of the capital cost of the proposed extensions being reduced materially below the original estimate.

The line is one which we cannot recommend to be constructed as being likely to prove a remunerative undertaking.

The Seal of the Railway Commissioners of New South Wales was hereunto affixed, this first day of November, 1895, in the presence of,—

{	E. M. G. EDDY,
	Chief Commissioner.
	CHARLES OLIVER,
	Commissioner.
	W. M. FEHON,
	Commissioner.

H. McLACHLAN.

354. *Mr. Wright.* With regard to the questions asked by Mr. Leo about the narrow gauge line between Cobar and Broken Hill, is it not rather an advantage that that line should still remain as a narrow gauge line in the hands of a private company;—would it not be an advantage to keep that line as it is? It depends on the way in which you look at it.

355. We are proposing to construct a line with the object of getting the traffic at Broken Hill;—would not the retention of that tramway line be more likely to force the traffic this way than if we took it over and made it a portion of the Government line? Not if the gauge were changed.

356. Do you think it would help us to get the traffic if we changed the gauge? I think it would block the traffic going to Adelaide.

357. The proposed line, I suppose, is to be one for the conveyance of coal and crude ores. Necessarily there will be large engines and heavy trains? Yes.

358. Have you any experience of lines without ballast conveying heavy mineral traffic? It is a question of weight of engines more than anything else.

359. Are you satisfied that it would be prudent to construct an unballasted line under the circumstances? I think, on the grades of this line you could run the full length of trains you require without having any very heavy locomotives.

360. Could you run a 300-ton train, for instance, without a big locomotive? Yes; if the grades are not worse than 1 in 200.

361. You would have to consider the whole distance from Orange downwards? I think you must look upon that as a separate question. From Molong to Parkes you have the light 60-lb. rails, and from Parkes to Condobolin you have a cheap line under course of construction.

362. But in conducting mineral traffic at a cheap rate you must not cut it up? Yes.

363. So that the line will necessarily have to carry heavy engines for the purposes of traffic? Yes.

364. Are you quite satisfied that the proposed line, without ballast, is capable of carrying the heaviest class of engines we have, with a train of 300 tons? The heaviest locomotives are those just recently imported. The engines themselves weigh 65 tons, and their tenders 109 tons.

365. Are you satisfied that, without ballast, the line will carry these weights upon it? I should require to put more sleepers in.

366. That, of course, would entail increased expenditure. What additional sleepers would you provide? I think two extra sleepers per rail length would be necessary. That is 352 extra sleepers to the mile. I should put them down at an average of 5s. per sleeper, or £90 per mile.

367. Then to enable the proposed line to carry the heaviest class of mineral traffic, what would be the additional cost per mile? I calculate that it would be necessary to put in additional sleepers, which would cost about £33,000 over the present estimate.

H. Deane,
Esq.

7 Aug., 1896.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, sworn, and examined:—

368. *Chairman.*] Will you describe the maps furnished to the Committee, and what their colouring means? The purple colouring indicates the Upper Silurian formation; the reddish brown indicates the Devonian; the red indicates granite; the green indicates the Lower Cretaceous, or artesian water-bearing formation; the dark green indicates the Upper Cretaceous, or Desert Sandstone formation; the uncoloured portion of the map represents the Post-Tertiary formation. I think the greater part of the route would be underlaid by the Palæozoic rocks, which are not artesian water-bearing; but these rocks are hidden by the Post-Tertiary clays and sands which form the surface of the plains. Practically the only chance of getting artesian water is where the railway line would cross the valley of the Darling. I cannot state the width of this belt where artesian water might be obtained, as it can only be defined by boring, and this is being done gradually by the Department of Mines.

E. F.
Pittman,
Esq.,
A.R.S.M.

7 Aug., 1896.

369. What is the possibility of mineral development contiguous to the route under consideration? Except in the neighbourhood of Mount Hope, Euabalong, and Hillston, there is no known mineral deposit.

370. Have there been any mineral discoveries south of Mount Hope? Yes; there have been mineral discoveries between Mount Hope and Condobolin.

371. The belt there does not go very far west? No; it may be that there are mineral deposits west of those points, but they do not appear at the surface, which is composed of superficial Post-Tertiary deposits.

372. Is there any likelihood of artesian formation along the proposed route? There is no certainty; but there is a probability of artesian water being obtained where the line crosses the valley of the Darling.

373. Then any close settlement on the land must come from stored water? I think so. It would not be safe, in the present state of our knowledge, to rely on the occurrence of artesian water.

374. Can you express any opinion with regard to the permanence of Broken Hill? There can, I think, be no question as to the permanence of the sulphide ores. At any rate they occur there in very large quantities.

375. Is it likely to be worked for a very considerable number of years? I think there is no doubt of that.

376. Are the sulphide ores of good enough quality to justify us in believing there will be a large output for a considerable number of years? I am of that opinion myself.

TUESDAY, 11 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and examined:—

377. *Mr. Wright.*] Have you any personal knowledge of this projected line? I have read over the Commissioners' report, and have had some conversation with them about it.

378. Have you any information from outside sources about the traffic? Nothing further than is contained in the Commissioners' report.

379. How was the information upon which their estimate of revenue was based obtained? It was obtained to some extent from the traffic officers.

380. Have any of the traffic officers been over the route? Not over the direct route. The figures have been obtained, to a great extent, from Mr. Harper.

381. They were arrived at by him through his general knowledge of the country? Yes, and of the stations which would be affected by the proposed line.

382. Did any Departmental officer visit Broken Hill? The Commissioners themselves have been to Broken Hill.

383. I suppose they were supplied with certain information there by the local residents? Yes.

384. Was not a local organisation formed to advocate the construction of a railway to Broken Hill? I believe there was a committee to advocate the construction of a railway.

385. I suppose the Commissioners made their deductions from the information laid before them by that committee? Not with regard to this traffic. The estimate of local traffic was arrived at from information obtained by Mr. Harper, and other officers.

386. Do you think that, if the proposed railway were constructed, it would be likely to secure any large proportion of the traffic from Broken Hill to Sydney, or *vice versa*? That is very problematical.

387. Ores are classed in your rate-book under the head of "Miscellaneous"? Yes; but there is also a special rate for crude ores.

388. What would be the cost of bringing crude ores 696 miles? Twenty-nine shillings a ton. The rate is $\frac{1}{4}$ d. a ton per mile.

389. But not less than 120 tons must be sent in a week? Yes.

390. If charged for under the head of "miscellaneous," the carriage for that distance would be £1 16s. 5d.? No, about £1 11s. 1d.

391. Can you give me any idea of the present rate of carriage between Broken Hill and Newcastle? I think it is about £1 a ton. I believe that that is the rate upon which the sulphide corporation base their calculations.

392. If the present rate is £1, would the people send ore across by the railway at a cost of £1 9s. per ton? No, I do not think they would.

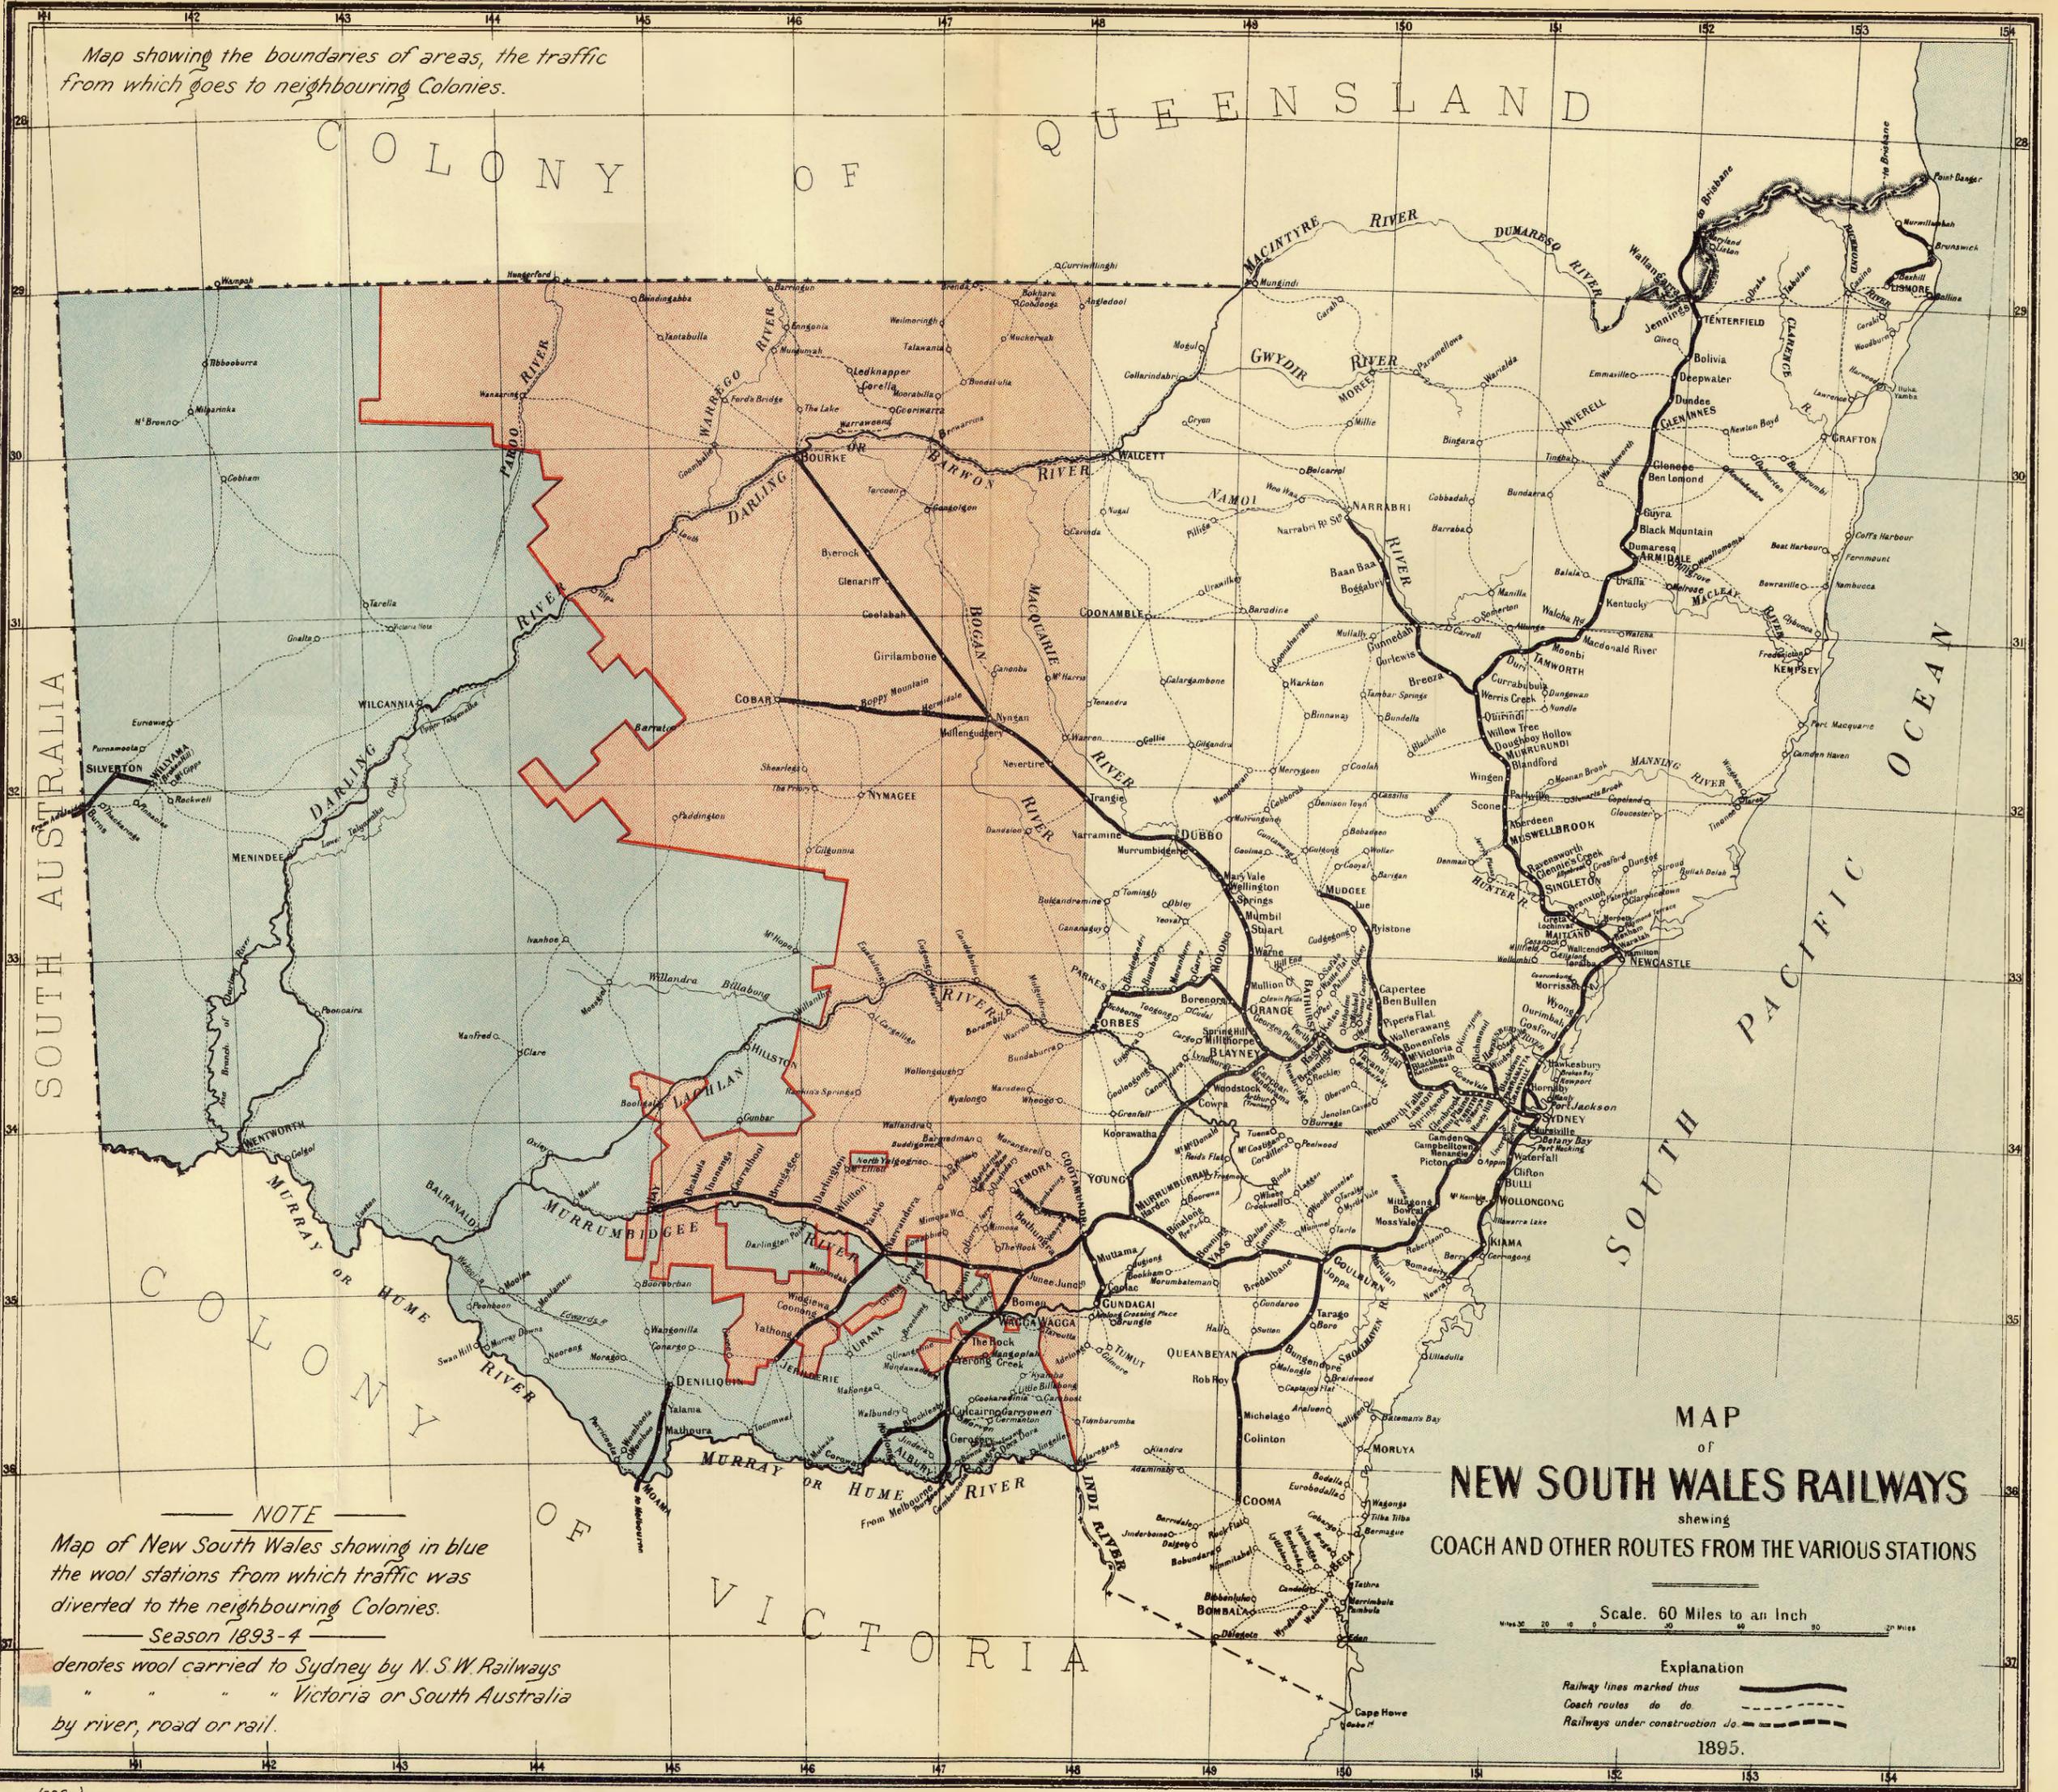

H.
McLachlan,
Esq.

11 Aug., 1896.

H.
McLachlan,
Esq.
11 Aug., 1896.

393. You see no great probability of our getting any large portion of this traffic in the event of the railway being constructed? Not under present circumstances.
394. Would the same remarks apply to the coal traffic? I think so.
395. Notwithstanding the fact that the Lithgow coal mines are 100 miles nearer Broken Hill than the metropolis is? Yes. Circumstances are altering Broken Hill traffic to some extent. They are commencing to do all the smelting away from Broken Hill, so that the traffic in coal and coke is falling off greatly. The difficulty with the railway there now is that they only get traffic one way.
396. What would it cost per ton to bring ore from Broken Hill to Eskbank? £1 5s.
397. Five shillings a ton more than it would cost to bring it to Newcastle? Yes.
398. Would the difference in the rate be the same with regard to coal? Coal would come under the "miscellaneous" rate, and would cost about £1 6s. 8d. a ton from Eskbank.
399. What would be the additional cost of taking ore from Sydney to, say, Wollongong? About 2s. 6d. per ton to Dapto.
400. So that it would cost £1 11s. 5d. to bring ore from Broken Hill to Wollongong? Yes.
401. While the charge coming round by steamer would be £1 per ton? You would not be able to have ore taken to Dapto for £1 a ton. I daresay the ore would be brought to Port Kembla for that, and then 1s. a ton or more would have to be added to pay for its conveyance to Dapto.
402. So that the cost of bringing ore by train to Broken Hill would be about 10s. a ton more than is now paid to bring it round by steamer? Yes, but if we brought ore by train from Broken Hill to Newcastle we should have to charge about £1 12s. 6d. a ton, as against £1, which is the present price by steamer.
403. And what applies to ore applies to coal? The train rates for coal are a little higher. I do not know what rates they have for coal from Port Pirie to Broken Hill; but the consumption of coal at Broken Hill is decreasing. I heard from one of the officers of the railway there a little while ago that they had a very low rate, but that their loading was going the one way.
404. I suppose that in the event of further discoveries of carbonates, they would smelt upon the spot? Yes. They deal with low-grade ores now.
405. Coal would have to be taken by the cheapest route in any case? Yes; and that would be round from Newcastle by water.
406. Do you think that the rate could be reduced to less than ½d. per ton per mile? I hardly think so. The present rate is very low. Circumstances might occur which would cause the Commissioners to alter the rate; but I do not think that the Committee would be wise in taking such an alteration into consideration.
407. Are the Commissioners favourable to the construction of this line? The Commissioners, so far as I can gather their opinion, do not urge the construction of this line as a line that will pay. They leave it to the Government to say whether it should be constructed as a matter of policy. Looking at it as a matter of railway management, they say that it will not pay.
408. *Mr. Fegan.*] Have they made that statement definitely? Yes, they show what the line would cost, and what traffic it would get.
409. *Mr. Wright.*] Is not the bulk of the £12,717 which is put down as revenue made up of charges against the Postal Department? The postal charge is £3,842.
410. That leaves about £9,000 for goods and passengers? Yes.
411. I presume that truck rates would come into force if the line were constructed? Yes.
412. Would they be proportionate to those charged on the Bourke line? Circumstances would alter so much if the line were constructed.
413. The truck rates would practically be arbitrary? Yes, and the wool rate would be arbitrary.
414. The truck-rate to Bourke—503 miles—is £41 for 6 tons, or £6 16s. 8d. per ton. If that rate were applied to Broken Hill the charge would be £9 8s. 1½d. per ton;—do you think you would get any considerable portion of the traffic with a rate like that? No; we should have to make a special rate, and I do not see at the present moment how we could quote a lower rate.
415. You would have to quote a lower rate to get the traffic? Yes; the present rate is made for traffic this side of the Darling.
416. And from how far west would you get the bulk of the traffic? I am given to understand that the proposed line would obtain the whole of the traffic, including wool from, say, 100 miles west of Euabalong. Once you get on to the Darling, it would be problematical whether you got anything, because you would have the river competition to face.
417. Are you aware that the Mossgiel traffic now goes to Hay? The bulk of that traffic goes to Melbourne at the present time.
418. But some of it comes to Sydney, *via* Hay? Yes.
419. That traffic would be diverted by the proposed line? Yes.
420. You would also capture a considerable portion of the traffic that now finds its way to the Murrumbidgee? Yes; I hand in a map showing the areas affected by the reductions made by the Victorian Government to secure our traffic.
421. The traffic from the area represented by the uncolored portions of the map is secured by our Railway Commissioners? Yes.
422. The space colored yellow represents an area where New South Wales and Victoria compete for the traffic, and where the Victorian Government offer a reduction of from 61 to 66 per cent. upon the rates charged to their own people for wool? Yes.
423. The space colored green represents the area in which they offer a reduction of 61 per cent? Yes; the competition is less keen in that district, and therefore the rebate is less.
424. The space colored brown shows the area in which they offer a reduction of 46 per cent? Yes.
425. What rebates have been allowed by our Commissioners in this war of tariff? We have no recognised scale.
426. But you have made concessions? Yes; we have made concessions. Those were exceptional inducements, and I do not think they were continued. The rebates offered by the Victorian Government forced the Commissioners to give concessions in order to retain our trade.
427. What concession was made to Mr. Faulkner? He got a special concession last year or the year before, but it was not repeated.

Map showing the boundaries of areas, the traffic from which goes to neighbouring Colonies.

1895.

428. What concessions have been given within the yellow area? It is difficult to speak in exact detail, because no general rule has been laid down. Every concession has been made to meet special circumstances.

H.
McLachlan,
Esq.

429. Do you think the proposed railway will enable you to get a great deal of this traffic at better rates? Yes, and it will enable us to get traffic which we have not hitherto had. I hand in another map showing the boundaries of the areas the traffic from which goes to neighbouring colonies. 11 Aug., 1896.

430. Will the proposed line enable you to secure all the traffic north of the Lachlan and the Willandra Creek? Yes, I think so.

431. Will you be able to get that traffic by charging ordinary rates, or will you have to reduce your rates in order to secure it? We shall get it at ordinary rates. Mr. Harper has estimated that the extension of the line to Condobolin will give us 1,400 tons of wool which had previously gone to the other colonies. We expect to get another 800 or 900 tons by a further extension of 50 miles, and a similar quantity by an extension beyond Euabalong.

432. You expect to get that traffic at a fair paying rate? Yes, at a reasonable rate.

433. From how far west will you be able to get the traffic? From about Ivanhoe, I believe. Once you get to the river the water competition will be too great to enable us to do anything.

434. Beyond Ivanhoe the Commissioners have little hope of securing any considerable traffic? I think it is very doubtful.

435. So that the 150 miles of line between here and Broken Hill would not be employed? There would not be much traffic on a good part of that line.

436. Is there any possibility of securing traffic between Broken Hill and Menindie? There might be a certain amount of traffic from Broken Hill to Menindie, and thence down the river.

437. Do you think it would be cheaper to get goods up the river from Menindie and thence by rail to Broken Hill than to get them direct from Adelaide by rail? There would be a chance of doing so.

438. Is there any strong hope of a local traffic between the river and Broken Hill? Not to my knowledge.

439. It is said that there might be a considerable demand for timber at Broken Hill. That timber would be obtainable from lower down the river, and sent up to the railway at Menindie? I have no knowledge of what the traffic would be.

440. If it is possible that goods will come up the river to Menindie, and take the train thence to Broken Hill, there may be an outlet for traffic at Broken Hill through Menindie and down the river? Yes. There might even be a traffic in ores that way.

441. So that there is a possibility of the traffic both ways between Broken Hill and Menindie? Yes; but I have no special knowledge on the subject. I have never been in the district.

442. Have you had any conversation with the Commissioners upon the subject? Yes.

443. Was not the question of traffic extensively gone into? Not more than I have mentioned.

444. The general possibilities of the traffic were discussed? Yes.

445. And you have practically expressed the views of the Commissioners upon the subject? Yes; so far as I have been able to gather them.

446. I understand that the Commissioners do not take a hopeful view of the prospects of the proposed line? No; they see no prospect of the line paying right through.

447. Though the Commissioners offer no violent opposition to the line, they point out that if the line is constructed they will have to take the responsibility of paying the interest upon nearly £1,000,000, while they will lose £30,000 per annum in other ways? The loss will be greater than that. The working expenses shown in the report are calculated for a revenue of £12,000; but the working expenses incurred to earn 17,000 would be additional. The annual loss upon the line would be about £40,000 in round figures.

448. So that to earn the additional possible £17,000 worth of traffic there would be an additional expenditure of between £8,000 and £9,000? Yes; £17,000 would be the traffic on the main line, and I think it would be reasonable to say that it would cost half as much to earn it. The proportion of expenditure to earnings on the main lines is about 55 per cent., so that the increase would be £8,500 or 8,600.

449. But notwithstanding, the Commissioners offer no violent opposition to the line? They leave it entirely to the Government, to be dealt with as a matter of policy.

450. If they were asked, "Would you advise the construction of this line in the interests of the country and of its commerce," what would they say? They would not say any more than they said in their report. They set out the facts, and they leave the Government to come to a decision.

451. *Mr. Fagan.*] Is it not a fact that the Commissioners desire to see this line constructed, seeing that it will connect the metropolis with the furthestmost district of the Colony? The Commissioners, so far as I know, have expressed no opinion on that subject. They say that the Government may, as a matter of national policy, construct the line; but they point out that its construction will entail a very heavy annual loss.

452. The Commissioners say, "The line should be looked upon to a great extent as a part of a national line, ultimately being extended to serve the Lachlan district as far as Hillston." Is not that an opinion that the line is really necessary as a matter of policy? The Commissioners do not deal with matters of policy. They simply deal with matters of management.

453. But do you not think that that is their opinion? I cannot say. Speaking of the proposal as a commercial undertaking, they say that the construction of the line would mean a big loss.

454. Did not the Departmental figures show conclusively that the Cobar line would be a failure? No, the Commissioners recommended the construction of that line.

455. Did not Mr. Harper say that it would not pay? I am not aware. Of course that line does not pay now. There is a loss of two thousand pounds a year upon it.

456. But the loss is comparatively small, compared with what was expected? Yes, the line has done better than was expected at first. It is being worked more cheaply than was at first thought possible.

457. The proposed line would shorten the journey from Sydney to Broken Hill in point of distance by about one-half? Yes.

458. Do you not think that that will be of advantage to the Colony ultimately? It might be an advantage; but the traffic between the two places is so small that the connection will not pay. We book passengers through to Broken Hill now, but for the first six months of this year only fifty-six passengers were taken from Sydney to Broken Hill, and thirty-nine from Broken Hill to Sydney, or ninety-five in all.

H.
McLachlan,
Esq.
11 Aug., 1896.

459. What is the present fare? Single—first-class, £8 16s. second, £5 15s. 6d.; return—first-class, £13 2s. 6d., second-class, £8 13s. 3d.

460. If the proposed line were constructed, what would the passenger rates be? They would be very much lower. The present rate to Bourke—503 miles—is £4 3s. 6d. first-class.

461. Do you not think that a reduction in the rate would increase the passenger traffic? I do not think there would be much passenger traffic between Sydney and Broken Hill.

462. Can you give us a list of the railways which are not paying, and of the amount of revenue which they produce? Yes. The following statement is taken from the Railway Commissioners' Annual Report for 1895-6, and shows the earnings and expenses:—

EARNINGS and expenses in connection with a number of outlying lines in the Colony for the year ending the 31st December, 1895.

Line	Length	Capital cost.	Interest on capital.	Working expenses.		Total earnings.		Loss after providing for working expenses and interest.	
				Year ending December, 1895.	Year ending December, 1894.	Year ending December, 1895.	Year ending December, 1894.	Year ending December, 1895.	Year ending December, 1894.

* First section, Lismore to Mullumbimby, opened 15th May, 1891; second section, Mullumbimby to Murwillumbah, opened 24th December, 1894. † Opened 1st February, 1895.

We have not got the earnings of the line from Sydney to Bourke. The main lines have been treated as a whole; but the earnings of certain branch lines have been kept separately, in order that the Commissioners may see how they are paying.

463. Which do you call the main lines? The lines from Sydney to Albury, to Bourke, and to Tenterfield.

464. The Commissioners do not know what are the earnings of those three lines? They are not worked out separately. They know what the lines earn as a whole.

465. The coal required at Broken Hill is taken round to Port Pirie by water? Yes.

466. What is the minimum rate and the maximum rate you allow for various lines? The cost per mile, including rolling stock, workshops, and everything else, is £14,500.

467. What traffic do you expect to get from Condobolin? Wool principally, together with a certain amount of inward general traffic, and some mineral traffic.

468. A great proportion of the country through which it is proposed to construct this line is good country, and would grow almost anything? I have never been over it; but I understand that down the Lachlan valley is all good country.

469. Do you not think that the construction of the proposed line would induce settlement and greater development of our mineral resources? To some extent, I think it would.

470. Have you not taken that matter into consideration? Yes.

471. So that the estimated annual loss of £40,000 might be reduced by one-half in a very short time? It might be; but I do not know that it is likely to be.

472. *Mr. Hassall.*] Do you know whether the Commissioners have taken into consideration the advisability of an extension to Broken Hill from some point other than Condobolin? Some years ago they reported upon a proposal to extend the railway from Nyngan through Cobar and Wilcannia to Broken Hill. That was in 1889. They were then rather in favour of the extension.

473. A connection between Cobar and Broken Hill would be much shorter than the proposed connection? I do not think that the difference would be very great; but it would make the distance from Sydney greater.

474. Do you know whether it has been proposed to extend the railway from Temora to Broken Hill? That extension was referred to when the proposal to carry the line from Parkes to Condobolin was under consideration; but the Commissioners thought that an extension from Parkes to Condobolin, as the first section of a line to go ultimately to the Darling, was better.

475. Do you think that the country from Condobolin to Mossiel is as good as the country through which a line from Temora would pass? Yes, it is river country.

476. It is pretty well settled country? Yes, down the Lachlan.

477. Wool growing is the principal industry? Yes.

478. There would not be much chance of increasing the carrying capacity of the land even if the railway were constructed? I am unable to say. I do not know whether the railway would have much effect upon the pastoral production there.

479. The Commissioners are of opinion that Condobolin would be the best place from which to extend the railway to Broken Hill? Yes, that is their opinion.

480. Do you know if they have any idea of thereby attracting some of the traffic which now goes to Adelaide? The proposed extension will bring some of the traffic to Sydney which now goes either to Adelaide or to Melbourne. Once you get out far west, the country practically belongs to either Victoria or South Australia. The Commissioners think that the extension of the railway to Condobolin would bring 1,400 tons of wool to Sydney per annum from places which now send to the other colonies.

481. Do the Commissioners think that they would get all the wool from as far out as the Darling? Wool grown on places near the river would not be sent over the railway, except in bad seasons. Of course we would get some of that wool, but it would not be wise to reckon upon it as an important factor in the traffic.

482. Do you think that the extension of the line would tend to the development of the mining industry around Mount Hope? Yes. I believe that Mount Hope was closed for a time because of the cost of haulage.

483. Have the Commissioners enquired into the proposed deviation *via* Lake Cudgellico and Hillston? No. The matter of route is practically determined before the proposal is laid before the Commissioners.

484. I do not suppose that the detour would make much difference in the annual cost of the line? No, it would not effect either the traffic or the expenditure very much.

485. It might serve a larger area of country? Yes.

486. *Mr. Roberts.*] In 1891 the Commissioners reported upon a proposed line from Nyngan to Cockburn? I think that was in 1889.

487. Did they take up the same position in regard to that proposal as they do to the one under consideration? No, they were rather favourable to the construction of that line.

488. Did they recommend that it should be constructed? They practically recommended its construction.

489. Were they able to say that it would be a profitable undertaking? They did not give any estimate of the probable traffic, but they went over the line, and they received promises and assurances which indicated the likelihood of a considerable traffic springing up. Since then circumstances have altered considerably. Broken Hill instead of increasing, has decreased in population, and the Commissioners have modified their opinion.

490. If the Commissioners were now asked to report upon an extension from Cobar, their report would be different? Yes, as you will see by referring to page 16 of this evidence.

491. What reason had they for supposing that there would be more traffic than they estimate now? They were assured at that time that a great deal of the traffic would come to Sydney, if a railway were made.

492. On sentimental grounds? No; circumstances have largely altered by the establishment of smelting works at Newcastle and Illawarra; and the people interested in these works are the people interested in the Silverton Tramway. In 1889, however, these smelting works were not thought of, and it was proposed to establish smelting works on the western line.

493. Do the Commissioners prefer the proposed route to the route by way of Wilcannia from Condobolin, or from Cobar? The Commissioners would prefer the Condobolin-Menindie line. Their position is this: They report upon any line which is recommended to them; but as a rule, they do not advise upon routes. They have reported upon the proposed extension from Cobar, and they prefer an extension from Condobolin. In 1889, the railway did not go further than Molong, and to take the line from there to Broken Hill would have required an extension 133 miles longer than the proposed extension. When they considered the extension through Cobar and Wilcannia, they paid no regard to rival routes; they simply reported upon the line submitted to them.

494. What were the views of the Commissioners with regard to the advantage to be obtained by tapping Wilcannia? They have only reported on the proposal before the Committee; though of course it will be an advantage to have the line taken as far south as possible, so as to enable us to compete with the other colonies to better advantage. The traffic from this district will not travel north, so that if you have your line higher up, you leave a large portion of country open to Victoria.

495. If the line went to Menindie, would not Victoria still get a great deal of New South Wales traffic? No; because such an extension would intercept the traffic, and bring it this way. If the line were extended from Cobar to Broken Hill, all the country further south would be open to the other colonies; whereas a lower line would command a very great part of the traffic.

496. Is not the Darling easily navigated between Wentworth and Menindie, and very tortuous between Menindie and Wilcannia? The traffic from the Darling would go down to the other colonies in any case.

497. By taking the railway to Wilcannia would you not prevent a lot of traffic from going to Victoria? I do not know if that would affect the question very much. I do not think that there is much difference between Wilcannia and Menindie, so far as the navigation of the river is concerned. When the river is blocked at Wilcannia, you generally find it blocked at Menindie. There is no large stream coming in between the two places.

498. Is it likely that people will pay 10s. a ton more to send ores by train to this part of the Colony, than they now have to pay for sending them by water? I think it is very doubtful whether any of that traffic will come to Sydney by train. Circumstances might arise which would enable the Commissioners to quote a much lower rate; but I do not think there is much possibility of it.

499. Does the traffic estimate of £12,717 include anything for the carrying of ore? No, as explained in the report.

500. Was the deviation by way of Lake Cudgellico and Hillston suggested at the time the Commissioners reported upon the extension? I do not think it was.

501. Can you tell us what were the views of the Commissioners upon the deviation? They have not had the matter before them for consideration. I do not know whether Mr. Deane has completed the detailed survey right through.

502. Have the Commissioners been over the proposed line? They went over the route of the proposed line from Cobar, which traverses very similar country. They have not been over the route of the line which the Committee are considering.

503. The proposed extension can only be looked upon as a national work to give the people of Broken Hill communication with the metropolis? Yes; it will not pay from a commercial point of view.

H.
McLachlan,
Esq.

11 Aug., 1896.

H.
McLachlan,
Esq.
11 Aug., 1896.

504. *Mr. Black.*] Is there anything in the suggestion that the proposed extension might be used as part of the line connecting directly with Adelaide? I do not think so. There is very little direct traffic to Adelaide.

505. It has not been taken into consideration as affording direct communication between the two capitals? It would give direct communication, but not very much would be gained by that. The distance would practically be the same as by the present route, and, as we could not at present give an express train, the time of journey would be longer.

506. Is there an unbroken gauge from Broken Hill to Port Pirie? Yes. I think they run a 3-ft. 6-in. line right through.

507. Have you any personal knowledge of the country between Menindie and Mossgiel? No.

508. There has been no opinion expressed that if that country were opened up by a railway, settlement would increase? No.

509. From what you have heard of the country, you do not think that it is likely? Well, it is purely a pastoral country, and there is not much water on it.

510. Do you think that the commercial importance of such places as Hillston, Mossgiel, and Ivanhoe entitle them to railway communication with the metropolis? We are spreading out that way, and it is only a matter of growth. Not many years ago one could not get further than Orange; but now the railway is in process of construction as far as Condobolin, and no doubt it will be extended still further by degrees.

511. You think that the line, if not extended to Broken Hill, might be taken beyond Condobolin? Yes, by degrees.

512. *Mr. O'Connor.*] How did the line from Condobolin to Wilcannia come to be abandoned? A Loan Bill was passed to make provision for the construction of that line, but the work was never proceeded with. I believe that Mr. Wright was Secretary for Works at the time.

513. That was before the Commissioners were appointed? Yes. The matter was debated in the House in 1884, about four years before the Commissioners took office.

514. *Mr. Humphery.*] The distance from Broken Hill to Sydney is 696 miles, as against 253 miles from Broken Hill to Port Pirie? Yes.

515. A difference of 440 miles in distance would render it impossible for our line to compete with the Port Pirie line? Yes.

516. You said that you could carry ore at $\frac{1}{2}$ d. per ton? Yes; that is the rate in the books.

517. Are you aware that Mr. Harper, when examined in connection with the extension from Nyngan, expressed the opinion that ore could not be carried profitably for 1d. per ton per mile? I am not aware; but, as a matter of fact, we have provided a rate of $\frac{1}{2}$ d. per ton per mile.

518. Have you taken into consideration the fact that you have to rise over 3,000 feet in approaching the coast districts, and in going away from them? Yes. But, of course, the construction of smelting works at Lithgow would enable the traffic from Broken Hill to avoid the mountains.

519. But you would have to rise about 3,000 feet to get to Orange? Yes; and then from there to Lithgow you have very few difficulties.

520. What is the height of Menindie? I do not know. The rise is very gradual.

521. What is the height of Dubbo? 865 feet.

522. How many feet have you to rise between Dubbo and Orange? 2,000 feet. The distance between Dubbo and Lithgow is comparatively short. The major part of the journey would be over easy grades.

523. When Mr. Harper stated the opinion that it would not be possible to carry ore from Broken Hill at 1d. per ton per mile, do you think he took into consideration the probability of larger engines being used? I do not know upon what he based his opinion, but no doubt at that time we had not much experience as to what could be done with big locomotives. We were then only commencing to work big train loads. I think that if he were asked the question now, it would be found that his opinion had altered.

524. Do you think that you could carry at a profit with a rate of $\frac{1}{2}$ d. per ton per mile, having regard to the grades? You could carry very big loads from Broken Hill to Dubbo, a distance of over 400 miles.

525. But the proposal is to bring Broken Hill traffic to Newcastle and to Illawarra? I do not think that it would pay you to carry ore that distance for $\frac{1}{2}$ d. per ton per mile, unless you could get back loading.

526. What prospect is there of any appreciable traffic between Newcastle or Illawarra and Broken Hill? I do not think that there is a prospect of much traffic.

527. Therefore, in your opinion, any increase in the Commissioners' estimate will not be justifiable? No. The Commissioners made that estimate after a careful consideration of all the circumstances.

528. By extending the railway to Broken Hill, do you run the risk of losing any of the traffic that you will obtain by the extension to Condobolin? No; I think that we should gain traffic. I do not see how we can lose any.

529. The object of the Condobolin extension is to prevent traffic going to Hay, and then to Melbourne and Adelaide? Yes. When the proposal to make that extension was under consideration, it was estimated that we should gain 1,400 tons of wool from places which now send to the other Colonies.

530. But there must be a certain point at which you will cease to gain traffic? Yes.

531. From that point on to the Darling no benefit will accrue to New South Wales from the construction of the line? There might be a little local traffic.

532. The railway could not compete against river traffic from Menindie? I think not.

533. How far from Menindie will you cease to obtain traffic? I could not say exactly; but I am very doubtful whether we should get any traffic from near the river.

534. It is clear that the Commissioners do not view the construction of this line with favour, except as a matter of sentiment, by reason of its affording a connection with Broken Hill? It may do, as a matter of national policy; but as a commercial undertaking they think that it will mean a big loss.

535. *Mr. Trickett.*] Do you know the present population of Broken Hill? 18,000 or 19,000 people, I think.

536. In 1889 it was stated to be 15,000? Yes; but an assurance was given then that the population was rapidly increasing.

537. It did increase for a time? It increased to 22,000 very shortly after the Railway Commissioners made their report.

538. It has since gone down again? The population was 19,000 people, according to the last figures that I saw.

539. The probable increase of population was made a very strong argument in favour of the extension from Nyngan? Yes.

540. Did not the Commissioners, when they reported upon the Nyngan extension, look upon a connection with Wilcannia as strongly recommending the line? They thought that from a national point of view, it would be a good thing to connect that part of the country with the metropolis.

541. Are we to understand that they have abandoned the idea that Wilcannia is a place of importance? No, they still say that the line might be considered as a matter of national policy. They say, "Lines of this character can only be dealt with upon national principles."

542. Surely the advantage of connecting with Wilcannia is a local consideration? Yes; but the matter had a national aspect. The advantage of opening up the country might be considered.

543. Is not Wilcannia one of the largest pastoral centres in the Colony? It is a large pastoral centre; but Bourke is a larger one.

544. When the Nyngan extension was under consideration, did not the stock inspector report that there were over 3,000,000 sheep in the district? I am not aware.

545. If that were stated in the evidence, you would have no reason to doubt the accuracy of the statement? No.

546. Is not navigation from Wilcannia a very uncertain matter? Yes, to some extent.

547. If constant communication with Sydney by rail were afforded, do you not think that the pastoralists would avail themselves of it? They might avail themselves of the railway in bad seasons.

548. Do you not think that they would be educated into using the railway always? They might; but of course they would take the cheaper route, which might often be the river.

549. I wish to refer you to this paragraph in the Commissioners' report, of 15th July, 1889—

While Wilcannia and the surrounding district depends at present upon water-carriage for its supplies, and as a means of getting wool to the seaboard, the carriage is uncertain, and it is fair to assume that a portion at least of the traffic would go by rail if such a means of transit were available.

Do the Commissioners still hold to that view? Yes; that is one of the reasons why the Commissioners look upon this proposal as to some extent, a national question. When the river is low, the people there are subject to great losses which would not happen if they had regular communication with Sydney by rail. Still the Commissioners do not say that a railway to Wilcannia would pay.

550. They stated that such a railway would be largely used for the conveyance of stock in dry seasons? Yes.

551. And that a large traffic in coke was likely to spring up? That statement is to be discounted by reason of the recent developments in the mining industry of Broken Hill.

552. If all these things were true, as applying to the Wilcannia route in 1889, why have they become untrue in 1896, seeing that the country is still used for exactly the same purposes, and all the circumstances remain unchanged? The Commissioners only report upon the route submitted to them. They do not go round the country looking for alternative routes. The route submitted to them in 1889 was from Nyngan through Cobar and Wilcannia. The present route was not thought of. Then too, the circumstances at that time were very different. The railway had not been extended beyond Molong, whereas it has now been taken 113 miles further west. A railway to Menindie would be a far better line from a strategic point of view, than a railway through Wilcannia; but at the time the Wilcannia extension was spoken of, there was not the same undercutting of rates. The Commissioners were not, at that time asked to consider the Menindie route, and they did not consider it.

553. If the Cobar route had been again submitted to the Commissioners would they have reported in favour of it? No. In their report of the 8th May, they say—

The consideration of this question is so much affected by the scheme recently reported upon by us, in connection with an extension of the Cobar line to Broken Hill via Wilcannia, that we feel obliged to refer to that scheme, and to assume that the Government will not now proceed with the construction of that line.

The Commissioners go on to say that they would prefer the Menindie line, showing that the new mileage, which I spoke of, was an important factor in their calculation.

554. Still there has been no change of circumstances to bring about a change of opinion? I think that there has. Circumstances have altered very materially since 1889.

555. The distance from Cobar to Broken Hill is 275 miles, and from Condobolin to Broken Hill 366 miles? Yes, but in 1889 the distance via Menindie to Broken Hill would have been about 480 miles.

556. In 1889, the Commissioners strongly recommended the construction of a line *via* Cobar and Wilcannia. They further recommended that it should be constructed in four sections? Yes.

557. If that line had been constructed, a mistake would have been made? They recommended it as a national line, but they did not say that it was going to pay. They do not say that this line is going to pay.

558. Have they carefully weighed the question of trade? Yes, they have considered it carefully.

559. Mr. Whitton in 1889 said that the best route to Broken Hill would be "from Nyngan to Cobar, thence to Wilcannia, and Silverton". He said further "the country from Nyngan to Wilcannia is remarkably easy for railway construction"? Since then circumstances have altered, because the Railway has been extended to Condobolin.

560. Mr. Harper comparing the Nyngan and Condobolin extension gives this evidence:—

Do you think that they would both be unprofitable lines? Yes, that is my opinion.

Is that your opinion? Yes. Of course the Nyngan to Cobar line almost pays now.

561. But speaking of the extension right through? Yes.

562. You are of opinion that either extensions to Broken Hill would be unprofitable? Yes.

H.
McLachlan,
Esq.

11 Aug., 1896.

THURSDAY, 12 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed railway from Condobolin to Broken Hill.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

H.
McLachlan,
Esq.
12 Aug., 1893.

563. *Mr. Trickett.*] The Commissioners in their report dated 1st November, 1895, say:—"The line is one which we cannot recommend to be constructed, as being likely to prove a remunerative undertaking." I suppose that that remark applies to any line to Broken Hill at the present time? Yes; so far as its profitable working is concerned.

564. The Commissioners have nothing to do with the selection of a particular route. They simply report upon the proposal put before them by the Government? Yes. The Act provides for the making of such reports.

565. But, inasmuch as they are required to work the traffic upon any new line, they are anxious that non-paying lines should not be constructed? Yes.

566. This line is recommended as a "national" line;—could we have a national light line? The Commissioners apply the term "pioneer" to lines of this character.

567. But would it be desirable to have a light line of railway to connect two colonies? One of the merits of these lines is, that in the first instance they are sufficient for the traffic offering, and that afterwards they can be improved as the requirements of the service increase.

568. *Mr. Deane* told us the other day, that to make the proposed line sufficiently strong to carry heavy mineral traffic, more sleepers would be required, and that this would increase the cost of construction by £33,000. Do you think that such an improvement of the line would be necessary? I almost think so; but it is rather an engineering matter.

569. If the principal traffic upon the line is to be mineral traffic, it would be best to make the line sufficiently strong to carry that traffic? Certainly.

570. If the railway does not go to Wilcannia, the large volume of trade which goes from that place to Melbourne will continue to go to Melbourne? I am inclined to think so.

571. The proposed line will not abstract any of that trade? I do not think that we shall be able to get any traffic from places near the river; at any rate, not in good seasons. It would not be well to count upon such traffic.

572. Will you summarise what you consider to be the advantages of the proposed line? It would bring Broken Hill nearer to Sydney: it would pass through better country than any other line, and considered strategically, it would give the Commissioners better advantages in competing for the traffic against the railway systems of the other colonies. The proposed line will be about midway between the Cobar line and the Hay line.

573. What would you consider the disadvantages of an extension from Cobar to Broken Hill? Such a line would run through poorer country, and would not offer us the same advantages for competing for the traffic. Then, too, the distance from Broken Hill by that line would be further, and where you have competition every mile counts.

574. The Commissioners had no voice in determining the route of the proposed line? No.

575. *Mr. Clarke.*] In the event of the Broken Hill mines being worked out, what other source of traffic will there be for the railway? If the mines failed, I do not know what traffic there would be from Broken Hill.

576. Do you think that goods for the supply of Broken Hill will be sent over the proposed railway, instead of coming from Adelaide? I think that goods would be sent to Broken Hill by other routes.

577. The ore at present goes by rail to Port Pirie? Yes; at a cost of about 14s. a ton.

578. *Mr. Lee.*] Are the Railway Commissioners able, with the means at present at their command, to capture the trade from Victoria in the districts which Victoria now controls by her differential rates? It is very doubtful whether, under existing conditions, we could get the trade from the country round about Mossgiel and the other places referred to yesterday, because river carriage is very cheap, and it would be very expensive to cart the wool to any of our stations.

579. That being so, will not the trade from that part of the Colony continue to flow to Victoria for all time unless steps are taken to attract it in this direction? Yes.

580. I would draw your attention to this paragraph in the Commissioners' report:—

Ultimately the line will be of enormous advantage to the settlers in these districts, and will also largely influence the question of the present abstraction of New South Wales wool into Victoria, as, if the pastoralists are able to put their traffic into the railway lines closely adjoining their runs, it would put a stop to the cartage that now goes on to the Murrumbidgee River, and thence *via* Echuca to Melbourne. We are still of the same opinion.

Does not that appear to be a strong recommendation on the part of the Commissioners that something should be done to obtain the traffic of this Colony for this Colony? The proposed line would enable us to get much of the traffic that now goes to Victoria, but in getting that traffic we should lose a very large amount of money.

581. The Commissioners also say, "Ultimately the line will be of enormous advantage to the settlers of these districts." It can only be of advantage to them if they use it. Is not that a strong argument that the trade will come this way? Yes; that is one of the national advantages of the line. No doubt it would be an advantage to the Colony to deal with its own trade; but the advantage would be obtained by a loss on the railway. Each mile we go into that country puts us in a better position to compete for the wool of the district.

582. With the means at present at the disposal of the Commissioners, they are powerless to divert the traffic from Victoria? Yes.

583.

583. And unless some extension is made, the traffic from these districts will continue to go to Victoria? Yes.

584. If the proposed line is constructed, do you think that any wool or other station produce will be carried from the interior of this Colony to the Darling, to be sent thence to the Victorian railways, or to South Australia? No. Once we got away from the river, I think the wool would come to Sydney. The Commissioners estimate that the proposed line would bring about 3,000 tons of wool to Sydney, in addition to the 1,400 tons which the Condobolin line would secure.

585. Do you think that Broken Hill people would send ore by train to Menindie, and thence down the river? They might do so.

586. Is it not likely that the Port Pirie line would prevent them from doing so? No doubt that line would compete with our line, and it would be a question for the mine-owners to decide which was the cheapest way to send their ore.

587. Have you been lead to suppose that they would send their ore to Menindie by rail, and thence down the river? It is very problematical. I do not think it would be wise to count upon any traffic of that kind.

588. In speaking of the line as a national line, I take it that you regard it in its character of an inter-colonial connection? Not altogether. A line might be a national line, and yet purely a local one. For instance, if there were a coal-field 10 miles from the port of Newcastle, which could not be used for want of a railway, and the Government considered it necessary to make such a line, that might be regarded as a national undertaking. The proposed line, running as it would through a district often affected by drought, would be of national advantage in enabling pastoralists to remove starving stock to more favoured localities.

589. Does the term "national" tend to include the term "intercolonial"? Yes; it would cover it.

590. When the Commissioners referred to the line as a national one, had they in view an ultimate connection between Brisbane and Adelaide? Yes; they referred to that possibility in their report of 1889.

591. By means of the proposed line, and a connection between Dubbo and Werris Creek, 300 miles could be saved in the journey from Brisbane to Adelaide? Yes; but such a line would have no great commercial value at the present time.

592. Would not the conveyance of mail matter, and of passengers, be a considerable item in its revenue? There would not be much in it at the present time. Besides, if you had a cheap line, you could not run a fast express over it.

593. But, as a foundation for such a connection, the line would be valuable? Yes.

594. Would it not also be valuable when the question of uniformity of gauge came to be considered? Yes; but that is much in the future.

595. If the proposed line were taken to Broken Hill, it is not likely that there would be a second extension in the same direction? The Commissioners think that it would not be wise to have two lines going across the Colony at the present time, whatever may be necessary in the future.

596. Whatever the immediate prospects of the line may be, its future possibilities are very great? Well, any such traffic between Brisbane and Adelaide is altogether in the future.

597. During the late drought in the western district, were the railways largely availed of to remove starving stock? Yes; to a considerable extent. The Commissioners reduced the rates to one-half where stock was being conveyed from districts where there was no feed to districts where there was feed.

598. Was that remunerative? They did not look so much to immediate profit as to the ulterior advantages which we would get. I do not think there was much profit in it, especially where we had to run the trucks empty one way.

599. Do you find that stock are generally trucked at the large depots instead of being driven down the line? Yes.

600. Have the drovers competed with the railway in the same way as the carriers have done? The competition of the carriers is a very small thing, compared with the bulk of the railway traffic. I do not think that much stock has travelled past Bourke. It would hardly be possible for them to travel along the railway line, because of the want of feed.

601. The railway is used in preference to the road? That is my opinion.

602. Of late years a number of chilling and refrigerating works have been established in the country, which are doing a large business? Yes.

603. You are aware that the country through which we propose to take the railway is an enormous sheep-grazing country? Yes. In the county of Dowling, through which the line would pass, there are 247,000 sheep; in the county of Blaxland, 500,000 sheep; in the county of Nicholson, 256,000 sheep.

604. That country is admitted to be about the best sheep country we have in fair seasons? I do not know much about it of my own knowledge.

605. Do you not think that it is reasonable to suppose that if the railway is made large chilling establishments will spring up there? Yes; but we get a good deal more gross revenue from the carriage of live stock than from the carriage of chilled meat.

606. There were no chilling works at Bourke before the railway was made? No.

607. Nor were there such works at Werris Creek, Gunnedah, Tenterfield, Nyngan, and other places before the line was made? No.

608. Will not the construction of the proposed line give opportunities for the establishment of similar works in the country of which we are speaking? I daresay it would.

609. The traffic upon which you base your estimate of revenue is principally station produce, mails, and a few passengers? Yes; but I would point out that you could not have a live stock traffic and a dead meat traffic at the same time, and you would get more revenue from a live stock traffic than from a dead meat traffic.

610. But where you carry 10,000 live sheep, you would probably carry 20,000 or 50,000 carcasses? I would not like to speak as to that.

611. Did you ever carry 5,000 head of cattle from Tenterfield in three weeks, before the chilling works were established there? There has not been a tremendous chilled meat traffic from Tenterfield. If the Tenterfield works had not been established, cattle and other live stock would have been sent by rail to the capital to be killed there, and that would have given us more revenue.

612. Is it not reasonable to suppose that as the business of chilling meat increases the rates of carriage for dead meat will be reduced? The rate is a very low one now. The Commissioners have more than

H.
McLachlan,
Esq.
12 Aug., 1896.

- once considered the question of reducing it; but they do not hold out much hope of being able to do so.
613. The tendency at the present time is to kill stock in the vicinity of the pastures? Yes.
614. And is it not reasonable to suppose that a large chilling factory will be established in the heart of the district which the proposed line will pass through? I think so.
615. *Chairman.*] Parkes, Dubbo, and Stockinbingal are all about the same distance from Sydney? Yes.
616. But it would be more difficult to work traffic on the line from Sydney to Dubbo or Sydney to Parkes than on the line from Sydney to Stockinbingal? Yes; if anything, the advantage would be in favour of the proposed line.
617. The distance from Sydney to Broken Hill by lines taken through any of these three places, would be about the same? Yes.
618. But as regards ease in working, the advantage would be in favour of a line through Stockinbingal? To a slight extent. But it must be remembered that you would have less new line to construct in making a connection from Condobolin to Broken Hill; secondly, that such an extension would pass through the best country; and that, thirdly, the Broken Hill traffic has been regarded as likely to go to Lithgow. There is no coal-producing centre on the southern line.
619. Have the Commissioners any definite opinion in regard to the proposed deviation through Cudgellico and Hillston? No; they have not been consulted about it, and I believe they have not looked into the matter.
620. Would their opinion be the same with regard to a line *via* Euabalong as with regard to a line *via* Cudgellico? I think they would like to consider the matter carefully before giving an opinion. There is a lot of mineral country near to the northern route.
621. With a railway to Hillston, could the Commissioners draw off the traffic which at present goes to the Melbourne railways, that is under existing rates? I think so.
622. At Mossgiel you get into debatable land? Yes, or a little to the west of that district. There is a great deal of competition there.
623. *Mr. O'Connor.*] The advantages afforded by the railway in the conveyance of live stock have greatly increased the wealth and prosperity of many parts of the Colony. Would it not be of advantage to people if, instead of having to send live stock to Sydney, which they can only do in certain seasons, and for which they have only a limited local market, they were able to send chilled meat, not only to Sydney but to other parts of the world? Yes.

James Burt, Esq., Draftsman-in-Charge, Information Bureau, Department of Lands, sworn, and examined:—

J. Burt, Esq.
12 Aug., 1896.

624. *Mr. Hassall.*] You know the proposal under the consideration of the Committee? Yes.
625. Have you a description of the country through which the line will pass? We have no detailed description, but I can give you information as to the holdings in that district, and the rentals which the Crown receives from the land there:—Starting from Condobolin the line passes principally through alienated and reserved lands (the alienated lands being almost wholly conditional purchases and conditional leases) for a distance of about 20 miles. Thence to Euabalong, half the distance through alienated lands, and half through leased areas. From Euabalong to the Willandra Billabong, through resumed and leasehold areas, apparently intersecting a few portions of alienated land. From Willandra Billabong to Broken Hill through resumed and leasehold areas, intersecting small isolated portions of alienated lands. From Condobolin, going westward, the line apparently passes through the following pastoral holdings:—

R.A. Condobolin—£2 14s. per section; 640 acres.	L.A. Willandra—1½d. per acre.
L.A. Mowabla— $\frac{9}{16}$ d. per acre; terminates 10 July, 1900.	L.A. Moulbong—1½d. per acre; terminates 1918.
R.A. Kiacaroo—Forfeited.	R.A. Boondarra—£2 2s. 8d. per section.
L.A. Do —1½d. per acre; terminates 10 July, 1900.	L.A. Do — $\frac{3}{16}$ d. per acre; terminates 1918.
R.A. Booberoi—17s. 9d. per section.	R.A. Mossgiel—£2 2s. 8d. per section.
L.A. Do — $\frac{7}{8}$ d.; terminates 1918.	L.A. Do —1½d. per acre; terminates 1918.
L.A. Euabalong—1d. per acre; terminates 1918.	R.A. Clare—12s. 3½d. per section.
L.A. Eribenderry—1½d. per acre; terminates 1918.	L.A. Do —1½d. per acre; terminates 1918.
R.A. Murrin—Forfeited.	R.A. Kilfera—6s. 4½d. per section.
L.A. Do — $\frac{7}{8}$ d. per acre; terminates 1918.	L.A. Do — $\frac{4}{16}$ d. per acre; terminates 1918.
R.A. Gunninguldric—5s. per section.	R.A. Manfred—14s. 4½d. per section.
L.A. Do —4s. 10d. per acre; terminates 1918.	L.A. Do — $\frac{1}{16}$ d. per acre; terminates 1918.
R.A. Uranaway—Not renewed.	L.A. Albermarle— $\frac{2}{16}$ d. per acre; terminates 1918.
L.A. Do —½d. per acre; 1918.	L.A. Moorara— $\frac{3}{16}$ d. per acre; terminates 1918.
R.A. Rota—Forfeited.	L.A. Tolarno— $\frac{1}{16}$ d. per acre; terminates 1918.
L.A. Do — $\frac{4}{16}$ d. per acre.	L.A. Kinchega— $\frac{5}{16}$ d. per acre; terminates 1918.
R.A. Wallandra—£2 13s. 4d. per section.	R.A. Do —£1 12s. per section.
L.A. Do —1½d. per acre; 1918.	R.A. Mount Gipps—16s. per section.

626. Where does the proposed line cross the boundary of the Central and Western Divisions? About 30½ miles from Condobolin. That boundary then follows the Lachlan River on its north side until you get to the Murray. The leaseholds in the Western Division all terminate about 1918, and the Minister has only power to resume land which is within 10 miles of a town containing fifty inhabitants.

627. Is half the land along the route of the proposed line available for settlement? No; the line passes through leasehold areas nearly the whole way.

628. What about the proposed deviation *via* Cudgellico and Hillston? The same remark would almost apply to that line; but the land between Condobolin and Cudgellico, which has not been alienated, is generally of a rather inferior character. It has been offered on improvement lease, but only one or two leases have been taken. It would be good agricultural land if it were cleared, and if the rainfall could be depended upon.

629. Would the deviation pass through as much alienated land as the more northerly route? Yes.
630. Then the land on the southern side of the river must be as good as that on the northern side? Yes, to judge from that circumstance.
631. Is the land on the Lachlan and the Willandra Billabong pretty good right through? I cannot say from personal knowledge; but inasmuch as every acre on the Lachlan River is held under lease, I suppose that it is. As you get out towards Broken Hill, there is not quite so much land held under lease.
632. Judging from the rentals paid, the land held under pastoral lease and occupation license is of inferior quality? Yes; only two or three of the leaseholds have been reappraised, and they have been reduced to the rentals I have quoted—forty-two hundredths of a penny and thirty-three hundredths of a penny. The highest rent paid is for Eribenderry, where the rent is one and nine-tenths of a penny per acre. That is just beyond Euabalong. That country has a frontage to the Lachlan, and another frontage to the Willandra Billabong.
633. As you go further west the rentals decrease? Yes.
634. Is the land suitable for other than pastoral occupation? I could not say definitely.
635. What is the rainfall? At Broken Hill it is 9 or 10 inches per annum, and near Condobolin it is about 20 inches per annum.
636. Except on the Lachlan and on the Willandra Billabong, the line passes through what is practically dry country? Yes.
637. So that artificial water supplies will have to be obtained? Yes.
638. *Mr. Lee.*] Is there much small settlement in this district? Not that I am aware of. In the western district the small settlement takes the form of homestead leases. I have a map showing the Forbes Land Board District, in which Condobolin is situated, and also a map showing that part of the Western Division through which the line will pass.
639. What are the reserves shown on the first map? They are water reserves, travelling stock reserves, and forest reserves.
640. About one-third of the land seems to be reserved? About 25 per cent. of it.
641. Are there as many reserves in the Western Division? No. Those in the Western Division are nearly all for travelling stock routes, or to provide access to water.
642. There are no large reserves which could be thrown open to allow of small settlement? No.
643. Would not the proposed line go through some portion of the resumed areas? Only to a limited extent. From 10 miles beyond Euabalong to the Willandra Billabong the line would pass through resumed areas for about 16 miles. I have made no distinction between homestead leases and pastoral leases—they both run for about the same period.
644. Then there may be a large number of homestead leases which are not indicated on the map? Yes; there are some homestead leases.
645. Are they held by the original lessees? I think the tendency has been for them to revert to the original holders.
646. Is the country suitable for small settlers? I have no personal knowledge of it, but I should not think so.
647. A great deal of the country is infested with rabbits? I believe so.
648. Are there many applications for reserves for villages or townships? I am not aware of any.
649. Where artesian bores have been put down, has there been any desire for small settlement? The only place I know of is Pera.
650. There are no improvement conditions connected with leases in the Western Division? No.
651. Do these leases stand in the names of the original lessees, or in the name of various banking institutions? I cannot say, but the information could be readily obtained.
652. Is any of the land dropping back into the hands of the Department? In the list which I read to the Committee there are only three resumed areas which have been forfeited.
653. Has that land been taken up again? No.
654. This land, although leased, is still Crown land, so that no compensation would have to be paid for it if it were required for railway purposes? No.
655. *Chairman.*] What about the land through which the proposed deviation will pass? The land from Condobolin to the boundary of the western division is nearly all alienated, and from there to Lake Cudgellico about one-third of it has been alienated. The rest of it is comprised within leasehold and resumed areas.
656. When will the leased land revert to the Crown? In 1918.

J. Burt, Esq.
12 Aug., 1896.

TUESDAY, 19 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CHARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

John Howell, Esq., Managing Director, The Smelting Company of Australia (Limited), sworn, and examined:—

657. *Chairman.*] You have a full knowledge of the mineral deposits of Broken Hill? I think I have.
658. *Mr. Fegan.*] What position do you hold in connection with the Broken Hill mining companies? I am not connected with them at all now, although for about five years, or a little over, I was general manager of the Broken Hill Proprietary Company.

J. Howell,
Esq.
19 Aug., 1896.

- J. Howell,
Esq.
19 Aug., 1896.
659. I suppose you are thoroughly acquainted with the conditions of the mines at Broken Hill? I think I am.
660. How many years do you think silver-mining will last up there? That is rather a difficult question to answer. There is ore enough there to keep the present output going for twenty-two or twenty-three years I should think.
661. I suppose there is no other mining but silver-mining carried on up there? Silver-mining and lead-mining.
662. Do you treat the sulphide ores up there? By concentration for shipment only.
663. Have you anything to do with the sulphide works which are being erected at Newcastle? No.
664. Have you anything to do with those near Wollongong? I am managing director of that company.
665. How many tons a day are you able to treat there? We expect that, when we are in full blast, we shall be able to treat 300,000 tons a year, and possibly more.
666. How are you to get your ore? At present we can only get it *via* Port Pirie.
667. What is the present output at Broken Hill? From the whole lode.
668. From the whole lode? It must be something over 11,000 tons a week, though that is not as large as it has been. The whole of that ore is not shipped from Broken Hill. About 6,000 tons of it are treated by the Broken Hill Proprietary Company in their own works at Broken Hill.
669. Have you heard of the Broken Hill Proprietary Company coming to Newcastle? They have bought a site for works near Newcastle, with the intention, I believe, of treating sulphide ores there.
670. Will it come to anything? I think that is doubtful.
671. The company of which you are director, and the Newcastle company, will, between them, treat a large quantity of ore? Yes; at least 700,000 tons a year.
672. If the proposed railway were constructed, would your company take advantage of it to bring ore to Illawarra? I am inclined to think that they would.
673. I suppose you have no knowledge as to what the Newcastle company would do; they would have to speak for themselves? Yes; under our present arrangements it would be more convenient for us in every way to bring our ores by rail from Broken Hill instead of by water *via* Port Pirie. If the proposed railway were constructed, we could take the ore from the ore bins at the Broken Hill mines and put it into our ore bins at Illawarra without any transshipment.
674. Can you tell the Committee what the difference would be between the railway charges and the water charges? We expect to be able to get ore from Port Pirie by water for about 5s. a ton. At the present time it costs 13s. a ton to send ore from Broken Hill to Port Pirie, and it would cost about 3s. a ton to bring ore from Sydney to Illawarra.
675. And I suppose you consider time of some importance in these matters? Yes, it is of great importance.
676. You think that your company would use the railway if it were constructed? I think they would. That would be their disposition.
677. Although the freight might be a little dearer, ore would be brought across much more quickly, and the charges of transshipment would be saved? Yes.
678. That is a great consideration? Yes.
679. Do you think that there is likely to be any development in mining along the route of the proposed line? Not very much.
680. Have you traversed that part of the country? I have not been much on this side of Menindie.
681. Then we must rely for our revenue chiefly upon the mineral traffic from Broken Hill? Yes; and from mines in the vicinity of Broken Hill.
682. I suppose the ores at Broken Hill are fairly rich? Yes; there is a very large quantity of payable ores in sight at the present time—zinciferous lead, and sulphide ores.
683. Payable ores? Yes. The best evidence of that is that the companies are selling the ore outright to people in Europe and in these colonies, and they find ready buyers.
684. Under the new process the trade will develop? Yes; and an ore which to-day is not profitable will, in less than two years, be found to be profitable, providing that silver and lead keep up their price.
685. There is no doubt about the success of this new process? Not a bit. There has never been any doubt about it in my mind.
686. How many tons would your company send along the line? About 300,000 tons. The principal Broken Hill mines are capable of producing at the present time, if worked to their full extent, between 800,000 tons and 1,000,000 tons of ore per year.
687. Do you think that the proposed line should be constructed? I have thought so for a good many years.
688. Why? It has been a foregone conclusion with me for a long time that the zinciferous ores would have to be treated at the seaboard where there was plenty of coal. One reason why it was considered that sulphide ores would not pay was that people thought that the freight from Broken Hill to any place where cheap coal could be obtained would be too high to allow of a profit on the working. During the last three or four years, however, rates have come down very considerably, and they may come down still more. With a direct line of rail from Broken Hill to Sydney, and, as I understand, very easy grades for a great portion of the way, I think the ores could be brought as cheaply overland as by water, especially when the two or three transshipments which are necessitated by the present route are taken into consideration.
689. You would not wait until the question of federation was settled? No.
690. I suppose another reason that prompts you to support this railway is the fact that Broken Hill is one of the principal towns of the Colony, and has no connection with the metropolis? That is an important reason.
691. Is there any other reason? There is a large number of smaller mines in the vicinity of Broken Hill which will, in all probability, produce ore in considerable quantities within a year or two.
692. The construction of the proposed line will be the means of further developing these mines? Yes.
693. Of considerably developing them? Yes.
694. The present output would increase considerably if there were direct communication with the seaboard of New South Wales? Yes. You are masters of the situation here, because you have cheap fuel, which is the greatest of all considerations in the treatment of sulphide ores. Without cheap fuel, you cannot

J. Howell,
Esq.
19 Aug., 1896.

cannot work profitably a majority of the Broken Hill sulphide ores. Including coal for the manufacture of coke it takes about $3\frac{1}{2}$ tons of coal to treat 1 ton of sulphide ore, and coal costs delivered at Broken Hill about 35s. a ton, whereas the ore can be brought down here for much less.

695. It is cheaper to bring the ore to the coal than to take the coal to the ore? Yes. Another matter to be taken into consideration is that, after you have treated the ores at Broken Hill, you have still a large product to send away in the shape of bullion, for which much higher freights are charged than are charged for ore. Lead bullion, which is 26 or 28 per cent. of the weight of sulphide ore, costs 30s. a ton to send to Port Pirie. They will not carry bullion for the same rate as they carry ore.

696. Have your company any land about Broken Hill? No.

697. Only the mines there? That is all. There are nearly 2 miles of a regular ore-producing lode, through which extends a body of zinciferous lead silver-ore, varying in breadth from 16 to 200 feet, and of unknown depth. The lode had been opened to a depth of over 1,200 feet, and it is safe to say that the body of sulphide ore will average a width, so far as is opened, of 40 feet. If calculations are made on the basis of the existence of a body of ore, 40 feet wide, 500 feet deep, and 8,000 feet long, and 10 cubic feet of ore are allowed to the ton; that will give 16,000,000 tons. We cannot say that all that would be profitable ore; but it is safe to say that below the main workings at the present time 16,000,000 tons of ore could be obtained. We know very well that the lode extends 400 or 500 feet lower; but we have not taken that into consideration. Shafts which have been put down show that ore exists at a depth of over 1,300 feet, so that in all probability ore could be obtained at a depth of 1,800 or 2,000 feet, and possibly more.

698. *Mr. Roberts.*] Are your works at Lake Illawarra now in operation? They are under construction.

699. You have not yet brought any ore from Broken Hill to Lake Illawarra? No.

700. What do you calculate will be the cost, per ton, of landing crude ore from Broken Hill at your works at Lake Illawarra? About 21s. a ton, including wharfage and everything else.

701. Would the ore be brought to Sydney, and then sent to Lake Illawarra by rail? Yes.

702. Would it not be cheaper to land the ore somewhere along the coast? No; we find that it would be best to land it at Sydney, and bring it down to Illawarra by rail.

703. Will 21s. a ton include every expense of every kind whatsoever? Yes.

704. Will it include the cost of handling? Yes.

705. We have it in evidence that if the proposed line were constructed, the Commissioners would charge £1 11s. 5d. to convey ore from Broken Hill to Illawarra;—is it likely that your company would pay 10s. a ton more than they would pay under present conditions, simply that they might have their ore brought by rail through the Colony of New South Wales? No; we could not do it. Such a charge would prevent an immense amount of ore from coming away from Broken Hill. There is a good deal of ore upon which there would not be a profit of 10s. a ton.

706. It would be absurd to expect any business man to do such a foolish act? It would.

707. If the rate I have quoted is the lowest that would be charged, would you feel justified in advocating the construction of a line? I would not.

708. If the Commissioners were unable to bring ore to Broken Hill, what other traffic could they secure? There is a good deal of wool which would come this way.

709. Where would it come from? From north and north-west of Broken Hill, as far as the Queensland border. There is a lot of wool coming into Broken Hill now.

710. Would the Railway Department carry any wool that they do not get now? Yes; a large quantity.

711. Where does it now go? It goes from Broken Hill to Adelaide by rail, also to the Darling, and then down the river.

712. To Victoria? No, to Morgan, in South Australia. There is a big trade on the Darling River during the wool season. Other industries are springing up there.

713. What other industries? I am very largely interested in a boiling down and meat preserving works there. We ship about 1,000 tons of stuff a year. That place is situated on the banks of the Darling.

714. Is all the stuff sent to Adelaide? Yes, every bit of it.

715. If the proposed line were constructed, you would be very glad to give New South Wales the preference, if our railways could carry at the same rate as you are now paying? Yes.

716. But under no other circumstances; you would send your goods by whatever route was the cheapest? Yes, we would have to do so.

717. Have you been over the route of the proposed line? No, I have only been about 150 miles from Broken Hill, coming this way.

718. You are thoroughly conversant with the country surrounding Broken Hill for a radius of about 150 miles? I am.

719. Do you think the proposed route *via* Menindie is preferable to any other that has been surveyed? I think that it is.

720. Do you prefer it to the suggested route from Cobar through Wilcannia? I do.

721. And to a line from Condobolin through Wilcannia? Yes.

722. On what grounds? By coming further south you will get a great deal of business which you will not get if you go to Wilcannia. The country further south is better; and if you went to Wilcannia you could not expect to get traffic from places like Menindie. That traffic would continue to go down the river.

723. I understand that Wilcannia is a very important stock centre? It is in the midst of a very large sheep country; but a line to Broken Hill by way of Menindie would get most of the Wilcannia traffic.

724. You prefer the proposed route to any other yet suggested? I do.

725. Have you any knowledge of the country about Mount Hope? Very little. Only from hearsay.

726. Is there likely to be a mining development there which would add to the traffic on the proposed railway? There is some mineral in that country. There is a good deal of copper through there; but the carriage is so heavy that they have not been able to make it pay so far.

727. Do you think that the construction of the proposed line would be likely to assist in a marked degree in developing the mineral resources of New South Wales? It certainly would, particularly now when the great bulk of the ores produced must come to some central works for treatment. We have reached a stage in mining when small trifling mills, like those that have been put up for working free gold ores, must be abandoned. The ores being raised now are nearly all sulphide ores, and they cannot be treated in small works. They must be brought to regular metallurgical works.

- J. Howell, Esq.
19 Aug., 1896.
728. Of course, you see the difficulty that the Railway Commissioners will have in competing with railways of the neighbouring colonies? There is no doubt that there will be a very sharp competition.
729. I suppose the South Australian Government would carry the ore for much less than they charge now rather than lose the trade? I do not think that the South Australian people could carry it much more cheaply than they do at present, because their fuel is pretty expensive.
730. You advocate the construction of this line? I do.
731. Do you advocate its construction in the face of the figures as to rates of carriage, which I have placed before you? The main source of traffic will be cut off if those rates could not be reduced.
732. You would only feel justified in recommending the construction of the line on the assumption that those rates would be reduced? Yes. If the Commissioners are not able to compete successfully with the South Australian Government in the carrying of Broken Hill ores they will lose the greater part of the traffic for which the line would be built.
733. In that case you would not feel justified in recommending the construction of the line? No.
734. *Mr. Black.*] Are there not smelting works at Port Pirie now? Yes.
735. I understand that they are not adapted for the complex treatment of refractory ores? They are not.
736. I suppose there is no likelihood of their being extended so as to become suitable? No.
737. You said in reply to Mr. Roberts that a great deal of ore would not return 10s. a ton profit;—do you mean a net profit after deducting £1 1s. per ton carriage to Illawarra? Yes.
738. Any increase upon that rate of carriage would deduct something from the 10s. a ton profit? Yes.
739. Do you know whether the mining at Mount Hope is likely to be permanent? I do not.
740. On what do you base your opinion that a line to Broken Hill would be likely to pay;—is it on the carriage of ores and wool from the Broken Hill district? Chiefly on the probability of a great deal of ore being brought from the Broken Hill mines.
741. But that would depend upon the rates imposed by our Railway Commissioners? Yes.
742. If they are not satisfactory the ore will continue to go to Port Pirie? Undoubtedly.
743. I suppose that the carriage of goods necessary to the people of Broken Hill will depend upon the same circumstances? Yes, to some extent. There is a large population there, which would be supported almost entirely by imported goods and goods produced in this part of the Colony, if there were a railway from here to Broken Hill.
744. I suppose there would not be a great number of people travelling to Broken Hill;—not so many as there were eight or ten years ago? The travel there is increasing.
745. Is there any fresh development in the mines at Broken Hill? Yes.
746. In what direction is this development, taking the Proprietary Mine as the centre? North of that.
747. Is it a spur breaking away? No; it is at the north end of the main lode—in the Junction and Junction North Mines.
748. The North Junction Mine is on a ridge, is it not? The whole mine is on a ridge.
749. The North Junction is also on a ridge? Yes.
750. Is this extension on the ridge, or beyond the ridge? It is right on the ridge.
751. I suppose it is possible that the lode will follow the ridge all round? Yes; it has followed the whole length of that ridge, from one end to the other.
752. The ridge extends round the town pretty well like the rim of a saucer—Broken Hill being within it? Yes; but it is not all the same ridge.
753. Has any prospecting been done in the ridge which is on the other side of the town? Westward.
754. Yes? Yes.
755. Have any results been obtained there? Yes; they have obtained a good deal of ore from small veins.
756. But nothing likely to be permanent? A little further on, beyond a ridge which you can see, a good deal of ore is likely to be obtained. There are some good-sized mines there, and a good many of them. They are the mines that were worked profitably in the early days, before the Broken Hill Mine was started.
757. Are any of the outlying mines being worked profitably now? South of the main Broken Hill lode—about 6 miles south of Broken Hill—there are one or two mines which are working profitably; at least, they have been working for a year or so, and I presume that they are being worked at a profit.
758. Is much mining done at Silverton? Very little.
759. A lot of prospecting was done there some years ago, in the ridges through which the dry water-course runs into the town of Silverton. Did that all result in failure? Yes, the ore there did not last long. The mineral was surface deposit more than anything else.
760. In spite of that, you think that as a silver-field the Barrier Ranges have some prospect of permanence? I regard Broken Hill as the most important silver lead mine in the world to-day.
761. You think there is no chance of its petering out? No.
762. *Mr. Humphery.*] Have you any objection to say what the capital of your company is? It is £500,000.
763. Is it an English or a local proprietary? An English proprietary.
764. How much have you already expended on your works at Lake Illawarra? About £55,000.
765. What is the contemplated expenditure? About £200,000.
766. Does that expenditure include the opening of an entrance to Lake Illawarra as well as the construction of the works in progress? No.
767. Is it in contemplation to open the entrance? It is.
768. Have you fixed any period within which the work will probably be commenced? We have nothing to do with the harbour business.
769. The opening of the harbour is not one of the objects of your company? No.
770. Yours is simply a smelting company? Yes.
771. What do you estimate to be the maximum quantity of ore which you will be able to treat per annum after the completion of your works? We intend to erect works capable of treating a little over 100,000 tons of ore a year, and to increase their capacity to about 300,000 tons per year, or more, if necessary.
772. That would be your maximum? Between 300,000 tons and 400,000 tons would be our maximum.
773. If, when working at your maximum, the cost of carriage were increased by 10s. a ton, that would mean an annual increase in expenditure of £150,000? Yes.

J. Howell,
Esq.
19 Aug., 1896.

774. Will it be cheaper to treat the ores at Lithgow than at Lake Illawarra? No.
775. Why? I think we can get material of all kinds more cheaply at Lake Illawarra than at Lithgow.
776. Will not your principal outlay be for fuel? Yes, that will be the principal thing we shall require.
777. But would you not save something in carriage if 160 miles were taken off the distance which the ore would have to be carried? That would depend a good deal upon what the Railway Department charged us for carrying our lead bullion and other products.
778. That is an important factor in dealing with the Broken Hill ores? Yes.
779. You say that sulphide ores contain about 26 per cent. of lead? Yes, in weight.
780. So that if, in addition to the cost of carrying the ores, you have to pay nearly three times as much for the carriage of bullion, there would practically be double freight? Yes.
781. Your company have recently constructed a railway? Yes.
782. With what object? To connect our works with our coal mines.
783. So that the coal may be brought at the lowest cost to the smelting works? Yes.
784. If the entrance to Lake Illawarra were opened, would you be able to bring ore by water direct to the smelting works? To within a mile of our works.
785. There would be a mile of cartage? A mile of railway journey.
786. The handling of the ore would not be lessened? No.
787. So that it would be as cheap to bring ore to Sydney, and send it thence by train to Illawarra, as to bring it by sea to Lake Illawarra? Yes, or very nearly as cheap.
788. There would be the same amount of handling in each case? Yes. There would be a saving in other respects, however, if we could bring goods direct to Illawarra by water. With regard to ores, there would not be a saving of more than 1s. per ton.
789. It is to be expected that unless you could have your ores carried from Broken Hill to Lake Illawarra for £1 a ton, you would not use the railway? We would not.
790. In estimating the probable earnings of the railway, we must accept that as about the maximum rate for ore? I think so.
791. Besides your works at Lake Illawarra, what other works are there in course of construction at which it is probable that Broken Hill ores will be treated? There are the sulphide works, near Newcastle.
792. Is the freight to Newcastle greater or less than the freight to Sydney? I presume that it would be greater to Newcastle, because the distance is 60 or 70 miles more.
793. Any difference would be in favour of Sydney? Yes.
794. But the probability is that freight to either place would be about the same, with, if anything, something in favour of Newcastle, because of a saving in handling? I do not know where the Newcastle smelting works are.
795. I am assuming that they are at the water's edge—that would save handling? Yes.
796. Do you think that there would be much difference in the conditions prevailing at Lake Illawarra and Newcastle, so far as freight is concerned? Very little.
797. We may expect that £1 would be the maximum rate that could be paid for the carriage of ore from Broken Hill to either place? I think so.
798. Have you any idea as to the quantity of ore that would probably be treated at Newcastle? Possibly 300,000 tons per year.
799. You do not know how much it is intended to expend there? I believe it is their intention to spend £200,000 or £300,000.
800. Is it probable that the Newcastle works will be able to treat a larger quantity of ore than the works in course of construction at Lake Illawarra? That I cannot say.
801. *Mr. Trickett.*] What is the rate per ton for carrying ore from Broken Hill to Port Pirie? Thirteen shillings a ton for sulphide ores.
802. And how much for other kinds of ores? It was, not long ago, about seventeen shillings and sixpence for oxidised ores.
803. What is the freight from Port Pirie to Sydney? There is no regular freight, but we expect to get the ore carried for 5s. a ton.
804. Are there extensive smelting works at Port Pirie? Yes.
805. But the new process which you are introducing is not used there? No; the works there are simply for smelting oxidised ores.
806. What do they use for this smelting—coal or coke? Both.
807. In what proportions? About 16 cwt. of coal to a ton of coke.
808. Is it not a new thing to use such a large quantity of coal? I am speaking of the total quantity of coal used. No coal at all is used in smelting, except in producing power.
809. Coke exclusively is used for smelting? Yes.
810. When the Public Works Committee were inquiring into the proposal to take a railway from Nyngan, *via* Cobar and Wilcannia, to Broken Hill, they were told that good coke could not be manufactured in New South Wales;—is that still so? The New South Wales coke is not as good as the English coke.
811. Is it nearly as good? It is very nearly as good.
812. What is the cost of English coke now? It is very low now. I think they are laying down English coke at Port Pirie for 24s. or 25s. a ton.
813. How does English coke compare with colonial coke? Colonial coke has 6 or 7 per cent. more ash or deleterious matter than English coke, and its physical construction is not quite so good.
814. *Chairman.*] What percentage of ash is there in the English coke? About 7 per cent., and about 13 per cent. in the colonial coke.
815. *Mr. Trickett.*] The coal you will require at your Illawarra works will be the local southern coal? Yes.
816. A railway to Broken Hill would not benefit by a coal traffic? If they could carry coal back to Broken Hill there would be a large traffic in it.
817. At Illawarra you propose to treat whatever ore is sent to your works? We are establishing general metallurgical works. We take all kinds of ore—gold, silver, lead, and copper.
818. Is that the practice which prevails in America? Yes, extensively; in fact, nearly altogether.
819. In America is the smelting work chiefly done locally, or is it done at the seaports? Formerly it was done locally, but now almost all of it is done at the railroad centres, and at the seaports.
820. The system of smelting which you propose to adopt differs from the ordinary process? The smelting is the same, but there is a difference in the method of preparing the ore for the smelters. 821.

- J. Howell, Esq.
19 Aug., 1896.
821. A certain amount of smelting will go on at Broken Hill notwithstanding the existence of your works at Lake Illawarra? I think not. My experience has been that when such works as those which we are constructing are established small smelting works are almost done away with.
822. When a Sectional Committee was at Broken Hill some years ago some of the local mining managers, and notably Mr. Lane, seemed to object to the practice of sending ore away for two reasons—the great cost of the dual management, and the difficulty arising in connection with the mixing of ores. If your works are established at the mine you have the ores necessary for blending and mixing close at hand, but it would not be so if your works were at a long distance from the mine? I think that it would be quite the contrary. In large smelting works like ours you get ore from all parts of the country, and, consequently, could make a better blend than if you were confined to the ore of only one mine.
823. This is what Mr. Lane says: "In handling the furnaces we have a variety of ore to deal with. If we can mix it we can always regulate the furnaces, but if the furnaces are 100 miles distant we cannot do it." Do you agree with that opinion? I do not.
824. No difficulty of that kind would be likely to occur at Lake Illawarra? None whatever. One of our reasons for establishing a place like this is to get a mixture of ores.
825. But you will not be able to mix up the various ores which are the property of various companies? We shall buy the ores at their assay value. That is one of the great advantages of a concern like ours. We separate mining from metallurgy altogether. We mix gold, silver, lead, and copper ores, and smelt them all together.
826. You pay for the ores and take all risks? Yes.
827. *Mr. Humphery.*] Is the same thing done at Swansea? Yes. We are buyers of ores.
828. *Mr. Trickett.*] What is the consumption of coal at Broken Hill per week or per month? I cannot tell you. The coal trade there will fall off very greatly as soon as they quit smelting.
829. Can you tell us what coal costs a ton delivered at Broken Hill? No; I have been away from Broken Hill for more than a year.
830. If a harbour is made at Lake Illawarra, will it not be cheaper for you to bring your ores *via* Port Pirie than along the proposed line? That will depend on the rate of freight on the proposed line. We do not expect to gain much by the opening of Lake Illawarra so far as the freightage of ores is concerned.
831. What benefit will accrue to you by the opening of the lake? We shall be able to get iron and lime for fluxes more readily.
832. Where are those materials to be secured from? They may come from along the coast north or south, possibly from Tasmania.
833. Fluxing materials are scarce in the Illawarra district? Yes; there is very little iron, and very little lime there.
834. There is a plentiful supply of lime fluxing near Broken Hill, is there not? Within 40 miles of Broken Hill.
835. At Tarrawingie? Yes.
836. Is not the supply almost inexhaustible? It is exhaustible; but they will not want it very much longer. As soon as they quit smelting there they will not require lime.
837. You look upon it that these works are going to close up Broken Hill as a smelting centre? Not so much the construction of these works as the exhaustion of the oxidised ores. They are coming to an end very fast.
838. Smelting will be almost discontinued there when your works are finished? Yes.
839. Can you say what will take place with regard to the Broken Hill Proprietary Company? The Broken Hill Proprietary Company is the only place on the line where they are smelting. The "South" furnaces are idle, so are the "Central," and so are the "British" furnaces. All those mines are now dealing with sulphide ores.
840. You said a little while ago that the population of Broken Hill was increasing? No, that the travel to and from Broken Hill was increasing.
841. The population of Broken Hill has decreased of late years? I do not think it decreased last year, but the year before it decreased rapidly.
842. Can you give any explanation of that? Yes; several of the mines had stopped altogether, so that there was no work for the men.
843. The mines stopped because they ceased to be paying concerns? They had exhausted their oxidised ores, and had no means of treating their sulphide ores. Now they are starting again.
844. It is suggested that the proposed railway should be what is known as a light line, the sleepers being further apart than is the case with ordinary heavy lines. Do you think such a line would be suitable for the class of traffic which it would have to carry? I do. It is a splendid road-bed, and a line constructed as it is proposed to construct this line would be better than two-thirds of the new American railroads in the Western States.
845. You think that a light line would be capable of carrying heavy ore traffic? I do.
846. If the Government could save £33,000 by making a light line, do you think it would be advisable to save it? I think that the railway proposed would be quite good enough for the traffic.
847. Beyond the mere question of actual ore freight, I suppose you have not considered the earning probabilities of the line? I have not.
848. *Mr. Clarke.*] If there is a difference of 10s. a ton between the present freights and the railway freights there is not likely to be much traffic upon the railway? No.
849. Business people will always adopt the cheapest means of conveyance? Yes.
850. You have stated that it is probable that wool would be carried along the line. Would wool be carried to Sydney from places about Menindie and Wilcannia? I think wool could be sent to Sydney from those places as cheaply as it can be sent to Adelaide at the present time.
851. Is not water carriage generally cheaper than land carriage? Yes; but on the present route there are several handlings. They have to tranship at Morgan.
852. If a railway were made to Menindie would not the trade from that district still go to South Australia? Everything below Menindie would still go to South Australia; but the great sheep country lies north of the proposed railway.
853. Is it probable that supplies of various kinds would be sent to these districts from Sydney by rail? Yes, I think so, and I think that that traffic would be a very important factor in the earnings of the railway.

J. Howell,
Esq.
19 Aug., 1896.

854. Would it not be cheaper to get supplies from Adelaide? The freight on goods from Adelaide to Broken Hill is pretty high. It will all depend upon the rate fixed upon our railway.

855. You are aware that it was proposed to take the railway to Broken Hill *via* Cobar and Wilcannia;—would that line be as suitable as the proposed line? I do not think so.

856. Is the land along the route of the proposed railway good agricultural land? Much of the land that I have been over would be very good for agricultural purposes; but the rainfall in those districts is uncertain.

857. We have it in evidence that the loss upon the proposed railway would be £10,000 per annum;—do you think it would be advisable to run the line at such a loss as that? It would depend a great deal upon what the future was going to be.

858. *Mr. Lee.*] You have stated that it will cost about 21s. a ton to bring sulphide ore from Broken Hill to Lake Illawarra, and that of that amount 13s. a ton is paid to the Silverton Tramway Co. and the South Australian Government;—that is a very large proportion of the total cost? Yes.

859. If you were to let a contract for the conveyance of 50,000 tons of ore, could you have it delivered at that price? There is some doubt about that. The low freight of 5s. a ton from Port Pirie to Sydney, which prevails at the present time, is owing to the fact that vessels taking cargoes of coal to Port Pirie have to come away light. If you sent ships to Port Pirie for the ore you could not get it back at that rate. Therefore, if we were to let a contract for the conveyance of 50,000 tons of ore within a month, we would have to pay a higher price for the water carriage.

860. You propose to deal with 300,000 tons of ore a year;—will you be able to have that quantity of ore brought round from Port Pirie at 5s. a ton? No; we do not expect to get it at that.

861. What do you really expect to have to pay? I am only dealing now with freights as they exist.

862. The establishment of your works at Lake Illawarra will bring about a decrease in the consumption of coal at Broken Hill? Yes.

863. And that will reduce the number of ships wanting a return freight? Yes, to some extent.

864. Therefore, it is probable that the freight from Port Pirie will be more than 5s. a ton;—do you think it would be fair to put it down at 10s. a ton? I should say 7s. a ton would be a fair price.

865. That would make the total cost of conveyance 23s. 6d. a ton? Yes.

866. If you were to let a contract for the conveyance of 50,000 or 100,000 tons, you could get it delivered at that? Yes.

867. If it cost £1 11s. 5d. per ton to bring ore from Broken Hill to Lake Illawarra by railway, which route would you be prepared to use? We should be compelled to use the Port Pirie route.

868. The value of the ore would not admit of your paying the higher rate? No.

869. Therefore the railway could not expect to get any traffic so far as the conveyance of sulphide ores to Lake Illawarra was concerned? Not if the freight was as high as you have named.

870. Is not $\frac{1}{2}$ d. a ton a low rate for the carriage of minerals;—do you know of any place in America where they carry for less? I do.

871. What do they carry for? They carry ore over certain roads in America for a little over three-fifths of a cent. per ton.

872. Supposing there were extensive smelting works at Newcastle, I suppose they could get their ore brought round from Port Pirie for about 21s. a ton? It would not cost much more than that.

873. If the cost of bringing it direct from Broken Hill by rail were £1 13s. 2d. a ton, would they be likely to use the railway? No. If it is a settled fact that that is the lowest rate at which the railway can carry ore, there would be no traffic in ore from Broken Hill.

874. Supposing smelting works were erected at Lithgow, and it cost 24s. 10d. to land sulphide ore there from Broken Hill, would such an establishment be able to compete with places at Illawarra or Newcastle? No.

875. Then what prospect has the railway of getting any of the Broken Hill ore? None at all, if the Commissioners cannot carry at a lower rate than is charged at the present time for water carriage.

876. The fact of extensive works being erected at Illawarra and Newcastle to treat Broken Hill sulphides must mean the closing of smelting furnaces at Broken Hill? They will close anyway.

877. If the furnaces at Broken Hill were stopped, no great quantity of coal or coke would be sent to Broken Hill by railway? A great deal of coal would still be required there to generate power, and for domestic purposes.

878. Do you think that coal could be carried 696 miles by railway as cheaply as it could be sent round to Port Pirie by water? If it could be carried at the rate charged for the carriage of ore it could.

879. If coal were carried from Lithgow for $\frac{1}{2}$ d. a ton, and 8s. were allowed for its price, it would cost 32s. 10d. a ton to deliver it at Broken Hill? Yes; and coal there costs more than that now.

880. But at ordinary rates it would cost £2 9s. 8d. to send coal from Newcastle to Broken Hill by railway? People could not afford to pay as much as that.

881. Do you know of any reason why the Proprietary Company should send their bullion direct by rail to Sydney instead of down to Port Pirie? No, I do not.

882. Then what traffic will there be for the railway from Broken Hill? If the railway cannot carry at rates as low as those at present being charged, it must expect to get very little traffic.

883. *Mr. Wright.*] What is the rate for general merchandise between Adelaide and Broken Hill? I cannot say.

884. Is it anything like £8 or £9 a ton? I think not.

885. The lowest rate from Sydney by rail would be a little over £9 a ton;—would such a rate be likely to secure the traffic for our railways? I do not think so.

886. You are aware that the Commissioners are supposed to manage our railways so as to make them pay working expenses and interest upon the outlay? If that is an established rule, which cannot be departed from, I do not see that they will get very much freight from Broken Hill.

887. If the Commissioners say that they cannot reduce their rates, is there much likelihood of traffic from Broken Hill? I think not.

888. Is there any possibility of works being established at Broken Hill for the treatment of sulphide ores? I think not.

889. This is a progressive age;—possibly some further development will occur in the process of treating sulphide ores? There is very little chance of that.

- J. Howell,
Esq.
19 Aug., 1896.
890. I understand you to say that oxidised ores are pretty well worked out? They are very nearly gone.
891. You have stated that you have known places in America where the freight for the carriage of minerals was much less than it is here; what kind of country had they to haul over? Comparatively level country.
892. You are aware that between Orange and Sydney there is a lot of rough country to travel over? Yes; but there are places in America where they have carried ores for less than one cent a mile, although they have had to go over a mountain 8,000 feet high.
893. *Mr. Black.*] Will the construction of this railway have a tendency to develop the working of low-grade ores;—I suppose that is a matter which will depend wholly upon the rates charged for carriage? Yes. A railway would have a tendency to open up whatever mineral resources there may be between Sydney and Broken Hill.
894. *Mr. Fegan.*] If the Commissioners reduced their rates to £1 a ton, how many tons of ore per annum would be sent from Broken Hill down here? They would be able to send away nearly 800,000 tons.
895. Do you think it is under the mark to say that the proposed railway will only earn £30,000 a year? I think so, if they carry that quantity of ore.
896. Do you think that the Commissioners would attract traffic if they charged more reasonable rates? Well, if they could not carry ore for less than $\frac{1}{2}$ d. a ton per mile they would make nothing by carrying a large quantity for lower rates.
897. If the freight was reduced to £1 a ton, the railway would carry at least 500,000 tons of ore a year? There is no doubt of that.
898. That would pay, would it not? I should think so.
899. *Mr. Humphery.*] Supposing the Commissioners are right in saying that they cannot carry ore for less than 30s. a ton, they would lose £250,000 a year if they carried 500,000 tons a year for £1 a ton? Yes.

George Skelton Yuill, Esq., (Messrs. G. S. Yuill & Company, Limited), sworn, and examined:—

- G. S. Yuill,
Esq.
19 Aug., 1896.
900. *Mr. Roberts.*] What line of business are you engaged in? We are general merchants and steamship agents.
901. Have you a line of steamers running round the Australian coast? Yes; we are agents for the Adelaide Steamship Company. Those steamers trade all round the coast from Cairns, in Queensland, to Wyndham in Western Australia.
902. You have had a great deal of experience in connection with shipping in these colonies? Yes.
903. Your steamers call at Port Pirie? Yes; we have a line of steamers running to Port Pirie, but they take freight only.
904. Does the freight come principally from Broken Hill? Yes.
905. Ores from the Broken Hill mines? Ores and bullion.
906. What are the rates of freight between Port Pirie and Sydney or Newcastle? They have varied at different times. Within the last few years they have ranged between 8s. and 5s. a ton. They have been coming down steadily, and I believe that business has been done at 4s. 6d. a ton.
907. Would that be from Port Pirie to Newcastle? It would be the same from Port Pirie to Sydney, or to Newcastle.
908. Would it be possible to carry ores at a still lower rate than 4s. 6d. a ton? I do not think so.
909. In the event of a railway being constructed from Broken Hill to Sydney, I suppose that the Railway Commissioners would compete for your trade? If they took the ores, I suppose they would; but we generally find that, in the long run, railways do not interfere with our trade. Something else always crops up by the time the railway is made.
910. If a large quantity of freight were likely to be taken away from your steamers, you would probably be willing to carry ores at much lower rates than those which at present prevail? We could not carry ore for less than 4s. 6d. a ton, and I do not think we could carry it for that. Now, we get good carrying one way, so that we can take cheaper carriage back.
911. Do you get a large amount of freight from Sydney to Port Pirie? We carry coal from Newcastle to Port Pirie.
912. Is that coal sent on to Broken Hill? Some of it goes to Broken Hill, and some of it is taken by the South Australian Government.
913. What is the freight for coal from Newcastle to Port Pirie? It varies; but it is between 6s. and 7s. a ton.
914. Why do you charge 6s. and 7s. a ton for coal, and only 4s. 6d. for ore? Well, if we did not bring the ore, we would be coming back empty. We look upon the ore as back carriage.
915. Is there a very large traffic now between Port Pirie and Broken Hill, by rail? Yes, there must be, because of the quantity of stuff we have to carry.
916. Do you know how much merchandise is taken to Broken Hill from Newcastle and Sydney by your steamers? Very little merchandise goes from Sydney. We used to take coke from Newcastle; but since the duty has been removed, the people at Broken Hill will not buy colonial coke. They buy German coke.
917. Is that superior to the Australian coke? It has less ash; but it is not otherwise superior.
918. What is the difference in price landed at Broken Hill? I cannot tell you that exactly. I think about 28s. a ton is the lowest price at which German coke has been laid down at Port Pirie. The railway freight has to be added to that.
919. What would be the freight from Port Pirie to Broken Hill? I do not know.
920. Is there a large passenger traffic from Sydney to Broken Hill by way of Port Pirie? Absolutely none.
921. Is there a large passenger traffic from Port Pirie to Sydney? No; none at all.
922. I suppose you pick up passengers at Adelaide? I do not think there is much traffic between Sydney and Broken Hill by any route. The better class of passengers travel from Melbourne to Adelaide, and thence to Broken Hill by rail, as a rule. There is very little traffic between Sydney and Broken Hill.
923. When Broken Hill was booming were many passengers carried by sea? There was never much passenger traffic from New South Wales to Broken Hill. Broken Hill was supplied with labour principally from South Australia and from Victoria.

924. There is not much merchandise sent from Sydney to Broken Hill? No; Broken Hill is supplied from Adelaide mostly.
925. Is much merchandise supplied from Melbourne? A little comes from Melbourne, but not much.
926. Do the passenger fares by the steamers compare favourably with the railway fares? They are much lower; but there is really no traffic to speak of.
927. Have you formed an opinion as to the policy of constructing the proposed line? I do not think the line would pay.
928. It would be absolutely impossible for the Commissioners to compete against the water carriage? Yes; they are geographically handicapped.
929. Because of the proximity of Broken Hill to the coast? Yes. As Mr. Howell pointed out, the oxidised ores of Broken Hill are now being exhausted, and that will make a change in the traffic. They will not require so much coke.
930. But Mr. Howell spoke of the immense quantity of sulphide ore which is in sight? Yes; but that will mean nothing but mining, so far as Broken Hill is concerned.
931. The South Australian Government will not allow our railways to take the trade from there? They will compete for the trade.
932. And the steamers would be glad to carry the ore at lower rates than are charged now? Well, they would not carry at rates which would not pay them. I do not think we could carry ore at a lower rate than 4s. 6d. a ton.
933. *Mr. Black.*] Do you think that the removal of the duty from coke has had anything to do with the recent reopening of certain mines which were shut down for some years? I do not know.
934. *Mr. Fegan.*] Why do the Broken Hill people prefer German coke to colonial coke? Because it is cheaper.
935. Is it as good? I should think that they are about equally good; but I am not an expert.
936. German coke being cheaper than colonial coke, it gives them greater facilities for working their mines? Well, they find that the colonial coke is not so good as the German coke at the present prices.
937. *Mr. Lee.*] But the bulk of the coke used at Broken Hill always came from abroad? Yes.
938. *Mr. Fegan.*] Is there any reason why they do not ship much merchandise from Sydney to Broken Hill? The geographical position has most to do with it.
939. Does anything sent from Sydney to Broken Hill go through South Australia free? Yes; you can send it through in bond.
940. Do you take any coal from Lithgow to Broken Hill? No.
941. How many tons of coal do you take in a month from Newcastle to Port Pirie? I suppose about 4,000 tons a month. A great deal of that coal is used by the South Australian Government.
942. What is the largest quantity of coke that you have taken? Five hundred or 600 tons. We have not taken any coke since the duty was removed.
943. *Chairman.*] Do you contract to take ore right through from Broken Hill to Sydney or Newcastle? No; we only take it from Port Pirie.
944. You have nothing to do with the land carriage? No.
945. Would you land ore on the Kombla jetty for 4s. 6d. a ton? No. I do not think we would land it in Sydney for 4s. 6d. a ton.
946. Would you land it there for 5s. a ton? I do not know that 5s. a ton would pay; it would depend upon the back cargo.
947. Would you land ore at Kombla for the same price as you would land it in Sydney? If there were a breakwater there, and proper appliances upon the jetties. Under present conditions it would sometimes be impossible to lay a steamer alongside the Port Kombla jetty.
948. What is the highest rate you have got for carrying ore during the last twelve months? I should think about 6s. 6d. a ton.
949. Five shillings and sixpence would be about the mean? Yes, that would be about a fair thing, judging by the experience of the past; but the rates depend a great deal upon the back cargo.
950. *Mr. Humphery.*] What quantity of ore have you carried from Port Pirie, and where? A great deal of ore is brought from Port Pirie to Sydney now by steamers which call in there, and then come on here to load wool. We have been carrying bullion mostly. We have carried from 10,000 to 20,000 tons of bullion in the year. It is easier to carry bullion than to carry ore.
951. *Mr. Lee.*] What is the rate for carrying bullion? I have been talking rather of the rates for carrying bullion than the rates for carrying ore. Ore would cost about 6s. a ton to carry.
952. *Mr. Humphery.*] What is the freight for coke from England or Germany to Port Pirie? It is an open market. I do not know what the freight is at the present moment.
953. Is it much higher than the freight from Newcastle to Port Pirie? Not a great deal higher.
954. Can you say what the difference is? I do not think that it is more than 2s. or 3s. a ton.
955. Coke can be landed from England or Germany at Port Pirie for from 2s. to 3s. a ton more than it costs to bring it from Newcastle? Yes; I believe that that is about it.

THURSDAY, 20 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and examined:—

J. Harper, Esq.
20 Aug., 1896.

956. *Mr. Humphery.*] Have you made a report to the Railway Commissioners as to the probable earnings of a railway from Condobolin to Broken Hill? I have made a report to the Commissioners; but not on the subject of the whole of the earnings of the line.

957. Have you that report with you? Yes.

958. Will you read it? Yes; it is as follows:—

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 22 November, 1895.

Projected Railway, Condobolin to Menindie.

THE distances of this projected extension are as follows:—

	Miles.
Sydney to Condobolin	329½
Condobolin to Euabalong	35½
Euabalong to Menindie	253
Menindie to Broken Hill	65
Total mileage to Broken Hill	683

Exclusive of the extension to Condobolin, which has now been approved of, the total mileage to be constructed to connect Condobolin with Broken Hill would be 353½ miles. The distance from Sydney to Broken Hill, *via* Cobar, is 734 miles, 274 miles of railway to be constructed. The distance to Broken Hill at present, *via* Melbourne and Adelaide, is 1,387 miles.

In November last year I reported on the question of an extension from Condobolin in the direction of the projected line, and herewith attach copy.

Since that date the number of sheep in the district has decreased; but as the figures of 1894 may be taken as representing its ordinary carrying capacity, it may be fairly assumed that under ordinary circumstances the amount of traffic estimated would be obtained.

As I mentioned in my previous report, this district is very sparsely populated, and devoid of any agricultural developments.

East of the Darling the populations of the various counties are as follows:—

Blaxland	1,171
Livingstone	458
Manara	245
Menindie	317
Mossgiel	693
	<hr/>
	2,884

Of this number about 2,000 would come within the operation of the line.

With regard to townships, they are as follows:—

Euabalong, population	83
Mossgiel	114
Ivanhoe	61
Menindie	194
Cudgellico	250
	<hr/>
	702

As I assume the object of the construction of this line would be of national importance rather than a desire to immediately obtain paying results, the only estimate which I prepared has been that of the wool, which we are likely to obtain, and which at present finds its way to other colonies.

The value of this in freight would be (approximately) £13,000 per annum, whilst we might look for an addition of goods traffic in the shape of station supplies, &c., which would probably amount to 1,000 tons, or £5,000 per annum.

Although the district through which this line passes is not, generally speaking, a fattening one; should the season be a good one, sheep are fattened, as an instance of which I may mention that Mossgiel Station has a draft of 15,000 fat sheep for the Sydney market this year. We might, therefore, probably anticipate about 500 trucks of live stock per annum, which would yield about £4,500 over the whole distance to Sydney.

The amount of passenger traffic is, of course, purely conjectural.

The total earnings of the few principal items as enumerated by me would be—

Wool	£13,000
Goods	5,000
Live stock	4,500
	<hr/>
	£22,500

As already mentioned, however, I take it that the real objective point of the line will be Broken Hill, with its population of 20,000 or 30,000, and its enormous deposits of ore.

As shown in the distances given above, Broken Hill would be within 683 miles of Sydney, as against 1,387 miles by the present route.

The distance from Broken Hill to Adelaide is 331 miles.

I think there is very little doubt that with our coal deposits and timbers, were a line constructed, a very large and profitable business would be developed.

As far as the trade of the Darling is concerned, I would not expect that we would to any extent divert this by the extension to the Darling at Menindie, unless it might be during a season such as the present, when the river is unnavigable.

The

MINUTES OF EVIDENCE—RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

The earlier report above referred to is as follows:—

New South Wales Government Railways, Goods Superintendent's Office, Sydney, 27 November, 1894.

Parkes to Condobolin Railway.

J. Harper,
Esq.
20 Aug., 1896.

WERE this line extended 45 miles from Condobolin, that is to Euabalong, the clips of eighteen stations, which have almost invariably been carried to other colonies, would, in all probability, be secured. These would represent about 900 tons of wool.

In addition to this, 1,400 tons of wool, credited to the extension to Condobolin, would fall in at Euabalong. At 1d. per ton per mile, which is the basis rate for this distance, the local earnings would be:—

	£	s.	d.
900 tons new wool at 3s. 9d.	168	15	0
1,400 tons of wool, credited to Condobolin extension, at 3s. 9d.	262	10	0
	£431	5	0
900 tons of this wool would be, as previously indicated, new wool, and at the through rate of 77s. 8d., would increase the earnings by.....	3,495	0	0
Total	£3,926	5	0

A further westerly extension of 50 miles from Euabalong would, in all probability, secure the clips of eleven other stations, which have hitherto gone to other colonies. These would yield about 1,200 tons of wool. The local earnings would be:—

	£	s.	d.
1,200 tons at 4s. 2d.	250	0	0
And through earning, 1,200 tons at £4 1s. 10d.	4,910	0	0
Total	£5,160	0	0

A further extension of 50 miles in the same direction would probably secure the clips of six other stations, yielding about 800 tons of wool:—

	£	s.	d.
800 tons at 4s. 2d. per ton	166	13	4
800 tons at a through rate of 86s.	3,440	0	0
Total	£3,606	13	4

Any further westerly extension would scarcely secure the wools of the large stations which have frontages to the Darling, as, in all cases, these stations have their wool-sheds on the river bank.

Of course, after passing Euabalong the settlement is very sparse, and the result in general traffic would not be of an important character.

I attach a map on which the stations which would be affected by the various extensions are indicated.—JNO. HARPER, The Secretary.

959. Are we to understand that £22,500 is your estimate of the probable earnings of the proposed line? For through goods, wool, and live-stock traffic, both ways. My estimate does not include passenger traffic, the conveyance of mail matter, or anything of that kind.

960. Have you an estimate of the probable earnings from passenger traffic, the conveyance of mails, &c.? No; I did not make such an estimate.

961. You say that the whole of this traffic will probably reach the railway at a point less than 500 miles from Sydney? No; at a point not more than 540 miles from Sydney, or about 70 miles east of Menindie. I took the distance simply as the crow flies; there had been no survey.

962. Would you get the whole of this traffic if the line stopped at Mossgiel? We would get the greater part of it; but I do not think we could get the whole of it.

963. What proportion would you get? From 75 to 80 per cent. of it.

964. If the line stopped at Hillston, what proportion of it would you get? I have not gone into that question at all.

965. In your estimate of the probable earnings, you do not refer to the carriage of ore from Broken Hill to Sydney? No.

966. Have you made any estimate of the value of that traffic? No.

967. Why? Because I could not ascertain the conditions under which the ore would be carried.

968. Have you made any estimate of the lowest rate at which ore could be carried by rail from Broken Hill to Sydney? No.

969. Can you give the Committee any idea as to what is the lowest rate the Commissioners could charge without incurring a loss? Only by referring to the rate-book. The cheapest rate for ore is $\frac{1}{2}$ d. a ton per mile.

970. Would any lower charge result in loss? I should think so, unless there were a return traffic to balance the freight.

971. What would be the through rate on ore from Broken Hill to Sydney? 29s. a ton.

972. How many tons could your most powerful engines haul from Broken Hill to Sydney? I could not tell you; that is an engineering question.

973. At the present time, how many tons do you bring from Bourke in one load? I could not tell you; the loads have to be broken up several times.

974. Can you not tell us what one of the Baldwin engines would haul over the western line? We could start from Bourke with a train of perhaps 80 trucks; but they would have to be divided and sub-divided on the road.

975. *Mr. Wright.*] What can the engines haul over the steepest parts of the line? About 250 tons.

976. That would be the maximum load? Yes, over the steepest part of the line. That is the paying load.

977. *Mr. Lee.*] Do you mean over the steepest part of the extension? No; over the steepest part of the existing line.

978. *Mr. Humphery.*] We have been told that 800,000 tons of ore might be sent from Broken Hill to Sydney by rail per annum;—how many trains a day would be required to carry that quantity of ore? About twelve trains a day.

979. And how many trucks for each train? Forty trucks, if they were each of 6 tons capacity.

980. Therefore, you would require nearly 500 trucks a day to carry this ore? Well, we have some trucks which are capable of carrying 22 tons each, and they would probably be employed.

981. Do you think that in the estimate placed before the Committee provision has been made for sufficient new rolling stock to deal with a traffic of this kind? I do not know what estimate has been made for new rolling stock.

- J. Harper, Esq.
20 Aug., 1896.
982. In making the estimate of traffic, has it been assumed that the ore would continue to be sent from Broken Hill to Port Pirie and thence by water? I do not think that the Commissioners have paid very much attention to the possible carriage of ore.
983. In your opinion the estimate of earnings has no reference to the carriage of ore from Broken Hill? Absolutely none.
984. When you were examined in regard to the proposed line from Nyngan to Broken Hill *via* Cobar and Wilcannia, you were of opinion that that extension was an unsuitable one to make, and that a line from Molong to Broken Hill *via* Menindie would be better. Will you give your reasons for preferring the latter line? At that time the railway stopped at Molong, and it was my firm impression that the country about Parkes and Forbes, and Condobolin justified the extension of the railway in that direction rather than an extension from Nyngan.
985. Except as what you term a national line, you could not recommend the extension of the railway beyond what point? I am not prepared to recommend its extension beyond Condobolin, on commercial grounds.
986. You think that when the line reaches Condobolin, you will get all the profitable traffic which would come to it if it were extended as far as 540 miles from Sydney? Yes, that is my opinion.
987. Any further extension would be attended with loss? Yes.
988. Will you distinguish between the national aspect and the commercial aspect of the line? I consider that if the line is looked upon in its national aspect the users of the existing line should not be called upon to bear any loss which may be incurred in working it. That loss should be met by some national source of expenditure. Under the present system, the users of the railways have to make good the losses upon non-paying lines.
989. Can you say if £1 per ton would cover the expense of conveying ore from Broken Hill to Sydney? I would repeat that the lowest rate I know of is 29s. a ton— $\frac{1}{2}$ d. per ton per mile.
990. We must regard 29s. a ton as the minimum charge for conveying ore from Broken Hill to Sydney without loss? That is the position.
991. Any lower charge would mean so much loss to the Commissioners? Yes.
992. And the larger the quantity of ore carried the greater the loss? Yes, unless a return traffic is developed. In that case the existing rates might possibly be lowered.
993. Have you given any consideration to the development that may follow the construction of the proposed line? It seems to me that the erection of sulphide works on the coast will diminish the return traffic to Broken Hill. Six or seven years ago, when coke and coal were being sent to Broken Hill in large quantities, there was some prospect of a return traffic; but, under existing circumstances, trucks would have to run the whole distance one way empty.
994. What would you estimate the cost of returning empty trucks from Sydney to Broken Hill? I could not estimate it.
995. A charge of $\frac{3}{4}$ d. per ton per mile would simply cover the cost of bringing full trucks from Broken Hill to Sydney? And of taking empty trucks back to Broken Hill. I do not suppose that the Commissioners would increase their rates because of this empty running.
996. But the cost of conveying the ore would be increased by the long distance you would have to send back empty trucks? Yes, though the same thing happens in other places.
997. Cannot you form an approximate estimate of the cost of returning empty trucks? No, because I do not know the circumstances under which the line would be worked. It would be impossible to furnish an estimate until the work had commenced.
998. We are told that the cost of conveying ore from Broken Hill to Sydney *via* Port Pirie is £1 per ton. It would not be possible for the Commissioners to compete at that rate? I do not think so.
999. Besides losing 9s. a ton—the difference between their present rate and £1 per ton—there would be the expense attending the return of empty trucks? Yes. At the present time we carry ore at the rate of $\frac{1}{4}$ d. per ton per mile, irrespective of the consideration that trucks may have to be taken back empty. If the return of empty trucks were very large, as it might be on the Broken Hill line, a distinct loss might be incurred. On the existing lines we send back a certain percentage of trucks loaded; but on the Broken Hill line there would be a continual procession of empty trucks in one direction.
1000. You expect very little passenger traffic? I did not make any estimate of the passenger traffic, because I know nothing about it. I have not been to Broken Hill.
1001. Taking the population of Broken Hill and of intermediate places as a basis, can you tell us approximately what the passenger traffic would be? I cannot; the conditions of Broken Hill are very peculiar. It is unlike any other place that we have had to deal with. The fact that all the trade relations of Broken Hill are with the other colonies renders it impossible to make such an estimate as you require.
1002. Can you form an estimate of the probable return from the conveyance of mails? That is allowed for in the Commissioners' estimate of £12,000 per annum.
1003. Are you of opinion that the Commissioners estimate of earnings is a full one? Well, I am not in a position to speak about the passenger traffic at all. £3,000 seems very little for a line like that; but the estimate is not mine.
1004. It is your opinion that there will be no profitable traffic beyond Condobolin; No paying traffic.
1005. You appear to be unfavourable to the construction of the line? Yes; that is the view I take with regard to it.
1006. Therefore, you are not prepared to show any reasons why it should be constructed? No, and I am not in a position to urge any strong reasons against its construction, because I have not been to Broken Hill, and I know nothing of the conditions affecting the proposal, beyond those referred to in my report.
1007. Mr. Trickett.] When examined in connection with the proposal to construct a line from Nyngan to Broken Hill through Cobar, you were of the same opinion? Yes.
1008. You are unfavourable to the construction of either line? Yes.
1009. You see no reason for altering the opinions which you expressed in regard to the proposed extension from Nyngan? No.
1010. But if a line is to be constructed, you would prefer to see it taken along the Lachlan, and through Menindie? Yes.
1011. Why do you prefer to tap the river at Menindie instead of at Wilcannia? The most direct route
to

to Broken Hill from the Lachlan would be through Menindie, and an extension of the line from Condobolin would pass through exceptionally good country, country capable of settlement.

1012. Apparently the shortest way of getting to Broken Hill from our present railway system would be to go from Hay? Yes; but I do not think the saving in distance would be very much.

1013. What would be your objections to an extension from Hay? I do not think that such an extension would be of any value in securing trade for this Colony. Our experience is that once the wool reaches the Murrumbidgee it is practically lost to us. A great deal of the wool which now goes down the river comes from places lying to the north of the proposed line.

1014. You advocate the Menindie route as a sort of middle course? Yes; it would divide the country better than any other.

1015. Is there much difference in the character of the country along the three routes? From Ivanhoe to Menindie, and from Cobar to Wilcannia, the country is nearly all the same. It is all mallee scrub and sandy country.

1016. Which would serve the larger pastoral area—a line *via* Menindie or a line *via* Wilcannia? A line *via* Menindie, through Mossgiel.

1017. Have you been to these districts? I have been to Wilcannia. So far as Menindie is concerned, you will notice that I say in my report that we could not hope to get much traffic from the country within 50 or 60 miles of the river; and the same thing would be true in regard to a line to Wilcannia.

1018. Is it the universal experience of the Commissioners that when the river competes with the railway under favourable circumstances people prefer to use the river? Yes.

1019. Are there other circumstances affecting the course of the traffic;—is the traffic affected according as the district from which it comes has been taken up by people in Melbourne or Adelaide? That is so to some extent; but people would send their wool to Sydney by our railways, and then on by steamer to Melbourne if that were cheaper than the present means of conveyance. We carry a lot of wool that way now.

1020. Wool can be carried upon the river more cheaply than upon the railway? Yes, if the river is navigable.

1021. Things being equal, the wool would go by river? If the freight to Sydney and to Melbourne were the same the wool would probably go to Melbourne; but if the freight to Sydney were lower than the freight to Melbourne, it would come to Sydney.

1022. You look upon this country as suited chiefly for pastoral occupation? Yes.

1023. Mr. Howell told us on Tuesday that a large quantity of ore would be brought from Broken Hill to Lake Illawarra to be treated;—have you taken into consideration the possibility of the railway getting any of that traffic? No.

1024. If the ores could be brought to Lake Illawarra more cheaply by some other route than by the railway, it would come by that route? Yes.

1025. If the railway charge were 31s. 2d. a ton, and they could get ore brought by some other route at less expense, they would send it by the cheaper route? If they could get ore sent by some other route for 30s. a ton, they would send it by that route.

1026. The wool traffic, I suppose, would only take place during certain periods of the year? Yes.

1027. How much do you think you would obtain from the carriage of stock? £4,500. I allow for 500 trucks.

1028. The carriage of live stock is not very profitable, is it? It does not pay so well as the carriage of wool; but it pays as well as the carriage of grain.

1029. The carriage of wool is a great source of profit? Yes.

1030. This is part of your evidence in regard to the Nyngan extension:—

What would be the resources of that line? That trade is worth about £3,000,000 a year. That is the last estimate we have of the Darling trade.

? Those figures represent a value of the wool and stores carried on the Darling, not the value of the trade to the railway authorities.

1031. You are not able to state what amount of freight that trade would bring to the railway? No.

1032. Is the volume of trade in that part of the country as great now as it was then? I do not think there has been very much alteration in it, though the drought and commercial troubles may have diminished it a little.

1033. How did you arrive at the estimate of traffic which you have submitted to the Committee? I took the number of sheep upon the various stations, and I allowed 14 bales of wool per 1,000 sheep. Then I calculated that out at a rate of 1d. per ton per mile.

1034. Have you allowed for all the stations in the district, or have you made an exception in the case of stations whose traffic is likely to go by river? I have excluded all stations having a frontage within about 60 miles of the river.

1035. But in bad seasons you might pick up a great deal of the trade which you would lose in good seasons? We might; but it is an open question. As far as Broken Hill is concerned, it gets its supplies now direct by railway, and the river stations generally hold large stocks in hand. Then, too, the Darling is generally navigable as far as Menindie for some time after it has failed higher up.

1036. How long is the river navigable—continuously? Sometimes for seven or eight months in the year it is not navigable, especially in the upper reaches.

1037. But is it not generally navigable at the time when people want to send their wool down? Yes; it has been so during the last seven years.

1038. Has there ever been an interval during which people could not get their wool sent down? Not for more than two years at the most.

1039. Is Menindie a growing town? Not so far as I know.

1040. Would the construction of the railway tend to make it a larger centre? I daresay a certain amount of traffic would come up the river to the railway. I daresay the South Australian people would then be in the position in which we are in at Bourke. Lines upon which they could get good freight would be cut.

1041. How does Wilcannia compare with Menindie? It is a larger town.

1042. That seems rather an argument for the extension of the railway that way;—Wilcannia seems to impress itself upon one as a place at which the railway should tap the river? Wilcannia is purely and simply a river town. I do not see that the railway would divert traffic from that point.

1043. Unless prohibitive dues were imposed upon the river? Yes. Wilcannia owes its position to the fact that the river is frequently navigable there when it is not navigable to Bourke, and thus stores can be distributed from Wilcannia when they cannot be distributed from Bourke.

1044.

J Harper,
Esq.
20 Aug., 1896.

- J. Harper,
Esq.
20 Aug., 1896.
1044. Have you studied the mining capabilities of the country through which the line will pass? No. Of course there are mining developments along the route of the proposed line as well as along the Wilcannia route.
1045. As good? I do not know about that.
1046. What are the mining prospects of the country along the proposed route? Well, that country can scarcely be said to have passed out of the prospecting stage. At Mount Hope there is an established mining centre.
1047. The country which the line would traverse is largely pastoral? Yes.
1048. And likely to remain in pastoral occupation for many years to come? Yes. After the Willandra Billabong is crossed, the poor rainfall militates against successful agriculture.
1049. There seems no prospect in the near future of a large increase in population? No.
1050. Do you think that the proposed line will answer the purposes for which it is intended if it is lightly constructed? Of course, it would be better if the line were capable of carrying heavy roads at a low rate of speed.
1051. But if it is to be a national line, connecting two colonies, would a low rate of speed be satisfactory? I should think so. What we have to consider is the connection with Broken Hill, rather than the connection with Adelaide.
1052. Your rate of the carriage of ores is a low one? Yes. The Commissioners hope that it will assist in the development of the mineral resources of the Colony.
1053. It is lower than the South Australian rate? Yes; but I saw a paragraph in a newspaper the other day to the effect that the South Australian Government propose to reduce their rates from Broken Hill.
1054. I suppose that if it were likely that the proposed line would be constructed, they would reduce their rates still more? It almost looks as though they were reducing their rates in anticipation of the construction of the proposed line.
1055. Their charge used to be 1d. a ton for coke, and 1½d. a ton for ore. Do you know if those rates still prevail? I do not. There are generally private rates between the companies and the department.
1056. I believe that when the Nyngan extension was proposed, it had the effect of reducing rates? Yes.
1057. And seeing that the distance from Broken Hill to Port Pirie is less than 300 miles, while the distance from Broken Hill to Sydney would be 700 miles by railway, would not the South Australian Government be able to compete successfully against our line? I think that the bulk of the ore would go to Port Pirie, which is only 253 miles from Broken Hill.
1058. *Mr. Clarke.*] The estimate of the earnings of the line contains no allowance for the carriage of ore? No.
1059. You think that it is not probable that any great quantity of ore will be brought along the line? That is my opinion.
1060. Do you know the nature of the country between Condobolin and Broken Hill? I have been out about half-way to Minindie.
1061. Is there any country out there which is capable of growing cereals? Not after you get about 10 miles beyond Hillston.
1062. Would any revenue be derived from the carriage of produce? Only very little.
1063. The distance would be too great? Well, the trade offering would be very little.
1064. Where does Broken Hill get her supplies? From South Australia.
1065. In the event of the proposed line being constructed, would she get them from Sydney? No.
1066. She can get them more cheaply from South Australia? Yes.
1067. On commercial grounds you think it is not advisable to construct the line? No.
1068. Or upon national grounds? You can hardly expect me to give an opinion upon that point.
1069. Is it probable that the mines at Broken Hill would continue to pay? I cannot say.
1070. If the mines were likely to fail that would be a reason for not constructing the railway? Yes, and a very strong reason.
1071. *Mr. Lee.*] Do you know how the mining companies at Broken Hill arrange for the carriage of their ore at the present time? No.
1072. Do you know whether they have contracts with the Silverton Tramway Company? I fancy that they pay a consolidated rate, which is shared between the Silverton Tramway Company and the South Australian Government.
1073. Is it not part of the duty of the officers of your Department to find out how this leakage of trade to South Australia occurs? It is due to the difference in mileage between Broken Hill and the two capitals.
1074. During the Nyngan to Cobar railway inquiry it was alleged that the Broken Hill Mining Company had made contracts with the Silverton Tramway Company for the conveyance of their ores to Port Pirie for at least eight years ahead? I have seen that stated.
- 1074½. Do you know whether there is any later information at hand in regard to these contracts? No. I think Mr. Howell would be able to give you the information you want. I scarcely think, however, that he would have said that the New South Wales railway would carry so much ore if the rate were £1 a ton, supposing a contract of the kind you mention had been let to the Silverton Tramway Company.
1075. You put the carriage of low-grade ores from Broken Hill altogether out of consideration? Yes.
1076. You believe that it would be quite impossible for our railway to get that traffic, because of the nearness of Port Pirie? Yes.
1077. That is the crux of the whole thing? Yes; we recognise that we could not compete with that comparatively short length of line.
1078. If no means of conveyance at present existed, the proposed line would get a lot of the traffic? Decidedly.
1079. But the trade having now become centred at Port Pirie, and the interests of wealthy corporations being concerned in keeping it there, it is not likely that it will ever come to our railways? No.
1080. And the price of ore is such that economy must be exercised in regard to its conveyance? Yes.
1081. The same remarks would apply to the question of coal and coke traffic? Yes.
1082. There is no probability of any large amount of traffic in coal or coke over our railways? No; and present indications point to the fact that less coke and coal will be used in Broken Hill in the future because the ores are being taken elsewhere to be treated.

J. Harper,
Esq.
20 Aug., 1896.

1083. Therefore, no ore or bullion will be brought away from Broken Hill by the proposed line, and no fuel taken into it? That is so. If we had been able to bring about a traffic in ore to Lithgow, with a back carriage of coal and coke, the rates might have been reduced; but the possibility of that traffic has disappeared.
1084. The distance from Broken Hill to Lithgow is 600 miles? Yes.
1085. So that the rate for crude ore would be 25s. per ton? Yes.
1086. If ore can be brought to Illawarra now for 21s. and 22s. 6d. per ton, it is not likely to be taken to Lithgow for 25s. a ton? No; the occurrences of the last year or two have quite altered the condition of things.
1087. The erection of large smelting establishments at Newcastle and Lake Illawarra has changed the prospects of the Broken Hill railway? Decidedly.
1088. When the Nyngan extension was proposed, there was a probability that the ore might be treated at Lithgow? Yes.
1089. But that is out of the question now? Yes.
1090. Is there any other probable source of traffic which the construction of a railway would foster? I cannot conceive of any. The country, after you reach a certain point, is only suitable for pastoral occupation.
1091. Will you give us your definition of a "national" line? I cannot do more than repeat what I have already said.
1092. In what sense of the word would the line be a national one? I said that I considered that a national line was one the burden of which was borne by the whole community, and not by the users of the railways.
1093. Is not the whole community burdened with the loss upon our existing system? Only to a very small degree. It is the producers of the country, who have to pay relatively high freights, who suffer. I regard a national line as one the cost of whose construction and maintenance is paid for out of national funds.
1094. *Chairman.*] What reason is there for considering this a national line? That is a matter which I cannot discuss.
1095. *Mr. Lee.*] Is the construction of the line demanded in order that there may be a uniform gauge between the two colonies, or for defence purposes, or for anything of that kind? It might have elements of that character, but they are not such as I have to consider. The line may be proposed as an alternative line for the carriage of military material.
1096. In the event of the failure of the mines, what would there be to sustain Broken Hill? Nothing. The surrounding country is very inferior for pastoral purposes.
1097. If the ordinary goods and passenger traffic of the place could be secured to our railways, it would be very valuable? Yes.
1098. Is the population there likely to increase or to decrease? I cannot say.
1099. If the output at the mines were to diminish, the population would decrease? Yes; and I think the population will decrease because of the ore being treated elsewhere. The people now engaged in smelting at Broken Hill will have to go to Newcastle and elsewhere.
1100. *Mr. Egan.*] I understood you to say that part of the proposed line would pay? I consider that at the Condobolin end, the line would have some prospect of paying.
1101. Would that part of the line between Broken Hill and Menindie pay? No, I should think not, under existing conditions. Goods coming that way will have to pay 900 miles of river freight, and nearly 70 miles of railway freight.
1102. You do not think that if that line were constructed the supplies to Broken Hill would come through Menindie;—is not the country there good enough to enable them to grow a good deal of the supplies for Broken Hill? They might grow vegetables and fruit, and even if they grew all the produce required for Broken Hill, it would not amount to very much.
1103. You cannot give us any description of the country along the proposed line? Well, I have only been over it for a certain distance, but I know that on to the river it is all mallee.
1104. You say that you cannot afford to carry goods for less than $\frac{1}{2}$ d. per ton per mile? No.
1105. Supposing you could get 800,000 tons of ore to carry if you reduced the rates, would not that pay? No, I think not.
1106. In that case the greater the traffic the greater the loss? Yes.
1107. Do you not think that when the Commissioners spoke of this as a national line they had some idea of the necessity of connecting a great mining centre like Broken Hill with the metropolis? I do not think that the term "national" was applied to the line by the Commissioners. I believe that it was referred to them as a "national" line.
1108. Do you think that the term "national" is applicable to it in the sense I have suggested? Well, I can scarcely say how the term came to be applied to the line.
1109. Is not South Australia drawing the greater part of her railway income from Broken Hill? Yes.
1110. The Broken Hill traffic accounts for her railways paying at the present time? Yes.
1111. It would materially hurt South Australia if that traffic were taken away from her? Yes.
1112. Do you not think that the reason for calling this a national line is that it would connect one of the largest towns in the colony with the metropolis, the trade of that town at present going entirely to another Colony? Well, there are half a dozen large towns on the Murray to which the same remark would apply.
1113. But the people in those towns could take advantage of our railways? They would have to travel some distance to get to them.
1114. The people of Broken Hill could not use our railways? Well, they could travel down to the railway at Hay.
1115. No matter how great the traffic might be, it would not pay to carry ore for less than $\frac{1}{2}$ d. per ton per mile? Not under present conditions. If we get back-carriage in coal we might be able to reduce the rates; but if the trucks had to be run empty the whole way back the profit would be very much reduced.
1116. *Mr. Hassall.*] Have you taken into consideration the proposed deviation *via* Cudgellico? No; the Commissioners have not had it under their notice.

J. Harper,
Esq.
20 Aug., 1896.

1117. Do you know anything about that country? Yes. There is no doubt that such a deviation would add to the traffic; but I do not know how much it would increase the total length of the line. The idea was to connect that district with the main line by a branch line. Until the Willandra Billabong is reached there is very little difference between the land on either side of the Lachlan, though the land in the Central Division is slightly better than the other land.

1118. If the deviation only increased the total length of the line by 6 or 7 miles, do you think it would be wise to carry it out? I think it would be worth considering.

1119. In the event of the line being extended from Condobolin, would you expect to derive any considerable traffic from the Mount Hope district? At the present time the traffic from Mount Hope is very small; but it is impossible to say what the capabilities of the case are. It might develop as Cobar has done.

1120. Do you think that the construction of the line would have any effect upon its development? Now that improved methods for treating ores have been adopted, every mile of line would tell. I fancy that even the Condobolin extension will be appreciated at Mount Hope. The distance between the two places is something like 80 miles.

1121. It is pretty good country to travel over? Yes.

1122. That country will be in a better position from the construction of the line to Condobolin than it was when the railway only went to Forbes? Yes.

1123. Does the information which you have obtained in regard to the probable traffic on the line corroborate the statement of the Commissioners that there will be a loss of about £40,000 per annum upon it? It more than corroborates it, because I have only taken into consideration the pastoral traffic. I have made no allowance for passenger traffic.

1124. Do you think that the construction of the line would increase the production of the country through which it passes? Within some distance of Condobolin it might lead to an increase of the area put under cultivation; but I scarcely think that the increase would be sufficient to justify its construction.

1125. Would it increase the production of the pastoral country? No, unless to the north of the line, where a great deal of land has practically been abandoned to the rabbits. Possibly if people could get wire-netting carried there cheaply, there would take up that country again. The country to the south is carrying almost as much as it is capable of carrying.

1126. You do not expect to attract any of the traffic which now goes to Adelaide? No.

1127. The Broken Hill traffic must naturally gravitate to Adelaide? Yes, and to Port Pirie.

1128. And the bulk of the passenger traffic would go that way, because the interests of the Broken Hill people are identified with South Australia? I think so.

1129. Mr. Roberts.] Is it not a fact that the Railway Commissioners do not recommend the construction of this line from any point of view? That is how I read their report. They simply leave the facts which they have elicited for the consideration of the Government.

1130. They merely say "If viewing it from a national point of view you think it is advisable to construct this line, we will do the best we can with it after its construction"? Yes, that is practically what they say.

1131. In making an estimate of the traffic, you did not take into consideration the possibility of carrying any large quantity of sulphide ore? No; and the erection of large works for the treatment of ores upon the coast confirms me in my original opinion in regard to that traffic.

1132. In view of the fact that this proposed extension will not cost more than £2,600 a mile, could you not afford to carry ore over it at a lower cost than $\frac{1}{2}$ d. per ton per mile? No, because the earnings would have to be debited with a proportion of the cost of the existing line. Of course, if there were carriage back the other way, the rate might be reduced.

1133. But if you can afford to carry freight for $\frac{1}{2}$ d. a ton over lines which have cost much more than the proposed line will cost, could you not reduce the freight upon this line? On the existing lines we very often have back freight, for which we get 6d. and 7d. a ton, and we can therefore afford to take ore at $\frac{1}{2}$ d. a ton; but on the Broken Hill line we should have to haul our trucks quite empty in one direction. On the Cobar line, for instance, the traffic balances. We carry as much coke and coal to Cobar as we bring back ore and other material. We carry all the supplies required at that place at a relatively high rate. If we had to run empty in one direction, a rate of $\frac{1}{2}$ d. a ton per mile would probably not pay.

1134. Therefore, it is not probable that ore could be carried from Broken Hill for less than $\frac{1}{2}$ d. per ton per mile? No.

1135. Do you not think that if the railway were taken to Menindie it would increase the export of wool down the river? We can very soon stop that by making the rate to Menindie as high as the rate to Sydney. We do not allow people to use our railways against us if we can help it.

1136. Do you not think it would be better to take the line *via* Wilcannia, so as to prevent the wool being exported down the river? I do not think an alteration of the route would have any effect of that kind, and a line to Wilcannia would compete with the present line to Cobar.

1137. Is it likely that the proposed line will get much traffic from Mount Hope? The Mount Hope traffic will probably come to the line about Euabalong.

1138. Do you approve of the deviation *via* Cudgellico to Hillston? Well, I have not had time to think about it yet. Such a line would go through some good country; but I do not know how the deviation would affect the whole distance; and it would be rather out of place for me to recommend any increase in the total length of the line, when I have stated that one of the recommendations of the proposed route was, that it was shorter than any other.

1139. I think you told Mr. Humphery that Condobolin was as far as you would go to get paying traffic? Yes.

1140. You would not extend the railway to Hillston? No; because Hillston is only 65 miles from Carrathool, and the moment the river comes into competition with us we have to make our rates very low. Therefore, it would be probable that we should have to charge the same rate from Hillston, as from Euabalong or Condobolin, so that we should get no profit out of the line.

1141. You think it would be impolitic to extend the line beyond Condobolin? Yes; at the present time.

1142. Mr. Black.] The staple industry of Broken Hill is mining? Yes.

1143. If there were no mines there would be no town? No.

1144. As far as you know the mines have a fair prospect of permanency? Yes.

1145. If the Commissioners did not anticipate that they could successfully compete with the Port Pirie line, why did they put this proposal before the Committee? I am not aware that they had the proposal put before the Committee. J. Harper,
Esq.
1146. Have you any reason to imagine that the construction of the proposed line would induce traffic? Not to any extent. 20 Aug., 1896.
1147. The country which it would traverse is not adapted for agriculture? No.
1148. Would the construction of the line encourage the opening up of new mines? It might. There is a lot of mining country out there; but I do not say that the construction of a railway is absolutely necessary for its development. As a matter of fact the Cobar mine was very extensively developed before the railway got within 300 miles of it.
1149. Would the construction of the proposed railway offer an inducement for the opening up of low-grade mines? I do not think that the country has been examined sufficiently to make it easy to answer that question.
1150. If 800,000 tons of ore per annum could be brought from Broken Hill to Sydney by the proposed railway, would it not be possible to largely reduce the freight charges? No.
1151. Lumping together interest and capital, the expenses of maintenance and replacement, and working expenses, and averaging the total annual cost at so much per mile, you reach a limit which is a constant barrier to the lowering of rates beyond a certain point? Yes; I might point out that the Commissioners, in preparing their estimate of the expense of working the proposed line, made no allowance for the carriage of this ore.
1152. The percentage of capital invested in the construction of railway lines forms a small part of the freight charges? The Commissioners appropriate every year the whole of the earnings from the goods and live stock traffic in order to pay interest upon the line.
1153. What amount of interest would have to be paid upon the capital cost of the proposed line? £34,287 per annum.
1154. I want to know what proportion of the freight charges go to pay that interest? Assuming that there were no working expenses, the carriage of 800,000 tons of ore per annum would produce nearly enough to pay interest upon the capital cost of the line. The earnings from that source would not pay any part of the working expenses, which would be three or four times as much.
1155. The rate of interest compares with the working expenses as 1 to 4? Not necessarily. It depends upon the character of the freight.
1156. Well, in this instance? I can hardly say. We know that no traffic could be carried for less than $\frac{1}{2}$ d. per ton per mile under these conditions.
1157. But the difference in the cost of construction between a heavy line and a light line would not make much difference in the cost of carriage? It would, inasmuch as there would be a larger amount of interest to pay. The policy of the Commissioners is now to establish local rates in order to make lines pay. When the traffic justifies it, the extended through rates are applied.
1158. In a rate of $\frac{1}{2}$ d. per ton per mile, the amount set apart for the payment of interest would be infinitesimal? Yes.
1159. But if 800,000 tons of ore were carried from Broken Hill to Sydney annually the trucks would have to run empty one way? Yes.
1160. That would prevent a reduction in the freight charges? Yes.
1161. The ordinary traffic would not balance this? We would not expect to have any loaded trucks to send to Broken Hill worth speaking of. In the wool season there might be about 800 trucks required to take back carriage. About half the wool-trucks would probably be loaded with back carriage.
1162. Do the Commissioners anticipate a large return from the carriage of timber to the Barrier? No.
1163. They imagine that timber will continue to go there from America and Vancouver, via Port Pirie? Yes; there is no large local source of supply.
1164. If it were necessary to have a national railway to connect with Adelaide, would not a line through Hay and Morgan be the nearest route? I do not think there would be a saving of more than 2 or 3 miles by that route.
1165. *Chairman.*] Have you been from Hillston to Carrathool? Yes.
1166. From Hillston to Temora, via Wyalong? Yes.
1167. From Hillston to Condobolin, via Lake Cudgellico? Yes.
1168. From Condobolin to Mossgiel, on the northern side of the river? No; but I have been from Condobolin to Ivanhoe, and from Hay to Mossgiel.
1169. Could you send us a brief description of the country along those various routes? Yes.

FRIDAY, 21 AUGUST, 1896.

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane,
Esq.

1170. *Chairman.*] You have a statement to make? Yes. I have had the portion from Condobolin to Cudgellico examined by Mr. Stuart, and the following is his report:—

21 Aug., 1896.

Condobolin to Cudgellico, Report by C. McDonald Stuart.

Sir,

11 August, 1896.

I have the honor to report that I have examined the country between Condobolin and Cudgellico, with the view of running an alternative line by this route via Hillston, Mossgiel, and Menindie, to Broken Hill, and I have shown an approximate line on the accompanying tracing. This line leaves the present survey beyond Condobolin at about 332 miles from Sydney: thence, turning to the left, crosses a lagoon which is an overflow from the river, and taking a southerly direction over a dry sandy spit runs down to the river; thence crossing it, and passing over about 2 miles of flooded ground, crosses

H. Deane, Esq. crosses Nerathong Creek, and keeping in the same direction (to get away from the flooded country as quickly as possible) skirts around the head of another lagoon, and taking advantage of the sound country inside Water Reserve No. 2,323, follows this up for some distance; thence bending westerly crosses Wallaroi Creek below where Wallamundry Creek joins it in Richards' selection; and thence running south-westerly bears for Cudgellico over undulating country interspersed with low gravelly ridges and some isolated hills; thence passing to the southward of the Back Wardry Range, heads straight for Cudgellico through comparatively level country, and joins the present survey from Wyalong to Hillston on the eastern side of the lake.

21 Aug., 1896.

I have shown a small deviation to this route, leaving Condobolin close to the township and crossing the river below the present road-bridge. This would probably have less flooded country to contend with; but it passes through more valuable purchased property and interferes with more river frontage on the town side.

Another slight deviation is shown at Cudgellico which would give a straighter line, but crosses at a wider place than the neck, and would necessitate a heavier embankment.

Most of the country passed through, excepting the ridges, is of a comparatively good quality, of fine sandy loam, suitable for agricultural purposes. It is, however, for the most part covered with box, pine, and mallee scrubs, the greater part of the settlement, after passing Walleroi Creek, being to the southern side of the proposed line and scarcely any between it and the river.

The most common timbers are box and pine, with some belts of ironbark in the ridges. The latter is of variable quality, but probably sufficient of good quality suitable for sleepers could be procured.

Ballast will be easily obtained, most of the ridges being composed of slaty rock, and there is an outcrop of basalt in the Dundos Hills.

I append an estimate of the probable cost, assuming the length as 55½ miles, which is about 4 miles longer than is marked on the plan, as the line will no doubt work out longer in locating it in order to get as light earthworks as possible.

I have, &c.,

CHAS. McD. STUART.

Estimated cost (say) £2,250 per mile.—H. D. 15/8/96.

The length of this part of the line, it will be seen, is 56½ miles, and the estimated cost is £2,250 per mile. The part from Cudgellico to Hillston has been surveyed, and was finished about eighteen months ago. The length from Hillston to Mossiel is through flat country. The crossing of the Lachlan is a comparatively small one, and I estimate the cost of this portion of the line, including the bridge, at £2,300 per mile. The length is 60 miles. The total length of the deviation is thus 170½ miles, which is 14 miles greater than that of the line originally submitted. Further, as requested, I give a number of estimates in tabular form of alternative lines which have been referred to in my evidence:—

<i>Condobolin to Hillston, via Euabalong.</i>	
Condobolin to Point A, 92½ miles, at £2,200	£203,500
Point A to Hillston, 22 miles, at £2,500	55,000
Bridge	5,000
Total.....	£263,500

<i>Condobolin to Mossiel, via Cudgellico.</i>	
Condobolin to Cudgellico, 56½ miles, at £2,250	£127,125
Cudgellico to Hillston, 54 miles, at £2,500 ..	135,000
Hillston to Mossiel, 60 miles, at £2,300	138,000
Total.....	£400,125

<i>Condobolin to Mossiel, via Euabalong.</i>	
Condobolin to Mossiel, 154½ miles, at £2,200.....	£339,900
Viaduct, &c.	26,400
	1,700
	176
Total	£368,176

<i>Cobar to Broken Hill.</i>	
Cobar to east side of Darling, 459 miles to 606 miles—147 miles, at £2,726.....	£400,710
Crossing of river at Wilcannia, 606 miles to 615½ miles—9½ miles	96,210
Wilcannia to 721 miles, 615 miles to 721 miles—105½ miles, at £2,300	242,650
721 miles to Broken Hill, 721 miles to 734 miles—13 miles, at £3,740	48,750
Station at Broken Hill	6,000
Telegraph.....	5,650
Total.....	£800,000

<i>Condobolin to Broken Hill, via Wilcannia.</i>	
Condobolin to east side of Darling, 329½ miles to 590 miles—260½ miles, at £2,500 ...	£651,250
Crossing of river at Wilcannia, 590 miles to 599½ miles—9½ miles	96,210
Wilcannia to 705 miles, 599½ miles to 705 miles—105½ miles at £2,300.....	242,650
705 miles to Broken Hill, 705 miles to 718 miles—13 miles, at £3,750	48,750
Station at Broken Hill	6,000
Telegraph.....	7,770
Total.....	£1,052,630

1171. *Mr. Wright.*] Is there a grade of any consequence in the deviation? There is one of 1 in 100 only. It is all very easy, only we have to make the line a little crooked.

1172. *Chairman.*] You have given us the distances over the routes and the cost? Yes. I have given also an estimate of the line of railway to Hillston, going by Euabalong, and an estimate from Condobolin to Mossiel on both sides of the river—alternative estimates. The amount from Condobolin to Mossiel, *via* Cudgellico, is £400,375, and from Condobolin to Mossiel, *via* Euabalong, £368,176. There is a difference of about £32,000.

1173. Have you the distance and the cost of the line from Condobolin to Hillston, *via* Cudgellico? Yes, that is here. It only wants picking out. The amount is £252,375, and the distance is 110½ miles.

1174. Have you the distance from Temora, *via* Wyalong, and the cost? I have not the cost.

1175. Can you give an approximate statement with regard to it? I gave you the distance.

1176. Can you give an approximate statement as to the cost? It is pretty easy country.

1177. What is the distance? From Temora to Hillston, *via* Wyalong.

1178. Yes? Temora to Cudgellico, 109 miles; Cudgellico to Hillston, 55 miles.

1179. That is 163 miles? Yes.

1180. Approximately the cost would be about £300,000 from Temora to Hillston? It would be more than that. It would be more than £2,000 a mile. I should reckon that on an average it would be about £2,400 a mile.

1181.

- 1181. Nearly £400,000? Yes; it is £391,000.
- 1182. Have you the distance from Hillston to Carrathool? No, but I can get it.
- 1183. Will you give us the distance and the cost? I do not know that there has been any examination of the route to Carrathool.
- 1184. If you have not had a survey, you had better say so? There has been no survey.
- 1185. We presume that you have made these comparisons as equal from an engineering standpoint? Yes.
- 1186. They are equal in all ways? Yes; I had intended that.
- 1187. In other words the power required to work them would be about the same, the gradients being pretty well the same? Yes, they are all the same, with 1 in 100 as a maximum.
- 1188. *Mr. Trickett.*] If the line went through Euabalong or Mossgiel there would be no greater engineering difficulties than on the proposed route? We go through Mossgiel in any case.

H. Deane,
Esq.
21 Aug., 1896.

Percy Scarr, Esq., Principal Assistant Engineer, Roads and Bridges Branch, Department of Public Works, sworn, and examined:—

1189. *Chairman.*] Have you a statement with regard to the roads between Condobolin and Broken Hill? I have a statement here showing a list of the scheduled roads that might have any bearing upon the proposed line, and a statement showing the amount expended on each from 1892 to 1895-6 inclusive. Also a tracing showing the roads. I have also a report from the Roads Officer at Hay, Mr. G. S. Mullen, and a tracing showing the roads in the Hay road district. The following is the report from the Roads Officer at Hay:—

P. Scarr,
Esq.
21 Aug., 1896.

Reproposed Railway—Condobolin to Broken Hill.

Sir, Roads Office, Hay, 15 August, 1896.

In accordance with telegraphic instructions of yesterday, I beg to submit, under separate cover, plan showing information required, as far as this district is concerned.

All scheduled roads north of Murrumbidgee are shown in red, and the more important unscheduled roads in brown. The whole of the traffic from the country shown within my boundaries, i.e., the Willandra Creek on the north, trends southwards to the navigable rivers Murray and Murrumbidgee, and the railway, Hay to Junee line.

The most important line of traffic is that from Cudgellico to Whitton (105 miles), though very little country beyond Cudgellico is affected, as the trend of traffic is there split in various directions, viz., to Cobar, Forbes, and Temora railways.

Another important road is that from Hillston to Carrathool (70 miles), which serves the country as far north as Roto.

The road Ivanhoe to Hay (130 miles) is classed as second in importance in this district, and draws traffic from a distance of 40 miles north and east of Ivanhoe, and the trend of traffic throughout the central portion of district is via this road southerly to Hay.

Four stations—Kilfera, Clare, Oberwells, and Til Til use the road Ivanhoe to Balranald, and the stations immediately west use Euston as their shipping-place. Tolarno, Albermarle, and Moorara use the river Darling, and would probably continue to do so even were proposed railway constructed.

The correct position of proposed railway route is not known to me, but is shown approximately in pencil, now marked in green; the southern boundary of probable division of traffic between the two systems is shown in blue hatching, the only doubtful cases being those of Gunbar and Til Til.

As to probable effect of railway, if carried out, no new roads would require to be placed on schedule; the present ones, as far as can at present be foreseen, would meet all requirements.

Yours, &c.,
G. S. MULLEN.

Item No. 1895-6.	Mileage, 1895-6.	Road.	Amount Voted.					Amount Expended from 1892 to 1895-6.

- 1190. Have you any personal knowledge of that district? I have only a general knowledge of it.
- 1191. Have you a direct road from Ivanhoe to Broken Hill? No. There is no direct road from Ivanhoe to Broken Hill that we have any cognisance of.
- 1192. Is there from Hillston to Mossgiel? Yes.

- P. Scarr, Esq.
21 Aug., 1896.
1193. Then on to Ivanhoe, but going further west, you have to go to Wilcannia going north? The scheduled road is from Booligal to Ivanhoe, not from Hillston. We have a road from Ivanhoe to Wilcannia, and one from Wilcannia to Broken Hill. Of course there is a traversable road from Ivanhoe to Broken Hill, *via* Menindie.
1194. *Mr. Trickett.*] Is there a mail from Ivanhoe to Menindie direct? I could not tell you.
1195. How much per mile is spent upon the class of road between Condobolin and Broken Hill? It varies very much; but I am handing in a statement of the expenditure.
1196. I thought those roads were scheduled? They are; but the expenditure per mile varies on them, according to their importance.
1197. Is there a departmental limit to the expenditure upon roads of a particular character? The mileage expenditure ranges from £50 down to £5 a mile. The £50 per mile is on the principal roads where there is a very heavy traffic.
1198. What is the average on roads of this character? I could hardly answer that question without figuring it out.
1199. *Mr. Lee.*] Do the roads through that country take the direction of the contemplated railway? No; the roads generally cross the railway.
1200. What is the trend of the roads through that country? As a rule, the roads run north and south, except the main road along the Lachlan River.
1201. According to the tracing the roads run almost at right angles to the railway? Yes, as a general rule.
1202. I presume that your roads are simply laid down there for the purpose of giving communication with the various small centres, and to give access to the nearest railway? Exactly.
1203. As a rule, you do not expend money upon the roads generally there;—it is only at particularly bad spots, is it not? In bridging and making embankments across swamps, and places of that kind.
1204. It has not been the policy of the Roads Department to create made roads throughout that western country? No; as a rule, there is no material to make roads.
1205. Is there any intention to do it? I think not.
1206. I suppose there would be a reason for not doing so? One of the principal reasons is that there is no material to make the roads of.
1207. Another would be that they are not required? Hardly.
1208. The nature of the country is such that the traffic can go on over the ordinary surface roads? In the dry seasons you cannot improve the road, but in the wet seasons it becomes almost impassable.
1209. Therefore the road question does not enter into the railway question? I do not think it touches it at all.
1210. Have you any special knowledge about the river at Menindie or the crossing of that river? No; I have not been out beyond Booligal.
1211. Have you had to make any special provision in consequence of the flooded state of any portion of that country by way of embankments, punts, boats, or anything of that kind? Not that I remember; nothing very extensive at any rate.
1212. That is to say that the country in its normal condition requires no special attention from the Department? No.
1213. *Mr. Trickett.*] I suppose there has never been any great agitation to form a permanent or metalled road? No; we hear very little of the road question out there, except as to isolated spots, when they become very bad, and creeks require bridging, and so on.
1214. I suppose you are aware that the population between Condobolin and Menindie is very sparse indeed? Yes.
1215. There has never been any agitation for a metalled road? No, nothing of the kind. There has been no attempt to make any continuous road.
1216. Then the question that it would be as important to make a railway as to make a metalled road would not come in? It would not, because there is no likelihood of a road ever being required in that direction.
1217. There is no intermediate traffic to create a demand? No; except up and down the Lachlan.

TUESDAY, 25 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FEGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Ebenezer Glencross Grant, Esq., Representative in New South Wales and Queensland of the Walter A. Wood Mowing and Reaping Machine Company of New York, sworn and examined:—

- E. G. Grant, Esq.
25 Aug., 1896.
1218. *Mr. Clarke.*] Are you acquainted with the country through which the proposed railway will pass? Yes, I am acquainted with the country on both sides of the Lachlan River. I know the country on the north side fairly well from Parkes to Euabalong, but I do not know much about it beyond there. I know the country on the south side right through.
1219. You know the country in the neighbourhood of Condobolin? Yes.
1220. And from Condobolin right along in the direction of Hillston? Yes.
1221. What kind of country is it? Most of it, as far as Condobolin, going through from Parkes, is good agricultural country. It is patchy between Condobolin and Euabalong, and on to Cudgellico. On the south side of the river, from Cudgellico to Hillston, I would call it all good agricultural country.
1222. How far does the good country extend from Condobolin in the direction of Broken Hill? There is not such good agricultural land between Condobolin and Cudgellico, but it is all good between Cudgellico and Hillston, and there are good patches on towards Mossgiel. I have not been beyond Mossgiel.

1223.

1223. Is that country capable of producing cereals? Yes, I consider the country between Cudgellico and Hillston the best wheat land I ever saw. I never saw better wheat land.
1224. And beyond that again? It gets more patchy. There is some good wheat land between Hillston and Mossiel, but the land is not so good as the other land to which I have referred.
1225. You do not know anything of the country between Mossiel and Broken Hill? No, nothing whatever.
1226. Do you think it would pay to grow breadstuffs out in those districts to send to Sydney? I have no doubt about it. It would pay if there were railway communication. I know that there is a prospect of very large areas there being taken up for wheat-growing. At the present time the land is useless, because producers would be handicapped by freight charges of 6d. per ton per mile.
1227. I suppose you are aware that wheat can be sent to Sydney from South Australia and Victoria at very low rates? Yes, for about 10s. a ton.
1228. To send wheat from Hillston or Condobolin to Sydney would cost more than that? A little more; but the freight upon wheat in this Colony is exceedingly low. Wheat could be produced in the district to which I refer as cheaply as in South Australia.
1229. Is it clear open country? No; some of it is mallee country, and some pine country—it varies considerably.
1230. What is the soil like? Most of it is a strong chocolate soil.
1231. That, I understand, is the best soil for growing cereals? Yes. I am certain that wheat could be produced in the district very cheaply. The land is very easy to work, and I do not think it would be difficult to clear.
1232. Is the country well watered? No, but there is a fair rainfall. They have an average rainfall at Hillston of about 17 inches per annum, and a little more at Cudgellico. In South Australia the rainfall is not so great, and in the large wheat valleys of California the rainfall averages only 10 or 11 inches.
1233. I suppose you are aware that wheat, once it gets a fair start, does not require a great deal of rain? Yes; I have been mixed up with wheat-growing more or less all my life.
1234. You think that if the proposed railway were constructed it is probable that large quantities of cereals would be sent from the district to Sydney? I have no doubt of it. I know one gentleman who is thinking very seriously of taking up 30,000 or 40,000 acres, if he can get the land. He has the ambition and the capital to put some 20,000 acres under wheat; but unless railway communication is given to the district that will be impossible.
1235. Would there be any other market besides the Sydney market? There would not be a great local market, even westward towards Broken Hill. The price of wheat is ruled by the European market, and we would have the European market open to us just as other places have. Then, too, the district would be an excellent hay district, because it has a bright and clear atmosphere. The South Australian hay and chaff brings the best prices in the Sydney market, because it is grown in a bright and clear atmosphere. The rainfall being light, the hay would not be rank. A fine hay would be produced, which would be marketable.
1236. Are you aware of the proposed cost of the railway? I have seen the estimates.
1237. Do you think that the carriage of cereals would be sufficient to pay interest upon the cost of the line? Not for some considerable time, at all events; but I consider that in six or seven years the district will send from 15,000 to 20,000 trucks of produce to Sydney annually. That is a backbone for the traffic.
1238. You cannot say anything about the quantity of sulphide ore that would be brought from Broken Hill? No; I do not know anything about that matter. I do not know what that class of traffic would be worth.
1239. Do you think it would be justifiable in the public interest to spend so large a sum of money as is proposed in constructing a railway merely to carry cereals to Sydney from the country between Condobolin and Mossiel? I would put the cereal and produce traffic down at about one-half of the whole traffic. I think that the country would be justified in the undertaking, considering that this would form part of an overland connection with the other colonies. I have seen a number of such lines constructed in other countries. There they have traversed in some cases hundreds, and even thousands, of miles of barren country in order to get at some particular point, and eventually the line has made the intermediate country productive. I believe in the American principle of letting the railway develop the country. Here we believe in getting the traffic first, and building the railway afterwards; but in my opinion the only way of developing a country is to build railways through it.
1240. You would make the railway, believing that settlement would come afterwards? Yes; railways induce settlement. You cannot get along without them.
1241. *Mr. Lee.*] Where were you before you came to New South Wales? I was living in the States.
1242. Have you had an opportunity of comparing other parts of Australia with that of which you have been speaking? I know all Australia, except Western Australia, fairly well, and I know the north island of New Zealand.
1243. How do the climate and soil of South Australia and Victoria compare with the climate and soil of the district of which you have been speaking? I would take the mallee country of Victoria and a great deal of the wheat land of South Australia as very similar to this land. I do not think they have so much rain in South Australia.
1244. In South Australia the production of what is carried on under almost a minimum rainfall? Yes.
1245. But with fair average returns? Yes.
1246. Are you well versed in the qualities of wheat? I do not call myself an expert in wheat.
1247. What is the general character of wheat raised in semi-dry climates? Generally it brings a better price on account of its thin husk. It makes a better milling wheat.
1248. You are aware that the character of the country changes very much beyond Mossiel? So I understand.
1249. Your evidence would point to the fact that, whatever might be done towards constructing a railway to Broken Hill, it would be profitable to extend the line to Mossiel? Yes.
1250. You will not commit yourself to a statement as to the advisability of carrying the line right through? Except that I have seen in other countries the advantage of having a through connection. Take, for example, such a great undertaking as the Union Pacific Railway in America. The point they wanted to reach was San Francisco, and some of the large western cities, and to do that they passed through nearly 2,000

E. G. Grant,
Esq.
25 Aug., 1896.

- E. G. Grant, Esq.
25 Aug., 1896.
- 2,000 miles of unproductive country until they came to the plains of California. Once they got to the Pacific coast, they were able to draw a large amount of traffic from the east.
1251. A great deal of the country through which that line was taken had a very small population at the time? Scarcely any. Some of the States have almost sprung into existence since the opening of that line.
1252. That line, by bringing centres of population within touch of the markets, has greatly developed the country? Yes.
1253. Were the people who settled along it citizens of the country or attracted from other places? The people came either from the Eastern States or from Europe. Most of the homesteaders, as they call them there, were attracted in this way. Many of the railways in America have been built upon the land-grant system, and the companies have employed European and Eastern agents to get people to settle upon the land.
1254. Those railways could only be made profitable by the settling of people on the land? Yes.
1255. Has the system had the effect of settling people upon the land? Yes.
1256. How long have you had a knowledge of the western parts of this country? For six or seven years.
1257. Have you been over the country frequently? Two or three times in the year.
1258. In wet as well as in drougthy seasons? Yes.
1259. How do you think that agriculture will fare in dry times? They had a very dry season there last year, but I found that their crops were better than the crops in other parts of the Colony. The crops in some of the best producing districts—Bathurst and Goulburn, for instance—were practically a failure, whereas some of the dry districts had fairly good crops.
1260. I suppose it has frequently occurred to you that our great western interior carries only a very small population? An extremely small population.
1261. Do you think that there is as much probability of population settling in the western part of this Colony as there was of population settling between New York and San Francisco? I do; because the land is better—and, after all, land is the attraction. The presence of minerals booms a country for a time, and brings population; but I have never heard of mining bringing permanent prosperity. A country never becomes permanently prosperous until people begin to cultivate the land.
1262. The natural products of the soil are looked upon as the safest investment for freight? Yes.
1263. Mineral resources may be somewhat erratic? Yes; and the people connected with mining belong more to a migratory class.
1264. *Mr. Wright.*] I understood you to say that good wheat is always grown in hot countries? I said that they grew good wheat in dry countries.
1265. Does not the quality of the wheat depend upon the constituents of the soil? There is no doubt about that.
1266. Is not the soil upon which wheat is grown in South Australia largely impregnated with lime? I could not say, because I have not seen any analyses of that soil.
1267. Have you ever been to Kingston and Laccpède Bay? No.
1268. You think that good wheat is generally grown in dry climates? I have found it so. I would call the climate of South Australia a dry one; but South Australian wheat brings the best price in the London market, and South Australian flour the best price in the Sydney market.
1269. Still you are not a judge of the soil? I consider myself a fair judge; I generally know whether soil is or is not good wheat soil.
1270. Have you been on both sides of the Lachlan? Yes; I know the country on both sides of the river fairly well.
1271. Which land do you consider the best? As far as Condobolin, the land on the north side; but, after that, the land on the south side.
1272. The Willandra Creek is on the north side of the river? Yes. There is some nice land on Roto Station; but the land generally is more patchy on the north side of the river.
1273. Have you been across from Condobolin to the lake? Yes.
1274. Which route did you travel? I have travelled both north and south.
1275. Did you go through Bajalory Station? Yes.
1276. What is the land around there like? I should say that it was patchy.
1277. There is a considerable extent of bad land? Yes.
1278. On the Dundoo Range the land is very inferior? Yes, very.
1279. Was there not a special and particular cause for the railway extension in America which does not apply to Australia? Well, people were able to get to America more easily, because it is near the large centres of population in the old world. Then, too, the American land laws are more liberal than ours.
1280. The large influx of population into America every year made it necessary for people to push out back. That necessity does not exist here? That is so.
1281. For some years 500,000 and 600,000 people arrived in the States annually, and either they or older inhabitants had to push out back? Yes. As many as 800,000 people arrived there one year; but the number arriving now is very small—I think about 100,000 a year.
1282. Do you think that if the same thing occurred in Australia, the results would be similar? Yes, to some extent. I consider that this land is thirsting for settlement. People want to go on to it, but they cannot do so, because there are no means of communication with the outside world.
1283. We have some 1,000,000 acres of wheat land which are much nearer to Sydney, and which are in the hands of small holders; but they are not cultivated? I do not know how to account for that. I have always thought that the New South Wales land laws were not as liberal as they might be. Then, too, the land is taken up in too large areas. The selectors go to a great deal of expense in fencing and making other improvements, and in so doing they exhaust their capital, and are prevented from going in for cultivation.
1284. I suppose you have realised that the bulk of our selectors desire to be small sheep farmers rather than wheat producers? Yes.
1285. If railway communication were given to this district, have we any guarantee that the land would not be used for sheep farming rather than for wheat? I think you have, in the fact that the cultivation in this district has increased very largely, although there is no railway communication. I have known the district for seven years. When I came to the Colony seven years ago, wheat growing west of Parkes was almost

almost unknown. Now, there is a large area of wheat land between Parkes and Condobolin. At that time practically no wheat was grown between Hillston and Gunbar; but now there are some 15,000 acres of land under wheat there.

E. G. Grant,
Esq.

25 Aug., 1896.

1286. Is there not a flour-mill at Hillston? Yes.

1287. You say that the country there has of late gone extensively into cultivation, and that the construction of a railway would extend the cultivation further west? Yes; a few years ago there was no cultivation beyond the Macquarie at Dubbo; but now, within 30 miles of Dubbo, and on the other side of the Macquarie, there are 10,000 or 12,000 acres of land under wheat.

1288. I suppose your occupation takes you a great deal among the farming population? Yes; then, too, we have travellers upon each of the railway lines, and they are always reporting to us how things are going on.

1289. *Mr. Hassall.*] Can you compare the proposed railway to Broken Hill with the railway from New York to San Francisco? I think so. I am firmly of opinion that most of us will hear of the English mails being landed at Freemantle, and the proposed railway would be part of the trans-continental line. Then, too, I think there would be a great deal of through traffic from Adelaide, and Broken Hill and the surrounding districts ought to produce a fair amount of traffic. I have been to Broken Hill; but I do not know much about it.

1290. Would not a globe-trotter who wished to journey through the Colonies prefer to go round by way of Adelaide and Melbourne, instead of coming right across? Yes; but the line would not depend upon the globe-trotters; it would have to depend upon the people of the country. It is the local population that makes the traffic of a railway.

1291. Does not the geographical position of Broken Hill render it impossible for the bulk of the traffic to go anywhere but to South Australia? South Australia must attract a great deal of the Broken Hill traffic.

1292. Then the question arises, what traffic would the proposed line have to depend upon? First of all there would be a huge backbone in the carriage of cereals and produce from as far as Mossgiel; then the large pastoral industry would bring its share. Unquestionably, too, there would be some traffic from Broken Hill, and all these atoms would tend to make up a whole.

1293. What traffic would you expect from Broken Hill? I do not know; but I know that there is a good deal of traffic from Broken Hill.

1294. You would not expect any traffic in minerals? The traffic would be connected with the mining industry; but I am somewhat a fool in regard to mining matters—I take no interest in them.

1295. If it has been conclusively proved to us by practical men that the conveyance of minerals from Broken Hill to our coast by way of Port Pirie would be cheaper than across by the proposed railway, do you think the traffic would come by the railway? Undoubtedly the traffic will follow the cheapest route.

1296. So that the only traffic that might be expected would be through passenger traffic from Broken Hill? I would depend very little upon the passenger traffic. I believe in freight for making a line pay. Of course a railway develops the passenger traffic. Take the railway from Molong to Parkes, for instance. I do not suppose that less than twenty-five people a day travel on that line; but I have travelled the route by coach on many occasions, and been the only passenger.

1297. You could not expect any traffic from agricultural productions beyond Mossgiel? No; I have been told that that country is not very good.

1298. Would the railway increase the carrying capacity of land used for pastoral purposes? I could not tell you. Of course, there would be a large amount of traffic during the wool season, but I would not depend upon the pastoral traffic; still, all these things would help to make up a traffic.

1299. If this proposal had been submitted to you as a capitalist, and if it had been pointed out to you that if you undertook the construction of the line you would lose £40,000 a year by it, what would you have done? If I were a capitalist, and could see an opportunity of getting my money back in ten years' time, I would construct the line.

1300. But could you? I think so.

1301. Do you know what is the life of a mining field? I do not know what the average life of a mining field is, although I have seen a good many rise and fall.

1302. Do you know anything at all about Broken Hill? I have been there twice by way of Adelaide.

1303. Do you think that the soil and climate there are suitable for agriculture? I do not.

1304. Therefore, all the railway could rely upon would be the mineral resources of the place? Yes.

1305. If the place petered out in twenty-five years, would you risk losing £40,000 a year for ten years in the expectation of recouping it in the following ten or fifteen years? Yes; because I believe that the proposed extension will form part of a trans-continental line.

1306. Do you not think that in the event of there being a trans-continental line it would be taken to Port Darwin? Both routes have their advocates, but I think the line will reach Freemantle first. The Western Australian Government are building very rapidly in this direction, and I think that we shall have railway communication with Western Australia before we have communication with the northern territory. I do not think that the distance from Port Darwin and Freemantle to Colombo or the Red Sea would differ very much. The difference would be so small as to be scarcely worth speaking of.

1307. If the railway were taken to Port Darwin it would serve the northern territory, Queensland, South Australia, and Victoria, whereas a line to Freemantle would leave Queensland out? Yes; but this Colony is going to get the traffic, however the line goes.

1308. A national line would have to serve the whole of the Colonies? Certainly.

1309. The question we have to consider is, whether New South Wales can afford to risk the loss of £40,000 a year in order that the national line may be constructed;—you think that the construction of this line through the agricultural district to which you have referred would be beneficial? Yes; it would induce a great deal of settlement, and that would mean revenue to the Colony.

1310. Do you think that the construction of the railway would result in larger areas being put under cultivation? I think so. I know that if the railway were constructed a great many people would look for land in that direction.

1311. Where would they have a market? They would have to come to the metropolis for a market.

1312. Could they compete successfully with the Adelaide people, who can land stuff here for 10s. a ton? Wheat can be grown and put on the railway trucks for 1s. a bushel, and they are doing it very little, if at all, in South Australia. The cost of carriage would not, I suppose, be more than 12s. a ton.

- E. G. Grant,
Esq.
25 Aug., 1896.
1313. Have you any idea of the rate of carriage from Parkes to Sydney? I suppose it would be about £3 or a little more a truck. It costs the South Australian people something to get their produce to the seaport, and then they have to pay a freight of 10s. a ton to get it to Sydney.
1314. I have seen it landed for 1s. a ton? I am speaking of the present rates.
1315. *Mr. Wright.*] Two shillings and sixpence a ton to Newcastle and 5s. a ton to Sydney are the general rates? The rate for flour is 10s. a ton. I am interested in produce business in Sydney at the present time, and I know that is the rate which has been paid.
1316. *Mr. Hassall.*] Have you any idea as to what area of land is under cultivation in the Condobolin, Euabalong, Hillston, and Mossgiel districts? There are about 14,000 acres of wheat this year in the Hillston and Gunbar district. I have been told, within the last three weeks, by a farmer at Gunbar, who has been gathering statistics for somebody or something, that that is the area under wheat there.
1317. Do you think that that area is likely to be increased under any circumstances? It is not likely to be increased, unless the district gets railway communication.
1318. What is the drawback? The expense of carting produce to the railway.
1319. Do not most of the farmers use their own teams? Yes; but their time is worth something. A great many of them go carrying during the season.
1320. In the slack time, could they not convey their own produce for less than 6d. a ton a mile? I do not think so. Besides, they have to take it while the roads are open. Many of them could not afford to hold it for any time.
1321. Are the roads very bad out there? I think that the road between Gunbar and Carrathool is the worst I ever saw.
1322. What is the soil like? It is a black, dirty-looking soil.
1323. Is it a chocolate colour? No; it is out of the chocolate district. You have to go through a stretch of very bad country before you get to Carrathool. From Hillston to Cudgellico you have fairly good country right through; but there is no good country between Carrathool and south of Gunbar.
1324. The land you speak of is not suitable for agriculture? No; it is totally unfitted for it.
1325. Where does the agricultural land lie? It commences south of Gunbar and goes on to the Lachlan. There is some agricultural land along the Willandra Creek and up at Roto. The land as far as Mossgiel is fairly good; but most of the good land is south of the river. Coming in towards Cootamundra and Temora the land is good again.
1326. Is it not good land about Booligal? I would not call the land there good.
1327. Do you know what the rainfall of the district is? The average rainfall in the Hillston district for the last ten years has been about 17 inches, and about 19 inches at Lake Cudgellico.
1328. Is this rainfall sufficient for agriculture? Yes; in the Valley of San Joaquin in California, the average rainfall is 11 inches.
1329. *Mr. Roberts.*] Have you travelled from Sydney to Broken Hill through New South Wales? No.
1330. How far have you been west? To Mossgiel.
1331. You are perfectly familiar with the character of the country all the way from Parkes to Mossgiel? Yes.
1332. Do you approve of the suggested deviation shown on the map, *via* Cudgellico and Hillston? That is the way I would take the railway.
1333. Would you prefer that route to the Euabalong and Mossgiel route? Yes; you miss the agricultural land if you go along the north side of the river.
1334. Am I to understand that the land from Condobolin to Mossgiel and on to Hillston is good land? Yes; on the south side of the river. On the north side of the river there are some good lands on Roto station; but that is all. I would not call that part of the district by any means a good agricultural district.
1335. Have you ever been to Mount Hope? No.
1336. Do you think it would be a safe thing to construct a railway to Mossgiel? If I could not take a line on to Broken Hill, I would not take it further west than Condobolin. I am a great believer in a through line to bring traffic. I have never seen a through line that has not developed traffic; but I have never seen a branch line pay.
1337. Is it not a fact that the only traffic we could expect to get from Broken Hill would be with the sulphide ores? I understand so, and I understand further that it would not pay to bring those ores to Sydney by rail.
1338. In view of that fact, what would you think of a proposal to make the line terminate at Mossgiel? I would not regard it with favour.
1339. But such a line would go through all the good country that you speak of;—what would be the use of carrying the railway further on? I have always found that a railway develops traffic from some place or another. One never knows where the traffic comes from; but still it comes.
1340. Do you think that a railway could be extended to Hillston without any loss to the State? It would be better to take the line to Hillston than to take it to Mossgiel. An extension to Mossgiel would draw very little traffic.
1341. Hillston would be the centre of a large agricultural district? Yes; or rather the end of it.
1342. After leaving Condobolin, do you not come on to some flooded country? It is flooded country more or less all along the river to Euabalong. There are some nice high patches; but generally it is what I would call a flooded country.
1343. What about the country between Condobolin and Hillston? It is only liable to be flooded near the river. A little way back it is not flooded.
1344. Is any settlement likely to take place between Mossgiel and Menindie? I do not know.
1345. *Mr. Black.*] Do I understand you to say that you only approve of the construction of railways which run right through from one point to another? The construction of such a line is often an inducement to through traffic.
1346. You appear to think that, no matter how much a railway to Hillston would increase settlement, it should not be constructed unless it can be taken right on to Broken Hill;—that seems a peculiar position for one who is interested in farming? I said that if I had capital to invest I did not think I would go beyond Condobolin. If the line were to be extended beyond Condobolin I would not go further than Hillston.

1347. Despite the agricultural possibilities of the district, you do not think it would be advisable to carry the line beyond Hillston? I should not do so if I were constructing the line to develop traffic. Of course the State can develop traffic better than a private individual, and I daresay that in a few years a line to Hillston would pay.

E. G. Grant,
Esq.
25 Aug., 1896.

1348. You favour the construction of a line to Broken Hill because it would bring New South Wales into more direct communication with Adelaide;—are you aware that it would make very little difference in the distance between the two places? I do not know what saving it would make, but I assume that it would make a saving.

1349. Do you not think that a better direct route could be obtained by making a connection between Hay and Morgan? That would be a better through route.

1350. Would it pass through better country? No.

1351. Do you not think that the country from Hay to Wentworth is better than that between Mossgiel and Menindie? I do not know the country at all. I have been as far as Balranald from Hay, and there my knowledge of it ends. There is no country between Hay and Balranald which is as good as the country between Cudgellico and Hillston.

1352. *Mr. Humphery.*] How many bushels to the acre do you allow for when you say that wheat could be placed upon the railway for 1s. a bushel? They could grow 20 bushels to the acre in the Hillston district. They have a higher average yield about Wellington and Dubbo.

1353. What would be the probable route of a line from Freemantle? It would pass through Broken Hill.

1354. Would it not touch the coast of South Australia? No; it would not go through Adelaide.

1355. Would it not be shorter? No; I think it would be nearer to come through Broken Hill. Trains would branch off the main line to Adelaide and Melbourne.

1356. *Mr. O'Connor.*] You were for many years in America? Yes.

1357. There they construct railways in order to create traffic? Yes.

1358. Do you remember the great enterprise of Bishop Ireland, who took up a desert and made a railway through it? No.

1359. At any rate, it has been the policy of America to make railways to develop the country, and they have paid largely? Yes.

1360. You are of opinion that if the railway were extended to Hillston the population of the district would be considerably increased? Yes.

1361. Because of the facilities offered by the railway? Yes.

1362. If you were a Minister of the Crown, with your present intelligence and experience to guide you, would you sanction the extension of this railway? I say unhesitatingly that I would, and I would make what we call a light railway. I have no sympathy with the heavy expensive lines that have hitherto been made. I was brought up in the English railway service, and still take a great interest in the railway systems of the different colonies. I have always been of opinion that we spend too much in constructing a railway. I believe first of all in letting the railway develop the country, and then in letting the country develop the railway.

1363. No matter how good the yield, or what the industry of the people, profits cannot be very great if roads are bad and carriage high? That is so.

1364. As a matter of economy, a light railway would be less expensive to the State than continuous road-making? Yes.

1365. *Mr. Trickett.*] How does the climate of this colony compare with the climate of places in America in which they grow wheat? Of course, the climate of the Eastern States of America is quite different from the climate of the Western States; but in the Sacramento and San Joaquin valleys the temperature is higher than in the wheat-growing districts of South Australia, and the temperature of the South Australian wheat-growing districts is higher than the temperature of Hillston.

1366. Is the rainfall in America pretty regular? They have no rain in California from April until October.

1367. The rainfall about Wilcannia is very uncertain, according to the evidence of the local post and telegraph master;—you may have three or four bad seasons in succession;—how would that affect a wheat crop? Wilcannia is 200 miles west of the district of which I am speaking. I do not know the Darling district below Bourke.

1368. In America they give the land for nothing? The Government will grant a man 160 acres for nothing, with the right to pre-empt another 160 acres. That facilitates settlement and enables the land to be taken up in small holdings. Here the trouble has been that people have taken up too much land. In America you can buy land from the railway companies for about 2½ dollars an acre.

1369. The railways there are built on the land-grant system? Yes; the Government take the odd blocks in each township, and the railway companies the even blocks.

1370. Does the population go right out to distant places at once, or do intermediate places become settled first? The population keeps drifting out along the line pretty quickly.

1371. Do they go in for irrigation in America? Only in the western district.

1372. Can the wheat crops be grown by irrigation? I do not think you could make much of a wheat crop by means of irrigation any more than you could grow potatoes that way.

1373. But you want a regular rainfall for wheat? Yes.

1374. *Chairman.*] What do you regard as the better land between Condobolin and Hillston—that on the north or that on the south side of the Lachlan? That on the south side of the Lachlan.

1375. What area of wheat-growing land would the construction of a railway to Hillston render accessible? I know of over 1,000,000 acres of wheat land there; but I do not know how much of that would be available.

William Henry John Slec, Esq., F.G.S., Chief Inspector of Mines and Superintendent of Diamond Drills, Department of Mines, sworn, and examined:—

1376. *Mr. Lee.*] You have had very extensive experience in the Mines Department? Yes; twenty years.

1377. Your duties have required you to travel all over the Colony, including the western districts? Yes; I have had a good deal of experience in the western districts.

1378. I presume that you know the location of all the mining centres there? Yes.

1379. Do you know the route of the proposed line? Yes.

W. H. J.
Slec, Esq.,
F.G.S.
25 Aug., 1896.

W. H. J.
Sloce, Esq.,
F.G.S.
25 Aug., 1896.

1380. What mining centres would there be within easy reach of that line? There is a little gold-mining done within about 30 miles of Condobolin. Then, until you get to Mount Hope, the country is pastoral country. From Mount Hope to Broken Hill there is no mining. I have prepared a short statement which I would like to read to the Committee:—

Having a thorough knowledge of the country between Condobolin *via* Menindie to Broken Hill, I beg to state that the said tract of country may be generally termed as pastoral. In my opinion agriculture, without irrigation, is not likely to be successfully carried on in that part of New South Wales.

Re Mining.

After the railway passes the district of Mount Hope, it would again merge into essentially pastoral country where there would be very little probability of any extensive mineral discoveries; hence the prospects of the payable nature of the railway would depend entirely on the pastoral interest. But I have no doubt that the railway would stimulate the mining industry in the Mount Hope district, and that a larger quantity of metal would be produced, and in consequence an increase of population would take place.

1381. Do you know how far the route of the proposed line is from Mount Hope? No.

1382. Which way do you go when you visit Mount Hope? In the olden times I have frequently gone from Forbes through Condobolin and Euabalong to Mount Hope, and from there on to Cobar. I have gone to Mount Hope many times, and by many routes.

1383. Is the statement that the country between the route of the proposed line and Mount Hope is sandy in character correct? Yes; the soil is mostly sandy.

1384. Are not the ores obtained at Mount Hope of a low grade? They have been.

1385. It would be impossible to cart those ores 20 miles to a railway? They have been carted all the way to Condobolin and Forbes. The ore itself would not be carted. They would have to take out the metal on the spot. It would never pay to cart the ore.

1386. Are there not some gold-mines in the district? Yes, at Mount Allen, which is about 12 miles from Mount Hope.

1387. Those mines could not be profitably worked if the ore had to be carted a long distance to the railway? No.

1388. Are you of opinion that if the line were diverted to Mount Hope much traffic would result? I think it would be better to take the line close to Mount Hope.

1389. Because of the large quantity of low grade ore which would then be sent to the nearest coal-mines to be treated? I do not think it would pay to take the ore to Lithgow; but the construction of a railway would induce the mining company to erect better furnaces, and they would thus be able to get their copper away at a cheaper rate. I do not think you can ever depend upon having the ores to take away.

1390. You do not think that either gold or copper ore would be sent away if the line were taken near to Mount Hope? No; except a little as samples.

1391. But it is probable that better treating appliances would be erected on the spot? Yes; and that would mean an increased population.

1392. Do you think that the copper-mines at Mount Hope would yield much traffic to the railway? Not unless the railway stimulated them to some extent.

1393. Are the mines rich enough to admit of a sufficient output to make the line pay? I do not think that the output would exceed 100 or 150 tons a week, even if there were a railway, and the mines which are now idle were working.

1394. One of the difficulties which the people there have to contend with is the absence of water? Yes.

1395. The construction of a railway would not overcome that difficulty? No.

1396. Mining in that district must always suffer more or less from the want of an ample supply of water? Yes, always.

1397. Do you think that the mineral resources of the district are sufficient to justify the Government in extending the railway there? No; I should say not. I do not think that the line would pay; but on a national basis, I think it should be constructed.

1398. You do not see a prospect of sufficient traffic to pay interest and working expenses? No.

1399. If the line is to be taken from Condobolin to Menindie it should, in your opinion, go nearer to Mount Hope? Yes.

1400. Because it would thus obtain a certain amount of traffic? Yes.

1401. You are aware that the construction of the Cobar line has considerably developed the mines there? Yes; but those mines were working long before the opening of the railway.

1402. They are working now very profitably? Yes.

1403. I presume that the railway has had something to do with their success? It has had a great deal to do with it.

1404. What would be the relative distance from Cobar to Lithgow and from Mount Hope to Lithgow? I do not know; but I think that Cobar would be nearer to Lithgow than Mount Hope would be.

1405. It is the metal that is sent away from Cobar, not the ore? They are now sending ore to Lithgow to be smelted.

1406. Do you think that they could do that profitably at Mount Hope? It would not pay for the Mount Hope mines to erect such large works as they have at Cobar. The Cobar deposit is a very large one—the largest we have in Australia, whereas the Mount Hope deposit occurs in horizontal patches. At Mount Hope they have never had the formation of a real lode, while at Cobar they have had it from the surface downwards.

1407. Do you think there is any large area of unexplored mineral country in the Mount Hope district? I do not think so.

1408. The probability of an extensive development there is not very great? I do not think that we shall have any extensive field there. There may be small patches.

1409. The moment you get past Mount Hope there is nothing until you get to Broken Hill? No. In 1881-82 I was Gold Commissioner at Mount Brown, and I frequently had occasion to go through all that back country.

1410. Would you care to express an opinion as to the permanency of the lodes at Broken Hill? I have no doubt whatever that the lodes there are permanent.

1411. Do you think that they will furnish large quantities of sulphide ores for many years to come? I think that they will last for the next fifty years, provided the problem how to properly treat sulphides is solved; and we are fairly on the road to that solution.

1412. They are bound to discover the proper means of treating these ores sooner or later? Yes; and there are large numbers of mines which have very small deposits, and under the present system will not pay, but which, a few years hence, may pay.

W. H. J.
Slee, Esq.,
F.G.S.

25 Aug., 1896.

1413. Is there not a movement on foot to treat these ores in the vicinity of Newcastle and Illawarra? Yes; but it is to the interest of the South Australian people to have them treated in that Colony.
1414. What prospect do you think the proposed line would have of carrying any of the ore from Broken Hill? I am afraid that the railway could not compete with the water-carriage.
1415. The ores are low-grade, difficult of treatment, and consequently will not stand very heavy rates of carriage? They will only stand a very small freight.
1416. The rates prevailing by way of Port Pirie are so much lower than the contemplated railway rates that you are of opinion that the railway will not get any freight of this character? That is so. I have been given to understand by those who are supposed to know that in time the ore from Broken Hill will be landed at our ports for £1 a ton. The railway could not compete with a rate like that. No doubt a railway would create a good deal of through traffic from Broken Hill.
1417. Passenger traffic, and possibly goods traffic, but not low-grade ores? Yes.
1418. Do you know of any class of traffic which might be developed by the construction of the line? Nothing, except the passenger traffic and pastoral traffic.
1419. You do not think that the railway would develop any new industry or increase production? It would settle population along the line here and there, but nothing very much for years to come.
1420. You think the project somewhat premature? I think that as a national work the line should be made; but as a payable line the proposal is premature.
1421. In the event of the Broken Hill mines depreciating from any cause, what would become of the population of Broken Hill? My opinion is that the population of Broken Hill is not likely to get below 10,000 for many years to come.
1422. Do you think that there is any prospect of its increasing? It will increase if the sulphide lodes can be properly treated. There will be no agriculture there.
1423. If the ores are taken for treatment to some other place, less coke and coal will be sent to Broken Hill, and the shutting up of the furnaces will mean the reduction of population? The number of smelters will be reduced, but the number of miners will be increased. Still they would always have to have smelters there of some kind.
1424. And you think that the resources of the place are ample to maintain the town in its present state of prosperity? I think so.
1425. Have there been any fresh discoveries in Broken Hill of late years? No; at one time it was thought that precious stones had been found there—rubies; but they turned out not to be rubies.
1426. What are the geological expectations of the place? The geological features of the district are such that we ought to have got gold and copper there, as well as silver.
1427. There is still a possibility of getting those metals? There is a great probability, but so far they have not been found in payable quantities.
1428. The great difficulty of water storage has been overcome? Yes.
1429. Unfortunately the district is a little too remote from Sydney? It is too close to the borders of South Australia. As a national work, I think the railway should be made.
1430. If there is no prospect of the line paying while the population of Broken Hill is at its greatest, what will be the prospect in years to come? Small communities will settle along the line, and perhaps agriculture will be tried, though I do not think it will ever be successful. They have agriculture now at Nymagee; but there is a failure of the crops every two or three seasons out of four.
1431. Do you think that the construction of the railway would cause ore to be sent to Menindie to be treated? If the railway had been taken to Menindie in 1833, I believe it would have paid over and over again, because then the smelting would have been done on the Darling. I was at Broken Hill with Mr. Wilkinson about that time, and we recommended the construction of such a line.
1432. But a change has taken place by reason of the construction of the Silverton tramway? Yes; and furnaces have been built in South Australia.
1433. It is almost impossible for us to recapture that trade now? We might gradually get some of it back.
1434. But it is more likely to go down to the coast and then come round by ship? Yes. I do not think one could come to any different opinion who had travelled round to Broken Hill by way of Melbourne and Adelaide and back through New South Wales. The Broken Hill traffic must always go through South Australia.
1435. A railway to Broken Hill must not expect to get any of the mineral traffic? No.
1436. Though it might get some passenger and goods traffic, and might develop small settlements along the route? Yes; if we could control our rainfall, agriculture could be undertaken out there; but, as we cannot, agriculture will not be successful.
1437. You say, emphatically, that if a line is taken from Condobolin to Menindie, it ought to go near Mount Hope, because it would then be sure to get a certain amount of traffic? Yes.
1438. Have you anything to do with the Water Supply Department? I used to have to do with artesian boring.
1439. Can you tell the Committee what prospect there is of getting water along the route of the proposed line? It is out of the question to expect to get artesian water, but you would get stock water at a depth of 200 or 300 feet; that is, rain-water which has gradually percolated through the softer parts of the surface.
1440. In sufficient quantities to supply the railway locomotives and meet with the requirements of the railway generally? The water I speak of would be no good for the engines; it is brackish, and full of magnesia.
1441. And the only water we could depend upon would be water stored in tanks? Yes; except on the Lachlan and the Darling.
1442. From Mossgiel to the Darling would be a very long stretch? Yes; from Mossgiel to Menindie you would have to depend upon tanks.
1443. *Mr. Fegan.*] What number of men are there working in connection with mining between Condobolin and Mount Hope? In the Mount Hope district, taking in Mount Allen and Gilgunnia, there are about 1,200 men.
1444. Where do they get their stores from? The Mount Hope people go principally to Forbes and Parkes for their stores.
1445. Those stores come from Sydney? Yes; as soon as the railway is extended to Condobolin the people will go there.
1446. Do they send their ore to Sydney? No; they crush it on the spot.

- W. H. J. Sloc, Esq., F.G.S.
25 Aug., 1896.
1447. I suppose you have great hope of developing Mount Hope? The construction of a railway there would stimulate the place. They have only "pig-rooted" there so far.
1448. Do you expect much from those mines? I do not expect as much from them as from the Cobar mines.
1449. What is the chief production of the Mount Hope mines? Copper. From the Mount Allan mines they get gold.
1450. Any silver? No.
1451. Do you know the route to Wilcannia? Yes; I have been there frequently.
1452. Do you think that a line *via* Wilcannia would be better than the proposed line? I think the Cobar route would be the best.
1453. Do you know the road from Menindie to Broken Hill? Yes; I have been over it frequently.
1454. I suppose that at the present time the people of Broken Hill get their supplies from South Australia? Nearly all of them.
1455. Is there any possibility of the land between Menindie and Broken Hill producing sufficient to supply the wants of the people of Broken Hill? Not without irrigation. The land is very sandy and poor.
1456. What amount of ore was taken from Mount Hope last year, have you any idea? No. I think the output of copper would be about 25 tons a month, but that would be the outside.
1457. If the railway is taken to Condobolin, will the Mount Hope people continue to go to Nyngan? No; because Condobolin will be nearer.
1458. What is the distance from Condobolin to Mount Hope? I think it is 80 or 90 miles.
1459. What is the population of Mount Hope? At present about 300.
1460. There is no possibility of a line to Mount Hope paying? I do not think so.
1461. You think that as a connection between Broken Hill and Sydney the proposed line should be constructed? Yes.
1462. At the present time that town has to do business with another Colony? Yes; and if you want to get from the metropolis to Broken Hill you have to go through two colonies. It takes three nights and three days to get to Broken Hill from Sydney.
1463. A portion of the land through which the line would go is good agricultural land? There is some good agricultural land on the south side of the Lachlan as far as Mossgiel; but there is very little agricultural land on to Menindie.
1464. I understand that there is fair land from Condobolin to Mossgiel, but that from there to Broken Hill the land should only be used for pastoral purposes? Yes.
1465. Is it good pastoral land? Only fairly good. It carries a sheep to every 10 or 12 acres. At Mount Brown it requires as much as 14 acres to feed a sheep.
1466. Is there any water between Menindie and Broken Hill? No; water could only be obtained by sinking.
1467. *Mr. Hassall.*] Have you made any examination of the country between Mount Hope and Cobar? Yes.
1468. What is your opinion of that country? A small deposit of copper may be found there; but I do not think any large discoveries will be made, because the district has been so much overrun by prospectors.
1469. Is it mineral country? Yes; right through. There are small deposits of copper and gold there, but hitherto they have not been found payable.
1470. What is the probable life of the Mount Hope field? The Mount Hope field is quite different from the Cobar field. The Cobar mine goes down on a lode formation, with a proper underlay; but at Mount Hope the ores are in horizontal beds, and they have never been tried at any great depth. The mines have been worked by tributors, and so far, to use a vulgar phrase, the place has only been "pig-rooted."
1471. Is there any prospect of minerals being discovered between Mount Hope and Menindie? For 20 or 30 miles from Mount Hope the country looks metalliferous, but after that nothing can be seen.
1472. Has it been prospected? To some extent; but it is very difficult country to prospect, because it is very scrubby, and there is no water.
1473. The whole of it is practically given up to pastoral occupation? Yes; and a miner cannot go out there unless he is able to get a paddock for his horse, and so on. The difficulties of prospecting are greater there than in the more settled districts.
1474. You do not expect any great discoveries there? Nothing very extensive as at Cobar or Nymagee.
1475. Do you think that fresh discoveries are likely to be made in the Broken Hill district? I believe that some of the Broken Hill lodes away from Broken Hill itself have not been properly prospected. There is a very large extent of country there.
1476. Can you tell the Committee how much? All the country between Mount Browne and Broken Hill is metalliferous. Going from Milparinka to Wilcannia, and about 60 miles from Wilcannia, you pass through our opal fields. The whole of that country is cretaceous, and it is likely that sooner or later it will be found to contain large deposits of opal, like those at White Cliff, where some of the best opals in the world have been discovered. That country extends right into South Australia.
1477. You think that the mineral deposits there are likely to be found of a rich and permanent character? Yes; the country of which I speak lies beyond Broken Hill. The shortest route from places like Milparinka would be to Bourke.
1478. Do you think that it would pay to construct the proposed line? No. Its construction might stimulate settlement; but I do not think for one moment that the railway would pay, either at the present time, or for years to come.
1479. Do you think that it would encourage and assist mineral development? It might create small settlements, and the people might prospect near those settlements, but agriculture would never flourish out there. At Mount Browne we had only 1½ inch of rain in ten months, and they were obliged to send out camels from South Australia to relieve us. At Wilcannia, the average rainfall for years was only 8 inches.

WEDNESDAY, 26 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
 The Hon. CHARLES JAMES ROBERTS, C.M.G.
 The Hon. WILLIAM JOSEPH TRICKETT.
 The Hon. DANIEL O'CONNOR.
 HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
 JOHN LIONEL FEGAN, Esq.
 THOMAS HENRY HASSALL, Esq.
 GEORGE BLACK, Esq.
 FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

William Briggs, Esq., Chairman, Lithgow Coal Association, sworn, and examined:—

1480. *Mr. Wright.*] Have you any knowledge of the proposal before the Committee? Only from what I have seen in the newspapers. W. Briggs,
Esq.
1481. Have you been over the country which the proposed railway would traverse? No.
1482. If the railway is made is coal likely to be sent from Lithgow to Broken Hill, or are minerals likely to be brought from Broken Hill to Lithgow? I think that the Darling would stop the traffic very much. 26 Aug., 1896.
1483. According to the railway authorities the cost of transit from Broken Hill to Sydney by rail would be much higher than the present cost by sea. We further heard from the Commissioners that coal could be taken from Newcastle to Broken Hill by sea, and ore brought from Broken Hill to Newcastle by sea more cheaply than this transit could be accomplished by railway? Well, I have heard that the railway authorities have offered to carry coal for $\frac{1}{2}$ d. They do it in America for $\frac{3}{4}$ d.
1484. The distance from Lithgow to Broken Hill is about 700 miles; would you be likely to send coal across to Broken Hill by railway? I think so.
1485. Is the coal obtained at Lithgow suitable for smelting purposes? Yes, very.
1486. Is it comparatively free from sulphur? Fairly so. We make very good coke.
1487. I presume you know that for smelting purposes it is necessary to have the coal as free from sulphur as possible? Well, arrangements are now being carried out for establishing large smelting works at Lithgow.
1488. Are these works being established by people interested in the mines there? No; they are being established by Dr. Reade, of Singleton, and his party.
1489. The present contributories of the Cobar mine? I think they are. They intend to spend a large amount of money at Lithgow.
1490. It takes from $3\frac{1}{2}$ to 4 tons of coal to smelt 1 ton of ore, so that it is cheaper to bring the ore to the coal than to take the coal to the ore? Yes.
1491. Can you furnish us with an analysis of the Lithgow coal? I will supply you with it.
1492. What proportion of ash, or other deleterious matter, does your coke contain? I would rather not answer that question from memory. I will supply the Committee with the information.
1493. You are under the impression that if the railway is made it is possible that a certain portion of the Broken Hill traffic will come to Lithgow? There is every prospect of it, though, of course, the distance is great.
1494. Notwithstanding the great amount of haulage, you think that the Commissioners might be induced to carry ores from Broken Hill at a rate which will enable them to be smelted at Lithgow? Yes; they have offered to make us some very large concessions. We have been trying to advance our business out towards Bourke and Cobar, where they have such primitive ideas as to prefer wood to coal. The Commissioners have met us very fairly.
1495. What do they charge you between Lithgow and Bourke? A mileage rate—1d. per mile is the ordinary rate. South they give us a uniform rate of 6s., though the ordinary rate would come to 7s. 6d.
1496. A rate of 1d. a ton a mile would prohibit any traffic between Lithgow and Broken Hill? We have tried to show the Commissioners that whereas they charge a lower rate for the carriage of wood they are put to more expense, because of the greater cost of handling the wood; but their reply is that there is much more business done with wood than there would be with coal. I think we could very well make coke for 15s. or 18s. a ton, and the freight, I imagine, would be about 16s. 8d. a ton to Broken Hill, so that we could deliver our coke there for about 32s. a ton, whereas the people of Broken Hill now pay £3 a ton for English coke delivered.
1497. Have you any idea what the Newcastle coke costs them? I forget what the price of Newcastle coke is.
1498. Is it higher or lower than the price you have named? No one sells coke for the price I have named; but that is the price at which we could sell it if there were a demand for large quantities.
1499. *Mr. Fegan.*] You represent the associated coal-mine owners of Lithgow? Yes; I am Chairman of the seven collieries there.
1500. How many tons a year do you raise? About 200,000 tons, or something like that.
1501. How much coke do you burn up there? Only one colliery there is making coke at the present time—the Vale Colliery. We really have no outlet for coke now.
1502. What is the reason that there is not much of a demand for coke? Some years ago we erected large furnaces for the burning of coke at the Vale of Olwydd Colliery, but the expenses and the freight were so great that we could not compete against the foreign coke. They could put in German coke cheaper than we could supply our coke.
1503. Can they do that now? Well, if the Commissioners came down with the freight and met us, we would do it as cheaply as they can, and beat them.
1504. Coke is made out of the small coal, is it not? It all depends. To make the best coke you have to wash the coal.
1505. The small coal is got comparatively cheaply compared with the large coal—you pay the men so much a ton for the large coal, while the small coal falls through and is not reckoned? Yes; but we cannot get as good a price for the small coal as we get for the large coal. We sell it at 2s. 6d. a ton.

1506.

- W. Briggs, Esq.
26 Aug., 1896.
1506. But the small coal is the coal mostly used in making coke—you have not to crush much large coal? You could not get enough small coal to do anything with it.
1507. How many tons of coke do you make in the year? We do not make any now. We have left off making coke for many years.
1508. The £1 a ton duty which was placed upon coke was not sufficient to enable you to make it profitably? No. You must remember that at that time the demand for coke was very small. It is very expensive to make coke, and the manufacture will not pay unless there is a large demand.
1509. The duty of £1 a ton which was placed upon coke did not help your firm to make it? No; the only colliery at Lithgow making coke is the Vale. Mr. Chapman is making coke.
1510. He has a colliery up north? Yes; at Seaham. He represents the New Zealand Assets Company.
1511. That Company have the Lithgow Colliery and the Seaham Colliery? Yes.
1512. Is it not a fact that the coke manufactured at Lithgow was inferior both to the Newcastle coke and the imported coke? I am not aware. Our colliery has not made coke for some years, and therefore I cannot speak positively about the matter.
1513. Would you be surprised to hear it said? I would not be very surprised. The making of coke was a new industry when we took it up, and I do not think we had fair play. We never had a large demand.
1514. How much a ton are you getting for your coal at the present time? Different prices. It all depends upon where it goes. The price for coal going out west is different from the price of coal going south. We "put in" coal going south very cheaply, because there is so much competition.
1515. You will be surprised to hear that English or German coke can be supplied at Broken Hill for £2 a ton? Yes.
1516. You would not be able to supply coke for that price? We could supply it at about 32s. a ton, if we could get it over to Broken Hill for 16s. 8d. a ton.
1517. Do you know Mr. Wilton, colliery proprietor at Lithgow? Yes, very well.
1518. In giving evidence in regard to the Cobar to Cockburn line, he said, with reference to the Lithgow coke, "I understand it does not bear comparison with either the English coke, or the coke made at Newcastle. It requires a special treatment." Do you hold with that? No; and I do not know how he arrived at his conclusion. Neither he nor I have ever tested the matter practically. He has a pottery which uses up all his small coal.
1519. You could not afford to pay a penny a ton for the conveyance of coal to Broken Hill? No.
1520. What is the capacity of the smelting works which are being erected at Lithgow. They have not been erected yet, but I believe that they are going to be very extensive.
1521. Dr. Reade has a coal-mine at Singleton? Yes. He was anxious to come to Lithgow, I believe, because of the quality of the coal there. We made him some overtures, but they did not suit him, and he has now established himself at Eskbank.
1522. Is the coal you get at Lithgow as good as the coal in the Illawarra and Newcastle districts? It is altogether a different kind of coal. There is no gas in it, and it is harder. Mr. Eddy speaks very highly of it for steaming purposes, though I think the Metropolitan surpasses it a little. Still he is perfectly satisfied with it.
1523. Is it not on account of the price that he is satisfied with it? Long before he had it at that price he was satisfied with it.
1524. Was there no other reason for his satisfaction? He tested it to see if he could use it for a quick service.
1525. Is not Lithgow coal preferred because there is not the same probability of a strike occurring up there that there is in other places? No.
1526. You would be surprised if you heard that that has been said? You must bear in mind that I am acquainted with the contracts which have been made with the Government for years past, long before there was any trouble, or before the Metropolitan mine was working, and since. I imagine that you are referring to the contract which we have taken for the Eveleigh coal.
1527. Yes; your price was very much lower than that at which any other colliery could supply it? Well, the price pays us.
1528. Supposing the Government were unable to carry coke to Broken Hill for $\frac{1}{2}$ d. per ton per mile? Well, we could sell the coke at 18s. a ton at the pit's mouth, so you can easily find out whether we could supply coke to Broken Hill if $\frac{1}{2}$ d. a mile freight was charged by the Commissioners. It would all depend upon what the foreign coke was delivered for.
1529. Coke is much cheaper now than it was five years ago? Yes; though I have been informed that £3 a ton has been paid for it recently.
1530. *Mr. Roberts.*] Do you appear here as an advocate for the construction of the proposed line? No; I have nothing to do with it. I am not interested in it in any way.
1531. I think you came here with the idea that if the line were constructed you might be able to see your way as a commercial man to get a good return for any capital you might invest in sending the productions of your mines to Broken Hill? I think that I shall be under the ground before any return can be reaped from that traffic.
1532. Do you think that the proposed line would be of any service to your company? Well, the benefit is very remote.
1533. Have you given any consideration to the matter from that point of view? Yes; of course it is quite to be understood that if business places were established along the line, or at Broken Hill, so that trade came from there to us, we should benefit by the construction of the line.
1534. But you have no particular feeling in the matter? No; I do not suppose that it will concern me.
1535. *Mr. Trickett.*] I understand that some time ago they did not manufacture good coke in the Colony? I am not prepared to say that the indifferent quality of the coke caused us to discontinue; it was rather the smallness of the demand, combined with the high freight.
1536. Now that the demand is greater, coke is a payable commodity? There is a little more demand for coke, but the Vale of Clwydd mine has not gone in for it again.
1537. Does the company which is erecting smelting works at Lithgow intend to buy up ores and smelt them there? I am not prepared to say what they intend to do, because I have no connection with the company.

company. I only know that they came to us to get land, and that, our terms not suiting them, they arranged with Mr. Sandford, at Eskbank, who has told me that everything is completed, and that they are about to begin. I suppose that all they will do at present will be to treat the Cobar and Sunny Corner ore. 1533. They do not contemplate getting ore from so distant a part of the Colony as Broken Hill? I should think not.

W. Briggs,
Esq.
26 Aug., 1896.

William McIntyre, Esq., Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—
1539. *Chairman.*] Have you prepared a plan showing the location of population between Condobolin and Broken Hill, along the route of the proposed line? I have a plan showing the several electoral districts through which the proposed line would pass. I have also a short statement, which is as follows:—

W. McIntyre,
Esq.
26 Aug., 1896.

Electorate.	Electors.	Population.
The Lachlan	1,758	5,421
Wentworth	1,719	4,108
Sturt	1,785	5,232
Broken Hill	1,880	8,600
Alma	2,068	8,537
	9,210	31,798

Of the total population, over 22,000 are located to the west of the Darling River, leaving under 10,000 along the route from Condobolin to the Darling River. The principal centres of population are Euabalong, Cudgellico, Hillston, Mossgiel, and Menindie. The population in that part of the Colony is about three times the number of people upon the electoral rolls. There are, at least, two males to every female out there.

1540. *Mr. Regan.*] No part of the electorate of Wilcannia comes within the influence of the line? I have only taken the country within 50 miles on each side of the proposed route. The southern boundary of the Wilcannia electorate would be very close to the limit. The only populous centre along the route is Hillston. None of the other towns have a population of 500.

1541. Is Silverton included? Yes. I have gone right through to the South Australian border.

1542. *Chairman.*] The blue lines on the map show the subdivisions of the various electorates, and the figures show the number of electors within those boundaries? Yes.

1543. To find the actual population you have multiplied the number of names upon the rolls by three? No. The information as to the actual population in electoral divisions was obtained from the police.

1544. After leaving the Lachlan, until you get close to Broken Hill, there does not appear to be a population of more than 3,000 people contiguous to the line? I should not think that there would be more than 10,000 people altogether in the electorates I have named, between Condobolin and the Darling.

1545. Your figures embrace pretty well the whole of the population from the Lachlan to the Darling, coming down at the Darling to within approximately 40 miles of the Murray? Yes.

William Henry John Slee, Esq., F.G.S., Chief Inspector of Mines and Superintendent of Diamond Drills, Department of Mines, sworn, and further examined:—

1546. *Mr. Roberts.*] You know the country along the route of the proposed deviation to Hillston? Yes.
1547. Is that good agricultural country? None of it can be considered good agricultural country until you get near to Hillston.

W. H. J.
Slee, Esq.,
F.G.S.

1548. Which do you think would be the better route, *via* Euabalong or *via* Hillston? I should think it would be best to take the line *via* Mount Hope. An agricultural population settled at Hillston could supply the Mount Hope district.

26 Aug., 1896.

1549. Do you think that if the line were taken by way of Euabalong it would assist in the development of the Mount Hope mines? Yes.

1550. Do you look upon that field as a permanent one? I think that in the future it may be worked with more profit than at the present time. I have no doubt that a mining population will be settled there for many years to come.

1551. Is there a settled population there now? There has been a settled population of a few hundreds for some years past. The population of the whole district, including Gilgunnia and Mount Allen, is about 1,000.

1552. Have the mines been worked to any great depth? No; not below 300 feet.

1553. Are there any mineral deposits between Mount Hope and Menindie? No; 30 miles after leaving Mount Hope there are no mineral deposits.

1554. Do you not think that if the line, instead of being taken from Condobolin to Menindie, were taken to Wilcannia and thence to Broken Hill that would tend to the further development of the mineral resources of the district? My knowledge of the country along both routes leads me to prefer the Cobar line. Such a line would be more likely to pay than a line from Condobolin through Menindie.

1555. *Chairman.*] Do you mean for mineral purposes? For mineral purposes.

1556. *Mr. Roberts.*] What minerals would be likely to be discovered between Cobar and Wilcannia? Copper and gold.

1557. Any silver? Not much.

1558. How far from Broken Hill in any direction may further mineral developments be expected? Going out in the direction of Wilcannia the mineral country ceases within 25 miles of Broken Hill, because the cretaceous formation comes in there. The mineral country does not extend any great distance out towards Wilcannia or towards Cobar; but, out towards Milparinka, I think that sooner or later mines will be put down right through the district. The whole of that country is a cretaceous sea, and here and there are islands of Silurian rocks in which we get the precious minerals.

1559. What minerals are obtained at Milparinka and Mount Browne? Gold and a little opal have been found out there; but not in payable quantities. It is all alluvial gold on quartz reef.

- W. H. J. Slee, Esq., F.G.S.
26 Aug., 1896.
1560. Are the opals of any value? The White Cliff opals are, I believe, the best known, and those fields will be found to extend on towards Wilcannia.
1561. How far from Cobar towards Wilcannia is the district likely to undergo much mineral development? For not more than 50 or 60 miles. After that the alluvial country comes in.
1562. You think that Broken Hill should be reached by way of Wilcannia in preference to any other route? Yes; because I believe that a large population would come into Wilcannia from out Mount Browne way. Our opal-fields would feed to a certain extent from Wilcannia.
1563. There is more likely to be a further discovery of minerals close to Cobar than close to Mount Hope? To a large extent, yes.
1564. You look upon the Cobar country as being superior to the Mount Hope country? Yes; it is far superior, so far as minerals are concerned.
1565. You do not think that Mount Hope is of sufficient importance to warrant the construction of a railway there in preference to an extension from Cobar? I would not say that. I think that our mining industry should be encouraged everywhere. Of the two lines, I would prefer an extension from Cobar as the most likely to pay.
1566. Is any iron ore to be obtained out in this district? Iron ore is to be obtained near Mount Hope.
1567. Any coal? No.
1568. *Mr. Clarke.*] You said yesterday that you could not recommend the construction of the line on commercial grounds, but that you considered that on national grounds it might be advisable to construct it;—what do you mean by national grounds? To encourage the people living in these back countries who have to undergo a great deal of hardship and privation, and to enable them to get to civilisation at less cost.
1569. The population between Hillston and Menindie is very sparse? Yes, at the present time.
1570. I suppose that there are only a few sheep stations there? That is all. The construction of a railway would encourage the settlement of small communities, which would grow into larger communities.
1571. We have it in evidence that the construction of the railway would mean an annual loss of £40,000;—is not that a great deal? Yes. I would say, do not construct the line as a paying concern. But if the Government wish to open up the interior by the construction of light railways, being content to wait for a return, then I say, construct the line. I feel confident that, if the railway is constructed, there will be a great loss upon it for many years to come. On national grounds, however, I say that Sydney should be connected directly with South Australia. It is only on those grounds that I recommend the line.
1572. *Chairman.*] Cobar is infinitely superior to Mount Hope as a mining centre? Yes.
1573. Cobar is likely to become a permanent field;—you are doubtful about Mount Hope? Yes.
1574. Extending west from Cobar, you do not expect much development except in connection with opals? Yes.
1575. But north from Broken Hill to Wilcannia, you believe that there will be large mining developments, and that it would be wise to have a railway as close to those fields as possible? Yes.
1576. In your opinion there will be no great mining development in the country between Condobolin and Broken Hill? I do not think so.
1577. That is pretty well the case from a mining standpoint? Yes. I have been all through that country several times.

Alexander Bruce, Esq., Chief Inspector of Stock, Department of Mines, sworn, and examined:—

- A. Bruce, Esq.
26 Aug., 1896.
1578. *Mr. Hassall.*] Can you give us any information about the country between Condobolin and Broken Hill? I know the country partially; I am not thoroughly well acquainted with it.
1579. What is the principal form of land occupation there? The occupation between Condobolin and Broken Hill is pastoral occupation.
1580. What does the country carry—cattle or sheep? Sheep principally.
1581. Have you any idea what its carrying capacity is? A great deal of it is not very good, and some of it is only middling; perhaps you might class it as country which will carry a sheep to every 3 acres.
1582. Is much of the country covered with scrub? I am not able to say from my personal knowledge, but, speaking from hearsay, I know that there is a good deal of scrub in that district. I cannot say whether the scrub is exactly on the route of the proposed line.
1583. Is the district rabbit-infested? Yes.
1584. Thickly infested? In some parts. The lessees are getting pretty large reductions because of the rabbits.
1585. Until some steps are taken to do away with the rabbits, the number of cattle and sheep in the district is not likely to increase? No; but I understand that fencing has been erected, and that other means are being taken to get rid of the pest. We hope for something from the new legislation we expect.
1586. Does much stock come to Sydney from that district? Some of the stock comes to Sydney, but a good deal goes to Victoria, and some to South Australia. I have a map, the pink tinting upon which shows the area from which stock traffic would be drawn to the proposed line. The approximate number of stock within this area is:—

District	Horses.	Cattle.	Sheep
Wentworth	1,892	3,223	575,832
Balranald	1,179	1,922	294,841
Hillston	3,141	4,602	750,553
Condobolin	1,702	3,282	448,786
Ivanhoe	1,910	2,272	740,703
Menindie	3,903	6,466	928,836
Wilcannia	2,327	3,902	614,337
Total	16,054	25,660	4,353,888

Converting cattle into sheep, by counting ten sheep for each head of cattle, I estimate that the number of sheep to be removed from the district each year would be 768,429. About 150,000 of these would go to Broken Hill; 50,000 to Adelaide; 200,000 to Melbourne; and the balance, a little over 360,000, would come

come to Sydney. I have prepared a paper bearing upon the question of reduced railway rates on store and breeding stock, while being carried in the level outlying dry portions of the Colony, which, I think, might interest the Committee. It is as follows:—

A. Bruce,
Esq.
26 Aug., 1896.

Reduced railway rates on Store and Breeding Stock while being carried in the level outlying dry portions of the Colony.

It would be an inestimable boon to our stock owners in the western, north-western, and northern portions of the Colony, who have so frequently to struggle with dry seasons, and at times severe droughts, if the Railway Commissioners could see their way to lower the charge for the carriage of store and breeding stock, in the level portions of the Colony (say from Dubbo to Bourke, and Junee to Hay and Jerilderie), proportionately to the cost of haulage on those portions of the line mentioned, but not, of course, below a rate which would pay to carry on these portions. The portions referred to lie to the north and west of the blue line shown on the map which I have submitted.

I make this suggestion because I understand that on the level country, an engine can take at least twice the load that it can from Dubbo or Junee to Sydney, and because I believe that such a course would tend, before long, to greatly increase the railway traffic by leading owners in those portions of the Colony to send their store and breeding stock by rail, where they were able to reach the train, as it would be greatly to their advantage to adopt that course.

In order, the better to show what my suggestion is, I will suppose that 5,000 store sheep, purchased in the country to the west or north of Hay, have to be taken to the Young District to be fattened, and that they are trucked from Hay to Junee, from which, unless they are to go by rail at ordinary rates, the sheep would proceed to their destination on foot. In that case, if the rates charged by the Railway Commissioners were such as would induce the owners of the sheep to truck instead of travel, the following advantages would accrue to him:—

- (1.) There would be a great saving of time in getting the sheep to their destination; for while the journey on foot, extending to 167 miles, would, travelling at the regulation rate of 6 miles a day, take twenty-eight days, that by train, including time, trucking, and unloading, would not occupy more than one and a half day; and this is a very important advantage.
- (2.) The risk of actual loss of sheep on the journey would be much less by train than by the road. This would especially be the case in times of drought, for with low rates owners would not put off sending their sheep to the mountains, as they now frequently do, till they are actually starving, when they can get them carried at starving rates, but when they in many cases die by the way.
- (3.) But the principal benefit, so far as the owner is concerned, in trucking instead of travelling the sheep on foot, would arise from the saving of condition, and preventing deterioration of the fleece.

Now that the travelling stock reserves are almost all under lease (i.e., out of a total of some 8,000,000 acres contained in these reserves there are only about 500,000 acres reserved from lease, and 7,500,000 acres under lease), the waste and deterioration going on when stock are travelled is exceedingly heavy. Indeed, so serious is it that I believe it would in many cases, even in ordinary seasons, pay owners better (if they could only see it) to truck their stock where they can do so without going far out of their way, than to travel by road; for sheep travelled for twenty-eight or thirty days by a road on which there is little or no feed, would, if they were in no more than fair store condition when they started, be "dog" poor when they reached their destination, and would take perhaps three months after they did so to get into as good condition as they were in when they started, thereby losing all that time, and perhaps missing the best time of the year for fattening. It is one thing to get the sheep home in poor condition, and quite another for them to arrive in good condition; and when in addition to this the deterioration of the fleece through starvation and dust, and by burrs and other noxious weeds picked up by the way, is taken into account, it will be seen that it would, as I have said frequently, pay the owner better to truck even at the ordinary rates than to travel his sheep by road.

While this is the case, as there was at one time sufficient pasture by the way, travelling stock did not suffer as they now do; and as their owners have been accustomed to take their store and breeding stock by road, they would not at first be inclined to send them by rail and pay cash, for which they do not see an immediate return. They would, therefore, look upon the freight as an extra expense, and it is, I think, necessary that some inducement such as I have suggested should be held out to lead them to truck, instead of travelling, their sheep on foot to their destination. (See statement contrasting traffic by road and rail, appended to this paper.)

I need scarcely point out that if this suggestion, or any modification of it, were considered practicable, and acted on it would bring a very large addition to the railway traffic. How much that would be is hard to say, but, to give some criterion of the increase which the trucking of store and breeding stock would make to this branch of the traffic, I submit the following statement of the stock traffic in 1895, as reported by the Inspectors of Stock, and make an attempt at an estimate (which, no doubt, is a very uncertain one) of the additional stock which would, under such a system, be likely to be trucked instead of travelled,

Tentative Estimate of increase of Railway Sheep Traffic if suggestion were acted on.	
Stock Traffic for the whole Colony, as reported by the Inspectors of Stock for 1895	24,000,000
<i>Less</i>	
Say, one-half for same lot of sheep having been reported by more than one inspector	12,000,000
Sheep which cannot reach the train	3,000,000
Sheep which leave Colony on foot	1,000,000
Sheep which are now carried by rail	4,000,000
	20,000,000
Possible increase of trucking	4,000,000

According, therefore, to this tentative estimate, there are 4,000,000 sheep in the Colony not now put on the train to be moved from one place to another, which might, if their owners chose, be conveyed in that way to their destination; and if this estimate is at all near the mark, the portion of that number which would be in the country to which it is suggested the reduction of freight should apply, might, it is thought, be put at one-half (say) 2,000,000, plus the Queensland traffic, 1,000,000.

The Inspectors' reports show that during 1895 the largest stock (cattle) traffic amounted to (say) 1,300,000, and, estimating one head of large stock as equal to ten sheep, that would make the large stock equal to (say) 13,000,000 sheep, and that, again, taken in the same proportion as estimated above, would make 1,275,000 sheep to be added to the 3,000,000 there shown, and making a total traffic equal to 4,275,000 sheep in the dry part of the Colony.

STOCK TRAFFIC BY ROAD AND RAIL CONTRASTED.

<i>By Road.</i>			
Droving 5,000 sheep from Hay to Junee—167 miles, at 6 miles per day = 28 days, at £3	£	s.	d.
per 1,000 per week	60	0	0
Waste of condition of the sheep, at rate of $\frac{1}{2}$ lb. per day = 3 $\frac{1}{2}$ lb. each = 17,500 lb. at $\frac{1}{2}$ d.	54	13	9
Deterioration of the fleece by dust, starvation, and noxious weeds—taking the fleeces at 6 months, and 2 $\frac{1}{2}$ lb. each, and the difference in the value of the wool at $\frac{1}{2}$ d. per lb. = 2 $\frac{1}{2}$ d. per sheep, and on 5,000	42	19	4
Risk of loss and deaths of sheep by the way through accident, carelessness of drover, want of feed or water, &c. (say) $\frac{1}{2}$ per cent. = 25, at 5s.	6	5	0
Loss of time as compared with rail (say) 26 $\frac{1}{2}$ days.			£163 18 1
<i>By Rail.</i>			
Yarding and trucking 5,000 sheep at Hay	5	0	0
Railway freight at ordinary rate on 5,000 sheep from Hay to Junee, 167 miles, 50 trucks, at £4 7s. 9d. per truck	219	7	6
Unloading at Junee	2	10	0
			226 17 6
<i>Deduct—</i>			
Reduction as suggested (say), one-third on railway freight	73	2	6
			£153 15 0
			£10 3 1

A. Bruce,
Esq.
26 Aug., 1896.

I prepared that paper because I could see that the prospects of the line would depend largely upon the stock traffic, which is a very important and a constant traffic. If anything of the kind I suggest could be done, I think it would help the extension of our railways, not only into this district, but in other directions.

1587. In the event of the line being extended to Broken Hill, what great stock routes would it tap? A good deal of the Queensland traffic and stock from the northern part of South Australia comes in by way of Wompah, and Tibooburra. Then it should catch the Hungerford traffic. The traffic from the central part of Queensland making for the Darling comes in at Barringun. It is a long distance from the proposed line to Melbourne, and a good way to South Australia, so that the railway would have a chance of drawing the traffic to Sydney.

1588. You think that it would be more profitable to send the stock by rail to Sydney than to drive it on to Melbourne or to Adelaide? Yes, at times.

1589. The Victorian stock tax would tend to divert stock to Sydney? Yes; so long as the Victorian stock tax is continued there will be little prospect of stock for export going to Victoria.

1590. Do you think that it is likely that large consignments of fat stock coming in from Queensland would pass the points you have mentioned? Yes; a good deal of stock comes over at Hungerford and also at Tibooburra.

1591. Whatever stock crossed there, would be in addition to what would be attracted from the area tinted pink on your map? Yes.*

1592. *Chairman.*] Will you send the Committee any information you may have in regard to the existence of a stock tax in South Australia? Yes.

1593. *Mr. Lee.*] The existing stock routes are largely used by sheep and cattle coming in to our western railway system? Yes; most of the cattle coming from Queensland cross at Barringun.

1594. Large numbers of cattle come in from Queensland every year? Yes.

1595. The Sydney market is very largely supplied with Queensland cattle? Yes; both store and fat cattle are introduced.

1596. Is the traffic likely to be affected in the future by the spread of the tick? A very large portion of Queensland is still open country. All the country south of the central railway from Rockhampton to Longreach is open.

1597. But if the tick spreads south is it not likely that this Colony will prevent the Queensland cattle from crossing? Yes; the crossing of cattle may be prohibited, but I think that it is not unlikely that cattle will be allowed to come in after they have been dipped.

1598. Will not the dipping be almost impossible upon a large scale? No; they can dip 800 in a day. The cattle will have a 40-ft. swim.

1599. The shutting out of the Queensland cattle would take a large amount of traffic from our railways, and would mean the loss of a large revenue? The loss of a considerable revenue.

1600. You know the Darling country pretty well? I have been at Wilcannia.

1601. How many sheep do you think there would be within 100 miles on each side of the proposed line? There are 4,000,000 sheep in the area tinted pink upon the map which I have produced.

1602. The stock from this district now finds its way either to the Sydney market, or to intermediate chilling and preserving works? Yes; there is a place of the kind you mention at Carrathool, and another on the river. The only other place very far west is that at Bourke.

1603. Would the extension of the railway to Broken Hill have the effect of establishing more of these works? I think that preserving works would be established at Menindie.

1604. Why at Menindie? It is good country there, and, having regard to the present drift of the traffic, it is a good centre.

1605. You have inquired very closely into the frozen and general meat export trade? Yes.

1606. Is it going to develop? Certainly.

1607. That means that more works will be established close to the pastures? Yes.

1608. The district where the proposed railway would traverse is one where sheep can always be obtained? Yes; though the seasons are rather irregular.

1609. But, on the whole, that district would furnish a fair supply of fat stock? Yes; and works of the kind you refer to would meet the irregularities of the seasons. Whenever the pastoralists have a great number of fat stock the stock could be sent to these works.

1610. At the present time, when they have a good season, there is no market for the stock? They have a long way to go for a market.

1611. The stock are kept on hand until a great many of them die, because of a bad season? The paddocks get over-stocked and perish in dry seasons.

THURSDAY,

* NOTE (on revision):—The duty on stock from this Colony entering South Australia is as follows: Cattle, £1 per head; horses, £2 per head; sheep, 1s. per head; and pigs, 6s. per head.

THURSDAY, 27 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Henry Chamberlaine Russell, Esq., C.M.G., B.A., Government Astronomer, sworn, and examined:—

1612. *Chairman.*] Have you brought a map showing the rainfall on the country between Condobolin and Broken Hill? I have here a map showing the average rainfall during a series of years upon the country lying within 50 or 60 miles on each side of the route of the proposed line, and another map showing the average monthly distribution of rain in the same district.*

H. C. Russell,
Esq., C.M.G.,
B.A.

27 Aug., 1896.

1613. How does the rainfall vary between Condobolin and Broken Hill? At Condobolin the rainfall is from 20 to 21 inches, while the rainfall at Broken Hill is about 9½ inches. The decrease is remarkable for its regularity, and this is accounted for by the fact that there is no high land between the two places; the presence of high land is one of the chief causes of variation in rainfall. In the part of the country to which we are referring the rainfall is distributed pretty equally throughout the year. In the district north of Bourke the rainfall in the first half of the year is better than the rainfall in the second half of the year; while in the southern districts, about Narrandera, the reverse conditions prevail, making the latter country very favourable to the growth of wheat, which the former is not.

1614. So far as the rainfall is concerned, the Condobolin district is more suitable for wheat-growing than the north-western district? Yes.

1615. If you gave us information with regard to the distribution of rain at Hillston, could we take that as a fair example of the character of the distribution throughout the district? You would get about the mean at Hillston.

1616. The totals being greater to the east and less to the west? Yes; the average monthly distribution is a degree above, and a degree above Hillston is, in January, 1.55 inches; in February, 1.27 inches; in March, 1.59 inches; in April, 1.77 inches; in May, 1.85 inches; in June, 1.33 inches; in July, 0.92 inches; in August, 1.42 inches; in September, 1.23 inches; in October, 1.45 inches; in November, 1.30 inches; and in December, 1.34 inches. The records extend over a period of about sixteen years.

1617. Were there any very dry seasons during that period? Yes; there have been several, but I have no particulars with me about them. The rainfall in a very dry season is about 50 per cent. less than the average rainfall.†

1618. What is the total rainfall at Hillston? 16½ inches.

1619. That rainfall is sufficient for wheat-growing, other conditions being favourable? Well, 16½ inches is about as small a quantity of rain as would permit of wheat-growing.

1620. Any place west of Hillston would be too dry for wheat? Yes; of course, in particular years wheat might be grown out there, and plants might be cultivated which would thrive with a small rainfall; but ordinary cereals, such as wheat and corn, could not be profitably grown west of Hillston.

1621. If there is no artesian water between Hillston and Menindie, it is not probable that there will ever be any close settlement between those places unless we have a population there engaged in mining? The natural distribution of rain there makes it unlikely that a dense population would be able to find the means of living in that district.

1622. How much is the rainfall lessened when you get to Mossgiel? Nearly 2 inches.

1623. At Mossgiel the rainfall is less than is necessary for the successful cultivation of wheat? If the rain fell in the latter part of the year it might be possible to grow wheat there; but, as a matter of fact, it is pretty evenly distributed throughout the year.

1624. What you have said about Hillston will apply to Mount Hope? Yes; the difference in rainfall between the two places would not be appreciable.

1625. Are you aware if the mining operations at Mount Hope are affected by the smallness of the rainfall there? Personally, I do not know whether they have any difficulty in obtaining water; but intervals of several months often occur between useful rains, during which a very large amount of evaporation would take place, and, unless great care were exercised in storing the water, the tanks would dry up.

1626. How does the Wilcannia rainfall compare with the Menindie rainfall? The average rainfall for the year at Wilcannia is 11½ inches, and at Menindie 10½ inches. The difference is due to the difference in longitude, Menindie being further west than Wilcannia.

1627.

* NOTE (on revision):—The average monthly rainfall for one degree north and south of Hillston and Condobolin would be—Hillston: January, 1.55; February, 1.27; March, 1.59; April, 1.77; May, 1.85; June, 1.33; July, 0.92; August, 1.42; September, 1.23; October, 1.45; November, 1.30; December, 1.34. Condobolin: January, 2.03; February, 2.00; March, 1.81; April, 1.63; May, 2.01; June, 1.63; July, 1.12; August, 1.73; September, 1.61; October, 1.80; November, 1.64; December, 2.00.

† NOTE (on revision):—Rainfall observations made at Booberoi, Euabalong, and Lake Cudgellico, New South Wales, during the year 1888, the driest year ever recorded:—Booberoi, near Lake Cudgellico—January, 0.18; February, 1.11; March, 0.05; April, 0.14; May, 1.42; June, 0.30; July, 0.71; August, 0.06; September, 1.49; October, 0.11; November, 0.17; December, 1.69; total for year 1888, 7.43 inches; average for all years, 19.10 inches. Euabalong, near Lake Cudgellico—January, 0.34; February, 1.31; March, 0.13; April, nil; May, 1.84; June, 0.05; July, 0.62; August, nil; September, 1.69; October, 0.10; November, 0.29; December, 2.04; total for year 1888, 8.41 inches; average for all years, 19.60 inches. Lake Cudgellico, during the worst drought recorded—January, 0.18; February, 2.83; March, nil; April, 0.12; May, 2.09; June, 0.34; July, 0.34; August, 0.44; September, 0.63; October, 0.09; November, 0.34; December, 1.66; total for year 1888, 9.06 inches; average for all years, 18.92 inches. I cannot obtain full particulars about Lake Cudgellico. The area I find is about 2½ square miles, but I have no measure of the depth of the water. Mr. J. R. Holding, postmaster, Wilcannia, a very old resident of that part of the Darling, informs me that Lake Menindie does not get brackish as it dries out, but remains fresh to the last. The reason for this is that it only fills in the very highest floods when the river water is quite fresh.

- H. C. Russell, Esq., C.M.G., B.A.
27 Aug., 1896.
1627. Would the rainfall in the country traversed by a line from Cobar *via* Wilcannia to Broken Hill differ very much from the rainfall on the country between Condobolin and Broken Hill? No; the rainfall at Cobar is about an inch more than the rainfall at Hillston.
1628. The remarks you made with regard to the proposed line would apply pretty well to a line *via* Cobar, except that Cobar itself has a little better rainfall than Hillston? Yes. I do not know whether the Committee have before them the facts connected with an attempt to conserve water in Menindie Lake some years ago. In 1890, during the big flood in the Darling, water was allowed to flow into Menindie Lake, and it was stated that 100 square miles of water, 13 or 14 feet deep over a great part of the surface, were thus stored. As to Lake Cowal, I do not know if the Committee are aware that a good deal of irrigation has been carried on there by means of water taken from the lake. Lake Cowal is about 40 miles south-east of Condobolin.
1629. Is the lake filled by the overflowing of the Lachlan? I think not, unless on very rare occasions. Its great supply seems to come from the Yeo Yeo and Manna Creeks, which drain the country about Grenfell and Young.
1630. Do you know anything about the state of Lake Cudgellico and Lake Cowal in dry weather? Lake Cudgellico is much smaller than Lake Cowal, which, I believe, is about 18 miles long and 5 or 6 miles wide.
1631. Have you any record as to the quantity of water stored there? No; I have no measures of the lake. I have measures of a lake of a similar size—Lake George—but the climate there is different.
1632. You express no opinion as to the permanency of Lake Cowal and Lake Cudgellico? No.
1633. Did you ever hear that Lake Menindie or any of these lakes became brackish? No; but I know that the water generally becomes brackish whenever a lake is drying up. In Lake George the water becomes so brackish that it is poisonous for human beings to drink.

Henry Taylor, Esq., Officer-in-Charge, Rabbit Branch, Department of Lands, sworn, and examined:—

- H. Taylor, Esq.
27 Aug., 1896.
1634. *Chairman.*] Have you a personal knowledge of this country? Yes; but I have not a very vivid recollection of it. It is some years since I was there.
1635. Can you give us any information as to the operations of the Department for the extermination of rabbits in that part of the country? The operations of the Government in that direction have been suspended for the last six or seven years.
1636. *Mr. Roberts.*] Have you ever been over the route of the proposed line? I have been to Broken Hill, and I have been along the Darling as far as Menindie, and from Menindie across to Hillston and Ivanhoe, and back to Hay. I have never been down the Lachlan as far as Condobolin.
1637. But coming from Menindie, you have been as far as Hillston? Yes.
1638. What is the character of the country about Hillston? So far as I recollect, it is mostly covered with the coarser kind of salt-bush and blue-bush.
1639. Would it be suitable for growing wheat? I do not think so. My impression of it is that it is land which, under existing conditions, is suitable only for grazing purposes.
1640. What is the character of the country between Menindie and Mossgiel? I can only describe it as rather level country, and covered with the ordinary edible scrubs—blue-bush, cotton-bush, and salt-bush. Its carrying capacity is very limited.
1641. Is it fairly good pastoral country? So much depends upon seasons. Sometimes it is very bad. I suppose that the average carrying capacity may be put down at one sheep to 6 or 7 acres.
1642. Can you give the Committee any information as to the trouble to which the squatters have been put by reason of the rabbits? Almost the whole of the country from Hillston to Broken Hill has been the scene of very extensive operations, both on the part of the pastoral lessees and the Government having in view the destruction of the rabbits.
1643. For how many years past? Since 1884.
1644. Can you tell the Committee how much has been expended by the Government in endeavouring to exterminate the rabbits in that part of the country? I could tell you, in round figures, the expenditure which has been incurred in the whole of the country lying west of Albury on the south and of Barrington on the north: but it would take some time to ascertain how much has been spent upon the properties through which the proposed line would pass.
1645. What has been the result of these efforts to suppress the rabbits? In that district some hundreds of miles of wire-netting fences have been erected at considerable expense, and most of the known methods of rabbit destruction have been resorted to—poisoning the water, poisoning sticks, poisoning pollard, and suffocating by means of bi-sulphide of carbon; but I think that Providence is chiefly answerable for the destruction of the rabbits there. The severe droughts, and consequent want of water, have done more to destroy them than anything else. In times of drought I have seen the rabbits in such a poverty-stricken condition that they could not get out of the way.
1646. What is the state of the country now? Last summer was a very disastrous one, both for the rabbits and for the sheep: but the cool season of the year, and the existence of more favourable conditions, are allowing the rabbit to breed up again.
1647. Has the stock-carrying capacity of the runs been improved during the last few years? I think it has depreciated.
1648. Because of the rabbits? Yes, and because of the severity of the seasons.
1649. Are there signs of improvement in the country between Menindie and Mossgiel? I suppose that the country is being improved by the erection of fences and the construction of tanks and wells.
1650. Is any grass to be seen there? I think very little. My recollection is that it is not a grass-producing country.
1651. Would the construction of the proposed railway lead to the improvement of the runs? I suppose that the railway would improve any holding in the immediate vicinity, but whether the construction of the proposed line would prove beneficial to the community at large is very doubtful.
1652. Do you think that if the railway were constructed the rabbits, instead of being destroyed, might form a valuable article for export? I do not think so. I do not think that the class of food which the rabbit gets out there would make the carcase a marketable commodity.
1653. Have they to live upon the salt-bush and the cotton-bush? In the dry time the bark of the sandal-wood is a great food for them.

1654. Is it not a fact that shipments of rabbits to England have proved successful? I do not know that they have proved successful; but I know that shipments have been made from places in the vicinity of Narrandera and Hay. The country is better down there. The food of the rabbit in the district to which I am alluding deteriorates the quality of the flesh, and depreciates the value of the skin. The animal is less furred and the skin is lighter.

H. Taylor,
Esq.
27 Aug., 1896.

1655. Having been over the country, do you feel inclined to give an opinion as to the advisability of constructing the line? I do not think that my opinion would be of much value. I have been across to Broken Hill by way of Adelaide, and I have been along the boundary from Wentworth. I should think that the country would have to be more settled in order to make the construction of the railway profitable. It would all resolve itself into a question of trade between Menindie and Broken Hill and Broken Hill and Adelaide.

1656. Do you think that the construction of the railway would increase the production of wool between Menindie and Mossgiel? I do not think so, unless it conduced to greater settlement.

1657. You think that the land is so inferior that the probability of increased production is rather remote? I should think so. I think a man would want a very large area to be able to make a living by growing wool.

1658. *Chairman.*] Had you any knowledge of this country before the advent of the rabbits? No; my personal inspection of the country dates to seven years back.

1659. Taking the country right through from Hillston to Broken Hill, would you say that its average carrying capacity was a sheep to 8 acres? Yes.

1660. *Mr. Wright.*] Can you tell us what the squattages about the Willandra are assessed at? I do not know.

1661. Your statement as to the area required to feed a sheep is based upon what you have seen of the country? Yes; and from conversations which I have had with pastoralists from time to time.

1662. *Mr. Humphery.*] You know the country round Hillston? I have been to Hillston.

1663. What is the average carrying capability of the country immediately round Hillston? Taking the district all round, I should say that it would not be capable of carrying more than one sheep to every 6 acres.

James George Carroll, Esq., M.P., sworn, and examined:—

1664. *Chairman.*] You represent the Lachlan electorate in the Legislative Assembly, Hillston being pretty well the centre of that electorate? Yes.

J. G. Carroll,
Esq., M.P.

1665. Have you a good knowledge of the Lachlan district, and the country further to the west? I have a knowledge of the country from Condobolin on the south side, and then on along the route of the proposed line for nearly 200 miles.

27 Aug., 1896.

1666. Do you know the country from Condobolin to Mount Hope? I know it from the boundary of my electorate.

1667. How far west to Condobolin is the boundary of your electorate? I join the Condobolin electorate at 30 miles south. I know the country then for 100 miles north of the Lachlan, going out towards Nymagee and towards Mossgiel.

1668. Do you know the country on the northern side of the river from about Euabalong, going north? Yes; 12 miles up from Euabalong.

1669. From Euabalong, going in a westerly direction, to a point pretty well half-way between Ivanhoe and Menindie? About 20 miles past Ivanhoe.

1670. From Hillston, going east, you know the Lake Cudgellico country, and on to Condobolin? Yes.

1671. South-easterly, you know the country from Hillston to Wyalong, and on to Temora? Yes.

1672. Due south, you know the country from Hillston to Carrathool? Yes.

1673. And for a considerable distance south-west from Hillston towards Wentworth? Yes.

1674. *Mr. Black.*] What is your opinion of the country within the area you have described;—is it fit for agricultural purposes? Yes; portions of it.

1675. I presume they are not limited in area? No. At Hillston the land on the south side of the river is more suitable for wheat-growing than for any other purpose I know. Between Hillston and Mossgiel the land is splendid country for pastoral purposes.

1676. Open country? Open country.

1677. Some of that country is fairly adapted for agriculture? Yes; some of it is. We find that the land which grows wheat well will only carry a few stock. On the northern side of the river the land is assessed at from 2d. to 3d. an acre, or a little more—that is, between Hillston and Mossgiel—while 1d. an acre is a good price for the country on the south side of the river. The land from Lake Cudgellico to Hillston, with the exception of the hills and the flooded country, is all suitable for wheat-growing.

1678. On the other side of Mossgiel, beyond Ivanhoe, the land begins to deteriorate somewhat? Yes.

1679. It begins to fade away into the scrub country? Yes.

1680. But it is fairly good pastoral country? Yes, in the Lachlan district.

1681. Are there patches which are fit for agriculture? There are patches here and there.

1682. What would you say was the extent of those patches? I could not say. When the land was thrown open in 1885 nearly every portion available was taken up immediately, whereas in other places it is still open.

1683. The eyes of the country have been picked out for agricultural occupation? Well, the great rush was to get country for stock.

1684. They are not using the land for agriculture? Very little. At Mossgiel they get their flour and their chaff from the Lachlan. I do not say that the land would not produce these things, but the people do not go in for growing them.

1685. What encouragement would they require to induce them to go in for agriculture? Well, the people over there go in for stock.

1686. Why—because it pays them better, or because it is less troublesome? There are 10,000 acres in homestead leases, and a great deal of that area is held by people who gave up cultivating, in order to go in for sheep-farming.

1687. When you speak of stock, do you mean sheep solely? Yes.

1688.

- J. G. Carroll, Esq., M.P.
27 Aug., 1896.
1688. Do you think that on such small areas sheep-grazing pays? Well, latterly the prices have been so poor that it has not been paying either on large or on small areas. The people there are too far from a market.
1689. Do they grow wool only, or do they also supply the meat market? They supply the meat market. They drove their sheep to Hay and to Carrathool, and truck them from there.
1690. How is the road from Hay to Hillston? It is rather a good road at times.
1691. It is always a good road in good weather? Yes; but the country being soft, the rain soon spoils it.
1692. That country would be crab-hole in places? Yes, particularly getting on to the Hay side.
1693. You know the country beyond Ivanhoe and towards Menindie only by repute? Yes.
1694. It has the name of being a very inferior class of country? Yes; on Clare Station the homestead leases have been taken up, but at Kilfera none have been taken up, although 100,000 acres have been available since the 1884 Act was passed.
1695. Do you know of any wheat having been grown in that locality? Most of the settlers and squatters about Mossgiel generally go in for a stack for their own use, but not for sale.
1696. Have you any idea how many bushels to the acre that land returns? At Hillston, for about five or six years, the average yield was, I think, over 14 bushels. I have been told by a farmer that some of the scrub land has given as much as 32 bushels to the acre.
1697. Have you any idea of the sheep-carrying capacity of the country between Condobolin and Ivanhoe, taking the average? I could not give you the average; the country varies very much.
1698. Give us the average of the most favourable portions? The best portion is between Hillston and Mossgiel. That is the best sheep country.
1699. How many acres are required to carry a sheep? I think they allow from 3 to 4 acres there.
1700. The best land would carry a sheep to every 3 or 4 acres? Yes.
1701. What is the carrying capacity of the worst land? When you get into the mallee, it is hard to say what the carrying capacity of the country is, particularly since the rabbits came, because they have interfered so much with the edible scrubs.
1702. Would you say that the worst land would only carry a sheep to 10 acres? Well; station-managers and others, who are supposed to know more about stock than I do, are not able to agree as to what the timbered country will carry. On the north side of the river I have known the selectors to run a sheep to the acre on a small piece of ground.
1703. You could not say definitely what the carrying capacity of the worst land is? No.
1704. You think it might be something over one sheep to 10 acres? I cannot tell you how many acres it would take to keep a sheep in certain parts of the country.
1705. You have already said that the land on the south side of the river is superior to that on the north side? For cultivation.
1706. As a rule, the land in that locality, which is best adapted for agriculture, is not so well adapted for pastoral purposes as some of the other land? That is so.
1707. It does not carry so much edible scrub? The land between Mossgiel and Hillston is nearly all plain country, cotton-bush and salt-bush shrubs growing upon it. The scrubby country is upon the south side of the river.
1708. But your evidence was that some of the country that was best adapted for agriculture, was not so well adapted for pastoral purposes, and I understood you to say that that was because it did not carry so much of the edible shrubs, by which, I understood you to mean, blue-bush, salt-bush, cotton-bush, and so on? It is admitted that land which grows timber is always better for cultivation.
1709. Do you mean big timber? Well, of course, if it grows big timber it shows that it is strong land.
1710. Land may carry a good deal of scrub, and yet not be at all suitable for agriculture? I have known them to grow wheat upon the plain country, and also upon the timbered country, and it seems to be always fairly successful.
1711. To the best of your belief, the best agricultural land is found south of the river, and in the neighbourhood of Hillston? Yes.
1712. That land has not yet been put to its best use? No; but there are a good many farmers there who grow wheat and other things.
1713. But they hardly grow it for market—more for their own use? They make their living by it? There is a flour-mill in Hillston, and when they over-produce, they take their grain 50, 60, or 70 miles by team to the railway. Round Mossgiel, they grow only for their own use, but at Hillston they gave up sheep-farming and went in for wheat-growing. They found that, on a small area, especially where the country was timbered, they could not live by sheep-farming.
1714. Do you think that the construction of the proposed railway would give an impetus to the farming industry? I do.
1715. Do you think it would be justifiable to construct a railway through the most fertile parts of this district without carrying it further on towards Broken Hill? Of course, if we did not make it a national line, a light line would do.
1716. A light line would serve the requirements of the district? Yes; and I think the district is entitled to such a line.
1717. You know the country north of Euabalong well? Yes.
1718. The land at the back of Euabalong is not fit for agriculture? I would not say that it is not, but that land lies in the Western Division.
1719. It is fair pastoral country? It requires a lot of ringbarking and scrubbing. The scrub is very bad in places. I have known of good crops being grown there. A gentleman there goes in for cultivation very successfully.
1720. North or south of Euabalong? About 3 miles south of the township. It is on Euabalong Station.
1721. Do you know Mount Hope? Yes.
1722. What is your opinion of the permanency of that field? The miners about there say that there is plenty of copper ore, but I am not a practical miner, so that I cannot speak of my own knowledge. The place being so far inland, and the cost of carriage being great, they have never properly gone in for mining there for many years past.
1723. Do they treat the ore on the ground? They smelt it there.
1724. Are they able to smelt it successfully? It depends upon the price. A few years ago the price of copper

copper was £90 a ton, and then it came down to below £40 a ton. The distance from the market being so great, the mining industry there has almost as good as stopped. J. G. Carroll,
Esq., M.P.

1725. Is the copper pure, or is it found in conjunction with other minerals? They make pure copper. 27 Aug., 1896.

1726. There is not a percentage of gold in it? There was at one time, when they got the iron flux from Mount Allen. Now that Mount Allen has developed into a gold-mine, I do not think that any gold is found in the copper. There are two copper-mines at Mount Hope, the first of which has been working for, I suppose, twelve or fifteen years.

1727. Do you know how many men there are on the field now? There are not many there now. A few years ago Mount Hope carried a population of, I suppose, 2,000, but I think that not more than 500 or 600 people would be settled there now, including children. There are two schools there.

1728. Is the falling off in population due to the fact that the mines are partially worked out, or that there is a want of proper conveniences for working them? I take it that it is because of the want of proper conveniences.

1729. Do you think that if they had better communication with larger centres of civilisation the population would increase? I think so. There are men who have been out there from the very first, and they have great faith in the place. They seem to think that the ore is plentiful enough. It is said that there are other copper finds about there; but copper is of so little value now that they have not bothered with them.

1730. How far is Mount Allen from Mount Hope? Ten or 12 miles.

1731. It is a gold-field? Yes.

1732. How many men are there there? I am not able to tell you how many men are working there now. There is a small township, with two hotels, a school, and some residences.

1733. Were you favourably impressed with the prospects of Mount Allen? I have no interest in the place, so that I am not able to say what its prospects are. I believe that the deposits are very patchy. I was there when the place was opened four years ago, and I saw the stone dollied.

1734. How long have you known the district? I went to the Lachlan in 1876, and in 1879 I went round Cowan Downs. Mount Hope was not opened then.

1735. Has the rainfall during most of the time you have spent in the district been sufficiently heavy for agriculture? We have had several droughts, but after the drought broke up in 1888 until last year the people were able to grow a crop every year, and even last year the crop was not a complete failure. One man had as good a crop last year as he ever had, but he was an exception.

1736. With five or six good seasons in succession the people there would be able to run the risk of a bad season? Some of them think that they do better in a bad season, because they get better prices.

1737. *Mr. Humphery.*] I believe you gave evidence during the inquiry into the proposal to extend a railway from Temora to Wyalong, and that you said that you were familiar with all the holdings within 100 miles of Hillston? Yes, pretty well.

1738. Can you say how many selectors there are engaged in cultivating the land, or in grazing sheep, between Condobolin and Hillston? No.

1739. Has there been an increase or a decrease in their number since the Wyalong inquiry? There has been no rush for land lately. Very few selections have been taken up.

1740. Has there been any increase in cultivation during the last five or six years? The cultivation around Hillston is increasing every year.

1741. How many acres are there under cultivation at the present time? I am not able to say.

1742. Any large area? Lower down than Hillston, perhaps 30 miles further down, towards Gunbar, there is a man who has over 1,000 acres under cultivation.

1743. Where does he send his produce? Principally to Carrathool.

1744. What distance is that? I should say that he would have to go 50 miles.

1745. Do you think that he would send his produce to Hillston if the railway went there? Yes; there is a belt of country round there where all the farmers are cultivating.

1746. When that man sends his produce to Carrathool, where does it go to afterwards? To Sydney.

1747. Are there not some very large stations close to Hillston, or between Hillston and Mossiel? Yes.

1748. What distance from Hillston is Trida Station? Sixty miles, or a little more, north-west.

1749. And Willandra? That run begins within a few miles of Hillston.

1750. How many sheep are shorn there? They have shorn 200,000.

1751. How many have they shorn at Trida? I do not remember.

1752. At Mossiel? They have shorn a great number of sheep there.

1753. Where does the wool go from those stations? Mostly to Melbourne.

1754. Do you think that the wool would come to Sydney if the railway were extended beyond Condobolin? Yes.

1755. Is it probable that any of that wool will come to Sydney if the railway is only taken to Condobolin? They go down to Hay now, and unless great inducements were offered by the Commissioners, the trade would not be diverted. Now they can always put it on the steamers at Hay and send it by river to Echuca.

1756. What is the most distant point westward to which the railway could be extended with a prospect of a profitable return? Unless the railway had a better destination than through my electorate, it would not be advisable to take it very far. The population out there is very small, particularly as you get further west.

1757. You think that the line should not stop between Condobolin and Broken Hill? It appears to me that a line to Broken Hill would be a good national line.

1758. What is the most distant point to which the railway might be carried with the hope of a profitable return? The land for about 75 miles west from Hillston is all good land, especially for pastoral purposes. During reasonable seasons it is not possible to get better sheep than they get there. They are healthy and sound, there being no disease either in the sheep or in the country.

1759. Is it your opinion that the whole of the produce from the district 70 miles west of Hillston would be carried by the proposed railway? Yes, I should say so, if it were constructed.

1760. That produce would come to Sydney instead of going to Victoria? It would all have to come this way. The people there have more inclination to deal with Sydney now than they had formerly.

1761. You say that you do not think any traffic would come to Sydney from beyond Mossiel? I do not

J. G. Carroll,
Esq., M.P.
27 Aug., 1896.

not think so, because of the competition with the rivers. You could go a little further than Mossgiel—20 miles further, perhaps.

1762. *Mr. Clarke.*] You are not acquainted with the country between Mossgiel and Menindie? No.

1763. What area of land is likely to be put under cultivation between Condobolin and Hillston? I could not say; but if the railway were made there would be a rush to take up land there. Nearly all the land on the south side of the river would grow wheat.

1764. Is the land near Condobolin better adapted for wheat-growing than the land at Hillston? I am not able to speak of the country further up; but I understand that they grow good wheat at Condobolin. There is very little cultivation around Lake Cudgellico, but the land there is suitable for cultivation. The people of Hillston are Victorian farmers, and go in for cultivation. The others are older residents, and go in very little for cultivation.

1765. The country you speak of is held principally under pastoral lease? Yes; but a great deal of it has been abandoned.

1766. Why? Because of the low prices of stock, and because of the rabbits. It would appear to me that the squatters have never done well since the Act of 1884 took part of their runs away. Since then the bank failures and other adverse circumstances have combined to upset things.

1767. Are there many selectors along the route of the proposed line? There are on the south side of the river, between Hillston and Condobolin.

1768. *Mr. Lee.*] After you leave Mossgiel, the land almost at once deteriorates in quality, does it not? About 20 miles further on than Mossgiel.

1769. The country between that point and within a short distance of the river is of a very indifferent character? That is at the other end.

1770. Yes? Yes, but I have never been there.

1771. You are aware that there is no small settlement there? Yes; and the land there, although it has been thrown open to settlement, has not been taken up.

1772. The small settlement, so far as you know it, does not extend further west than Mossgiel? Not a great deal further.

1773. Naturally that country would carry population in the future if the land could be worked at a profit? Yes.

1774. How is the land held at the present time; is it not held by the squatters who pay very low rents? Yes; the Lachlan divides the Central from the Western Division.

1775. The land on the northern side of the river is locked up for twenty-seven years, while the land on the southern side of the river is now available for selection? Yes.

1776. Is there any quantity of land on the southern side of the river suitable for settlement? Yes, suitable for settlement in small holdings.

1777. Holdings up to the maximum area allowed in the Central Division? Yes.

1778. If the railway were constructed, revenue could come to it from the northern districts only under the same occupation as that which now exists? Yes.

1779. For at least twenty-seven years settlement there cannot increase? There is a lot of land in the Western Division which could be taken up for homestead leases.

1780. But have not those leases been a practical failure? A good number of them have. The country is too far from a market.

1781. The people there have to depend almost entirely upon grazing? Yes.

1782. And owing to the low price of stock and wool that has not lately been profitable? No.

1783. Have you considered the advisability of extending the line right through to Broken Hill? I cannot say that it would be advisable to extend the line right through to Broken Hill, especially when the Commissioners point out that there will be a loss upon it.

1784. A very heavy loss? Yes.

1785. If you were informed that in all probability a line to Broken Hill would not get any of the mineral traffic from that district, would you advocate its construction? No.

1786. Do you think that any advantage is to be gained by extending the railway beyond Condobolin? I consider that since the Government own so many million acres out there, which are now lying idle, it is a pity that some communication should not be given to the district.

1787. You think that more reasonable facilities should be afforded for sending produce to market at all times, and at a reasonable rate? Yes.

1788. If such facilities were afforded, do you think it would lead to further production? Yes. That district is a great place for growing wheat. The land is very easily cultivated, and I am sure that the area put under cultivation would be astonishing if the railway were made.

1789. Would not the capabilities of the district be thoroughly tested by an extension of the railway to Hillston? Yes.

1790. I think it follows from what you have said that the bulk of the traffic will come from the valley of the Lachlan? Yes.

1791. Would it not, therefore, be wise simply to extend the railway to Hillston, and let it remain there until that part of the country had developed sufficiently to justify a further extension? Yes; I think that would be reasonable.

1792. Do you approve of the proposed survey? No.

1793. Could you suggest any improvement? I have suggested a deviation by way of Lake Cudgellico and Hillston. I understand that that will only make a difference of about 6 miles in the total length of the line.

1794. Would not such a deviation put the line out of the reach of the Mount Hope people? Mount Hope is 40 or 45 miles from the river, and would be about 50 miles from the deviation. The proposed route would be about 25 miles nearer.

1795. There are some large deposits of low-grade ores at Mount Hope? Yes.

1796. Do you not think that if the line were taken nearer to Mount Hope it would secure a great deal of traffic which would not come to it if it were taken by the route which you suggest? You would get the trade just the same if the railway were taken by the route I suggest. Of course if the railway went to Mount Hope it would develop the place more than a line 50 miles away would develop it.

1797. The country between the river and Mount Hope is sandy? Yes.

1798. It would be a long distance to carry low-grade ores; the question arises, therefore, whether it would be better to deviate towards Lake Cudgellico or to deviate towards Mount Hope;—which route would secure the larger amount of traffic? The southern route. Where there is a great deal of cultivation a great deal of employment must be given to a railway line.

J. G. Carroll,
Esq., M.P.
27 Aug., 1896.

1799. Is the mining at Mount Hope at all active? No. They are just working the mines, that is about all. I am not sure that one of the mines has not suspended work because of a dispute.

1800. Is the want of water a difficulty there? It has always been a trouble at Mount Hope; but at Mount Allen they get a good supply from a well. At Mount Hope they smelt the ore by using timber, and in that way the mines help to clear the country.

1801. Do the people of Condobolin raise any objection to the proposed deviation? I have heard no objection to it.

1802. Do the people of Hillston desire to be connected with the railway? Yes. They have been agitating for a connection for years, and they are still agitating for it.

1803. Which is the most important centre in the electorate? Hillston. It is like a market town. They have the assizes there, the land court, a flour-mill, and saw-mills. The people of Hillston would prefer an extension from Wyalong.

1804. On what grounds? I have not been there lately, but I see from the paper that they think such a railway would have a good deal to carry.

1805. Would that be a shorter route for them? I do not think so. I think that the proposed route would be shorter.

1806. A fair quantity of wheat is grown at Condobolin now in good seasons? I understand so.

1807. Where do they find a market for it? They have a flour-mill there. I do not know if they over-produce, but at Hillston they have over-produced for some years past.

1808. If they required a market, where would they go—to intermediate places, or to the metropolis? They would have to send their grain to Sydney. Intermediate places have their local growers and their local mills.

1809. Going to Sydney they would have to pass through Parkes, Forbes, Molong—all wheat-producing districts, where there would be no market for their productions? Yes.

1810. *Mr. Fegan.*] Do you represent the request of the people of your electorate for a railway? I am pledged, not to this railway in particular, but to use my influence to get a railway to Hillston.

1811. And you think that this is the best opportunity for advocating the connection? Yes. I think it is my duty as their member to voice their opinions when I can honestly do so.

1812. Therefore you appear here in your representative capacity? Yes.

1813. What is the chief product of Hillston? Wool and wheat.

1814. How many townships along the route of the proposed line do you represent? There is Euabalong, Cudgellico, —

1815. What is the chief product of Euabalong? It is situated in a pastoral district. Mount Hope is 40 miles from Euabalong; then there are Hillston and Mossgiel.

1816. What are the productions of Mossgiel? That is in a pastoral district.

1817. The only mining centre in the electorate is Mount Hope? There is also Gilgunnia and Nymagee.

1818. But I mean on the line of railway? Yes.

1819. South of the river you have Lake Cudgellico;—what is the chief production of that district? The people there are engaged in pastoral pursuits. Lake Cudgellico is about 8 miles from the river.

1820. Is any fishing carried on in the river? There is fish in the Lachlan—Murray cod, bream, perch, and catfish.

1821. Is there any extensive business carried on in fish? No.

1822. For want of development? There is no trade in fish there.

1823. You have never been to Broken Hill? No.

1824. I understood you to say that 20 miles beyond Mossgiel the land deteriorates very considerably? I cannot speak of it of my own knowledge; but from the fact that it has not been taken up, I suppose it is not so good.

1825. You have no other reasons for saying that it is poor country? I know nothing of it from personal observation.

1826. South of the Lachlan there is plenty of land open for selection? Yes.

1827. But on the north side the land is shut up for twenty-seven years? Yes.

1828. Which country is the better watered—that on the south or that on the north side of the Lachlan? That on the north side of the Lachlan. There they have Willandra Creek and other small creeks.

1829. Do those creeks run throughout the year? No.

1830. For how many months in the year are they dry? It is hard to say; but the Government are at present constructing a weir in the Lachlan about 18 miles up from Hillston which will cause the water to flow down Mirowi Creek and through Middle Creek. Of course if the water in the river is low the creeks cannot be kept running.

1831. How many months in the year are the creeks dry? I have seen them dry for months and months, and then I have seen a flood. They are very uncertain.

1832. Have you ever seen them dry for nine months in the year? During a drought they might be dry for that time. Of course, though the creeks may not be running there is water here and there.

1833. There is no sure water supply either north or south of the proposed line? There is a sure water supply at Lake Cudgellico, because of a little weir which has been placed there to keep the water from running back to the river. The lake was dry in 1882; but it has not been dry since.

1834. *Mr. Humphery.*] That was before the erection of the weir? Yes. The weir has only been there for about seven or eight years. The old residents say that the lake was dry in 1852.

1835. *Mr. Fegan.*] Does the Lachlan ever become dry? I have seen it a chain of waterholes on several occasions.

1836. From Condobolin to Mossgiel there would be no sure water supply? In the good part of that country you can obtain water by sinking wells.

1837. Artesian water is not obtainable there? No. The wells about Mossgiel are about 120 feet deep, while those at Hillston are about 100 feet deep.

1838. What kind of water do they get out of those wells? Very good water. If you are not used to it the taste is a little mineral. I have drunk it for years.

- J. G. Carroll, Esq., M.P.
27 Aug., 1896.
1839. Has it to be boiled? No; it is beautiful water. There are some very good wells around Hillston; but in places the water is brackish, and only fit for stock.
1840. How far do you think it would be proper to extend the line west of Condobolin? As a local line, I do not think it would be wise to extend it beyond Hillston. The country beyond being pastoral country, people could drive their stock to Hillston.
1841. Would a line to Hillston pay? I think a light line would pay.
1842. A line costing about £2,000 a mile? I think a suitable line could be constructed for that.
1843. What is the distance from Condobolin to Hillston? 120 miles.
1844. That would be £240,000;—do you think such a line would pay? I cannot say.
1845. Would you advocate the construction of such a line if it meant a loss to the State? There might be indirect benefits which would justify its construction. I think that the Government is justified in spending a little money in developing the resources of the country, and giving the people who are settled upon the land an opportunity of making a living out of it.
1846. There would not be much passenger traffic between Hillston and Condobolin? I cannot say what the traffic would be.
1847. Wheat and stock would be the chief products of the district? Yes. Of course railway communication would encourage people to travel. They think seriously over the matter before travelling by coach.
1848. Do they grow much fruit in the district? Yes; oranges, lemons, grapes, apples, but not to any great extent, and cherries, but they are not a certainty.
1849. I should think it would be a good district for grapes? Very good.
1850. And railway communication would develop the fruit industry? Yes.

FRIDAY, 28 AUGUST, 1896.

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.	CHARLES ALFRED LEE, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	JOHN LIONEL FRGAN, Esq.
The Hon. WILLIAM JOSEPH TRICKETT.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.

(The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Hugh Giffen M'Kinney, Esq., Principal Assistant Engineer, Water Conservation and Irrigation Branch, Department of Public Works, sworn, and examined:—

- H. G. M'Kinney, Esq.
23 Aug., 1896.
1851. *Mr. Black.*] Will you give the Committee some information with regard to the operations which have been carried out at Lake Cudgellico and the Willandra Billabong? At Cudgellico we have a small self-acting flood-gate at Lake Creek. The lake depends upon the overflow from the Lachlan for a supply, and if there were no flood-gate the water would fall very low as the supply in the river subsided. To prevent that we have erected a self-acting flood-gate which keeps up the supply, and has, in fact, made it permanent. Then we have a weir at the head of the Willandra Billabong which throws the water 14 miles up the Lachlan, and diverts the supply down to some distance below Mossgiel. At Lake Menindie we have no works. A dam was constructed and a number of works were carried out, but nothing has been done recently.
1852. Is there not another lake in the neighbourhood of Cudgellico? Yes, east of Cudgellico, but no works have been constructed there. We have got levels with a view to the possibility of supplying Lake Cowal from the Lachlan. We have done nothing in the way of works.
1853. What are the prospects in that part of the country with regard to artesian boring? The prospects are not good as far as I have heard; in fact we have found no artesian water in that district, and there does not seem to be any prospect of it.
1854. Do you know anything about water being found in wells near Mount Hope? I have heard that there is a good supply of water near Mount Hope. It is obtained in the wells.
1855. Might not that be soakage from the mountain? Yes.
1856. Therefore, it would not have the alkaline flavour of most of the water about there? Yes; that is the case. There should be a fair chance of getting good soakage water there. Some years ago the question did crop up with regard to getting water in that district, and I saw Father Curran on the subject. He was of opinion that we were likely to get fair supplies of soakage water in some of the valleys in the district, but he did not think we would get any artesian water. However, I had not an opportunity of pursuing the subject.
1857. Is it likely that the railway people would be able to obtain supplies of water along the proposed line, except by the construction of dams? There are several places where there is pretty good storage for water. The Willandra Billabong carries the water down to the heart of the dry country. There is a supply of water in lakes which comes down from the Darling. A good deal has been done by the pastoralists in the construction of dams. There is a good supply of water in some of the lakes.
1858. Do you know the country out there? I have not been right through it, but I have been at both ends. I have got levels right through it.
1859. Have you a very high opinion of the soil? There is very good soil in the neighbourhood of the Lachlan and as far round the Willandra Billabong as I have gone, but I understand that the land gets much poorer as you go towards the Darling. I may mention that we have got another weir in progress to further divert the water supply at a place called the Middle Billabong, between Hillston and the Willandra Billabong, about 5 or 6 miles in a direct line below the head of the Willandra Billabong.
1860. *Mr. Trickett.*] Looking at Menindie and the tract of country eastward to Mossgiel, is not that a waterless part of the country? It is very dry country naturally.
1861. What means would the railway authorities have for getting water there for engine purposes? I do not know of any good supplies that they would have until they got to the lakes I have pointed out.

1862.

1862. I am speaking of the country between Menindie and Mossgiel? The railway goes close to some lakes, but I do not know of any really good supply in that district.

1863. Does not the water become brackish when the lakes are low? Yes; the water is bad when it gets low.

1864. Does not that apply to most of the conserved water in the western district? Yes. With regard to these lakes, I had information compiled some time ago as to their depth and the quantity of water they hold, but I cannot speak from memory. I know that in some of the lakes between Mossgiel and Menindie there is a good depth of water, and they are capable of further improvement by improving the channel that leads to them.

H. G.
McKinney,
Esq.

28 Aug., 1896.

Edward Fisher Pittman, Esq., A.R.S.M., Government Geologist, sworn, and further examined:—

1865. *Chairman.*] There is one point on which we omitted to question you previously, that is, as to the extent of the Lithgow coal deposits and their suitability for smelting purposes? I am afraid I cannot say much about their extent, as I have not come prepared with the information. We have never mapped them in detail. There is a large amount of coal there, enough to last for a very considerable time. The quality of the coke is not equal to some of the coke prepared on the eastern coast. The ash is rather large.

E. F. Pittman,
Esq.,
A.R.S.M.

28 Aug., 1896.

1866. Are we justified in believing that there is an unlimited supply of coal at Lithgow? I do not think there is a probability of the coal being worked out for a great many years. Of course, it all dips this way from Lithgow. Lithgow is almost the extreme limit. There is enough coal working eastwards to give what you might call an unlimited supply. I may say that the coke is very much higher in ash than the quality of the coke which the secretary of the Broken Hill mine said was necessary for his mine. But I found, on going into that question, that the quantity of ash in the coke imported and used at Broken Hill is also very much higher than the secretary for the Broken Hill mine said he would use under any circumstances.

1867. Have you a statement dealing with the subject? Yes; it is as follows:—

Lithgow is situated in what is known as the western coal-field, and is on the western margin of the main coal basin of New South Wales. The coal seams at Lithgow belong to what are termed the *Upper* coal measures or *Newcastle Series*. These seams outcrop at Lithgow and dip eastward under Sydney, where they have been proved to occur at a depth of about 2,900 feet. It therefore follows that eastward of Lithgow there is what may practically be called an unlimited supply of coal. This coal is of the quality known as semi-bituminous or steam coal. I have taken the mean of seventy-four different analyses of coal from various parts of the western coal-field (as published in the Annual Reports of the Department of Mines), and find the composition to be as follows:—

Water.	Volatile hydro-carbons.	Fixed carbon.	Ash.	Sulphur
2.82	30.04	54.91	12.23	.823

Coke is manufactured from Lithgow coal at the Vale Colliery. In the year 1892, I reported on the quality of the coke made in the northern, southern, and western coal-fields, as compared with the imported coke used at the Broken Hill mines, and I then found that the Lithgow coke, made from washed coal, contained 15.47 per cent. of ash, and .59 per cent. of sulphur. (*Vide* Ann. Rept. Dept. of Mines, 1892, pp. 35-37). I believe the coal-washing plant has been improved since my visit, and it is possible therefore that the percentage of ash in the coke now made may be less than that quoted. The western coal, however, contains a rather large percentage of dirt so intimately mixed with it that it is a matter of difficulty to reduce the amount of ash in the coke to any great extent.

A statement of the annual output of coal from the western coal-field for the eleven years, 1885-1895, is as under:—

Output and Value of Coal raised from the Western Coal-field taken from the Annual Reports of the Department of Mines.

Year.	Quantity.			Value.			Year.	Quantity.			Value.		
	tons.	cwt.	qr.	£	s.	d.		tons.	cwt.	qr.	£	s.	d.
1885	311,762	16	0	76,836	13	3	1891	346,804	13	0	74,104	17	10
1886	281,229	0	0	68,616	15	0	1892	236,363	1	0	57,414	13	8
1887	302,137	0	0	79,036	0	2	1893	190,377	19	1	43,241	14	5

1890	343,232	3	1	65,995	3	0							

The Hon. Charles Augustus Goodchap, M.L.C., sworn, and examined:—

1868. *Chairman.*] You have had an opportunity of considering the question of the connection of Broken Hill with the railway system of this Colony;—would you be so good as to give the Committee a statement of your views? I have perused some portion of the evidence given on the subject, and it is with direct reference to that evidence that I wish to offer some observations. I should like to say, first, with reference to some observations which have been made by the Chairman to the Committee about the apparently delicate position which I occupy in this matter, that, were they my own views and opinions, I would not come before this Committee to give any expression of opinion on the subject; but what I shall have to say will not be my own views and opinions—it will be based upon the evidence given by some of the witnesses; and it did seem to me, on perusing that evidence, that there was a certain amount of vagueness in the statements made, and in some cases it was totally free from any definiteness or pertinence. Before this matter came before you as a Committee, I wrote a letter to the paper suggesting that there should be remitted to you the question whether the line from Condobolin to Wilcannia on to Broken Hill would not be the preferable line, rather than a line from Condobolin *via* Menindie to Broken Hill. The reasons I advanced in support of that view were—first; that there was, as I thought at the time, a difference of only 5 miles in favour of the Menindie route; and second, that the crossing place of the river at Menindie was far more difficult than the crossing place at Wilcannia. I have perused Mr. Deane's evidence on that subject, and he shows that the difference is not 5 miles, as I thought, but 22 miles. Further, contrary to all accepted opinions prior to the inquiry (namely, that Wilcannia was the easier place to cross), that Menindie is far more easy as a crossing place, and that the crossing at Wilcannia would necessitate an outlay of some £26,000 more. These are two very important considerations, and I may say at once that they tended to convert my view on the subject, and, accepting Mr. Deane's statement

The Hon.
C. A.
Goodchap,
M.L.C.

28 Aug., 1896.

The Hon.
C. A.
Goodchap,
M.L.C.

28 Aug., 1896.

as accurate, I would certainly say that the line *via* Menindie would, under the circumstances, be the preferable route. I have jotted down some observations with reference to the evidence given on various points, which control in a large measure, as I think, this question. I may say generally that it seems to me that, unless the administrators of the railway can secure the ore traffic from Broken Hill, it is very problematical whether the construction of the line would be justified. It seems conclusive from the evidence that smelting works will not be erected at Lithgow. Therefore, all calculations must be based on the carriage of ore from Broken Hill to Illawarra; and further, that the Commissioners, to secure the traffic, must be prepared to do it for £1 per ton. I see that Mr. Howell in his evidence says that 800,000 tons per annum could be secured at that rate. Mr. Deane says that the heaviest engines could be used on the new line if more sleepers were put in, at an additional cost of £33,000, interest upon which would represent less than £1,200 a year. Turning to page 6 of the Railway Commissioners Supplementary Report for 1895, it will be found that on a grade of 1 in 100, the New Australian consolidation engines will haul 700 tons at a speed of 15 miles an hour. Those engines have been designed and manufactured to carry a very large tonnage. I understand the aim of the Commissioners for Railways has been to increase the haulage power of the engines, to increase the carrying capacity as compared with the tare of the trucks, and to remove, by alteration of the gradients, these obstructions to the carrying of a large load, which, of course, with heavy grades necessarily occur. With these three objects in view, it seems to me that the resultant effect has not, according to the evidence, been produced. There ought to be a very large train load for a moderate grade of 1 in 100. The evidence shows that the ruling grade on the line from Condobolin to Broken Hill will not exceed 1 in 100. The Commissioners in their report give a diagram and the particulars of the engines. They say there that the Australian consolidation goods engine will haul the following loads:—1 in 40, 350 tons; 1 in 75, 615 tons; 1 in 100, 700 tons; 1 in 150, 750 tons. The rate of speed is also given at 10 miles, 12 miles, 15 miles, and 18 miles an hour. I consider that 15 miles an hour is ample speed for goods traffic of this character. With regard to the trucks, there is a diagram given of their tubular waggons with a tare of 10 tons, having a carrying capacity of 22 tons. From these data it will be seen that one of the new engines will haul 450 tons net, that is deducting from 700 tons, the weight of the trucks. It will haul 450 tons, which, at £1 per ton, will realise a gross revenue of £450.

1869. Is that at Dapto? Yes; at Dapto, 750 miles from Broken Hill. Of course, the next inquiry is if you get a revenue of £450 a train, what will it cost you to earn it. I should like first of all to call attention to this fact that this galena ore is easily packed between the wheels, and the truck can necessarily be made very much smaller than if you had to carry a large tonnage of wool, or any other such bulky produce. I think that a truck measuring not more than 14 or 15 feet would be ample to carry 20 tons, and it would not have a tare of more than 8 to 9 tons. Therefore, the load is as 2 to 1 to the tare. The expenses of such a train would be 4s. a mile for 500 miles. For 250 miles of the journey the grades would be very much more severe than 1 in 100. I meet that by providing a cost of 6s. per train mile for that distance. That would admit, if requisite, of an assisting engine being used to overcome these stiff grades. I allow 4s. a mile for 500 miles, and 6s. a mile for the heavy grades. The whole distance would be 750 miles, and the total cost of that train would be, on that calculation, £175. Then the empty running on the back journey would be 750 miles at 4s. a mile. Going back with empties a very much larger number of trucks would be taken even over the heavy grade than would be taken if the trucks were full. Thus the journey from Broken Hill to Illawarra and the journey back would represent a sum of £325. In this calculation no estimate has been made of any return traffic by the train, but, of course, there would be some. It will be seen that at £1 per ton there would be £125 profit upon each train, that is without taking into consideration any carriage back.

1870. *Mr. Wright.* I take it that is the profit on the bare working expenses of the train itself? Yes; £125 would go towards the interest on capital. I include in the 4s. the maintenance of permanent-way locomotive and traffic, and general expenses. That is all included in the 4s. per train mile. I may say that, according to the last report of the Railway Commissioners, the whole of the train mileage for 1896 was run for 4s. a mile. That includes all the traffic on busy and unbusy lines, and that is the general figure which is arrived at in ascertaining what is the expense per train mile of the whole service. The Committee will perceive that an ore traffic, which is loaded by the owners and unloaded by them, requires little care in its transit, no risk or liability, so that in taking an average cost of 4s. per mile for easy grades, and 6s. per mile for stiff grades, a very liberal estimate has been given; there are, in effect, no terminal charges. A total freight of 800,000 tons per annum, and that is the estimate given by Mr. Howell, if the Commissioners can carry it for £1 per ton, would require 1,770 trains at 450 tons per train, which would give a net profit of £221,250 per annum, after paying working expenses. The total amount required to pay interest on capital and working expenses would not exceed, at the outside, £60,000; but I eliminate the working expenses from this, because they are already calculated in the statement which I have given, so that there is only the interest on capital to look to. That would be under £40,000 per annum, even if they constructed the line in the way proposed by putting in additional sleepers, which Mr. Deane says will be sufficient to enable the heaviest engines in the Department to run over them. The line shows a profit of £221,250 per annum. I admit that this statement of the case presents the question in the most optimistic light. There will probably be many factors to disturb this aspect. First, the weight of the haul may be found to be a net 375 tons instead of 450 tons. The evidence of the Commissioners is that the engine will haul 450 tons; but I take it that that may be a little over-estimated, and it will be feasible and reasonable to say that that haulage power will be reduced from 450 tons to 375 tons. Secondly, the quantity of ore may be reduced to 300,000 tons instead of 800,000 tons. It seems to me that 800,000 tons is such a large quantity that one would like to receive such a statement with a little qualification. Moreover, I want to show the worst aspect of the case. Thirdly, a charge of £1 per ton may be found to be too high to attract the traffic. Mr. Howell says that £1 a ton would attract the traffic, but that would materially depend upon what a competition rate might be able to do. I have taken, I think, the lowest rates at which competitive traffic could be conducted from Broken Hill to Cockburn, and from Cockburn to Port Pirie. The Tramway Company could not well reduce their charge below 2s. 6d. per ton for the carriage of stuff from Broken Hill to Cockburn. To carry it from Cockburn to Port Pirie—219 miles—the South Australian Government could not well charge less than 8s. They are charging considerably more than that now; but I am assuming that they would reduce their charges; but they could not well reduce them below 8s. per ton, which is less than $\frac{1}{2}$ d. per ton per mile. The sea freight would have

have to be 5s. per ton. It is now sometimes 4s. 6d., and sometimes 6s. a ton. When they do it for 4s. 6d. a ton it is because they are carrying coal to Port Pirie. I see by the evidence that the oxide ores have given out, and very little coal will be needed in future for smelting purposes at Broken Hill, or even at Port Pirie. Then there are port, insurance, and shipping charges, which may reasonably be put down at 2s. 6d. These figures added together show that the traffic from Broken Hill, by Port Pirie, to Illawarra or Newcastle cannot be conducted under 18s. per ton. I am quite sure that it could not be done for less than that. Say that the Commissioners carried the ore at 18s. per ton for 375 tons, that would give a revenue of £337 per train, and, say, £50 per train for back loading of coal. I am quite certain that either from the coal mine at Illawarra, or from the coal mine at Lithgow there would be no difficulty in obtaining at a moderate rate a return traffic to the amount of £50 per train. That would be carrying the coal back at any price the Commissioners liked, because they might as well put some coal on the trains running empty. If they only charged 10s. per ton or less for the return traffic, that would be so much profit. Now the working expenses, as before, would not be more than £325, leaving a profit of £62 per train. Calculating 300,000 tons instead of 800,000 tons, the number of trains would be 800, which, at £62, would be equal to £49,600. In this last calculation it shows a profit in excess of the Commissioners' estimated loss. Everything has been put down at the lowest. The traction power of the engines has been reduced nearly 17 per cent.; the trainage charge, 10 per cent.; and the quantity of ore to be hauled, over 60 per cent. That statement is derived from the figures furnished by the Commissioners themselves. I have not attempted to make any calculation outside of their calculations, and I do not wish to do so; but I say that the evidence given before this Committee and the evidence furnished in the Railway Commissioners' Annual Report show clearly that the ore traffic, if it can be done at 18s. per ton from Broken Hill, will result in the profitable working of that line, not only paying working expenses, but interest upon the capital. As to the other traffic, I have not gone into it. I am prepared to accept the Commissioners' statements as to what that traffic will be. Besides the 18s. per ton for shipping the ore at Port Pirie and bringing it here there will be a lot of handling. Of course, there will be a great advantage in carrying it right through on the New South Wales railway from bin to bin.

1871. *Chairman.*] It is perfectly clear that the railway will have to face reduced rates and fares;—do you say that 18s. per ton is the minimum? Yes; that is to deliver the ore at Illawarra. I do not think the Commissioners could do it under 18s. a ton and pay full interest on capital.

1872. Then, your evidence is, that if competition by water and the South Australian railway system brought down the rate below 18s., you believe the profit of £40,000 will disappear? There would still be some profit.

1873. Can the Railway Commissioners carry the traffic under 18s. per ton? No; they could not pay full interest on capital from that traffic alone.

1874. Eighteen shillings per ton is the lowest rate at which the transaction would be commercially possible? Yes.

1875. Supposing, that instead of the traffic going to Illawarra and Newcastle, it stopped at Lithgow? Then it could be done for 15s. per ton, or even less.

1876. And you do not believe that the competitive system could land the ore at Illawarra or Newcastle at less than 18s. per ton? No; I believe that on the evidence given. I do not offer any independent evidence. These are the figures.

1877. But the fact that you quote those figures implies that you do not differ from them? I do not differ from them.

1878. *Mr. Humphery.*] In estimating the minimum at 375 tons net for an engine, are you simply quoting from the report of the Commissioners, or are you expressing your own opinion as to the haulage power of the engine referred to? I am not expressing any opinion myself upon the haulage power of the engine. The Commissioners say that it will carry 450 tons. I say let us make a little rebate and reduce it by 17 per cent.

1879. Now, I want your opinion? I have no opinion to offer on the subject.

1880. Are you of opinion that an engine of the type mentioned by the Commissioners will haul in one load 450 tons from Broken Hill to Illawarra? Not without an assistant engine, which I have provided for.

1881. But with an assistant engine for 250 miles, are you of opinion that the type of engine described by the Commissioners will haul from Broken Hill a load of 450 tons net, which would be equivalent to nearly 700 tons? I cannot believe otherwise. They state it, and they have tried it. I saw a report in the paper that the engine took up to Bathurst a load in excess of the Commissioners' anticipations.

1882. Have you any objection to state your own opinion? I must decline to offer an opinion on that subject. I do not wish to give any opinion which seems to be antagonistic to that of the Commissioners. I accept in all good faith their statement that the engine will do that.

1883. Do not misunderstand me. So far as your evidence has gone it has been a commentary upon evidence already given. You are quite qualified to offer an opinion to which considerable weight must be attached, and I should like you to give your opinion. Do you think 4s. would be ample provision for 500 miles with a net load of 450 tons? Yes, I am of that opinion. There is no doubt that the engine would burn more fuel than an ordinary engine, but that is compensated for in various ways, and I think that 4s. per train-load over that grade is a liberal estimate, and would be found ample in practice.

1884. In order to convey 800,000 tons per year from Broken Hill to Illawarra, would not that necessitate five or six trains per day each way? Yes.

1885. Would a single line be sufficient for that amount of haulage? I do not think the difference of six trains a day on what I may call main lines would affect the carrying capacity of a single line. Of course, in the far interior, towards Broken Hill, there would be nothing in the way. Six trains would follow at a respectful distance all day long.

1886. Then, in your opinion, a double line would be unnecessary? Yes. I believe it has been calculated in England by experts that if your trains do not exceed seventeen in a day you do not require to double your lines.

1887. Have you calculated what the expense of haulage per mile would be according to the lowest estimate you have given? It amounts to 0.29d. including interest upon capital.

1888. Is it your opinion, not being guided by the evidence of the witnesses who have been examined, but from your own experience, that the distance from Broken Hill to Illawarra, 750 miles, could be negotiated

28 Aug., 1896.

at a cost of a little over $\frac{1}{2}$ d. per ton per mile? * Yes, for a long and constant haul of that kind. It is very different from a train-load which you cannot depend upon, and which would be varying. I say that 0·29d. for a train-load of that kind is an ample charge. It would pay working expenses and interest on capital. 1889. If we have been told that the very lowest charge, that would cover the cost of running between Illawarra and Broken Hill is $\frac{1}{2}$ d. per ton per mile, do you think that is excessive? I say it is contradicted by their own evidence. Whoever gave that evidence is contradicted by the Railway Commissioners, and contradicted by evidence taken before this Committee. My own opinion is that it can be done for 0·29d.

1890. That is a little more than half of the estimate given to us? Yes; that is to say, if the engine will do what it is represented to do.

1891. Am I right in believing that you have expressed the opinion that the engine will do what it has been estimated to do? Yes; I think it ought to do it. I know it is a combination of what is known as the American consolidation type, with all the good qualities of the English engine added thereto, and in America engines of that character haul quite as great a load as this engine will be asked to do.

1892. Can you mention any railways at the present time that are hauling at a rate of a little over $2\frac{1}{2}$ d. per ton per mile? Yes; in America the rate is less than $\frac{1}{2}$ d. per ton per mile in some cases.

1893. Can you specify the lines? It is done across the prairies; I do not know the names of the lines in America, but I know that in the conduct of the great wheat traffic it is carried at less than $\frac{1}{2}$ d. per ton per mile.

1894. In estimating the cost of haulage at 18s. per ton, have you taken into consideration all conceivable expenses, including contingencies? Yes.

1895. You have no doubt that the railway would cover expenses at that rate? Yes; provided that they can get the ore.

1896. That is assuming a minimum carriage of how many tons? 300,000 tons.

1897. That is without taking into consideration the estimate of the Railway Commissioners for goods and passenger traffic? Yes; without going into that question in any way, except that I should like to say that the cost that they estimate for the conveyance of general merchandise must be lessened by the fact that some of it would be taken by the return trains which bring down the ore.

1898. Why have you estimated that the South Australian railways and the Silvertown tramway could not carry ore from Broken Hill to Port Pirie at the same rate that you think the ore might be carried from Broken Hill to Illawarra? Their engine power is very different, and the gauge of their line is not so wide.

1899. What do you estimate is the very lowest freight at which the South Australian railways could convey ore from Broken Hill to Port Pirie? I do not know what rate they might charge for strategic reasons, but commercially they could not do it under 8s. per ton from Cockburn to Port Pirie.

1900. How much would that be per mile? A half-penny per ton per mile; they could not do it for less.

1901. In your opinion, although the New South Wales Railway Commissioners might carry it for a little over $\frac{1}{2}$ d. per ton per mile, it would not be possible to convey the ore from Broken Hill across the South Australian railways for less than $\frac{1}{2}$ d. per ton per mile? Yes.

1902. Why could not the South Australian lines be equipped in the same manner as the New South Wales lines, so as to carry the ore at the same rate? If they made the railway precisely similar to ours, or even stronger, and equipped it with the same engine power, I think they could carry it at nearly the same rate, except that their 3-ft. 6-in. gauge, instead of 4-ft. 8½-in. gauge, would militate against the tare of the trucks being so light as ours in comparison with carrying capacity.

1903. What difference would the different gauge make in the hauling power of an engine? Arbitrarily, I would put it down at about 100 tons.

1904. That would be 100 tons in favour of the New South Wales broader gauge to start with? Yes.

1905. That would be equivalent to more than 25 per cent.? Yes. I should not like to speak as if I were giving an authoritative opinion on an abstract subject of that kind.

1906. Have you taken into consideration the cost of fuel? Yes.

1907. That would also go to increase the cost of haulage on South Australian lines? Yes; undoubtedly.

1908. That is another factor in the competition that would probably arise between the two lines? Yes.

1909. So you think you have not underestimated when you fixed 10s. 6d. as the probable minimum cost from Broken Hill to Port Pirie? No.

1910. We are assuming that 18s. must be regarded as the minimum at which the New South Wales railways could convey ore from Broken Hill to Illawarra, or 15s. per ton to Bowenfels? Yes; anything below that would not pay interest upon capital. Eighteen shillings per ton will not only pay working expenses but also interest on capital.

1911. Anything below 18s. would leave a loss, including interest? Yes; the amount of loss being dependent upon the sum of the reduction.

1912. You have had under consideration all the various routes proposed for this railway—would you like to express an opinion as to which would be the best route? The shortest route would be the best, in view of the possibility of getting the ore traffic.

1913. Is that the only reason for extending the line to Broken Hill? Not the only reason, but the only adequate reason, commercially speaking, because I cannot conceive that that line will pay working expenses and interest on capital, unless it has the ore to carry.

1914. Do you mean that there are other reasons which might influence the construction of the line? In reading through this evidence, I have noticed that there are other reasons—national reasons.

1915. That would not weigh with you? As a railway manager, I do not think I would allow that to weigh with me.

1916. *Mr. Trickett.*] Is not $\frac{1}{2}$ d. per ton per mile the lowest rate at present charged by the Railway Commissioners for any commodity? I see by the evidence that that is the lowest charge.

1917. In estimating that this ore should be carried on the railways for $\frac{1}{2}$ d. per ton per mile, have you taken into consideration the question of fuel? Yes.

1918. Would not the coal necessary for the return journey have to be conveyed by the train right away to Broken Hill and be brought back again? The return trucks going back empty, or for the most part empty, would carry the coal required for locomotive purposes, and it could be staged, *en route*, where required.

1919.

* NOTE (on revision).—The difference between $\frac{1}{2}$ d. per ton per mile and 0·29d., though apparently unimportant, really means, on a large traffic like this, no less a sum than £100,000.

1919. You have taken that thoroughly into consideration? Yes.

1920. Have you taken into consideration the difficulty of watering between Mossgiel and Menindie? I see by Mr. Deane's evidence that there would be ample provision made for that. That, of course, is a capital charge, and is not included in working expenses, unless it might be necessary to pump the water.

1921. Have you brought all your long experience to bear in trying to see everything in the view which you have put before the Committee? Yes.

1922. You think the whole success of the line would depend upon the quantity of ore to be carried? No doubt.

1923. The lowest quantity you have put it down at is 300,000 tons? Yes.

1924. That is the quantity they say they can smelt per annum at the new works at Newcastle. Supposing it is a fact that all the mining companies at Broken Hill have entered into a contract with the Silverton Tramway Company for a period of seven years from the 1st January, 1897, to send ores and produce over the tramway and the South Australian railway, would that alter your view of the payable traffic to come by the proposed line? Yes; of course if they have entered into a contract like that, they must observe the contract, or pay the penalty.*

1925. If the ore only amounted to 100,000 tons per annum, it would not be worth while constructing the line? No.†

1926. *Mr. Wright.*] You have read the evidence of Mr. Deane as to the construction of this railway, and the manner in which he intends to strengthen it;—do you think that the road could be strengthened sufficiently to bear this enormous traffic? Mr. Deane seems to have had some recent evidence as to the power of these roads to stand traffic of that kind. He says that by putting the sleepers closer together he can construct a road which will bear the largest engines we have.

1927. *Chairman.*] Have you not allowed for that in your calculation? Yes.

1928. *Mr. Wright.*] Do you think, from your own experience, that a road laid as Mr. Deane proposes, even with additional sleepers, would carry the enormous weight of these engines drawing 450 tons net weight, the rails being 60 lb. to the yard, without ballast, and with two additional sleepers? I should say, from my past experience, that it would be rather a weak road to depend upon, but there is this factor to be considered—that the rate of travel is not to be more than 15 miles an hour.

1929. Do you not think that this road would batter up very soon with the enormous weight of the engine and loads? I know our estimate used to be that an engine with a tender carrying coal and water weighing over 100 tons could not be carried on a 60-lb. rail, but may be done if they strengthen the rail by putting the sleepers closer together, which is the practice in America. If by the addition of two sleepers in an 18-feet rail it can be so strengthened as to carry this weight, I think a discovery has been made which was not made in my time. But railway science is progressive, and they may have discovered it since.

1930. If you were Railway Commissioner, knowing nothing more than you know at present, would you sanction the construction of such a line to carry these weights over it? No; I would want a very much heavier rail to start with.

1931. According to your lights, to carry this traffic a heavier rail than 60 lb. will be required? Yes; unless the weakness of the rail can be provided for by placing the sleepers closer. That is an engineering question on which I would not like to offer an expert opinion.

1932. I ask you your opinion as to the position you would take up? If I were Commissioner for Railways, and that proposition were placed before me, I should receive it *cum grano salis*, and ask for further information.

1933. In your estimate of traffic of 365 tons net weight for a train, do you think one push-up engine would be enough to bring it over the mountains? I understand that although it would be a heavy train it would be a short train, not more than twenty trucks, of 15 feet long. That would be easier to get over. There is no fear with an assisting engine of buckling the train.

1934. In your experience as a Railway Commissioner, what was the heaviest load that the strongest Beyer-Peacock engine which you had would carry over the mountains? I got an engine when I was Commissioner for Railways from America called the 105 class. I said to the locomotive engineer that I wanted that engine to take up a gross train of 200 tons from Penrith up the Zig-zag—1 in 30. The locomotive engineer made a calculation, and he told me I could not do it—that it was utterly impossible. I said, "I will try it nevertheless. There may be a stoppage and there may be a run-back, but I will have an assisting engine there to back up the train in case of that occurring." However, we went away with the load and carried it to the top with the greatest ease.

1935. What was the net weight of your load? I should say about 160 tons.

1936. Against a net weight now said to be able to be carried of 450 tons? I do not say that that engine would not have done more.

1937. Is that the greatest load you knew to be taken over a mountain grade with one engine? I think a greater load than that was taken. A similar engine got out by Mr. Middleton took a greater load.

1938. Is not this Australian consolidation engine said to be able to carry 450 tons net load on a grade of 1 in 100? Yes; it is stated so here.

1939. From your experience, what net load would that engine carry over a grade of 1 in 40? I do not know the character of this engine, but it says here that on a grade of 1 in 40 it will take 350 tons.

1940. What would be the net load on a grade of 1 in 40? You may take the tare at one-third; that will be 234 tons net.

1941. Do you care about expressing an opinion as to the capacity of these engines? I really do not know anything about them. I know the diameter of the wheel and the cylinders, and the length of stroke, and all that sort of thing, and by a formula which engineers have they calculate what an engine will do under these circumstances.

1942. You assume that that report having been published it is correct? Yes; I cannot assume anything else.

1943.

* NOTE (on revision):—Too much importance should not be attached to this alleged contract; it could possibly be upset on the ground that it was made contrary to public policy; or, if sustained, the compensation for loss would not be large. It must be remembered that it is only a contract for 35 miles of traction.

† NOTE (on revision): 100,000 tons would only give a contribution to interest on capital of some £16,000, after paying working expenses. The answer given by me is qualified to that extent.

- The Hon. C. A. Goodchap, M.L.C.
28 Aug., 1896.
1943. Do you think you have made a liberal calculation as to the expenses per train mile? Yes.
1944. What is the general cost per train mile? A mere fraction over 4s. per mile. That is according to the last report of the Commissioners. That includes all expenses.
1945. Without including interest on capital? Yes.
1946. What were the earnings per train mile according to the last report? 7s. 3½d.*
1947. Do you think, from your past experience, that this traffic could be carried from Broken Hill to Illawarra for 18s. a ton and leave a margin of profit? If the engine can do what it is represented to do that can be done easily.
1948. Have you noticed the evidence given by the Secretary for Railways on this question? Yes.
1949. In answer to me, he said that the Railway Commissioners were cognisant of the evidence he was giving, and he stated he did not think it was possible to carry the traffic for less than ½d. per ton per mile. We have also Mr. Harper's evidence, and he seems very emphatic that a profit cannot be made;—what is your opinion of that? You have all had some experience of public officers, and that while they are not aware of it, they are prejudiced in their evidence. They do sometimes, unconsciously, manage to give such evidence as would seem to meet some particular views and opinions and wishes. I should not like to say anything against those officers. I know they are very valuable.
1950. Do you not think that if they gave evidence of that kind they might give evidence to suit the views of the Commissioners? I would not say that; their evidence is given on oath. I noticed that Mr. McLachlan said in answer to one question that the circumstances might change, and that the Commissioners might think it desirable to make a lower charge. I do not know in what way the circumstances could change. The natural features of the country cannot change.
1951. *Mr. Fegan.*] Did you not state, in reply to Mr. Wright, that if you were Railway Commissioner, and such a line as this were recommended for the traffic from Broken Hill, you would not approve of it? I would like to construct a stronger line to carry traffic of that kind.
1952. If you look at the official description, will you not see that provision has been made for the present traffic, and also the prospective traffic? They propose that if the traffic is very large to strengthen the line.
1953. What is your opinion with respect to present conditions? If we take the estimate of the Railway Commissioners, I am sure the line is quite strong enough.
1954. In that case you would take the same course? Yes; they do not anticipate getting any ore.
1955. But if a huge output of ore were carried at £1 per ton, you could not recommend such a light railway? I should like a heavier line of railway.
1956. In your estimate, I understand you do not make any provision for any traffic other than the ore? No.
1957. Taking the Commissioners' estimate with your estimate, £30,000 more should be added to the revenue for the carriage of other goods? Yes.
1958. Taking the very lowest estimate, you think this would be a paying line? Yes; always provided that they can get the ore, and that they can carry it as they state there they can.
1959. What would you consider to be national reasons for the line? That is a very wide question; probably the amelioration of the condition of the people resident in the district might be a national question. I have no doubt it is.
1960. Also connecting the westernmost city with our own metropolis? Yes; and there is a good commercial reason too, because all railways are more calculated to pay if they run from one large centre to another.
1961. Also in view of the competition of the various colonies as far as the railways are concerned, do you not think that we should try to gain this traffic for our railways? I have no doubt of that in my own mind. I look upon it in this way from a national point of view: that the Government of this country own the locality; they are providing for the government of that part of the country; they erect Court-houses, administer justice, they secure every man in his rights, and preserve law and order; but we are getting from that part of the country no benefit, except, it may be, a slight benefit from the sale of land. Commercially we are at present cut off from that part of the country.
1962. Therefore, the construction of this line, in order to bring the people of Broken Hill near to us, ought to be a consideration with this Committee? There is no doubt about that.
1963. If this line were constructed, what would be the difference in the charge for carriage of the ore to Cockle Creek, as compared with Illawarra? It is a very stiff line between Cockle Creek and Sydney, and I should be inclined to make a higher charge if it were taken to Newcastle. I should be inclined to put on 1s. 6d. per ton more.
1964. That would be 21s. 6d. per ton? Yes.
1965. Even that would be less than they are now charging for conveying the ore by way of Port Pirie? I believe the present charge is 25s. per ton.
1966. *Mr. Roberts.*] Assuming that this line were constructed on the understanding that the ore would be carried at the rate of ½d. per ton per mile,† might not that lead to a reduction in the charge for carriage of similar freight all over the Colony, thus rendering what are now paying lines non-paying ones? If I were the administrator of the railways, I would not allow such a consideration to weigh with me for a moment. I would be going for special traffic under special circumstances, and I should make it exceptional, and not allow it to be made general.
1967. Would not a demand be made for a reduction by people who are now paying ½d. per ton for similar traffic? That might be the case, but it would be very unwise to give way. I would give way if the circumstances were identical. Give me the same train-load for the same distance, and I would do it, and make a profit out of it.
1968. *Chairman.*] Have you taken into consideration the difficulties in working the Zig-zag. We have already had representations made to us that the Zig-zag is pretty well choked now with traffic? I have taken all that into consideration. I think it is possible that the Commissioners will soon find another route to overcome that difficulty.
1969. Do you not regard the question of passing the number of trains required over the Zig-zag to meet this traffic in conjunction with the present traffic rather serious? I cannot assent to that.

* NOTE (on revision):—To show the economic advantage of constant and heavy loads, such as this ore traffic will provide, it may be pointed out that notwithstanding the low rate proposed to be charged, the earnings per train mile will be at the lowest computation 9s., while the average earnings for all services are only 7s. 3½d.

† NOTE (on revision):—See note to Question 1888.

WEDNESDAY, 14 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Richard Sleath, Esq., M.P., sworn, and examined:—

1970. *Chairman.*] You are Member for the Electoral District of Wilcannia, in the Legislative Assembly of New South Wales? Yes.

R. Sleath,
Esq., M.P.

1971. Would you like to put your views on this proposal before the Committee in the form of a statement? I will make a short statement. I know the country fairly well on both routes. I know Broken Hill, and have a fair knowledge of its trade, and I am perfectly satisfied that railway communication with Broken Hill is advisable. I am not in a position to say whether the railway would pay immediately on its construction or not. I am inclined to think that it would not; but from my experience I believe that in a short time it would pay working expenses and interest on cost of construction. In my experience in that part of the Colony, I found that periodically we get spells of dry weather, and the only outlet for the greater portion of that western country is by means of water carriage by the Darling River. Last year, for some four or five months, the river was not navigable, and it has been explained to me by business men the great loss it is to them when anything of that kind occurs. When their only means of transit is blocked it is most expensive to adopt any other means. In dealing with the produce for Wilcannia, I know when I was up there eighteen months ago they were getting their stuff through from South Australia to Broken Hill, and thence by teams to Wilcannia. Owing to the drought there was no water on that track, and I suppose almost a score of teams which started from Broken Hill were unable to get through. The bullocks died by the way, and their stuff was simply stranded. If there were railway communication, the whole of the produce would go by rail undoubtedly; for it has been pointed out that, depending as they do now on the river carriage, they have to keep a very large stock in hand, and the saving of interest on the surplus stock, and the insurance, would more than compensate for the extra cost of carriage by rail. To the north of Wilcannia, lately, there has been a good deal of fresh development in regard to mining, and although no one can positively say yet what the future of these gold-fields may be, certainly at the present time it looks much better than ever it did before. There are several hundred more men employed, and there is a great stretch of country now being taken up for reefing purposes, which previously was unthought of. It was not supposed to be auriferous. What the ultimate development may be no one can say. Then, close to Wilcannia, there is opal-mining, where quite a number of men are employed—I suppose 400 or 500. Lately there has been a fresh discovery made about the same distance from Wilcannia, but about 30 or 40 miles from the present place where mining operations are being carried on. The route from Cobar to Wilcannia is much shorter—almost 100 miles—than the route from Condobolin *via* Menindie to Wilcannia, and the cost of construction would, I think, be about the same. The nature of the country is much the same, and the cost of construction would undoubtedly be about the same. The quality of the country is also much the same. It undoubtedly is better country at Condobolin, and around Hillston, and in those districts, than it is at Cobar. But, taking an equal distance from Broken Hill either way, it is much the same character of country. There is very little to be said in favour of one as against the other. The cost of bridging the river would, I think, be much about the same. One advantage which the Cobar route would have over the Condobolin route—and I think it is rather an important one—is that it would almost go through the centre of that western country which is not supplied with railway communication. A railway by the Condobolin route would go within a reasonable distance of the Hay railway line, and would undoubtedly take an amount of traffic which now goes to Hay and thence to Sydney by rail. Although it might be some advantage to those closely adjoining the proposed route, I do not know that it would be of much general advantage to the whole of the western country. If the railway were constructed by the other route, unless some very great reduction was made in the cost of freight, I do not for one moment expect that we would get anything like the whole of the Broken Hill mine traffic. I feel satisfied that it would be almost impossible to construct a railway to bring sulphide ores direct from Broken Hill to Sydney. In my opinion that should be left entirely out of the question, because I am sure it would never be done. But undoubtedly if railway communication was established direct with Sydney from Broken Hill, an amount of traffic other than the mine traffic would undoubtedly go right through. At the present time the position is, perhaps, not quite so bad as it was a few years ago. When the fiscal policy of this Colony was of a protective character, the people of Broken Hill had to get their produce from another Colony. Their butter, bacon, cheese, and that sort of thing had to come from South Australia, and they had to pay customs duty in addition to railway freight. They had something like 200 or 300 miles of railway freight to pay as well as the duty and the trouble of clearing the goods at the Customs House. The people complained very bitterly that they were shut off by circumstances from the other portions of this Colony, and were unable to trade with those portions. Should a railway be constructed by either route to Broken Hill, there is no doubt that there would be a fair demand for, and a considerable traffic in timber and that sort of thing. The timber which has been used at Broken Hill—and great quantities have been used—has been mostly imported from Puget Sound, Tasmania, New Zealand, and Western Australia. It has been found that the cost of getting our inland timbers first to the seaboard, and thence by water carriage to Port Pirie, or Port Adelaide, and thence by rail to Broken Hill, would make it too expensive for them to use at all. For this reason New South Wales timbers have never really had an opportunity of being used—or even being tested to see whether they are suitable for mining purposes or not. Some years ago, those who were interested in railway construction took the trouble to estimate the cost of bringing coal direct from Lithgow to Broken Hill by rail. At that time they were able to show that coal could be landed in Broken Hill cheaper from Lithgow direct by rail than from Newcastle by water to Port Pirie and thence by rail to Broken Hill. But I believe the reductions which the Government of South Australia have since made in their railway carriage would somewhat compensate for the figures which were then, no doubt, perfectly correct.

14 Oct., 1896.

1972.

76. 1/4

R. Sleath,
Esq., M.P.
14 Oct., 1896.

1972. If a railway is to be constructed to Broken Hill, you favour the northern route for three reasons—first, because geographically it is the better route; secondly because the traffic it gets will not be a leakage from other lines; and thirdly because the recent discoveries would make it appear that the district north-west of Wilcannia would be a good mining centre? Yes.

1973. You have expressed no opinion with regard to the comparative merits of the country along the two routes from a pastoral standpoint? I do not think I have. Of course, anyone who happens to travel over one portion of either route would hardly be in a position to form a very correct opinion as to the quality of the country, because, as you know the country changes, and you find good patches as well as bad patches. I have travelled over most of that country several times; in fact, I have travelled through it for a number of years, and I am satisfied that taking the same distance from Broken Hill on either route the country is somewhat similar, and the carrying capacity is about the same.

1974. There is no material difference? I do not think so. On the Condobolin route we have a length of nearly 100 miles of better country. It is only 270 miles from Broken Hill to Cobar, and it is about 370 miles from Broken Hill to Condobolin; and, of course, the last 100 miles, as you go towards Condobolin, would certainly be much better country than that which is closer to Broken Hill; the rainfall is much better.

1975. Roughly speaking, your last reason is that approximately there is 100 miles less line to construct at a proportionately less expenditure? Yes.

1976. You dismiss at present freights the question of the railway carrying ore? Yes; at present freights it would be impossible.

1977. You do not see how it is going to compete? It cannot compete at present freights. I am not a railway expert, but I know that some years ago, in America, when the private railway companies were not paying, in fact, were very far from paying, they made tremendous reductions in different parts of the States to carry low grade ores. I have no personal knowledge, but I am informed that the private companies were able to make tremendous reductions in the freights so long as they could carry as much as they wanted to carry at their own time. If they could take 10,000 tons of ore one week, and none next week, or if they could just take the ore as they chose, they made tremendous reductions, of course the reduction in the price of silver would make a difference; but at that time a number of mines which had been unable to work before were able to work afterwards at a profit. I do not know what the Railway Commissioners may do, but at present rates it would be simply impossible for the railway to compete with the other means of carriage. If a railway were constructed to the river from Broken Hill, they would be able to get water carriage. In that way, I think, they would be able to carry sulphide ores, and land them either at Illawarra or at Newcastle more cheaply than they could take them to Port Pirie and bring them round by water to those places, because instead of having 230 miles of railway carriage, they would only have one-half that length. By the route to Menindie they would have only 65 miles, and by the route to Wilcannia, they would have 110 miles rail carriage, and then they would only have the water carriage down the river.

1978. You go down the river I suppose to Goolwa, and, perhaps, to Port Victor? Yes.

1979. Again, it becomes a matter of freight? Quite so. I am not in a position to say how it would work out, but it might be done in that way. In the treatment of refractory ores what is required is either fire or water. In Broken Hill they have not a sufficient supply of water to treat the ores at anything like a reasonable cost. They have erected on one of the properties there a new system of concentration known as the Hancock Jig. I had some experience of the concentrating plant on the Proprietary mine. I was in charge of the plant for some time, and the great difficulty we had to contend with, among other things, was the inferior quality of the water. We had to use very highly mineralised water, which did not give a satisfactory result; sometimes it was in that state that it really was not fit for concentrating purposes. If you had railway communication to the river, it is probable that a concentrating plant might be erected on the river to reduce the amount. Some of the refractory ores in Broken Hill, and there are great quantities of them, before they could be properly dealt with, would have to be reduced at least 1 ton in 5. The carriage either by rail or water of the concentrates containing the silver and lead in the 5 tons of ore, would not be so great then. Up to the present time there has been no opportunity to do anything like that. Some time ago it was proposed to erect concentrating works on a larger scale at Port Pirie; but that, I think, was abandoned, because the concentrators then in use did not give satisfactory results. After some years of experimenting they have adopted this Hancock Jig.

1980. *Mr. Fegan.*] Which is a thorough success? I can quite understand that it is, because those who have been experimenting have had a very long experience in the treatment of ores, as well as an experience of all sorts of concentrating plants. If you could get any amount of water within, say 60 or 100 miles of Broken Hill, it is just possible that with a concentrating plant—not necessarily in connection with the Proprietary mine, because around Broken Hill there are miles of country containing any amount of low-grade ore which would pay for working if there was anything like a reasonable means of extracting the mineral—it is more than likely that if the railway was constructed in the near future a concentrating plant would be erected on the river where they would have a continuous supply of water.

1981. *Chairman.*] You are aware that there is likely to be a great alteration in the location of the treatment of Broken Hill ores? Yes.

1982. That means a tendency to take the ore to the coal? Yes.

1983. Is it not likely to alter the whole aspect? It will, to a very great extent. Up to the present time, the ores which have been treated at Broken Hill have not been what you may term refractory ores, but free ores. They have never attempted to treat refractory ores to any extent; but even amongst the free ores—the ordinary carbonate of lead ore—there is any amount of ore of a low grade character, in and around Broken Hill, giving 10 or 15, or perhaps in some cases, up to 20 ounces of silver, and carrying very little lead probably. It will not pay to smelt that ore in Broken Hill; in fact the smelting is so expensive that it would not pay to smelt that ore anywhere. But by putting it through Hancock's Jiggers, you would reduce 5 tons (purely by water, without any fire at all) to perhaps 1 ton, and save, perhaps, 90 per cent. of the mineral that was in the 5 tons. In the case of sulphide ores, undoubtedly the tendency is to take the ore to the coal; but outside the sulphide ores there is any quantity of low grade free ores in and around Broken Hill which will never be worked at a profit until they get a cheap supply of water in Broken Hill, or are able to take the ores cheaply to where there is water. Still a great quantity of ore being raised now at Broken Hill is sulphide.

1984. You are speaking of the possibilities rather than the present outlet? As a matter of fact, even in some of the mines right on the line of lode—if you take the British mine, it has in sight, I suppose, thousands of tons of low-grade free ore, oxidised ore; and so it is in a number of other mines. But it will not pay them to raise it now, because they have no means of treating it.

R. Sleath,
Esq., M.P.

14 Oct., 1896.

1985. In your opinion, is the river a cheaper means of transit for most of the produce of the Wilcannia district than a railway, when the river is navigable? Yes, undoubtedly, for wool and all that sort of thing.

1986. With an intermittent river, you think it might be wiser, sometimes, to pay a higher freight by railway than to have the delay in the river carriage? Yes. Within the last two months, owing to the river being low, and not in too good a condition, about seven or eight barges have been sunk, and in a great many cases nearly the whole of the wool has got wet. That, as you know, reduces the value of the wool by a long way.

1987. Do you know what the freight from Wilcannia to Broken Hill is by road? It is about £5 a ton, under ordinary conditions. During the severe drought last year it was more than £5 a ton, because when a teamster took a load out from Broken Hill the chances were against his getting through with his load. Perhaps he would lose all his bullocks, and would not be able to get the freight over.

1988. You mean that in a really serious drought the traffic would be suspended? It would. Generally speaking, the carriage out there under ordinary circumstances is 1s per ton per mile. In favourable weather, when there is plenty of grass and that sort of thing, you may get loading taken at a somewhat cheaper rate, but when it is scarce it is more costly. As regards the teamsters' union which was formed at Bourke, Hay, Wilcannia, and Broken Hill that was their minimum rate.

1989. *Mr. Trickett.*] Do I gather from your evidence that you think a line from Broken Hill to Menindie would largely suit the requirements of Broken Hill? I think it would. Of course it will become a question of railway policy as to whether it would be advisable to do that, but a line from Broken Hill to Menindie would, in a great measure, meet the requirements of Broken Hill.

1990. Looking at the whole question from an economical point of view, as well as a national point of view, if the whole scheme could not be carried out justifiably, you think that a line from Menindie to Broken Hill would very much suit the requirements of Broken Hill? Yes, and I believe that it would pretty well pay.

1991. You think it would pay? I am satisfied that it would in many ways. Some members of the Committee have visited Broken Hill and seen what sort of a place it is, and know that the people have very little opportunity to get away from the heat and dust. If excursion trains could be run on Saturdays, the passenger traffic would be pretty heavy. The returns from passenger traffic alone, if special trains were run, would be pretty heavy.

1992. It would also open up a very large timber trade for fuel purposes? Yes, for fuel purposes, because an order has been issued by the Department of Mines that people are not to cut timber within 10 or 20 miles of Broken Hill. There is very little timber to cut within that area, because the little timber which was within the area has been used during the last ten or twelve years. They used it very largely in the mines before they got railway communication from Terowie.

1993. Having been a resident of Broken Hill, and being in pretty frequent touch with the place, are you able to say whether the feeling of the people is very much in favour of a railway to Menindie? Yes, I am positive that the people are anxious to get railway communication with the river. They are not particular if it is to come from Sydney. I am certain that they are indifferent whether they get it from Cobarr *via* Wilcannia or Condobolin *via* Menindie, but I believe they would be perfectly satisfied with a railway from Broken Hill to Menindie.

1994. You have referred to the quality of colonial timber for mining purposes. As the difficulties of moulding and handling colonial timber are so great, do you think that the mining companies are likely to prefer imported timber for mining struts and so on? The advantage in using the imported timber, speaking more particularly of Oregon, which is generally used, is that it stands the different gases underground very well. It does not fret underground. It is very light and easily handled, and comparatively speaking, it is pretty strong; but for some classes of work it is absolutely useless. For instance, in regard to shaft work and that sort of thing it is absolutely necessary to have some sort of hard timber.

1995. Do they use hardwood timber now? Yes. I do not know where they may be getting their timber from, but when I was more closely connected with mining there we used to get a good deal of West Australian jarrah, and Tasmanian stringybark. We also used a quantity of New Zealand pine, but it was not very good mining timber.

1996. Do you think that with easy access to the mines our hardwood timber would be largely used? I do not mean for a moment to say that it would entirely take the place of imported timber, but I am perfectly satisfied that a great quantity of colonial hardwood would be used. In 1890, owing to the weather, I believe, two timber vessels did not arrive. A vessel was supposed to arrive every month, but at that time two months had elapsed without a vessel arriving. We were entirely out of timber, and the mining companies had to send to Sydney, Melbourne, and Adelaide to buy up all the old timber, which had been used for other purposes, and at very great expense they got some inferior stuff. Undoubtedly, if there was a means of getting New South Wales timber to the mines, the directors would use a fair quantity of it, not only because it would be suitable and cheaper than they could get it elsewhere, but because it would be a supply upon which they could fall back in the case of a failure, such as I have mentioned.

1997. I understand that you prefer the Wilcannia route to the Menindie route? Yes.

1998. Can you state how the two routes compare as stock centres which would be likely to feed the railway? I do not know if I could go into details. As far as stock centres are concerned, judging roughly, the whole of the stock for the whole of the north-western portion of New South Wales comes to Wilcannia. They travel very often on to Bourke, and there they are shipped by rail, or travelled further. Then again they travel through by Hay on to the Victorian border. Not only the stock produced in New South Wales comes through Wilcannia, but great quantities of both cattle and sheep from the borders of Queensland.

1999. Those are mostly travelling to the southern market? They travel both ways. They come up to Wilcannia, and they travel also to Adelaide. As far as the carrying capacity of the country is concerned, the average of sheep to the acre would be much about the same. By the railway by the Condobolin-Menindie route they would get easier access to the Hay railway.

R. Sleath,
Esq., M.P.
14 Oct., 1896.

2000. You recognise the fact that the pastoralists would still use the river for wool carriage? Undoubtedly. I feel confident that no matter which way the line may go the only freight which would really come from the river would be the ordinary produce. The necessary goods for consumption would, undoubtedly, come by rail from Sydney if it was constructed, whether the river was up or down. It would pay the merchants there to get them sent by rail.

2001. Speedy transit and the non-necessity of over-stocking, and the risk of catching a market would influence their decision in favour of using the railway? Just so. Then there is the saving in insurance to be considered. Some storekeepers in Wilcannia keep from £8,000 to £12,000 worth of stock in hand. 2002. With a continuous means of transit, that could all be dispensed with? Yes; it could be brought down to a small amount.

2003. Your chief reason for urging the adoption of the Cobar-Wilcannia route is that it would serve a country which is not well supplied with railway communication, and that the lower line is within fair touch of a line of railway? Yes, the pastoral country being about equal, and the mineral country being so much better.

2004. That is up towards Mount Browne and those places? Yes. The Rev. Father Curran has been reporting on that country lately, and Mr. Slec has also been over that country. I have not got a copy of their reports just now, but I know that Mr. Slec's report is highly favourable; and I am satisfied that Father Curran's report will be a favourable one, and that there are vast possibilities in that country lying to the north of Wilcannia in regard to mineral development.

2005. *Mr. Wright.* Do you know the country well between Cobar and Wilcannia? Very well.

2006. Is there much traffic likely to be picked up along that country by a railway—suppose a railway was built from Cobar to Wilcannia, would there be much intervening traffic? There would certainly be a considerable amount of traffic. Around Nyngan quite an amount of chaff and that sort of thing is produced. The people beyond Cobar complain bitterly of the great cost of road carriage between Cobar and Wilcannia. There is no agricultural land between Cobar and Wilcannia, and the only freight you would pick up there would be station freights, such as wool and stock.

2007. Do you know the district known as the Paddington Blocks, including Mr. McPherson's station? Yes.

2008. Is it not all good country through there? Yes; it is certainly some of the best country west of Cobar.

2009. It is all wheat land, is it not? It is only lately they have started to grow wheat. I could not say what the result of their experiment has been.

2010. All that country has good red soil? It is certainly splendid soil, but it is only a few years since they started growing wheat there. During the last two years they have had so little rain that they have not had a proper trial.

2011. Do you think that the whole of that country from Cobar to Wilcannia, with the amount of rainfall, would produce large wheat-crops? I am perfectly satisfied that there is no land in this country, or in any other country, which would produce better wheat-crops if it had anything like a fair rainfall.

2012. You are aware that it does not require a very heavy rainfall to produce wheat? No. Within 2 or 3 miles of Wilcannia they have produced some excellent wheat.

2013. If a railway is constructed from Cobar, *via* Wilcannia, there is a possibility that a great deal of that country might be used for growing cereals? Yes; and eventually I am satisfied that it will.

2014. How is the country along the projected line from Willandra Creek to Menindie suited for the growth of cereals? I am inclined to think that the soil is not so good.

2015. It is inferior soil to the other? That is my opinion.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane,
Esq.
14 Oct., 1896.

2015. *Chairman.* You desire to make a statement to the Committee? I do. Through the favour of the Committee I have been enabled to read Mr. Goodchap's evidence and compare it with the answers given by me to questions 354 to 367, inclusive. I find on reading my evidence over it is not as clear as it might be, and although the conclusions drawn by myself are right, the statements evidently misled Mr. Goodchap. I now wish to put the matter in a clearer form, and request that the Committee will allow these observations to be added to my evidence. It was never proposed that, on the cheap lines in the interior, engines of the P., J., or T., class, with axle loads of from 15 to 16 tons, should be used on them—nor is there any necessity to do so. Even on the line under consideration, with its possibility of "heaviest mineral traffic" there is no need. Trains of 300 tons are quite possible on grades of 1 in 100 if locomotives with axle loads of 12 tons are used, and the heavy or rather long trains of 700 tons, mentioned by Mr. Goodchap, can be drawn over the line on more favourable grades without having recourse to the new 'I' class of locomotives. For this kind of traffic, however, I recommend additional sleepers. The Condobolin-Broken Hill line, as authorised, was to be of the cheapest possible construction, with 60-lb. rails, and for the most part without ballast. I have satisfied myself of the practicability of conducting traffic, and even large traffic, under these conditions, and I have always stated that where heavy locomotives are to be used, it is advisable to put down a heavier rail. I have also pointed out that the earth road without ballast is a temporary expedient, to be improved as time goes on by ballasting. This is in accordance with American practice, where roads are first laid without ballast and afterwards improved. With regard to the short trucks weighing 28 or 29 tons gross, the use of which is proposed by Mr. Goodchap, I consider that they would be most detrimental to the road. The load per axle would be so heavy that with the short wheel base the oscillation induced during rapid runs would give the permanent way a terrible knocking about. There is, however, apparently no necessity for such a class of rolling-stock. Bogie trucks, 30 to 35 feet long, will carry the same load, and can be made as light as the proposed short ones, and the running would be easier. The only difference would be that the trains would be longer. The grades on the Condobolin-Broken Hill line would be quite suitable for long trains without using the heaviest class of locomotives. With the exception of the two ends of the line where grades of 1 in 100 may prove unavoidable, nothing worse than 1 in 150 need be anticipated. At the ends of the line an auxiliary engine can help to pull up the loads if necessary. Probably the greatest difficulty that would arise in providing for the working of the heavy traffic between Broken Hill and the mountains, would be found in the limit of allowable axle-load on the Molong-Parkes line, which has 60-lb. rails and 1 in 60 grades. As heavier rails cannot now be substituted, except at very great expense, some other expedient must probably be looked to. The carrying capacity of the line would of course be largely increased by placing

placing additional sleepers under the rails, but I doubt whether the requisite hauling power for the long trains coming in from the west could be obtained without doubling the locomotives.

2017. The question of ballast in any country depends on the kind of country over which you are going to construct the line, and the work which the line is called upon to perform when constructed? Yes, to a great extent. If ballast was easily obtainable it would be foolish not to put it in.

2018. Is the country such as the Condobolin-Broken Hill-McIndie line will pass over suitable for the carrying of heavy traffic on a cheaply-constructed line? Yes.

2019. Is that route still in your opinion suitable for the construction of a light line without ballast? Yes. 2020. We were informed in South Australia by the Engineer-in-Chief, as well as by his predecessor, that although South Australia had an idea in the first instance of constructing lines without ballast, and with a minimum of ballast, as the construction of the lines proceeded it demonstrated the un wisdom of that to them, and in no instance, I think, have they less than 7 inches of ballast, and the sleepers boxed over, because of the hot weather;—what would you say in regard to that statement? I adhere to my previous opinion that it is quite practicable to lay down lines in the way I have proposed, and afterwards, of course, to improve them as I recommend. I think there is no doubt, even on very poor soil—soft soil—you can adopt that practice. I do not know the method which was adopted in South Australia, but I have satisfied myself that it can be done. It is a proper thing to be done for the light lines in the interior. It is necessary to take care that the formation is well drained. That is a matter which has not been sufficiently attended to. I believe that in Australia previously attempts have been made to make earth lines, and that matter has not been sufficiently attended to. When a proposal was first made to lay down cheap lines like this line, I objected because it was proposed to lay the lines practically on the surface of the ground. I am not laying a line on the surface of the ground. I am in every case forming an embankment, or else there is a cutting with a sufficient rounding of the formation to give the drainage that you want. We also want to be particular that the ends of the sleepers are not covered. If the ends of the sleepers are closed in by the earth they form sloppy pits in wet weather; but if they are left clear, which is one of the great principles of this class of railway construction, then the water cannot lodge under the sleepers.

2021. You would not box up the sleepers then? No; the ends must be left free in earth ballasting.

2022. Where you require to ballast, what depth of ballast will you put in? I should put in about 5 inches where it was necessary.

2023. At what portion of the line will you use ballast? At very few places, forming an insignificant proportion of the length.

2024. You think that eventually, in order to have a satisfactory line, it will be ballasted? It will be better ballasted.

2025. Eventually it will be done? Yes.

2026. Suppose your line will carry the ore which is likely to be raised in Broken Hill to Condobolin, you still adhere to the opinion that a line without ballast would carry 800,000 tons in a year? Yes, it could be carried.

2027. But that, gradually, ballasting operations would have to be begun, and eventually the line would be ballasted? I am sure the Railway Commissioners would gradually ballast the line, but it might be a long process, because it is a line of great length.

2028. If the whole of the line is to be ballasted in fifteen years, it is only a question of saving that much interest in the first instance—it is not saved for all time? I do not say that it must be ballasted, but I say that the Commissioners would, no doubt, ballast it. There are thousands of miles of line in America which have never been ballasted, and perhaps never may be ballasted. In the southern parts of the United States and on the Southern Pacific Railway there are long lengths of line which were constructed without ballast, and which have no ballast now.

2029. In country no more satisfactory from the construction standpoint? No.

2030. And called upon to meet heavy traffic demands as a line carrying the ores from Broken Hill to Condobolin would? There is a very heavy traffic over some of the lines. Most lines on the Southern Pacific Railway carry very heavy traffic.

2031. The more powerful the engine you can use, the more cheaply the load will be hauled? You can take longer trains.

2032. A long train carries a big load? Because of the flat grades, you can use a lighter engine.

2033. You propose on this line, hauling this enormous traffic, not to use the best engines in the Colony, or the most powerful engines? It was never intended to use those very heavy engines.

2034. What weight would the engines be which you intend to use? I have limited the weight to about 12 tons per axle, with 60-lb. rails.

2035. The consolidated Australian engine weighs 107 tons? Yes, with the tender, which weighs 41 tons.

2036. What is the weight of the engine you propose to use? The engine, without the tender, is 66 tons, of which 59½ tons are on the driving wheels.

2037. Do you think it would be wise for the Colony to use small engines with these large engines in their possession? If the smaller engines will take the load.

2038. You explain that statement by saying that the grade is so easy that a lighter engine will do the work as satisfactorily? Yes; that is on the easy grades which we expect to get.

2039. Your explanation in regard to the ballast is that you believe that those who express this definite opinion as to the absolute need for ballast have lost sight of, or rather do not know, the operations you intend to carry on of keeping the road dry and properly drained? Yes; it is the difference between practicable working and failure.

2040. *Mr. Hoskins.* You stated that in the early days of railway construction in Australia the persons who constructed the lines did not appear to consider the question of drainage so much as you think they ought to have done;—has the importance of providing for drainage been impressed on your mind since you have seen the pioneer railways in America? Perhaps I did not make myself quite clear. I did not refer to the early construction of railways generally, because they have always been well drained, I think. I referred specially to cases where attempts have been made to do without ballast.

2041. Is it not a fact that in a good many instances, in this Colony, sufficient provision was not made for carrying off the surface water by means of culverts and small bridges? Yes.

2042. Was not the Cootanundra accident ascribed to a cause of that kind? That was supposed to have been due to a very exceptional rainfall, and the bursting of the dams on the creek.

H. Deane,
Esq.

14 Oct., 1896.

- H. Deane,
Esq.
14 Oct., 1896.
2043. Is it not a fact that since many of our railways have been opened, you have been compelled to increase the waterways under the lines, in order to give more facilities for drainage? Yes. It is almost impossible, in all cases, to design the culverts to give the proper amount of waterway.
2044. This Condobolin-Broken Hill railway is to be constructed primarily to bring sulphide ores to Lithgow or to the coast—and, taking the estimated quantity of ore to be provided from Broken Hill at 700,000 or 800,000 tons a year, do you not think that, on an average, the quantity of ore taken over that line a day, if the trade was equal to the expectations, would be at least 1,000 tons? It would.
2045. As the trucks would be brought loaded in one direction from Broken Hill, and I presume very little back loading would be taken, empty trucks would have to be run the whole distance in order to provide the means for conveying the ore down? Yes.
2046. Would not that necessitate for that long distance a double line of railway? It would necessitate a number of crossing loops.
2047. Would not that greatly increase the expense of the line? Not very much.
2048. *Mr. Humphery.*] You considered the possible traffic which might have to be carried over the line in estimating that it would cost £2,600 per mile? I could not say that in the first instance I did take into consideration the extent of the traffic. What I provided is a line of a certain class, and I have endeavoured to show that that class of line is quite capable of accommodating a very large traffic.
2049. Is it not your opinion that the line, as proposed, would be equal to a traffic of 3,000 tons of ore per day? Yes.
2050. If it was 3,000 tons per day, that would mean four or five long loaded trains from Broken Hill to the coast? On the figures submitted there is a probability that the maximum quantity would be 800,000 tons a year.
2051. In your opinion would the line, constructed as you propose, be equal to the traffic of that magnitude? It would be a very large traffic. It really means about 1,000,000 tons gross.
2052. *Mr. Hoskins.*] In point of fact, could a single line be worked with such a large traffic going in one direction? It may be done if there are sufficient loops provided. It would mean about seven trains a day in one direction. That is not an impossible number.
2053. *Chairman.*] How many hours would it take a train, hauling that class of traffic, to go from Broken Hill to Sydney, a distance of 700 miles? It would not go more than 20 miles an hour.
2054. Supposing that it takes thirty-six hours for a train to go from Broken Hill to Sydney, and seven trains are run every twenty-four hours, there would be ten and a half trains run in thirty-six hours? Yes.
2055. Therefore, in thirty-six hours there are twenty-one trains running backwards and forwards? I think that is right.
2056. *Mr. Humphery.*] What type of engine is run now from Sydney to Bourke? Not one type merely.
2057. At what distance from Sydney is the lighter type being used? The heavy engines do not run, I think, beyond Wellington or Dubbo.
2058. At what point from Sydney are you using light rails in the direction of Condobolin? From Molong.
2059. Therefore, it would be necessary to reconstruct the line from Molong if it was deemed essential to have a first-class line between Broken Hill and Sydney? Yes, if you want to have a first-class line you must lay down heavier rails from Molong.
2060. Would you not also require a first-class line to have ballast? Between Molong and Parkes there is ballast.
2061. From Parkes right out to Broken Hill, would it not be necessary to use ballast, if you were to construct a first-class line? Certainly. I should not call it a first-class line without ballast.
2062. What is the difference in cost between a first-class line with ballast and full-weight rails, and the class of line now under consideration? That matter requires to be carefully gone into. It would probably amount to £500 or £600 a mile at least.
2063. Do you think you are under-stating or over-stating the probable cost? Under-stating rather than otherwise, I should think. The cost of the ballast would be heavy, and the further you go west the freight would come to more and more.
2064. Is it your opinion that to construct a first-class line the additional cost would be from 20 to 25 per cent? I should think so.
2065. Would it be necessary, in your opinion, to have a first-class line between Parkes and Broken Hill, to move the traffic which it is anticipated may possibly be obtained from Broken Hill? I do not think so. I think the traffic would be maintained. But if there is a large traffic it ought to pay to make a good line.
2066. What do you think is the heaviest load which can safely be moved by the type of engine which you say will have to be used between Broken Hill and Parkes? You would not run the same engine through-out, because it would be divided up into sections. You might run the same length of trains, but you would vary your engine when you got the heavier grades.
2067. Would you not use the same type of engine all the way from Broken Hill to Parkes? You would as far as Condobolin. Perhaps Condobolin would be a changing place.
2068. Would you use a heavier type between Condobolin and Parkes? The first thing I should do if I had to run that heavy traffic, having these light rails and 1 in 100 grades between Parkes and Condobolin, would be to ballast that line and put it on a somewhat similar footing between Molong and Parkes. A ballasted line between Parkes and Condobolin, with 1 in 100 grades, would be on a somewhat similar footing to the unballasted line with flatter grades further west.
2069. Will you kindly give me an answer to my question as to the heaviest loads which could be hauled between Broken Hill and Parkes? I have looked into the matter, and I consider that on the unballasted line with the flat grades trains of 600 tons gross could be taken.
2070. What would that be net? About 400 tons. If there is such a large traffic it would be proper to provide trucks, the dead weight of which would only be half the load they carry.
2071. Are you of opinion that Mr. Goodchap's estimate of 275 tons per train load is not an excessive one? I think that can be done.
2072. You think that that could be carried on the line which you propose to construct? Yes.
2073. Are there not some steep grades between Parkes and Forbes and Molong? Yes; 1 in 60 grades between Molong and Parkes.

2074. Would the engines which would haul the trains you are speaking of, between Condobolin and Broken Hill, be able to take the same trains up these steep gradients to Molong? No. H. Deane,
Esq.
2075. Therefore, if the traffic in sulphide ores be as large, or nearly as large as is estimated, it would necessitate employing, between Parkes and Sydney, nearly twice as many engines as from Condobolin westward? Yes, or larger ones. 14 Oct., 1896.
2076. The larger type of engine would increase the expense, and more fuel would be used? Not proportionately.
2077. And the money expended in the construction of engines would be more? It is not proportionate to the increase of the hauling power. The number of men employed, for instance, is the same.
2078. At all events the traffic could not be worked as cheaply between Parkes and the coast as it would be between Condobolin and Broken Hill? No.
2079. *Mr. Fegan.*] When you were asked to make an estimate of the cost of this line, the Commissioners' figures as regards so many tons to be carried were not before you? I had the Commissioners' report.
2080. This very heavy traffic was not brought under your notice until Mr. Howell gave his evidence before the Committee? No; I did not hear of this very heavy traffic at first.
2081. Therefore, the description of this line is based on the data which the Commissioners supplied to you—that is a light line for light traffic? A light line, I pointed out to Mr. Humphery.
2082. If it had been pointed out to you in the first instance that in all probability there would be 800,000 tons of sulphide ore to come from Broken Hill to Sydney, you would never have proposed to construct a light line without ballast? No. I think there is very little doubt that if such a large traffic had been anticipated, a better class of line would have been required.
2083. Therefore, it was on the Commissioners' figures you based your estimate of the cost per mile? I was asked to prepare a proposal for that class of line.
2084. That is for a pioneer line? Yes.
2085. *Mr. Hassall.*] Admitting the necessity for ballasting the line between Parkes and Condobolin, in view of the heavy traffic to be hauled, do you not think it will be absolutely necessary to ballast the remaining portion of the line, considering that you have undulating plains to travel over? Between Condobolin and Broken Hill, I expect to get grades of 1 in 150, and therefore I can provide for a lighter locomotive than between Condobolin and Parkes; but because one would have to use heavier locomotives between Condobolin and Parkes, I recommend the ballasting of that bit. I want that piece ballasted so as to carry heavier rolling stock, and not because the class of country is worse than it is between Condobolin and Broken Hill. On the contrary, probably it is quite as good. It is on account of the easier grades between Condobolin and Broken Hill, and the possibility of using lighter engines, that you can do without ballast.
2086. Can you do without ballast in the vicinity of Broken Hill—you have to deal with what is called the Darling Range there? The line as laid out has a long grade of 1 in 100 at Broken Hill. There it may be necessary to have an auxiliary engine to help you up if there are any heavy loads moving towards Broken Hill; but as a matter of fact, that grade would all be with the load.
2087. You do not think it will be necessary to ballast the line there? I do not think so.

THURSDAY, 15 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.
The Hon. JAMES HOSKINS.
The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Thoman Waddell, Esq., M.P., sworn, and examined:—

2088. *Chairman.*] You represent the Electorate of Cobar? Yes. T. Waddell,
Esq., M.P.
2089. You are aware there was previously a proposal to extend the line from Cobar to Wilcannia? Yes. 15 Oct., 1896.
2090. Would you like to make a general statement to the Committee? Yes. I think, as far as my knowledge goes, that the route from Cobar to Broken Hill would be, all things considered, much the better of the two. My reasons are, in the first place, that the lower down the Darling River the railway crosses the harder it will be to get trade to Sydney. For instance, the Railway Commissioners have had a very great deal of difficulty in getting trade from the Bourke district on account of the river competition, and in order to get that trade they have had to reduce the rates considerably. That being so, it appears to me that the lower down the river the railway crosses the more difficult it will be to draw trade to Sydney, and the railway will labour under adverse conditions as regards profits and traffic. Take, for instance, as an illustration, the matter of extending the railway to Walgett. If the railway were extended to Walgett there would not be the same difficulty in getting trade from that point on the river as there is from Bourke. The Railway Commissioners would be able to charge rates that would be more just, considering the long distance that goods would have to be carried. A railway to that point on the Barwon River would pay much better than the railway to Bourke. For the same reason, when you got further down the river from Bourke it would be more difficult to draw the trade to Sydney.
2091. You might give us the length in miles from Brewarrina to Bourke, from Bourke to Wilcannia, and from Wilcannia to Menindie? From Wilcannia to Menindie is about 100 miles, not by the winding of the river, but as the crow would fly. I do not know the other distances, but I will supply them. Although there is only a difference of 100 miles between Wilcannia and Menindie, still that means 100 miles nearer the sea-border—100 miles closer to the capital of South Australia, from which a great deal of the supplies to the Darling River has always come. I feel confident that if the line goes by the route now proposed, in preference to a line from Cobar *via* Wilcannia, it will mean that less trade will be got. The next thing is, if there is any doubt or uncertainty, as I suppose there will be, as to this line paying, it will be much less likely to pay, all other things being equal, if the line now proposed is taken in preference to that by Cobar,

T. Waddell, Esq., M.P.
15 Oct., 1890.

Cobar, as I think it will cost £155,000 more. There will be that extra sum of capital invested in making the railway. That would be a future obstacle against the line paying. Then, again, although I have not actually been over the country from Condobolin to Broken Hill, *via* Menindie, at least not all of it, still I have lived in the Darling district a good many years, and I have had the opportunity of meeting so many persons and getting so much information about that country, and have such a good personal knowledge of the Cobar country, that I can fairly compare the two routes. There is no doubt whatever that the land on the Condobolin to Menindie route is much inferior to that on the other route, and I think it is undoubted that the rainfall is less. Consequently, the poorer land and less rainfall the production would be much less. In making railways an indirect object, if not the direct object, is to develop the productive capacity of the land the railway goes through, so there would be a chance of much greater development in the way of produce if the line went from Cobar, as the country is better and the rainfall greater. That would be another source of profit to the line, and people would be more likely to settle along the Cobar route on account of the richer character of the soil and the better rainfall. There would be a greater likelihood of smaller holdings on that route than on the other. Another point worthy of consideration is this: If the line goes from Cobar to Broken Hill, I think there will be a better opportunity for farmers and producers to compete for a certain portion of the market at Broken Hill than if the line went the other way. I think it will be found that between Nyngan and Cobar there is excellent wheat-growing land capable of producing hay and wheat to almost any extent. The farmers there would be much nearer to Broken Hill than farmers on the other route, and much better able to compete against the South Australian people. It would be a longer distance to carry produce from Condobolin than from Cobar. Then the fact that there would be a saving of about 91 miles in the length of the line should cause the railway to be much more quickly constructed. For these reasons, I am much in favour of the Cobar route in preference to the Condobolin one.

2092. The points you have mentioned are these: The river is likely to be more permanently navigable to Menindie than to Wilcannia? Menindie is nearer the seaboard, and the river is more likely to be navigable in dry seasons up to that point.

2093. You emphasise the question of extra length, and the necessary extra cost? Yes.

2094. And the rainfall is better higher up the river? Yes.

2095. You think the additional rainfall would enable farmers to grow wheat between Nyngan and Cobar, while they would not be able to grow it at Mossgiel and beyond? Yes; I have no doubt that wheat may be grown about Cobar, and ultimately past Cobar.

2096. *Mr. Hassall.*] Have you taken into consideration in putting forward your view of the case that the distance from Nyngan to Broken Hill would be something like 350 miles, while the distance from Broken Hill to the territory of South Australia, where they are capable of producing cereals and other produce, is only something like half that distance? I quite realise that, and that there would always be that handicap against the farmers in any portion of our Colony competing with the South Australian farmers; but if there is a chance of getting any of the Broken Hill market for produce, I think the farmers on the Nyngan to Cobar line would have a better opportunity of getting it than those on the other line.

2097. Do you not think the country about Menindie is equally adapted, say, under a system of irrigation, for producing all that might be required at Broken Hill, as the country between Wilcannia and Cobar? I think if production had to be carried out by irrigation it would not be so likely to pay as wheat and hay grown by natural rainfall, which could be done in three years out of four between Nyngan and Cobar.

2098. Do you think the Cobar people, or any settlement that might take place around Cobar, could compete successfully with settlement around Hillston? I think so. They would have a better chance, because they would be much closer in the first place, and distance would be a great factor in the matter of competition.

2099. The distance from Hillston to Broken Hill is considerably shorter than from Cobar to Broken Hill, and the land about Hillston is beyond all shadow of doubt admirably adapted to the cultivation of wheat;—the agricultural land extends about 25 miles west of Hillston, and might be used for that purpose;—do you not think, therefore, that in the event of Broken Hill people looking to the east for their supplies, that the country around Hillston would possess an advantage over the country around Cobar or Nyngan? I am only speaking from memory, but I am inclined to think that the rainfall would be better in the Cobar district than it would at Hillston.

2100. The distance from Sydney to Broken Hill *via* Condobolin is 696 miles; from Sydney to Hillston it is 444 miles;—that leaves 252 miles as against about 350 miles from Nyngan? Hay will grow splendidly most of the way between Cobar and Wilcannia. I have been over a great deal of that country. Some lessees have had small patches of hay, and it has done very well. Hay will grow well to a large extent for at least 40 or 50 miles west of Cobar.

2101. Have you taken into consideration the increased distance that would have to be travelled in running from Broken Hill to Sydney *via* Cobar, compared with the route from Broken Hill *via* Condobolin? Yes; I think the increased distance would be about 40 miles, but there would be less bad country for the railway to go through. I think the difference is fully made up in that way.

2102. What is the description of the country between Cobar and Wilcannia? I have not been over the whole distance down to Wilcannia, but a good way out from Cobar the character of the country is mostly rich red soil, some rather sandy, but thickly timbered. I think it is country of a character that within the next few years will be scrubbed and ringbarked, and made good for grazing, and probably a good deal of it will be put under cultivation.

2103. Do you think it would pay anyone to go so far afield to start agriculture beyond the expectation of supplying the local market? I do not think it would pay to go in solely for agriculture any distance west of Cobar. In the vicinity of Cobar there is a market, but halfway between there and Wilcannia it would not pay to go in for agriculture solely. In conjunction with grazing it might be found to pay to a certain extent.

2104. Do you know anything of the mineral character of the country between Cobar and Wilcannia;—is there any likelihood of great development taking place? There is every probability of payable goldfields being got between Cobar and Wilcannia.

2105. How far from Cobar? At one place 10 miles west of Cobar, at the Amphitheatre, gold has already been got, although not yet in payable quantities; still there is a prospect of ultimately getting payable places. The country a long way west of Cobar being of the same character as that round Cobar, and such

such good mines having been got in the neighbourhood of Cobar, there is good reason for expecting new developments west of Cobar that would make the line pay. The mineral developments there would be a great factor in making the line pay. That is what has made the present Cobar line pay as it is now paying.

2106. Do you know anything of the country between Wilcannia and Broken Hill? No; I have not been over that route. Higher up the river I have been across the country and seen a good deal of it, and I presume it is not very different.

2107. How far would the White Cliffs field be from the railway? I do not know.

2108. Do you think a railway across the Darling, dealing with the pastoral products, the carriage of wool particularly, and goods required at the stations, would ever compete with river carriage? I think if the railway only went to Wilcannia it is very doubtful whether it would pay; but if it went to Broken Hill, I think there would undoubtedly be a lot of traffic in connection with the mines. As regards competition at Wilcannia, although that place is higher up the river than Menindie, I have no doubt there will always be serious competition between the river and the railway.

2109. Do you not think, no matter from what point the railway might be extended towards Broken Hill, that the question of its paying would, to a great extent, depend upon whether you could convey mineral products from Broken Hill for treatment on the seaboard? To a large extent it would rest on that; but local produce would undoubtedly be a considerable item in connection with the railway carriage, and the lower down the river the line crosses the less local produce will come to Sydney.

2110. There is no possibility of the local produce paying working expenses, let alone interest and cost of construction? Not for many years to come.

2111. You know the country pretty well, that it is sparsely settled, and adapted only for pastoral pursuits under present conditions, and you think there is no justification for the construction of the line unless you could secure a great deal of the mineral traffic from Broken Hill which now goes in other directions? Yes.

2112. *Mr. Fegan.*] Do you know the district between Wyalong and Hillston? No.

2113. Do you know Hillston? I have not been at Hillston.

2114. Have you been at Menindie? No.

2115. You know the Cobar route very well? Yes, most of it.

2116. When that line was before the Committee it was pointed out that it would hardly pay—the Cobar-Nyngan line I mean? I am not sure as to what evidence was given.

2117. However, since its construction it has been gradually earning, so that is one line which may be called a paying one? Amongst others who advocated that line in the first instance I was one; and one of the reasons we gave for urging that the line should be made to Cobar was that it would be an additional link in connecting the South Australian system with that of New South Wales. Another reason was that it would help to develop the copper-mines, which could not be worked at a profit unless the railway was made. What was stated has been fully borne out. Since the railway has gone there the Cobar copper-mines have started work, simply because of the railway, and have proved a great success. They could not have been worked otherwise.

2118. Is there a prospect of these mines lasting for a considerable time? For many long years to come.

2119. Taking the line from Cobar, do you advocate that it should go to Menindie instead of Wilcannia? Certainly not.

2120. Then you would call at Wilcannia, and go on from Menindie? The route I would favour would be from Cobar *via* Wilcannia to Broken Hill.

2121. Seeing that on the northern route there is a greater rainfall and better land than on the southern route, you think there would be a prospect of people on this side being able to supply the Broken Hill residents? There would be a better prospect of competing than on the other route.

2122. Do you know the land between Wilcannia and Cobar? I know a good part of it.

2123. Taking the matter all through, judging from your own knowledge, and from what you have heard from other people, you consider the northern route is preferable to the proposed one now before the Committee? I have no doubt of that in my own mind.

Hugh McLachlan, Esq., Secretary to the Railway Commissioners, sworn, and further examined:—

2124. *Mr. Humphery.*] Since you were last examined the evidence of Mr. Goodchap has been taken, and I presume the Railway Commissioners have read and considered that evidence? I do not know whether they have considered it. I do not think they have done so.

2125. Has not your attention been specially directed to it? The Commissioners having submitted their evidence thought that it would be unnecessary to go into the matter further.

2126. The Commissioners have given their evidence based on one set of circumstances, but Mr. Goodchap rests his contention that the line should be a profitable one on a different set of circumstances? That set of circumstances is not practicable. Speaking generally, Mr. Goodchap calculates that this line is going to be equal to the line between Sydney and Orange for instance, and is taking a class of engine of which we have only five in the Colony. As a matter of fact the Commissioners do not intend these engines to run on the proposed line. Between Broken Hill and Sydney with a full train load you would have to use three different classes of engines—a light one from Broken Hill to Condobolin, a heavier one from Condobolin to Molong, and a still heavier class between Molong and Dapto. The Commissioners did not intend a pioneer line to carry the heaviest class of rolling-stock and engines. In their report dated 19th November, 1894, they stated:—

We have for some years past urged that for new extensions in purely pastoral and level country, where the traffic would be exceedingly light, a line capable of carrying a light locomotive, with the ordinary class of rolling-stock, at a speed of about 15 miles per hour, in daylight only, could be constructed, exclusive of bridges, waterways, and station accommodation—which latter should be of the most simple nature—for about £1,750 per mile. * * * Lanes of this character would avoid the great disadvantage of break of gauge; they would cost scarcely anything more in the first instance than a narrow gauge line; and the whole of the ordinary rolling-stock, exclusive of engines, which could be selected from the lightest types existing in the service, could pass over them and thus avoid the great disadvantage and cost of creating a new class of rolling-stock.

The Commissioners expected in proposing these pioneer lines that they would develop the country but not carry loads that could be sent over a line costing, say, £10,000, per mile. The Commissioners would not like to say what would be the heaviest load they could take over such lines, as they have had no practical experience of them yet to justify them in giving a definite opinion as to their fullest capacity.

2127.

T. Waddell,
Esq., M.P.
15 Oct., 1896.

H.
McLachlan,
Esq.
15 Oct., 1896.

H.
McLachlan,
Esq.
15 Oct., 1896.

2127. The question raised is this: What character of line would enable you to carry maximum loads of ore from Broken Hill to Wollongong or Newcastle; and assuming you could carry maximum loads, at what rate per ton could they be carried? The Commissioners would not like to say anything below the present figures. The cost of the line is a matter for an engineer.

2128. I am not putting that question. I want you to divest yourself wholly of any idea as to the cost of the line. I want to know from you, having regard to the length of the line, the probability, according to the evidence, that from 500,000 to a 1,000,000 tons of ore may be carried, at what rate per ton it would be possible for you to carry the ore? That is a matter that has not been considered.

2129. You remember when examined on a former occasion you expressed the opinion that anything less than a $\frac{1}{2}$ d. per ton would mean a loss? I said it would not be wise to calculate on anything less than a $\frac{1}{2}$ d. per ton.

2130. You said the construction of this line would mean a "big loss"? Yes.

2131. In round figures £40,000 a year would not cover it? I think somewhere about £60,000; I think it was considerably more than £40,000.

2132. Had you taken into consideration the possibility of conveying ore along that line, assuming the line to be a first-class one? No. As a matter of fact you would want to consider a big increase in the cost of the line to make it suitable for carrying the heaviest rolling-stock. You would want to create rolling-stock that would probably come to half a million of money to carry these 300,000 or 400,000 tons of ore.

2133. Have you remarked in Mr. Goodchap's evidence that he put down the working expenses at 4s. per mile? Mr. Goodchap is basing his calculation on an average train load of 375 tons, and I do not think that the average goes above 130 tons.

2134. Therefore, you say it would cost more than 4s.? I should think so.

2135. Mr. Goodchap's estimate was that 375 tons would give you, at 18s. a ton, £325, and assuming a back loading of £50 that would make £375, so that, practically, there would be an earning of £60 per journey. It is all theory.

2136. Mr. Goodchap, in his evidence, stated as follows:—

Say that the Commissioners carried the ore at 18s. per ton for 375 tons, that would give a revenue of £337 per train, and, say, £50 per train for back loading of coal. I am quite certain that either from the coal-mine at Illavarra, or from the coal-mine at Lithgow, there would be no difficulty in obtaining at a moderate rate a return traffic to the amount of £50 per train. That would be carrying the coal back at any price the Commissioners liked, because they might as well put some coal on the trains running empty. If they only charged 10s. per ton or less for the return traffic, that would be so much profit. Now the working expenses, as before, would not be more than £325, leaving a profit of £62 per train. Calculating 300,000 tons instead of 800,000 tons, the number of trains would be 800, which, at £62, would be equal to £49,600.

What have you to say to that? Mr. Goodchap has based his calculation on the average cost per train mile throughout the whole railway system, but that average would not be above 120 or 130 tons. If he is proposing to lift the average to 375 tons, I do not think the comparison is a fair one.

2137. The Sectional Committee were informed during their inquiry at Broken Hill, and in South Australia, that the cost of carriage between Broken Hill and Port Pirie for sulphide ores over the South Australian railway was about a $\frac{1}{2}$ d. per ton. Now the South Australian lines are, I suppose, inferior to the New South Wales lines in gauge, and consequently, I suppose, in engine power;—how is it that they can carry at a $\frac{1}{2}$ d. per ton and the Commissioners are unable to carry at the same rate? The Commissioners do quote the same rate.

2138. Not without incurring loss? Well, for any decent loads they quote a $\frac{1}{2}$ d. Our grades are generally much steeper than those in South Australia. Mr. Thow told me that the grade from Cockburn to Port Pirie is a down grade.

2139. Another factor would be, perhaps, the back loading? I do not know the local circumstances myself.

2140. Do you not think that upon a 4-ft. 6-in. gauge, with a type of engine such as you are using, you should be able to carry at a lesser rate than can be done on the South Australian line? If everything else were equal.

2141. You think it is not worth while to compete for the carriage of the Broken Hill ores? I think they must be in a better position in South Australia to do so. I understood from Mr. Thow that their gauge was favourable from the mines to the seaboard. The distance being practically little more than a third of the way we would have to haul the ore—that would be in their favour.

2142. We were told by Mr. Deane that it would be possible, on the line under consideration, to haul 375 tons with the class of engines that could be safely used? Up to a certain point.

2143. Assuming that to be the case, would it not be profitable to convey ores between Broken Hill and Condobolin at less than a $\frac{1}{2}$ d.? I do not think the Commissioners would like to say. Any rate less than a $\frac{1}{2}$ d. they would consider there was not much profit in.

2144. Have you looked into the figures quoted by Mr. Goodchap:—I may tell you they are said to be taken from your own report? They are not taken with the full consideration of all the circumstances.

2145. Making every allowance, if Mr. Goodchap is correct there should be a margin of profit instead of a loss. Mr. Goodchap's assumption is based on the possibility of carrying much less than 800,000 tons? It is all theory as to what you will carry.

2146. But it is upon the assumption that a certain number of tons would be conveyed that a profit is calculated. The evidence is that twice the quantity of ore mentioned by Mr. Goodchap might be carried;—can it be carried at a lesser rate than by water *via* Port Pirie, assuming that you can get the traffic, and assuming that your engines could do the work; in fact, would it not be possible to carry it for less than a $\frac{1}{2}$ d. per ton? I think you must look at the thing from a practical point of view. That is to say, as a competing company, we have three times the distance to haul. They have loading both ways, and they have a contract for carrying the ore for seven years. There are so many different circumstances to take into consideration that it is not wise to theorise too much as to what you can do over a level tract of country.

2147. I do not desire to press you unduly, but I think it is absolutely necessary that you should read Mr. Goodchap's evidence, and consider that portion of it where he bases his calculations upon the report of the Commissioners? But he bases his calculations on a train load of which does not average within a third.

2148. I would draw your attention to Mr. Goodchap's evidence. The latter portion of his answer to Question 1868, and his answer to Question 1869. That is a very clear statement of the results that would follow upon the assumption that a load of 450 tons could be conveyed;—what reply have you to make to

Mr.

H.
McLachlan,
Esq.
15 Oct., 1893.

Mr. Goodchap's assumption that a profit of £125 per train could be made? Mr. Goodchap's calculation is based upon an engine which the Commissioners think it would be impracticable for the line to carry.

2149. For a moment disregard the present estimated load of 125 tons, and assume for the purpose of this calculation that your engines are of the type that could be used upon a suitable line, and would be equal to a haulage of from 375 to 450 tons? I do not think it is wise to go into theory. In the first place, in the opinion of the Commissioners, the line would not carry the load Mr. Goodchap makes out.

2150. Against that, Mr. Deane says that the line, as proposed to be constructed, would be equal to 375 tons, and at a cost of an additional 25 per cent. it might be made a first-class road; then I suppose it would be equal to the use of engines of the highest type? We have had no experience of that. The Commissioners are doubtful whether these big loads could be safely carried, and if they could be carried they would involve a high cost of maintenance.

2151. We are told that if we like to compete for it we may possibly have up to 800,000 tons of ore. It is only a question of what can be hauled. Will a certain class of road enable you to compete for that traffic, and if so at what price? That is the question that comes before this Committee. In your report you have ignored all question of the carriage of ore? The Commissioners do not think that they will get the ore from Broken Hill to carry, and if they took ore into their consideration they would be misleading this Committee. They would not like this Committee to consider they would be able to charge a lower rate than a ½d. per ton per mile.

2152. I am obliged to press you upon this point. You say the Commissioners think they would not get the ores. We say on the evidence submitted to us that you may get, if you like to compete for it, a certain quantity of ore. Now if you can get that, and upon the assumption that your best type of engines will enable you to haul a certain load, what is the lowest price at which you could convey that ore from Broken Hill to Newcastle or Wollongong? Assuming that we would get it, the Commissioners say they would not like to quote any rate lower than a ½d. a ton per mile.

2153. And assuming that you could use engines that would haul certainly not less than 375 tons per load? On the flat country, yes.

2154. Even then it could not be done for less than a ½d.? Even then they would not like to quote a lower rate.

2155. Therefore, upon that estimate, it would be useless to construct a line as proposed in the expectation that it would become profitable? The Commissioners think there would be a loss of money. They are always prepared to say that experience of these lines might show they could be worked more profitably than they expect; but it would not be wise to say to the Committee they could do so and so, and hold out hopes that might result in the country being committed to a large expenditure. They simply speak so far as their experience has given practical results.

2156. Your evidence given to-day simply confirms your evidence given on a former occasion; but it is felt to be necessary in view of what has been stated here by a gentleman of Mr. Goodchap's knowledge and experience, that his figures, based upon the Commissioners' report, should either receive confirmation or be refuted; and you say that, notwithstanding Mr. Goodchap's quotations from the Commissioners' report, and the opinions he has formed based upon that report, it would not be possible to convey ores from Broken Hill to the coast for less than a ½d. per ton per mile? The Commissioners would not like to hold out any hope of a lower rate than that.

2157. And we must discard from our consideration any question of profit in connection with the conveyance of ores from Broken Hill to the coast? Yes.

2158. *Chairman.*] How many engines are there in the Colony that will draw a load of 450 tons from Molong to Sydney? We have five engines that would take 350 tons, and then they would have to be assisted in certain places.

2159. You have no engines that would take a load such as Mr. Goodchap has estimated from Molong to Sydney? No; you would want a push-up engine for 60 miles out of the journey.

2160. *Mr. Humphery.*] In your estimate of rolling-stock you did not take into consideration the traffic we have just spoken of? No; if there were a traffic of 300,000 tons, it would mean an expenditure of £400,000 in providing the necessary rolling-stock.

2161. *Chairman.*] If the ore were to be carried from Broken Hill to the extent mentioned in Mr. Goodchap's evidence, the question of undue crowding of the line from Bathurst to Sydney would require to be considered, there being already a considerable number of trains on that route? I think Mr. Goodchap said something about seventeen trains on a single line of railway, but we have more than that already. It is a question whether you would not have to duplicate your line if the traffic came on to the Western railway, and this would mean an enormous expenditure.

2162. How would it work to Lithgow? Then you would still have to carry a certain quantity from Lithgow to the sea-board. I suppose you would reduce your quantity about a third, or perhaps less than that, as it would be low-grade ore.

2163. You regard the case as hopeless to Lithgow with the power the South Australian Government have? There would be more prospect of getting the traffic to Lithgow if the works had been established there.

2164. Do you regard it as hopeless to Lithgow? If there were a certainty of getting the works established at Lithgow it would be worth reconsideration, but as the works are established elsewhere, and the companies are committed to other establishments, it does not look as if Lithgow would get a share of the work.

2165. *Mr. Hoskins.*] Is it the opinion of the Commissioners that if the line were constructed, and two or three thousand tons of ore per day carried, the railway from Bathurst to Penrith could be worked unless it was considerably altered by doubling the line or by making a large number of loops? It would be almost necessary to duplicate the line; but I have not consulted the Commissioners on the subject. I think it would be necessary to spend a large sum of money to give the accommodation required for carrying such a traffic. Our officers complain already at times of the crowding on the Western line.

2166. Have the Commissioners been in the habit of carrying ores or cheap dead-weight loading at a farthing per ton per mile on the railway? Not to my knowledge.

2167. You have never heard of it? No.

2168. Have you ever heard of it in any of the other colonies? No; we carry at cheaper rates than any of the other colonies.

2169. Not in England? Not to my knowledge.

2170.

H.
McLachlan,
Esq.
15 Oct., 1896.

2170. As the competition is great, the presumption is that if the ore were carried at that rate there would be a serious loss? Certainly; I do not think there would be any profit in it.

2171. Have the Commissioners considered this view of the case, that if any approximation of the estimate of the ore to be brought over the line were realised, and as there would be necessarily very little back loading, a large number of trucks would be taken empty over the line? They have considered that.

2172. Therefore, if they carried at a low rate and took back empty trucks, there would be a still greater loss, or has that loss been taken into consideration? They say, looking at the thing practically, they would not like to recommend any rate lower than a $\frac{1}{4}$ d. per ton per mile.

2173. Mr. Goodchap mentioned that the ore could be conveyed in trucks with a tare twice as large as the net weight;—did you ever have trucks on the railway during Mr. Goodchap's management that came up to that? We have trucks in which the paying weight is double the tare.

2174. But they have only been recently introduced? Within the last five or six years. I do not exactly recollect the tare and tret of the old type of trucks. Our standard tubular truck weighs 11 tons 7 cwt., and carries 23 tons.

2175. *Mr. Wright.*] Please refer to the portion of the evidence given by Mr. Deane about the line, which I will now read:—

364. Are you quite satisfied that the proposed line, without ballast, is capable of carrying the heaviest class of engines we have, with a train of 300 tons? The heaviest locomotives are those just recently imported. The engines themselves weigh 65 tons, and their tenders 109 tons.

365. Are you satisfied that, without ballast, the line will carry these weights upon it? I should require to put more sleepers in.

366. That, of course, would entail increased expenditure;—what additional sleepers would you provide? I think two extra sleepers per rail length would be necessary. That is 352 extra sleepers to the mile. I should put them down at an average of 5s. per sleeper, or £90 per mile.

367. Then, to enable the proposed line to carry the heaviest class of mineral traffic, what would be the additional cost per mile? I calculate that it would be necessary to put in additional sleepers, which would cost about £33,000 over the present estimate.

Then I asked Mr. Goodchap the following questions:—

1930. If you were Railway Commissioner, knowing nothing more than you know at present, would you sanction the construction of such a line to carry these weights over it? No; I would want a very much heavier rail to start with.

1931. According to your lights, to carry this traffic a heavier rail than 60 lb. will be required? Yes; unless the weakness of the rail can be provided for by placing the sleepers closer. That is an engineering question on which I would not like to offer an expert opinion.

1932. I ask you your opinion as to the position you would take up? If I were Commissioner for Railways, and that proposition were placed before me, I should receive it *cum grano salis*, and ask for further information.

I want to ask you now, in preparing this estimate, was the rail or the rolling-stock contemplated to be of the heaviest class? No, the lightest class.

2176. The question of mineral traffic was never taken into consideration? No.

2177. From your evidence I take it that the lightly constructed line and the light rolling-stock were not designed by the Commissioners to compete for this mineral traffic, and the thing was never seriously considered by them? No.

2178. Mr. Goodchap spoke of a 15-foot truck that would carry 30 tons;—what would be the effect on an ordinary roadway of four pairs of wheels carrying 30 tons? I am not an engineer; but I think it would be destructive to the road.

2179. What do the heaviest locomotives carry on six or eight pairs of wheels? We have had a suburban engine with 16 tons to the axle, but that is an exceptional thing. About 15·10 tons is the heaviest weight per axle.

2180. What would your heaviest truck carry? Twenty-two to 23 tons; that is, on double bogies—practically eight wheels.

2181. What would that be to the wheel? About 4 tons.

2182. What would 30 tons be on four wheels? About 7½ tons to the wheel, and that would be very destructive to the road.

2183. So this is a class of vehicle you do not know of, and never heard of before? Not with that load.

2184. Have you ever had a personal conversation with Mr. Deane on the subject of this line? Not to my knowledge.

2185. No conversation about Mr. Goodchap's evidence? Only casually; I never discussed the matter with him.

2186. No conversation between yourself and the Commissioners? Not to any extent. The Commissioners would rather not endeavour to contradict the evidence that may have been given.

2187. But I may point this out, that an ex-Railway Commissioner comes before this Committee, and gives evidence that strongly upsets the evidence you yourself gave, and destroys the evidence of Mr. Deane;—do you not think it is a serious matter for yourself and the Commissioners that you should be in a position to support your evidence? I think the Commissioners would leave it to the Committee to determine.

2188. Do I understand that the Commissioners do not care anything about these comments? They have given their opinion, and they think this Committee will attach due weight to it.

2189. And no special communication has taken place between yourself and any officer of the Department in dealing with this evidence? I did speak to Mr. Kirkcaldie and Mr. Thow with regard to some information I gave as to the number of trucks that might be required. I asked them, supposing the traffic would have to be carried that distance, what additional rolling-stock would be wanted.

2190. You would require for this traffic to import all the engines and manufacture exclusively the rolling-stock suitable for the traffic? Yes; it would come to £400,000.

2191. The Commissioners do not think the prospects would justify them in going to this expenditure? They think not.

2192. In Mr. Goodchap's evidence he spoke of 4s. 2d. as the expense per train mile? That was based on what we take as the average load, say, about 120 tons.

2193. If you ran a series of trains carrying 120 tons the cost per train mile of working them would be less than if the weight were doubled? If the weight were trebled I think it would. The cost per train mile covers everything—repairs, renewals, &c.

2194. The calculations of Mr. Goodchap based on the cost per train mile are not correct? I think not.

2195.

2195. *Mr. Trickett.*] When you gave evidence before, were you aware that the Silverton Tramway Company had entered into a new contract with the Broken Hill mines for seven years from the 1st January, 1897, for the conveyance of their ore to Port Pirie? I understood something of that sort had been done.

2196. *Mr. Egan.*] You think it impossible to compete for the trade of Broken Hill considering they have only something like 253 miles to take it to Port Pirie? They must be in a better position to compete than we are.

2197. *Mr. Hassall.*] Would there be any possibility of cutting rates to compete with the present mode of transit from Broken Hill to Port Pirie? Having a shorter distance to haul they would hold the key of the position.

2198. And they would have the back loading to assist them in their efforts to reduce the rates of carriage from Broken Hill to the Port? Yes.*

H. McLachlan,
Esq.
15 Oct., 1896.

FRIDAY, 16 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Condobolin to Broken Hill.

Alexander Wilson, Esq., stock and station agent, sworn, and examined:—

2199. *Chairman.*] What are you? A stock and station agent in Sydney.

2200. Have you had an opportunity of seeing the map showing the position of the proposed line? Yes, I know the whole of the country well. The reason of my being here is that I have known the whole of that country more or less for twenty years. I might begin by stating that I have taken an active interest in the development of New South Wales ever since I have lived in it, nearly a quarter of a century. I have taken an active interest in all matters of a federal character, my business and inclinations having led me to be a good deal associated with the adjoining colonies. I have such a definite opinion on the federation question that last year I lectured on the subject, and dealt very fully with railway construction from a federal point of view, and I particularly took up the question of a connection with South Australia without going through Victoria, and I advocated a line from Cobar to Broken Hill *via* Wilcannia, giving what I thought very pertinent reasons for it. For one thing I advocated a trans-continental line from Bourke to Port Darwin chiefly because it would go through good country of a kind all the way, as compared with any other trans-continental line then proposed.

2201. You intended it to go from Bourke? From Bourke through Queensland, picking up the termini of their three main lines and reaching Pine Creek.

2202. Then you propose to go straight to Pine Creek, or pick up the line now partly constructed to South Australia going north? No, I ignore that line. I showed the worthlessness of that line for trans-continental purposes. They run a train only once a fortnight on the northern extension of the South Australian line.

2203. Will you state, as briefly as you can, your route from Bourke? From Bourke going a northerly, and slightly westerly direction, crossing the border in the Northern Territory about 200 miles from the Gulf, crossing all the Western Queensland watersheds about their middle course, avoiding all the flooded ground, the result of tropical rains.

2204. You go west of Cloncurry? It might be 100 miles to the south-west of it.

2205. Just about the Herbert? Crossing the headlands of the Herbert. It is only 300 miles further to Adelaide coming to Nyngan by that line than it is by their own overland line. If South Australia decided to make a branch from Bergott's Springs, that is where their present northern line makes a tremendous bond from the west and north-west; if they made 500 miles to connect it with Long Reach and with Central Queensland, it would only be 100 miles further by that route than by their own trans-continental.

A. Wilson,
Esq.
16 Oct., 1896.

* Note (on revision):—

Office of the Railway Commissioners, Sydney, 19th October, 1896.

Sir.—In compliance with the request of your Chairman, I forward herewith an extract from the report of the Railway Commissioners of Victoria (1893), in regard to the rates for coal, as under:—

“Coal is now being produced in Victoria in quantity and quality sufficient to largely affect outside supplies. We thoroughly realise the importance of the development of this industry, and have, consequently, given facilities for a largely increased consumption. It is too early yet to state the result from a financial point of view, but experiments are being conducted which will enable us to fix a price commensurate with its value. The rates for the carriage of this coal have been reduced from 1d. to ½d. per ton per mile. The rate to the consignee is ¾d., the Government having agreed to recoup the Department to the extent of another ¼d. per ton. We are of opinion, however, that the rate of 1d. per ton per mile, which is charged for all other coal, is scarcely remunerative, and we think a further subsidy should be provided by the Government, in order that the Department may not have to carry Victorian coal at a loss.

“(Sd.) R. H. FRANCIS, W. M. KIBBLE, K. L. MURRAY, Railway Commissioners.”

I cannot trace that the later annual reports of Victoria have referred to the question, but apparently it has recently been engaging attention, as I find in the *Argus* of the 28th ultimo, regarding a proposed new classification of rates for the carriage of goods by railway it is stated that—

“It is almost certain to be represented to the Government that the present rate of ½d. per ton per mile for the carriage of coal from the Korumburra mines in the present quantities is not a payable one, notwithstanding that the grade on the Great Southern line has been reduced, and the Cabinet will be asked either to urge Parliament, under the terms of the Railways Act passed last session, to vote a sum of money equal to ¾d. per ton per mile on the coal carried or allow the full charge of 1d. per ton per mile to be made, which is the rate on firewood. The Act referred to states that where a question of policy is involved, such as the development of the Gippsland coal mines, the Government can ask Parliament to make good any loss arising from the carriage of goods at an exceptionally low rate. Formerly a sum was annually voted to recoup the Department for the loss on the carriage of coal.”

“I have, &c.,

“H. McLACHLAN,

“Secretary.

“The Secretary, Parliamentary Standing Committee on Public Works.”

A. Wilson,
Esq.
16 Oct., 1896.

continental line to Adelaide, and the line I suggest would be through productive country or country capable of being made productive. There is no desert whatever.

2206. You go direct to the northern line? They can only run a train once a fortnight on that line. The people who have gone there are sorry that they ever went. My cousins have had property out there for half a life time, and it has been only a sink of money all the time. As regards crossing the Darling with a connection from a line here to Broken Hill, of course Wilcannia has been to some extent the capital of a large area of back country. There is no disputing that fact. It has lost some of its position owing to the uncertain supply of goods by the river; but it was for many years the capital of a large extent of back country right out into Queensland and into South Australia. Menindie commands no country whatever practically. I am speaking from a knowledge of the two places extending over a great many years. I was all through that country years before Broken Hill was dreamt of, and formed an opinion about it then. As to the value of the line from Condobolin to Broken Hill, from a New South Wales point of view—that is from a paying point of view—for increasing the productiveness of the country, I thought I knew that country pretty well, and I must confess that I was exceedingly surprised on reading the account given of it by General Hutton after he had had a trip through that country about a year ago. It has been on my mind ever since that if there were a tract of country such as he led the public to believe there was between Menindie and Mossgiel, I had altogether overlooked it. That was the only large tract in that part of the country that I had not travelled over. I thought I would go through it, so I went from Mossgiel to Menindie and Broken Hill, and I can now say that I am surprised that General Hutton should have formed the opinion to which he gave expression in Sydney on his return. He described the country between those two places as alluvial plains, capable of growing enough wheat for the whole of Australia and a considerable part of the world besides. A great part of my life has been spent in learning what the country is capable of, and having gone from Balranald to Ivanhoe, and from Mossgiel to Wilcannia, and taken other trips, I thought that I would make up the connecting link, and my opinion is that there is no alluvial country there whatever. It is a totally different formation. I think it is an accepted theory that that country came out of the sea and brought its saline properties with it, and that is entirely against the idea of there being any alluvial plains.

2207. *Mr. Trickett.*] You would not like to start a market garden there? It is a good deal of a struggle to keep a green thing alive in that country.

2208. *Mr. Fegan.*] With water? You can do anything with water and heat in a certain amount of soil. What you might think to be the worst part of that country would be the best if you had water—that is the pure sand hills approaching the Darling. The hundred miles of country that are described as alluvial plains have a skin of sandy loam on the surface and a patch of marl immediately below—the very worst kind of soil that you can undertake to irrigate. That is the kind of country between Mossgiel and Menindie. With water on the first bluish it would give wonderful results, but they would not be permanent. It would be the worst country in New South Wales to irrigate. All that salt bush country has certain mineral substances in it, and after the first shoots have gone off and the plants are expected to continue and to flourish, they nearly all die off. Pure sand is infinitely better. Next to alluvial it is the best for irrigation.

2209. *Chairman.*] You are talking of the country in a general way? From Mossgiel to Menindie. The same remark applies with not quite so much force all the way from the Lachlan to Broken Hill. I once had charge of a Bill for the construction of water supply works at Broken Hill and Menindie, and also for a tramway; partly because I was supposed to be well up in all the surroundings of that district, I was asked to take charge of that Bill. I had no faith in the prospects of the company myself. I told the promoters so. I said, "I will give my attention to the Bill in Parliament," but, as a matter of fact, I thought they were a pack of fools. That was eight or ten years ago. The project never came to anything. I have been to Broken Hill several times since, and I am still more amazed that some of my friends had any faith in the possibilities of such a scheme, and that any productiveness was likely to be created in that neighbourhood. As regards the line, I have been in conversation with people about the Willandra and the Lachlan. One gentleman who went up there many years ago sheep-farming is now trying wheat-farming—I refer to Mr. Campbell, of Euabalong. I asked him what he thought of the prospects of the railway, and he said, "Well, I do not think the railway would do us any good."

2210. *Mr. Fegan.*] His evidence to us is different from that? I will tell you the expression that he made use of. He said, "I look at it in this way. When we have a short crop, we have a good market for it; but if the railway is brought into the back country, and especially under the freetrade system, when we have a short crop, Victoria and New Zealand will come in and scorch up any little market that we might have." I am a freetrader, and I believe that if the railway is to be made that is no argument at all.

2211. *Chairman.*] Did he think that the land about Euabalong would grow crops? He thinks they could grow crops if they had their own market assured to them, but not in competition with the outside world.

2212. He thinks crops would do fairly well at Euabalong? Yes; in any good forest country from the Lachlan down to the Willandra.

2213. *Mr. Wright.*] Does not Campbell produce 4,000 or 5,000 bushels of wheat a year? I do not know. He has several hundred acres under crop at the present time. He will get no wheat, but he will be able to get a medium crop of hay. He is of opinion that they could not grow wheat to send to Sydney for the open market. I am not expressing an opinion that I formed in the last week or two, but many years ago. When the late Sir William Morgan was Premier of South Australia, I interested myself in seeing a good deal of country there, and I said to him then, "Your wheat-growing must come to an end in South Australia." He said, "Why?" I said, "It will come to an end when the people of New South Wales begin to realise the fact that there are millions of acres in New South Wales, with better climate and much better soil, which will grow two or three times as much wheat per acre as the land you are trying to force settlement on in South Australia. It so happens that Hillston is about in a line with the centre of the South Australian wheat areas. If you take from Hillston to Bathurst, and Albury to Dubbo, you have a tract of country there with double the rainfall of South Australia, and advantages for producing wheat equal to those of any place in the world." That was almost before wheat-growing was commenced in Riverina. I was then a resident of Riverina. It was in the early days of my Parliamentary experience in this country that I expressed that opinion.

2214. *Chairman.*] Do you know the country from Hillston to Wyalong? Not as a through line. I know the country about Wyalong and towards the Lachlan, but I have not been through the scrub country there.

2215. What sort of country is it from Wyalong to Grenfell? First-class land, except for a few miles out of Grenfell. It is broken country there, then good country a few miles out of Grenfell. Then you get rich plains till you are within 10 miles of Wyalong. It would all grow wheat, but it is not what I would call first-class wheat country; it is a rich, fattening, boree country. You pass through first-class lands 15 miles out of Grenfell—then you get on the Marsden Plains a heavy black soil like the Liverpool Plains. I go through the country and look critically at the land, and I have inspected nearly every acre of land between Grenfell and Wyalong during the last three or four years.

A. Wilson,
Esq.
16 Oct., 1896.

2216. What is the character of the country from Grenfell to Cowra? It is nearly all good, except the hills. The flat country is nearly all good strong wheat land, almost a little too heavy for the present day. In good seasons the crop grows very strong, the straw being 6 ft. high, and as thick as one's finger.

2217. Supposing you started from between Cowra, on the Blayney and Young line, and went west? There is a patch of country there which is all good producing land from the New South Wales point of view. A railway a little out of Cowra, through Grenfell as far as the Lachlan, would be a justifiable and satisfactory line. I have a strong opinion that the line, if not made from there, should be made from Young to Grenfell and Forbes, and then from Parkes to Narromine. If New South Wales wanted to sink a few hundred thousand pounds in railway construction that is a country which will carry a large population. Every acre will grow wheat. I have had occasion to see a good deal of that country, because for some weeks I was assessing between the Macquarie and out to Parkes, and I visited nearly every holding in that district.

2218. How far is Narromine from Dubbo? It is 22 or 24 miles west of Dubbo. Every acre from Narromine to Parkes is first-class wheat land, and population is settling there in spite of all the difficulties.

2219. *Mr. Wright.*] Do you know the country between Cowra and Marengo? Yes.

2220. Do you consider that good country? No, that is coming towards Burrowa.

2221. Is there much of the country from Cowra to Grenfell suitable for wheat-growing? A great deal of it. There are some hard hills there; but what is good is superior.

2222. If you were running a railway from near Cowra to Wyalong, where would you cross through Grenfell—would you go through the Weddin Mountains? If it were proposed to take a railway, you would not start from Cowra, but somewhere on the Young line. I do not know whether you could go through Grenfell or not with advantage; that is an engineering matter. The tendency ought to be to keep to the south as much as possible.

2223. You are aware that east and west of Grenfell there are mountains and inferior country? Yes.

2224. You would go through Caragabal? Yes; and towards Marsden.

2225. Then up Back Creek? You would about touch Back Creek. You would be between Back Creek and Billabong station.

2226. And through the Mallee Plains run? Yes.

2227. And all that country, with the exception of the area around Grenfell, is very good country? Yes.

2228. Do you know the country beyond Wyalong? Not right through. I have been on several runs about there.

2229. Have you been at Wollongoug? Yes.

2230. You pass Wollongoug on to the Dandoo Hills? Yes.

2231. All that country around Wollongoug is good country? Yes.

2232. Do you consider the myall country good? It is not to be compared with the open white box forest.

2233. As a matter of fact, you hold the opinion that, although the country is magnificent for grazing purposes, it is not the very best class of soil for wheat? Caragabal and Marsden Plains I do not look upon as first-class wheat country.

2234. I suppose you are aware that it is all myall plains down about Cudgellico? I understand that there is a considerable extent of rough country there, and a pretty high ridge to cross.

2235. What is the country that it is proposed to reach from the Lachlan;—have you been through Dent's place, Oma? Yes.

2236. Is there rough country about Bogolong? Yes; it is in some respects like Liverpool Plains—you have worthless hills and rich myall plains. It is not like the Riverina district. In the Riverina district the value is pretty uniform, but in this district you may be on land that is worth £2 an acre, and half a mile off the land may not be worth 5s. an acre.

2237. From your knowledge of land you would not consider any portion of that tract really first-class land except on the banks of the Lachlan? No. About Marsden it is first-class grazing country and second-class wheat land.

2238. *Chairman.*] What do you call first-class wheat country? Any of the white box forest, such as you see between Wagga Wagga and Albury.

2239. Do you regard Molong as a first-class district? Yes; any white box forest is good. That is the best wheat country as things have developed to-day, and it is the sort of country that you meet with almost without a break from Narromine into Parkes and Parkes to Forbes and towards Grenfell.

2240. The whole extent of country from the western line to the Lachlan is first-class country? Yes; once you get on the flat box country there is a stretch of country extending from the Lachlan to the Murray, between Parkes, Condobolin, Wagga Wagga, and so on, away to the Murray. That is the country that I told Sir William Morgan would grow wheat for all Australia. I think I was, to a certain extent, a true prophet, because there is going to be no wheat in South Australia this year.

2241. Have you been through that belt of country separating the high lands west of Lake Cowal? I have not. I think you would get hilly, broken country there.

2242. It consists of ridges? Yes; and patches of mallee. Bearing on the original question, I may say that I went, as a pastoralist, to look at some country in South Australia, where the railway passes through from Adelaide to Broken Hill, and at the time I speak of they were contemplating throwing it open for farms. That is after you leave Petersburg, going to Broken Hill. I said I was afraid it was a great mistake, and Mr. Goyder agreed with me, as it was outside his rainfall line. They resumed the country there and settled farmers on it, and the result has been, in many cases, a disastrous failure.

2243. Not enough rainfall? No; and owing to the saline nature of the soil. In all that salt-bush country, after one or two spurts in good seasons, the moment there is the slightest dryness in the soil things

90

A. Wilson,
Esq.
16 Oct., 1896.

things go right back. It is admitted in South Australia that it was a fatal mistake to settle people on that land. The settlers are starving, and the Government are constantly making efforts to relieve them. 2244. Do you know anything about the cultivation of the mallee in Victoria? Yes; my people first settled on the fringe of the mallee in Victoria. The best country out Wyalong way is mallee country. There are patches of mallee there, mostly good but superficial. They have had the same experience in Victoria. What there is of the surface soil is thoroughly good. If I wanted to start a farm in that district I should go for a patch of mallee. In Victoria the mallee means a great stretch of country, but about Wyalong it is only in streaks and patches. The mallee country in its natural condition grows nothing but mallee, but it has the best soil of that class of country. A good many people have the idea that mallee is the generic name for scrub, but it is not so. I was rather amused with one reason given for the construction of a line from Condobolin to Broken Hill, which was that the Broken Hill people would come to Menindie for recreation and recuperation. I have been at Menindie in good seasons—I was never there in summer-time—and my recollection of it is that it is moving sand. The people were shovelling sand out of the corners of the verandahs, and that was winter-time. I think that anyone who wants a holiday would rather spend five times as much to get down to Port Pirie.

2245. *Mr. Wright.*] What effect will the construction of the railway as proposed have upon the wool traffic round about Willandra, and from there to the Darling? I am not very sure. The railway to Menindie would have the effect of taking the wool from Mossgiel to Menindie to go to Melbourne or Adelaide. Whatever people may say about their patriotism, we have had enough experience to know what that is worth. When I was advocating the construction of the line to Hay and a line to Jerilderie, I had some faith in the statement made that the people would certainly use the line. But when it comes to a question of 5s. a ton on the carriage of wool, the wool will go where the 5s. a ton will be saved. The wool from nearly every station in the Mossgiel district goes to Melbourne. Some of it comes to Sydney, and goes by sea to Melbourne. Westward of Mossgiel it has been the practice for the wool to go to Balranald, and from there to Hay.

2246. Instead of a railway bringing wool to Sydney it would mean a leakage? I think so.

2247. As a matter of fact, all that country is served by Victoria and South Australia? Absolutely. I think that the only station below Condobolin in any way attached to Sydney is Mr. Lee's. Once you leave there everybody is for Victoria. It is very much like pumping water up hill to get the business here from Menindie to Broken Hill.

2248. *Mr. Hoskins.*] Too many are ledger-bound in Melbourne? The whole of them, without exception. I doubt whether there is a place between the Lachlan and the South Australian border where there is a man who can say what he will do with his business without reference to somebody else. It is all Melbourne.

C. E. Rennie, Charles Edward Rennie, Esq., Chief Draftsman, Department of Lands, sworn, and further examined:—

16 Oct., 1896. 2249. *Chairman.*] You were asked by the Committee to furnish information with regard to the abandoned resumed areas down the Lachlan and by the Willandra to Broken Hill;—have you got the information? Yes. The total approximate area abandoned within 20 miles of each side of the Lachlan River commencing from Condobolin, thence within 20 miles of each side of the Willandra Billabong, and thence *via* Bulla Bulka to Broken Hill is 759,000 acres—that is, inclusive of reserves.

2250. We were informed when in the district that within the boundaries of two pastoral properties, the Merri Merrigal and the Hunthawong, which lie between Hillston and Cudgellico, there were 1,000,000 acres of abandoned country? I am only giving the area within the limits prescribed.

2251. There is more outside? Yes.

2252. Can you find out the area abandoned taking 40 miles north of the Hay and Junee line? Yes.

2253. Do you think it would be possible to state the number of holdings that have been taken up, and what has become of those that have been surrendered since? That information was, I think, furnished by Mr. Burt, of the Lands Department.*

* NOTE (on revision):—The following is the information asked for by the Committee.—C. E. RENNIE, Chief Draftsman, Department of Lands.

SCHEDULE of abandoned resumed areas within 20 miles on each side of the Lachlan River, commencing from Condobolin; thence within 20 miles on each side of the Willandra Billabong; thence *via* Bulla Bulka to Broken Hill. These areas include reserves from sale.

33	Kiacatoo	31,851	Classed as inferior lands ; part offered as improvement leases 118 to 121 C. ; 118 sold, others not ; 21,800 now available.
499	Pahsthan.....	27,579	Offered in two blocks for occupation license at 10s. per section, but not sold.
266	Mowabla	9,275	Offered as improvement leases 159, 160 C.D., but not sold.
689	Melrose	141,393	D.S. reports not worth offering ; is barren useless land.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Condobolin to Broken Hill.

APPENDIX.

A.

LETTER FROM THE HON. C. A. GOODCHAP, RESPECTING THE PROPOSED RAILWAY.

Sir, Union Club, 6 August, 1896.
The Engineer-in-Chief, by the report of his evidence in to-day's *Telegraph*, says that the distance from Sydney to Broken Hill *via* Wilcannia is 743 miles, while the distance *via* Menindie is 683, difference 60 miles; and he adds "this was of considerable moment in connection with the question of direct communication with Broken Hill, &c."

It is admitted, of course, that every mile additional increases the advantages of the shorter route, but has not Mr. Deane made a mistake in regard to the mileage; is it not 720½ miles between Sydney and Broken Hill *via* Menindie instead of 683? Mr. Deane in his evidence says that the distance from Broken Hill to Condobolin *via* Menindie is 366½ miles; the Commissioners' time-tables show that the distance from Sydney to Forbes is 289, and the distance from Forbes to Condobolin is 65 miles—720½ miles.

The difference between the two routes—Menindie and Wilcannia—according to this showing is less than 24 miles instead of 60 miles, an error of 36 miles, a very important and significant difference in determining the proper route.

I would very respectfully suggest that Mr. Deane may be afforded an opportunity of revising his evidence on this point. I have, &c.,
CHAS. A. GOODCHAP.

The Chairman, Parliamentary Standing Committee on Public Works.

B.

[To Evidence of J. Burt, Esq.]

PARTICULARS RESPECTING LAND WITHIN A RADIUS OF 20 MILES ON EITHER SIDE OF THE PROPOSED RAILWAY.

Proposed Railway Line from Condobolin to Broken Hill.

Memorandum.

Department of Lands, 19 August, 1896.

ONE of the members of the Public Works Committee having expressed a desire for information respecting the number of homestead leases at present in existence in proximity to the proposed line, a schedule is enclosed giving the names of the lessees and the area so held within 20 miles on each side of the proposed line. Total number of homestead leases is 200 for an area of 1,487,698 acres.

A schedule is also enclosed, giving the names of the present holders of the pastoral holdings through which the line passes. Twelve out of twenty-four holdings stand in the names of banks or other financial institutions.

The Chairman, Public Works Committee.

J. BURT.

SCHEDULE of Homestead Leases within 20 miles of the proposed Railway Line from Condobolin to Broken Hill.

Twelve holdings out of twenty-four stand in the names of banks or financial institutions.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

SATURDAY, 5 SEPTEMBER, 1896.

[The Sectional Committee met at the Council Chambers, Lithgow, at 7.30 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Condobolin to Broken Hill.

Mr. Horace Edward Seymour Bracey, Mayor of Lithgow, sworn, and examined:—

1. *Chairman.* What is the catchment area from which the water supply for the town of Lithgow is obtained? Nineteen square miles.
2. What is the rainfall here? The average rainfall is about 40 inches.
3. What is the discharge of Farmer's Creek? Our delivery is 700,000 gallons every 24 hours. The storage capacity is 120,000,000 gallons. The delivery was calculated at a dry time of the year. After heavy rain it would be much greater.
4. What did your water supply cost you? About £13,000 altogether. The estimate was £15,000.
5. Did that sum embrace the cost of the pipes and distributing mains? It included everything.
6. If operations were commenced in the town which would create a much larger consumption of water, you would have to go to further expense to increase your supply? We have a very large supply now, but if we required more water we could about double the storage capacity of the reservoir by building a dam about 2 miles further back.
7. The supply could be made practicably inexhaustible at a slight additional expense? Yes.
8. At what per 1,000 gallons can you afford to supply water? At the present time I think the rate is too high. We fixed a rate which we thought was necessary to cover the cost. We charge manufacturers requiring water 1s. per 1,000 up to 250,000 gallons per annum, 9d. per 1,000 up to 500,000 gallons, and 6d. per 1,000 for any quantity over 500,000 gallons. Next year we hope to be able to reduce these charges by one-third, bringing the prices down to 8d. 6d. and 4d. The Council are quite willing to assist any industry which may be established here, and I have no doubt that these prices might be still further reduced.
9. Do you believe that your Council can supply water more cheaply than it could be obtained by any pumping scheme? Much more cheaply. There is nothing to prevent us from supplying it at almost a nominal rate.
10. And with a little extra expenditure your supply would be practically unlimited? Practically inexhaustible. Our pressure at the present time averages from 60 to 100lbs.; but by sinking the inlet-pipe we could get an additional pressure of 45 lbs.
11. Is there a direct fall from the reservoir? Yes. At the present time our inlet pipe is only 3 or 4 ft. from the surface, but by sinking it we could obtain additional pressure. Of course, in the event of fire pressure becomes very important. Our present consumption is 24,000 gallons a day. We estimate that a fall of 1 inch over the catchment area would fill the dam, and by making proper impounding arrangements we could furnish an unlimited supply, no matter what industries might spring up. The catchment area is rocky ground and there is no possibility of any settlement springing up near it whereby the water might be defiled.

Mr. H. E. S.
Bracey.

5 Sept., 1896.

Mr. James Ryan, editor of the *Lithgow Mercury*, sworn, and examined:—

12. *Mr. Trickett.* How long have you been in this district? About twelve years.
13. Can you give us a description of the smelting-works which are now being erected at Eskbank? The matter was first taken up last year by the local progress association, of which I am Secretary, and all the correspondence went through my hands. We found that the Cobar Tributary Company were not treating their matte here because the railway freights favoured the Newcastle district to the extent of £37 for every 100 tons treated. We therefore applied to the Railway Commissioners for such a reduction as would place us upon an equal footing with Newcastle. A reduction was made, with the result that instead of being at a disadvantage we were at an advantage to the extent of £11 13s. 4d. per 100 tons. The rate granted for the trainage of matte from Cobar to Lithgow is 14s 8d. per ton. The distance between this place and Cobar is 364 miles. That makes the rate 48 pence, or a shade under a halfpenny per ton per mile. I

Mr. J. Ryan.

5 Sept., 1896.

Mr. J. Ryan. believe that it was these low rates that induced the Cobar Company to establish their works here. I have here a statement in regard to the work proposed to be done, which I received from Mr. Longworth, and which I would like to read.

5 Sept., 1896.

14. You believe the statement to be a correct one? Yes. Mr. Longworth informed me that he intended to put up eight furnaces. These would treat 125 tons of matte weekly, with an expenditure of about 25 tons of coal for each furnace, or 200 tons of coal altogether. He expects to treat about 6,500 tons of matte per annum. The matte is concentrated in Cobar to about one-tenth of the original bulk of the raw ore, and Mr. Longworth anticipates that it will be found to contain from 40 to 50 per cent. of copper. On the 1st or 2nd of July last, I interviewed Mr. Longworth, for the paper which I edit, and this is an account of the interview:—

Then at the end of three or four months, everything will be ready for the treatment of mattes? Yes; and we will then employ some 60 men about the furnaces, irrespective of the coal, which will be used to the extent of 25 to 30 tons daily.

What kind of furnace do you propose? The ordinary reverberatory. I expect they will be capable of treating about 125 tons of matte weekly.

This, I believe, you regard as only a beginning? That is so, but I can't say what it may grow to; it may grow a lot bigger. When we get going properly we will, I expect, be able to treat most of the western copper found near the railway line. There is room, on the basis of our intended operations, for unlimited development if such is needed.

No, we won't use the electric light at present. But on this matter *my opinion is that there is no place in the world better than Lithgow to start an electrolytic plant* for the treatment of copper and all suitable ores. Why, with your (small) coal at 2s. a ton it is as good as Niagara.

Last night I saw Mr. Longworth regarding the Broken Hill ore, and the fluxes necessary for treating them. He told me that those ores required ironstone fluxes, and he knew of the existence of big bodies of suitable fluxing material in the Cobar district, carrying from 4 to 5 dwts. of gold. Assuming that this material cost £1 a ton to bring to the works, the gold would pay for the carriage. You would thus have the flux virtually delivered free. It costs £1 per ton for flux at Broken Hill. Of course the character of the ironstone flux required varies with the character of the ore to be treated. In a letter written to the *Cobar Herald*, Mr. Longworth said—writing in regard to the removal of the smelting works to Lithgow—“The saving from firewood alone will mean to the Company about £30 per week.” I have also been in communication with Mr. John Howell, in the hope that he might establish a branch of his works at Lithgow for the treatment of ores coming from the western district, and I have had four letters from him in which he promises to visit Lithgow as soon as he is able to find the time. I have also a letter from Mr. Cook, giving the result of an interview with Mr. Howell, and stating that Mr. Howell promised to visit Lithgow. Mr. Cook adds that Mr. Howell “seemed very favourably impressed with what I had told him of Lithgow.” I have made inquiries as to the price at which limestone could be supplied at Lithgow, with the result that I find that it could be delivered here in ordinary quantities for about 5s. 8d. per ton, including freight, and that for large quantities the price would probably be very much smaller. In addition to limestone, we have at Piper's Flat large ironstone deposits. I cannot give you exact information as to their extent; but their existence is a matter of official knowledge, and has been reported upon frequently. I have received a report from a local correspondent at Portland, to the effect that a contract had been concluded for the supply of limestone from this neighbourhood to the works at Illawarra. I have not been able to personally verify this statement, but it was supplied to me as editor of the paper. My correspondent writes:—

A piece of good news for this place is that Mr. W. Haigh, the manager of the Portland lime works, has received an order from the Illawarra smelting works for as much lime and limestone as he can supply them with. The smelting works require about 100 tons of stone per day.

Portland is within 14 miles of Lithgow. I mention this matter because in giving evidence before the Committee Mr. Howell said that fluxing material was difficult to procure near Lithgow.

15. You contend that the Lithgow and Eskbank district is suitable for the establishment of fluxing works, by reason of its good water supply, its almost illimitable coal supply, and the presence of abundant fluxing material? Yes. Speaking generally, I believe that we have the cheapest coal in the world, and that the supply is, for all practical purposes, illimitable.

16. The ore which would be brought here from Cobar for treatment will, you say, be reduced at Cobar to about one-tenth of its original bulk; that, of course, reduces the amount of freight claimed by the railway? Yes; but I assume that it would not pay to send large bodies of crude ore for long distances. The ore is concentrated for the sake of economy in transit.

17. Would the same thing be done with silver ore? I cannot speak from personal knowledge; but I think that silver ore would be more profitable.

18. You think that silver ore would be sent in the original bulk—that it would not be treated at Broken Hill? It would be sent here in greater bulk. Of course, if a railway were made to Broken Hill, and concentrating work were done there, the line would be used for the transport of coal from here, and that would give the Railway Commissioners what they want—a return traffic.

19. I understand that it is proposed to treat about 60,000 tons a year at the smelting works which are being erected here? No about 6,500 tons; but there is a probability of further extension. If Mr. Longworth can secure the trade, he will be quite open to deal with other companies for the treatment of their ore.

20. There would be no difficulty in enlarging the works? I am not aware of any.

21. Do you know what the proposed works are likely to cost? I should estimate the minimum cost at £5,000.

22. Is it proposed by the proprietors of these smelting works to buy ores from other people? Primarily they have their own ores at Cobar, which will supply them with 6,500 tons of matte, but I understand that the company will be open to treat with other companies, or, perhaps, to buy other mines, and thus increase their ore supply.

23. What rate per ton per mile does Mr. Longworth allow for the carriage of ore from Cobar? The rate which our Association helped to secure to him is 14s. 8d. per ton, for the whole distance.

24. The distance from Lithgow to Broken Hill is 600 miles, and the Railway Commissioners say that they cannot afford to carry ore for less than ½d. per ton per mile, or 25s. per ton for the whole distance;—are you prepared to say whether a smelting company could afford to pay a rate like that? No, I am not; but if the Commissioners can bring 6,500 tons of matte from Cobar for a little less than ½d. per ton per mile, I should think that they could bring ore from Broken Hill at a still lower charge.

25. If smelting works were established at Eskbank for the treatment of ores brought here from Broken Hill, the coal traffic to Broken Hill would be considerably diminished? Coal would, I assume, be required there for

for ordinary household purposes, to create engine power, and for manufacturing purposes generally. Mr. J. Ryan. It would also be required for such concentration as it might be deemed necessary to do on the spot.

26. According to Mr. Howell, they do not propose to concentrate at Broken Hill; they propose to send the ores away crude? Then the whole thing resolves itself into a question of the cost of carriage from Broken Hill. 5 Sept., 1896.

27. But you are of opinion that if satisfactory arrangements could be made in regard to the cost of freight, this district would prove peculiarly suitable for the establishment of smelting works? I think so. I cannot see how the contrary could be proved.

28. And Lithgow being 150 miles nearer Broken Hill than Lake Illawarra is, ore would probably be treated here more cheaply than at Lake Illawarra? Yes. I understand that in smelting about 3 tons of coal are required for every ton of ore. Inasmuch as the average price of coal here is 1s. a ton less than it costs elsewhere, there would be a saving of 3s. for every ton of ore treated. There would also be the saving in freight which you mention.

29. At what price per ton will coal be supplied to the smelting company? Mr. Sandford could give you that information. The minimum average prices of coal, I estimate at from 3s. 9d. to 4s. per ton in the Lithgow district, from 4s. 9d. to 5s. 3d. in the Illawarra district, and from 5s. 9d. to 6s. 6d. in the Newcastle district.

30. Does the coal here compare favourably, so far as its quality for manufacturing purposes is concerned, with the coal in the other districts you have named? I believe it to be good coal; but I cannot make a definite comparison.

Mr. William Sandford, proprietor of the Eskbank Colliery and Ironworks, and of the Eskbank Estate, sworn, and examined:—

31. Mr. Hassall.] Will you tell us the extent of the coal area in your estate? 1,700 acres is the unworked area. Mr. W. Sandford.

32. Can you give me any information in regard to the coal areas held by other people here? No. 5 Sept., 1896.

33. What is the average thickness of your seam? They are working from 5 feet 9 inches to 6 feet at the present time.

34. Is it expensive to get the coal out? No, the coal is easily worked.

35. Do the facilities for obtaining the coal compare favourably with those in other mines in the Colony? Very much so, I think. In this district we can get coal more cheaply than it can be got in any other district.

36. Can you give us an analysis of your coal? No; but it is of good quality, and suitable for iron-working.

37. Is it good coal for smelting purposes? I should think so. I would compare it with the English coal used for similar purposes.

38. What is the cheapest price at which it could be supplied at the pit's mouth? It can be put on the trucks at 4s. a ton. A great deal would depend upon the quantity to be supplied. I could undertake to supply 100,000 tons a year for 100 years.

39. Mr. Howell informed the Committee that they have practically proved the deposits of silver ore at Broken Hill at about 16,000,000 tons. If they dealt with that ore at Broken Hill a large amount of coal would have to be sent there. Could you deliver the coal on the trucks here at 4s. per ton? Yes, or for less—3s. 9d. a ton.

40. The cost of carriage by train would determine whether you could compete successfully with the coal conveyed to Port Pirie by water and thence by rail to Broken Hill? Yes.

41. In the event of large smelting works being established at Lithgow, would there be any reason to fear that operations might be suspended at any time? None whatever.

42. There would be no fear of a block because of the occurrence of a strike or anything of that kind? We have had no strikes of any importance in this district.

43. What quantity of ironwork do you turn out in the twelve months? About 5,000 tons of finished iron in the year. That is what we did last year.

44. How many hands do you employ? Nearly 200 in the ironworks, and about 50 in the colliery.

45. What is about your average pay-sheet per month? To-day we paid £2,316, and last month £2,400—about £2,000 a month.

46. Have you any intention of enlarging your works? That depends a great deal upon circumstances—upon the facilities offered for the expansion of the business.

47. What is your opinion of this particular portion of the Colony as a site for smelting works? It is unequalled. We have the cheapest coal in the world, and abundance of good fresh water. There is not sufficient water for smelting purposes in the western district. Then, too, we have good fire-clay which can be converted into fire-bricks, we have good sand for the bottoms of the furnaces, and we have good moulding sand. Then, not far from here, we have iron ore of undoubted quality. We have also limestone.

48. Have you any idea of the extent of the ironstone deposits or of the limestone deposits? I have no official knowledge; but I believe that both exist in large quantities.

49. Could this fluxing material be supplied at Lithgow at a pretty cheap rate? Yes, at very low prices.

50. Can you obtain definite information upon the subject? I do not know any other place where you could get limestone as cheaply as you can get it in this district. I buy a great quantity of it for my foundry at times.

51. Is there any other information which you would like to give the Committee? We are offering very good terms, together with railway sidings, and coal delivered upon the ground, to anyone wanting land to put down works upon. Water could also be supplied very cheaply. There are other colliery proprietors in the district who also would, no doubt, be willing to give every facility to anyone wishing to invest capital in the erection of smelting works here. In other places they have to pay a large amount for water, fire-clay, and so on. With regard to coal going westward, the Lithgow Coal Association would, no doubt, supply it at very low prices.

52. Then, any person desiring to erect smelting works would practically have the whole of his capital available for that purpose, the cost of land, &c., being merely nominal? Yes. We could deliver the small

Mr.
W. Sandford.
5 Sept., 1896.

small coal, which is used for smelting purposes, for 2s. a ton. I have travelled through America, in England, and on the continent of Europe, and I do not know a better place than this for the establishment of a manufactory. I would not have undertaken the liabilities which I have here, were I of a different opinion. We have a good climate, and one can work here the whole year round. This place has been called the Birmingham of Australia.

53. Are your mines dry? We have to pump a little, but not very much. Our mine can be dried with a good pump in a few hours per day. We estimate that we have 6,000 or 7,000 tons of coal to the acre, so that altogether there are about 10,000,000 tons of coal available. I could deliver from the two collieries 100,000 tons a year, or any quantity that would be wanted. That is apart from what the other collieries supply.

54. How many other colliery proprietors are there? Six besides myself. I should think that a considerable quantity of coal would be used at Broken Hill. There must also be a large consumption of galvanised iron and of bar-iron. That we could supply, and the freight would be a source of revenue to the railways.

55. At what price per ton could you deliver galvanised iron? We are now charging £16 10s. a ton for it. The freight for galvanised iron is very low. The freight to Broken Hill, if the proposed line were made would be £2 0s. 3d.

56. What is the price of bar-iron? We could deliver it for about £8 a ton.

57. Would the freight be the same? Yes. The freight depends upon the quantity sent. With regard to coke I would be prepared to put down the necessary plant and to manufacture largely if there were a demand for it.

Mr. Louis Buckland Blackwell, Assoc.M.Inst.C.E., mining manager, Vale Colliery, Lithgow, sworn, and examined:—

Mr. L. B.
Blackwell,
A.M.I.C.E.
5 Sept., 1896.

58. *Mr. Fegan.*] How long have you been at the Vale colliery? Two years.

59. Have you had experience elsewhere? Yes.

60. How long have you been in this district? I have been seven or eight years in the Western district.

61. Were you managing any other colliery? Yes, the Cullen Bullen colliery.

62. How many acres of coal land are there at the Vale colliery? I would not like to speak definitely; but approximately we have 600 or 700 acres.

63. What is the thickness of the seam? From 5 ft. 6 in. to 5 ft. 9 in.

64. Is it a good seam? Excellent.

65. How many men have you employed? About forty, above and below ground.

66. What is your hewing rate? One shilling and eight pence a ton.

67. What do you sell your coal for? It is sold to the Lithgow Coal Association at various prices according to the contracts entered into, and according to whether it goes east or west.

68. At what price could you send coal to Broken Hill? For about 4s. a ton and freight.

69. How long have you been making coke at the Vale colliery? The first experiments were started in 1890.

70. Were they successful? Not quite so successful as they have been during the last 18 months.

71. Can your coke be compared with the Wallsend coke as regards quality and amount of ash? The amount of ash is slightly greater.

72. Do you agree with the statement that the Lithgow coke is unfit for smelting purposes? At the present time we are supplying coke to the Great Cobar Copper Mining Company and to the Sunny Corner Company and we have had no complaints. During the last 18 months or 2 years we have very largely improved the density of our coke.

73. Is the patent your own? I have no patent. The arrangements are my own.

74. Your arrangements have improved the quality of the coke? No tests have been made by the Government since I took charge.

75. Has any test been made by yourself? Yes, several.

76. What are the tests? We can reduce the ash by a very large percentage, but our present consumers do not ask for this reduction. Mr. Longworth, of the Great Cobar Copper Company, suggested the other day that I should not remove the ash at all, and I assumed from his remarks that it acted as a flux.

77. Have you compared the analysis of your coke with those of other cokes? Yes, we can reduce our ash to about 10 per cent.

78. Have you an analysis of the Newcastle coke? The amount of ash in Hood's coke (English) varies from 4.75 to 9.70. In the Newcastle district the amount of ash is brought down to 7.82 per cent. At Singleton it varies from 9 to 10 per cent. At the Co-operative Mine it varies from 10 to 12.65 per cent.; at Unanderra it is about 11.5 per cent., at Mount Pleasant and Bulli, from 13 to 14 per cent.; and at the Vale colliery, in 1892, 15 per cent., and about 12 per cent. at the present time. We can reduce the amount of ash in our coke still further. It is only a matter of cost; but not being pressed by our large consumers to do so, it is not worth our while to make any change.

79. You use small coal chiefly in the manufacture of the coke? Yes.

80. The coal goes through certain washing processes? Yes, the western coals are interstratified with foreign matter which has to be removed.

81. What would your plant cost? A plant like that could be built for from £70 to £80 per oven.

82. What is your present output? About 60 tons a week.

83. How much per oven? From 2 tons 10 cwt. to 2 tons 15 cwt. per charge.

84. How many charges can you have in a week? With improved ovens we ought to have a charge out every 4 days. At present it takes nearly 7 days. If we had more to do we should have to erect a larger plant. Another very important matter to consider is this: Assuming that the total output of coal from the whole district amounts to 30,000 tons per annum per mine, and 10 per cent. of that is small coal, that amount of small coal is only capable of producing a certain quantity of coke. In 1892 Broken Hill was consuming 1,000 tons of coke per week. Assuming that the consumption now is as large as it was then, this district, in order to supply the demand, would have to use not only the whole of the small coal raised but some of the large coal. We would have to pay £8,000 a year for producing and crushing the large coal, and that would increase the cost of manufacturing the coke by 1s. 8d. or 2s. a ton.

85. How much per ton can you supply the coke for now? For about 15s. a ton delivered in the trucks for large contracts.

86. That would be about £2 a ton at Broken Hill? Yes.

87. Do you not think it strange that a person who knows this district very well should state that your coke cannot bear comparison with the Newcastle coke? I do not think that it has been recently analysed, or that a test has been made within the last 2 years.

88. If there were large smelting establishments here to supply, your coke works would have to undergo a complete change? Yes.

89. The most modern machinery would have to be erected to cope with the demand for coke? Yes. It has already been proved that with proper appliances we could produce coke yielding only about 10 per cent. of ash.

90. That would compare very favourably with the English coke? Yes.

91. Could you produce that coke at 15s. a ton? Yes.

92. Will the coke that you are now producing carry well without breaking? If there were no carriage there would be no breakage. That would be one advantage in having the smelting works established here.

93. But supposing there was a demand for coke in Broken Hill, could you make coke of a quality to stand the carriage? I fancy that our coke is more friable than the English coke. It would give a better result in Lithgow than in Broken Hill.

94. Is that because of the quality of the coal? All coke breaks more or less in transit; ours will stand the crushing weight in the furnace. The density of the coke is an element in its success. It should be able to stand the weight of the metal in a furnace without crushing.

95. Can you tell us why English coke can stand carriage better than your coke? If we had more approved appliances we could make a coke which would bear a fair comparison with the English coke. At the present time there is no particular reason why we should spend much money in producing a better coke.

96. If you had the appliances you could produce coke which would compare in all respects with the English coke? Yes.

97. How many tons of coal go to a ton of coke? After deducting the dirt which has to be removed, about $2\frac{1}{2}$ tons.

98. Do you know what English coke is sold at now? No.

99. How many acres of good coal land are there in Lithgow;—the coal-seam goes eastward, does it not? I suppose there must be over 10,650 acres of coal-land held by private individuals, and there is a large area of land not yet taken up. The minimum quantity of coal would be 53,000,000 tons.

100. That would be about 5,000 tons to the acre? More than that.

101. Do you think it will pay to carry on coal-mining operations in this district more extensively than they are carried on at the present time? I think so.

102. Do you think that you can compete successfully with other parts of the district? Yes.

103. If the coke industry developed, more collieries would be required to supply the necessary quantity of small coal? Small coal is only made by the screens and in hewing; an increased production of large coal would mean an increased production of small coal.

104. You use a large quantity of water in the manufacture of coke? A fair quantity.

105. Do you use the same water more than once? It is used over and over again in the process of washing.

106. There is no fear of the water supply proving inadequate, even should your operations be considerably extended? No. If we went short of water we could get it from the town supply.

107. Do you know anything about the iron deposits in this district? I have seen them on more than one occasion; but I could not give you information as to the thickness of the seams.

108. I suppose you use a large quantity of timber here? Yes.

109. Have you plenty of timber to supply your wants? Yes, within a very few miles.

110. Where do you get your timber? From Blackheath, and from other stations upon the Mountains. There is an unlimited supply.

111. I suppose you are acquainted with the requirements of the iron-smelting industry? I have not any practical experience in that direction.

112. Have you seen the fluxing deposits at Portland? Yes, I have seen the lime deposits, which extend from Portland to Ben Bullen. The deposits are very extensive, and the depth is very great.

113. Limestone is used largely for flux in the treatment of silver ore? I believe that limestone has been ordered in large quantities from Mr. Haigh, at Portland.

114. *Mr. Hassall.*] In the event of a large coal trade being opened up with Broken Hill, a greater quantity of small coal would be produced here;—would you not then be able to obtain practically all the small coal you required for coke at a very nominal figure? It would all depend upon the basis upon which the work was done. If the coke works had to buy the coal from other collieries, a certain market price would have to be paid for it.

115. But one industry would help the other? Yes.

116. You should be able to obtain a sufficient supply of small coal at a low figure? Yes; and our present hewing rate of 1s. 8d. is for large coal. For small coal the rate would be about 1s., supposing there were a very large output.

117. Would that enable you to reduce the price of coke to 15s.? We would be prepared to bring it down another 1s. if we could rely upon a sufficient demand.

Mr. Thomas Wilton, colliery proprietor, Lithgow, sworn, and examined.—

118. *Chairman.*] What evidence do you desire to give the Committee? I desire to give evidence as to the price at which coal might be delivered at Broken Hill, supposing the proposed railway were constructed. I had an interview with Mr. Eddy last Thursday morning in regard to the matter. Some time ago a reduction was made in the rates for bringing matte from Cobar for treatment here. The Railway Commissioners gave a rate of less than $\frac{1}{2}$ d. per ton per mile for that traffic. I asked Mr. Eddy if he would give the same rates upon the proposed Broken Hill line, and he said, "Oh, you may take that as a basis." He gave me as the distance from Lithgow to Broken Hill 63 $\frac{1}{2}$ miles. In the rate-book the rate for the carriage of agricultural produce

Mr. L. B.
Blackwell,
A.M.I.C.E.

5 Sept., 1896.

Mr.
T. Wilton.
5 Sept., 1896.

Mr.
T. Wilton.
5 Sept., 1896.

produce and manure is 13s. 4d. a ton for 500 miles, subject to jumping rates of 2d. for every 25 miles beyond 300 miles. If those rates were applied to the coal traffic to Broken Hill, it would make the freight 14s. a ton from Lithgow to Broken Hill. Of course, lower rates have always been given for the carriage of agricultural produce than are given for the carriage of coal, and this has always been a source of contention. There can be no doubt from the remarks made by Mr. Kirkcaldie in 1891, that the Railway Commissioners would be prepared, as is done in America and elsewhere, to carry such things as coal at less than cost price for the sake of the collateral traffic if they had sufficient justification for doing so. Therefore, I think it reasonable to suppose that if the Commissioners will carry agricultural produce for 14s. a ton for 600 miles they would carry coal for at least 20s. a ton. At $\frac{1}{2}$ d. per ton per mile the cost of carriage would be about 25s. per ton; but I have no doubt that the coal could be carried for about 20s. a ton. Coal costs here about 4s. a ton, so that at that rate it could be delivered in Broken Hill for 24s. a ton. The very existence of Broken Hill depends upon its being placed in cheaper communication with a coal-producing district. Otherwise what wealth there is there must be lost to this Colony. In 1891 the problem seemed to be, how to treat the sulphide ores. The question then was whether Broken Hill could exist for more than ten years; but now a process has been discovered for treating these ores, and very large works are being erected at Lake Illawarra to treat them. It has been stated that the trade in coal to Broken Hill would cease if the ore were brought here to smelt, but I would point out that if coal could be obtained cheaply at Broken Hill more properties there would be developed. The lowest price of coal in Broken Hill is £2 2s. a ton. In 1891, coal there cost £2 8s. a ton, and the Proprietary mine was using 44,375 tons. The quantity of coal taken to Broken Hill last year was about 43,000 tons, and the greater part of it was used in the smelting of ores. There is no doubt that if coal could be supplied there at a cheap rate it would stimulate the opening up of other mines. The construction of a railway, which would mean the giving of cheap carriage, would bring about the establishment of large populations at both ends of the line, and a lot of collateral traffic would thus be provided. We do not build railways out here simply because they will pay; we build them to develop the resources of the country. What would have happened if the proposal to construct the Western line had been considered simply from the standpoint of whether it would pay. Taking 10 per cent. as the average amount of small coal obtained in a mine, it must be remembered that twice as much small coal is left underneath as is brought to the surface, because the miners load the trucks with forks, and the small coal slips through. I do not think Mr. Blackwell mentioned that. If all the small coal were brought up, it would not be necessary to crush the large coal. 119. In that way the production of small coal could be materially increased? Yes. If we were all making coke, we should not have to crush very much large coal.

120. *Mr. Trickett.*] You could not afford to pay $\frac{1}{2}$ d. per ton per mile to send coal to Broken Hill? The consumer would have to pay it.

121. Could the consumer afford to pay it? He could pay it now. It seems to have been assumed that if the proposed line were constructed the Broken Hill ores would necessarily be sent to the smelting works at Lake Illawarra; but, as a matter of fact, if the ore were sent along the proposed line it would not pass Lithgow unless some other coal district were discovered nearer to Broken Hill.

122. Do you charge more for coal going west than for coal going to Sydney? Yes; we are selling coal to the Government for 3s. 9d. a ton, though not very much is made out of that price.

123. Do you get much higher prices for the coal going westward? We get all sorts of prices where we think there is no competition.

124. A witness in Sydney stated that if smelting works were erected at Esk Bank you would not contemplate obtaining ore from so distant a part of the Colony as Broken Hill? That is nonsense. If the Broken Hill ores were sent along the railway they would never get to Illawarra; they would stop here.

125. A representative of the Lithgow colliery proprietors who was examined by the Committee stated distinctly that it was not contemplated that ores would come from so distant a part of the Colony as Broken Hill? I do not agree with him. All the other coal proprietors think that the ores will come here.

Mr. William Bragg, part proprietor of the Oakey Park Colliery, sworn, and examined:—

Mr. W. Bragg. 126. *Chairman.*] You have heard the evidence which has been given in regard to the various matters into which the Committee are inquiring? Yes.

5 Sept., 1896. 127. Do you agree with it generally? Yes.

128. I understand that you desire to make a statement in regard to the manufacture of coke in connection with your mine? I am in treaty with a company to make coke at our colliery. There is a great deal of coke going from the southern and northern collieries to Sunny Corner, to Cobar, and to other places. I have given the matter a great deal of consideration for the last seven years, and I have made considerable inquiries. I find from the Vale colliery that they can make coke as good as, if not better, than the other cokes to which I refer.

129. As good coke as is made in the Colony? Yes. I expect in a short time to be able to start a Coke Manufacturing Company. I think from what I have seen of the Vale coke that we should be able to turn out a good article. I sent two trucks of coal down some time ago, and they told me it was of very good quality for making coke.

130. You believe that there is a future for the coke industry in Lithgow? I believe that there is a good opening here for the industry altogether apart from the Broken Hill trade.

131. *Mr. Trickett.*] If smelting is carried on here to any great extent will the manufacture of the coke develop? Undoubtedly.

132. And coke would be made which would be suitable for smelting purposes? Yes.

133. If 100,000 or 200,000 tons of ore were brought to Lithgow annually, there would be no difficulty in treating it, owing to the inadequacy of the supply of coal, or of water, or of fluxing material? None at all. We have every facility for treating the ores here.

WEDNESDAY, 9 SEPTEMBER, 1896.

[The Sectional Committee met at the Royal Hall, Condobolin, at 10 a.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. George Burnett, Mayor of Condobolin, sworn, and examined:—

134. *Chairman.*] How long have you been here? About seventeen years.
135. Do you know the district fairly well? I know a lot of it.
136. Do you know the country north from Condobolin out towards Nyngan? Yes, all that country, out as far as Cobar, and I have been from Condobolin to Mount Hope.
137. Do you know the Willandra Billabong? Not very well. I have passed through that district.
138. Do you know the country from Condobolin to Euabalong on both sides of the river? Fairly well.
139. Do you know the country from Euabalong to Hillston *via* Lake Cudgellico? No, I do not. I have been along the track, but I could not say what the country is like.
140. Do you know the country from Euabalong *via* the Willandra Billabong to Hillston? I know the country on the north side of the river to Hillston.
141. Do you know the country from Hillston to Wyalong? No.
142. What is the country like from Condobolin to Euabalong, on the north side of the Lachlan? It is all good wheat-growing country.
143. How does it compare with the country between Condobolin and Parkes? If anything, I think is better wheat-growing country; at any rate it is quite as good.
144. What is the country like between Condobolin and Euabalong, on the south side of the Lachlan? It is more grazing country, and away from the river it is scrubby and ridgy.
145. Therefore a railway would go through better country on the north side of the river than on the south side of the river? Yes.
146. From Euabalong *via* Cudgellico to Hillston what is the country like? I think it is principally swampy country—lignum country along the river; but I do not know it well enough to express an opinion upon it.
147. From Euabalong to Hillston, passing the Willandra, what sort of country is it? From what I know of it, it is splendid grazing country, and in the immediate neighbourhood of Hillston, splendid wheat land—high upland.
148. You think that the railway should go on the north side of the river as far as Euabalong? Yes.
149. Which side of the river would you take the railway from Euabalong to Hillston? I think still, on the north side.
150. Would not that leave out Lake Cudgellico? Yes. You would have to make two bridges over the Lachlan to tap Lake Cudgellico from here.
151. Is the Cudgellico country good country? About Cudgellico it is good wheat-growing country.
152. Is there a large area of it? Yes, and some splendid crops of wheat have been grown there. At the present time, however, it is rabbit infested.
153. What is good wheat land worth about here, that is, in its natural state? It is being sold from about 7s. 6d. an acre.
154. You can buy it for that? It has been sold for that lately—from 7s. 6d. to 10s. an acre. That is what it fetches at auction.
155. Good wheat-growing land? Red soil, timbered country. I know of several large selections within 10 or 12 miles of Condobolin which have been sold for 7s. 6d. and 10s. an acre.
156. That would be land for which the selector had a certificate? Yes, there were Government instalments to pay upon it. If I were buying that land I should consider that I was paying 27s. 6d. an acre for it.
157. Do you think that there will be any trade from here to the west? I think that the west is the farmers' market. I am a farmer, and I think that that will be my best market.
158. Does much stuff go that way now? A lot of stuff goes that way now, and a great deal goes to Carrathool and Whitton. The Cobar line taps the country up on the other side.
159. Do you think that you could supply wheat and flour, and things of that kind to Broken Hill? I do not know. It would depend upon the freight.
160. And upon the population to be supplied? Yes.
161. The present population in the western district is rather sparse? I consider that if I grow 1,000 bags of wheat and have them gristed into flour, I shall have a market for the flour in the west; but that will depend upon the population.
162. Is there much going on at Mount Hope? I think it is a pity they have not a better outlet for their mineral wealth. There is splendid copper and silver, and payable gold there; but the place is so isolated that the people can hardly work the mines. They have so much to pay for carriage that they cannot send the ore away for treatment, and they can hardly afford to treat it on the spot themselves.
163. A line to Mount Hope would simply mean cheaper freight? Yes.
164. What sort of country is there about Mount Hope—agricultural country? It is inferior mallee country principally. There are good flats, and in towards the river from Mount Hope there is splendid country.
165. *Mr. Trickett.*] You seem to favour the northern route? Yes, the direct route.
166. Is not the land along that route in the Western Division? Yes.
167. The land on the southern route is in the Central Division? As far as Hillston, I think.
168. Is not the land in the Central Division better adapted for settlement than the land in the Western Division? I am not sufficiently acquainted with the land on the south side of the river to be able to give an opinion.
169. But inasmuch as that land is in the Central Division, would not the conditions be more suitable for settlement? The country has not been as much settled upon as it would have been if it had been good agricultural country.

Mr.
G. Burnett.
9 Sept., 1896.

- Mr. G. Burnett.
9 Sept., 1896.
170. The land in the Western Division is locked up for twenty-eight years? Well, the land in the Central Division has not been taken up as it would have been if it had been suitable for agriculture. About Lake Cudgellico it has been taken up.
171. Upon what route would the land be most quickly taken up, supposing a railway were made? I think there would be most population on the southern side of the river.
172. What minerals are obtained at Mount Hope? A good percentage of silver, very rich copper and payable gold have been found there. Some ten years ago payable gold was found there.
173. Is difficulty of access the chief drawback to the development of Mount Hope? Yes.
174. I suppose they suffer from want of water there sometimes? Very seldom now. They used to suffer from want of water; but I think there is a Government tank there now.
175. But for mining purposes the supply is limited? They are a little better supplied than they used to be; but I do not think they have too much.
176. The ore cannot be usually treated locally? They cannot treat their ore there because of the want of water.
177. If they were brought within a reasonable distance of a railway they could send their ore elsewhere to be treated? Yes. I am sure that Mount Hope would give employment to hundreds of men if they could treat the ores there.
178. Is it a large field? Yes, there are three large copper-mines there. They are something like 5 or 6 miles apart, on a straight line of reef. The gold mines are about 6 miles further out in a north-westerly direction.
179. Are there many people employed there? They were in full swing when I was there last; but the place has been shut down now for three or four years past. The price of minerals became so low, and there were so many difficulties in the way of treating the ore, that they had to close their mines. Still they do work a little. There has always been somebody working there.
180. You say that the agricultural outlet from here should be to the west; do they grow anything at Hillston? Yes; they grow large quantities of wheat there.
181. You could not expect any market at Hillston? No, but there should be a market further out into the interior, at Mossgiel, Ivanhoe, and those places. Of course, the homestead lessees about Mossgiel are turning their land to wheat-growing.
182. Would not places like Ivanhoe get their produce from Hillston instead of from Condobolin? I do not think that Hillston could supply all that back country. The people out there must either get their produce from this place or around by water.
183. If the railway were to stop at Condobolin, from how far west would traffic come here to go to Sydney? It would come from Mount Hope and from out in that direction.
184. From Hillston? I do not think it would come from Hillston. That traffic would go to the Hay line. Of course it would all depend upon the cost of haulage to Sydney.
185. Have you any idea of the population between here and Hillston? No.
186. I suppose it is pretty sparse? Yes; but there is a fair population about Euabalong, wherever there is any land worth taking up.
187. You have travelled the greater part of the road from here to Hillston? I have been from here to Hillston two or three times, and I have been to Euabalong.
188. Whether you crossed the river at Condobolin or at Hillston, the expense would be about the same? Just about the same. There would be no difficulty at either place.
189. Mr. Hassall.] What do they do principally in Hillston? The country is nearly all used for sheep farming.
190. Does much stock come that way? All the Queensland stock goes to the southern markets that way. That is the main road.
191. Where does it make for? It crosses principally at Hay and at Maude on the Murrumbidgee, and then goes to Deniliquin.
192. Is there any fat stock coming this way to go to Sydney? Not since the Bourke railway was opened. That railway takes all the fat stock coming from Queensland, and all the surplus stock from the back district.
193. Where does the wool from the stations out towards the Darling go? The wool from the stations near the Darling goes down the river to Wentworth, and thence by steamer to Melbourne.
194. But I mean from the stations some distance this way? Principally to Hay and Balranald. A lot of that wool goes through Deniliquin to Melbourne.
195. Do you think that the extension of the line to Condobolin will bring a lot of that wool this way? It will bring a lot of the wool that now goes to the Bourke line to the Hay line. It all came here before those railways were opened.
196. It will practically tap about half the country between here and Cobar? A little more than half.
197. And as far as Ivanhoe going towards the Darling? I think so.
198. Do you think that the proposed extension of the line, either along the Lachlan valley or along the Willandra Billabong, will lead to any appreciable increase in settlement? Yes, I am sure that it will. The great drawback to the country in the interior is its want of railway communication. A man can hardly make a living on a small holding unless he has railway communication.
199. What would they go in for there? There is a lot of good agricultural land which would be broken up for wheat-growing and sheep-farming combined. I think all the land is suitable for that purpose.
200. But, in the event of this country being taken up for the production of wheat and other agricultural produce, where would you look to for a market? We would have just the same resources as we have now, even if the railway did not go past Condobolin. We have Sydney on the one side, and the chance of a market to the west. The only benefit we get from a railway is that it enables us to obtain our goods more cheaply. Of course, in sending produce back we have other districts to compete with. If the proposed line is made it may be five or ten years before the country is populated.
201. But, in the event of the country towards Hillston being taken up for farming, would not the western market be closed to producers living nearer this way? I do not think so, though it might. It would just depend upon the population.
202. Do you think that the population can increase materially in this part of the Colony? I think so. There is a vast amount of land now locked up in the hands of pastoralists—principally Crown lands—and

I see no reason why it should not be populated. It is the want of railway communication that keeps back population. From the farmers' point of view it is better that the land should be locked up for twenty-eight years, because more produce will then be required from this district. At the present time thousands of tons of produce go from here.

Mr.
G. Burnett.
9 Sept., 1896.

203. You admit that the country about Hillston is as good as the country around Condobolin? Yes; on Kiacatoo Station I have seen larger crops of wheat grown, and they have been practically as good.
204. But places further west would have less distance to send their stuff, and, therefore, could probably undersell you? They might, and I would be very glad if they could, because I never look at anything from a selfish point of view. If the railway will do a thousand people good and injure only a few around Condobolin, I would say let the thousand people be benefited. I would like to see the railway extended all through that interior country. Somebody must benefit by its construction.
205. *Mr. Fegan.*] How many bushels of wheat to the acre do you obtain here? The average wheat crop about Condobolin can be put down at from 12 to 16 bushels to the acre.
206. And what is the average crop at Hillston or Lake Cudgellico? I have no information on that matter. They have had enormous crops there and some very light crops. It all depends upon the season.
207. Is the rainfall there more or less than it is here? I think that we have a larger average rainfall.
208. How many inches of rain have you had this year—about 1½? About that; but this has been a very dry season.
209. You are a carrier as well as a farmer? Yes.
210. What does it cost per ton to carry goods from here to Forbes? £1 or 30s. It depends upon the state of the road.
211. Have you carried much to Euabalong? No. The price from Forbes to Euabalong is generally about £2 a ton. That would make the rate about 30s. a ton from here.
212. What is the distance? About 40 miles. It is considered a bad track to travel. Then, too, there is not so much loading out that way, and there is no back loading.
213. Do you think that with railway communication there would be any chance of developing the Mount Hope mines? I think so.
214. Do you know whether the mines are owned by syndicates or by small companies of miners? No.
215. You say that there is payable gold there;—what do you call payable gold? A friend of mine prospected there for two or three years, and he got from 10 to 12 and 15 dwt. to the ton.
216. Who owns the copper-mines there? I do not know.
217. Why is it that they are closed? I think the great drawback to the place is the want of communication. They cannot get their ore away.
218. What is the distance between Euabalong and Mount Hope? Forty miles.
219. You say that want of water is a great drawback there? Yes.
220. Do they ever attempt to smelt their ore there? Yes, they had furnaces working when I was there ten years ago; but the price of copper went down very low, and they had so much to pay for haulage both ways that they found they could not compete with other places.
221. A railway passing Mount Hope would give an impetus to the mining industry there? Yes, I think so.
222. Have you been beyond Hillston? Not out towards Ivanhoe.
223. Are there any mines out that way? No.
224. Do you think that a line out west would give the people of this district a market for their produce in place of the Sydney market? I think so.
225. Do you think that if the railway came within 15 miles of Mount Hope the people there would be induced to further develop the mines? Yes.
226. But if they were more than 15 miles from the railway, the cost of haulage would be a bar to their development? To a slight extent. I think that a railway would bring in capital for the working of the mines.
227. Would a railway within 15 miles of the place be good enough for them? I would rather see the line taken right to Mount Hope, though the line as proposed would be a great help to the place.
228. The country between Condobolin and Cudgellico is inferior? Some of it is.
229. You would not compare it with the land at Hillston? No, I think the Hillston land is the better.
230. The land between Condobolin and Cudgellico is not as good as the land either at Condobolin or at Hillston? I do not think it is.
231. I suppose that there will be a large area of land thrown open for leasehold settlement near this township? Yes, they are opening up a lot of country.
232. When is it to be thrown open? I think a lot of it will be thrown open this month.
233. That will bring a large number of settlers here? Yes.
234. Do you think that there will be many applicants for the land? Yes.
235. More applicants than there will be allotments? Yes.
236. These people will want a market for their produce? Yes.
237. Do you think that the extension of the railway towards the west would give an outlet for produce? Yes.
238. *Chairman.*] You know where it is intended to have the railway station at Condobolin? Yes.
239. In extending the line from Condobolin westward would much compensation have to be paid for town land which would have to be resumed? Not much.
240. You regard the amount as almost nominal? Yes. Except for 2 or 3 miles from Condobolin the surveyed line does not go through three-quarters of a mile of purchased land.
241. Do you think that £5 an acre would be sufficient to pay for land close to the town, and that £1 an acre would be enough for land still further away? Yes; or 27s. an acre, perhaps.

Mr. Humphery William Grey Innes, council clerk, Condobolin, sworn, and examined:—

242. *Chairman.*] Have you been long in this district? This is the twenty-fourth year.
243. Have you a full knowledge of the district? A pretty good knowledge. I know the country on both sides of the Lachlan as far as Hillston.
244. Within 25 or 30 miles of the proposed railway? Yes.
245. Which is the best way to get to Hillston by railway? I think that the line should be taken on the southern side of the river.

Mr. H. W. G.
Innes.
Sept., 1896.

- Mr. H. W. G. Innes.
9 Sept., 1896.
246. Where would you cross the Lachlan? To escape the flooded country I would cross about 15 miles below Condobolin. I would favour the proposed deviation.
247. *Mr. Hassall.*] Have you any idea of the quality of the land down there? The land between here and Condobolin, and for a distance of about 10 miles south, is excellent. Further back there is a belt of mallee, and on the other side of that there is good country again.
248. What is the width of the belt of mallee? About 3 miles.
249. And the length? About 8 miles. That is the biggest patch of mallee there is out there.
250. Beyond that the country is good again? It is not so good as the river frontage.
251. Is this country suitable for agriculture? Yes.
252. The whole of it? Yes. Why I advocate the southern route is that a line going that way would serve Cudgellico, where there is excellent country, and Lake Cudgellico will, in time to come, be a reservoir from which water can be taken for irrigation purposes.
253. How is the lake filled? From the Lachlan in flood-time.
254. Have any steps been taken to conserve the water in the lake? They erected flood-gates there some years ago, but they are only temporary.
255. Do they answer the purpose of conserving water in the lake? Yes.
256. Do you think that if a substantial weir were erected, with flood-gates upon the latest principles, the water could be kept in the lake? Yes.
257. Is the land round the lake suitable for agriculture? Yes, it is splendid land. Once you get to Cudgellico the country seems to open out. There is a wider extent of good country to the south.
258. Is the country as heavily timbered out there? No; a good deal of it is open country.
259. Is any part of the country being irrigated from the lake? Yes.
260. Is the fall of the land of such a character as to make that possible? The country is comparatively level.
261. You would not want to raise the water to any height in order to use it for irrigation? No. There is a small area there upon which an enormous crop of potatoes is grown. That land is irrigated from the lake. Potatoes are a very uncertain crop in this climate.
262. Is the country on to Hillston good country? On the north side part of it is pretty good, but there is some ridgy country. When you get to Willanthry it is comparatively open country.
263. What is the distance from Cudgellico to Willanthry? Thirty or 32 miles.
264. If the railway were taken to Hillston, would that promote further settlement along the route? I am sure of it.
265. Would it encourage agriculture? Yes.
266. Would it benefit the people out west? Yes; the western country is subject to periodical droughts. At such times the Darling is not navigable, and there would then be a good market out there for surplus produce from this district.
267. Have any attempts been made by the pastoralists in the west to grow anything for the use of their stations? I believe that some of them grow a little on the Darling, where they are able to irrigate. I believe that they are growing crops of lucerne.
268. But between the Darling and the Lachlan? No; not so far as I know.
269. They have no water supply which they can depend upon? Not away from the Willandra Billabong. They may grow something out that way.
270. But in a dry time there is always a pretty good demand for forage? Yes.
271. That demand is supplied from this district? It would be supplied if we had railway communication.
272. Could you not supply it from here now? No, you could never get there, because of the long stretches of dry country.
273. The cost of conveyance would eat up all the profit? Yes. There are such long stretches without water that teams could not possibly travel.
274. I understand that there are tanks upon the stock routes? Between here and Bourke there is a splendid lot of tanks.
275. Where is the country that you could not travel into? The country lying between Mount Hope and the Darling. There is no water supply there at all.
276. In the case of a drought, do they try and shift their stock from that country? Further down they do.
277. Would a railway assist them to move their stock? Yes, it would enable them to take their stock away in time of drought.
278. And so save thousands of sheep which would otherwise perish? Yes; there is a good deal of settlement north of Hillston—between Hillston and Mossgiel—homestead leases. It is a great advantage to have the country cut up into small holdings in that way, because it enables more stock to be carried. On the Burrawang Run they have only half as much land as they had when I first came here, but they shear more sheep.
279. Do you know any of the stations out west? Only on the river.
280. Are there any large holdings on the river? Yes, there is Wooyeo. Cudgellico is on that holding.
281. Is there much land still available for settlement out in that direction? Yes, and on Uabba and Merri Merrigal. There is a lot of land available in those three holdings.
282. Do you think that that land will be taken up when the opportunity offers? Yes, it is sure to be taken.
283. Will it be taken up for agriculture, or for grazing purposes? People are going in for both now. They find that it pays them to combine the two.
284. I presume that the land will give a far better return from agriculture than from grazing? Yes.
285. How many acres are required to feed sheep? The profit from a sheep is about 2s., and on good country you can take a sheep to every 1½ acre. It is a very poor crop, however, that will not return you 10s. an acre after all expenses are paid.
286. A selector who combines agriculture with grazing runs less risk of losing his stock in time of drought? Yes; at one time I used to grow a good deal myself, and in good seasons I used to save all I grew and buy produce from other people while it was cheap. Then I sold my chaff for £8 a ton, though in ordinary times I would have only got £3 for it. Droughts occur regularly every four or five years. You can always depend upon them.
287. But by combining agriculture with grazing you could take advantage of good seasons and store the crops, when obtained, for use in time of drought? Yes; Mr. Gatenby has benefited by growing crops by irrigation, and then making ensilage. He saved 3,000 sheep in one drought. 288.

288. Back from the river how do they manage for a water supply;—do they depend upon tanks? Yes; Mr. H. W. G. the wells are very uncertain. People who have made wells have generally found the water to be salt. Innes.
289. At what depth have they got water? At 100 or 120 feet. We are not supposed to be in the artesian formation. 9 Sept., 1896.
290. Have they tried any artesian bores? One gentleman in the district purchased a plant for £1,000; but the Government Geologist told him he was not within the artesian area, so he forfeited £100 deposit, and did not go on with the boring. That is the only case of the kind that I know of.
291. Is there any prospect of the country between the Lachlan and the Darling ever carrying more stock than it carries now? I do not think so.
292. Do you think that it is pretty well stocked now? Yes. That is their ruin; they have overstocked.
293. Do you know of any land out there that has been abandoned as practically useless? A lot of land north from Mount Hope was thrown up.
294. What was the matter with it? It was covered with scrub, and infested with rabbits and vermin of all descriptions. A lot of country was thrown up at Roto.
295. Would that country ever be good if the rabbits were got rid of? I do not think that it would ever be much good.
296. Is it practically barren useless country with which you can do nothing? Yes.
297. Neither railway communication nor anything else would help it? I think not.
298. So that, practically, settlement in that direction is not likely to increase at least not for some time to come? I do not think so, except upon the rivers, when the land there is thrown open.
299. The land in the Western Division is held under a long term of lease? Yes.
300. The proposed deviation would have this advantage, that it would go through land situated in the centre of the district? Yes; round about Hillston there is beautiful country.
301. How far does that country extend towards Ivanhoe? I do not know; I have never been any further out than 30 or 40 miles. Between Hillston and Hay there is splendid country. The distance is about 100 miles. It is all beautiful open country, and is comprised within two holdings, Gunbar and Illilliwa.
302. Do you know the country on the Willandra Billabong? I have been told that it is very good country; but I do not know it.
303. You do not think that any large increase of settlement is likely to take place away from the river for some years to come? No. There is some splendid land within 15 miles from here, which will be thrown open to-morrow, and I believe that there are a great many applicants for it. I have received applications from several people myself and I have heard that a great many others are coming down. On the 8th October some land 6 miles from here, and some other land 12 miles from here will be thrown open. The land that is to be thrown open to-morrow is on the Bogandillon Holding, and the other land that I speak of is on Gulgo and Mickabil. There are a 1,000 acres of land for which I think there will be 100 applicants.
304. *Mr. Fegan.*] Is it good land? Splendid land.
305. On the south side of the river? Yes.
306. What is it fit for? For both agriculture and grazing. I reckon that 1 acre of it is worth 10 acres of the land on the other side of the river. I would be one of the applicants myself.
307. Do they grow much fruit up here? They do on the river, where they can get good water. There is a garden 15 miles out where a man grows stone-fruit principally. Apples are not a success here, although about Forbes they grow them as well as in any part of the country.
308. Is there any dairy-farming here? One man used to go in for it; but there was not a sufficient market for the produce. When the Mount Hope and Nymagee mines were going ahead he used to get rid of a large quantity of his surplus stock there.
309. With a market dairy-farming would be a success here? I am sure of it.
310. *Mr. Trickett.*] From your own experience of the district, which do you think the better of the two routes proposed for the railway? Unquestionably the southern route. For one reason it would induce more settlement, the country being more easily available, and the land better.
311. Where would you cross the Lachlan? About 15 miles from here.
312. *Chairman.*] Speaking approximately, how much land could be made available for settlement between Condobolin and Hillston under the terms of the Act? About 250,000 acres.
313. Of that area, how much in your opinion is suitable for agriculture? I should think about 100,000 acres.
314. If that land were thrown open would it all be taken up? I believe so. There is a great demand for land in this district.
315. If the railway were extended from Condobolin to Hillston would that land be taken up for agricultural purposes? For agricultural and pastoral purposes combined, in portions not exceeding 2,560 acres.
316. Where do the people here look to for their market? I think that we shall have the markets of the world when we get a railway. We shall have the English market for our wheat.
317. If the proposed railway were constructed, you would be able to sell some of your produce to the people further west? Yes. I recognise that our best times would be when there were periods of drought further west.
318. But the Broken Hill people can be supplied from South Australia, and between Condobolin and Menindie there are not more than 10,000 people? I should not think there would be as many as that. Hillston is about the same size as Condobolin.
319. What is the rainfall here? I think about 20 inches. I got some returns from various stations, and the average was a little over 20 inches.
320. That amount of rain is sufficient for cereals, if it falls at suitable times? Yes. I have known only 12 inches to fall here in the year, and up to the present time we have had only a little over 8 inches this year.
321. When will the residue of the leasehold areas between here and Hillston, for which an extension of lease was given, become available? In four years, from last July.
322. In your opinion, will it all be taken up then? Yes, I think so. It will practically all be taken up if it is thrown open in the form of settlement leases and homestead selections. The Mayor referred to cases where land had been sold for 7s. 6d. an acre; but the holders of that land were over head and ears in

- Mr. H. W. G. Innes.
9 Sept., 1896.
- in debt to the banks, and the sale was practically a forced one. They got that price for the whole of their land, including their conditional leases. Over 10,000 acres was sold at that price, the same price being paid for conditionally leased land as for conditionally-purchased land.
323. What would you say that land suitable for farming would be worth here, that is, in its rough state? Freehold land, within 25 miles of the town would be worth £2 an acre. It has been sold for that.
324. What is the bare value of the land to the Government? One settlement lease has been thrown open at £1 6s. 8d., and an other at £1 5s. an acre.

Mr. James Rabinowitch, storekeeper, Condobolin, sworn, and examined:—

- Mr. J. Rabinowitch.
9 Sept., 1896.
325. *Chairman.*] How long have you resided here? About thirteen years.
326. What information do you desire to give the Committee with regard to the proposed line? It goes through rabbit country from start to finish, and the population is very scattered. I suppose that in the first 25 miles you will come across only two or three houses. There are no people at all between here and Lake Cudgellico. There is very little traffic across. Most of the traffic from that district goes to Whitten.
327. On the Hay line? Yes. It is not likely that people in close proximity to that line will send their produce here. Knowing the nature of the country I believe that they will never attempt to come this way.
328. You believe that the line should not go beyond Condobolin? No.
329. It should not go to Hillston? Certainly not.
330. *Mr. Fegan.*] What opportunity have you had for ascertaining the nature of the country? I have known it for the last thirteen years. I have been between Condobolin and the Lake dozens of times. There are only a few half starved "cockies" out there. The entire country is monopolised by the rabbits.
331. Have you farmed any part of that country? No; but I have been up and down through it. The few people who are there are half starving. The land is right enough if you can destroy the rabbits.
332. Do you not think that the people of Lake Cudgellico ought to have a railway as well as the people of Condobolin? I have never been in favour of a line to Condobolin. I am one of the few who have been fighting against it.
333. You think that if the line were taken further on it would not pay? I am sure that it would not pay the wages of the station-masters employed. It will never pay even as far as Condobolin. You only find three or four passengers at a time coming here by the coaches now. I have been up and down through the district, east west north and south.
334. You have had every opportunity of seeing the country and the people living in it, and you have come to the conclusion that it would be unwise to take the line past Condobolin? Yes, at the present juncture. If they found gold mines further out, the population there might increase.
335. In the event of no gold being found, it will be many years before it would be wise to construct a line through this country? Yes. The construction of the line would mean a national loss.
336. You did not advocate the construction of the line to Condobolin? No. I do not think that the line should have come further than Parkes or Forbes, because there are not enough people out here to give traffic to a railway. I do not see why the country should be put to great expense in constructing railway lines for the benefit of Goldsbrough, Mort, & Company, and other large financial institutions interested in station property.
337. Therefore, you are entirely against the construction of the proposed line? Yes.

Mr. George Cochrane, book-keeper for Messrs. Nicholas and Reymond, flour-mill and saw-mill proprietors, Condobolin, sworn, and examined:—

- Mr. G. Cochrane.
9 Sept., 1896.
338. *Chairman.*] How long have you been here? Two and a-half—nearly three years.
339. Have you any knowledge of the country to the west of Condobolin? I know it as far as Lake Cudgellico and Mount Hope. I know the country for about 70 miles on both sides of the Lachlan.
340. What are your views with regard to the proposal into which the Committee is inquiring? I am prepared to give evidence in regard to the quality of the wheat grown here and the possibility of a market in the west.
341. Where is the wheat grown here? It is grown all around Condobolin, and wheat is sent here from Lake Cudgellico.
342. Is that the farthest place from which it is sent? Yes.
343. Is much wheat grown on the southern side of the river? No, not much.
344. Is much grown on the northern side of the river? Yes, a considerable quantity. For the season 1894-95 we bought here 11,373 bags of wheat. Last year, owing to the drought, very little wheat was grown here; but our purchase for 1895-6 was 1,393 bags.
345. What proportion of the wheat grown near Condobolin is made into flour locally? Last year we got it all. The year before a lot of it went to Parkes.
346. Did one-third of it go to Parkes? About one-fourth.
347. Can you give us any idea as to the quantity of wheat produced between Condobolin and Mount Hope? I have no information upon that point.
348. Can you tell us how much wheat is produced on the southern side of the river between Condobolin and Lake Cudgellico? There is not much grown on the southern side of the river. A lot of what is raised goes in Temora way, and some is sold out Wollengough way. Out past the Lake it goes to Whitten.
349. What would be the effect of the construction of the proposed railway upon the trade of Condobolin? Such a railway would open up a market for us out west. Last year we sent over 300 tons to Sydney from here. Of course, with a line out west, we would have a chance of doing business out towards the Darling.
350. How far is it from Condobolin to Menindie? I could not tell you now.
351. Or to Broken Hill? I do not know.
352. Therefore it is not possible for you to form an opinion as to whether the wheat sent from here could control the Broken Hill market, or whether the South Australian people could deliver wheat there more cheaply? I think the South Australian people would have a big voice in the trade.
353. It is all a question of freight? Yes. As far as I know the South Australian people have the best of it at present. The distance is against it.
354. Your western trade would practically cease at that point where South Australia could successfully compete

compete with you. Have you any idea as to where that point is? At present our market is pretty well limited to within 80 or 90 miles.

Mr.
G. Cochrane.

355. That does not bring you much beyond Lake Cudgellico? No; and there is a mill at Hillston which would compete with us. 9 Sept., 1896.

356. In competing for the western trade, Hillston would have an advantage of 100 miles less carriage? I think that our outside limit would be Mount Hope, at any rate for a time. Beyond that it would be a question of competition and railway freights.

357. Do you regard this district as suitable for the production of cereals? Yes.

358. How do you think it would compare with Forbes? As far as the country itself is concerned, it is equal to anything about Forbes. With rainfall we could grow anything.

359. You think that the soil is quite as good as that of Forbes, but the rainfall being less affects the production? The soil is quite as good.

360. Is there likely to be any timber trade to the west? That is very hard to say. It would depend upon the amount of building going on.

361. Then you expect only to have a local sale for your timber? Yes, at present.

362. Do you expect to be able to send it to more populated parts of the Colony? I hardly think so.

363. A line to Hillston would pass through country similarly timbered? Down that way they have not got the timber that we have.

364. Have they no pine at Hillston? I believe not, though I cannot speak definitely.

365. *Mr. Trickett.*] What is the present price of wheat per bushel? Four shillings.

366. Is that a good paying rate? That would pay handsomely with anything like fair seasons.

367. That price would be sufficient to encourage growers to enlarge their agricultural areas? Yes; if that price can be kept up it will pay them well.

368. There has been a considerable advance in the price of wheat during the last twelve months? Yes. In the 1894-5 season we bought at 1s. 10d. a bushel. That was the Sydney rate less the carriage from here to Sydney.

369. How do you account for the increase in price? In 1894-5 there was a big harvest; but last year the harvest was very small. At the present time we have to get flour from Forbes.

370. Therefore the more they grow the less it pays the farmers? With a big yield the farmers must take Sydney prices less the cost of carriage.

371. Would 2s. a bushel pay them? I do not think so. From 2s. 6d. to 3s. a bushel would pay them.

372. The closer the people were to a railway the better chance they would have of making their work remunerative? Certainly.

373. Do you find that where railways have been extended wheat growing has increased? I think that always occurs, because the railways give the growers a chance of getting their produce to market.

374. Would that occur if this line were taken further west? I hardly think so.

375. Why? It would cost a great deal to put water upon the country back from here. The rainfall is very small. Directly you get away from the river there is no water at all. You would have to provide water, and wheat growing by itself would hardly pay.

376. How far from the river frontage would the land be suitable for wheat growing? The land anywhere about is suitable for wheat growing.

377. But would the production of wheat be practicable and payable? That would depend on the seasons. If you do not get rain it does not matter how good the land may be. The people who take up land away from the river will go in for agriculture to a certain extent, but it is very hard to say how it will pay them.

378. You do not think that if the line were taken as far as Hillston it would encourage agriculture very much? In view of all the land now open in the Colony I do not think it would. Of course it would bring a few settlers who would do a little wheat growing.

379. I suppose most of the wheat growing in the district filters through your firm? The biggest portion of it does.

380. Are you able to say whether the people who grow wheat make a good living out of their holdings? That is hard to say. Some of them make a fair living. They get a fair price one year though next year the crop may be a failure altogether; there is no regular rainfall; one year we will have a good season and the next year a very poor one.

381. Is the farming class as a rule pretty well off in this district? No, they are just about making a living. They are just struggling along; of course there are exceptions.

382. Have you considered the proposed extension as a national work, or as a line likely to bring the Broken Hill ore to Sydney to be treated? I cannot see that it can compete with the line to Port Pirie and water carriage from there.

383. What is the rate of carriage for cereals by railway? 28s. a ton from Sydney, I believe.

384. That is a specially low rate is it not? Yes, the rate is 14s. a ton to Sydney and 28s. a ton from Sydney.

385. Is the bulk of the tonnage that goes from this district through Forbes and Parkes to Sydney wheat and wool? Yes, there is nothing else.

386. You do not look upon the proposed extension as likely to be very profitable to the Government? I do not see how it can be.

387. Is the population between here and Hillston at all extensive at the present time? No. There are isolated selectors and station holders.

388. Is the country suffering from the rabbits? There are a lot of rabbits once you get down to Euabalong. There are not a great number up this way.

389. Why are they more numerous down there than here? Because the people have not gone in for killing them.

390. Is not the population up here a little denser? I do not think so; but the rabbits do not seem to have extended in this direction. Booberoi is wire-netted, and they have been destroying them in every way they can. That seems to have blocked them.

391. I suppose it is a very costly matter to keep them down? Yes; wire-netting runs into money.

392. What is the experience here when land is thrown open for selection? There is a great demand for it, though a lot of the country thrown open is scrubby.

393. Do you find that the people who take up these holdings generally stick to them? In most cases they manage to struggle on.

Mr.

Mr. John Bouffler, farmer, Condobolin, sworn, and examined:—

- Mr. J. Bouffler.
9 Sept., 1896.
394. *Chairman.*] How long have you been here? Nearly sixteen years.
395. *Mr. Trickett.*] Where are you farming? Close to the town, north from here.
396. What is the extent of your holding? I am farming on the share system. I sold out of the selection lately, and I took a paddock on the share system, so that I would not be idle, until I could get some more land. I have 130 acres of wheat in. The holder of the land gets one-third, and I take the balance.
397. Does he supply you with machinery? No; I have all the appliances. He has to refund a portion of the seed-wheat out of the crop.
398. Formerly you were a farmer on your own account? Yes.
399. Were you successful? I have had a lot of experience in the Orange district; but I would just as soon grow wheat here as there. Taking average seasons I would get more wheat, and the land is more easily cleared.
400. Is it better to work on the terms upon which you are now working than to work upon your own account? No; I would sooner work on my own account. Now, if I get £1 for my wheat, 6s. 8d. has to go for rent.
401. Is the land you have started on cleared? It is sufficiently cleared for ploughing, though there are a lot of trees standing upon it.
402. But you were able to start right away? Yes; and that was an advantage.
403. Is the share system a new idea in this district? Yes, this is the first season that it has been adopted.
404. Is it likely to be largely availed of? I think so. I think that when the railway comes here a good many teamsters will do that sort of thing.
405. But how will the farmers do in a bad season? I never knew a total failure of the wheat crop since I have been here.
406. How was it last season? Bad. Last season was the worst I have known.
407. Were you on the share system then? No; I was on my own account then. This is likely to be a bad year. The year before last I got 22 bushels to the acre from 105 acres. Last year the yield was under 5 bushels to the acre. This year the yield promises to be about 10 bushels to the acre. I cannot give information with regard to the country more than 25 miles beyond Condobolin, because I have not been further out than that; but for that distance the land is well suited for wheat growing.
408. Is it a great drawback to farmers to have to send their produce 25 miles to a railway station? It means a charge of 6d. or 8d. a bag.
409. The railway charge for a similar distance would be almost nominal? Yes. It would be a serious handicap to be 30 miles back from the railway if you were growing wheat.
410. Do you think the line should go through the country on the northern side of the river, or that it should go on the southern side of the river? I think that the country on the northern side of the river is the better. It is very swampy on the other side of the river; that is, from here to Kiacatoo and Mickabil, about 12 miles from here. The country is very much the same on both sides close to the river.
411. The country on the northern side of the river is in the Central Division? Yes; there are patches on the southern side of the river where the land is suitable for wheat-growing. Some of the farmers have grown wheat there for thirteen or fourteen years, and with good results.
412. There is a lot of land there suitable for wheat growing? Yes; back from the river; and there are patches of good land on the river. Most of the land on the river is, however, better suited for grazing.
413. The land on the southern side of the river will be available for settlement sooner than the land on the northern side of the river;—that is a point in favour of the deviation? Yes.
414. What has been the experience here when land has been thrown open to the public? Not much land has been thrown open. I have been waiting twelve months to get a suitable block. My experience has been gained principally in the back country, 17 or 18 miles back. Nearer the river you get better land and better results.
415. That is why you came to this district? Yes. I have been waiting for land since July twelve months.
416. You think that the land will be readily taken up when it is made available? I am positive of it.
417. When you were at Orange, what did you regard as a paying price for wheat? It is seventeen years since I was farming at Orange.
418. What would you regard here as a paying price for wheat? Not less than 2s. 3d. a bushel.
419. Would 2s. 3d. a bushel pay? It would just about clear us.
420. 2s. 6d. a bushel would pay? Yes. I would cultivate extensively if I knew I could get 2s. 6d. a bushel.
421. Do you know anything about the probabilities of a market for agricultural produce west from Condobolin? Through to Broken Hill we would have a chance of a market in places where the climate is not suited for the growth of wheat. The cost of railway carriage would be a handicap to places nearer Sydney.
422. How do you clear your land here? We ringbark the trees, and let them burn out.
423. Will the roots burn out? All the old trees will burn out.
424. In the Orange district clearing is very expensive? Very expensive. There is no mistake about the production of wheat here if the season is favourable.
425. What is the average yield to the acre? Thirteen bushels.
426. That is a very fair average? Yes; and the wheat is of very good quality.
427. Do you know the country about Trundle? Yes, I have been through it.
428. How does the country between Condobolin and Hillston compare with that country? I only know the country 25 miles west from here. The country about Lake Cudgellico is very good—equal to anything over 25 miles by report only.
429. When the Trundle paddock was thrown open the land was immediately taken up by farmers? Yes; that is very good country both for pastoral purposes and for wheat growing.
430. You think there would be a good many more people out here if the country were thrown open for settlement, and there were better means of communication? I feel positive about it. There are three families connected with me—two sons-in-law and a son—and we are eating our heads off waiting for land.
431. I suppose that with all these holdings it is necessary that a man should work himself? Well, if a man is newly married and has no family, he must depend to some extent upon outside assistance.
432. But he must do a good share of the work himself? Yes; agriculture is a business which requires looking after as much as anything else.

433. *Mr. Fegan.*] Why did you give up farming at Orange? I sold out and went on to the head of the Bogan.

434. Then you came down here? No, I went back to Orange and kept an hotel there for a short time; but the rent was too heavy, and I had to throw it up.

435. You are waiting now for land to be thrown open here? Yes. If I had property in town I would sell it by auction to-morrow to get on to the land.

436. You will be an applicant for the land that is to be thrown open to-morrow? Yes; I have applications in.

437. Have you done any carrying? Yes, we used to carry extensively; my children only.

438. Do you do any carrying now? No. We have 12 draught horses and machinery, stump-jump ploughs, single-furrow ploughs, strippers, and so on. We are fully equipped for work when we can get the land.

439. Are your sons with you on the share principle? Only one. I have a boy eighteen years of age who put in 100 acres of wheat in seven weeks.

440. Do you try anything else besides wheat? I have a lot of cattle and sheep. I will not depend upon one thing.

441. Do potatoes grow well? Certain sorts. The Early Rose grows very well.

442. Have you a good market for potatoes? An excellent market, now that the railway is so close. Potatoes are £5 or £6 a ton.

443. You do not think that the railway should go past Condobolin? I do not think so.

444. Do the people want this line? I think that most of them believe that they would be better off without the extension. Individually, I think it will be better for the district. It will give a bigger market.

445. Do you think that the farmers in the neighbourhood of Condobolin would have to look to the west for their market, instead of looking to Sydney? Sydney will give the ruling prices.

446. You would soon fill the local market? Yes.

447. Do you think the western market would be preferable to the Sydney market? I think so.

448. You think that the time is not far distant when the people of Condobolin will have to look to the west for a market? I do not know about that. Sydney will always be open to us.

449. But is there not greater competition in Sydney? Yes; but with proper facilities I think we should be able to compete with any district.

450. The soil is good? Yes, the soil is good enough.

451. And on the average profitable crops are obtained? Yes.

452. Did you do any dairying? We always did our own dairying, and we have made about 30s. a week.

453. An extension from Condobolin west would give greater facilities to the farmer, and induce him to dairy as well as to rear sheep and grow wheat? Yes. I think that an extension to the west would be a good thing for the farmers. After you get a certain distance west you come to a district where they cannot grow wheat.

Mr. John Coppock White, general commission agent, Condobolin, sworn, and examined:—

454. *Chairman.*] How long have you been in this district? Twenty-one years.

455. *Mr. Hassall.*] What have you been doing during that time? For the first fourteen years I was a station-manager. Since then I have lived in Condobolin, as a stock, station, land and general commission agent.

456. At one time you filled the position of rabbit inspector? Yes. I think I was appointed about 1884.

457. What part of the country were you then working over? From Silverton to Menindie. Broken Hill was just outside my district; but I was acquainted with it. It was on Mount Gipps Run.

458. Have you any personal knowledge of the country lying between Condobolin and Menindie? Yes, I know it all.

459. What description of country is it? There is some very good country between here and Mossgiel, and on Mossgiel; but there is also some very bad country—mallee and desert.

460. On which side of the river? On the northern side.

461. There are patches of good country, interspersed with large patches of bad country? Very inferior, practically desert country. Further west again, going towards Menindie, it is very good sheep-carrying country; but the country is not at all suitable for agriculture, and will never be unless you get water there.

462. That is the country lying between the Willandra Billabong and the Darling? Yes. The country between Menindie and Broken Hill is very inferior.

463. How is the country watered? By tanks and wells. It is fairly watered for station purposes.

464. The water supply is artificial? Yes, once you leave the river. The Billabong, I understand, is weired.

465. After leaving the Billabong, the whole of the water supply is artificial? Yes.

466. What is that country stocked with? Sheep.

467. Where do the rabbits commence? You find them all the way from here to Broken Hill.

468. Is the country very thickly infested? More or less thickly all the way. In some places it is very much worse than in other places. Of course the rabbits are thickest on the better country. They make for the best pasture.

469. The stock run in the country is principally sheep? Yes; and I believe that the country will always be used chiefly for sheep, unless they strike artesian water. It is essentially of light stock-carrying capacity, but sound. It will not grow wheat.

470. How many acres are required to feed a sheep? In an ordinary season I suppose about 5. Of course when a squatter gets a good season he piles on stock.

471. Is 5 the average for the whole of that country? Yes, from Mossgiel to Broken Hill. On the other side of the Darling the country is worse. It is sandier and lighter carrying country altogether.

472. Is that country suitable for any form of occupation? Not that I know of.

473. Do you think it likely that any other form of occupation will come into vogue in the near future in the event of a railway being constructed? Not unless they can get water. With water you could grow anything.

Mr.
J. Bouffler.

9 Sept., 1896.

Mr.
J. C. White.

9 Sept., 1896.

- Mr. J. C. White.
9 Sept., 1896.
474. Do you think that that country is likely to be more closely settled? I do not think so. It is a succession of plains after you get through the desert country. It is a succession of plains all the way to the Darling, and very dry, arid plains.
475. Do you think that the carrying capacity of that country would be increased, if a railway were made through it? Not unless they could get water. With water it would be wonderfully increased.
476. Is there a stretch of useless country through there? Yes. There is a lot of mallee country that is not worth occupying and I think the squatters have cut it out of their run. Some of them fenced it in, but they found that they lost so many sheep through the wild dogs that it did not pay them to keep sheep there, and so they fenced it off again. It is a howling wilderness now—a breeding place for dogs and kangaroos.
477. Do you know any way of destroying the rabbits? I do not. The only hope for the future is in wire-netting fences. Wire-netting I think is the great cure. What is wanted is a fence that is dog-proof as well as rabbit-proof. The selectors unfortunately cannot afford to buy the netting which would be the means of saving them.
478. Is wire-netting the only method discovered up to the present time by which the rabbits can be coped with? Successfully—yes.
479. And the expense of putting up wire-netting fences is practically beyond the means of homestead lessees and small selectors? Yes; they are all strugglers.
480. Do you think the construction of a railway through this country would benefit the people upon it to any extent? I am of opinion that a railway benefits the country to a certain extent, but it would not benefit this country very much. A railway would not lead to very much settlement in this country.
481. You do not think that it would materially increase settlement? I do not think so. There would be no small settlers; but there might be a few homestead lessees—10,000-acre men.
482. In your opinion the construction of a railway through that sparsely settled country must result in a national loss? I think so. I do not think we could ever command the Broken Hill market.
483. Could the growers of produce here compete at Broken Hill with South Australian farmers? I do not think so. I have been all through South Australia. They can grow wheat so much cheaper there than we can grow it in this Colony.
484. How much more cheaply? They can grow wheat at Terowrie, which is only 150 miles from Broken Hill, whereas here we are nearly 400 miles from Broken Hill. I do not think that we could possibly compete with South Australia,
485. Could the people of Hillston compete for the Broken Hill trade? They might; but I do not think so. The Hillston country is splendid sheep country, but it is not agricultural country. They do not get enough rain there, and they cannot depend upon the crops.
486. You discard Hillston as a place for agricultural settlement? Yes; I do not think there would be much agriculture there, though it is splendid country for sheep. They have the land at Hillston, but they do not get the rainfall.
487. How far west from Condobolin could they grow crops successfully? They cannot grow much about Mount Hope.
488. What about Lake Cudgellico;—how far out in that direction can they grow crops successfully? Out there they all grow crops more or less; but the crops are uncertain. One year you may have a payable crop, but next year you have nothing. I was managing on Wooyeo for seven years.
489. What was your experience there? The rainfall there is about 2 inches less than the rainfall at Condobolin. The rainfall there is about 18 inches per annum, while the rainfall at Condobolin is about 20 inches per annum. I think that the selectors at Lake Cudgellico have made a mistake. That is proved by the fact that the station-owners have bought nearly all of them out. It is only a matter of time when the station will have the lot of them.
490. Are there any fresh selectors coming along to take their places? No; not much land is being thrown open there. The last land thrown open for settlement leases no one would take up.
491. What has been your experience of selections in this district;—have the selectors practically trafficked in the land? Yes; in no district has there been more traffic in land, by means of dummies, and so on. I am of opinion that it was the greatest mistake ever made to encourage men to select in a country like this. Even when the railway comes here they will be badly off, unless they can get special rates for sending their wheat to Sydney. Otherwise they will still be in the hands of the mill, and be compelled to take whatever the mill-owner likes to offer. At the present time wheat can be landed in Sydney from California more cheaply than it can be sent to Sydney from Parkes or Forbes.
492. So you have to depend upon the local market, which is easily supplied? Yes. If the millers buy the wheat for a certain price, they can afford to send it away.
493. Do you expect to get a market further west? The wheat comes here from a radius of 60 miles. The wheat-growers are practically in the hands of the miller. That was exemplified some time ago when people who had sold their wheat to the mill for 1s. 10d. a bushel had to buy back seed-wheat at 4s. 6d. a bushel. A railway will not do anything for them unless they get special rates.
494. Do you think that the country is justified in expending nearly £1,000,000 in constructing a railway to Broken Hill when the prospect of a return is so remote? I have studied the matter a good deal, and, knowing the country as I do, I say that I do not think the construction of this line is justifiable. I cannot see what would make the line pay in the future.
495. You consider that the country is so infested with rabbits that it would be practically impossible to increase its carrying capacity for many years to come? Yes. The squatters are not in a position to spend the money necessary to keep down the rabbits and the native dogs. The native dogs are almost as great a pest in this district as the rabbits.
496. Do you know of a system coming into operation in this district whereby the farmer takes the land from the private owner, and works it on the share principle? I do not think it has come into vogue in this district at all. Mr. Kenneth Mackay started that idea at Wallendbeen, and Mr. Greenc has gone into it largely at Grenfell; but I do not know that it has been started here.
497. Do you think it is likely to come into operation here? I do not think so. There is plenty of land in this district. It is at present locked up in useless reserves, and should be thrown open.
498. What do the people propose to do with the land if they get it? They cannot traffic in it now, so that they have to make homes upon it. People want to settle upon the land now, and the railway will bring population into the district. People are coming here now, and all the land that is thrown open is being snapped up eagerly.

499. But they have not a very bright outlook, even if they do come? I cannot see that they have a very bright outlook. Mr.
J. C. White
500. Do you think they will take up the land? I know, as a matter of business, that they wish to do so, because I get continual applications. There is no question but that this will be a very large wheat-producing district. The soil cannot be beaten for wheat-growing, and the climate is suitable. 9 Sept., 1896.
501. The wheat is not affected by rust? I do not think it is affected by any disease. This will be one of the largest wheat-producing districts in the Colony.
502. But you do not think that the railway will give you a market? Not at present rates for carriage.
503. *Mr. Fegan.*] What sort of road is it from Hillston to Menindie? A very fair road.
504. Did it cost anything to make? No; the country is quite flat.
505. Has any public money been expended upon that road? No; except for bridges and culverts.
506. Are there many bridges and culverts? No.
507. Are there any expensive ones? No, because there are no large watercourses to cross.
508. Do you think that the time has come for constructing a railway from Condobolin to Broken Hill? Personally, I do not. I do not see how it would pay.
509. Do you not think that the people of Broken Hill could be brought nearer to the people in this part of the Colony? Yes; but I think that a line which would lead to closer settlement would be from Cobar to Broken Hill. That country is very superior to this.
510. You are well acquainted with the country between Menindie and Broken Hill? Yes.
511. Is it possible to grow supplies on the other side of the Darling for the people of Broken Hill? I do not think so. Out there it is partly desert country—sand and scrub and dry lakes. Without water they could not grow anything.
512. Supposing they had water? Then they would be able to grow almost anything.
513. But there is no way of getting water except from artesian supplies, and it is very improbable that they exist there? Yes. I believe that that part of the country is outside the artesian area.
514. *Mr. Trickett.*] You know the country between Cobar and Wilcannia and Broken Hill? Yes.
515. Why do you think that that would be better country for the line to traverse? The land is better. There is no desert country there.
516. But it is waterless country? There is only artificial water there; but the country is better than that on the proposed line.
517. Better for what purpose? For grazing.
518. And that is all this country is suitable for? Yes.
519. Will it carry more sheep to the acre? Yes.
520. The rainfall is about the same? There is not much difference.
521. Wilcannia is a very large sheep country? Yes.
522. Do you know what the stock register in the Wilcannia district is? I think it is about the same as the Condobolin register—between 2,000,000 and 3,000,000 sheep.
523. I suppose you look upon Wilcannia as a very important centre? It will be. It is on the overland route to Queensland and Mount Browne, and all those outlying places.
524. What kind of mineral field is Mount Browne? I think it will some day be a good one. It is not prospected yet.
525. The dry character of the country retards its development? Yes, the country is terribly dry.
526. How far is Mount Browne north of the line between Cobar and Wilcannia? It is north-west from Wilcannia.
527. About how many miles? About 200 miles I think.
528. Why is not that country better prospected? Because it is a difficult country to get about in. It is dry and out of the way.
529. How would a line 100 miles off help them? I do not think it would help them very much.
530. What is the country like between Wilcannia and Broken Hill? It is fair sheep country.
531. Not as good as that between Cobar and Wilcannia? No; but better than the country between Menindie and Broken Hill.
532. Do you think that the better character of the country would compensate for the increased length of the line? Well, I am of opinion that Cobar is to be a great mining field, not only for copper, but for silver and gold.
533. You think that, independently of agricultural and pastoral pursuits, the Cobar line would get more trade than the proposed line? Yes. A line from Cobar would catch the whole of the Queensland trade.
534. Are you able to say which would be the easier route from an engineering point of view? The country is all easy.
535. And not liable to be flooded? No, unless by an extraordinary flood in the Darling. In some places the water is sent back a good distance.
536. Is the proposed line liable to be flooded? No, there is no danger of floods once you leave the river.
537. How far does the flood-water come back from the river? I do not think that down below here it goes more than a mile from the river, and then it only covers the plains for a few inches.
538. *Chairman.*] Would any expensive resumptions be necessary in Condobolin, if the line were carried further west? I have no doubt that the station people would try and bleed the Government.
539. But would it be possible to sustain any large demand for compensation? I do not think so, once you get away from the town.
540. But immediately about the town? Immediately about the town you might have to pay something.
541. Can you give us any idea as to what the land would be worth? Three or four years ago there was a land boom here, and the price of land was run up to a most exorbitant figure.
542. What is your valuation to-day? About £5 an acre.
543. Is the land immediately adjacent to the town all private land? Yes, where the line goes.
544. Further to the west, say, 10 or 15 miles out, what is the land worth? £1 an acre.
545. Therefore under no circumstances is it likely that a great amount will have to be paid for compensation? I think not. For the first 35 miles from Condobolin to Euabalong the land on the northern side of the river, and adjacent to the river, is fairly good; but there are stringybark ranges coming in pretty close. For the last 10 miles to Euabalong the country widens out into plains, and is considerably better.

- Mr. J. C. White. 9 Sept., 1896. From Euabalong down the Lachlan to the junction of the Willandra, and up the Willandra for some little distance, there are good plains with bits of cultivation upon them for a width of possibly 5 miles. Back from that again it is scrubby country. From where the firm red line shown on the map crosses the Billabong there is good country which is of considerable width. To Mossgiel the country continues good; but from the head of the Willandra for about 25 miles the country is practically a desert. From there on to Menindie, it is a succession of open plains—fairly good sheep country, with belts of timber.
546. What is it from Condobolin to Cudgellico on the southern side of the river? Fairly good.
547. As good as from Condobolin to Parkes? Better than that. It is not so scrubby.
548. But from an agricultural point of view? Well, it is good country.
549. What is it from Cudgellico to Hillston? That is good country.
550. And from Hillston to Mossgiel? Good country.
551. Therefore, the dotted line shown on the map goes through fairly good agricultural country almost the whole way? Yes. They grow good crops of wheat at Hillston occasionally; but I am of opinion that only a precarious living can be made by growing wheat, owing to the dryness of the climate. There are about 13,500 acres under wheat in this district.

THURSDAY, 10 SEPTEMBER, 1896.

[The Sectional Committee met at "Byrnes' Hotel," Cugong, at 7.15 p.m.]

Present:—

THOMAS THOMSON EWING, Esq., (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | THOMAS HENRY HASSALL, Esq.
JOHN LIONEL FEGAN, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Edward Byrnes, hotel-keeper and selector, Cugong, sworn, and examined:—

- Mr. E. Byrnes. 10 Sept., 1896. 552. *Chairman.*] What area of land have you? I have only 40 acres.
553. How long have you been here? It is six years since I settled here.
554. Do you know the Lachlan country pretty well? Yes.
555. From here to Condobolin? Yes.
556. And from here to Willandra? Some parts of the Willandra—not far back.
557. From here *via* Euabalong to Hillston? Yes.
558. Do you know anything with regard to the gold discovery which has been made here? Yes.
559. What is the character of the country 8 or 10 miles out of Condobolin, coming this way? It is all good country for farming.
560. Do you regard the box country as good farming country? Yes.
561. Is it good for wheat-growing? Yes.
562. Is it worth clearing? Yes; the box land is not so good as the sandy soil.
563. The open plains you do not regard as so very valuable? No.
564. But the heavily timbered box country close to the river you think is good country? Yes.
565. Which side of the river is the country best for farming purposes? I think on the northern side.
566. When you come to the more open plains, what is the country like? The Committee, to-day, came down the frontage; but further back you get red-soil country right down to Cugong. The country adjacent to the river would be good country if it were worked up.
567. Does the proposed route of the railway go through good country? Yes, good farming country.
568. As good as that at Cugong? Yes.
569. Do you regard this as good land? Yes.
570. Have you cultivated it? Only for my own use. I get a very good crop from it; but I only grow hay.
571. What would be your average crop? I have never stripped it.
572. How many tons of hay to the acre? About 2 tons.
573. Does the wheat crop look as good as the crops in other places where wheat-growing is successful? Yes.
574. Do you know the rainfall here? No.
575. The soil is good enough, but the yield may be materially interfered with by drought? Yes.
576. How many bad years do you get? As a rule, we get three good seasons and then a bad one. There have been times when we have got two or three bad seasons together, but generally there is only one bad season in every four years.
577. Going towards Hillston, is the country better *via* the Willandra than *via* Lake Cudgellico? As far as I know, there is not much difference.
578. How far to the west from here is the soil as good as it is here? The nearer you get to Hillston the better it is. Forty or 50 miles from here you get sandy soil, with mallee and pine.
579. Is the country as good as this? It would be as good if it was cleared; but it would take more to clear it.
580. You believe that wheat would grow 40 or 50 miles west of Cugong? Yes.
581. How far north is the country good? Right out to Menindie they get good country.
582. The principal produce of this district is wool? Yes.
583. When were the Cugong gold-fields discovered? About two years ago.
584. Have there been any promising developments? Yes, there is one claim—the "Yellow Streak"—which appears very promising. There are other claims, but they have never been worked.
585. What have the returns from the "Yellow Streak" been? I can only speak from hearsay. I believe they have had an ounce to the ton.
586. Have you any other information which you would like to give the Committee? I think that a railway ought to cause the Crown land in this district to be settled.

587. How far west from here is the boundary line between the Central and Western Divisions? It is only $\frac{1}{2}$ a mile from here.
588. In your opinion, is the land on the northern side of the river about the same as the land on the southern side? I think it is just about the same.
589. Box country running back to gravelly plains and red soil? On the other side of the river you would, I think, get more mallee, and the country is flatter.
590. But the proportion of inferior to good country would be about the same? Yes.
591. Are there many rabbits in this district? A good many at times. They are kept down pretty well just here. They increase very rapidly if they are not kept down.
592. When was your worst year for rabbits? I think about two years ago was our worst year.
593. Now you have them fairly well under? Yes; but they breed up again pretty quickly. The squatters keep them down with poisoned pollard.
594. Is it possible to deal with the rabbits successfully? Yes; with a small holding you can keep them down.
595. Upon how many acres could a man keep a wife and family about here, supposing he had a railway and a market? I should think that if he had 640 acres he would be able to keep a family.
596. Could a man work that area? Yes.
597. What would it cost to clear the box country for the plough? From 8s. to 10s. an acre; that is, to get rid of the suckers. I do not know how much you would have to pay per acre for burning out the trees.
598. Do you think that the clearing of the heavy box flats would be an expensive matter? Yes. I do not think that it would be so expensive to clear the pine country.
599. What would it cost to clear the pine country? From 5s. to 15s. an acre. They would use a stump jumper.
600. If the proposed railway were constructed, would people come here and go in for agriculture? I believe that they would after a time.
601. Would they engage in mixed farming? Yes; on the large holdings they would work that way.
602. At what price would it pay you to grow wheat? I could not say. I think that 2s. 6d. a bushel would pay very well.
603. Two shillings and sixpence a bushel upon the ground? Yes.
604. Are there many farmers about here? There are not many in this district. There are a few on Kiacatoo.
605. Is there much traffic along the road here? It is principally local traffic.
606. From how far west does the wool come this way? Thirty-five miles, I think.
607. Where does the wool beyond that point go to? On to the Hay line.
608. To Melbourne? I think it goes to Sydney. When there is a railway to Condobolin, I daresay more wool will come this way.
609. Is the country along the route of the proposed line liable to floods? No.
610. How far back does the Lachlan flood-water go? In some places between here and Condobolin it goes back perhaps 5 miles.
611. Right over the country? No; only up the creeks and depressions.
612. The floods are not such as would interfere materially with agriculture? No; the route of the proposed line is on high land. The flooded country is the low-lying box country.

Mr. Herbert Evans, miner and selector, Cugong, sworn, and examined:—

613. *Mr. Trickett.*] I understand that you have resided here for the last twenty years? Yes.
614. You have been engaged in mining pursuits during that time? Yes.
615. What do you think of the mining prospects of the district? I have every reason to think that we should have a good field here.
616. Where are the mines situated? About 4 miles north-east from Cugong.
617. What is the character of the field? Auriferous.
618. Any alluvial gold? Not as yet.
619. What has been the highest yield? Four ounces to the ton.
620. Was that in any quantity? They reckon that about £2,000 worth of stone has been crushed in the battery here, and it has averaged 15 dwt. to the ton.
621. Has the field been developed by capital to any extent? Not up to the present, but we hope that it will be.
622. What is the drawback to its development? The want of publicity.
623. And the want of capital to purchase large crushing plants? There is a small crushing plant which is keeping things going at the present time.
624. On the river? Yes; within $\frac{1}{2}$ a mile of this place.
625. Are there many men working at the mine? About thirty, I think, in the mine itself, and in prospecting and working the other mines.
626. Are the prospectors making a living? I do not think they are making a good living, because they have only a low-grade stone. There are ten or eleven mines opened, and the stone crushed on trial has averaged 12 dwt. Of course, poor-men parties cannot develop those mines.
627. How long has this prospecting been going on? Fifteen or eighteen months. In my opinion, the land has not been properly prospected. They have merely got upon the edge of the gold country.
628. Has any officer of the Department of Mines been out to look at the place? Mr. Jackett was out, and so was Mr. Slee. He gave a very good report of the "Yellow Streak."
629. Is there any alluvial? None has been found as yet. The alluvial, I should imagine, is very deep. I believe that Sandy Creek is the alluvial source.
630. The "Yellow Streak" mine is about to be floated into a company? Yes; it is pretty certain to be floated.
631. You know the country pretty well between here and Condobolin? Yes.
632. Do you agree with Mr. Byrnes' evidence in regard to it? I quite agree with it. On the southern side of the river you find clay flats.
633. What are your views with regard to the suitability of the district for wheat-growing? I am not much of a farmer. At Condobolin they grow wheat successfully, and with the same climate and the same class of soil, I do not see why we should not be able to do the same here.

Mr.
E. Byrnes.
10 Sept., 1896.

Mr. H. Evans.
10 Sept., 1896.

- Mr. H. Evans. 634. *Mr. Hassall.*] Is the rainfall the same? Yes.
- 13 Sept., 1896. 635. *Mr. Trickett.*] Has wheat-growing paid about Condobolin? No, because of the want of means for grinding the wheat and getting it to market. They have to sell it to the flour-mill for what they can get, and pay what they like to charge for the flour.
636. You think that with better means of communication they would get better prices? Yes, there would be a better chance of opening a market, and there would be more encouragement for the farmer.
637. Do you think there would be any market for wheat towards the west? I should think so. There is a great population here, and almost a starving population. We have to pay famine prices for everything we get.
638. There does not seem to be a great population here? The refuse from the Sydney market is sent up here, and the people living here have to keep them.
639. How are they sent here? By the Labour Bureau.
640. Are they doing no good for themselves? No. The farmers have no market, and they cannot employ these people.
641. How would a railway help them? A railway would give them a market, and the farmers would then employ any surplus labour.
642. Do you think that men could live upon small holdings in this district? Yes.
643. What area? 200 or 300 acres. That area would keep a lot of families happy who are now travelling about.
644. Could people live upon that area by farming? They could live upon the same principle as the crofters at home. At any rate they would be able to make homes for themselves. Now, many of them have no homes.
645. *Mr. Hassall.*] Have you any idea of the extent of the auriferous country? I think it extends to the Barrier. There is very little clay on the northern side of this country from here to Menindie. I travelled across to Mossgiel from Wilcannia years ago. That is all the same class of country.
646. How far does the range in which the "Yellow Streak" is run? This granite goes out about 50 miles from here.
647. What are the strata here? Slate from here to the northern side, and on the flat country granite. The granite comes to within 200 or 300 yards of the slate.
648. Here we are practically at the junction of the granite and the slate country? Yes.
649. In what direction does the line of demarcation between the two run? A trifle to the west or north.
650. Does the range in which the "Yellow Streak" exists run practically down to Condobolin? Yes. That is a spur from the main range working down from Parkes.
651. There is a continuation of the metalliferous country right away from Parkes beyond Condobolin and on to Mount Hope? Yes.
652. Have any other minerals besides gold been discovered in this country? Twenty miles from here, nearly north, there is a tin lode for which a lease has been applied.
653. Do you think there is likely to be any development in the mining industry here? I firmly believe that this will be a great mining centre.
654. But you want capital? Yes.
655. The miners themselves are too poor to thoroughly prospect the place? Yes. The only people we have about here are a few boundary riders.
656. You have no practical miners down here? No; just the local population.
657. *Mr. Fegan.*] What is the depth of your deepest lode? 125 feet is the depth of the "Yellow Streak." Between 20 and 30 tons taken from that claim averaged 4 oz. and 3 or 4 dwts. to the ton.
658. What is the width of the lode? It started at 2 ft. 6 in. and increased as it went down, though the stone is of a slightly lower grade. At 125 ft. they are getting 14 or 15 dwts.
659. Are many people sent here by the Labour Bureau? None have been sent here lately.
660. But they have found their way out here? Yes.
661. Do twenty of them pass through here in a week? Twenty a day very often. A man might as well keep a family as keep the travellers that pass through.
662. Do you think the farmers about here and the men working in the mines would use the railway if it were made? Yes, and it would give the miners a chance of getting provisions more cheaply.
663. That is a great consideration? Yes.
664. What do they charge you for flour out here? 28s. a bag in Condobolin. A bag is 200lb.
665. What is the carriage from Condobolin to Cugong? About 5s. They give about 1s. 6d. a bushel for wheat at the Condobolin mill.
666. What is flour sold for elsewhere? From £14 to £18 a ton. The price depends upon the season.
667. Do you think this land would be any good for dairying? It would not be so good for dairying as for wheat-growing. For dairying you want constant rain.
668. Would it be good for fruit-growing? Yes, it could not be better.
669. What fruit would it grow? Fruit of every kind. Across the river they grow every description of fruit; but only in a small way, because they have no market.
670. A railway would give facilities for sending fruit to market? There is no doubt about it.
671. Do you think the people would take advantage of the railway, in order to send fruit to market? I do.
672. How long have you been mining? Ever since I have been in the country—thirty or forty years.
673. What is your idea of the prospects of this field? I have pinned my faith to it, and I am staying on it.
674. You think that with capital and railway communication the mines will be developed, and work will be found for hundreds of men? Yes. The crushings of ten mines which have been opened at Cugong average from 12 to 14 cwts., and in many parts of the country, companies are working stone of a very much lower grade with payable results. It is only capital that will bring about the right class of work.
675. Is there no made road to this place? There is no made road, but there is a very good road to travel over. The Government would not give us a tank until there were some further developments. We managed to get a school after a lot of trouble, and a post-office.
676. How far are the mines from water? Four and a-half miles.

677. What water is that? The Lachlan water. We have a nine-head battery near here.
678. You think that if there were a railway, capital would be spent in developing the mines? I have not the slightest doubt about it.
679. The people in this part of the country think that they ought to receive the same consideration as people in other parts of the country? Well, that is what I think.
680. Do you think that the proposed route to Menindie is better than the route to Wilcannia? I should say that it would have a better chance of obtaining the Broken Hill traffic.
681. Do you think that the country between here and Menindie would in the near future give a return to a railway? I do, judging from the way in which the Western line has opened up the country.
682. I suppose you have plenty of timber here for your mining operations? Yes, the timber is splendidly situated for mining purposes.
683. You use a lot of timber? Yes.
684. Have you any timber for houses? There are belts of pine, box and mallee, which are all suitable for any kind of work required in this district.

Mr. H. Evans.
10 Sept., 1896.

FRIDAY, 11 SEPTEMBER, 1896.

[The Sectional Committee met at Cabot's Hotel, Euabalong, at 4 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT. | JOHN LIONEL FEGAN, Esq.
THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. John Edgar, grazier, Errebendery, near Euabalong, sworn, and examined:—

685. *Chairman.*] How long have you been here? About twenty years.
686. What area have you? 16,000 acres of leasehold, and about 6,000 acres of purchased land.
687. Is that your total holding? Yes; about 22,000 acres in all.
688. How far is your holding from Euabalong? It is 9 miles down the Lachlan.
689. *Mr. Hassall.*] What frontage have you? Five miles straight across.
690. And what depth? About 8 miles.
691. What is the country at the back of you? Open box country and mallee pine scrub.
692. How far does the good country extend back from the river? Right to the boundary of the run.
693. And beyond the boundary? It becomes inferior—mallee and scrub country.
694. Rabbit infested? Yes.
695. Is it in occupation? Yes.
696. What is the country above you? Similar to my own. That is on the creek. When you get further back it is different. North Wooyeo has a frontage something like I have, until you cross the creek, then you get into mallee and pine scrub.
697. What do you think this land is good for, taking it as a whole? The frontage land is first-class grazing country, if the rabbits are kept under, and very good cultivation country. Very nearly all of Errebendery could be put under cultivation.
698. Are the rabbits very thick? They are.
699. Do you know anything of the country along the route of the proposed line? For a certain distance.
700. Do you know anything of the country out towards Mossgiel and Ivanhoe? I have travelled out as far as Menindie.
701. What is your idea of the country? From about 20 miles this side of Hillston, on to Albemarle, it is all very nice grass country—open plains and box country. That is, leaving the billabong on the right, and going past Mossgiel to Kilfera and out that way.
702. Do you know the country between here and Condobolin out towards Mount Hope? That is hilly scrubby pine country. Roto is very nearly all scrub. As far as you can see from Mount Hope it is all mallee; that is, from Mount Hope out north-west towards Wilcannia. It is nice open country to the north of the proposed line for about 20 miles, as far as Ivanhoe. All the country I travelled over is open light-box country. From Condobolin it is open country.
703. But we saw the best country on the road we came by? Yes, you saw the best of it. After you come through Kiacatoo there is country 10 or 12 miles to the right which is very good, and then you get into hilly, scrubby country which is not worth anything. Still even on that country there are flats which are good for cultivation.
704. If the proposed railway were constructed would much of this land be put under cultivation? That is hard to say. There is no market there; but growers here might get a market in Sydney, or where there is a population.
705. Is there any market to the west? Not very much. Of course the stations want flour, and supplies and pollard for destroying the rabbits, and that is about all they use.
706. Do you think the people out here could compete in the Sydney market with growers nearer the coast? I hardly know, I have had no experience in wheat-growing. Some very good crops have been grown about here.
707. How much to the acre? Sixteen or 20 bushels.
708. Could they depend upon a crop here every season? I have been here twenty years and I have only seen two failures.
709. Do you cultivate part of your area? I cultivate from 15 to 20 acres every year. Last year was a failure, we got nothing at all then.
710. What is the average yield of hay per acre? I have had 2½ tons of hay to the acre, and I should think we will have nearly as much this season.
711. You look upon this as pastoral country? Yes, it is good pastoral country. If there were a market for wheat, any quantity of wheat would be grown here.

Mr. J. Edgar.
11 Sept., 1896.

- Mr. J. Edgar. 712. Where would the people get the land? There is land on the other side of the river. On this side of the river the land is all locked up.
- 11 Sept., 1896. 713. How long does your lease run? Twenty-eight years.
714. The country on the northern side of the river, although suitable for agriculture, is not available? No. Within 15 or 20 miles of Hillston there are resumed areas which would be available for settlement; but from here to Willanthry the country is not available.
715. Is there much settlement going on in the district? Not lately; in fact, the people have been clearing out mostly.
716. Is there plenty of land available in the Central Division? Yes, I think so.
717. Why are the people clearing out? I suppose because of the rabbits and the dry weather. There is no market, and no work is going on. Everything here is at a standstill. Half the stations are only quarter stocked. They lost their sheep, and they have had to stock up again.
718. Have the losses been very heavy? Yes, taking them all through. I have lost as many as 12,000 sheep in the year on my small place. That was through having a number of stock which I could not send away when I wanted to. You could not travel the sheep away. We hung on to them, hoping that rain would come.
719. Do you do nothing with them? The only thing you can do is to take the wool off them.
720. Mr. Hassall.] Would the construction of the proposed line benefit the district materially? It would benefit the people who are here; but I could not say whether it would settle more people here. I believe that it would do my place a lot of good. It would enable me to get rid of stock when I had too many. I should also be able to sell my fat sheep.
721. Do you send everything to Sydney? Yes.
722. How much do you pay to get your wool carted to the railway? We now always send our wool to Whitton; but, of course, when the railway comes to Condobolin we shall send the wool there. We get it carried to Whitton for about £2 10s. a ton, and it costs about £6 a ton to get it taken to Sydney. Messrs. Permewan, Wright, & Company take it for that.
723. Mr. Trickett.] What is the distance to Whitton? 110 miles from my place. It would be about 50 miles from my place to Condobolin. A railway would enable us to get up our goods cheaply, and to send our wool away cheaply. I have often had 1,000 sheep here which I would have been glad to send away by rail, but which it was not worth while to send by road.
724. How far would the Condobolin extension serve the people out here? It would serve the people out about as far as the lake. The lake is about 90 miles from Whitton.
725. Can anything be done with the scrubby rabbit-infested country;—is it worth spending money upon it? I would not like to say what can be done with it; but it requires a lot of money to deal with it.
726. Would you like to go and tackle it yourself? No; I do not think I would like to go there if there were open country available. If no other country were available, and there were a market, you might get people to go there. There is no water out there.
727. You would have to depend upon an artificial supply? Yes.
728. What is the carrying capacity of your run? Without rabbits, about 2 acres to the sheep.
729. With the rabbits, you require about 3 acres to a sheep? Yes.
730. Is it good wool-growing country? Yes, very good.
731. What is about the average weight of a fleece? About 6 lb. I have got as much as 1s. 1d. per lb. for my wool.
732. You are not getting anything like that now? No; last year I got 8½d. The year before that I got less.
733. Do you know of any successful agriculturists out here? A neighbour of mine has 200 acres under cultivation. He has been farming for ten or twelve years, and has done very well by growing hay and wheat.
734. Does he send his wheat to Condobolin? No; the people here buy wheat, hay and flour from him, so that he has a local market.
735. Mr. Hassall.] If two or three others came here, the local market would be fully supplied? Yes. During the last two years the market has been much better than it would otherwise have been, because of the dry times.
736. Do you suffer from floods along the frontage? Yes, for about a mile and a half or 2 miles out when the river is very high, but that does good rather than harm.
737. The ground along the route of the proposed line would not be flooded? No.
738. Would it make any difference which side of the river the proposed line was constructed? On the northern side you can get a better route. On the other side you would have more water to contend with in the shape of creeks and lagoons.
739. The railway is surveyed 5 or 6 miles from Euabalong;—must it go back as far as that to keep out of the flooded country? There is no water on the other side of the creek, which is only about 4 miles from here. The line does not cross that creek.
740. No water lies on the country where the line is located? No.
741. Would the line as located answer the requirements of the residents? Yes, I think it would be near enough.
742. Chairman.] Do you think that when the railway is constructed traffic from Euabalong and on towards Willandra, which at present goes to Whitton will go to Condobolin? Yes, from about half-way between here and Hillston the traffic would go to Condobolin. It would be a better track, because there is plenty of water this way, and on the other route there is no water.

Mr. Frederick Small, post and telegraph master, Euabalong, sworn, and examined:—

- Mr. F. Small. 743. Chairman.] How long have you been here? All but sixteen years.
- 11 Sept., 1896. 744. Mr. Egan.] What amount of business do you do here in the year? The telegraphic business has fallen off, though the office work is kept up, this being a repeating station for Mount Hope.
745. What are the last returns you sent in? The telegraphic business has averaged a little more than £1 a week.
746. And the postal business? There is a sale of stamps amounting to £150 or £160 a year.

747. What is the population that the office serves? This place is a junction for the districts up and down the river, and for Nymagee and Mount Hope. The postal district takes in the country within about 100 miles back, and on as far as the lake, and back as far as Condobolin. Mr. F. Small.
11 Sept., 1896.

748. Is the district making progress? For the last two or three years it has been practically at a standstill.

749. What is the cause of that? I attribute it to the rabbits, and to the decrease in the values of stock and wool.

750. Do you think that the closing of the banks had anything to do with it? The district was suffering even before the closing of the banks.

751. The presence of the rabbits is the chief drawback to progress? Yes; the farmers and selectors, who might otherwise have made a comfortable living, have had to leave their places because of the rabbits.

752. Have you had any experience in farming? None whatever.

753. How do you know that this is a very good district? I know it from what I hear, not from my own experience. Living among the people I know pretty well what their troubles are.

754. What was the revenue of the post office before the bad times came? I have sold over £400 worth of postage stamps.

755. Has the population of the district been greater than it is at the present time? I do not know that. I have not seen any difference in the town for some years.

756. Are there many people passing to and fro? No. I am of opinion that the railway to Condobolin will do the district good.

757. Do you think it is advisable to bring the line from Condobolin on here? No, I think not. If the railway were extended this way people would be unable to take up land near it, because the land there is all locked up, and there is no water where the line runs.

758. What is the difference between Sydney prices and those here? I cannot tell you; but I should think that things would be from 50 to 100 per cent. cheaper in Sydney.

759. Would not a railway materially reduce the cost of living? Speaking for myself, I would like to see a line here next week.

760. Do you not think that a railway, by giving greater facilities for using the land, will induce people to settle here? I think so, if good land were available; but I fail to see where suitable land can be obtained.

761. Do you think that if the line were constructed it would materially help people to settle here, because it would reduce the cost of living so much. I cannot say. I have no practical experience of the matter.

762. Would you look for an increase in business? I think there would be an increase in business. I think that the opening of the line to Condobolin will do good to all these places, because it will bring all the traffic up the river to Condobolin. If the train ran right through all these little places they would simply be left.

763. What is the rainfall of this district? The average rainfall is between 15 and 16 inches. I have here a statement showing the rainfall for each year from 1886:—1886, 19 inches 25 points; 1887, 32 inches 32 points; 1888, 8 inches 41 points; 1889, 23 inches 47 points; 1890, 24 inches 11 points; 1891, 23 inches 47 points; 1892, 14 inches 84 points; 1893, 13 inches 91 points; 1894, 26 inches 80 points; 1895, 13 inches 33 points; 1896, 10 inches 26 points.

764. *Mr. Trickett.*] Looking at the proposal from a selfish point of view, you would like to see the line constructed, but you do not see the least prospect of it paying? I do not.

765. Have you a good road at the present time? Yes, except in a wet season. Sometimes the teams cannot travel along it at all.

766. For how long? In a wet year they may have to camp for weeks.

767. But such seasons are exceptional? Yes.

768. How many travellers go through this place in a week both ways? Some days we scarcely see anybody, other days there will be a good many people.

769. How many people go by in a week who would be likely to pay railway fares? Not more than fifteen or twenty, perhaps.

770. Can you give us any instances where farmers have been successful in this district for a number of years? Mr. Davis is an instance.

771. Can you tell us of anyone else? No; I cannot mention anybody else.

772. Do you know many people who have started farming here, and who had to give it up? No, I do not. Mr. Day started on rather a large scale, and it seems to have paid him, but I do not know any others who have gone into the business in a really practical way.

773. Mr. Davis has had the local market? Yes.

774. Where does this gentleman live? About 12 miles from here, on the northern side of the river and lower down.

775. I suppose he has a good deal of land? No doubt it is good land. It is an ordinary river flat; but most land of that character is good land.

Mr. Michael Wyer, senior constable of police, Euabalong, sworn, and examined:—

776. *Mr. Trickett.*] How far does your district extend? Thirty miles down the river, 15 miles up the river, and about 35 miles in a northerly direction. Mr. M. Wyer.
11 Sept., 1896.

777. I understand that the population in the district is about 300? Yes.

778. How many people are there in the township? Seventy-one.

779. Have you any information to give us with regard to the occupation of the land? Yes; I think the following table gives the information that you require:—

Agricultural and Pastoral Statistics for Euabalong Police Patrol District, 1895.

Alienated Land.		Crown Lands.	Total area under cultivation.	Area under wheat for grain.	Total yield of wheat.
Freehold.	Rented.				
acres. 61,366½	acres. 600	acres. 627,359	acres. 616	acres. 40	bushels. 400

Area under cultivation, 1896--1,075 acres; of same, 1,023 acres were sown for wheat, not yet gathered. 1896--total area under cultivation, 844 acres; area under wheat for grain, 330 acres; total yield of wheat, 8,200 bushels.

- Mr. M. Wyer. 780. How long have you been here? Over four years.
- 11 Sept., 1896. 781. Has the district progressed in that time or gone back? It has gone back.
782. What is the reason for that state of things;—what has made it go back? The climate is not good, and a great number of sheep have died through the drought since I came here. The quality of the wool has also been injured by the drought.
783. Are the people in the district fairly prosperous? Not very prosperous.
784. How are most of them occupied? They are scattered up and down amongst the stations.
785. The holdings here are mostly very large? Yes. There are a few small holdings, ranging from 2,000 acres down to 640 acres.
786. What is the 640-acre man—an agriculturist? Something of an agriculturist.
787. Have they picked bits of country? All that I know have good water frontages.
788. They have picked pieces? Yes.
789. Do you think that this is a country which is suitable for small land-holders? It might be if there were a colony of them, and they depended one upon the other.
790. Do you think the small holder can get a living here by growing produce and sending it away? Not unless prices go up.
791. What kinds of produce does it pay a man to go in for? The only thing you could grow around here is wheat.
792. To grow wheat successfully the price would have to go up and the cost of carriage would have to come down? Yes.
793. But you cannot conscientiously say that you think the proposed railway would be a paying concern? No, I should think it would not pay.
794. You do not think that people would rush to take up this country? I could not say; but unless a lot of people came here the line would not pay.
795. Mr. Fegan.] Why? There would not be enough to import or export.
796. Is it not a fact that population generally follows a railway? Yes.
797. Is not that what would take place here? Population might settle within a few miles of the line for some distance; but not right through. The line might create a population between Condobolin and this place.
798. How long do you think it would be before the line would pay? I could not say.
799. Have you heard anybody asking for the railway? I have heard people say that they did not care whether the line came or not.

Mr. William M'Lean, storeman, Euabalong, sworn, and examined:—

- Mr. W. M'Lean. 800. Chairman.] How long have you been in the district? About twenty-five years.
- 11 Sept., 1896. 801. You are employed in Euabalong? Yes.
802. Where do you get your goods? From Sydney, through Forbes.
803. What is the rate of carriage from here to Forbes? I could not tell you. The rate from Sydney for general merchandise is about £7.
804. Do you know the rate for wool from here to Forbes? No.
805. When the line goes to Condobolin will your produce come from there? Yes.
806. Where does the wool from here go? The wool from below goes to Whitton, but from the country above us it goes to Forbes.
807. Euabalong is situated on the dividing line? Yes.
808. When the railway is brought to Condobolin the traffic will go there? Yes.
809. And the line of demarcation will shift further west? Yes.
810. Do you know anything about farming? No.
811. Have you a fair knowledge of the country about here? Yes. I have been from here to Forbes on both sides of the river, but I have not been away from the road.
812. On the southern side of the river, what is the country like between here and Forbes? It is good country.
813. As good as the country between here and Condobolin? Yes.
814. How would you describe the country between here and Condobolin? From here to Cugong is good country.
815. What lies behind that? The country behind is not too good.
816. How wide is the belt of good country? Eight or 9 miles.
817. From Cugong towards Condobolin, what do you think of it? I reckon that it is good country—as good as the other.
818. What about the country at the back? It is not so good.
819. How wide is the belt of good country? I could not tell you. I have not been out there; but I reckon that the frontage is all good.
820. Fit for wheat-growing? Yes.
821. Would you grow wheat on the flooded box flats? I reckon that they would grow wheat.
822. It would be a considerable expense to clear them? Yes. I reckon that any of the country on the river frontage would grow almost anything. It is good grass country, and where it grows grass it ought to grow wheat.
823. Do you agree with the evidence of the postmaster in regard to the state of the district? Not altogether. I think that the cause of the prevailing depression is that the land about here is all locked up in large holdings, upon which there are very few people employed. Some years ago a good many persons were employed in putting down improvements; but there is nothing of that kind going on at the present time.

SATURDAY, 12 SEPTEMBER, 1896.

[The Sectional Committee met at the Public Hall, Lake Cudgellico, at 7 p.m.]

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. WILLIAM JOSEPH TRICKETT.

JOHN LIONEL FEGAN, Esq.,

THOMAS HENRY HASSALL, Esq.

The Sectional Committee further considered the proposed Railway from Condobolin to Broken Hill.

Mr. Thomas Brooks, farmer, Lake Cudgellico, sworn, and examined:—

824. *Chairman.*] Where do you live? At Lake Cudgellico, about a mile and a half north of the township.

825. What area of land have you? There are 115 acres where I am living.

826. How long have you been here? Since 1882.

827. What have you been doing during that time? Farming. I have 2,560 acres at Uabba, where I have been living during the last twelve months.

828. In what direction does that holding lie from here? Fourteen miles due west.

829. How long have you had it? Since August, 1883.

830. What have been your operations in the district—agricultural or pastoral? Both.

831. What has been your experience with regard to agriculture—I suppose wheat is your staple? Until the last three years we have not gone in much for wheat, because we are too far from a market. Three years ago I put in 300 acres of wheat, and I had a very fair crop—about 13 bushels to the acre.

832. Could you depend upon that crop? That was a very heavy crop. The land here wants to be cropped three or four times before it becomes good. At first it is rather strong. The crop grows too rank.

833. What happened to the crop next year? I did not put one in.

834. You have only put in one crop? Yes. I have had other crops of 30 or 40 acres for the last fourteen years.

835. What is your opinion of the box-flats for agriculture of any kind? The river-flats are not good wheat country, but they are good hay-growing country. They are too strong for wheat. The pine country is the best for wheat.

836. Would the river-flats be somewhat expensive to clear? Not very expensive.

837. How much an acre would make them ready for the plough? £2 or £2 5s.

838. I suppose pumpkins will grow here? Yes; and on the river-bends potatoes.

839. What would the pine country yield per acre if put under wheat? On an average, 10 or 12 bushels.

840. What would it cost to clear and put in a crop? About 35s. an acre. It would depend upon the amount of timber on the land. All the pine country is not heavily timbered.

841. What would be the cost of the next crop? The next crop I could put in for 11s. per acre, including seed.

842. What about the open plains with the box belts between them? They would grow good wheat after two or three years cropping, but not before.

843. They want to be broken up, so that the air can get into them? Yes.

844. Why do you think that they would grow good crops after a time? The ground is very strong, and the crop at first would be rank. There are selectors upon these plains further down the river, and that is their experience.

845. What could we reasonably expect after, say, the third crop? About 11 or 12 bushels to the acre, on the average.

846. Does that fairly describe the country from an agricultural standpoint? Yes.

847. With regard to the climatic conditions, in your opinion, is the rainfall here sufficient to enable farmers to grow wheat with fair success? Yes, I think so.

848. What experience is that opinion based upon? Upon practical experience here.

849. You have seen crops growing year after year? Yes, every year for thirteen years. I have never had a complete failure. Last year the crop was a partial failure; but that was more on account of the rabbits than because of the season. I do not protect the ground from the rabbits. I think we have an average rainfall here of 19 inches.

850. Do sheep do well in this country? Splendidly.

851. How many acres are required for a sheep, speaking from a selector's point of view? It has been proved here that a selection will carry a sheep to 2 acres, though we are afraid to put so many sheep on.

852. You are speaking of average land? Yes.

853. Is that good wool? The wool is splendid.

854. It brings a good price? Yes.

855. Do you know the country between here and Condobolin, on the south side of the river? Yes, pretty well.

856. Will you describe it? It is pretty well all pine country; good agricultural land for the first 25 miles, but after that it becomes ridgy.

857. What is the timber? Box ridges and pine, with some patches of mallee.

858. If the proposed line were constructed, which way would you take it—on the southern side or on the northern side of the river? On the southern side. There would be more settlement on this side of the river. There is more land open for settlement.

859. Is the land better? No; I do not think that it is quite as good on the average. There are a great many patches of it good, but it is not uniformly so good.

860. You take into consideration the fact that on the southern side of the river the land is in the Central Division, while on the northern side it is in the Western Division? Yes.

861. What is the country like north from Euabalong? Principally mallee. Coming here the line would come through plains. Keeping out 6 miles north from Euabalong you get into the mallee.

862. How far west does the mallee run? Until you get to Roto.

863. Right on to the Willandra? Yes.

864. Is the Government line located in the mallee country? Yes; it runs through mallee country for 40 or 50 miles. There may be a clump of thick pine and oak.

Mr.
T. Brooks.

12 Sept., 1896.

- Mr. T. Brooks.
12 Sept., 1896.
865. Do you think that that line has been wisely located, having regard to the development of the country? No.
866. Have you ever been to Forbes? Yes.
867. Could a line be got through from here to Forbes? Yes.
868. Through good country? Yes, with the exception of the last 25 miles at this end. It would go principally through pine country, until you got above Condobolin.
869. Could that country be used? Yes, it could all be used. From Condobolin to Forbes the country is even better. There you get some of the best country in New South Wales.
870. Would that be north or south of Lake Cowal? North of it.
871. Will such a line go through level country? Yes, the country is perfectly level.
872. And is it good country? It is splendid country. There are patches of pine and yellow box.
873. Have you ever been to Grenfell? Yes.
874. Could a line be got from here to Grenfell, keeping south of Lake Cowal? Yes, with the exception of one ridge called Billy's Lookout.
875. What kind of country is it? Good agricultural country.
876. Is the land good? Yes, far superior to the land down this way.
877. And it is all in the Central Division? Yes.
878. Do you know the country from Hillston to Wyalong? Yes.
879. What kind of country is it? It is valueless country by Rankin's Springs. That is the direct route.
880. To develop this part of the Colony, where would you put your line? I would start from Grenfell and go through the Bland and Humbug country, and follow the river down. That is all very good country and level, and pretty well all Crown land.
881. Where do you sell any stuff you grow? The wheat I grew three years ago I carted 60 miles to Condobolin. I paid 1s. a bushel to have it ground, and I brought back the flour and sold it to the stations round about. I was 25 or 30 per cent. out of pocket by the transaction. It is impossible to grow wheat here profitably without a railway. If there were a railway I should continue to increase my area every year. I have sufficient plant to cultivate 1,000 acres, if I could make it pay.
882. If there were a railway you would cultivate that area? Yes.
883. Where do you send your wool? To Whitton.
884. What do you do with any fat stock you may have? We have fat stock in the spring, but we have to keep them here as a rule until they get poor and die. I have 400 fat lambs now which I would send away if we had a railway. I cannot sell them here.
885. It does not pay you to send a small lot away along the road? No. You cannot drive them. They waste away. Every selector in the district is in the same position. We are afraid to breed sheep because we cannot sell them. We always have a pretty fair rainfall, and a pretty fair grass in the winter and spring; but we have to keep our stock until the end of the summer, when they gradually get poor, and if we have no summer rains they die.
886. At what price will it pay you to grow wheat here? With average crops, wheat would pay at 2s. a bushel sold on the ground, or delivered within 8 or 10 miles.
887. What revenue would a railway derive from country like this? That is more than I can say. Unless the railway does come here there will not be a selector left.
888. Would available land be taken up if a railway were constructed? Yes.
889. The Government would be able to get rid of all its unalienated land? Yes. It is all splendid land for wheat-growing.
890. Are the Committee to understand that sheep cannot be got away from this district? If you converse with the selectors you will find that they are frightened to breed sheep in case of their dying on their hands. We are afraid to stock up our runs.
891. If they could get the sheep away when they were fat, it would be different? Yes. We should then have no hesitation in putting on stock.
892. Your experience is the experience of all who are similarly situated? Yes, of all the selectors in the district.
893. What effect have rabbits had upon the country? They have depreciated the value of the land considerably. Upon small holdings we can cope with them very well by netting and poisoning; but the Crown land round about gives us a great deal of trouble. The young rabbits get through the netting; but a week or a fortnight's poisoning will get rid of them.
894. Your great trouble is want of means of communication? Yes, the want of railway communication. If we could get our stock away we should have no losses.
895. How would you supply water to the back country? By means of tanks.
896. Can people afford to do that kind of work? Generally speaking a selector has a pretty good plant, and teams of horses and bullocks, and, after his crop is in, he has time to put down a tank, if it is only a small one at first, and a larger one afterwards. This is good holding country, as a rule.
897. What area could a man live on in this country, going in for mixed farming? I consider that 2,560 acres would be sufficient where there were proper means of communication. If a man cannot live on that area he cannot live at all.
898. Do you approve of the proposed railway as located north of Euabalong? No.
899. It would be of no benefit to the people about here? Not much. I would have to come 20 miles up the river before I could cross to get to a railway, and then go 9 miles out. That would be 29 miles altogether.
900. What distance is it to the proposed line from here? About 17 miles.
901. That would be better than a railway to Condobolin? Yes.
902. How far could a farmer afford to carry his grain to get to a railway station? The grower can scarcely afford to carry his wheat any distance. Ten or 12 miles would be as far as he could afford to cart it. He ought to be able to get to the railway and back in a day.
903. Do you require to enclose all your holding with rabbit-proof netting? If I were taking up land afresh I would not enclose it all. I would enclose the cultivation land with a small mesh; but I think that the rabbits could be kept off the other land by poisoning.
904. What would it cost to put up a small-meshed fence? £60 a mile, including the cost of the wire and the fencing.

MINUTES OF EVIDENCE—RAILWAY FROM CONDOBOLIN TO BROKEN HILL.

Mr. Alexander Gordon Huie, Secretary to the Progress Committee, Lake Cudgellico, sworn, and examined:—

905. *Chairman.*] How long have you been here? About thirteen years.

906. *Mr. Trickett.*] You are pretty well acquainted with the district, its capabilities, and requirements? Yes.

Mr.
A. G. Huie.
12 Sept., 1896.

907. What is the population of Lake Cudgellico? I should say that the population is about 500—that is, taking the country within a radius of 10 or 15 miles. There is rather a large percentage of young people and children included in that number.

908. How many adults would there be? 200, if not more.

909. What are their occupations? There are a good many carriers, shearers, and selectors; but there are not many artisans or tradesmen.

910. They reside principally in the town? Yes.

911. What is the population of the town? About 200 or 250, I suppose. There are ninety-seven children on the roll at the local school.

912. Has the population increased or decreased since you have been here? It has been about stationary for the last six or seven years. Some people have gone away, and very few have come in their stead. The natural increase is about the only increase that there has been.

913. Why has the district not progressed? The only reason I can give is that the distance from a railway makes it impossible for people to grow things here at a profit.

914. What have the people who have left the district been? Selectors, carriers, and shearers.

915. Have they assigned as their reason for going the want of a ready market? Yes.

916. Have the farmers in the district been successful as a class? Not as a class. There are individuals who have done well.

917. What has been the reason for the success of those individuals? They have had a larger amount of energy for one thing, and have not engaged in other work, such as shearing and carrying. The men who have stuck to their land and have tried to make a living from it have in a measure succeeded; but those who have gone and come have not done well. Instead of the land keeping them they have had to keep the land.

918. Where is the produce disposed of? A considerable amount has been sent to Mt. Hope. That is the chief market for chaff and so on. The wheat mostly goes to Hillston. The year before last a considerable amount went to Hillston, and some to Condobolin.

919. The local market is very limited? Yes.

920. If a large number of farmers were to settle here, would they have any outlet for their produce? Hardly any. There is land open now, but it has not been applied for because it was not certain that the produce could be sent away. If the construction of the line were assured, the land would be taken up freely.

921. Do you think that climatic conditions would militate against the success of farming here? In most years they would not.

922. In most years you think you could get good crops? Certainly.

923. What sized holdings have the men who have been successful? In one instance a man has nearly 2,000 acres; in another instance there is only a small area, not more than 500 or 600 acres. In some cases, again, men have the full complement.

924. We have heard a great deal about the trouble which the rabbits have created? The rabbits are a very serious drawback at the present time, and have been for years.

925. Do the people fairly try to cope with them? Some do and some do not. Those who try to keep them down are seriously handicapped by reason of the fact that nothing is done to prevent them spreading on Crown lands.

926. If there were a law to compel people to deal with this pest, would that be an advantage? I should say so, within reasonable limits.

927. What is the rate of freight from here? From Whitton to Lake Cudgellico the rate of freight is about £3 a ton. In very wet weather it may be higher, and at times loads may be taken for less. The freight is about the same each way.

928. What would be the freight from here to Condobolin? From £1 to 25s. or 30s.

929. There will be a considerable saving to the producers if they send to Condobolin? Yes.

930. But you do not think that it will satisfy the district to have the railway stop at Condobolin? No.

931. Are you of opinion that it would not pay the farmer to send his grain more than 10 or 15 miles to the railway? I think that that is so. It might be sent 30 miles, or possibly more; but the margin of profit would then be very small.

932. Have you any statement which you would like to make to the Committee? There is one matter to which I should like to refer. There are large deposits of limestone in the district which may be of value. As to the question of route, there is a strong feeling in favour of the line being constructed close to the town; but it would be better to have the line going as surveyed than to have it stay at Condobolin.

933. If the line were extended from Condobolin, on which route would there be most traffic? I think that the prospect of traffic would be better on the line passing near Lake Cudgellico. On the northern side of the river there would not be much settlement for years. A very large part of the country north of Buabalong, and extending west, is very rough.

934. Is there much traffic from Cudgellico in the direction of Hillston and Menindie? Not very much. A considerable amount of flour is brought from Hillston here.

935. You could not expect the traffic in that direction from this distance? Hillston will more than supply its own requirements, but I have no idea what market there would be further on.

936. Until a few years ago, gold-mining operations were carried on at Lake Cudgellico? Yes.

937. Why have those operations ceased? Because the management was not of the best. As far as I have been able to learn, there is still gold in the reef. There has been some gold mining out near Murrone's Bridge. The mine there, I believe, is shortly to be reopened. There is a 5-head battery there.

938. How long were the mines here working? I cannot tell you. I do not think that they have been working for nine years past.

939. You have not heard of their being re-opened? It has been spoken of several times; but nothing has been done.

940. The machinery has all been removed? Yes.

947.

Mr. Allan MacInnes, selector, Lake Cudgellico, sworn, and examined :—

Mr.
A. MacInnes.
12 Sept., 1896.

941. *Mr. Fegan.*] Where is your selection? On the banks of Lake Cudgellico, 4 miles from here.
942. Where do you get your stock from? I have a butchering business; and I nearly always breed my own stock. For the last six or seven months I had to buy stock up the river—from Mr. Hayley, of Booberoi, principally.
943. How long have you been a selector? For the last sixteen years.
944. How many acres have you? About 1,000 acres.
945. Is any of your land under cultivation? I have a few acres of potatoes in at present.
946. Have you ever tried wheat? Yes.
947. With what result? I have had about ten crops, and only one failed. That was in 1884.
948. How many bushels have you got to the acre? I have always cut the crop for hay. I think it would average from 12 to 14 bushels.
949. Is it fairly good wheat? Yes.
950. Have you a river frontage? No; I have a frontage to the lake.
951. Have you tried irrigation? Yes; I have been irrigating for a good many years. I have 100 acres which I can irrigate from the lake by gravitation. I think that irrigation, if carried out on a large scale, would be very profitable here, supposing that we had a market.
952. What would it cost per acre to irrigate on a large scale? It would be very easily done here. The land I irrigate is lower than the surface of the lake, and I have cut a canal through to the lake. I let the water run through this canal on to my land and flood it, and then when the ground becomes hard enough again I plough it.
953. Does it pay you to go to that trouble? Yes, it pays me well.
954. Is it a box flat that you irrigate? No; there never was any timber upon the land except two or three trees.
955. What are your prospects with that selection? They are fairly good.
956. Do you think that they would be better if a railway came near here? Yes; if I had a market I could do well growing potatoes by irrigation.
957. How far is Mount Hope from here? About 48 miles.
958. Was that a good market for your potatoes? Yes; I made £500 out of one crop when Mount Hope was working, and if I had had the potatoes I could have made £1,000. I used to sell them at 13s. a cwt. at the house, and the men used to take them to Mount Hope and sell them there for 26s. or 27s.
959. What were they selling them for then in Sydney? I cannot tell you.
960. How long ago is it? It was in 1888 or 1889.
961. What did you get for your chaff? I got as much as £10 a ton.
962. Did you irrigate the crop? Yes.
963. Are there other selectors in the same position as you are? I am about the only one who can irrigate by gravitation. There is country all round the lake which could be irrigated by means of pumping appliances.
964. I suppose you have only a local market for your meat? Yes.
965. Have you any stock on your land? About 800 sheep.
966. What do you do with the surplus? I sell it to anyone who will buy it.
967. Do you get a ready market for your cattle? Yes; when they are fat I can always sell them. I sell some to carriers, and others to butchers, or anyone who will buy them.
968. I suppose you would sell a single beast? Yes. It does not pay to drive sheep to market.
969. Do you employ any men here? I keep one man on the selection. I do all the work in town myself.
970. Have you ever taken any produce to Mount Hope yourself? Yes—potatoes and chaff.
971. What has it paid you to sell at Mount Hope? I have taken potatoes there since, and have sold them from 12s. to 8s. a cwt.
972. Did that pay you? Yes.
973. I suppose the Mount Hope mines are closed for the time being? Yes; but I hear that the Central is to start again shortly.
974. Have you sent produce there lately? No, not for two years. There have not been many people there. The few that are there are working on tribute, and there is not much money.
975. How many tons an acre do you get when growing potatoes? From 3 to 7 tons. I think that if the ground were worked well it would yield a good deal more. I do not take much trouble with it.
976. Have you tried anything besides wheat and potatoes? Yes—pumpkins and melons. They both grow well.
977. Does it pay you to grow them? No; there is not much sale for them. I believe that all this country would be taken up if we had a railway.
978. Where would you look for a market? I suppose we should have to send our stuff to Sydney.
979. Do you think there would be any market to the west? I think not. I think they would grow their own produce out that way. If they had a railway they would go in for wheat.
980. Have you sent any stuff to Condobolin? No; but I have paid £1 and 25s. a ton to get stuff taken from there.
981. What do you pay to get stuff from Whitton? I got some stuff from there a few days ago for £3 a ton.
982. So that the extension of the line to Condobolin will benefit you? Yes; more wheat will be grown about this district when the Condobolin line is opened.
983. Are you troubled by the rabbits? Yes.
984. Have you tried to cope with them? Yes; I always keep a man on the place killing rabbits.
985. You do not keep him specially to kill rabbits? No; but that is the biggest part of his work.
986. How do you deal with them? By trapping, and with poisoned pollard.
987. What does that work cost you? I suppose it would cost 5s. or 6s. a week.
988. Is your selection wired in? Three parts of it is; the Lake is the third frontage.
989. Do the rabbits cause very much damage? Yes.
990. Do you think it would be an advantage to have an Act passed forcing everyone to kill the rabbits? I think it would be the best thing that could happen if everyone had to kill his own rabbits. Some people here kill the rabbits, while others never touch them.
991. If such an Act were passed, would you soon get rid of the rabbits? If the land were all cut up into 1,000-acre blocks you would soon get rid of the rabbits.
- 992.

992. What, in your opinion, is the smallest area upon which a man can live away from a water-frontage, and without a railway? A man would require at least 3,000 acres.
993. But if he had railway communication? Then he could live comfortably on 1,500 acres.
994. Do you think that a great deal of the depression in this district is not caused wholly by the rabbits, but that want of railway communication has a good deal to do with it? Both are responsible.
995. Which is the greater evil? I think the rabbits.
996. And stringent legislation is required to force people to deal with them? Yes. If the country were all taken up we could keep the rabbits down.
997. How many sheep do you run on your land? I have 800 at the present time. This has been a very bad year. Up to last year my land would carry about a sheep to the acre. There is a place across here, 1,400 acres in extent, where they have shorn from 1,600 to 2,000 sheep.
998. Could a person who had no water-frontage make agriculture pay here? If he put his land under wheat it might pay. He could not grow potatoes without water.
999. Wheat is the only valuable crop that can be grown in this district? Yes, I think so, taking one year with another.
1000. Have you ever tried fruit-growing? No, not much.
1001. Has anybody here gone in much for fruit-growing? There are a few gardens.
1002. Are they successful? Some people are successful, and some are not. The gardens take a lot of attention, and people will not give it.
1003. If a man gave his attention to the matter, could he make it pay? I think so, if we had a market.
1004. Without irrigation? Yes, I think so. There are fairly good gardens about here which have not been irrigated; but there is no market for the fruit. I have seen grapes sold here at 12 lb. for 1s.
1005. The district is suffering from want of railway communication? Yes. We have no market for our fat stock, and if we drive them to the railway they lose condition so much that they will hardly pay freight. I have known of people having to send down money to pay expenses.
1006. Is there any work going on here now? Shearing is the principal work at the present time.
1007. What is the cost per mile of putting wire-netting on to a fence? I think that netting with 1½-inch mesh costs about £24 a mile in Sydney. Carriage to Whitton would be £2; there would be another £3 for bringing it here, and £4 for putting it up. Altogether, it would cost about £33 a mile.
1008. Which way do you go to Mount Hope? We cross Murren's Bridge. There is a surveyed road from there.
1009. What is the nature of the country through which you pass? There is a lot of mallee and yarran.
1010. Is it good land? The mallee land is not good. It is sandy.
1011. How many miles of country are good? For the first 25 miles from here it is plain country with box and yarran, and then there are about 15 miles of mallee country, and the balance is yarran and box. The country is inclined to be hilly near Mount Hope.
1012. What would that land grow? The mallee country might grow crops; but I am a bit doubtful about it; it is sandy country. The other country would grow wheat well. On the other side of the river there is a man who has 400 acres of wheat under cultivation this year. He is nearly always successful.
1013. More than half the land you describe is good land? Yes. For 36 miles out of 48 the land is good wheat land.

Mr. Henry Davidson Edwards, post and telegraph master, Lake Cudgellico, sworn, and examined:—

1014. *Mr. Hassall.*] What is the population of Lake Cudgellico? There are 784 people in this division.
1015. What is the extent of the division? It would run down to about Merri-Merrigal, 20 miles west. It has been altered lately on the eastern side; but, roughly speaking, it would be about 40 miles long, and going in a southerly direction about 20 miles.
1016. How long have you been here? Four years and nine months.
1017. Have you kept any record of the rainfall during that time? Yes; for the last ten years the rainfall has averaged 19·48 inches. My experience has shown me that the rain splits here. Most of the rain that comes from the north-west splits here, and goes south and north. The result is, that they have 15 or 20 points more at Rankin's Springs and Errebendery than we have here.
1018. Your rainfall compares favourably with that of other places? I am inclined to think that the rainfall at Errebendery, 16 miles north from here, would be greater than our rainfall.
1019. What is the rainfall at Euabalong? 20·29 inches is the average for the ten years from 1884 to 1894.
1020. Has the district progressed or has it stood still since you have lived here? It has deteriorated very much since Wyalong broke out. I could write out the names of fifty or sixty men who have left here and permanently taken up their residence at Wyalong.
1021. Were they engaged in mining here? In mining, carrying, farming, and all sorts of labour. Several selectors have left here.
1022. What have they done with their holdings? Some of the land is now merely waste land, breeding rabbits.
1023. Some sold out, I presume? Yes.
1024. I suppose most of them thought that there was a better opening at Wyalong than here? Yes.
1025. Have you any knowledge of the mineral resources of this district? The mining business has fallen off during the last two years. In my last report to the Warden at Hillston I gave a number of reasons why people were leaving off mining here. Wyalong, Yalgogrin, and Cugong have drawn miners away from here. In my opinion this place has never been properly prospected. I have discovered a reef about 3 miles from here.
1026. Do you issue licenses for the Mount Hope district? No; they get those licenses at Mount Hope. The Warden at Hillston visits there monthly.
1027. Has the population been increasing or decreasing? Decreasing. There was a large population at Mount Hope five or six years ago.
1028. Do you think there is any prospect of the mineral resources of this district being developed? If I can accidentally find a reef carrying gold, what could not others do if the place were properly prospected.

Mr.
A. MacInnes.
12 Sept., 1896.

Mr. H. D.
Edwards.
12 Sept., 1896.

- Mr. H. D. Edwards.
12 Sept., 1896.
1029. The residents of the district are perhaps not in a position to go prospecting? There is a great deal in that. This place seems to have become impoverished to a great extent because of the rabbits.
1030. Have the rabbits increased or decreased during your residence here? They have decreased during the last two or three years. We have had nearly two years' drought recently; but when I came here the rabbits on the common resembled lice. You could just see a moving mass of vermin. There were millions here.
1031. Are any steps taken to keep them down? Our herdsman expends a good deal of energy in keeping them down, but he has very limited means at his disposal. I have seen 1,000 rabbits for every rabbit you see now.
1032. Do you think that the rabbits will deter people from settling here? No I think that with small holdings the rabbits can be easily beaten.
1033. Have the people any inducement to take up small holdings? No, because of the want of a railway.
1034. In your opinion the construction of a railway would alter the position? Yes. I think that in twenty years time the lake would be a second Chicago.
1035. If the country were closely settled, and everyone turned his attention to farming, could the district compete with districts closer to the metropolis? I am inclined to think that a differential railway rate should be provided. I am ready to admit that settlers nearer Sydney have an undue advantage; but I believe that a man could live here and be fairly well off if there were a railway.
1036. Do you not think that the district will be benefited more by a big mining development at Mount Hope? That is not my opinion.
1037. I am thinking of the price given for potatoes referred to by a preceding witness? That is a thing which might happen once in fifty years.
1038. Is this district suitable for agriculture? Yes, it is an agricultural district.
1039. Do you think that the extension of the railway from Condobolin would be the most suitable extension that could be made? No. I have travelled all over Riverina, and my private opinion is that the railway should come from Grenfell or from Wyalong. I have been down the Condobolin line and all over the Bland country. I have been down as far as Hay and Booligal, and I have been out to Hillston, and as far north as Mount Hope. I think the Bland country is the pick of Riverina.
1040. You think that, as a matter of public policy, it would be better to bring the line up through that country instead of taking it through the poor mallee country to the north of Euabalong? Yes. From a local point of view it would benefit us to have a railway coming here from the north, because of the traffic which would pass through here to get to the line. From a national point of view, however, it would be better to bring the line the way I have described.
1041. If the railway were constructed on the northern side of the Lachlan, this place would benefit by the traffic passing through to get to the line? Yes. There would be enormous traffic from Rankin's Springs and places to the south. This would be the nearest point for those places.
1042. But from a national point of view you think that the line should come from Grenfell or Temora? Yes, to develop the magnificent country which extends from Wollengough to within 9 miles of Wyalong. Or it might be brought through from Grenfell.
1043. Where would you make it from Wollengough? I would go almost in a straight line south of Marsden about 20 miles, and through towards Grenfell, or else to Wyalong.
1044. What is the country like from Wollengough to Hillston? You get stony ridges, ironbark ridges, and a great deal of hilly country extending down through Rankin's Springs. The country is much better coming this way.
1045. Have you any knowledge of the timber resources of the district? Yes.
1046. Is there any timber suitable for railway sleepers? Yes; there is magnificent ironbark to be got through Wyalong way—timber of splendid quality.
1047. The narrow-leaf ironbark? Yes; the very best ironbark that you can get.
1048. Do you know anything of the timber resources along the proposed line north of the river? It is thirteen years since I travelled through there, and I was only through there once. I was very much struck with the country between Forbes and Condobolin. The country from Condobolin down towards Euabalong is not first-class country, but it is very good. It is not at all to be compared with the Bland country.

Mr. John Knight, store manager, Lake Cudgellico, sworn, and examined:—

- Mr. John Knight.
12 Sept., 1896.
1049. *Chairman.*] What are you? I am managing a store for my father.
1050. Have you been here long? Eighteen or nineteen years.
1051. Have you a pretty good knowledge of the district? Very fair.
1052. Where do you get your goods from? From Sydney, through Whitton.
1053. What are you paying from here to Whitton? £3 at present.
1054. And how much to Sydney from Whitton? £24 for a 6-ton truck. Small lots come to about £7 10s. a ton. Then there is commission at both ends.
1055. What would it cost you to take stuff down to Condobolin? I cannot tell you.
1056. What do you pay to Forbes? £3 a ton. It is 20 miles further from here to Forbes than from here to Whitton.
1057. When the railway comes to Condobolin you will save about £1 10s. a ton in carriage? We may.
1058. Do you believe that the land here would be all taken up if there were a railway? A good deal of it would.
1059. Is it suitable for wheat-growing? Yes.
1060. You have heard what has been said with regard to the rabbit pest;—do you agree with that evidence? Yes; I believe that with small holdings people could cope with the rabbits.
1061. Do you agree with the evidence of the last three witnesses in regard to the rabbits, the soil, and the possibilities of the district with railway communication? Yes.
1062. Is there any point that you desire to emphasise? I cannot say that there is. With a railway, people would be able to get away their produce. At present there is no market for anything that is grown. If the railway came within 20 miles of us, people would be able to get their produce away.
1063. Why has this district gone back? When we came here first there were no selectors in the district, or, at any rate, very few. The selectors came here fifteen or sixteen years ago.
1064. What was Lake Cudgellico seventeen years ago? A mining township.

1065. Mining disappeared, and the interests pertaining to mining disappeared also? Yes.
 1066. Then came the selectors, and the squatters made improvements? Yes.
 1067. The making of improvements has now ceased, so that there is very little expeniture in the district? Yes.
 1068. Are the people here fairly well off? Many of them, I am sorry to say, are not.

Mr.
John Knight.
12 Sept., 1896.

Mr. James Knight, prospector, Lake Cudgellico, sworn, and examined:—

1069. *Chairman.*] What are you doing here? I have been prospecting off and on for the last four years. I have got gold, and this year I had a portion of the Prospecting Vote allotted to me; but as there was no water I could not go out. I have sent some lots of stone to the Department of Mines for assay. I have had several small results of gold and silver, but nothing of any consequence. Two dwt. to the ton has been the biggest yield, and I have had silver up to 7 dwt. to the ton.
 1070. *Mr. Hassall.*] What kind of country were you prospecting? I have prospected all round Lake Cudgellico within a radius of 70 miles.
 1071. Have you tried the old workings at all? I have been down the shaft, and I took up a small parcel of stone and dollied it, but with no results.
 1072. *Mr. Trickett.*] What depth are they down? There is one shaft 40 feet showing a reef 5 feet wide.
 1073. What is the greatest depth to which they went? The greatest depth is 210 feet.
 1074. With drives? The drives are out from the main shaft, from the 210-foot level.
 1075. Have you had any other indications besides gold and silver? No.
 1076. No copper? I have had no copper.
 1077. Are there any other men prospecting in the district who have been more successful than yourself? No; unless it is Mr. Edgar, of Errebendery, who found the Errebendery Reef.
 1078. Has it been worked? Yes; but is not at present working.
 1079. Is there any alluvial gold there? No; the only place I know of where they get alluvial is 34 miles north from here, in the direction of Mount Hope.
 1080. Do you look upon this as a district at all likely to develop into a mining field? The country has not been prospected. It has simply been hen-pecked by men walking over it and tapping a stone here and there.
 1081. What are the prospects at Mount Hope? I have not been there for ten or twelve years. When I was there it was a thriving place. It has gone down principally, I think, owing to the decrease in the price of copper.
 1082. Is there much copper ore there? Yes, I think there is; but I cannot speak with certainty about it.
 1083. The mining prospects around here are not particularly bright? At the present time they are not bright. There has been no prospecting done that would enable one to give a sound opinion in regard to the matter.

Mr. James
Knight.
12 Sept., 1896.

Mr. Robert McEwan, Lake Cudgellico, sworn, and examined:—

1084. *Chairman.*] How long have you been here? Nearly twenty-three years.
 1085. *Mr. Fegan.*] You were manager of the mine here at one time? Yes.
 1086. Can you give us any information in regard to it? Up to the period I left there were five distinct lodes.
 1087. When did the mine start? About twenty-three years ago.
 1088. How far down are they? About 200 feet. There were several managers there after I left. The whole of this country is more or less disturbed, but I do not think the disturbance will extend far down. I think that when we get through the crust the disturbance will cease. The line of fracture is to the west. The disturbance has not taken place where the mine is, but I think that the concussion from the disturbance has broken the upper formations. That was one cause, perhaps, why the lodes were not so rich as they would have been if they had been properly stratified. We had to take out a great amount of material.
 1089. Do you think that below the disturbance a better formation will be met? Yes.
 1090. What is the result of your crushing? It averaged about half an ounce to the ton.
 1091. Would that be payable? Yes, under certain conditions.
 1092. How long has the mine been closed? Nine or ten years.
 1093. Why was it closed? After I left several managers succeeded me, and they did not seem to develop the mine properly. There was a want of judgment in the management, I think, though I do not say this to cast reflections upon the gentlemen concerned.
 1094. None of the crushings returned more than half an ounce to the ton? No.
 1095. Did any return less? No, not when I was there. Our reducing appliances were limited.
 1096. Since then appliances have been invented which would give a better return? Yes.
 1097. Had you to contend with much water there? I had an 8½-inch lift, and I could always keep the mine free with that, though the pump had to go night and day.
 1098. Is there plenty of water here for all the work that is necessary? Yes.
 1099. Have you a knowledge of the different strata about here? Yes; it is slate and sandstone—what we call mud-slate.
 1100. Is there likely to be any paying mine found here? I think so, if the country were properly prospected. I think that the whole of this belt is auriferous. We are in the same belt as Temora and Wyalong. The belt goes right across the continent.
