2803. If Inverell can, at the present time, get goods *via* Grafton by road, cheaper than by railway, is the inference possible that they will get them still cheaper when they have nearly 150 additional miles of railway carriage? They would get them by the cheapest way, no doubt.

2804. If the Railway Commissioners cannot carry goods 420 miles to compete against Grafton, will they be able to carry them 509 miles? The distance would be 460 miles. You have to add the distance between Inverell and Glen Innes.

- J. R. Smith,
Esq.
29 Sept., 1896.
2805. As a matter of fact we know that at Glen Innes itself, where the railway runs, the railway is eaten up by the teams on the Grafton road; and is not the inference very strong that the same thing will occur when the railway is constructed from Inverell to Moree. We have it in evidence that freight can be landed in Inverell from Sydney, *via* Grafton, for £4 10s. a ton. The railway charge to Glen Innes, is, at the present time, £5 a ton, truck rate. If they are going to charge the same to Inverell—and they can scarcely charge less—will not the competition by teams be as active as it is now? I should think so.
2806. Would it be correct to state that it is proposed to construct the line round by Moree for the purpose of enabling the Inverell farmers to send their wheat to Sydney? No: I do not think they can afford to send wheat to Sydney by rail, unless the Railway Commissioners carry it for nothing.
2807. You have stated that Inverell's great market is in the north-west? Yes.
2808. Of course, they cannot cross into Queensland? But they do; any quantity of them cross into Queensland.
2809. Notwithstanding the fact that they can produce stuff on the Downs for nothing? Notwithstanding that; because they get the back carriage.
2810. The wool does not come across this way now? Yes, it does.
2811. With £2 10s. a ton duty? Yes; and the Railway Commissioners pay it for them.
2812. Do you know that of your own knowledge? That is what I am told.
2813. What if the Railway Commissioners deny it? Then I believe the Railway Commissioners.
2814. Can you give the Committee any idea as to the population west and north-west of Inverell which is likely to be served by the proposed line? No; but I should imagine that you could obtain the information from the electoral rolls.
2815. You are aware that Inverell has an immense area of valuable wheat-growing land? Yes.
2816. If the railway causes the occupation of those lands, is there a population west and north which would consume the produce? If they put it all into wheat, I have no doubt the supply would be greater than the demand.
2817. Three years ago, when Inverell produced a very heavy crop of wheat, it nearly all went to Glen Innes; therefore that, to a certain extent, combats your argument that their great market is in the west. On the east of Inverell we have Glen Innes, Armidale, Tamworth, and all the population of the northern line of railways? But the Tamworth people grow more than they can consume themselves.
2818. As a rule, the great market of producers is not in the sparsely, but in the thickly-populated country? Yes.
2819. On the North, from the Macleay to the Richmond River, we have a population of between 80,000 and 100,000 souls, and they cannot grow one bushel of wheat. Would it be possible for the wheat-producers around Inverell to send their wheat to the coast to feed these people? No; I think you could get Adelaide wheat cheaper. They can land Adelaide wheat in Brisbane more cheaply than they can bring it from the Downs and land it in Brisbane.
2820. But, if the proposed railway is constructed, will it open the great wheat lands of Inverell, and enable the producers to send wheat to the metropolitan market? I do not think they can do that.
2821. Therefore you think their only available market is north and north-west of Inverell? Yes.
2822. Having supplied that market and their own wants, their consumption is stopped? I should think so. I should think the carriage would kill them for anywhere else.
2823. And you do not think there is any hope of their successfully catering for the trade towards the northern sea-ports? No, I think the only market Inverell has got is west.
2824. Do you think it is fair that the people where you reside, and in the northern and north-western country, should be, for all time, compelled to drag their produce to Sydney in preference to taking it by a more direct route to the seaboard? No, I think it would benefit them to get down in the cheapest way.
2825. You are aware that in other colonies they have not one port alone, but a number of railways running inland from the coast? Yes.
2826. Do you not think that that would be a good policy to adopt in this Colony? There is no doubt it would scatter the traffic.
2827. From your place you would be about 200 miles, if the railway were constructed to the seaboard? Yes.
2828. You believe in the general principle that the settlers on the soil should be offered the most direct and cheapest means of communication to a market which the Government can give them? Of course, the cheaper a man can get to market the greater profit to him.
2829. *Mr. Black.*] With regard to the consumption of Inverell wheat in Glen Innes—are you not aware that the Inverell climate is more suitable to the growth of wheat than the climate on the higher levels? No, I am not. I think they grow just as good wheat about Glen Innes as they do about Inverell. There is good farming land about Glen Innes, but Inverell is "the pick".
2830. Is the Warwick maize, which you were speaking about, as good as the maize grown about New England? Yes.
2831. Is it not inclined to be weevily? No; the land about Warwick is very high, and the Queensland Government have been cutting up tremendous tracts of country.
2832. Do you know Paramellowa? Yes, it is a small town.
2833. Is there any good country about it? There may be a little along the river frontage.
2834. I mean good country for grazing or agriculture? It is grazing country, excepting little bits along the river frontage, where they can cultivate.
2835. I suppose it is not a place of sufficient importance for the divergence of the line? No, I think there are only three houses in it.
2836. You say you think the construction of the line will not encourage population? I do not think so.
2837. You are of opinion, then, that it is not likely to divert any land now used for grazing to agriculture? I do not think it is.
2838. Is that because the land is more suitable for grazing than for agriculture? Yes; it is not agricultural land. You might get one good season in three or four if you tried it, but that would not pay.
2839. I suppose it is the climate and not the land which is objectionable? It is the climate. The rain does not come at the right time.
2840. It is not sufficiently regular? No; the black soil wants a tremendous lot of rain—twice or three times as much again as the red loamy soil.

2841. You are speaking of the land between Moree and Inverell? Yes, between Moree and Warialda, and towards Inverell. The nearer you get to Inverell it becomes more loamy.
2842. The black soil is inclined to harden on the top? Yes, and it cracks; if you could put water on black soil you could grow anything.
2843. Then, no matter how good the soil may be, the climate is not suitable for agricultural purposes? No.
2844. Do you know the bore at Moree? Yes.
2845. What kind of water is there? It is good water, although sulphurous.
2846. Is it inclined to be alkaline? I do not think so. It is rather peculiar to taste, but the stock will drink it readily.
2847. You do not anticipate any excess of population between Moree and Warialda on account of the construction of a railway? Nothing worth mentioning.
2848. There may, however, be some increase of population between Warialda and Inverell, or even beyond Inverell? Yes; no doubt there will be at Inverell.
2849. Then, the railway commends itself to you more on account of present prospects rather than on any future development? Yes.
2850. *Vice-Chairman.*] Do you think the proposed line between Inverell and Moree is likely to be largely used for the removal of stock? Yes.
2851. Sheep as well as cattle? Yes.
2852. Do you not think they will travel by road to Moree or to Glen Innes? They will never go to Glen Innes to be trucked to New England.
2853. Assuming there is a connection between Inverell and Glen Innes, would fat stock be sent to Inverell to be trucked to Sydney? No, never.
2854. What if the connection were made between Moree and Inverell? Fat stock would be trucked.
2855. *Mr. O'Connor.*] If a railway be constructed from Inverell to Moree, will it not encourage settlement? A little; but all the land which is any good is pretty well alienated.
2856. But it would offer facilities for settlement? Yes; but I do not think it would improve it. I do not think any more people would be settled there.
2857. In the event of the line being constructed between Inverell and Moree, would it not induce settlement, and if it did, and there were a larger product in the country than would be locally consumed, would it pay to bring it to the Sydney market? Not by railway, although that, of course, depends on the railway charges. If the railway brings it down for next to nothing it will pay, but it will not pay at the present rates.

J. B. Smith,
Esq.

29 Sept., 1896.

Edward Bellingham Price, Esq., M. Inst. C.E., Assistant Engineer, Department of Public Works, sworn, and examined:—

2858. *Vice-Chairman.*] Along with Mr. Scarr, you made an inspection of the country through which the proposed railway will pass, and on to the coast? We made an inspection between Glen Innes and Inverell, and out as far as Barraba.
2859. But not between Inverell and Moree? No; we went as far as Bingara and Barraba.
2860. And to the north of Warialda? No.
2861. Then you are not familiar with any portion of the country between Inverell and Moree, either north or south? I have been over the first 20 or 30 miles out from Inverell. We drove out from Inverell in different directions, but I do not know Moree, nor any of the country about there.
2862. Mr. Scarr and yourself made a joint report? Yes. I may state that Mr. Scarr went up to Warialda and Moree before I joined him.
2863. Did you accompany him? No. We went together to Bingara and Barraba, and came down by way of Manilla.
2864. Did you visit the coast together? Yes.
2865. Will you briefly state what portion of the coast line you inspected? We inspected a line from Tenterfield to Casino, a line from Glen Innes to Grafton, and a line from Guyra to South Grafton, through the Don Dorrigo Scrub. We went over five different lines between the Great Northern railway and Inverell.
2866. Have you recently read your joint report? I read some of it.
2867. Do you wish to add anything to it? No.
2868. Are the views you then expressed still held by you? Yes; of course that country has altered a good deal in the last 6 years.
2869. In what way? There is a little more settlement, and it seems to be going ahead. I think the views expressed then are the same as I hold to-day. I still think there is a great want of communication between the Great Northern line and the coast.
2870. Have you given any consideration to the proposal before the Committee to connect Inverell with Moree by rail? Yes.
2871. Do you think that is the best connection which can be made to give Inverell communication with the railway system? I do not think so. I still think the railway ought to go to Glen Innes.
2872. Will you state your reasons for thinking the connection should be made with Glen Innes in preference to Moree? I think the market for all that district is with the coast, and that a connection with Glen Innes is one link in it. If connection is made with Glen Innes, I have no doubt a connection will be made some day from Tenterfield to Casino, or from Guyra to South Grafton, and then the people of Inverell would get an outlet to the sea.
2873. Assuming that the object is to give Inverell connection with one of our railway systems—the northern or the north-western system—and that the coast railway is not at present under consideration, which do you think would be the better connection? Glen Innes.
2874. That is without regard to the cost? Yes; I think it would be more useful to Inverell.
2875. Why? I think the Inverell people will want to communicate with Queensland more or less. There is the traffic towards Queensland, and with Armidale in that direction.
2876. And you think the Glen Innes route would afford greater facilities than the Moree route? I think so. Of course the line being made from Narrabri to Moree is something in favour of the proposed line being constructed; but that was not proposed to be constructed when we made our joint report.

E. B. Price,
Esq.,
M. Inst. C.E.

29 Sept., 1896.

- E. B. Price,
Esq.,
M. Inst. C.E.
29 Sept., 1896.
2877. In view of the line having been constructed to Moree, are you disposed to modify the views you expressed with regard to the Glen Innes connection? No; I still think the connection with Glen Innes would be more useful to the Inverell people than the connection with Moree. It is a very roundabout way for people to travel from Inverell to Sydney. They turn a sharper angle than a right angle. I have no doubt, from the Railway Commissioners' point of view, it is a better line, and it has easy grades. They could carry heavy loads more cheaply. You would not have to go up the heavy grades which you would have on the Glen Innes line. I do not know whether the Railway Commissioners make any allowance for that in the rates they propose to strike.
2878. You are aware that the rate of carriage from the coast to Inverell, by steamer and team, is much lower than it is by rail? Yes; when we made inquiries we obtained evidence to that effect.
2879. So that, from a commercial point of view, neither the Moree nor the Glen Innes connection is likely to show earnings sufficient to pay interest on the cost of the railway and the cost of maintenance? I do not quite agree with that evidence. We went into the matter very fully.
2880. Tell me where you differ? If a line is made to Glen Innes I do not think the carriers will carry the whole way to Inverell. They might carry from Grafton to Glen Innes and put their goods on the railway. I do not see how it would pay them to carry them the other 45 miles by road.
2881. The evidence before us shows that the cost of carriage from Sydney to Grafton, and Grafton to Inverell, would be about £4 10s. a ton, against about £8 by rail? Those are the ordinary rates.
2882. Why do you think a connection between Glen Innes and Inverell will lead to a reduction of the cost by rail? I think the carriers would discharge goods there unless they were going beyond Inverell. If they were going a good distance beyond Inverell, it would not pay them to off-load at the railway. If they were bringing stores to a storekeeper at Inverell, it would be cheaper to land them at Glen Innes, and let them go on by rail.
2883. Do you think they could be carried for less by rail than by steamer and team? If the carrier brought them from Grafton to Glen Innes, and then put them on the railway, I think it would be cheaper than bringing them the whole way through by team, unless the carrier had again to take them off the railway waggon at Inverell, and bring them to a station 20 miles away.
2884. Have you considered the matter during the past six years? No.
2885. In point of fact, you are not prepared to give the Committee any information not contained in your and Mr. Scarr's joint report? No. I know we were satisfied, when we made inquiries, that if the railway were constructed to Glen Innes the Inverell farmers could send wheat to Sydney at a profit, but in that year wheat was at a high rate. We made out that they could send it to Sydney for under 6d. a bushel. Wheat was so high that year that it would have paid them to do so. The Railway Commissioners were then carrying it at 6d. a bushel.
2886. You are of opinion that the ordinary price of wheat would be insufficient to cover a charge of 6d.? I think it would be this year. It was 4s. 6d. a bushel then—exceptionally high. I think there was a failure in the Argentine wheat at that time. I think, if the line were made from Moree to Inverell, the people would be rather inclined to take the coach from Inverell to Glen Innes. They would certainly go that way if they wanted to get to Armidale.
2887. *Mr. Lee.*] You found Inverell to be the largest centre west of the Great Northern line? Yes.
2888. The largest producing centre and the largest population? Yes.
2889. Consequently, in connection with railway extension, it is a place which will have to receive some consideration? I certainly think it ought to be connected with the railway.
2890. That being the case, did it occur to you, when you were reporting, that as the Great Northern line was already constructed, and that it offered a close and ready connection, it would be the best means of facilitating the transit of produce to market? Yes; the question submitted to us was "What is the best connection from the Great Northern line to Inverell."
2891. And, amongst other routes, you had to inquire as to the Inverell to Glen Innes, the Inverell to Guyra, the Inverell to Uralla, and the Inverell to Kentucky routes? Yes.
2892. The Uralla and Kentucky routes you practically abandoned? Yes.
2893. You considered the question of connection with the Great Northern line? Yes.
2894. That was the dominating question with which you had to deal? Yes.
2895. And after taking distances into consideration, you came to the conclusion that the most suitable point in every way was Glen Innes? Yes; and I may mention that since then the line has been altered and improved. It was since our report was made that the line was re-surveyed and the grades reduced from 1 in 40 to 1 in 60. The cost of the line was also considerably reduced.
2896. And since then the cost of carrying grain on the line has also been considerably reduced? I do not think that it has been reduced since then. It was whilst we were there that the notices were put up at the railway station bringing it down to 6d. per bushel.
2897. You based your calculations on the new rates? Yes; about 17s. a ton, I think it was.
2898. Of course if you had had the question of the construction of a line from Moree to Inverell to consider at that time you would have made a report upon it? Yes; but it was not submitted to us at all.
2899. As far as the matter which was referred to you was concerned, you had no hesitation in coming to the conclusion that the point of connection ought to be between Inverell, and Glen Innes? For a long time we were undecided as to which was the better connection—Guyra or Glen Innes—and the amount of good land on the connection with Glen Innes turned the scale.

WEDNESDAY, 30 SEPTEMBER, 1896.

Present:—

THE HON. FREDERICK THOMAS HUMPHERY (VICE-CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

William Alexander Manning, Esq., Solicitor, Parramatta, sworn, and examined:—

2900. *Vice-Chairman.*] How long were you residing at Grafton? Six years.
2901. *Mr. Lee.*] How long is it since you left the Grafton district? Eight or nine months.
2902. Are you acquainted with the nature of the proposal before the Committee, which has for its object the extension of a line of railway from Moree to Inverell, with the object of carrying the traffic west of the Great Northern railway, and in lieu of any coastal connections? Yes.
2903. From what point of view do you desire to give evidence? I want to explain that from my knowledge of the country, and the people and its needs, the proposed line, and the way of carrying the traffic, will not be of material use to the people served.
2904. You mean the people at Inverell, and in that vicinity? Yes.
2905. What has led you to adopt that conclusion? My personal knowledge of the district, and the routes in which its traffic runs.
2906. Are you of opinion that the portion of the New England country known as Inverell, should have railway connection? Most certainly.
2907. And with what point? From the coast.
2908. You think its natural outlet for its produce, and for the receipt of supplies and return is by way of the northern coast? Certainly.
2909. Do you confine yourself to any particular port on the coast? I confine myself to the Clarence or Coff's Harbour—one or the other. I do not think it is very material which, although the shortest route is to Grafton, and therefore it will give the least haulage.
2910. Do you think any ports outside those two should be taken into consideration in connection with a coastal extension? I am quite sure that further north than that would not be nearly so serviceable. I am not so well acquainted with the possible connection at the Macleay, which, I believe, has been mooted. I have never been on that route; but I know the other route.
2911. You know the north-eastern railway from Murwillumbah to Lismore? Yes.
2912. Do you discard the port of the Richmond, or possibly Byron Bay? Entirely.
2913. Why? It is too far, I think. You have to drag your produce fifty or sixty miles further north, only to bring it back again down south. Your haulage is doubled by that means. Assuming that Sydney is the ultimate depôt for the produce to be hauled, the further you go north the less service you do to the interior.
2914. Have you been over the road from Grafton to Glen Innes? Yes, several times.
2915. Are you aware of its difficult nature for railway construction? No, I am not.
2916. Do you consider it to be a good route? I am quite sure of it.
2917. From what point of view? There is no difficulty whatever in it, except in ascending the mountains. All the rest is very simple work. There are a few miles of heavy work in it in the same way as there was between Penrith and Katoomba.
2918. But is there not a succession of mountains from the dip of the table-land to the coast until you get in the vicinity of the Clarence River? Nothing of the sort. It follows the river track mainly the whole of the way.
2919. Then the surveys must be wrong? I do not say the whole way, because it has to get into two or three different water-sheds, but they all trend the same way. The foot of the mountain—what was called the Big Hill, and now called Lord Hampden Hill, I believe—is 80 miles from Grafton, and I believe it is not more than 1,000 feet above the sea. Therefore, you have not much height to rise in 80 miles.
2920. Have you had an opportunity of examining the surveys? No.
2921. Supposing the surveys show that which is contrary to what you have stated? I know the country it passes through. I know it is impossible to say that up to that point there is any great difficulty. Up to this moment I have never heard that there was any great difficulty, except in regard to the mountains.
2922. Your opinion has been formed without any reference to detailed surveys? I am not a surveyor.
2923. But it has been surveyed more than once? Yes. It is not that part which has ever caused the surveyors any trouble. The part which has caused the surveyors trouble is from the 80-mile end up to the tableland.
2924. What is the settlement on the line? There is not very much.
2925. In fact, there is no land to settle upon? The land along the route is not particularly good.
2926. It may do very well for pastoral, but not for agricultural, purposes? Yes.
2927. Do you know Coff's Harbour? Yes.
2928. Are you personally acquainted with it? Yes.
2929. What are the possibilities of converting it into a harbour for ocean-going vessels? I can give you the generally received opinion, namely, that it is only a matter of money to make it one of the best ports on the coast.
2930. Anything can be done, from an engineering point of view, with plenty of money? But you have so many natural advantages there. You have two or three main islands right in the front to assist you in your work.
2931. But would it not require a very large expenditure of money to make it a convenient and safe harbour? I suppose so. I do not know much about the cost of breakwaters; but I do not think the cost of the breakwater works at Coff's Harbour would be materially greater than that in other parts.
2932. Where—in this Colony? Yes. For instance, the Wollongong works, which have been constructed for coal purposes, must be very nearly as costly. The breakwaters at the Clarence, I am sure, have cost more money than those at Coff's Harbour would require.
2933. Coff's Harbour, at the present time, is in a state of nature? Yes.

W. A.
Manning,
Esq.

30 Sept., 1896.

2934.

- W. A. Manning, Esq.
30 Sept., 1896.
2934. And if it were necessary to make a port there, a very large expenditure of money would be required inasmuch, as everything would have to be done? It is a partial port already. There is a fine jetty there, and shipping is continually carried on.
2935. For small steamers? Vessels up to 23 feet of water.
2936. Alongside the jetty? Yes; right alongside.
2937. Approachable in all weathers? In all weathers, except the severest.
2938. Compare that with the entrance to the Clarence at the present time; is not the Clarence a very much better port at present? Very much.
2939. Supposing it became a choice between Coff's Harbour and the Clarence, would not the weight be in favour of the Clarence? Certainly, for harbour purposes.
2940. Therefore, if it were necessary to extend the line to Coff's Harbour or to the Clarence, it would be better to take it to the Clarence? That is the direct route, and it is the route to the best port. The reason I put Coff's Harbour in the running is, because the line would run through such splendid country. If you go to Coff's Harbour all the arguments you would use against the Glen Innes-Grafton line are done away with, because you would have to go through such splendid country.
2941. That would be from Guyra *via* the Don Dorrigo Scrub? Yes, the Don Dorrigo and Orara Scrubs, which are of as fine land as can be found in the Colony.
2942. If a line were extended from Guyra to Coff's Harbour, then, so far as offering a convenient outlet for the produce of the Clarence to the table-land of New England is concerned, it would be of no value at all? Yes; because the Coff's Harbour country is part of the Clarence.
2943. But the bulk of the produce is raised on the Clarence River? Yes. You want to know a great deal about the way the surveys run to assist you in the matter. The only survey which has been considered to be really good and feasible comes off the table-land by a spur, which is half way between both places—about 30 miles from Grafton, and 25 miles from Coff's Harbour. That is the survey which has been accepted as the best so far known to pierce the Dorrigo, and to bring the produce down by that route through good country. If that be used, it comes to a point equi-distant from either port, and then diverges like a T piece. I explain that so that you cannot think that Grafton is out of the running with the Coff's Harbour line.
2944. But the more direct route to Coff's Harbour would be by way of Guyra? It comes to the same point.
2945. But it is shorter, and more direct? It is longer than the Grafton and Glen Innes line.
2946. It is longer to Grafton, but not longer to the point you speak of? It is 25 miles further as against 40 miles. Even so, it is shorter to that point to bring it to Grafton. I understand that the total length of the line through Guyra has been put down at about 140 or 150 miles, whereas the Grafton-Glen Innes line is 110 miles. If you add an extra 25 to your 110 miles, you still have a lesser length than 140 miles.
2947. Anyhow if you wanted to get to Coff's Harbour pure and simple from the nearest point on the Great Northern line, Guyra would be the nearest point? Yes.
2948. It only happens to be that the survey from Glen Innes to Grafton is the best known route in that direction. If it could be taken direct from Glen Innes to Grafton it would be very much shorter? Yes. The surveyed line from Glen Innes to Grafton is 110 miles. The surveyed line from Guyra to Coff's Harbour is about 150 miles. I know the line from Grafton to Glen Innes is the shortest line.
2949. Grafton *via* Newton-Boyd to Glen Innes is 102 miles? Yes.
2950. Guyra *via* Don Dorrigo Scrub to South Grafton is 145 miles? That is exactly the same distance to Coff's Harbour, because it touches a point of deviation half way between Grafton and Coff's Harbour.
2951. But the survey you are speaking of was not completed at the time Messrs. Scarr and Price's report was made in 1890? That was the survey upon which that report was made. The distance from Guyra to Grafton if reported as 145 miles is the same distance as from Guyra to Coff's Harbour. The line strikes a point of equal distance between both places, and there is no shorter way yet found to Coff's Harbour, because the country will not allow it.
2952. At that time the connection between the Grafton-Guyra line and Coff's Harbour had not been explored? Yes; it had, and so far they have not found anything better than the line Mr. Scarr reported upon.
2953. Have you been over the tract between Tenterfield and Casino? No.
2954. You have no doubt heard that there is a lot of excellent country between those two points? Yes.
2955. Have you ever heard of that country lying to the north of the surveyed line deviating, say at Sandilands, and going north from there to Tooloom, Acacia Creek and that country? Yes.
2956. Are you aware that there is an area of country there equal in every respect to the land on the Don Dorrigo, both in regard to its quality and its forest of timber? I should imagine that the extent is greater, but I believe it is grazing country.
2957. No, it is first-class land? It is first-class station country.
2958. I am speaking now not of the whole portion, but of the land which would be suitable for agriculture, and which is largely settled upon about Acacia Creek and Tooloom? That is near to the Queensland border.
2959. Lying between there and Casino? Tooloom is partly in Queensland.
2960. Although you speak so favourably of the Don Dorrigo and Coff's Harbour line, you do so because you happen to have a personal knowledge of it? Yes.
2961. At the same time you are prepared to admit there may be equally as good country at the other end? I should imagine so.
2962. You are aware that there has been large dray traffic between Grafton, Glen Innes, and Inverell for some years—in point of fact, ever since the line was opened to Glen Innes? Yes.
2963. And that the opening of the line to Glen Innes has never been able to secure the whole of the traffic to the north? Yes.
2964. They have always had a competitor in the teams from the coast? Yes; I have seen them myself.
2965. If the line were to start from Glen Innes and go round by Moree, and thence by Narrabri to Sydney, which would be the longest length of line in the Colony, do you think it would have the effect of securing the whole of the Inverell traffic? No.
2966. Why? Because the bullock teams would always compete with the line.
2967. In point of freight? Yes.
2968. Therefore you think that will not secure the traffic now being lost to the Great Northern line? Certainly not.
2969. If a connection were made the other way—from Inverell to Glen Innes—do you think that would have the effect of securing it for the railway? As far as Glen Innes it would.
- 2970.

W. A.
Manning,
Esq.

30 Sept., 1896.

2970. Do you think any extension from Inverell to Glen Innes would secure the Inverell trade to the railway? Certainly, for that length of line to Glen Innes.

2971. Do you wish to convey the idea that they would use the railway as far as Glen Innes, and then tranship to drays? Yes.

2972. Once on the railway trucks? Yes; they would take them off and send them down the mountains. They can get them from that point by railway and steamer cheaper than you can carry to Sydney by the line.

2973. Then there would be no justification in extending the line even from Inverell to Glen Innes, unless it were decided to continue it to the coast? That is a matter of policy. It is commonly held that the line must go down once it is joined with Glen Innes. What you want to know is whether or not that line as at present proposed, being an extension of the Narrabri line, will secure all the Inverell trade as against the trade which now goes to Grafton, and I say it will not.

2974. And on the other hand, if brought from Inverell to Glen Innes, you think it would part company with its trade at that point? A good deal of it. Plenty of people when once the goods are on the truck would rather let them remain there. At any rate, along that section of the line—the non-paying section—the common opinion is that if the trade were carried by a line to Glen Innes, the teams would be able to compete successfully with the line from Glen Innes to Sydney as they do now.

2975. You think that between Glen Innes and the coast the same amount of traffic will continue to go on as it goes on now? I do.

2976. Then it becomes an open question as to whether the Inverell traffic would be diverted at that point and go there, too? Undoubtedly, you would get the use of the line into Glen Innes; and I have no doubt you would get a large increase of trade to be carried down, but you would also lose some.

2977. I take it that your opinion is that a line should be constructed from Inverell to Grafton? I have not the slightest doubt about it. It is a national line, and it should be constructed.

2978. Supposing it is decided that a line shall not be taken from Glen Innes to the coast, but that it shall go from Guyra to Coff's Harbour, or from Tenterfield to Casino, would that affect your ideas of connection between Inverell and Glen Innes? No. The connection from Inverell to Glen Innes should be made no matter which of those lines is constructed, because it is the nearest possible route for the Inverell produce to get upon the line.

2979. Whether you go north, and start down the hill from Tenterfield to Casino, or whether you go straight ahead down the hill to Grafton, or whether you go south again and get off it at Guyra, and go to Coff's Harbour, it is equally the same thing—that is to say, you consider that is the most central part, and, therefore, will be the most desirable point to which to bring the western traffic to the Great Northern railway? Yes. In the interests of the western people themselves.

2980. Then in the event of coastal connection being made in the future from any other points north or south, or at Glen Innes, that line would equally serve you? Yes.

2981. Do you think the prospective traffic between the coast, from any point, and the table-lands of New England, will be sufficient to justify a coastal connection within the next twenty-five years? Yes; but whether you ever bring a line to the coast or not, you ought to connect the Inverell country with Glen Innes, as it is the nearest point of haulage.

2982. Your opinion, no matter what the coastal connection may be, is that the western traffic should be brought upon the Great Northern line at the point which you believe to be the most suitable, and that is Glen Innes? That is what I believe.

2983. And if it is attempted to take the traffic west of Glen Innes, by way of Moree to Sydney, it will be a mistake? I believe so.

2984. Is the district of Grafton and the Clarence, generally, increasing in importance? It is at any rate holding its own.

2985. But the products of that country have been materially increasing of late years by the establishment of butter factories? Yes; they are likely to bring about a very large trade.

2986. And the production of sugar is also very large on the rivers? Yes, it has been; but for the last two or three years there has been a great deal of frost to contend with.

2987. Have you considered the question of the connection by way of Inverell and Guyra? Yes, incidentally I have. I know a little of the country, having been through parts of it. I have been through the Tingha country, which will be partly pierced by the connection.

2988. Do you favour that connection? I would not like to pass an opinion upon it, because I do not know the nature of the country sufficiently. I have already said I think the Glen Innes connection better, because of the cheaper haulage and shorter distance.

2989. But as a matter of fact, it will be a longer distance to Sydney? A little longer.

2990. But under a system of extremely low rates for grain, a difference of 30 miles will not prove a bar? I should think not.

2991. Do you think it is a wise policy in the interests of the country to bring the western traffic to the Great Northern line with a view of making the Great Northern line pay better than it is paying, rather than constructing lines to take traffic away from it? The answer to that is that if the lines have been constructed in wrong places we must suffer for it. The lines should have gone to the coast.

2992. But we must deal with them as we find them. The Northern line was made for the express purpose of going to the metropolis of Queensland; it is now said that from Tamworth to the border it is a non-paying line;—having that in view, would it be in the interests of the country to construct a line which would still further take the traffic away from it, such, for instance, as the Inverell to Moree line? If the construction of that line will have a tendency to decrease the traffic on the existing line, you certainly ought to consider that as a bar to it, because your duty is to construct lines which will increase your present traffic on existing lines, and it is an undoubted fact that a line constructed to Glen Innes will do so.

2993. Once having brought the traffic of the west to the Great Northern line at that point, would it not have the opportunity of going south to its market, and going north, if necessary, to the Queensland market, or in the future going to the coast? Yes; that is the great merit of the Glen Innes-Inverell connection.

2994. But if that connection is not made between Glen Innes and Inverell, I presume that trade cannot be expected? I imagine so. I do not think, if you take it round by Moree, it will make any material difference to the Glen Innes trade.

2995. As things at present exist, the produce of the country is placed on drays and sent from Inverell, *via* Glen Innes, to the coast? Yes.

W. A.
Manning,
Esq.
30 Sept., 1896.

2996. Consequently the return loading is brought by the same route. Your argument is that, so long as there is a gap left between Glen Innes and Inverell, the same sort of thing will go on? Yes; notwithstanding the present railway construction.
2997. *Mr. Clarke.*] I understand you approve of a line from Glen Innes to the coast? I do.
2998. Is the land from Glen Innes, until you get within a short distance of Grafton, of a very inferior quality? It is ordinary grazing country—not very good.
2999. Is there much settlement there? Not a great deal.
3000. The distance from Glen Innes to Grafton is about 102 miles? One hundred and ten by the road, and 112 by the surveyed line.
3001. And from Guyra, through the Don Dorrigo country, to Coff's Harbour it is, I believe, about the same distance? It is more—over 140 miles.
3002. What is the distance from Coff's Harbour to Grafton? About 55 miles.
3003. I think you have stated that the land by that route is of much better quality than the land between Glen Innes and Grafton? Yes.
3004. Is there much settlement on that route? There is a good deal of settlement. It wants opening. It is dense scrub, and requires a great deal of labour before you can get a return from it.
3005. You refer to the Don Dorrigo Scrub, and the Orara Scrub? Yes.
3006. It is suited for growing anything? Anything in the world.
3007. Are the lower parts suitable for growing sugar? Yes; sugar is grown there now, also magnificent maize.
3008. Is it much of a dairying country? Yes; you could not beat it if you once got it cleared.
3009. Do you know anything of the country on the table-land between Moree and Inverell? A little of it. I have not been all the way to Moree, but I have been round Inverell a good deal.
3010. Are you aware that the Railway Commissioners do not intend to carry the line further than Inverell, and that there will be a break of 40 miles on which it is not intended to carry out the railway construction to Glen Innes;—do you think that will be advantageous to the country at large? No; I think it would be very improper to leave that country in its present state.
3011. You think that portion should be constructed even if that proposal is carried out? Quite apart from this inquiry it ought to be done.
3012. Do you know the rate of carriage by drays from Grafton to Inverell? No.
3013. It has been stated by some of the witnesses that it is £4 10s. a ton, and that the cost of carriage from Sydney by water is 15s. a ton? That may be. I know that the round freight by sea and team is cheaper to Glen Innes than it is by rail.
3014. Then, if a railway is constructed from Glen Innes to Grafton, would the carriage by drays be able to compete with the railway? No; they would never dream of competing with the railway.
3015. Would the carriage of goods be less than it would be by rail? No; the railway can carry much more cheaply than the team can on the mountain line.
3016. Some of those who have given evidence say to the contrary;—they say that even if the railway is constructed, it cannot compete with dray carriage? I have never heard that argument advanced against that route.
3017. You think, then, it would be desirable to have the line from the coast—either from Grafton to Glen Innes, or from Guyra to Coff's Harbour, and thence to Grafton, or from Tenterfield to Casino;—you think a line from one of these places is necessary? From one or other. I am very much opposed to the Tenterfield connection, because it will play so much into the hands of Queensland. It will practically annex our northern territory to Queensland. The whole of the country north of the Richmond would practically become Queensland territory.
3018. Is there much produce now going from the table-land to Queensland—I refer to hay, bran, wheat, chaff, and flour? I do not think so. Glen Innes does not grow anything; it is Inverell which grows it all.
3019. I suppose it grows something? Not very much; it is too cold, and the land is comparatively poor.
3020. But there would be an interchange of commodities from the coast to the table-land, and from the table-land to the coast? Materially so. There would also be a great increase of population, and an interchange of climate for health resort.
3021. I suppose you are aware that the harbour at the mouth of the Clarence River is much improved, compared with what it was a few years ago? Yes.
3022. What depth of water is there on the bar now? I think it is never less than about 18 feet. I have been over it several times, and it has always been that or more.
3023. I suppose that when the improvements are completed there will be a depth of about 20 feet? If they carry out the breakwaters, it is probable that they will deepen it still more.
3024. Coff's Harbour, I believe, is an open roadstead? Yes; with two small islands—natural breakwaters—in the front of it.
3025. If a breakwater were constructed from one island to the other, would it be a safe port? Yes.
3026. Would it be equal to the entrance to the Clarence? It would not have the size. Of course, nature's harbour is better than man's harbour.
3027. I suppose it would experience the effects of the easterly winds? Yes; of course in easterly weather no breakwater could keep the harbour smooth.
3028. *Mr. Roberts.*] How long were you resident at Grafton? Six years.
3029. Then you are familiar with the wishes of the people in that locality? Yes.
3030. Is there a strong desire on their part for connection with the table-land of New England? Very.
3031. And you think, in the interests of the public, such connection should be made? I think so.
3032. Have you been to Inverell? Yes.
3033. Are you well acquainted with the surrounding districts of Inverell? Pretty well.
3034. Do you happen to know that there is a large market for Inverell produce to the west of that town? There may be.
3035. Do you think an error would be committed if a line were constructed between Inverell and Moree? As a section of the existing line, I think it would be an error. As a section of the line from the coast to Inverell, I think it would be a very good thing.
3036. Believing there is a large market for Inverell produce to the west of Inverell, do you think it would be a mistake to connect those two points by railway? If I could believe that there is this large opening for the Inverell produce, I would say it would be a good thing; but I doubt there being that opening,

W. A.
Manning,
Esq.

30 Sept., 1896.

opening, because the two countries are of the same nature, and their produce is also of the same nature. I doubt that there is any material opening for the Inverell produce westward. There is a large opening for it where you can get an exchange; but there is no exchange. Moree is practically a portion of the Inverell district; it is not radically different country.

3037. Do you think the money which would be expended in the construction of the line could be better expended by connecting Inverell and Glen Innes? I do—very much better.

3038. In arriving at that decision, have you taken into consideration the expenditure of money which would be necessary to connect Inverell with Glen Innes, and compared it with the necessary expenditure to connect Moree and Inverell? I believe that the Moree line is much cheaper.

3039. In round figures the one which cost £3,000 per mile and the other—Inverell to Glen Innes—£6,000 per mile—having those figures before you, would you be inclined to modify your opinion? Certainly not. I do not care what the expenditure is, you ought to connect Inverell with Glen Innes, and not the further west. Inverell wants to come east—never to go west.

3040. Do you not think that the cost is a matter for serious consideration? I do not think so if one is materially better than the other.

3041. But where is the state to get its return from for the expenditure of its capital? It will get a better return out of the £6,000 per mile than out of the £3,000 per mile, if you have the money to lay out. If you are a capitalist possessing sufficient money to lay out £6,000, it is better to lay out that amount for its return, than to lay out £3,000 for its proportionately less return.

3042. Are you making that statement after having gone into figures, as to the probable traffic and the interest which would be derived? I have not gone into any figures on the subject. I base my views upon the knowledge that Inverell wants to come to the east; to go first of all north to Queensland, secondly to go south towards Newcastle and Sydney, and thirdly, whenever she can, to go east to the sea. Those are her three natural directions. She does not want to go westward at all, and she will not go westward to any material extent, so as to give you a profitable investment.

3043. Assuming for the moment that your suggestion were adopted, and a line were constructed from Inverell to Glen Innes, do you think that without further delay the line should be taken, say to Grafton? Yes, in the interests of the western country.

3044. Irrespective of what it may cost? Yes, within reason.

3045. *Mr. Black.*] Do I understand you to say the summit of the Big Hill is only 1,000 feet above sea-level? The bottom of it.

3046. Therefore there could not have been any great rise between Grafton and the bottom of the Big Hill? No.

3047. Is it not possible there might have been two or three mountains between? But there are not.

3048. How often have you travelled there? I have been up and down three times in my own buggy.

3049. Would you call the Buckarumbi Range a considerable ascent? Yes, if you had to go over it; but you have not to go over it.

3050. Does not the road take you over it? Yes, but the railway would not.

3051. Are you quite sure;—would it not have to pass over some portion of it? Yes, portion of it; but it would skirt it. It would more closely follow the trend of the waters. The existing survey never went near the Buckarumbi Range. It is only under the new suggestions that the Buckarumbi Range will be skirted.

3052. The foot of the Big Hill being 1,000 feet above sea level, and Glen Innes being 3,518 feet above sea level, and the distance between places from Glen Innes and the foot of the hill being $32\frac{1}{2}$ miles, that means between the foot of the hill and Glen Innes there is an ascent of 2,518 feet? Yes.

3053. Along a distance of $32\frac{1}{2}$ miles? Yes.

3054. Do you not think that that is a considerable item in the way of an ascent? It is nothing to your rise on the Blue Mountains. It is no heavier than what has been done.

3055. Do you think the circumstances in the two cases are precisely similar—that of the construction of a railway over the Blue Mountains, and the construction of a railway from Grafton to Glen Innes? The physical and geographical conditions are the same.

3056. But I refer to the circumstances which demand the construction of the railway? I think so. I think that the circumstances are precisely the same, because you have as good if not a better country at the back of the proposed route of railway than you have at the back of the Blue Mountains.

3057. The difference appears to me to be this—that it might be possible to get to the coast from the Great Northern railway by some easier route, but I do not know that it would be possible to get across the Blue Mountains without making a considerable deviation? I do not know whether there are any further routes. It is possible some other might be found; but if you know the average height of the New England Range, and if you have to go off it to the sea level, you know in the rough what you have to do.

3058. Have you stated that you imagine a line from Glen Innes to Grafton is likely to pay? A Grafton and Glen Innes section itself would never pay, but an Inverell section would be the making of it.

3059. Do you think there will be sufficient traffic between Inverell and Grafton to make it pay? I am sure of it.

3060. Within what time? To give them time to open the country, say, four or five years. It is only a sheep-walk now, and it is all capable of growing wheat from end to end—that is from Glen Innes outwards.

3061. I thought you said it was poor country? It is poor country as far as Glen Innes. Once you get beyond Glen Innes you begin to get upon the table-land and the western slopes, and they are rich enough to justify the railway. It is the Inverell end and the Clarence end which justify the construction of the connecting line, although the intermediate country is not up to the mark.

3062. You surely would not compare the country, say from Mulligan's to the top of the Big Hill, with the land say 5 miles west of the Big Hill into Glen Innes? No.

3063. Do you not think the land around Glen Innes towards the Big Hill is very superior to the other? It is.

3064. You do not think the construction of the railway is likely to promote settlement on the valley country between Mulligan's and the Big Hill? I do not think it will very much. Those who know, say there are some fine belts of country to the north, but I have not been on it, and I do not know.

3065. Do you think there is anything in the idea of some people that there are likely to be large metalliferous discoveries there? It seems to me that they are gradually getting on to good reefing work.

It

W. A.
Manning,
Esq.
30 Sept., 1896.

It is quite evident that Dalmorton must eventually become a mining centre—when they have had enough experience and capital upon it.

3066. *Vice-Chairman.*] Did I understand you, in answer to Mr. Black, to say that, in your opinion, the earnings between Glen Innes and Inverell would meet the interest upon the cost, and the maintenance of the line after four or five years right through between Grafton and Inverell? I think so.

3067. Have you any idea of the probable cost of the line between Grafton and Inverell? I think the estimates have been overrated. I suppose it would cost £1,500,000.

3068. £1,500,000 at 4 per cent. would, in round figures, mean £60,000 a year for interest alone;—would there be any probability of the earnings of the line paying interest as well as working expenses? I am quite sure that if you can populate the Inverell country sufficiently by means of that railway it will pay all that, and more.

3069. Assuming that a line between Grafton and Inverell is constructed, do you think the greater part of the traffic at present carried on the main northern line would then go by way of Grafton to Inverell? Yes.

3070. Commercially, the operation would be a very unfavourable one for the Railway Commissioners, because the line between Grafton and Glen Innes would deprive them of the earnings of the present main northern line? You say there are no earnings upon it.

3071. But they would be constructing a line practically in competition with the existing line? Yes.

3072. In what way would that increase the earnings of the railway? You would have all the earnings of the new line. You would have to set the earnings of the new line against the loss on the old line.

3073. Then you will have a large outlay of capital giving no return? Giving a return burdened by your present non-paying lines.

3074. But you see the commercial impracticability of spending £1,500,000 in competition with the existing railway system; therefore, unless you advocate the line from a national standpoint, it is not one which would probably be recommended? That is the only standpoint I recognise—the national standpoint. We cannot help the fact of the Railway Commissioners having bad lines to work. I say the national interest demands the other line.

3075. Is there anything you would like to add to your evidence? My desire is to emphasise the opinion that the construction of a line from Moree to Inverell will not be of material advantage to the country, nor to the Railway Commissioners, nor to the railway system of the Colony generally, because the Inverell produce will hesitate to go all that long way round when it can go by a very much shorter route—as it goes now. If you want to secure the Inverell trade to your existing railway system, you should connect it with Glen Innes; then its outlet would be either north to Queensland, south to Sydney, or eastward to the coast. That is the true interest of Inverell.

3076. *Mr. Wright.*] You know that the Great Northern railway runs from Werris Creek to the border? Yes.

3077. In the construction of the proposed line, you consider the Commissioners are advocating a scheme which will rob the northern line of a large portion of its traffic? I suppose it would. If any of the Inverell produce is to go by railway at all it will rob that line.

William McIntyre, Esq., Chief Electoral Officer, Chief Secretary's Department, sworn, and examined:—

W. McIntyre,
Esq.
30 Sept., 1896.

3078. *Mr. Clarke.*] Can you give the Committee any information as to the population along the proposed line of railway from Moree to Inverell? Yes; I have a map, showing the electorates in that portion of the country, and I have a return showing the population, in the divisions of those electorates.

3079. What, in round numbers, is the population about Moree, and a little distance from Moree which would benefit by the construction of the line? The whole of the people in the Moree division would benefit by it, and they number 3,350. I will give the population of the divisions adjacent to the proposed line—portions of three electorates, Moree, Inverell and Bingara. They include an area within about 30 to 35 miles on each side of the line. The total population within that area is 16,890. The electorate of Moree itself has a population of about 7,539, and the electorate of Inverell 8,124. I also give the population in the divisions of the electorates in the north-eastern portion of the Colony.

3080. What we should like to know is the population in the immediate vicinity of the proposed line, and who would be likely to benefit from it? I have taken the country in which I thought the people would benefit from the railway, and the population amounts to 16,890 in the divisions I have mentioned.

3081. *Mr. Wright.*] Do you include the Tingha division of Inverell? Yes.

3082. And the portion coming south? No.

3083. *Mr. Clarke.*] Can you give the number of people from Inverell to Glen Innes? I can give the numbers in the divisions along that line. The Inverell division itself has a population of 5,270—that is north of, and including Inverell; Elsmore division, 715; Glen Innes division, 3,420. The following is the statement:—

Electorate.	Division.	Population.	
		1895.	1896.
Moree	Moree	3,360	3,350
	Wariakda	1,800	1,955
Inverell	Graman	698	700
	Ashford	235	320
	Little Plain	646	646
	Inverell	5,260	5,270
Bingara	Elsmore	1,050	715
	Bingara	2,654	2,700
	Tingha	1,386	1,234
Total		17,179	16,890

Electorate.	Population.	
	1895.	1896.
Moree	7,141	7,539
Inverell	8,397	8,124
	15,538	15,663

W. McIntyre,
Esq.

3084. *Mr. Roberts.*] Are those figures taken from the last electoral roll which was compiled? No. They are taken from a return prepared by the police at the beginning of the year. They were asked to furnish the Chief Electoral Officer with the population in each electoral division.

3085. Then it is not confined to the electors, but it is the actual population? Yes, as near as the police can collect it.

3086. It is the latest information to hand? Yes; I think it was prepared in March last.

THURSDAY, 22 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	}	HENRY CLARKE, Esq.
The Hon. JAMES HOSKINS.		JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.		THOMAS HENRY HASSALL, Esq.
The Hon. WILLIAM JOSEPH TRUCKETT.		GEORGE BLACK, Esq.
The Hon. DANIEL O'CONNOR.		FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

George Alexander Cruickshank, Esq., M.P., sworn, and examined:—

G. A.
Cruickshank,
Esq., M.P.
22 Oct., 1896

3087. *Chairman.*] You represent the electorate of Inverell in the Legislative Assembly? Yes.

3088. Do you desire to make a statement, or shall we proceed in the ordinary way of examination? I should like to give my own evidence in my own way.

3089. The examination then will stand over till you have made such statement as you think necessary to prove your case? After repeated attempts to get a railway to Inverell, we have had several lines dealt with, and on two occasions had the proposal for a line from Glen Innes to Inverell submitted to this Committee. On each occasion it has been thrown out in the Legislative Council. Subsequently it was suggested to me that a more suitable line might be got by Moree. I then visited the district and made some inquiries, stating to the electors generally the information given to me as to the cost of the line and what the markets would be. On my return from England I found that a petition had been signed by 1,100 residents of Inverell, asking that the Moree to Inverell line should be submitted to the Works Committee. I wish to dwell steadily on this point, because many people have said that the majority of the district are against this line. I have taken this matter step by step. I have dealt pretty carefully with this petition, and I find it contains the names of the owners of nearly all the best agricultural land in the district, farmers, and the general public. I think it was presented to the Legislative Assembly during my absence in England; I should say about November, 1895. The next course I took when I came out was to look into the question of markets for the Inverell district. I took the population of the coast, of New England, of the western district, and of the southern district—that is, Newcastle, Maitland, and towards Sydney. I worked these out on a basis of carriage and communication. The next thing I did was to get from the Government Statistician a return of the three electorates of the table-land of New England—Armidale, Glen Innes, and Tenterfield—and the three electorates of the western portion of that part of the Colony—Moree, Narrabri, and Gunnedah—showing the population in each, what the consumption of grain would be, what the deficiency would be, where these districts would be supplied from, and what it would cost to supply them. The first district I took was Armidale. I find the area of the Armidale district is 897,400 acres; the population, 10,000 souls; and the distance to the boundary, $47\frac{1}{2}$ miles. The production of wheat—these returns are for 1894 and 1895, as the returns for 1896 are not complete—was 36,052 bushels; maize, 15,230 bushels; oats, 16,016 bushels. The distance from Tamworth is 77 miles. The consumption of wheat in that district is 64,300 bushels. The quantity grown in the district being 36,052 bushels, there is a deficiency of 28,248 bushels, to be annually imported into the electorate of Armidale. The consumption of potatoes is 933 tons, and the production 3,166 tons, leaving a surplus for export of 2,233 tons. I then took the electorate of Glen Innes. I wish here to be very emphatic, and point out that all my statistics are guaranteed by Mr. Ridley, the Acting Government Statistician. A lot of irresponsible figures have been given as to the required imports into the table-land of New England, which, if the Statistician's Department is to be relied upon, are not correct. The Glen Innes district has an area of 1,968,510 acres; the population is 6,680; and the distance to the boundary is 42 miles. The production of wheat is 28,476 bushels; of maize, 28,917 bushels; of oats, 26,432 bushels; and of potatoes, 2,157 tons. The consumption of wheat in the district is 41,750 bushels, leaving a deficiency to be imported into Glen Innes every year of 13,274 bushels. The consumption of potatoes is 608 tons, leaving a surplus of 1,549 tons for export. I then took Tenterfield, which has an area of 1,965,440 acres, and a population of 7,562. The distance to the boundary is 64 miles. The production of wheat is 34,195 bushels; of maize, 75,095 bushels; of potatoes, 912 tons; of oats, 1,896 bushels. The wheat consumption is 47,250 bushels, leaving a deficiency of 13,025 bushels. The Inverell electorate has an area of 2,309,840 acres; a population of 8,124; and the distance is 82 miles to the boundary. The production of wheat, 153,213 bushels; of maize, 106,812 bushels; of potatoes, 851 tons; of oats, 4,782 bushels. The wheat consumption is 50,750 bushels, leaving a surplus of wheat for export of 102,463 bushels. The consumption of potatoes is 739 tons, leaving a surplus of 112 tons for export. We can grow potatoes very largely about Inverell, but we have no market for them. It is too expensive to send them west. I now come to the Moree electorate, which has an area of 5,376,000 acres, and a population of 7,539. The distance to the boundary is 72 miles. The production of wheat is 7,782 bushels; of maize, 13,534 bushels; of potatoes, 94 tons; and of oats, nil. The consumption of wheat is 47,350 bushels, leaving a deficiency to be imported of 39,568 bushels. The potato deficiency is 586 tons. The Narrabri district has an area of 5,376,000 acres, and a population of 8,720; and the distance to the boundary is 72 miles. The production of wheat is 2,597 bushels; of maize, 12,820 bushels; of potatoes, 64 tons; and of oats, 18 bushels. The consumption of wheat is 54,500 bushels, leaving a deficiency of 52,003 bushels to be imported into Narrabri. I want to compare this western market with the table-land of New England, and to show that Gunnedah grows nearly sufficient for itself. The Gunnedah electorate has an area of 4,070,400 acres; a population of 7,500; and the distance to the boundary is 105 miles. The production of wheat is 43,389 bushels; of maize, 25,917 bushels; and of potatoes, 190 tons. The consumption of wheat is 46,850 bushels, leaving a deficiency 3,461 bushels. The consumption of potatoes is 679 tons, leaving a deficiency of 489 tons. I have put these three electorates in the western portion as the local markets in the west, and compared them with the local markets of the table-land. I take it that the country from Tamworth to Uralla is served from Tamworth. You could not serve it from Inverell at a distance of 110 miles, when the distance from Tamworth is only from 60 to 70 miles. I now wish to show exactly what the deficiency is in the table-land of New England as compared with the western portion.

portion. The basis taken by the Statistician was so many pounds of potatoes and so many bushels of wheat per man. I think it is 6 bushels of wheat for an individual. I have taken the town, the population, and the area of wheat and maize grown in all these districts. In three electorates in the Western Division—Moree, Narrabri, and Gunnedah—they import 1,800 tons of potatoes and 94,000 bushels of wheat. The districts of Armidale, Glen Innes, and Tenterfield have a deficiency in wheat of 54,675 bushels, and a surplus in potatoes of 4,006 tons. There would be no chance of Inverell sending these surplus potatoes to the New England district, and it could only send 54,000 bushels of wheat to supply the whole of that district, whereas to the west it has an opportunity of sending 1,800 tons of potatoes and 94,000 bushels of wheat.

3090. *Mr. Wright.*] Do you call Gunnedah to the west of Inverell; it is 100 miles to the south? Yes, but they have taken in further than that on the other side. I have merely put it in to take three electorates in the west. The average yield per acre from Inverell is 16 bushels. I then take the statistics that have been put in by the Glen Innes Committee, and I may say that I got these figures from Mr. Sinclair's evidence. He put in the coast population as 68,111.

3091. *Chairman.*] What are the boundaries? I will come to that in a moment. The difference in population between the district of New England and the Moree district is only 700.

3092. *Mr. Hoskins.*] Does that include Gunnedah? Yes. The coast population was given at 68,111. This included Casino, Ballina, Grafton, Kempsey, and the Bellinger. The population in the southern districts of Newcastle, Maitland, Singleton, Murrurundi, and Muswellbrook, as supplied by the Government Statistician's Department, is 100,974; for the Newcastle district, 54,006; Maitland district, 21,638; Singleton district, 10,675; Murrurundi and Muswellbrook districts, 13,260. That is the population which I say would be served with the surplus as against the population that would be served if the line went to the table-land. It is much easier to reach these 100,000 people than it is to reach any portion of the 68,000 who are down on the coast, unless by going to Newcastle and then coming back to Lismore and other places. The next point I took was the question as to how I was to get to these markets. I found out that by going to Glen Innes, in order to take the coast population, we would have to travel by team in every direction, and that would be costly. The rate for wheat sent from Inverell to Moree would be 8s. a ton, the rate from Inverell to Newcastle 12s. 10d. a ton, and only 13s. 6d. to Sydney. I was informed that probably the rates would be on much the same basis from Inverell as they are from Glen Innes. Greasy wool goes for the same price from Wallangara to Sydney as from Tamworth. The freight over the long distance of 414 miles would be 12s. 10d. to Newcastle; to Maitland and the other places in would be a little less. I think this only comes to 3½d. a bushel. In a wheat-growing district like Inverell we have only two points to consider—first, our local markets, and then our markets abroad. It matters not to us so long as we can get to the markets abroad which route we take. It is merely a question as to the cost of getting there. As far as Moree is concerned, if wheat can be landed there at the same price as at Newcastle, going by Glen Innes, it is immaterial which way we send our stuff. The only advantage is that in the Moree district, from a farming point of view, there is twice the consumption for our wheat that there is on the table-land of New England. It has been argued that we could not compete against the wheat-growing places between Inverell and Newcastle, but I find it would only cost us 2s. more a ton to catch Newcastle than it would cost the people about Tamworth. And the land about Tamworth being very valuable, they pay high rentals. Around Inverell land is of a nominal value, and wheat can be produced cheaper there than at Tamworth. The freight from Tamworth to Moree, a distance of 183 miles, would be 21s. a ton for wheat and flour as against 8s. a ton from Inverell to Moree.

3093. *Chairman.*] How much would it be from Tamworth to Narrabri? I am told in the office that the freight from Sydney to any inland town is pretty much double what it is the other way. It has been contended that the rates from Moree at the present being £6 a ton, if we added on the additional rate to Inverell we would have to pay so much more for goods that could be sent by Grafton. Now I find that wool comes from Bourke, 504 miles, to Sydney at £4 per ton, and the distance between the two lines would be only 10 miles, so what could be done by the Commissioners on one line could be done on another.

3094. *Mr. Wright.*] The freight from Narrabri is £4 5s. per ton;—Bourke is a competing station, therefore the rates are very low? I am informed that wool comes from Wallangarra at the same price that it does from Tamworth. I have always been a great advocate of the Glen Innes line, and am perfectly familiar with all the figures, as I have helped to compile them in every instance. Traffic will go to Glen Innes if the line goes from Glen Innes to Inverell, and will probably come over the ranges south. If, on the other hand, the line is made from Inverell to Moree, the traffic will go by the line to Moree. I have here the stock returns showing the position of all the stock on the pastoral lands which this railway line would go through, and I think you will see from the position where the wool is grown where the traffic will go. The Inverell district is not a great sheep place; there are only 586,000 sheep in the whole lot, and around Inverell there are only 240,000 sheep. Between Inverell and Glen Innes there are only four stations—Inverell, Newstead, Waterloo, and King's Plains. If the freights are £4 a ton, as from Bourke, all that wool must go on the train by Moree. Now this line passes through the Warialda district, which alone, according to the return of the Chief Inspector of Stock, contains 1,500,000 sheep. It has been contended by the other side that the wool of 400,000 sheep would not go by this line. I will take off, not only that 400,000, but I will take half a million sheep, and say that not a bale of wool from these sheep will go. We are prepared to take only what stock will come to the line. I tried to compare my figures with those of Mr. Harper, but I do not know how he has arrived at his figures. At some places I am over him, and at some places under. I have taken four or five ways of trying to prove what the population is, and the traffic of any particular district. I have done it at so much per head; I have got the returns of the traffic to the railway stations from the Government offices; I have my own knowledge of the stations I am interested in, and what loading we have; and having worked these all out together, I find that they pretty well all come to the same thing. I take, in the first place, this surplus of 100,000 bushels of wheat, and I say there is no doubt whatever that this would all go to the markets of the west. We would send, in flour and wheat alone, over 2,500 tons from the start.

3095. *Mr. O'Connor.*] Where would this 2,500 tons be sent to? To Moree; and we would immediately send 50,000 bushels of grain. One of my farmers told me that he had a thousand bushels of grain, and he is sending every bushel of it to Moree. We are paying £2 10s. a ton to send it there. The hides and tallow of the district and all the miscellaneous traffic in and out one way and another I am putting down at a thousand tons. The wool of 240,000 sheep, at fifteen bales to the thousand, I put down at £525.

The

G. A.
Cruickshank,
Esq., M.P.
22 Oct., 1896.

The passenger traffic from Inverell to Moree, and from Moree to Inverell, I put down at 6,000 persons or £3,750. The live stock I put down at £450. That is a very small allowance for live stock. I think I could send that number away myself. The Bingara district is only 25 miles from Warialda, and has a population of 2,700. This, I understand, Mr. Harper has left out altogether. I have put down the conveyance of mails at £1,200; that being the Railway Commissioners' own estimate. Those figures were given to me by a clerk of the Postal Department. The country between Warialda and Bingara is an agricultural district; but I am only putting down that they would send 700 tons of flour a year, which would come to £245. There are 1,505,540 sheep in the Warialda district, but I am only allowing that the wool of one million sheep would come to the line—that is, we have taken off half a million sheep in the district through which the line would pass. That comes to 3,000 tons, or £2,250 at 15s. a ton. These rates that I am quoting I got from Mr. Harper's evidence this morning. Hides and tallow I put down at 300 tons, £150; 3,000 passengers at 5s., £750; 3,000 trucks at 25s., £3,750. So as to be within the mean in everything, I have halved the quantity of goods that comes to Inverell. These returns were made up from store to store when we were dealing with the Glen Innes line. I have allowed a very heavy discount. Then I have taken the trucking goods to comes into the Warialda district from Moree—that would be return loading. There is a population in the Warialda division of the electorate of 1955, and in the Bingara division of 2,700. I am putting down less than half the returns that are given to me by the different railway stations that I have collected evidence from. The total of the estimated value of the traffic between Inverell and Moree is £19,415. I have not tried to claim in any way traffic which I think would diverge elsewhere, and if it can be shown that the figures can be cut down three or four thousand pounds, it will not hurt our case.

3096. *Mr. Roberts.*] According to your figures, the line would pay? It would pay from the start, and leave a surplus. A good deal has been said to the effect that there is no settlement in this district, and no likelihood of settlement. I have a return showing that within about 30 miles on one side of this line, and 70 on the other, going north from Warialda to the Queensland border—a return which has been prepared by the Electoral Department—there are 2,700,000 acres of Crown lands. It has been given in evidence that it takes 20 square miles of this land to keep a man. I have gone to the trouble of getting a full return of every station and the number of sheep running on these Crown lands, and I find that there are no less than 2,000,000 sheep. That area includes freehold land, but we know that nothing like one half is alienated. This country is carrying on the basis of 2½ acres to a sheep. On a basis of 2,000 sheep to a small grazier—and any man can live on 2,000 sheep—this country will settle a population of 500 applicants—that is, representative people. The average number of a family being about four and a half persons, this would mean a couple of thousand persons. Then there is the general population which always increases. So it is no use saying that this country will not settle any one or will not be populated. Every year in the Western Division we get as many as from thirty to forty applications for each block, so it is not fair to say the land will not be taken up. I would say that the most prosperous body of selectors are in the Central Division round about Moree. Further than that, beyond Moree, about a million and a half acres of land are being thrown open which I have not included in this return. There is a very large area of Crown lands in this Moree district from Narrabri across to Warialda and right down to the Queensland border. That is where we can settle the people.

3097. *Mr. Black.*] How many acres do you think? In a great many instances the settlers are living on 2,560 acres, and doing very well; and they are running sheep on the land.

3098. How many acres are available? To be served by this line alone there are about four million acres. The Committee have a return, I believe, showing within 15 miles of each side of the line half a million acres of land, of which, speaking from memory, some 250,000 acres are reserved lands. These reserves were made in the early days, when people were afraid the land was to be selected, and they applied for a lot of their best land as watering reserves. These reserves are some of the richest lands in the Central Division. Again, with regard to the rates, the year I went to England I sold all the wheat I was interested in at 2s. a bushel. I asked for a return to show the price wheat was selling for in Sydney and Newcastle. The lowest return for wheat sold in Sydney was in the month of January, when it brought 2s. 4d. a bushel; in February, 2s. 7d.; in March, 2s. 7d.; in April, 2s. 7d.; in May, 2s. 10d.; in June, 3s. 6d.; in July, 3s. 9d.; in August, 3s. 9d.; in September, 3s. 7½d.; in October, 3s. 7d.; in November, 4s. 6d.; and in December, 4s. 3d. According to railway returns given to me, we can reach these markets at a cost of 3½d. to 4d. a bushel. If we have been selling wheat at 2s. in Inverell, that could come to a market here, varying from 2s. 6d. to 4s. a bushel, and if we have land that will grow from 15 to 20 bushels to the acre, I think we can fairly say that we could compete with any market in any part of the Colony. And we should not be forced to sell in a market that requires only 50,000 bushels, the products of a district yielding 153,000 bushels. And the Commissioners, I understand, will undertake to carry by Moree, over the low grade, as cheaply as they will over the mountain, by Glen Innes. For myself, I am fully alive to the fact that before we can get the coast population, we can much more easily reach the southern population. It is immaterial to me how we reach it, but that is the market we want to get. We do not consider there is an adequate market at Inverell for all our produce. After providing for local consumption, we would send the rest elsewhere, either by one line or the other, whichever line it might be; but a bird in the hand is worth two in the bush. I am strongly of opinion that the present settlement of the Narrabri and Moree district would prove a market for a great deal of the surplus produce of the Inverell district; that ordinary future settlement on the Crown lands affected by this railway must add materially to the population; the fact that the Sectional Committee have expressed an opinion that agricultural pursuits cannot be followed in these parts to any extent, is the very reason why Inverell wishes to be connected (and under the existing railway rates, she could not be cut out by any competition); that any traffic to Inverell at the present time would be the traffic of this line, the carrying rates being equal; that the evidence given by the District Surveyor, at Moree, shows the value of the land between Inverell and Moree (he valued it from £1 to £1 10s. an acre); that any insufficiency of market found at Moree and its surrounding districts would tend to Newcastle, Maitland, and probably to Sydney; and that the present longest rates for agricultural products will enable Inverell people to compete in those markets against the agricultural districts lying between all foreign products imported and the district between Inverell and the metropolitan area. I have some returns here of the different runs, showing the number of sheep on all the runs. Unfortunately I think some of them are lost.

3099. Do you think the return you are referring to now is of importance? I do not think so, because I can

can come at the figures in two or three ways. I have the numbers as given by the Chief Inspector of Stock; and I have the information confirmed in a book issued from the Government Statistician's Office. In fact, the figures are affirmed over and over again; so I am inclined to think the Committee will not doubt my word as to the numbers.

G. A.
Cruickshank
Esq., M.P.

22 Oct., 1896

3100. Would the return be simply a reiteration or proof of what you have stated? It would only prove that the returns in the Government Statistician's office are correct, and that the Inspector of Stock's returns are correct.

3101. There are one or two points you might make reference to in order to complete your case. In taking into consideration the present local market to the east, do you consider it is worth while to contemplate any possible trade with Queensland? I dealt with this matter very fully when I was working for the Glen Innes line. At that time there was no duty on the border. While the duties remain I do not think we could avail ourselves of the trade.

3102. What is the duty? I do not know what it is. I think it is about 6d. per bushel. As far as the Downs are concerned the seasons waver very much; the district around Allora is very good. I went into this matter, and the conclusion I came to was that a great deal of the wheat and flour imported into Queensland goes by Brisbane, and does not cross the border. As the distance from us to Brisbane would be 353 miles, and as there would be heavy railway freight and duty, I do not think we could compete in Brisbane with sea-borne wheat, although we might send a little in dry seasons.

3103. Is it your opinion that the competitor for the markets you have mentioned is Tamworth? It would be a very weak competitor; it would not affect us at all. I am prepared to admit that Tamworth is a large producing district. If they put the Company's land under wheat they could produce an immense quantity.

3104. What is the through rate from Inverell to the Clarence? I have always paid £3 10s. by team.

3105. And from the Clarence to Sydney? I do not know what wool is now. I used to pay £1 10s. right through.

3106. Right through to Sydney? Yes; the sea carriage is about 15s.

3107. By team to the Clarence, and from the Clarence to Sydney, you have about a £4 10s. rate? Yes.

3108. By analogy, compared with Bourke, you have a £4 rate the other way? Yes.

3109. Would it be a fair thing to take the wool rates as significant of all rates? I take it that the Commissioners are business men, and where they have no competition they put on higher rates.

3110. I was not asking that question. We have, for instance, a rate of £1 10s. for wool from Inverell through to Sydney. The question is, comparing that with a £4 rate by Moree by the proposed line, is that a reasonable rate for all goods or only for wool? I am only dealing with wool in this case.

3111. Would it be reasonable to take that as a fair comparison for all goods? I could not tell you. I do not want to send wool to Sydney, I want to send it to Newcastle.

3112. One class of product can reach Inverell for £4 10s. per ton by sea, or £4 per ton by land by the proposed line. A great number of other things go to Inverell besides wool; is it reasonable to suppose that would be a fair comparison for the other products? That is a question I do not think I am competent to answer.

3113. For instance, a teamster takes wool down; you add the teamster's rate to the sea rate, but a teamster carries not only wool but sugar, groceries, and other things; would it be a fair thing to say £4 per ton for these? I do not know; the goods that come from Grafton are principally wire, sugar, and salt.

3114. What is the rate? £3 10s., I believe.

3115. *Mr. Wright.*] These goods are carried cheaper by rail? Yes.

3116. *Mr. Hoskins.*] How long have you resided in the Inverell district? I went there on the 16 October, 1878.

3117. How long have you represented the Inverell district? I was returned on the 25th January, 1899.

3118. You have continued to represent the district from that time till now? Yes.

3119. Are you acquainted with the persons who signed the memorial to which reference was made to-day? Most of them.

3120. What are they, freeholders, farmers, or residents of the town of Inverell? Freeholders, farmers, men representing from 25,000 acres of land down to men holding an acre. Some are men with the largest area of land under cultivation in the district.

3121. They all express themselves by this memorial in favour of having a railway constructed from Inverell to Moree? I think you will find the wording of the petition is, that the railway would serve the district. I was away when it was got up.

3122. They express approval of the line, and expatiate upon the reasons why the line should be constructed? Yes.

3123. There is a difference of opinion among the residents of Inverell in respect of the construction of a railway to that town, some favouring connection with Glen Innes, and some with Warialda and Moree? Yes.

3124. You do not reside entirely at Inverell? About 4 miles out of the town.

3125. You mix a great deal with the residents of the country? Yes.

3126. Can you, from your knowledge of the opinions of the persons who produce wealth from the land by cultivation, or sheep-farming, or cattle raising, tell us whether the preponderating opinion is in favour of a railway from Inverell to Moree, or from Inverell to Glen Innes? I think the people have been so long wanting a railway that they would take it from anywhere. I think the preponderating opinion is in favour of a line by Moree.

3127. Do you speak from your own knowledge? Yes; when I addressed the electors I announced my intention of favouring a railway to Moree, and I was returned.

3128. No dissent was expressed to the view that the line to Moree would be desirable; your advocacy of that line was not considered a disadvantage in your candidature? No.

3129. Judging from conversations you have had with people on the subject, is it your opinion that the majority of the people in the district are in favour of the Moree to Inverell line in preference to a line from Inverell to Glen Innes? If they were polled to-day they would be in favour of Moree.

3130. Can you tell the Committee why they favour the Moree line? I think greatly because we have been fighting for the other line twenty years, and are very tired of it.

3131. Have you ever heard the residents say they have found from experience that there is a better market for the products of the soil to the westward, and that they can get higher prices for their produce from the north-west than if they sent them to Glen Innes? The best market for some time past has decidedly been in the west.

G. A.
Cruickshank,
Esq., M.P.
22 Oct., 1896.

3132. Judging from the statistics you have read as to the deficient quantity produced in Glen Innes, Armidale, and Tenterfield districts, and the large quantity required by the residents of Warialda, Moree, and the north-west districts, do you consider that for the surplus wheat grown in the Inverell district there would be a much better market, or as good a market to the north-west, than on the table-land of New England? It is exactly 100 per cent. in favour of Moree and Narrabri.

3133. Have you ever been to Moree? Yes.

3134. Although there is scarcely any agriculture carried on around Moree, yet I suppose Moree is the centre of a large district in the north-west of this Colony? Yes.

3135. If a line were made from Inverell to Moree, do you believe it would not only meet the requirements of the Moree district for agricultural produce, but would also serve the residents in a number of other townships bordering on Queensland? Yes.

3136. Can you tell me the townships that would be so served? Collarendabri, Mungindi, Yetman, Walgett; we serve Yetman at the present time.

3137. Will not Walgett be supplied from Newcastle as cheaply? No, because the rates from Newcastle to Moree would be just double the rates from Moree to Newcastle, and they would pay more than double rates from Inverell to Moree, so we would really start from Moree at an advantage of about 10s. per ton over any stuff sent from Newcastle or from the sea-coast. The rate from Inverell to Newcastle would be 12s. 10d. per ton, and from Inverell to Moree 8s. per ton. The rate is higher to go into the country than from the country into the town.

3138. Some years ago you gave evidence before the Public Works Committee in favour of a line from Glen Innes to Inverell? That is quite correct.

3139. Was it not alleged by you and other witnesses in favour of that proposed line, that you wished to get a better means of reaching the sea, or the navigable waters of the Clarence River, and that you also wished to have a railway constructed from Glen Innes to Grafton? Quite right.

3140. Do you not think the reason why the people, whether at Glen Innes or Inverell, are in favour of the construction of a line from Inverell to Glen Innes, as against a line to Moree, is that they are mainly influenced in their views by the desire to have a railway to the coast? You will find in the evidence of three or four of the principal witnesses, that their object was to get to the coast.

3141. But if a line were made from Glen Innes to the Clarence River, although it would cost an enormous sum to make, it would tend to divert traffic from the other line? That is correct.

3142. Do you not think that wool from the Queensland border would be brought over a railway running from Moree to the coast, and then to Sydney and Newcastle? They have £2 10s. export duty to pay on the wool going out of Queensland. If it were not for that we would get, in addition to the ordinary traffic, a great deal of Queensland wool.

3143. Evidence has been given before the Committee by gentlemen who are managers of stations on the Queensland border, and have stations in this Colony, that in spite of that duty they bring their sheep over to this Colony, have them shorn, and take them back again;—have you ever heard of that? It is probably done, but I never heard of it.

3144. I gather that, although you expressed a desire some years ago to have a railway from Glen Innes to Inverell, you would still prefer, in the interests of the producers of the Inverell district, the construction of this proposed line from Inverell to Moree? Personally I am a Glen Innes man, but we want to get these markets, and I think it is immaterial which of them we get.

3145. But I suppose you do not anticipate that for some years to come the Government will make two railways;—therefore, which line do you prefer, the line from Inverell to Moree or from Inverell to Glen Innes? The Moree line is the better for the farming interest at present.

3146. *Mr. Trickett.*] I suppose you are free to admit that the Committee are put in somewhat of a difficulty owing to the tergiversation of the people of Inverell in this matter? No; I think it is the Legislative Council which has put them and myself in a fix by throwing the line out.

3147. You have referred to a petition with regard to the Moree line;—I suppose you know Mr. Grainger, of Inverell? Yes.

3148. He is, I suppose, a pretty representative man? Yes.

3149-50. What do you think of this evidence of his:—

Ninety-five out of 100 of the farmers and landowners in the Inverell district were in favour of the Glen Innes route.

What do you think of that? Will you tell me what you think of finding his name on that petition.

3151. Then there was another statement that Mr. Stout was responsible for;—he said that trade with Glen Innes was increasing every day? I think there is a good deal of trade done with Glen Innes.

3152. And a very strong feature they put forward to the two Committees that have been to Glen Innes and Inverell previously was that, notwithstanding the 4d. a bushel duty on wheat sent to Queensland, the Colony of Queensland, having a deficiency in supply to the extent of 2,000,000 bushels per year, the acknowledged wheat-growing centre of Inverell would find a better market there than in the district you have mentioned? I think you will find there was no duty on at that time.

3153. Oh, yes; because Mr. Sinclair, whom I think you will recognise as a leading man in Inverell, was asked the following question: "Would you be able to compete successfully, not only against sea-borne wheat or flour which might reach Brisbane, but also with the wheat produced in the southern and western parts of Queensland, notwithstanding the duty of 4d. per bushel?" And his reply was, "Yes, I presume that it will apply all round." Is that state of things altered now;—can you expect to look to Queensland for a market for your wheat? That greatly depends upon what Queensland produces. If she has a bad season, she will have to import whatever duty she pays.

3154. But you recognise it is a very doubtful supply? Oh, yes; in the ordinary course of things the duty will be a great drawback to us.

3155. I understand that your evidence chiefly is that this line would really be a great source of revenue to the railway authorities, and that the Inverell people would sooner have it than wait for the prospects of another? That is it exactly.

3156. *Mr. Clarke.*] You stated that you are in favour of the proposed line for various reasons? Yes.

3157. I understand that you were formerly in favour of the line from Inverell to Glen Innes? Yes.

3158. Can you give any reasons why you have changed your opinion? Because I could not get the other.

3159. It merely means that you want a railway, wherever you can get it from? Quite right.

3160. You are in favour of the line from Moree to Inverell? I am quite prepared to take the Moree line.

3161.

G. A.
Cruickshank,
Esq., M.P.
22 Oct., 1896.

3161. Is the country about Moree and the north-west fitted for agricultural purposes? No.
3162. Is it a grazing country altogether? A very good grazing country.
3163. I suppose the principal drawback to its being an agricultural country is the uncertain rainfall? Well, they get a fair rainfall; but the quality of the land varies. Fifteen miles to the east of Warialda, I suppose, you can grow anything; 10 miles from Warialda you cannot grow anything. When you get into the clayey and sandy country you cannot grow wheat well.
3164. Do you think it possible that in the future the country around Moree will be largely populated? I think so. I think population will increase there faster than in any part of the country.
3165. But it was stated in evidence that it would take 2,500 acres to support a family in that country? More than that in most cases. I am taking it at about 2,000 sheep to a family; a lot of river flats will carry at least 2,000 sheep to that area.
3166. Considering it would take such a number of acres to support a family in grazing sheep, how is it possible that there will be a large population in that district? Because you have a very large area. I suppose in the Moree district there are 5,000,000 acres of land, in Warialda the same, and in Narrabri probably the same.
3167. Does Inverell, at the present time, supply Moree and the north-western country with flour, chaff, bran, and other articles of fodder? To a great extent; and you must understand there is a rate of £2 per ton for carriage.
3168. Do you think that in the event of the railway being constructed cultivation would increase around Inverell and Warialda, and that there would be a much larger area put under crop? A very much larger area.
3169. With reference to the rates, is it proposed by the Government to put on differential rates? Mr. Harper said so in his evidence.
3170. Are you aware that this line would leave an annual loss of £2,800? I am sure that it would do nothing of the kind.
3171. That is the evidence we have before us of Mr. Harper and other officials? Mr. Harper showed £7,000 a year loss on the Glen Innes line.
3172. But I am asking about the Inverell line? But if you take his evidence in the one case you must take it in the other.
3173. You think by the increased cultivation and the increased trade that that supposed annual loss would be wiped out in a few years' time? I will not admit any annual loss at all.
3174. You must surely take the evidence of the Commissioners, and they anticipate an annual loss? But Mr. Harper tells you that he left out Bingara, with a population of 2,700, right alongside the line. He took no credit for any population east of Inverell, which we have done.
3175. With reference to finding a market for your surplus, if the time should come when there would be a surplus, do you think it possible to compete with wheat grown in Riverina and the other parts of the Colony on the borders of Victoria? I think so.
3176. They, of course, would have the same differential rates as you are likely to have on the proposed line? Yes.
3177. The trade with Queensland you do not anticipate would pay much at the present time? Not with the duties on.
3178. *Mr. Roberts.*] Is it not a fact that within 20 miles west of Inverell there is a very large area of agricultural land? Yes, some of the best wheat land in the Colony.
3179. Capable of growing I might say anything? Yes.
3180. But more particularly famous and suitable for the production of wheat? Yes.
3181. Then, towards Warialda it is somewhat patchy? Once you get out to the Big Plain I do not think it is so good. Around Bingara some large areas are being put under cultivation. I hear they are doing some farming there; it is a nice piece of country.
3182. From Warialda to Moree may be described as good pastoral country? Yes.
3183. Is it not a fact that Moree may be regarded as a purely pastoral district? Yes.
3184. And the same class of country extends westward for over hundreds of miles? Yes.
3185. But owing to the uncertainty of the rainfall agriculture had very rarely been experimented upon? Well, I do not think it is agricultural land. My experience is that you cannot make land which is not agricultural grow wheat. If you get a good year the wheat runs too much into blade, it does not run well into ear.
3186. Is it not fair to assume that Moree and the surrounding district would be a large market for a good quantity of Inverell produce, if railway communication existed between Inverell and Moree? I have no doubt whatever we would control the whole market.
3187. Is not the carriage between Inverell and Moree £2 per ton at the present time? Yes.
3188. And if the railway should be constructed the freight I understand would be 8s.? Yes.
3189. And the fact of its being £2 per ton at the present time would probably account for the limited quantity of Inverell produce being sent there? It is too costly to send it. I was told the other day that out Mungindi way they are paying 9s. per bushel for corn; at Inverell it is 1s. 6d. or 1s. 3d.
3190. Is the land about Inverell suitable for the production of potatoes? Very suitable indeed.
3191. Would it be as suitable as Glen Innes? No. We grow very fine potatoes. The district all around Guyra and Glen Innes has the reputation of being a great potato country.
3192. Is that owing to the cooler temperature of the table-land? I do not know what it is. They say they get harder potatoes there. I have seen wonderful yields at Inverell.
3193. Still, although they may not be equal in quality I suppose they would be a good marketable vegetable? I have known splendid potatoes in the Inverell market all the year round grown in Inverell.
3194. It would not pay to send them by team? Hardly; the freight is very expensive, £2 per ton.
3195. But if railway communication existed probably there would be a large market? Yes.
3196. How far south from Moree might you look for a market for potatoes? I think some of our potatoes would find their way to Gunnedah, but not much further.
3197. Certainly to Narrabri? Certainly to Narrabri.
3198. Are any potatoes grown at Narrabri? Narrabri grows 64 tons, but it has a deficiency of 730 tons every year.
3199. How many tons of potatoes were produced at Inverell according to the last return in your possession? There was only a surplus of 112 tons, but we do not go in for them, as there is no place where we can sell them. I have seen them so plentiful that anybody could have them for the digging of them.

FRIDAY, 23 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

George Alexander Cruickshank, Esq., M.P., sworn, and further examined:—

G. A.
Cruickshank,
Esq., M.P.
23 Oct., 1896.

3200. *Mr. Roberts.*] I think you said yesterday that a market for potatoes would be found west from Inverell as far as Gunnedah? Yes.

3201. Would potatoes be sent west of Moree, or would the trade be confined only to the railway line? I should think it would go further west and north.

3202. The market for potatoes would embrace an area somewhat similar to that for wheat? Yes.

3203. Can you say whether Moree and the surrounding districts are able to absorb all the surplus wheat in the Inverell district? The importations of wheat to Narrabri and Moree are 94,000 bushels, and the deficiency at Moree is 39,000 bushels.

3204. What is the annual production of wheat at Inverell? Last year the return was very small as it was a year of drought.

3205. What is the average production? The surplus of wheat for the year 1894-5 was 103,000 bushels.

3206. That would leave about 50,000 bushels for local consumption? Yes.

3207. Roughly speaking, Moree and surrounding districts would absorb the surplus? Moree and Narrabri at the present time could take the surplus of Inverell wheat.

3208. If this railway is constructed would a large area of land in the Inverell district be put under wheat? I have no hesitation in saying that it would be almost unlimited. My experience of farmers in a case of this kind is, that a marked increase takes place in the production and a marked demand for farms.

3209. Would there be any large quantities of stock trucked by Warialda? A large number.

3210. Can you supply any figures on that subject? I have put down live stock from Warialda to Moree 3,000 trucks at 25s.

3211. There would be a large quantity of wool sent from Warialda? Yes. In the Warialda district there are 1,500,000 sheep, and of that number I have taken only 1,000,000.

3212. *Mr. Wright.*] What country is represented by the district called Warialda? The sheep district commences at Little Plain, which is close to Inverell and goes right down to the Queensland border.

3213. How far, east and west, does this area run? The district extends for 20 miles to the east of Inverell; and about 30 miles to the south of Inverell; and from the railway line down to the Queensland border is about 60 miles. Along the border we start from below Bondshorc, and go down to Run 616. I have a return of every run in the sheep district, and the number of sheep on them, according to the owners' returns.

3214. It could not go very far west, because it would be nearer than to go to Moree. No. Evidence was given in Inverell, by Mr. Sinclair, that he thought 400,000 of these sheep would not go to the Warialda line.

3215. Where did he maintain that they would go? I do not know. I presume he meant that they would go to Moree. I take off 550,000.

3216. Some of them would go, as now, to Deepwater, and along there? I have left out the returns for down there. The country down below Ashford is in the Tenterfield stock district. I have left all that stock out to go to Deepwater.

3217. Is not some of that country included in the Warialda district? No.

3218. *Mr. Roberts.*] There would not be a large return traffic from Moree to Inverell? I think there would be a great deal of return traffic.

3219. Would it not be confined to general merchandise from Sydney, assuming that the rates were satisfactory? Yes. We take a great deal of salt and wire, and then there is generally a good deal of agricultural machinery coming to a district of that kind.

3220. As a matter of fact, most of the general merchandise would go by way of Grafton? That is quite a matter of rates.

3221. Where a storekeeper has sufficient time to await the arrival of teamsters, it would go by way of Grafton to Inverell? I think it is mostly heavy traffic which goes by that way at the present time.

3222. I think you said, yesterday, that according to your estimate of traffic, the line would show a profit from the start? Yes.

3223. What is your estimate for goods? From Moree to Inverell I have put down goods at 2,500 tons.

3224. Have you worked it out financially? Yes, in four ways. Sometime ago when there was an inquiry into a line, I heard Mr. Harper state that the ordinary traffic into a town is half a ton per head of the population. I got the returns from Narrabri, Inverell, Gunnedah, and all the different electorates to find out what the trade was. I got a return of the goods which went west from Glen Innes, and which, I take it, went to Inverell. I have only put it down at about one-half, so as to be well within the mark; in fact, for the whole of the Inverell district I have put it down at only 2,500 tons. I have excluded the Grafton traffic.

3225. Does that include the inward traffic and the outward traffic? No. I have put down 2,500 tons of goods for Moree and Inverell. From the Railway Department, I think in 1891, I got a return of the traffic from Glen Innes to Inverell, and I think it was stated at 5,000 tons.

3226. What is the rate per ton for 2,500 tons? I have put down 15s. When we were working up the Glen Innes-Inverell line we went from store to store, and found out what the people were getting in, and worked it out in that way. My estimate is well within the mark. Again, we worked it out by the number of teams travelling on the line, the number of journeys they made, and the average goods they carried,

carried, from the information we could get from the carriers. We worked it out in these many ways, and I think my estimate is well within the mark. On the 30th March, 1892, I asked in the House for a return showing the quantity of goods carried from Sydney and north of Sydney to Glen Innes and Guyra, also the quantity of goods sent from Glen Innes and Guyra respectively to Inverell for the twelve months ending 31st December, 1891. The Department gave the goods from Glen Innes to Inverell as 4,984 tons, which is without the Grafton traffic at all, and from Guyra to Inverell, nil. You will see that I have only taken one-half of that.

G. A.
Cruikshank,
Esq., M.P.
23 Oct., 1896.

3227. Does it say distinctly that it is without the Grafton traffic? It says the traffic from the railway station.

3228. Did you ask for a return of the Grafton traffic? No.

3229. Would not that be for goods which would come from Sydney to Grafton, and thence to Glen Innes? No; that is from the Glen Innes railway station.

3230. You have estimated the traffic from Inverell to Moree at 2,500 tons? Yes. I have another big return showing the goods outwards for all the different years, and putting that down again, it comes to about what I have given.

3231. I wish you to explain how you arrived at your estimated profit on the line;—will you be good enough to explain where you differ from the estimate of Mr. Harper, which shows a loss on the line? I only had his estimate in my hands for a few minutes. I have put down the estimated traffic and returns between Inverell and Moree. Mr. Harper estimates the goods traffic at 8,810 tons, and I estimate the goods traffic, inwards and outwards, at 5,500 tons.

3232. That would fall far short of Mr. Harper's estimate? If he includes wheat in his estimate I would add 2,500 tons to my estimate.

3233. He includes everything except passenger traffic, and the carriage of mails? Mr. Harper has wool 2,200 tons, and wool 1,000 tons, making a total of 3,200 tons.

3234. Where you have reckoned the charge on the carriage of goods at 15s., he has put down 10s.? I seem to have 3,600 tons where he has 3,200 tons.

3235. How does your estimate for wheat, hay, straw, and chaff, 5,000 tons at 8s., compare with his estimate? Wheat I have put down at 2,500 tons, 1,800 tons, and 1,250 tons.

3236. Mr. Harper puts down the wool at 1,000 tons? I have put down the wool at 600 tons from Inverell to Moree.

3237. Mr. Harper puts down the live stock at 250 trucks at 25s.? I have put the live stock down at 300 trucks at 30s.

3238. As regards the passengers to be carried, do you agree with his estimate? I have estimated the passengers at 6,000.

3239. Mr. Harper puts down the passengers at 5,600? He has left out Bingara which has a population of 2,700. It is only about 20 miles from the railway station, and yet he allows none of that traffic to the line.

3240. Are you aware that he has not considered any traffic which may be got to the east of Inverell, that is, towards Glen Innes? I understand that he has taken none to the east. We presume that the farmers will run down hill, because they do all their storekeeping, dealing, and banking with Inverell.

3241. If a line to Moree is constructed, how far east towards Glen Innes do you think people will be served with railway communication? I say, 20 miles. The carriers have a splendid metalled road running down hill. The farmer can run in with his load, and the probability is that he will not go back that day. Many of our farmers around Inverell have exactly the same distance to come in. They come in early in the day, do their shopping, and go out a little way in the afternoon.

3242. The distance between Inverell and Glen Innes is only 42 miles, so that half the people will be served by the Inverell station, and the other half of the people will go to Glen Innes? Yes.

3243. Having gone through Mr. Harper's figures, do you feel satisfied that they are under-estimated? They are under-estimated most decidedly. My figures come to £19,415.

3244. It would be very convenient if you would prepare an estimate on exactly the same basis as Mr. Harper has done, so as to show how your estimated profit is derived? I should be most happy to confer with Mr. Harper, and if he can show me where I am wrong in my estimate, to give way. I have taken out a great lot of stock between the Moree-Inverell boundaries. I have left out thousands of sheep which I feel sure would use the line.

3245. You have put down wool at 3,000 tons at 15s.? Yes; and he has put down wool at 2,000 tons at 13s. 4d.

3246. Then he has put down wool 1,000 tons at 17s. 6d.? Yes. I have estimated 600 tons at 17s. 6d.

3247. Roughly speaking, your estimate of the revenue is £6,000 in excess of his estimate? Yes. I had not the railway rates at hand when I made my estimate. I put down what I had been paying for my wool. I do not think I am very far wrong. I was surprised to see how close we are in places.

3248. If your estimates were realised, the railway would show an annual profit of about £3,000? Yes.

3249. That of course, would be exclusive of land resumptions, and any compensation which might be paid? Yes.

3250. Have you estimated what the State may have to pay for land resumption and severance? It is not very valuable land which it passes through. It will pass through a great deal of Crown land, I should think, and through land valued at from £1 to 30s an acre; and near the town, I suppose, it would not come to more than £5 an acre, unless at the railway station.

3251. Would it be fair to assume that in many cases the land would be given by the landowners? I would not altogether say that. I should think they would give the land at a nominal price. I should think the land resumption would be a very small item.

3252. Is it not a fact that pretty well all the farmers to the west of Inverell are favourable to the construction of this line? Yes, west and north.

3253. The farmers to the east, I suppose, would favour the Glen Innes connection? Most of them would.

3254. Having made such a thorough examination of these two routes, which route do you think, in the interests of the country, should be constructed? I think at the present time the Moree route.

3255. I wish you to bear in mind the commercial aspect of the question? I have dealt very fully with all this railway matter. I have been on their committees for about eighteen years. In advocating the Glen Innes line, our object always was a coastal connection. In the first resolution which was carried, the

G. A.
Cruickshank,
Esq., M.P.
23 Oct., 1896.

idea was to go from Glen Innes to Grafton, but lately at our meetings we have come to the idea that we are more likely to get a line from Casino to Tenterfield. We are fully alive to the fact that there is a very large market out west, and that our markets beyond the local markets of Glen Innes to the east, and Warialda to the west, for a number of years must be Maitland and Newcastle. On the lines between Inverell and Newcastle, and Inverell and Maitland, the carriage is exactly the same, so that when we put our wheat into the hands of the Commissioners, it is immaterial to us which way they take it. It is only a question of carriage. We feel that in time to come there will very likely be a line from Casino to Tenterfield or somewhere up to the coast; and then we think this gap will be completed, and we will have our coastal connection.

3256. If you had a coastal connection there would be a very large market at once for your cereals at Grafton, Lismore, and Kempsey? Yes.

3257. But at the present time that can hardly be taken into consideration on account of the cost of carriage to Grafton? No. We could not get to these markets if we had a line to Glen Innes tomorrow.

3258. Do you look upon Glen Innes as a good market for Inverell produce now? Tenterfield, Glen Innes, and Armidale together can only take 50,000 bushels of wheat.

3259. That is, according to your estimate, about half the quantity for which a market would be found in Moree? Exactly. These figures, I may mention, I got from the Government Statistician.

3260. Would you like to say anything about the carriage of general merchandise? Beyond wool and grain, I cannot say that I am an authority. The traffic managers say "We make a fresh schedule every year, we are business people; we look at the traffic in a district and we make our arrangements accordingly." They tell me that out Bourke way the Commissioners have carried goods in at as low as £3 13s. a ton for a distance of 500 miles. Mr. Harper in framing his estimate, has, I assume, taken all this into consideration.

3261. Large quantities of merchandise are now sent from Sydney, *via* Grafton, to Glen Innes, and thence to Inverell? Yes.

3262. Supposing a line be constructed from Glen Innes to Inverell, and supposing there be no coastal connection; do you not think it is very likely that the railway will be ignored, and keen business men will contract to have their goods taken from Grafton to Inverell, avoiding the expense of handling the goods at Glen Innes? Yes. In the first place they will take this course to save the reloading or unloading charge. In the second place many of the carriers are Inverell men dealing with Inverell stores, and it would suit the storekeepers, for that short distance, to give the carriers employment, as far as the Grafton goods are concerned.

3263. As far as the carriage of general merchandise goes, a line *via* Moree would be just as likely to get the merchandise traffic from Sydney as a line *via* Glen Innes? Yes.

3264. *Mr. Black.* How far does the Warialda sheep district extend south of Warialda? It goes down to Cobbedah, which is about 25 miles south of the line. It goes down into a peak containing three runs, namely, 373, 722, 733.

3265. It extends to within about 30 miles of Bingara? It goes 10 miles on the other side of Bingara, which is 20 miles from the railway line.

3266. How far east from Warialda does it extend? It has been altered this last month. On the east, it goes down to Little Plain; on the south it goes down to the river—I think you might almost say in a line direct from Moree to the north-western corner of Berongera Run.

3267. How far is that from Moree? About 60 miles. I am not claiming any of this country in my estimate.

3268. You are claiming some of the Bingara traffic? I am claiming that traffic.

3269. Do you think that the Bingara traffic will go to Warialda? I do.

3270. Even if a line be constructed to Manilla? I think a great deal of it will. All these wheat products will go west, I should think.

3271. Is there a metalled road from Bingara to Warialda? Yes; I should think it is as good as the Glen Innes road.

3272. Do you think it is likely to get a large proportion of the traffic? I think it must get a lot of the traffic from Bingara.

3273. With regard to the petition which has been presented, a number of the petitioners have signed petitions for a Glen Innes line at various times? Yes; I should think all of them in their time.

3274. There is nothing in the wording of this petition which binds anyone to prefer a Moree-Inverell line to a Glen Innes-Inverell line? No. I think you will find that both petitions are worded in that way.

3275. There is nothing to prevent any man who signed this particular petition from signing another petition in favour of the railway by another route? No; or *vice versa*.

3276. Even a man who has a preference for a Glen Innes-Inverell line may sign this petition without straining his conscience? Probably.

3277. Are you aware that there are a few signatures to the petition—not many I admit—from places which one would hardly think would be affected by the construction of this railway. For instance, how would any persons in Tingha benefit by its construction? Very materially, because they would send all the tin round.

3278. Do you think they would send their tin to Inverell? Most certainly, because they have 16 miles of a splendid road. If they go to Glen Innes they mostly come through Inverell. I think since some work has been done on the Elsemere Road they are not doing it so much.

3279. Do you think the Bingara people who signed the petition would also benefit by the construction of the line? I think so. There were some Inverell people working at a bridge down there.

3280. There are some signatures from Guyra? I think they would send potatoes to Inverell. Guyra potatoes go down as far as Goondiwindi.

3281. How is it the people of Guyra send their potatoes so much further than do the people of Inverell? You will have different cases of that kind. They have potatoes up there which they do not know what to do with.

3282. Is it not a fact that they cannot grow potatoes in Inverell as well as they can do on the high lands? Not as well—they do not keep so well.

3283. Did you advocate the Moree-Inverell line at the last election? No, before the election.

3284. You said yesterday that if a line from Glen Innes to Grafton were constructed it would divert the traffic from the existing railway? I did not say so; but I think it would.

3285. If your estimate of the traffic between Moree and Inverell is borne out, it will result in a proportionate reduction in the amount of the goods carried over the northern line to Glen Innes, and thence to Inverell? It would.

3286. The construction of a Moree-Inverell line would not mean an accession of traffic to the railway system, but a diversion of traffic from an old line to a new line? To an extent.

3287. As far as Werris Creek? Yes.

3288. You think there will be a return traffic from Moree to Inverell;—would that be goods from Sydney or Newcastle intended for consumption in the districts? Yes; mostly salt, sugar, and wire.

3289. Would there be no return of goods or products of the Moree district;—do they produce anything there which could be consumed in the Inverell district? No; there might be some traffic in a dry season with stock.

3289½. If your estimate of the goods carried to Inverell through Moree from Sydney should be discovered to be an over-estimate—if it should be found out that it is impossible for the railway to compete against the water-borne traffic to Grafton and thence by team, will there not be a constant return of empty trucks? No.

3290. Would there not be empty trucks running up from Moree to Inverell without goods in order to bring down the Inverell products to Moree? I say that they would get a return traffic.

3291. But I ask if they should not get a return traffic would not that take place? Probably.

3292. There will be no local traffic to take its place? Not much local traffic.

3293. In estimating the consumption of Inverell products at Moree, did you consider the competition with Warialda? Yes.

3294. What products have you attributed to the Warialda district? Practically nil, because they have no mill for flour. They have a mill at Bingara, and they had only 10,000 bushels of wheat in 1894-5, which was a good year.

3295. You do not apprehend that with the construction of the railway they may get a mill at Warialda? They may. There is a lot of good wheat country from about 15 miles east of Warialda. I have a lot of land down that way. Men have tried farming there a good deal, but they have not been very successful. The real good farming land is more about Reedy Creek.

3296. You do not think it possible that even if there be no flour-mill in Warialda, they may send their surplus, if they have any, to Moree? Yes, a lot of it; but I may tell you that all the agricultural land is in the Inverell electorate, and is included in my returns, except the high land plains. My electorate comes within 3 miles of Warialda.

3297. But the produce of that part of the electorate which borders on Warialda would not go into Inverell but to Warialda, and would be included in the Warialda traffic returns? Yes; but I may tell you that the land you are calculating on there is not yet under cultivation.

3298. You were talking yesterday of the homestead settlers at Moree, and you said that you thought that a homestead settler could live on about 2,500 acres? I said lots of them do.

3299. You said that there are about 4,000,000 acres of land available in the Moree district? No, I think you misunderstood me there. In this block of country, extending 30 miles from the railway line on the south down to the Queensland border on the north, up to about Waterloo on the other side, across there and down to Moree, there are, I think, 2,700,000 acres of Crown land by the Land Office returns.

3300. Where did you get your 4,000,000 acres from? On the other side of Moree. I think it was mentioned in a return furnished by the District Surveyor down there.

3301. If all this land were settled over, with an average of 4½ persons to each area of 2,500 acres, it would mean an increased population of about 7,000 people? Yes; but I have not calculated it on that basis at all. I have put down the population at about 3,000.

3302. Do you think that Inverell will supply Gunnedah? Not in wheat, but it would in potatoes to some extent.

3303. You think that Inverell would supply Narrabri with wheat? Yes.

3304. Have you not taken into consideration the probable competition with Quirindi—Quirindi is distant 108 miles from Narrabri, while Inverell is about 159 miles from Narrabri? Yes.

3305. With the distance of 52 miles in favour of Quirindi, do you think that Inverell will successfully compete with it? Yes, because we have a better climate; and I think you will find that we have a better yield.

3306. You think that will compensate for the extra 52 miles? I think so. We have a very good yield in Inverell. I think we can compete with any of these places.

3307. If the rates on the Moree-Inverell railway should be found, or should be deemed too high to attract traffic, a reduction of rates—if it attracted traffic—could not increase the estimated amount? I want to show you clearly that what applies to a railway by Moree applies exactly the same to a railway by Glen Innes,—the rates being the same to Newcastle, without taking into consideration the grades. With the zone system of 25 miles, the rate being only 2d. a ton, the carriage is practically the same to the two places. The only competing power is the team traffic to Grafton.

3308. You mean to say that the carriage for 509 miles, from Sydney to Inverell, will be as little as it would be for 576 miles, from Sydney to Inverell by Glen Innes? Yes. Either way the freights would be the same to Inverell.

3309. I suppose your estimate, as well as Mr. Harper's estimate of the traffic, is based on a fair aggregate production and consumption? Yes.

3310. Should the line fail to attract the amount of traffic you anticipate, and should a reduction of freights ensue, in order to attract traffic, such a proceeding, even if it attracted traffic which was formerly anticipated, would not raise the aggregate earnings of the railway to the former estimate, because they would be only carrying the same amount of goods at lesser rates? To bring that about, the goods would have to be carried between Inverell and Grafton at a lower rate than they are.

3311. At what do you anticipate they could land general goods in Inverell from Sydney? Taking the Bourke line as a basis, they would land them there at from £4 to £4 5s. a ton.

3312. That is from Sydney by train? Yes; on the same basis as they are carried on the Bourke line.

3313. That is a great deal less than they are landing them at Glen Innes now for? We send down wool at £2 17s. The rates for a lot of the goods are £5 a ton.

3314. You know that they do not carry general goods at the same rate as wool? Quite so.

3315. If we have it in evidence that the rate will be about £8 per ton, you do not think that would be rather

G. A.
Orvickshank,
Esq., M.P.

28 Oct., 1896.

G. A.
Cruikshank,
Esq., M.P.
23 Oct., 1896.

rather a prohibitory rate—at what rate could you land general goods from Sydney *via* Grafton? I do not know exactly what they pay. The steamer rate is from 8s. to 12s. 6d. a ton. When I was living up there, and got all my goods through Grafton, I used to pay £5 10s. a ton. I hear now that they are getting their goods up at from £3 10s. to £4 10s. a ton. As far as I know, it is heavy goods, such as salt, sugar, and wire, which go up. I understand that very few general goods go from Grafton.

3316. Mr. Kirkcaldie states that the present truck rate from Moree is £6 14s. 8d. per ton. You expect to send goods nearly 100 miles further at £2 14s. 8d. a ton less? Yes; because they are doing it at Glen Innes. We have been sending our goods to Glen Innes, and sending them back to Armidale and to Guyra, because the carriage on the long distance is so much cheaper. We find it better to send to Glen Innes, and pay the difference to Armidale, than to send from Sydney to Armidale. I have a copy of the differential-rate book here, and I think you will find that the rates for long distances bear out my statement. Out to Bourke the rate is £20 for a 6-ton truck.

3317. For what goods? It is the rate for rabbit-netting that I am looking at.

3318. But I am referring to general goods? I am under the impression that a great deal of the goods which go up from Grafton are heavy goods. To Wagga the truck rate is £24, and to all stations on the southern line from Wagga to Albury and Corowa it is only £18.

3319. Mr. Kirkcaldie says that if the rates are charged on the ordinary scale there will be an average of £8 a ton paid. If, therefore, goods can be landed from Sydney or Newcastle *via* Grafton, and thence by team to Glen Innes, at from £4 to £4 15s. a ton, and in exceptional cases at £3 13s. a ton, and if the only advantage in sending goods by railway be a saving of time, it is fair to suppose that the railway rates will be reduced by nearly a fourth if the Commissioners are to get the traffic,—instead of charging £8 7s. on an average all round, as Mr. Kirkcaldie says, they would have to charge about £4 7s. a ton? The case you cite is a very exceptional case for heavy goods.

3320. £3 13s. is an exceptional rate, but the average rate is between £4 and £4 15s.? It is £4 10s., I believe.

3321. That would mean that the Commissioners would have to reduce the rates from £8 7s. a ton to £4 10s. in order to get traffic away from the Grafton Road? I have calculated this on the rates which they are charging on the long lines. Taking the Bourke line, and all lines similarly situated on this flat country, if it pays the Railway Commissioners to carry at these rates, and we are put on the same footing, we can get this traffic.

3322. That is exactly what I say—that if the Commissioners want the traffic they will have to reduce the rate from £8 7s. a ton all round? It might run to somewhere under £5.

3323. The question whether it will pay its way or not depends altogether on the adoption of differential rates sufficiently low to enable the Commissioners to compete successfully with the sea route? I think you will see as regards Inverell I have taken a small estimate. I have been taking only half what has been imported into the district. After I made up my estimate I went and found what goes into Narrabri every year in return traffic from the cities. I found that the tonnage is 3,000 to Narrabri, to Gunnedah 6,166, to Tenterfield 2,123, to Glen Innes 9,741, and to Armidale 7,627. Of what goes from Glen Innes to Inverell I have only taken one-half. If we reduce to half rates to get the whole of the traffic—if we carried for 50 per cent. less than has been calculated to get the whole of the traffic,—we would not lose anything.

3324. *Mr. Hassall.*] With regard to the petition presented by you, and signed by 1,100 of the residents of Inverell, I presume that those persons are principally adults? As far as I know, they are.

3325. It does not include any school children? I looked carefully through the signatures, and I think you will find that they are all representative men.

3326. A large proportion of these people are engaged in farming and agricultural pursuits? Most of our farmers' names are there, I think.

3327. How many adults do you think would be against the railway if you could get all their signatures? On the electoral roll there are 1,800 names.

3328. Out of those 1,800 persons you have the signatures of 1,100 persons in favour of the railway to Moree? I think so.

3329. You know Moree pretty well, and you have travelled over the country between Moree and Inverell frequently? Yes.

3330. How does the country to the east of Inverell compare with the country to the west of Inverell, as regards its suitability for agriculture? The country lying 20 miles east of Inverell is about the best agricultural land. I suppose for 20 miles on the road to Glen Innes it is good agricultural land, and the land for 20 miles west of Inverell towards Warialda is magnificent agricultural land.

3331. Beautiful chocolate soil? Black flats and red loam.

3332. Practically, the country for 20 miles in each direction is similar? It is all good agricultural land.

3333. Beyond the 20-mile limit from Inverell to Glen Innes, what class of country do you consider it? It is more stony country, consisting of high lands.

3334. And beyond the 20-mile limit from Inverell to Warialda, what class of country is it? The great scope of agricultural land then lies down the river.

3335. There is a very large scope of agricultural land in that direction? Yes.

3336. You have seen from the documents submitted by the Railway Construction Branch of the Department of Public Works that they can construct 96 miles from Inverell to Moree for less than they can construct 53 miles from Inverell to Glen Innes? Yes.

3337. For nearly £40,000 less? Yes.

3338. In constructing the line *via* Moree they would open up 100 miles of country, as against 53 miles of country by taking the other route? Yes.

3339. Is it not possible, in consequence of the comparatively level nature of the country between Inverell and Moree, and between Moree and Werris Creek, that the Commissioners can convey goods as cheaply as, or more cheaply if anything, than they can by the mountainous route *via* Glen Innes? It would look like that.

3340. How is the land held between Inverell and Glen Innes? By Mr. Campbell, Inverell Station; Mr. Anderson, Newstead; Mr. Sinclair, Waterloo; and the Vivers, King's Plain Estate; and then there are some small properties around Glen Innes.

3341. Is the land freehold or leasehold? Freehold.

3342. The whole of the land worth purchasing has been purchased? Yes.

3343. And the land is practically comprised in four estates? Yes.

3344. How is the land held on the western side of Inverell? In mixed holdings. Out to Little Plain it is all freehold land—that is, for a distance of 12 miles. Then from Reedy Creek and Big Plain the lands are

are practically freehold estates. Then you get into Gragene Run, which is a mixed holding, consisting of so much freehold and so much Crown land. There is a big lot of Crown land to be thrown open there next year.

G. A.
Cruickshank,
Esq., M.P.
23 Oct., 1896.

3345. Is it of good quality? Yes. Between Inverell and Moree, within 15 miles of the railway on either side, there are 400,000 or 500,000 acres of Crown land, and of that area 270,000 acres are all rich reserves.

3346. That land is of pretty good quality? Yes; it is admirably adapted for pastoral settlement.

3347. On the eastern side of Inverell the proposed line, as surveyed, runs through private lands? Yes.

3348. On the route from Inverell to Moree the line goes through a portion of purchased land, and then gets into mixed holdings, consisting of freehold and leasehold lands of excellent quality? Yes.

3349. Do you think that land will be taken up and made available for settlement? I believe it will be applied for over and over again as soon as it is thrown open.

3350. There is a possibility of a large additional settlement on the land between Inverell and Moree in the near future? Yes.

3351. To what place do the farmers of Inverell look for a market more particularly? Mostly Moree.

3352. In saying that they look to Moree, do you take into consideration the country lying out towards the Queensland border as well? We take from Warialda right down the rivers, and right out to Moree. We cannot get further than there. At the present time the carriage is £2 a ton. But on the extension of the line to Moree we expect to get stuff out as far as Walgett.

3353. You are aware that it is pretty fair country to travel over from Moree to Walgett in anything like decent weather? Yes.

3354. As regards stock-routes, you are not confined to a narrow lane, which has the effect of practically closing the traffic? No.

3355. You think that with a railway to Moree you can practically command the Walgett market for Inverell cereals? Yes.

3356. Do you know the country about Moree pretty well? Yes.

3357. Do you know that agriculture has been tried there in the valleys and given up as a bad job, owing to the uncertainty of the seasons? It has been followed there.

3358. It is only in isolated places, and by means of irrigation, that they have been able to grow crops? Yes.

3359. Have you any knowledge of the little irrigation which has been tried at Boolooroo? Yes.

3360. That was successful on account of being able to water where necessary the small area? Yes.

3361. Do you think that the whole of the surplus wheat produced in the Inverell district could not be advantageously disposed of in that direction—in fact, more if you could produce it? I think we will supply all that market, and I believe we will supply a great deal towards Maitland and all the other towns. We can grow so much wheat. It is simply a question of putting in the seed.

3362. Do you think the producer can deliver his product at the market with a reasonable prospect of getting a fair return;—do you think that the charges for conveyance will not swallow up the price? No outside growers can compete with us.

3363. Have you taken into consideration the probability of Quirindi coming into competition with you? Yes; I have all the Quirindi returns.

3364. What is the distance from Quirindi to Moree? 172 miles.

3365. Could Quirindi, if it had to carry stuff 172 miles by rail, compete with Inverell, which has to carry its stuff only 97 miles? I would not think so.

3366. Is it not a fact that Inverell, even though handicapped with the road carriage, supplies a very large proportion of the Western District with cereals? I believe so. One storekeeper in Moree got 1,850 tons of stuff for himself from Inverell at £2 a ton carriage. We do not send all to Moree; we send down the rivers. If we could send it for 8s. a ton you can see how much more easily we could compete. We could not only send down to Moree at 8s. a ton, but we could get all the way out to Walgett, and right on towards Queensland.

3367. It is stated in the report of the Sectional Committee—"that the climatic conditions in the vicinity of Moree are unsuitable for agricultural products—the almost total absence of cultivation at the present time appears to furnish conclusive evidence on that point."; that is borne out by your own experience? Yes.

3368. Moree has been in the habit of looking to Inverell for the greater portion of her supplies? Yes.

3369. Do you know whether there is any prospect of the Narrabri district cultivating on such terms that it could compete with Inverell? Not Narrabri.

3370. Is it not a fact that their agricultural land is very limited in extent? They only grow about 2,000 bushels of wheat.

3371. They are a long way short in producing what they require? Yes.

3372. It is also stated in the Sectional Committee's report—"that this district does not appear to present a sufficient market for the products of the large producing centre of Inverell;"—is that borne out by your experience? Certainly not.

3373. Is it not a fact that a very large area of land will be shortly available for settlement in the Moree district, extending out to the Queensland border? A great deal of land.

3374. And from the quality of that land it is certain to be taken up very rapidly? Yes; it will be applied for over and over again.

3375. That must result in a largely-increased settlement, and demand for Inverell products? Exactly.

3376. It will create a much larger population, and it will necessitate a much larger area of land being put under cultivation in the Inverell district? Yes.

3377. One paragraph in the Sectional Committee's report has struck me rather forcibly, and it is this one:—"that Inverell as a great agricultural centre is entitled to the chief consideration in this inquiry." Do you not know of your own knowledge that proposals have been submitted to Parliament for railway connection with Glen Innes? Yes.

3378. That proposal has always passed through the Assembly? Yes.

3379. And it has always been rejected by the Legislative Council? Yes.

3380. Judging from past experience, and the evidence given with regard to the largely-increased cost of construction between Glen Innes and Inverell, as compared with the estimated cost of the line between Inverell and Moree, is it likely, in your opinion, that any proposal to connect Inverell with Glen Innes would now meet with a favourable reception? Not in the Upper House.

G. A. Cruickshank, Esq., M.P.
23 Oct., 1896.

- 3381-2. Therefore, as there is a prospect of a connection being made with Inverell, and as the Inverell producers are desirous of that connection being made, as it would open up to them a much larger market, it is advisable that this railway should be constructed? Yes.
3383. Do you think that this connection between Inverell and Moree would be more beneficial to the people of Inverell than would a connection with Glen Innes? Yes; at the present time.
3384. Is there any prospect of a market to the east of Inverell? Only to the extent of about 50,000 bushels of wheat, and wheat only.
3385. Where would that be disposed of? I think, frequently to Mr. Utz, in Glen Innes.
3386. In all probability the farmers who supply that demand would be in a position to haul the wheat to Glen Innes, provided that no railway were constructed, and they could not get a better market elsewhere? I think they are sending flour at 10s. a ton up to Glen Innes. We have carted wheat up there when the prices have happened to be good, which is only casually. The market up there is very limited.
3387. You have practically an unlimited market to the west? We have always a market in the west.
3388. Do you know whether flour has not been delivered from Inverell as far out as St. George's Bridge, in Queensland? I should think so.
3389. And also on the large stations lying between the Balloon River and the Barwon River? I know that our carriers have gone out a long way with our wheat into the western part of Queensland.
3390. Is it not a fact that many carriers from the Inverell district are in the habit of taking loading out from Inverell and Moree in a slow season, and bringing wool as back loading? Yes.
3391. The market for the Inverell produce is not bounded by the boundaries of the Colony? No; I think we will get a great market across the border.
3392. Will you give the Committee an idea of the area which you think will be supplied with Inverell products? I think we shall serve the country lying out from Walgett right across into Queensland, towards St. George, and then running in an easterly direction to a point nearly opposite Boggabilla.
3393. Is there any country to the south which could expect to compete with Inverell if a line be constructed to Moree? No; the only competing point gets its wheat from about Little Plain.
3394. If a line is constructed to Moree your market will extend to within a radius of 150 miles west of Moree? I think so.
3395. Is it your opinion that the proposed connection between Moree and Inverell is the best connection which can be made, having regard to the producing interests in the Inverell district? Yes.

TUESDAY, 27 OCTOBER, 1896.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

- | | |
|--|----------------------------|
| The Hon. FREDERICK THOMAS HUMPHREY. | HENRY CLARKE, Esq. |
| The Hon. JAMES HOSKINS. | CHARLES ALFRED LEE, Esq. |
| The Hon. CHARLES JAMES ROBERTS, C.M.G. | JOHN LIONEL PEGAN, Esq. |
| The Hon. WILLIAM JOSEPH TRICKETT. | THOMAS HENRY HASSALL, Esq. |
| The Hon. DANIEL O'CONNOR. | GEORGE BLACK, Esq. |
- FRANCIS AUGUSTUS WRIGHT, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

George Alexander Cruickshank, Esq., M.P., sworn, and further examined:—

G. A. Cruickshank, Esq., M.P.
27 Oct., 1896.

3396. *Chairman.*] I understand that you desire to make a statement in regard to your previous evidence? Yes. I have found, by going into the question of rates again, the reason for the discrepancy between my former statement as to traffic and Mr. Harper's statement, and I submit a comparison of the two returns:—

	Mr. Cruickshank's Rates.		Mr. Harper's Rates.		
		£ s. d.		£ s. d.	
<i>Moree and Inverell.</i>					
In and out goods, 3,500 tons, @	15/-	2,625 0 0	10/-	1,750 0 0	Mr. Harper has 500 tons less goods from Inverell, but he has left out carriage of minerals. Mr. Harper has 500 tons less produce, but consider my estimate quite reliable. In wool, adding Inverell and Warialda together, we differ only 600 tons; but Mr. Harper leaves out all wool east of Inverell and south of the Warialda line towards Bingera, which Mr. Cruickshank considers must come to the line, and makes the difference. We differ 2,000 tons in goods, Warialda and Moree; but considering the output of the Warialda district, and the population of Warialda and Bugara divisions, and the receipts from the railway stations at present, consider Mr. Harper's figures absurdly low. Difference in live stock immaterial. Mr. Harper allows for stock going by road that Mr. Cruickshank put in trucks. Passenger traffic differs 1,000; Mr. Cruickshank maintains estimate correct on population basis, and Mr. Harper in evidence admits being on safe side.

The Hon. Thomas Hawkins Smith, M.L.C., sworn, and examined:—

3397. *Chairman.*] You were for many years a resident on the Clarence? Yes, and I am so still.
3398. *Mr. Clarke.*] I understand that you have no knowledge of the country between Inverell and Moree? No.
3399. You have a statement to make in regard to a line from Glen Innes to Inverell? A line from Glen Innes to Inverell seems to me a natural one to make. Notwithstanding what statistics may prove, a line from Moree to Inverell can only be a temporary expedient. Eventually the produce of all the country to be served by such a line must go to the north coast, and when means of communication are opened up in some port on the north coast, the whole of New England and the country to the west of it will be occupied by people growing produce for export. At present nothing can be grown there which will stand 500 miles of railway carriage—except wool. The reason why there has not been much cultivation in that district is that the railway carriage to a port is so high that it eats up all the profits. With a railway to some port on the north coast, however, produce from the districts I speak of would have only 150 miles of railway to travel over. Such a railway would probably allow of grain and wine, and other things, besides wool, being produced.
3400. You think that there should be a connection between Glen Innes and Inverell with a view to, at some future time, an extension to the coast? Yes. At the present time the whole of New England, from Tenterfield to Armidale, is so far from a port that nothing can be produced profitably there, except wool.
3401. What is the rate of carriage from Grafton to Inverell? I do not know; but I have seen the rate from Glen Innes to Grafton stated as from £3 15s. to £4 a ton. On the Clarence there is a meat-preserving company at whose works 19,080 cattle have been treated this year. They are unable to get sheep, because of the distance by road to the New England table-land; but if there were a railway they would be able to preserve a great many of the sheep from New England and the country lying at the back of it. I have here, too, an advertisement which appeared in the *Grafton Examiner*, and which shows that the Fresh Food and Ice Company are prepared to purchase cream, butter, pigs, and other farm produce, at their works on the Clarence. It would help to find a market for such produce from New England, if it could be got down to the coast at a cheap rate.
3402. I suppose you are of opinion that with a line from Glen Innes to the northern coast there would be an immense interchange of products between the table-land and the coast district? Yes. The country on the table-land would be cultivated for such crops as it would pay to grow, while tropical fruits, sugar, merchandize, &c., would be sent from the coast to the table-land in exchange. We have made mistakes in our railway system before. We made a mistake in bringing the traffic from the Mudgee district to Sydney, instead of allowing it to go to its natural port, Newcastle.
3403. At the present time, very little goes from the table-land to the coast except wool? Nothing at all.
3404. What comes from the coast to the table-land? All kinds of merchandize and sugar. When drays come down loaded with wool they take back merchandize.
3405. The Clarence River is in a better position, so far as navigation is concerned, now, than it was in years gone by? A great deal. I have not heard of a vessel being detained for some years.
3406. What is the depth of water on the bar? Eighteen feet, I believe; but I have made no inquiry.
3407. When the harbour works are completed the depth on the bar will be still greater? I have been told so.
3408. Do you know anything about the state of navigation on the Richmond, or at Coff's Harbour? Only what I read in the newspapers.
3409. You think that on the whole it would be to the public interest to connect Inverell with Glen Innes, with the ultimate intention of carrying the line on to the coast? Yes.
3410. *Mr. Fegan.*] You are not acquainted with the country between Moree and Inverell? No.
3411. Then how can you draw a comparison between that country and the country lying between Inverell and Grafton? In my opinion it will be impossible to send Inverell produce—that is, except wool—500 miles by railway.
3412. Your great object is to connect Glen Innes and Grafton by rail, and to have a port at Grafton? Well, Grafton seems to be the natural port; but you might have the port anywhere on the Clarence or the Richmond. The Clarence is in a direct line from New England to the coast.
3413. You wish to draw the attention of the Committee to the possibilities of a connection between the table-land and the Clarence? Yes. I daresay there are plenty of men who know what Sydney was forty years ago, and who know how railway communication with the interior has added to its wealth. In a similar way, if the produce from the country at the back of New England, and from New England, is brought down to its natural port on the Clarence, we shall have a very large town there in less than thirty years. I have no personal interest in this matter.
3414. *Mr. Nassall.*] Do you think that a line from Glen Innes to Inverell would be of any advantage to the New England district without a connection to some part of the north coast? I think such a line would be more advantageous than a connection with Inverell going westward; although Inverell supplies Moree and the country to the west with flour, that is only a temporary market, and it seems to me that those places will one day grow all the produce they require for themselves. What traffic would there be on the proposed line, except wool.
3415. We have evidence to show that the Moree district requires something like 50,000 bushels of wheat per annum, while there is no agriculture further west? But have you not good bores there which will eventually be used for irrigation purposes?
3416. I do not think that any large area can be cultivated in that way. What I want to get at is this: would a connection between Glen Innes and Inverell be of any advantage to the north-coast district? No, unless the line were extended on to the north coast.
3417. You regard a line from Glen Innes to Inverell as the first step towards an extension to the north coast? Yes.
3418. You have said with regard to the meat works on the Clarence that they must look to the west for their supplies? Yes, for sheep. They can get their cattle from the Clarence and Richmond districts, and from the lower part of Queensland.
3419. Do you not think that a connection between Moree and Inverell would be the strongest argument in favour of an extension to the coast? I think it would be much more advantageous to have a connection between

The Hon.
T. H. Smith,
M.L.C.

- The Hon. T. H. Smith, M.L.C.
27 Oct., 1896.
- between Glen Innes and Inverell first. The line might then be carried further west, or it might be taken up towards the Queensland border.
3420. If no cultivation is done in the west, that district must look east for its supplies? I do not know that cultivation could not be carried out there if the water from the bores were used.
3421. *Mr. Roberts.*] Do you know the Inverell district at all? I do not know the country beyond Glen Innes.
3422. You know it by repute? I have always heard that it is one of the richest districts in New South Wales.
3423. Is your sole reason for preferring the Glen Innes-Inverell line to the Moree-Inverell line the fact that you consider it the first step toward a line to the north coast? Yes.
3424. How far is Glen Innes from a port on the Clarence? The latest survey goes to Glencoe. That distance is about 110 miles, I believe.
3425. That is the line you would like to see constructed? I think that is the only way in which the land in the north-western districts can be used for anything but wool-growing.
3426. Would there be a large market on the coast for Inverell produce? Yes; and there would be a large market on the table-land from the produce for the coastal districts.
3427. There would be an interchange of commodities? Yes; because the two districts would grow entirely different kinds of produce.
3428. Have you given any consideration to the proposal to carry the railway from Tenterfield to Lismore? No. It seems to me that such a line would be too near the Queensland border, and the trade would probably go to Brisbane instead of to Sydney.
3429. Would any wool be picked up along the route of a line from Glen Innes to Grafton? No; but there would be other produce. Cattle are now largely reared in those districts and, with proper railway facilities, no doubt dairying would be entered into.
3430. Would any timber be sent along the line? It is a thickly timbered district, but I do not know that any timber would be carried by the railway.
3431. *Mr. Hoskins.*] It is only 320 miles from Glen Innes to Newcastle; do you know that wheat is brought to Sydney from Berrigan and from places between Albury and Wagga, which are much further away? No.
3432. Supposing a railway were made from the coast to Glen Innes, and it had the effect of making that town a distributing centre for the district between Armidale and Tenterfield, what would the Government do with the railway from Armidale to Tamworth—close it up? No; there would always be traffic along that line. It is part of the main line connecting this Colony with Queensland. Then, too, there is a lot of country south of Armidale the produce from which would come to Sydney.
3433. Could not the mails as well as merchandise be sent round through Grafton? That would never be done. There would be a large passenger traffic from Grafton to the table-land, and that traffic would increase.
3434. Do you know that wheat is brought from Narromine to Sydney, which is a greater distance than from Glen Innes to Sydney? No; but of course Sydney is the natural port for the country along the western line, just as Newcastle is for the Mudgee district, and the Clarence for the north-western district.
3435. *Mr. Humphery.*] I understand your view to be that the railway should be carried due west from the coast? Yes; west, or north-west.
3436. You think that the reduction of railway freights would lead to a large increase in production upon the table-land and in the north-western districts? Yes.
3437. Is it your view that a railway from the coast should stop at Glen Innes? No.
3438. Do you think that such a line should be carried west from Glen Innes? Yes.
3439. So that eventually it would strike the north-western line? Once it got to Inverell it might be taken in any direction.
3440. Would you stop at Inverell, or should the line be taken further on? Naturally, it should not stop at Inverell.
3441. Your view is that the construction of a railway from Moree to Inverell may delay the connection between Inverell and the coast? Yes.
3442. Otherwise there is no reason why that line should not be made? Yes.
3443. *Mr. Trickett.*] You look upon this proposal from a national point of view? Yes, entirely.
3444. With a view to decentralisation, you think the whole of the traffic from the north-western country should go down to the nearest port? Yes.
3445. Have you considered whether a line to Grafton would pay? It would probably not pay at first; but as the country became more populated, and more land was brought under cultivation, the line would pay.
3446. You have not gone into figures? No.
3447. Why did you refer to the advertisement of the Fresh Food and Ice Company? That company is prepared to buy produce coming from New England. There would be a market for it on the Clarence. The company have cream sent to Sydney from as far west as Bathurst.
3448. What do they do with what they purchase at Grafton? They have not yet purchased more than is required for local consumption; but they intend to have refrigerating chambers placed in the steamers so that they may send produce to Sydney. They buy all kinds of farm produce—pigs, fowls, eggs, milk, and cream.
3449. A railway to Grafton from the table-land would feed this industry? Yes. A good deal would be produced between Grafton and Glen Innes.
3450. Does much wheat go from New England to Grafton? No wheat goes that way, because there are no mills on the Clarence; but some flour may be sent.
3451. Is much flour sent down? I do not know; but some is sent.
3452. I suppose the heavy rates of carriage would militate against much being sent? I suppose so. I think you could get flour cheaper from Sydney.
3453. Does much produce of any description come down from the table-land? I think only wool comes down.
3454. Are you pledged to any particular connection between the table-land and the coast? No.
3455. Have you long held the view that there should be such a connection? Yes; I have held it for a long time. Such a connection would develop the north-western district, just as the country about Orange and Bathurst has been developed by the railway,

3456. You look to these northern ports as possibly the outlets for large exportations to foreign countries? I do not know whether the river could be deepened sufficiently to admit large vessels, but a moderate sized ship could come up.
3457. *Mr. Wright.*] Do you know the population of the north coast district? No; but I believe that there are about 15,000 people on the Clarence, and the population is increasing.
3458. They grow no breadstuffs on the coast? No.
3459. You think that if the connection you speak of were made, a paying traffic would spring up in a few years? I think so.
3460. Is the population of the north coast district increasing very rapidly? There is only the natural increase.
3461. Is all the land that is available occupied? It is all occupied; but the greater part of it is occupied only for pastoral purposes.
3462. Is it all alienated? No.
3463. You know the country on the Upper Clarence leading towards the table-land? There are a lot of steep ranges between the Clarence proper and the table-land.
3464. I have been told that there are magnificent belts of timber all through that country? I do not think there would be very much where it is proposed to take the railway.
3465. I am speaking of the whole country from Tabulam right through to Guy Fawkes? Yes; but I do not think much cedar has been left there.
3466. There is a considerable amount of mineral wealth there? They have discovered a good many "blows" of gold; but I do not know that the fields will prove permanent.
3467. Do you think that a railway might be the means of opening up industries which we do not know of at the present time? Yes, I think so.
3468. You stated that the meat-works on the Clarence cannot treat sheep, because they cannot get them down? Yes.
3469. Cannot sheep travel down the mountains? Well, there are so many rivers to cross.
3470. And I suppose they would lose condition in coming down? Probably.
3471. *Mr. Lee.*] Have you been from the Clarence to Tenterfield? Yes.
3472. Is not the country between Grafton and Tenterfield very much superior to the country between Glen Innes and Grafton? Part of it is; but when you get up to Drake it is all very much the same.
3473. Are not the grades easier? That I do not know. The railway would not go where the road goes.
3474. Are there not more people getting a living either by mining or by farming between Tenterfield and Grafton than between Glen Innes and Grafton? I should think not. There is some mining at Drake; but I do not think that there is any farming between the Clarence and Tenterfield.
3475. When were you across there last? About three years ago.
3476. Are you aware that there are at least three times as many men at Drake now as there were five years ago? I dare say there may be.
3477. Are you aware that large areas have been taken up there by selectors during the last three years? No.
3478. So that your knowledge of the country is rather imperfect? Yes.
3479. Have you ever travelled from Casino by way of Peacock Creek and Dyraba to Acacia Creeks? I went that way some years ago.
3480. Is there not a large area of splendid country there? I do not think you could use it for much, except for pastoral purposes.
3481. Do you know Killarney—that is good soil? Yes, but Killarney is in Queensland.
3482. Is not the soil on Acacia Creek identical with it? I should have said not. I thought the Acacia Creek country was all granite country.
3483. No; it is all black soil country? ———

The Hon.
T. H. Smith,
M.L.C.
27 Oct., 1896.

TUESDAY, 16 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.
The Hon. JAMES HOSKINS.
The Hon. CHARLES JAMES ROBERTS, C.M.G.
The Hon. WILLIAM JOSEPH TRICKETT.
The Hon. DANIEL O'CONNOR.
HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.
JOHN LIONEL FEGAN, Esq.
THOMAS HENRY MASSALL, Esq.
GEORGE BLACK, Esq.
FRANCIS AUGUSTUS WRIGHT, Esq.
FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

3484. *Mr. Lee.*] Could you give us in detail the estimate of the traffic on the proposed line between Inverell and Moree? That is already given in my evidence. These are the figures:—

J. Harper,
Esq.
16 Feb., 1897.

Goods, 3,000 tons, at 10s.	£1,500 0 0	
Wheat, hay, straw, chaff, &c., 5,000 tons at 8s. (special)	2,000 0 0	
Wool, 1,000 tons at 17s. 6d.	875 0 0	
Live stock, 250 trucks, at 25s.	312 0 0	
Passengers, 5,600, at 10s.	2,800 0 0	
		7,487 0 0

The Warialda estimate, at which point a large volume of traffic will come in which would not have reached Inverell, even assuming the line had been extended from Glen Innes to that point, is as follows:—

Goods, 1,000 tons, at 10s.	500 0 0
Wool, 2,000 tons, at 3d. per ton per mile equal to 13s. 4d.	1,333 0 0
Live stock, 2,200 trucks, at 20s.	2,200 0 0
Passengers, 2,400, at 5s.	600 0 0
	4,723 0 0

Mails, 99 miles, at £12 per mile

1,188 0 0
£13,398 0 0
3485.

J. Harper,
Esq.
16 Feb., 1897.

3485. What was the last estimate you made of the traffic on the proposed line from Glen Innes to Inverell? The last estimate I made is shown on page 20 of the Minutes of Evidence. I applied certain calculations to some figures which were furnished me by the Inverell people. It was not my own statement of the traffic. The only figures which represent my estimate are those on page 20.
3486. On the very top of page 20 are these words "The Commissioners' first estimate of the traffic on the proposed line between Glen Innes and Inverell is based upon the following figures, through rates being adopted for the purpose." That is altered in a subsequent copy of the evidence which says "based upon the following figures, through rates being adopted for the purpose";—is that correct? That is quite right—through rates being adopted for the purpose.
3487. Then on page 20 I see a second estimate which is called a new estimate? That is a new estimate for the Moree to Inverell line.
3488. In the estimate of traffic regarding the Glen Innes to Inverell line, and also the Moree to Inverell line, have through rates been adopted in both instances? I think not in both instances.
3489. On what basis was the calculation of the traffic returns for the Moree to Inverell line made? On an arbitrary rate.
3490. What do you call an arbitrary rate? A rate which it is felt the traffic could bear, and proportionate to the rate which is being imposed elsewhere. The first estimate, made in 1890, was prepared upon an addition of the Inverell mileage to the Glen Innes distance. Since that date a number of lines have been constructed to which the Commissioners have applied special rates, in making which they have been guided by the circumstances—the cost of construction and the amount the traffic will bear. The Berrigan line is an instance, also the Forbes line and the Cobar line.
3491. *Mr. Black.*] Is there any line in existence where they carry wheat, maize, and potatoes a distance of 50 or 60 miles at 1s. 6d. a ton? Yes.
3492. *Mr. Lee.*] We want to find out how these rates are computed;—have you adopted any system in existence in the Department of Railways? Yes.
3493. Or have you adopted some fancy rate? It is not a fancy rate. It is 1½d. per ton per mile for goods.
3494. Is it equivalent to the truck-rate? It is less than the truck-rate for produce. In the one case, for goods, it is about 1½d.; for wheat it is about 1d. per mile.
3495. Then so far as wheat is concerned it is less than the truck-rate? We have half-a-dozen different kinds of truck-rates. It is more than the truck-rate for produce carried over long mileages. For instance, up to 50 miles, the rate for grain in the classification is a little over 1d. a ton per mile. For 100 miles it is precisely the rate that I have adopted, that is 8s.
3496. You say the rate has been struck as being that which the traffic from that district would be capable of bearing? Yes.
3497. Is that the basis? Yes.
3498. Are you sure about it? Yes; and apart from that it is the basis of the rate-book charges. For that distance the charge per rate-book, for from 96 to 100 miles, is 8s. per ton.
3499. As regards goods going to Inverell *via* Moree, what rate have you adopted? About an average rate. We have half-a-dozen classes of traffic which are being carried.
3500. Have you adopted the truck-rate? No.
3501. Is it more or less? Comprised in that estimate of mine there are goods which are carried at 8s. 4d. per ton, 10s. 10d. per ton, 17s. 2d. per ton, £1 16s. 3d. per ton, and £2 4s. 9d. per ton for that distance of 100 miles.
3502. Calculated on that basis, could you tell us what it would cost to land general goods at the truck-rate from Sydney at Inverell? I could not tell, because there is no rate fixed to Moree yet.
3503. I want to know clearly what rate is going to be charged on general goods by truck-rate from Sydney to Inverell? That I could not tell you. It is a matter for the Commissioners to decide after the line is constructed, according to the circumstances. But I say that for the purpose of an estimate under any circumstances the traffic will bear a charge of about 1½d. per ton per mile; that is, 10s. for the whole distance of 100 miles: That refers to the general traffic of the district; there may be some classes of goods which would pay more, and others which would pay less.
3504. But what basis do you adopt for a truck-rate, say to Glen Innes? The whole of the goods do not represent what we carry in truck-loads. We have some 500 articles which are classified at all kinds of rates. The average rate for goods carried on that line will be 10s. per ton. I do not care what goes to the cost and what does not. My firm conviction is that on that line we should be able to carry the quantity of goods I have estimated—and after all is said and done it is an estimate—at an average rate of 10s. per ton for 100 miles.
3505. All you have calculated then has been the estimated cost between Moree and Inverell? That is all.
3506. You have not estimated what the cost will be from the metropolis to Inverell, or from Inverell to the metropolis? No. I have not taken that into consideration.
3507. And your figures give no information whatever beyond the local rate between those two places? Simply an estimate of the traffic on that particular section.
3508. You do not pretend to offer an opinion as to what the cost of the traffic would be from the metropolis to Inverell? No, I could not do that.
3509. That being the case, are you prepared to accept the figures given by the Chief Traffic Manager, Mr. Kirkcaldie? I do not know what they are; I have not seen Mr. Kirkcaldie's evidence.
3510. He is asked on page 82, question 2169, "Could you give us a fair average of the cost per ton per truck?" To which he replies, "If we charge the ordinary scale, without having regard to competition, it will be at an average of £8 7s. per ton." That is the truck-rate from Inverell, *via* Moree, to Sydney? It would be as well that I should point out that in a previous question Mr. Kirkcaldie says that there is a class of goods at the rate of 23s. 4d. a ton.
3511. But Mr. Kirkcaldie was asked to give what is practically the fairest rate—a truck-rate, which is known to be about the lowest in existence—and he gave £8 7s. as the truck-rate;—I want to know whether your estimate has been based upon the truck-rate, and if not, on what has it been based? Mr. Kirkcaldie does not say that that is the rate that would be charged. He says it is an extended rate at the present classification.

3512. I want to know what the rate is going to be from Sydney? That I cannot tell you, neither could Mr. Kirkcaldie, I am sure. J. Harper,
Esq.
3513. Then of what value is your estimate? I come back to this. I say that on that line of 100 miles the Department will realise under any circumstances, no matter what rate is adopted, 10s. per ton on 3,000 tons. 16 Feb., 1897.
3514. Can you tell me now what is the rate to Moree? I do not know. No rate has been fixed or published.
3515. What is the rate to Narrabri? £31 4s. for a 6-ton truck.
3516. Is that the lowest rate? For certain classes of goods. That is not the lowest rate to Narrabri. I want to disabuse the minds of the Committee of the idea that my estimate of 3,000 tons includes all articles under the category of truck-loads. It does not. As a matter of fact perhaps 80 per cent. may be goods which are carried of a lower class. We have goods which are carried to Narrabri at 18s. 9d. per ton, others at 21s. 5d. per ton, at 36s. 4d. at £3 16s. 6d., and £4 15s. 1d.
3517. You work through the large agents here, such as Wright, Heaton and Co., who collect the goods and supply at truck-rates. I want to get at that? I do not know what the truck-rate would be to Moree. It has not been fixed by the Commissioners.
3518. You do not dispute the figures given by Mr. Kirkcaldie? I dispute them as being figures which cannot apply to Moree or to my estimate.
3519. You do not dispute the fact that if the present truck-rate were adopted the charge for goods from Sydney to Moree would be as stated by Mr. Kirkcaldie? I do not. If that rate were adopted, the charge would undoubtedly be as he stated.
3520. *Chairman.*] Is the truck-rate regarded as a fair rate at which to carry the trade of the colony generally? No; neither does it represent the trade of the colony. It does not represent 10 per cent. of the railway trade of the colony. Of the 3,000 tons of goods which I have estimated as the probable extent of the traffic, I do not consider that 10 per cent. or probably 5 per cent. would be carried at the high rates. My contention is that the average classes of goods that will be carried on that line can afford to pay 10s. a ton for 100 miles. The truck load does not represent the actual business of the Department of Railways. It does not represent 10 per cent. of the whole of our business in carrying merchandise.
3521. *Mr. Lec.*] You are now practically assuming a rate of 10s. per ton for 100 miles? Yes; to cover all the classes of goods we are likely to carry over the line.
3522. Is that the rate which exists on other lines—is that the general rate? I daresay it would work out very nearly an average of 10s. if you applied it to all the classes of goods for 100 miles.
3523. In that case the rate being 10s. per ton it would only cost 50s. per ton to take goods from Sydney to Inverell? That is quite possible. The 10s. of course in this case would be at the end of the distance, where there would be a sliding scale.
3524. But you do not admit for a moment that you carry goods for such a distance at 50s. a ton? Yes, I am quite sure we do. We carry goods of the miscellaneous class a distance of 512 miles for £1 9s. 4d.
3525. You say that the railway carries goods for over 500 miles for £2 10s. per ton, while everybody is paying about three or four times that rate? No they are not. The mistake is made in considering that the railway rates are based on a progressive scale. For instance, we would not charge the man who lived 300 miles away the same rate per mile for the whole of the distance as we would charge the man who lived 200 miles away. We must necessarily have a sliding scale. We must necessarily drop off as the distance increases. I will give a few instances of the rates charged for 412 miles and 512 miles respectively, which will show the charge for the last 100 miles. For a distance of 412 miles the following rates are charged: £1 5s. 6d.; £1 10s. 4d.; £2 12s. 7d.; £3 10s. 6d.; £4 17s. 7d.; £9 11s. 7d. For a distance of 512 miles the following are the rates corresponding: £1 9s. 9d.; £1 15s. 10d.; £3 2s. 7d.; £6 11s. 8d.; £8 3s. 10d.; £11 8s. 3d. If you subtract the one set of figures from the other it will give you the rate charged for the last 100 miles for different classes of goods. It will be found that the rates work out as follows for 100 miles: 4s. 3d. for one class; 5s. 6d. for another; 5s. for another; then 21s. 2d.; 26s. 3d.; and 36s. 8d. We carry one class of goods 412 miles for 25s. 6d. and the same class of goods 512 miles for 29s. 9d.—4s. 3d. a ton being the rate for the last 100 miles.
3526. What class of goods do you carry at £1 9s. 9d.? I will only mention those which I think will be of interest. All agricultural and vegetable seeds, bones and bone-dust, building-stone, copper-ores, &c.
3527. I only want to get at the general class of goods sent to a country storekeeper? Sugar, iron, wire, groceries, wines and spirits, draperies, and packed ironmongery, are goods that would be carried for 21s. 2d., 26s. 3d., and 36s. 8d. per ton for the 100 miles. That is according to the rate book. I do not mean to say for a moment that the Commissioners would find it judicious to make those charges. I wish to make it perfectly clear that I am not in a position to say what will be charged by the Railway Commissioners. We have differential rates all over the lines.
3528. In your estimate you have calculated the rates at per ton. Is there not a deduction made for truck loads? Yes. But in this case it would not be very large, because when you get up to those long mile-ages the truck-rate is about equal to third-class. It works out at 4d. a ton per mile—precisely the same thing.
3529. If you take those averages it brings it out at £7 5s.? Yes; but I do not take them for the purposes of my estimate, and I do not conceive it to be necessary to take them. I think we shall get 3,000 tons without having recourse to these high rates.
3530. You are estimating of course the quantity of goods that will pass over the line.
3531. Did you also consider the fact that the larger proportion of those goods would go over the remainder of the line? Decidedly.
3532. And if they would not stand the carriage through they would not be able to go over any portion of that line? I quite agree with that.
3533. It is all very well for you to estimate what that line will earn, but we want to know whether that traffic will be prohibited from going over it by the long length of line that it would previously have to pass over? My opinion is that 3,000 tons of the traffic would not be so prohibited. That is simply my individual opinion.
3534. But if the rates are such as the Chief Traffic Manager says, the traffic would be so prohibited? I do not think the Chief Traffic Manager says that the rates mentioned will be the rates fixed. I do not think he would say that, because he knows as well as I do that he has no right to give rates for the Commissioners until they have been made. 3535.

- J. Harper, Esq.
16 Feb., 1897.
3535. *Mr. Wright.*] He would mean rates based on existing rates? Yes. I want to clear the Traffic Manager from being placed in a false position. He could not say what the rate would be.
3536. Anybody could say what it would be based on existing rates? Certainly.
3537. *Mr. Lee.*] What the Committee want to know very clearly is, whether it is possible for the estimated traffic to run over a certain distance of line in view of the through charges from the metropolis? My opinion is that the 3,000 tons which I have estimated would be carried, and would earn 10s. a ton.
3538. Take any existing arrangement in the Department at the present time, and show us what the charge will be on general goods? As I mentioned before, the charges imposed by the Department are largely controlled by circumstances. A certain set of circumstances may arise here such as have arisen in Riverina and elsewhere, and in order to get traffic for the main line, which at present is not going on the main line, it may be necessary to adopt differential rates. Of course I cannot tell whether that will be so or not.
3539. Then your reply is that you have not estimated what the cost of traffic will be from Sydney to Moree, but have confined your estimate entirely to what will be the rates of traffic between Moree and Inverell? And Newcastle, because the greater part of the traffic goes there.
3540. Turning to Question 2254, you will see that Mr. Kirkcaldie is very emphatic in his evidence when he is asked this question:
- Then how will it be possible for you to carry 100 miles further than Moree, in competition with the sea-board, with goods delivered as you say at Inverell, *via* Grafton, at £4 15s. per ton? I do not see how we can do it unless we cut down the rates.
- Therefore, I want to know what rates we are depending on? That I could not tell the Committee.
3541. You are aware that this line has been recommended as the proper line to take the traffic west of the Great Northern line, and, if possible, to intercept the coast traffic? Yes.
3542. Certain facts are put before us, and I want to know clearly what the rate is going to be from Sydney to Inverell, in order to know whether or not that end is to be attained? I am not in a position to give the Committee that information.
3543. You have said that in estimating the rate between Inverell and Moree you considered it one which, in your opinion, the produce and goods of the district could bear? Yes.
3544. You are also aware that the distance from Sydney to Inverell, by way of Moree, is about 38 miles longer than by way of Glen Innes? Yes.
3545. You made the estimate of traffic when the Glen Innes to Inverell proposal was before this Committee, and I suppose you struck a rate which you thought the produce from Inverell to Sydney and back could stand? In that estimate I extended the through rate, that is, the through rate for the mileage beyond Glen Innes, and I said so. The estimate supplied to the Committee was not an estimate of mine; it was compiled from figures furnished to the Committee by local residents.
3546. The estimate on page 20 of the Minutes of Evidence says—"The Commissioners' first estimate of the traffic on the proposed line," &c.? That is quite right; that is my estimate, but the other is not.
3547. It also says, "through rates being adopted for the purpose." The line from Glen Innes to Inverell is 52 miles in length as against 101 miles from Inverell to Moree. In your estimate for the Glen Innes and Inverell line you put down wool at 3s. 9d. per ton, and now, in your estimate of traffic for the Inverell and Moree line, you put down wool at 17s. 6d. a ton, although the distance is double;—how do you reconcile these two estimates? It is quite right. If I had to make an estimate again to-morrow, under the altered circumstances between Glen Innes and Inverell, I should also apply the local rate. It is done in connection with all new lines; local and arbitrary rates are charged.
3548. But can you give us any reason why you should estimate the charge in one direction, from Inverell, at so much less than you estimate it in the other direction? Because what I did in 1890 was done under instructions, before the policy of the present Commissioners had been formulated of charging local rates. Since that date all new lines have been subjected to a local rate until they have commenced to pay. I am dealing now with the Glen Innes estimate before the Committee; but, as a matter of fact, I had nothing to do with the Glen Innes to Inverell estimate of quantities in 1891. If to-morrow I were asked to give an estimate of the traffic between Glen Innes and Inverell I should undoubtedly apply a local rate to the line.
3549. Discrepancies appear also in regard to sheep and cattle, wheat, maize, potatoes, hay, &c.? Yes; all through the extension of the through rate.
3550. If you had estimated at that time the same rate as you have estimated for the Moree to Inverell line, would not the revenue from the Glen Innes to Inverell line have been more than double the amount at which it was then put down? I would not like to say off-hand; it is a matter of calculation.
3551. Could you not calculate it now? I should also want to deal with it, having in view the cost of the working of the line—the 52 miles as against the 101 miles.
3552. But you have nothing to do with the working of the lines? In fixing the rates, the Commissioners must have regard both to the capital cost of the line and the cost of working.
3553. But are not the two things distinct;—is not the carriage charged as one item and the working expenses as another? No. When railway lines are handed over to them, or rather when they are designed, the Commissioners consider what rates a line will bear, with a view of paying interest on capital and the cost of the working expenses. They are not tied down to any hard and fast rate.
3554. Then, if the working expenses were higher, the rates should be higher? Decidedly. Of course, I do not know whether they would be.
3555. Can you not see that you have reversed the order of things altogether;—that you have calculated a high rate of working expenses on the Glen Innes line and calculated a very low rate of freight? I do not know that I have. The Commissioners have made it a *sine qua non* in making their reports on these lines that local rates should be enforced until the line paid, when other rates could be applied. This policy was not, I think, in operation at the time that estimate was made; and I think it a most unfair thing to bring that estimate in again, and compare the two sets of figures, in view of this explanation. As far as I am personally concerned, I have been absolutely candid in the matter. I have explained that this estimate was prepared under the then existing condition of affairs, and that the other estimate has been prepared since.
3556. We only want to know the reason why there is this great difference in the freights to be charged? I have given the only explanation I can offer.
3557. If you were asked to make an estimate of traffic to-morrow on the line from Glen Innes to Inverell, on the same basis as that upon which you made the estimate for the Moree to Inverell line, would not your figures of 1893 be very largely increased? Decidedly; I admit that.
- 3558.

J. Harper,
Esq.

16 Feb., 1897.

3558. *Chairman.*] Could you furnish such an estimate? I certainly could not undertake to furnish a fresh estimate of a line with which I dealt in 1890, without the authority of the Railway Commissioners. But I shall be glad to work out the figures if I have their authority.

3559. *Mr. Lee.*] I shall be glad if you will do so, taking exactly the same quantity and applying the same rates? Yes.

3560. *Mr. Roberts.*] Can you tell the Committee what the annual cost to this country would be if the proposed railway from Inverell to Moree were constructed? The Commissioners, in their report, give the total annual cost at £16,183, and the total estimated revenue from the traffic at £13,398.

3561. Leaving an annual loss of how much? £2,785.

3562. I understand that you are responsible for these figures giving the estimated revenue? Yes, to the extent of using the best of my judgment.

3563. And they are compiled in the way usually adopted in dealing with many lines in various parts of the country of which you have furnished estimates? Yes.

3564. And the information you have supplied to Mr. Lee in regard to revenue is as full as that which you are as a rule able to give when any proposed line of railway is under consideration by this Committee? Yes. It is not often that a set of circumstances arises in connection with a railway such as has arisen in this case, where there are rival routes, and also competition from outside. I think the same question cropped up in connection with the Berrigan line, where we were in competition with Victoria.

3565. Can you give the Committee, according to the latest figures in the possession of the Department, the cost of a line from Glen Innes to Inverell? Mr. Deane in his evidence gives the total estimated cost of construction at £317,907. I do not think the Commissioners have prepared an estimate of the working expenses.

3566. In the Minutes of Evidence attached to the Report of the Sectional Committee on the Moree to Inverell line, page 41, there are some figures showing the "estimated traffic and returns on proposed lines";—looking down the list do you see any exaggerated estimate? I think the estimate of the passenger traffic is too high, and also the estimate of the wool traffic.

3567. Do you consider that the estimate of wool from 240,000 sheep an over-estimate? Yes. I also consider the estimate of wool from 1,500,000 sheep from Warialda and district is incorrect. A lot of that wool will go into Moree. I prefer my own estimate of wool from Warialda at 2,000 tons.

3568. On page 121 of the Minutes of Evidence, Mr. Cruickshank is asked: "Having gone through Mr. Harper's figures, do you feel satisfied that they are under-estimated? They are under-estimated most decidedly. My figures come to £19,415." That is as against your estimate of £13,398. If Mr. Cruickshank's estimate is correct the line would show a profit of £3,332? Yes.

3569. Mr. Cruickshank, answering another question, says, "I should be most happy to confer with Mr. Harper, and if he can show me where I am wrong in my estimate to give way";—has Mr. Cruickshank ever had a conference with you on the subject? Yes; he saw me and had a chat with me. He certainly asked my opinion, but he did not alter his own views. The truth of the matter is that he included a district which I did not include. He included Bingara, for instance.

3570. You did not take into consideration the Bingara traffic? No; I did not consider that that traffic would fall into the line.

3571. Did you arrive at any conclusion such as this: That you would be prepared to, as it were, split the difference between your estimate of the traffic and that of Mr. Cruickshank? No.

3572. If the difference were split the line would be a paying line? I had no disposition to alter my estimate. I had arrived at it after careful consideration, and I was not inclined to alter it. Of course, it is a matter of opinion between Mr. Cruickshank and myself.

3573. Is your estimate based on the present traffic, or have you taken into consideration any anticipated increase of traffic? As far as wheat is concerned, and produce of that kind, my estimate was based on an anticipated increase of traffic.

3574. Could you tell the Committee what percentage of the produce of Inverell would find a market at Moree and to the west of Moree? I did not form any estimate of that.

3575. We have had evidence that the whole of the produce of Inverell could be consumed in Moree and the surrounding district;—would you like to give an opinion on that point? I would not like to do that. The circumstances differ so much in the Moree district. It is quite possible it might occur in one year. I rather looked at the produce of the district and its meeting with markets elsewhere—all over the line.

3576. In his evidence given before the Sectional Committee, Mr. Utz is asked:

2807. Can you give me any estimate of the volume of traffic which would be likely to come to a railway constructed between Glen Innes and Inverell? I can. It may appear very strange to the Committee if I enlarge upon the figures given by the Goods Superintendent and others who gave evidence in 1892; but I say from my own knowledge of the goods which go into the different districts, and from my knowledge of the goods which I send myself, and which go from other points, that I have not exceeded the tonnage which goes into those districts. I will give you my estimate of the goods which are sent yearly from Glen Innes into the Inverell district—from a point starting at Guyra, to a point ending at Deepwater. I say that the tonnage which goes into that district is 7,000 tons per annum.

Then again:

2809. Then what I understand you say is that, instead of only 4,000 tons of goods, as estimated by the Railway Department, going into that district, you are prepared to prove there will be 7,000 tons of goods going there? I am.

As I have not gone into the matter as far as the Glen Innes-Inverell line is concerned since 1892, it would be scarcely right for me to dispute what Mr. Utz has said.

3577. *Mr. Black.*] I believe one of the claims in favour of the Moree and Inverell line is that goods can be carried a long distance over easy grades at lower rates than over a shorter distance on steep grades? Yes.

3578. If that is so, can you carry wool profitably 54 miles over the steep grades of the Glen Innes line at 3s. 9d. per ton, when you charge 17s. 6d., or nearly five times as much, for carrying it a little less than double the distance? The exception in this case does not prove the rule. There are reasons for the exception creating a differential rate.

3579. Do you know any reason? I suppose it is simply because at that particular point there happens to be competition. Perhaps it does not represent as good a paying rate.

3580. I suppose you refer to the competition of carriers? Yes.

3581. Do you think any carrier between Inverell and Glen Innes could carry wool at anything approaching 3s. 9d. a ton? No; not between those points.

3582.

- J. Harper, Esq.
16 Feb., 1897.
3582. Do you think he could carry wool within 10s. a ton of the railway price? No; probably not between those points. But that rate would be part of an extension of the through rate for the purpose of securing the through traffic to Newcastle or Sydney.
3583. You mean to say that would be conditional on the wool being loaded on the railway and being carried on to Newcastle or Sydney? Yes.
3584. If you put such a low rate for the traffic on the Glen Innes to Inverell line, in order to secure the carriage of the wool to Sydney, how can you compete with the carriers from Glen Innes to Grafton when you charge 17s. 6d. a ton for wool from Inverell to Moree? We do not know what the through rate may be between Moree and Inverell. If the wool is put on the line at Inverell, and is carried in the direction of Moree, it certainly cannot go to Grafton. But if we charged 17s. 6d. between Inverell and Glen Innes, there is no guarantee that it would not go to the coast.
3585. But if you charged 17s. 6d. the wool would not be sent? Of course that is a matter to be decided afterwards, and as to whether inducements should be offered for the traffic.
3586. If you have to carry it at a lower rate than 17s. 6d. per ton, in order to get it on the railway, then your estimate will be altered? I do not say that it should be carried at less than 17s. 6d.; but, probably, by securing its carriage over the other lines of the colony as against its going by road, we could carry it at 17s. 6d. over a section of railway. We can make an arbitrary rate, so far as Moree is concerned, of 17s. 6d.
3587. Do you mean to say that if you got the people of Inverell to send their wool as far as Moree you could charge them more after it got there? No; I do not mean to say that, because that would have the effect of diverting it the other way. But we could charge them a reasonable rate through. Even assuming that we charged them the same as we charge Glen Innes to-day, £2 7s. 6d., I think it would have the desired effect, and would leave a fair proportion for the rest of the distance.
3588. When the wool gets to Moree, it has to go 311 miles to Newcastle? Yes; and it is only 7 miles further from Glen Innes to Newcastle than from Moree to Newcastle. The rate from Glen Innes to Newcastle is £2 17s. 6d., and from Narrabri to Newcastle £3.
3589. What is the rate from Narrabri to Moree? I could only speak the same way as Mr. Kirkcaldie did.
3590. If it were an extension of the existing through rate, it would be £3 5s. 3d. between Narrabri and Moree;—add 17s. 6d. to that, and it will be £4 2s. 9d.;—could not wool from Inverell *via* Grafton be landed at Newcastle for a little more than half that money? I am not prepared to say that that would be the rate. I daresay if the Commissioners found such a thing occurring as you suggest they would take steps to stop it.
3591. *Chairman.*] Do you know the rate from Glen Innes *via* Grafton to Sydney? I have no idea. The charges are constantly varying.
3592. *Mr. Black.*] Do you think honestly that the Railway Commissioners can afford to carry wool between Inverell and Newcastle at such rates with any chance of diverting any of the wool traffic from the Grafton-Newcastle route? I think so.
3593. *Mr. Hoskins.*] If a railway were constructed from Inverell to Moree, what would be the cost of conveying a ton of flour at truck rates from Inverell *via* Moree to Narrabri? The rates charged would be those upon which I based my estimate.
3594. What is the truck-rate per ton? Fourteen shillings from Inverell to Narrabri *via* Moree.
3595. And what is the charge made by the Department of Railways for conveying a ton of flour at truck rates from Newcastle to Narrabri? Twenty-five shillings and ninepence.
3596. Does the Department of Railways convey much goods to Narrabri to be taken to Walgett? We have done so this year by reason of the Darling not being navigable. A considerable quantity of wool which generally goes down the river has this year come into Narrabri. That is exceptional. Until last year the bulk of that traffic has gone down the Darling.
3597. Even then it is nearly all unloaded at Bourke? Yes.
3598. And at Brewarrina? Yes.
3599. Is not a good deal of local produce such as flour sent from Tamworth and Newcastle at the present time to Walgett and Brewarrina? Yes; a good deal of flour goes up that way.
3600. *Mr. Wright.*] To Brewarrina? No, not to Brewarrina, but to Walgett.
3601. *Mr. Hoskins.*] Is it not a fact that during the last few years, in consequence of the crops being deficient in South Australia, the trade in agricultural produce, such as flour and potatoes and so forth, which used to come from South Australia to Walgett and other towns in that neighbourhood, is now supplied from our own Colony? I do not know about the last two or three years, but the year before last the river was navigable, and boats were able to get up to Walgett from Bourke.

TUESDAY, 23 FEBRUARY, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

- J. Harper, Esq.
23 Feb., 1897.
3602. *Mr. Wright.*] If my memory serves me aright, you were asked to produce for the information of the Committee a return of the estimated traffic on the proposed line from Moree to Inverell, based on some figures you gave in connection with the Inverell to Glen Innes line, and also a return in connection with the Glen Innes line, based on your calculations in regard to the Moree line;—have you that return? Yes. It is based on the arbitrary rates which were applied in my estimate for the Moree to Inverell line. I have the estimated revenue of the Glen Innes to Inverell line, and that is based on the tonnage given

J. Harper,
Esq.
23 Feb., 1897.

given by me when examined upon my original estimate. Assuming that the same rate were charged for the 52 miles as is proposed to be charged for the 96 miles of the Moree to Inverell line, the estimate Glen Innes and Inverell would be as follows:—3,483 tons inwards at 10s., £1,741 10s. Of outwards traffic, there are 1,250 tons at 10s. a ton, £625; 4,500 tons of wheat, hay, potatoes, &c., at 8s. a ton, £1,800; 2,200 tons of wool at 17s. 6d. per ton, £1,925; 800 trucks of stock at 25s., £1,000; 6,250 passengers at 10s., £3,125; parcels, £200; total estimate of traffic, £10,416 10s.; mails, 52 miles, £624; grand total, £11,040 10s. If, however, the rates were made proportionate over mileages—that is to say, if $\frac{2}{3}$ ths of the estimated rates between Inverell and Moree were adopted—the amount would be for the traffic £5,642, and for mails £624, making a total of £6,266.

3603. What is the difference? £4,774.

3604. Can you explain it;—it is a lesser estimate than you originally calculated? Yes.

3605. You calculated 1,000 tons of hay at 1s. 10d., 3,500 tons of wheat, maize, and potatoes at 1s. 6d.;—the one estimate is considerably less than the other? Yes.

3606. The distance between Moree and Inverell is 96 miles? Ninety-six miles is the distance which Mr. Deane gives now. I think you will find that he gives the distance at 96 miles 35 chains. I believe he says, however, that he cannot guarantee it.

3607. May I ask you if, in your experience as Goods Superintendent, you have known wheat in any part of New South Wales to be carried over a section of 52 miles of railway at 1s. 6d. per ton? Yes; it is being carried to-day between the distances of 300 miles and 360 miles at a rate of 6d. per ton.

3608. But I want to know whether you can point to any special line of railway for a distance of 53 miles, or a section of a railway, taking any line you like, where that is the case? I suppose you do not want me to confine myself to the actual distance of 53 miles.

3609. Take it approximately? I will give it to you as nearly as I can get it. Take Culcairn and Boman. Boman is 305 miles, and the rate for 305 miles is 12s. 7d. Culcairn is 357 miles. For the actual distance of 53 miles the rate is 13s. 1d.; that would be a difference of 6d. upon the 52 miles.

3610. But on a line of railway 53 miles in length, what would be the ordinary rate of carriage? Five shillings and two pence.

3611. In this case you estimate 1s. 6d.? Pardon me; as I tried to explain before, the rate which I there gave was the extension of the through rate as between Newcastle and Glen Innes.

3612. Why was not the same thing given in the case of the Moree line;—why did you give in the one case 1s. 6d., the extension of the through rate, and in the other case 8s.? Simply because the Commissioners have, since the date of that report of mine, imposed local rates. In those days no local rates were applied.

3613. Was there not evidence to show that the people were willing to pay local rates? I believe that transpired at the second examination.

3614. The same thing, I suppose, would apply to wool? Yes; that has been treated in the same way.

3615. The reason for the difference is, you say, in the altered circumstances;—you originally calculated these rates as portion of the extension of a certain length of line, whereas now you treat the lines simply as local lines? Yes.

3616. And you are doing that in all cases? Yes.

3617. Do you remember the estimated rate of carriage of wheat between Finley and Berrigan? Yes; it was a proportionate extension of a special rate of 2s. 6d. per ton between Jerilderie and Berrigan. It is 1s. 6d.

3618. What would you allow for the 53 miles of special rates as against the 96 miles of through rates in the item of wool? What I say is that where the rates as estimated for the 96 miles between Inverell and Moree applied to the traffic estimated in 1891, between Inverell and Glen Innes, the total would be £11,040 10s. If $\frac{2}{3}$ ths of the estimated rates between Inverell and Moree were adopted, the total would be £6,266.

3619. But if you take the same tonnage as is shown in the original estimate, and calculate on the rate you have shown between Moree and Inverell, the total would certainly come to considerably more than your estimate? I can guarantee the accuracy of my figures as far as that is concerned. I have averaged the 96 miles, and have allowed $\frac{2}{3}$ ths for the line from Inverell to Glen Innes. The result is a total of £6,266. As far as the estimate of quantities is concerned, I give the estimate which I gave in 1890.

3620. What would be the special rate for 2,200 tons of wool? If you take $\frac{2}{3}$ ths it must work out to the same thing in the total.

3621. Is this calculation of yours of the traffic from Inverell to Moree based on a mileage calculation? No. It is based upon what I estimate the traffic will bear.

3622. I am not dealing with tonnage, but with the charges for freight;—is that based on anything? Yes, decidedly. It is based upon what I think will pay.

3623. You say that it is an arbitrary rate, and that there is no basis of calculation? There is a basis.

3624. Almost every item in the list is increased in price, yet you want me to understand that the total will come out less. How can that be? For instance, there are 3,500 tons of wheat, maize, and potatoes at 1s. 6d. per ton. In the case of the other line the estimate is 8s.;—does that 1s. 6d. represent $\frac{2}{3}$ ths, or what is it? At that rate it would be about 4s. 6d.

3625. There would be an increase from £252 to £700 on one item, and the same thing would apply to hay and other items, yet in the face of that you say that, based on the calculation of $\frac{2}{3}$ ths, the rates would be less? Yes.

3626. Have you not made some mistake? There is no mistake in my figures. I can go through them item by item if the Committee choose.

3627. What would be the traffic upon the Moree to Inverell line if calculated upon the same basis as the line from Inverell to Glen Innes? I can only repeat the evidence I have given before. £13,398 was, I think, my estimate of the traffic between Moree and Inverell.

3628. What would that estimate be if it were based on the same calculation as that upon which you have based the freight between Glen Innes and Inverell. We have two estimates. One appears on page 20 of the printed evidence. That is as to the amount and value of the traffic between Glen Innes and Inverell. Then later on we have an estimate of the traffic between Moree and Inverell in the event of that line being constructed. There is such a wide difference between the rates allowed in the one case and those allowed in the other that the Committee desire to know what revenue the Inverell to Moree line

J. Harper,
Esq.
23 Feb., 1897.

line would give on the rates as originally calculated? I should only be too glad to give you the information. My estimate in regard to the Moree to Inverell line I am fully prepared to apply to the Glen Innes to Inverell line.

3629. You have reported upon all railways which have been constructed in the colonies for several years past;—have you ever submitted to this Committee an estimate based on the carriage of wheat, maize, and potatoes for 53 miles at 1s. 6d.? Not since 1890.

3630. Have you ever allowed for the carrying of wool for a distance of 53 miles for 3s. 9d.? Not since 1890.

3631. This, then, is practically the only line to which this low estimate will apply? It is.

3632. Will you explain why, in the one case, you treat the traffic as part of the whole distance, whereas you are now treating it as traffic upon a special line? The circumstances are totally altered.

3633. In your treatment of the Moree line I see you have departed a great deal from the usual practice in the classification of traffic? I have done that for the last five or six years.

3634. It is the present practice of the Department? Yes.

3635. I understand you to say that both of your estimates are, to a certain extent, arbitrary ones;—your first estimate in connection with the Glen Innes railway was based upon the through rates, but your later one is simply the amount of traffic which in your judgment the carriage would bear? Yes.

3636. You think that by charging the rates quoted here you will ensure the traffic you mentioned? Yes.

3637. But if high rates were charged that would affect the traffic? I should think it would.

3638. Would it affect the carriage on wool, for instance? Yes, it probably would.

3639. If a line were run from Moree to Inverell would not the wool have to cross it? Yes; at Warialda.

3640. And taking the circumstances of the wool traffic into consideration, you have based the rates as low as you possibly could, consistent with fair earnings? Yes.

3641. You think it is quite fair to charge the rate you propose to charge from Warialda for wool? Yes, I think so.

3642. You have estimated 3d. a ton? Yes, I think we shall get that.

3643. How does the rate compare with your general rate for wool? Of course it does not represent an extension of the mileage rate, but it is a rate we get on the Cobar line, except from competitive districts.

3644. Is it higher or lower than the usual mileage rates? It is higher.

3645. What is the longest distance over which you carry wool on the New South Wales railways? It would be from Bourke, a distance of 50½ miles.

3646. What is the rate? £4 3s. 9d.

3647. What would that be per mile? Roughly speaking, 2d. per ton per mile.

3648. Therefore, the rate you propose to charge from Warialda is in excess of that? Yes.

3649. Why do you not ask 3d. a ton between Glen Innes and Inverell? I have said that the estimate to which you have referred was based on our through rate.

3650. But I am dealing with through rates;—you have mentioned the longest distance—Bourke to Sydney? I might explain that the Commissioners have seen reason to alter their policy in charging through rates on the extensions.

3651. In charging 3s. 9d. for the 53 miles you are charging less than half of the amount which is charged on any other line in the Colony? I am not; but I can give you approximately the basis of our rates, and it may possibly assist the Committee in their deliberations. The rate from 101 to 150 miles is 3½d.; from 151 to 200 miles, 2½d.; from 201 to 250 miles, 1½d.; from 251 to 300 miles, 1d.; from 301 to 350 miles, 1d. per ton per mile.

3652. *Mr. Hassall.*] In view of the different grades which would have to be traversed in the event of a line being constructed from Inverell to Moree, and thence on to Werris Creek, what load would you be able to take over such a line in comparison with the load which you could take over the mountain route? There would be a difference of 47½ per cent. in favour of the Moree route in the case of goods engines, and 38 per cent. in the case of passenger engines.

3653. You mean that there would be 47½ per cent. more loading in the case of goods engines, and 38 per cent. more loading in the case of passenger engines on the Moree line? Yes.

3654. So that practically you could convey a larger load over a line between Inverell and Narrabri, *via* Moree and Werris Creek, than you could over the New England portion of the line, and consequently you could afford to charge a cheaper rate? That is a fair thing to assume.

3655. Would that apply in both directions? It would apply in both directions, because the grades have been made to balance, as far as the loading is concerned. It is 100 against the load, and 80 in favour of it. At the suggestion of the Chairman I have had the thing worked out by our engineers, and those are the percentages.

3656. It amounts to this, that although the distance may be longer in the one case as compared with the other, you could convey the goods and passengers at a cheaper rate? Yes, in view of the increased load that could be hauled by the same power.

3657. Does that not also mean less wear and tear on the line itself? It means less engine mileage, and engine mileage means wear and tear.

3658. Which of the two lines do you think would pay the Railway Commissioners better in view of the circumstances of the country travelled through, and the grades on the two lines? My impression is that the line from Moree to Inverell would serve the larger district—it would cover more ground. Then the claims of the district to the north of Warialda are deserving of consideration. You would develop a greater extent of country for less money.

3659. Do you not think that the better market for the Inverell produce is to the west rather than to the east? There would be a good market to the west. I did not go into that feature of the case particularly, but applying the ordinary intelligence which any one brings to bear on any question of the sort, I think that is the case. Of course the people of Inverell would naturally desire to sell where they had the best market.

3660. *Mr. Roberts.*] When you were last here, I had an opportunity to ask you a few questions as to the probable traffic between Glen Innes and Inverell, but you explained that you had not gone into the matter since 1892. Have you been able to obtain any more information on the subject since you were last here? The last published estimate of the Commissioners which I have seen, on the capital cost of the

the working expenses of the line between Glen Innes and Inverell, is based upon an estimated cost of £427,400. That at $3\frac{1}{2}$ per cent. is £14,959. The working expenses would be: Traffic branch, £2,000; locomotive branch, £1,500; permanent-way, £3,638; total, £22,097. The new estimate is: Interest on £317,908, at $3\frac{1}{2}$ per cent., £10,232; working expenses, £7,138; or a total of £17,470.

J. Harper,
Esq.
23 Feb., 1897.

3661. From your long experience you are in a position to say whether your estimate of £11,040 is a fair one? I think it is a good estimate.

3662. Based on rates which, in your opinion, will pay? Yes.

3663. You have been asked, for the purposes of comparison I believe, to make an estimate in connection with the Moree and Inverell line, based upon the estimate of 1890, in respect of the Glen Innes and Inverell line;—is it likely that the rate adopted in that estimate would be adopted upon the line? I should scarcely think so in view of the Commissioners' policy.

3664. You appear to think that the estimate placed before the Committee by Mr. Cruickshank is rather an exaggerated one? Yes; I confess that it does not appear to me that it would be realised.

3665. Was not one of the chief items in his estimate of revenue from traffic from Bingara, which you have never taken into consideration. You do not think that if a line were constructed from Moree to Inverell that traffic would be picked up by it? I do not think that any but low-grade traffic would be carried by it. I am inclined to think that a great deal of the Bingara traffic would still continue to be carted to Manilla. There are many circumstances controlling the traffic now. Such low rates are now being charged by the teams that we cannot be as sanguine as we used to be in days when the teams received 9d. and 1s. per ton per mile.

3666. Can you mention any other item of traffic which was taken into consideration by Mr. Cruickshank and which has been omitted from your estimate? Mr. Cruickshank takes into consideration the traffic between Glen Innes and Inverell. I cannot allow for any traffic between those points; I think it would drift on to the main line.

3667. Would there not be some traffic to the west of the mountains? I have allowed for traffic to the west of Inverell, but not to the north-east.

3668. With regard to the estimate put before the Committee by Mr. Utz, a well-known citizen of Glen Innes, that gentleman in speaking of the probable traffic between Glen Innes and Inverell estimated that 7,000 tons per annum would go into Inverell. You have estimated only 4,000? Yes, between 4,000 and 5000 tons.

3669. Do you regard the 7,000 tons as an over-estimate? Yes.

3670. By how much? I can scarcely tell you. I have not made any inquiry as to traffic going in that direction since 1890. But from what we know of the trade and business of Glen Innes, I should not be inclined to think it had increased. Besides that, we might not get the whole of the traffic going into Glen Innes. My estimate is, I think, 3,000 tons.

3671. *Mr. Farnell.*] Some statements have been made by Mr. Utz, who is, I understand, a general store-keeper in the district of Glen Innes, and who has had dealings with the Inverell farmers, and he said that he had sent great quantities of wheat and flour to Narrabri, Moree, and Gunnedah, and that it had cost him something like 30s. a ton to send it to those districts;—would the construction of this railway be offering very much greater inducements to the people of Gunnedah, Moree, and Narrabri, to get their wheat direct from Inverell, than to get it *via* Glen Innes? Of course it would suit us better to haul it there.

3672. I think you said that it would cost 8s. a ton to carry wheat to Moree? I could scarcely speak of the rates at the present time.

3673. On the completion of a line from Moree to Inverell could you carry goods as cheaply over a line from Inverell to Newcastle as over the line from Glen Innes to Newcastle? I think the Commissioners would have a very hard try.

3674. Do you know whether there are any other resources in the district which would help to swell the traffic at any future time on the proposed line from Moree to Inverell? Well, the mineral resources of the district are awaiting development.

3675. Is there much timber round about Warialda? I should not attach much value to that. It would be too distant from a market.

3676. Which line would carry the more wool traffic;—the line from Inverell *via* Moree, or the line *via* Glen Innes? The line *via* Moree would undoubtedly pick up the wool from Warialda and the intermediate districts. It would not find its way to Inverell, I am sure of that.

3677. *Mr. Humphery.*] Have you been careful to exclude from your estimate of the revenue of the Moree and Inverell line all the traffic to the westward of Inverell which would probably go by road to Glen Innes? Yes, I have been very careful in doing that.

3678. Therefore your estimate may be taken to be a minimum and not a maximum? Decidedly.

3679. You think it is likely to be increased rather than lessened by experience? Yes, that is my candid opinion.

3680. *Chairman.*] You recognise that the competition which the Inverell to Moree line has to meet is, in the first place from the through line to Sydney, and then the competition from Inverell *via* Glen Innes to Grafton? Yes.

3681. That is what controls the differential rates at Glen Innes? Yes; the bulk of the wool which goes to Grafton comes from the west of Inverell to-day.

3682. You have first of all to beat the Inverell to Glen Innes line as a through line to Sydney, and then you have to beat the freight from Grafton to Sydney? Yes. As this line is projected through country in which the wool which now goes to Grafton is grown we have a chance of doing that.

3683. Having regard to the line as a local line, what you have to beat is the road carriage, and the rates you quoted in your last statement are rates which probably take into consideration the road-rates? Yes.

3684. Would a railway going east from Inverell to Glen Innes carry as much produce as a line going west from Inverell to Moree? No, I am sure it would not. My estimate is that the Warialda traffic would not come on to a line terminating at Inverell.

3685. On the Parkes-Condobolin line your estimate—the line being 60 miles long—is 10s. for wool, 17s. 6d. a truck for cattle and sheep, 3s. 4d. a ton for maize, wheat, and potatoes; on the Narrabri-Moree line, which is approximately the same length, your estimate is 10s. 6d. a ton for wool, from 21s. to 15s. a truck for sheep and cattle; on the Berrigan-Finley line, a fourth of the distance, there is a charge of 3s. a ton for special goods, 4s. a truck for sheep and cattle, and for wheat 1s. 6d.? Yes; that is regarded as proportionate to the charge between Jerilderie and Berrigan. j

- J. Harper, Esq.
23 Feb., 1897.
3686. On the line from Tamworth to Manilla, a distance of 27 miles, stock are charged 8s. 6d. a truck, and wheat 3s. a ton;—the reason I quote the rates is this: that in every instance you have to do exactly the same as you have going east from Inverell. I should like to direct your attention to the estimate which is given on page 7 of the Report of the Committee on the Glen Innes-Inverell line. The estimate of £15,000 there referred to is a widely different thing from the revenue you now appear to believe it possible to obtain from freight? The figures there referred to were not obtained by me at all.
3687. Will you also look at the figures upon page 9 of the Report, and when you have looked the matter up make it perfectly clear what is meant? Yes. Mr. Wright examined me upon that very point, and I was then careful to emphasise the fact that they were not my estimates. The rates there are all in excess of what I have proposed in connection with the other lines. They are the bald application of local rates.
3688. What is your opinion of the line from Inverell to Moree as compared with the line from Glen Innes to Inverell, as regards population? I think the line to the west has greater possibilities. It opens up twice the extent of country. There is more Crown land available for settlement, and a large portion of it is quite as good as is the best land between Glen Innes and Inverell.
3689. You think that settlement will eventually be as dense between Inverell and Moree as between Inverell and Glen Innes? It is so to-day.
3690. If a railway were constructed you think there would be as good settlement between Inverell and Moree as between Inverell and Glen Innes? Yes.
3691. For how much of the western country is Moree likely to be the depôt? My impression is that Moree will control everything to the west and north-west as far as the Barwon.
3692. Would you come down as far as Walgett? When you come to Walgett you have to consider the possibilities of railway extension in the direction of Coonamble, and then there would be the trade down the river from Bourke.
3693. You think then that at Walgett Moree is likely to find strong competition? Yes.
3694. But you think it would be a fair thing to take the area you have named, and to come down as far as a point between Collarendabri and Walgett, and to say that Moree would be its depôt? Yes.
3695. *Mr. Clarke.*] I understood you to say just now that you thought there would be greater settlement between Inverell and Moree than between Inverell and Glen Innes? Yes.
3696. Is the country from Warialda to Moree adapted to the growth of cereals? Yes. At Mungie Bungie, Yuaggaba, and Biniguy there is a good deal of land that will grow wheat.
3697. Is the rainfall regular? There is a rainfall of 25 inches, but I do not think they have ever tried to grow wheat there in earnest. If a few of the Victorian farmers settled there wheat would very soon be grown.

TUESDAY, 16 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHREY.	CHARLES ALFRED LEE, Esq.
The Hon. JAMES HOSKINS.	JOHN LIONEL FEGAN, Esq.
The Hon. CHARLES JAMES ROBERTS, C.M.G.	THOMAS HENRY HASSALL, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.
HENRY CLARKE, Esq.	FRANCIS AUGUSTUS WRIGHT, Esq.
	FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Morco to Inverell.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

- J. Harper, Esq.
16 Mar., 1897.
3698. *Chairman.*] There were several points in regard to which you were asked to furnish the Committee with further information? One point was the permanent-way expenditure as between Glen Innes and Inverell, and Moree and Inverell. I have an estimate from our engineer, in which he reduces them, but they are both reduced proportionately. The estimate was £3,600 for the permanent-way expenditure between Glen Innes and Inverell—that can be reduced to £3,000; and the estimate for the line between Moree and Inverell was £3,800—that can be reduced to £3,200.
3699. Have you considered the question of the western market? That I know scarcely anything at all about.
3700. The country west of Moree will be furnished by the river Darling, the river Barwon, and also any line that may come up to Wee Waa, or, indeed, any line west from Narrabri;—I suppose the country of which Moree is the depôt is a purely pastoral district? Yes.
3701. Is there likely to be any great increase of population in it? It is hard to say what developments may take place. All I can say is, that if the land is proved to be suitable for agriculture there will be big developments there. It is very hard to pronounce an opinion. At Narrourine, four years ago, when Mack and Austin took up their farm there, there was no cultivation; but the cultivation now is 3,000 acres, and the land has produced this year from 12 to 14 bushels of wheat to the acre. I do not think we understand half as much about our Colony in regard to wheat-growing as we ought to do.
3702. The question I am asking you to consider is one of a market for Inverell to the west;—do you think a market is likely to be furnished for Inverell in the country between Moree and Collarendabri—is there likely to be cultivation there? I am not prepared to risk my reputation by saying that the country out on the Barwon is not suitable for agriculture.
3703. It is the essence of the question as affecting the western market if wheat can be grown out there? I am not prepared to say that they can grow it; but, on the other hand, I am not prepared to say that they cannot. Under ordinary conditions, as regards rainfall and soil, of course, in the neighbourhood of Inverell wheat can be grown better than further west.
3704. Do you regard the question of a western market as an important one as affecting the extension of the railway to Inverell? A very important one.

3705.

3705. You think it possible that the western country may be able to grow sufficient wheat for its own requirements? It may be able to do so. Giralambone was at one time supposed to be desert country, but we have carried over 300 tons of chaff from Giralambone to Bourke this year.

3706. Cultivation has spread out into parts of the country from which you previously expected no returns? Yes; there are portions of the country in which agriculture is now carried on which it was never expected would become agricultural country.

3707. *Mr. Hoskins.*] Would not Inverell be likely to supply some of the towns over the Queensland border? No; I do not think so.

3708. *Chairman.*] What I should like you to say definitely is whether there is a market for Inverell beyond Moree? I am sure there is a market there at present.

3709. But you will express no opinion with regard to the future? No.

3710. *Mr. Lee.*] Has not the extension of the railway from Narrabri to Moree changed the condition of affairs as far as that western country is concerned; for instance, carriage to Moree is now reduced to a certainty on any day throughout the year, whereas under the old conditions there were times when it was impossible to get to Moree? We hope to be able to establish carriage every day of the year to Moree.

3711. And with the changed condition of things is it not probable that the people will take advantage of a market to obtain a supply how they like and where they like? Yes; but probably, like other people, they will like to have a choice of markets.

3712. The railway to Moree was built to fulfil a certain want; that part of the country was practically cut off from communication on account of a long stretch of bad road;—will not the railway admit of all the necessities of life being carried at a very much reduced cost? Yes; of course the railway will necessarily reduce the cost, but the people to the north of Warialda require consideration too.

3713. Why do you want two railways to do the work of one? Of course, after all, the object of our railways is to afford the greatest good to the greatest number.

3714. *Chairman.*] Your rate for wool from Narrabri is £3 15s.? Yes.

3715. From Narrabri to Moree and Inverell the distance is 159 miles? Yes.

3716. Unless you alter your rate from Narrabri you will have to carry the wool that distance for 5s.? Yes, unless we alter our Narrabri rate.

3717. Your rate for Inverell, *via* Moree, to Narrabri and Sydney, must not be much more than £4 if you are to get the traffic? I am not prepared to say what it will be. If we find that we have competition of a serious nature we shall have to consider what rates we will charge.

3718. What will it cost you to carry a ton of wool to Sydney by rail? No living man can tell you.

3719. If you find yourself at Inverell with certain competition at £4 a ton, and you have to meet it, and if it costs you more than £4 a ton to carry the wool to Sydney, you only have to do enough of it in order to ruin yourself? We shall not lose in the transaction. We might lose if we quoted rates which would represent a loss on our aggregate results.

3720. Do you think that the rate for ordinary goods of £3 13s., *via* Grafton, which has been given us, is possibly correct? I cannot say. All that I can say is, that if those who use the roads had to pay interest on their maintenance their rates would not be so low.

3721. What is the rate for ordinary store goods from Sydney to Narrabri? They vary a good deal; but I should explain that as far as Narrabri and that district is concerned, we always regard Newcastle as the port at which the whole of its business is done. The rate, however, for ordinary store goods from Sydney to Narrabri is about £6 a ton.

3722. We have had the rate quoted to us at £3 13s.;—are we justified in believing that that quotation refers to the same class of goods for which you quote a rate of £6 a ton to Narrabri? Yes, with the reservation that it might contain some of the same class. On the other hand, there are goods carried to Narrabri by rail at a rate varying from 12s. a ton to £6 a ton, and the percentage of goods which are carried at the higher rate are not more than 10 per cent. of the total quantity carried to Narrabri.

3723. How far is it by road from Glen Innes to Grafton? 110 miles.

3724. Do you at present carry most of the wool through Glen Innes, or does it go round by sea? Five times as much comes by rail as goes by sea.

3725. And if a line were extended into Inverell from Glen Innes, do you see any reason for believing that that proportion would be altered;—would you still carry the Inverell wool if a line went into Inverell from Glen Innes? Yes; I am sure we should carry it as far as that.

3726. *Mr. Humphery.*] What is the estimated cost of the 110 miles of road between Glen Innes and Grafton? About £250,000.

3727. How much a year does it cost to maintain that length of road? The last schedule vote was, I think, £7,000 or £8,000. Of course, if the Railway Commissioners were similarly relieved of interest charge, it would not be possible for anyone to enter into competition with the railway rates.

3728. *Chairman.*] If the proposed line were constructed, do you believe that the wool which at present finds its way to Glen Innes would come from Inverell, *via* Moree, to Sydney? A very large proportion of it.

3729. Do you believe also that the wheat grown in the Inverell district would find its way to Sydney by that route? It would not find its way to Sydney, but to Newcastle for export purposes.

3730. How far is it from Newcastle to Inverell? About 450 miles.

3731. Do you think that the wheat will bear carriage that distance? Yes.

3732. What would be the rate? 13s. 10d.

3733. And there is no doubt you think but that wheat will bear that rate? Yes; it would be about 4½d. a bushel. The farmers are paying more than that to-day from Berrigan to Sydney.

3734. It is not possible, you say, to let the Committee know the rate which the Commissioners propose to charge from Inverell to Sydney? No; I could not tell you that.

William McIntyre, Esq., Chief Electoral Officer, Chief Secretary's Department, sworn, and further examined:—

3735. *Chairman.*] You have some population returns to put in;—will you describe them? I have taken out approximately the population within a certain area indicated on the map I produce by getting the number of electors on the electoral roll within that area, and multiplying them by 3½, which I consider is about the proportion of population to electors.

W. McIntyre,
Esq.

3736. 16 Mar., 1897.

W. McIntyre, Esq. 3736. What are the boundaries of the area? It takes in a part of the Moree electorate, part of the Narrabri electorate, and part of the Barwon electorate. Commencing near Boggabilla, on the Dumaresq River; thence bounded by a line south-westerly to the head of the Courallie Creek, on the boundary between the Moree and Narrabri electorates; thence by a line westerly between the Thalaba Creek and the Namoi River, to the Barwon River, just about the junction of Thalaba Creek; thence north-westerly, crossing the Narran River, south-west of Angledool, and continuing north-westerly to the Colony boundary; and thence by that boundary easterly to the point of commencement.

16 Mar., 1897. 3737. How many people do you estimate are within that area? I have estimated that there are about 7,360 people within that area, or 2,003 electors.

FRIDAY, 26 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. DANIEL O'CONNOR.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

Henry Deane, Esq., Engineer-in-Chief, Railway Construction Branch, Department of Public Works, sworn, and further examined:—

H. Deane, Esq. 3738. *Mr. Roberts.*] I wish to get as fair a comparison as I can with regard to the loss which would be sustained if a railway line is made from Moree to Inverell, as compared with the loss which would be sustained if a railway is made from Inverell to Glen Innes;—am I right in saying that the annual loss on the proposed line from Inverell to Moree will be £2,785? I can only tell you what occurs in the Railway Commissioners' estimate, and that is given at £2,785.

26 Mar., 1887.

3739. I want similar figures with regard to the proposed line from Glen Innes to Inverell. These are the figures supplied to the Public Works Committee in 1892, at page 102 of the report submitted to Parliament:—

GLEN INNES TO INVERELL.

Revised Estimate, April, 1891.

Ruling grade	1—60
Length	53 miles 34 chains.
Cost of construction, exclusive of land	£427,400
Interest, at 3½ per cent.	14,959
<i>Working Expenses.</i>	
Traffic Branch	£2,000
Locomotive Branch	1,500
Permanent-way Branch	3,638
	£7,138
<i>Revenue.</i>	
Coaching	£3,200
Mails	500
Goods	4,500
	£8,200

That shows an annual loss of £13,897, as compared with an estimated annual loss on the proposed Moree to Inverell line of £2,785:—have you any later information which you would like to place before the Committee to show that if a line is constructed from Glen Innes to Inverell there would be a smaller annual loss than £13,897? No; that would be for the Railway Commissioners.

3740. Can you tell us where we could obtain that information? I think it would be better to apply to the Secretary to the Railway Commissioners. I can only get the information from the Railway Commissioners' report as to the traffic and working expenses.

3741. Is it not a fact that this estimate was made when the cost of construction of the Glen Innes to Inverell line was put down at £8,000 per mile? Yes.

3742. Is it not a fact that after many hours of professional labour the last estimate you have been able to make of the cost of constructing that line is £6,000 per mile? I think that was it. I gave all the particulars on a former occasion.

3743. If the line were constructed at a cost of £6,000 a mile, would these items of annual expenditure, such as traffic branch, £2,000, locomotive branch, £1,500, permanent-way branch, £3,638, be materially reduced? They would not be touched. What would be touched would be the interest on the capital cost.

3744. *Mr. Hoskins.*] What would be the difference in the cost of maintenance of permanent way, looking at the difference in grades on the proposed line, Inverell-Glen Innes, and the proposed line, Inverell-Moree? I think that mile for mile there would be very little difference, because, although on one line you have heavier grades, they are not at all bad. One in 60 is not a very heavy grade, and the ground is undoubtedly harder on the Glen Innes-Inverell line, and there would not be the same amount of subsidence. The line from Moree to Inverell will pass through a great deal of black soil and soft country, and I should think would require more work for maintenance per mile.

3745. *Chairman.*] The distance from Inverell to Moree is approximately twice the distance from Inverell to Glen Innes;—will it cost, approximately, twice the amount to maintain the line from Inverell to Moree as it will cost to maintain the line from Inverell to Glen Innes? I should think it would with the same amount of traffic over the line.

3746.

3746. What is the cost of construction of the two lines? Moree to Inverell is estimated to cost £279,500; the line from Glen Innes to Inverell, a distance of about 52 miles, is estimated to cost, at £6,000 per mile, £312,000.

H. Deane,
Esq.

26 Mar., 1897.

3747. What would be the cost of maintenance from Moree to Inverell? I have not gone into that question, but I know what maintenance costs on existing lines. That has been worked out. The system of earth-ballast construction is somewhat new, but so far as we can tell, if the traffic is light, I think the maintenance should be done for about £55 per mile.

3748. Is this correct: The maintenance of permanent-way only from Moree to Inverell will be £55, multiplied by (say) 100—that is, £5,500? Yes, roughly; but I wish you to understand that the cost of maintenance at present is rather an uncertain item with regard to this line. There are existing lines, for instance, Culcairn to Corowa, which, during 1895, were maintained at a lower cost. The line from Nyngan to Cobar was also maintained at a lower cost than that; but I do not want to put it too low, because with an earth line and without ballast there may be some expense to provide for which is not provided for on other lines.

3749. Are the qualifying remarks which you now make as applicable to one line as to the other? They are specially applicable to the Moree to Inverell line.

3750. With these qualifying remarks, the maintenance of the line from Inverell to Glen Innes would cost £52, multiplied by £55, which would give an annual cost of £2,860 for maintenance. Therefore the case stands thus: that although the line from Moree to Inverell will cost £32,500 less to construct than the line from Inverell to Glen Innes, it will cost £2,640 per annum more to maintain the Inverell to Moree line than it will to maintain the Glen Innes to Inverell line? Yes, roughly.

3751. *Mr. Roberts.*] When I asked you a short time ago with regard to the Glen Innes to Inverell line did you not say that the cost of maintenance and working would be the same as was estimated in 1892? No; you were then asking me if I understood rightly how the difference in estimated capital cost would affect the figures given by the Railway Commissioners at that date. I said that the only figures that would be affected by the difference in capital cost would be the interest on capital. I said that the cost of the traffic, locomotive, and permanent-way branches would not be affected thereby. I do not say that those figures would not be altered now. The Railway Commissioners might see fit to revise their estimate for those items. I only wished to point out that the only item affected by any alteration in the capital cost would be the item of interest.

3752. I asked whether the maintenance would be the same on the line if constructed for £6,000 per mile as it would be if constructed for £8,000 per mile? I do not think that was clear to my mind at the time.

3753. That was what I meant. Can you answer the question now. I have given the figures supplied by the Railway Commissioners in 1892 for traffic, locomotive, and permanent-way branches, and they come to almost the same as the estimated cost of maintenance of permanent-way, locomotive, and traffic branches on the Moree to Inverell line. Although the Glen Innes to Inverell line is only half the distance the cost of maintenance is put down as exactly the same on both lines? I do not know what the Railway Commissioners have put down for maintenance.

3754. Can you point where any alterations are likely to take place in the figures which I have quoted from the report of 1892? I may be permitted to point out that those are figures given by the Railway Commissioners. I have nothing whatever to compare them with in connection with the Inverell to Moree line, nor is it a task which I ought to be asked to undertake, that is, to revise the traffic estimates of the Railway Commissioners.

3755. But have you not just done so in answer to the Chairman? No; I gave the information as to the maintenance, which is an engineering question; but the question as to the whole of the working expenses includes traffic considerations. As a railway engineer, I have knowledge of the cost of maintenance of permanent-way.

3756. *Chairman.*] Do you take up this position: that you are prepared to express an opinion as to the maintenance of permanent-way, but not with regard to traffic and locomotive expenses? Yes. If I were asked with regard to the cost of maintenance of the Glen Innes to Inverell railway I should be bound to say that I considered £3,638 per annum too high; but I cannot make any comparison with the Moree to Inverell railway in the same way, because I have not the Railway Commissioners' figures.

3757. Will you be prepared on Tuesday to give the Committee an estimate of the cost of constructing the two lines, Glen Innes-Inverell and Moree-Inverell, and the cost of maintenance of the two lines? Yes.

TUESDAY, 30 MARCH, 1897.

Present:—

THOMAS THOMSON EWING, Esq. (CHAIRMAN).

The Hon. FREDERICK THOMAS HUMPHERY.

The Hon. JAMES HOSKINS.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

The Hon. WILLIAM JOSEPH TRICKETT.

The Hon. DANIEL O'CONNOR.

HENRY CLARKE, Esq.

CHARLES ALFRED LEE, Esq.

JOHN LIONEL FEGAN, Esq.

THOMAS HENRY HASSALL, Esq.

GEORGE BLACK, Esq.

FRANCIS AUGUSTUS WRIGHT, Esq.

FRANK FARNELL, Esq.

The Committee further considered the proposed Railway from Moree to Inverell.

John Harper, Esq., Goods Superintendent, Department of Railways, sworn, and further examined:—

3758. *Chairman.*] Have you received a letter from the Committee asking for certain information? Yes; I received a letter from the Secretary of this Committee asking for a statement giving, in addition to the estimated annual cost of maintaining permanent-way, and the estimated traffic expenses and locomotive expenses in connection with the proposed railway from Moree to Inverell, similar information with regard to a railway from Glen Innes to Inverell, the latter estimate to be prepared in view of what the figures would be if this railway were proposed at the present time. The Railway Commissioners have asked me to come here to-day to furnish the Committee with this estimate, which is theirs, of the expenditure on the two lines under the conditions as asked for by the Committee:—Glen Innes to Inverell: traffic expenses, £1,400; locomotive expenses, £1,580; permanent-way, £3,633; total, £6,613.

J. Harper,
Esq.

30 Mar., 1897.

3759.

- J. Harper, Esq.*
30 Mar., 1897.
3759. *Mr. Roberts.*] Can you explain why in 1891 the working expenses of the Traffic Branch were put down at £2,000, while now they are only put down at £1,400? Things have altered very much since 1891, as far as traffic and all other charges are concerned. There has been a very material reduction in the classification of stations and the number of men employed. The estimate I now submit is an absolutely revised one up to date. It has been very carefully gone into. The estimate for the line from Moree to Inverell is as follows:—Traffic charges, £1,100; locomotive charges, £1,775; permanent-way, £4,225; total, £7,100.
3760. *Chairman.*] According to these figures there is a difference in favour of the Glen Innes-Inverell railway in annual cost of maintenance of £487? Yes.
3761. And there is an advantage in favour of the Inverell-Moree line over the Glen Innes-Inverell line of £54 per mile in maintenance? I have not worked it out in that way. I have taken the cost of maintenance of the permanent way.
3762. Why not take the whole thing together;—you say that the Glen Innes-Inverell line will cost, roughly, £125 per mile? Yes; £124 6s. per mile.
3763. The Moree-Inverell line will cost, roughly, £71 per mile;—therefore there is a difference of £54 per mile? Yes.
3764. *Mr. Lee.*] Fourteen days ago, when Mr. Harper was giving evidence, he said the cost of maintenance of the Glen Innes-Inverell line could be reduced to £3,000; now he says it will amount to £3,633? I think I said I had gone into the matter with the engineer. I had not gone into the matter with the Railway Commissioners.
3765. Is not the engineer the only man competent to give an opinion on the subject? I should say the Commissioners are the most competent men to say how much the line would cost to maintain. I give these figures definitely to-day. I think if you read the context of the evidence you will see that what the engineer and myself worked out agrees with this. I hand in this to-day as being the Commissioners' estimate.
3766. *Chairman.*] Can you give us the cost of maintenance of a line which can be fairly compared with the Glen Innes-Inverell line? There is the Nyngan to Cobar line, 81 miles 27 chains. The cost of that line during last year for maintenance of permanent-way was £3,498.
3767. There is the Jerilderie to Berrigan line, which cost £74 per mile to maintain the permanent-way; Parkes to Condobolin, £77 per mile; Temora to Wyalong, £87; Berrigan to Emaley, £50; Condobolin to Broken Hill, £68? Circumstances control the cost of maintenance. If you have a line with heavy cuttings and embankments you have to maintain a stronger gang of men to deal with the road. As good a comparison as I can get for this line is the Cootamundra to Gundagai line, 34 miles in length, and the cost of maintenance is £2,632. That is for maintenance only. There is another piece of information which I have got absolutely correct up to date—that is, on a line between Glen Innes and Inverell the load would be 170 tons behind the engine. On a line from Inverell to Moree the load would be 360 tons behind the engine.
3768. *Mr. Roberts.*] Is 53 miles the last accepted distance for the proposed line between Glen Innes and Inverell? Yes.
3769. What would be the annual charge for interest on the two lines? The estimate for the Glen Innes to Inverell line for interest was £10,232. The estimate of interest on the Inverell to Moree line is £9,083.
3770. *Mr. Humphery.*] In estimating the interest on the Glen Innes to Inverell line did you take the rate at 3½ per cent.? Yes.
3771. *Chairman.*] Will the three items of annual cost be pretty well the same between Moree and Inverell as it will be between Moree and Narrabri? I think they will probably be about the same.
3772. Is that put down now at £37 per mile? Yes.
3773. *Mr. Lee.*] This is a revised edition? There is no desire to alter anything. I stated before that after consulting with the engineer maintenance could be cut down from £3,700 to £3,200.
3774. But now it appears that the total cost will be £7,100 from Glen Innes to Inverell? It is for all expenses £7,100, but it may be a revised estimate without there being any need to alter it.
3775. *Mr. Humphery.*] Do you estimate that the cost of maintenance per mile between Glen Innes and Inverell will be £68, as against £44 per mile between Moree and Inverell? Yes, for maintenance of permanent-way.
3776. *Chairman.*] Why will the Glen Innes-Inverell line cost so much more to maintain than the Moree to Inverell line? Because there are heavier cuttings and heavier grades. The wear and tear will be greater, and more men will have to be employed per mile on the Glen Innes-Inverell line.
3777. *Mr. Humphery.*] How does it happen that your estimate of traffic expenses between Glen Innes and Inverell, 53 miles, is £1,400, as against £1,100 between Moree and Inverell, 96 miles? The difference in grade will permit of fewer traffic men being engaged in lifting the business. For instance, the load between Inverell and Moree will be equal to forty trucks of stock, while between Inverell and Glen Innes it would not be equal to more than eighteen trucks, so that practically you could do as much with one train on one line as you could do with two trains on the other.
3778. That is to say, you will be able with one engine to draw 360 tons on one line as against 170 tons on the other? Yes.
3779. Will there be a daily service between Glen Innes and Inverell, and only a service three times a week between Moree and Inverell? I am not in a position to say that that will be the case, but it may be.
3780. *Mr. Humphery.*] In your estimate have you calculated upon having the same service between Moree and Inverell as you propose to have between Glen Innes and Inverell? Yes, when required. Provision will be made for running a daily service during the year when necessary, and that is included in the estimate.
3781. *Mr. Lee.*] Is that for a daily service? For a daily service, when required, in the busy season.
3782. *Mr. Humphery.*] Is your estimate a perfectly fair one in comparing the two lines? It is; otherwise the Commissioners would not send it here through me.
3783. You say this is the Commissioners' estimate, and that it is an absolutely fair one? Yes.
3784. *Chairman.*] If you had 1,000 tons of stuff to take away from Inverell you would know exactly the number of trains that would be required to take it from Inverell to Glen Innes, as compared with taking it from Inverell to Moree; but you could not possibly take the same basis to make a calculation with

with regard to the everyday traffic? This is absolutely calculated on what we know we are going to move, in accordance with the estimate of the probable traffic between both places.

3785. How will it be if you are running an engine and one carriage every day from Glen Innes to Inverell, or from Inverell to Moree? There would be no value in such a comparison of the loads, but the estimate of the traffic in the district does not indicate anything of that kind occurring. To move the traffic between Moree and Inverell we will require a tri-weekly service. There will be twenty-eight loaded waggons three days a week, all the year round; so there is not much prospect of having to run a locomotive and a carriage.

3786. *Mr. Lee.*] How do you get at that estimate of traffic? That is the estimate of traffic which I have submitted to the Committee; that includes Warrialdra.

3787. *Mr. Humphery.*] Have you made your estimates on the basis that there will be the same service between Moree and Inverell and Inverell and Glen Innes? It will depend upon the traffic offered. As far as the locomotive cost is concerned it is based on practically the same service to be rendered. That is to say the same amount of traffic to be lifted.

3788. With regard to the carriage of mails, have you put both routes on the same footing? At the same rate per mile.

3789. Have you estimated for the same service in both cases? I do not know that I took that specially into consideration when that estimate was given.

3790. In your estimate, placed before the Committee to-day, have you taken into consideration the proposed service between Glen Innes and Inverell as well as between Moree and Inverell? No; it would not require a daily service on the improved grades between Inverell and Moree.

3791. Did you propose to give a daily service between Glen Innes and Inverell? It would be necessary if we had the same amount of traffic to lift.

3792. Should not that be considered in making a comparison between the cost of maintenance of the two lines? Yes; the wear and tear would be greater on the line where we had to maintain a daily service.

3793. Do you say that you have fairly taken into consideration every circumstance that should be considered in making a comparison between the two lines? Every circumstance has been considered.

3794. *Mr. Roberts.*] We have an estimated revenue on the Moree-Inverell line of £13,398;—can you give us a similar estimate with regard to the Glen Innes to Inverell line? No; I have not dealt with that line since 1889.

3795. *Mr. Lee.*] Do you say that this estimate of traffic, locomotive, and maintenance expenses is for a daily service between Moree and Inverell? I should not like to say that.

3796. Can you tell the Committee what it really does mean? It means a tri-weekly service, and during (say) four or five months in the year a daily service.

3797. For about seven months in the year it would be a tri-weekly service? Yes.

3798. *Chairman.*] With a ruling grade of 1 in 100, and with a ruling grade of 1 in 60, does it mean that in the latter case there will only be half the expenditure for traffic, maintenance, and locomotive expenses? Yes; that is the estimate which you have before you, practically. I am not going to say that that is the case absolutely as far as locomotive and traffic expenses are concerned. I am not going to say that they vary in the same degree.

3799. *Mr. Roberts.*] In a report signed by the Secretary for Railways in April, 1891, I find that the estimated revenue on the Glen Innes-Inverell line is put down at £8,200;—do you think that that estimate would hold good at the present day? I fancy that there would probably be that amount of traffic. 3800. Then there will be an annual revenue of £8,200 on the Glen Innes-Inverell line, as against an annual revenue on the Moree-Inverell line of £13,398? Yes.

3801. Did you not state just now that the annual charge for interest on the Glen Innes-Inverell line would be £10,232? Yes.

3802. And that the total charges for traffic, locomotive, and permanent-way branches would amount to £6,613? Yes.

3803. That gives a total annual expenditure of £16,845 a year, and you say that these figures of estimated revenue would hold good? I do not say that they would hold good; but it is a fair estimate.

3804. If I deduct the revenue from the expenditure, that would show an annual loss of £8,645? Yes, on the figures you have; but, as I explained before, it is scarcely fair to ask me to give evidence on a line which is not now before me.

3805. *Mr. Lee.*] Are you prepared to swear that your estimate of traffic on the Glen Innes-Inverell line in 1891 would be an accurate estimate for 1897? No; I should be very sorry to swear it.

3806. *Chairman.*] What was the basis of your estimate in 1891? A through rate. I made a comparison at the request of the Committee after taking the proportionate mileage and applying the rate which is to be charged on the other line, and it makes it less than you have there.

3807. What is a fair estimate of the mileage? I do not know; it depends on the character of the traffic.

3808. It is manifestly not just to estimate one line on a through rate and another on a special rate? Yes; but at the request of the Committee I prepared some figures on that subject. Of course I do not in any way guarantee the tonnage, as it is so long since I have had an opportunity of investigating the matter.

3809. You have to beat the road between Glen Innes and Inverell;—could you beat it with the rates which you have quoted? Yes.

3810. Do you think that the rate of 17s. 6d. per ton for wool would beat the road between Inverell and Glen Innes? No; I do not think it would, and I did not propose to charge it.

3811. Would 10s. a ton for flour beat the road? We would not charge it for that distance.

3812. *Mr. Lee.*] Can you tell us what the 6-ton truck rate is for 100 miles, classes 1, 2, and 3? £2 10s. is our highest truck rate; practically for that class, but you can say that is for the 3rd class.

3813. Is £2 10s. a fair rate? Yes; it does not apply to 5 per cent. of our traffic. That does not cover classes 1 and 2, because they are never carried at that rate: they are carried at the classification rate.

3814. *Mr. Black.*] Have you ever considered the effect that federation might have on this railway? No.

3815. Under federation would not Inverell have a market in Brisbane at a distance of only 354 miles? Under federation, with freetrade, I fear that South Australia and Victoria would be able to undersell Inverell wheat with their water-borne wheat.

3816. But the wheat does not grow on the wharfs—there is the cost of carriage? Yes; but what I pointed out will be a very important element.

J. Harper,
Esq.
30 Mar., 1897

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Moree to Inverell.

APPENDIX.

A.

[To Evidence of H. Deane, Esq.]

ESTIMATED COST OF VARIOUS RAILWAY ROUTES.

Department of Public Works, Railway Construction Branch,
Engineer-in-Chief's Office, Sydney, 2 October, 1896.

Sir,

In compliance with your request of the 22nd ultimo, I beg to forward you the following information :—

Glen Innes to Inverell.

The estimate for this line can be reduced to £6,000 per mile, as stated in my evidence at my last examination. This will bring the total cost to £313,800. It is quite possible that, if this railway came to be constructed, tenders would be received at such a low figure as would enable the line to be completed for something less than this; but I do not feel justified, at the present moment, in reducing the estimate.

Guyra to Inverell.

With regard to the estimate for the above, I can only give this approximately, as the location of the line has not been definitely fixed. When giving evidence before your Committee during its first consideration of this line, I pointed out that, although longer than the Glen Innes to Inverell line, it could be made for the same total cost, as the country was easier—the grades adopted being similar. There has been no further examination of the route since this time, but I have little doubt that if a survey were made on the same principle as that of the other line, and the estimate based on the same assumptions, the total estimated cost would not exceed the revised estimate of the Glen Innes to Inverell line.

With regard to the other estimates asked for, I have gone into the matter in as careful and detailed a manner as I could with the limited time at my disposal. The following are the results :—

Tenterfield to Casino and Lismore.

This line is 121 miles 10 chains in length, and the estimated cost £1,354,564. The ruling grade is 1 in 50.

Glen Innes to South Grafton.

This line is 115 miles 57 chains in length, and the estimated cost £1,660,668. This line has also a ruling grade of 1 in 50, long lengths of which occur in the descent into the Mann River Valley. If a grade of 1 in 40 were adopted for this descent, the length of the line would probably be reduced by 5 miles and the cost by £90,000.

Guyra to South Grafton.

The length of this line is 156 miles 78 chains, and the total estimated cost £1,600,421. The ruling grade for the first 74 miles and for the last 23 miles is 1 in 60. The ruling grade through the heavy country on the Don Dorrigo Reserve and down the Guy Fawkes Range, being a length of nearly 55 miles, is 1 in 40; and it is not possible, without enormously increasing the cost, to put a flatter grade.

SUMMARY.

Line.	Length.	Estimate.	Per mile.
	m. ch.	£	£
Glen Innes to Inverell.....	52 25	313,800	6,000
Guyra to Inverell.....	58 10	313,800	5,401
Tenterfield to Lismore.....	121 10	1,354,564	11,183
Glen Innes to South Grafton.....	115 57	1,660,668	14,351
Guyra to South Grafton.....	156 78	1,600,421	10,195

H. DEANE,
Engineer-in-Chief for Railway Construction.

The Secretary, Parliamentary Standing Committee on Public Works.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

SECTIONAL COMMITTEE.

RAILWAY FROM MOREE TO INVERELL.

REPORT.

THE Sectional Committee appointed on the 29th September, 1896, to inspect, take evidence, and report with reference to the proposed Railway from Moree to Inverell, have the honor to report as follows:—

The Sectional Committee—consisting of Mr. C. A. Lee, M.L.A. (Chairman), Hon. Charles James Roberts, C.M.G., M.L.C., Hon. Daniel O'Connor, M.L.C., Mr. Henry Clarke, M.L.A., and Mr. George Black, M.L.A.—left Sydney by 6.15 p.m. train on Friday, October 2nd, 1896, arriving at Moree on the following afternoon. On Monday, October 5th, and Tuesday, October 6th, the Committee took evidence in the Moree Court-house; and on the following day, Wednesday, October 7th, accompanied by Mr. Charles McDonnell Stuart, supervising engineer, Railway Construction Branch, left by special coach for Warialda. On the journey the Committee inspected the route of the proposed railway, as far as practicable, to Biniguy, and thence to Yagobe and Highland Plain. At this point, 7 miles from Warialda, the Committee left the main road, and visited the site of the proposed railway station, 4 miles south of the township, and also inspected the land north and south of Kelly's Gully, portions of which were cultivated. On Thursday, October 8th, the Committee examined witnesses in the Warialda Court-house, and on Friday, October 9th, left by special coach for Inverell. The Committee followed the originally-surveyed route as far as its junction with the proposed route on the Gunnee estate, arriving at Inverell at 4.30 p.m. the same day. The Committee took evidence in the Court-house, Inverell, on Saturday, October 10th, and Monday, October 12th, and on the following day proceeded to Glen Innes. The Committee took evidence in the Court-house, Glen Innes, on Wednesday, October 14th, and on Friday, October 16th, returned to Sydney, which they reached at 11 p.m.

The Committee's inquiry at Moree embraced the examination of witnesses as to the present settlement of that and the surrounding district, its prospective settlement, and the consumption of flour and other produce. Evidence upon these points was obtained from, amongst others, the chairman of the Land Board, the district surveyor, the leading storekeeper, and several graziers long resident in the district. It appeared to the Committee that the present settlement within the land district of Moree was not sufficiently large to absorb the surplus agricultural products from Warialda and Inverell, and that the fullest settlement of all the Crown lands in the future available could not materially add to the population. Therefore, that the capabilities of the district to absorb in large quantities the products of Inverell and district do not appear capable of much development. Owing to the climatic conditions of the district it did not appear to the Committee that agricultural pursuits could be followed there to any extent. With the exception of some very small cultivated areas the Committee did not observe that agriculture had been attempted. There can be no doubt that the district furnishes a market for a quantity of produce, but, of necessity, it is limited. Whatever the demand, however, it is reasonable to suppose that it will be largely provided for by the railway extension from Narrabri to Moree.

The country eastward of Moree is flat, and is said to be above flood-level from the town to the vicinity of the Mia Mia Creek. From that point, for a distance of about 6 miles, there is evidence that the country is liable to submersion. To avoid these low-lying areas the railway survey has been carried some distance to the south. The flooded country terminates at a point on the Biniguy Run and the survey is then carried to Slaughter-house Creek. From thence to the proposed railway station site at Warialda the serpentine character of the surveyed route is made necessary by the ridgy nature of the country. The banks of the river near Slaughter-house Creek present a small area under cultivation; but between the creek and Highland Plain—which consists almost entirely of ironbark and box ridges, with occasional belts of pine country—the land does not appear suitable for the growth of crops, nor was any cultivation noticed. On Highland Plain, within the Warialda district, the land is held in small settlements, and a fair amount of farming and grazing is carried on. Two miles east of this point the Committee left the main road and passed to the south, through what is said to be the best agricultural area in the Warialda district. The cultivation, at present, is not extensive, but the evidence taken at Warialda is to the effect that it is only in recent years that cultivation has been on the increase. The land appears to be suitable for the purpose, the rainfall is sufficient; and it is probable that wheat and other cereals eventually will be largely cultivated.

The evidence tendered at Warialda was in favour of the proposal both as a means of offering a market for produce and for the transport of wool and stock, which would be trucked from about that point as a convenient centre for a large area of country. The residents object to the proposed railway station being fixed so far from the township, and urge the adoption of the alternative survey, involving an extra expenditure of £10,000, which would bring it within $1\frac{1}{2}$ mile of the town.

The surveyed route from Warialda towards Inverell passes through somewhat hilly country. For the first 8 miles the soil is of a sandy and inferior description. It gradually improves from that point to the Government tank—about half-way between the two places. Thence, the land of Little Plains, through which the line is surveyed, on the north side of the road, is of the best description for agricultural purposes, and so continues to Inverell. The land lying to the north of Inverell and for a considerable distance east is largely occupied by farmers, but a very extensive area of equally good land has not yet been brought under cultivation.

The evidence taken at Inverell extended over two days and was of an exhaustive character. A division of opinion prevailed as to whether the line should be constructed to Moree or Glen Innes. Statistics were presented showing the area under cultivation, the total production, and how the produce is disposed of. From returns presented by Mr. Borthwick, solicitor and landed proprietor at Inverell, bearing the signatures of a number of farmers and landholders in favour of the line to Glen Innes, and by Mr. Howard, secretary of the railway league in favour of the Moree line, may be gathered the nature of the existing division of opinion. The residents at Little Plain, an important agricultural centre about 16 miles west of Inverell, are strongly in favour of the proposal. Although some of them have found a market for their produce in Moree it was impossible to ascertain the total tonnage sent in any year to that market. They declare that the Moree district is the best market for their produce, and that any surplus not there consumed could be advantageously sent by the Moree-Narrabri line to Newcastle and Sydney. Those in favour of the eastern connection are of opinion that the Moree district will afford but a limited market even for present production, and that it is utterly incapable of absorbing their annual surplus. They argue that by connection with the Great Northern Line on the east they would have a shorter route than that of Moree to Newcastle and Sydney, also a choice of markets, and would be enabled thus to supply the deficiency in the wheat production of the whole of New England, from Tenterfield to Armidale.

As Inverell is the district proposed to be served, every means was taken to ascertain whether the proposed line would give the producers an outlet for their produce and enable them to obtain more readily their stores and supplies. It was emphatically asserted that they could not land inwards their goods at the truck rates quoted by the railway traffic manager, and they were of opinion that the estimated
revenue

revenue in this respect would not be reached, inasmuch as goods could be landed by way of the Great Northern Line to Glen Innes, and thence by dray, or by way of the coast and direct by dray, at considerably lower prices.

The Committee are of opinion that the estimated traffic to and from Inverell has not been overstated, and it is probable that with railway communication the increase in the output of agricultural produce alone will be very large. The evidence of the chairman of the local Land Board (Mr. Finley) was to the effect that the settlement in the district—of which he has twenty-five years' personal knowledge—is of a permanent and *bona-fide* character.

The whole of the witnesses at Inverell were loud in their demands for railway communication, and the Committee are of opinion that it would be in the interests of the country to comply with such an universal demand at the earliest possible date.

The Committee endeavoured to ascertain whether the holders of land in the neighbourhood of the proposed line were willing to grant the portions required for railway construction free of charge to the Government. Excepting in a few instances the holders who were questioned on the subject were averse to taking this course. In view, however, of the low price of land adjacent to the railway the cost of resumption would not be excessive. The evidence of the district surveyor at Moree showed that the average value of the land between Moree and Inverell ranged from £1 to 30s. an acre.

The route from Inverell to Glen Innes passes through excellent country for the first 18 or 20 miles. It then gradually commences to rise, and although the land appears to be good settlement is not so close until the neighbourhood of Waterloo Plain is reached, where is situated an extensive valley of rich soil. The rise from that point over the Waterloo Range is rapid. On the eastern slope towards the district of Glen Innes the soil improves in character, and settlement becomes close.

At Glen Innes eleven witnesses were examined, the chief of whom was Mr. Utz, whose extensive business transactions and long residence in the district enabled him to present the most minute details with reference to the demand for produce and the rates of carriage that prevail by every route. He, in common with all the other Glen Innes witnesses, was strongly in favour of a connection between Glen Innes and Inverell, and antagonistic to the present proposal. The question of coastal connection was here made a considerable feature; but, apart from that possibility, the witnesses were of opinion that the Inverell country would be best served by connection with the Great Northern line. The statement was continually reiterated that it would afford to the large producers at Inverell access to all the markets existing south and north of the point of connection.

The actual rates of carriage by all routes were definitely ascertained, and they confirm the evidence given at Inverell to the effect that if that district be connected by rail with Moree the dray traffic now existing between the former town and Glen Innes will continue, and that the revenue expected on the through carriage of goods from Sydney or Newcastle will not be obtained. It was pointed out that the estimate supplied to the Full Committee by Mr. Harper on September 9th—prepared in 1891—relating to the revenue derivable from the carriage of agricultural produce carried at 1s. 6d. per ton over the 54 miles of rail between Inverell and Glen Innes was an exceedingly low one, and could not be justified by the Department in view of their published list of reduced rates, which, for outward freight over this distance is fixed at 5s. 2d. per ton. This statement was confirmed by the production of several railway bills of lading at Glen Innes, proving that for similar imports the published rates had been charged, with an additional 20 per cent. Mr. Harper's appears, therefore, to the Committee to be a marked under-estimate, and although they have not the facts before them to enable them to decide whether the same apparent depreciation of probable returns has been applied to all the other items of Glen Innes-Inverell traffic, obviously, if they have been thus calculated, the estimated revenue would be considerably under that realised by a scale of charges equal to that prevailing elsewhere.

The

The Committee found that the question of coastal connection was to a certain extent involved in the proposal, but, not deeming it their duty to proceed to any of the places north or south of Glen Innes or toward the coast, they closed their inquiry at Glen Innes.

Having carefully examined the proposed route from Moree to Inverell and thence to Glen Innes, and considered the resources and markets of the various districts, the Committee are of opinion that the connection of Inverell with the railway system should be made with the main line at or about Glen Innes. Their principal reasons for coming to this conclusion are as follow :—

That the climatic conditions in the vicinity of Moree are unsuitable for agricultural products—the almost total absence of cultivation at the present time appears to furnish conclusive evidence on that point ;

That this district does not appear to present a sufficient market for the products of the large producing centre of Inverell ;

That to transport *via* Moree, the surplus produce of the latter place to the larger markets of Newcastle and Sydney would involve extra haulage ; and

That Inverell as a great agricultural centre is entitled to the chief consideration in this inquiry.

On Thursday, October 15th, the Committee met, and Mr. Roberts moved :—

“That it is desirable that the line of railway from Moree to Inverell, referred to the Committee by the Legislative Assembly, be constructed at a cost not exceeding £2,898 6s. per mile, exclusive of land resumption and compensation.”

Mr. O'Connor seconded the motion, which was negatived on division, as follows :—

Ayes, 2.
Mr. Roberts,
Mr. O'Connor.

Noes, 3.
Mr. Black,
Mr. Clarke,
Mr. Lee.

16 October, 1896.

CHARLES A. LEE,
Chairman.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

MINUTES OF EVIDENCE.

RAILWAY FROM MOREE TO INVERELL.

[TAKEN BEFORE THE SECTIONAL COMMITTEE.]

MONDAY, 5 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Moree, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G. }
The Hon. DANIEL O'CONNOR. }

HENRY CLARKE, Esq.
GEORGE BLACK, Esq.

The Sectional Committee proceeded to consider the proposed Railway from Moree to Inverell.

Mr. Percy Ernest Stirton, Mayor of Moree, sworn, and examined:—

1. *Chairman.*] How long have you resided in Moree? Six years.
2. Where were you residing before coming here? In Inverell.
3. Are you fairly well acquainted with both districts? Yes.
4. How long has Moree been incorporated? Five years; it is a municipal district.
5. What is the population within the municipal boundaries? About 2,000.
6. Has there been any increase in population since the completion of the line from Narrabri to Moree? A slight increase.
7. Has there been any increase in the number of buildings in the town? Yes.
8. Has that been occasioned by the recent extension of the railway or is it due to general causes? There has been a gradual increase; but I think the fact of the railway coming here has brought a number of people who otherwise would not have been here. A few new stores have been opened, and business people have arrived.
9. Has there been any agitation on the part of the Moree people for the extension of the railway to Inverell? No; no public meetings have been held.
10. Has no public expression of opinion been given? No.
11. Do you desire to offer an opinion in your official capacity which would voice the feeling of the residents? I would rather not; the residents are here, and I understand the Committee will take any evidence from them.
12. What is your opinion as to the wisdom of extending the railway to Inverell? I think it would benefit the district. Hay, chaff, and farm produce of any kind is very dear, because we cannot grow that kind of produce ourselves. We sometimes suffer from severe drought. If the produce could be landed here cheaply, it would be a great thing for the district.
13. Do you think the construction of the line would lead to an interchange of products, and offer a market for the producing country of Inverell? Yes; I think Moree would be a market for Inverell. I do not think, however, we should send much from here to Inverell.
14. *Mr. Black.*] Do you favour the construction of a railway chiefly on local grounds? Yes. Of course, I cannot say whether the line would pay or not, but it might.
15. Do you think there is any likelihood of it paying? I could not offer any opinion.
16. Would the principal course of traffic be the trade between Moree and Inverell, and the intermediate trade? I think it would, unless the Railway Commissioners induce the Inverell people to get the whole of their produce from the northern line. Otherwise, it would come through this way.
17. Do you think it is likely any quantity of produce from Inverell would be carried on to Sydney? Not by this line.
18. Do you think the products of Inverell—fruit, wheat, &c.—could be landed in Sydney more cheaply from equally-favoured districts which are in closer proximity to the metropolis? I should not think so.
19. If that is your opinion, your belief that the railway is likely to pay must arise from the idea that it will encourage a local trade between here and Inverell? And west, of course.
20. You think the construction of a railway would increase the traffic between here and the Queensland border? I think it will.
21. In what way? In produce.
22. You think that the produce will come from Inverell? I think it will, to go north.
23. Do you think produce from Inverell—taking Moree as the centre of distribution—can be landed in Moree as cheaply as can produce from Tamworth? My opinion is that it should. My business, however, does not allow me to enter into figures of that kind; others will be able to supply the information.
24. You have said that the construction of the railway will probably entail an increase of traffic out west—do you mean in the direction of Walgett and towards Mungindi? Probably towards Mungindi, and in the direction of Walgett.

- Mr. P. E. Stirton. 25. But are not the people in the direction of Mungindi compelled to obtain their supplies from Moree now? Yes.
- 5 Oct., 1896. 26. Do you think the construction of a railway will increase their capacity for consuming products? Yes.
27. In what way? If the people west, or towards Mungindi, can, by the construction of the railway, obtain their produce at a reasonable figure, the price of produce will become very much cheaper than it is now, and there will be greater consumption.
28. Do you think the people would consume products in sufficient quantities to warrant the construction of a railway 5 or 6 miles inland? I do not say that.
29. I suppose the wool produced in the direction of the Queensland border usually comes this way—at all events, since the railway to Moree has been constructed? I believe most of it does.
30. And the construction of a railway to Inverell is not likely to draw any more wool towards the line unless it be diverted from the Great Northern line? No; I do not think so.
31. Do you know anything of the rainfall of the district? I think we get 23 or 24 inches a year.
32. Do you think the rainfall at Moree is as good as the rainfall at Inverell? No.
33. If Moree had a rainfall equal to that of Inverell, I suppose this would be a very fair agricultural district? Our average may be equal to that of Inverell, and still we may not have such good agriculture. Inverell can depend upon its rain at suitable periods; here we get heavy irregular rains. A large quantity may fall, and then we may have none for a considerable time.
34. Have you not good spring rains? We have not had any this year, nor for many years.
35. Do you know the country between Moree and Inverell? Yes, very well.
36. Is it good for agricultural purposes? Yes; as you go towards Inverell.
37. Are you aware that in the near future a large quantity of land will be thrown open between Moree and Inverell—land which is now held as pastoral lease? Yes.
38. Can you give any information as to how that land would be taken up if it were available? The land in the district has been thrown open since the passing of the new Act principally as settlement leases, and I suppose the other will probably be thrown open under the same conditions.
39. If a line were constructed between Moree and Inverell, would it not afford a great inducement to people to take up land? I should think so.
40. How is the land out west occupied? Principally by pastoralists and selectors.
41. I suppose the construction of the proposed line would increase the importance of Moree, and would be a great advantage to the people out west, inasmuch as they would have railway communication as far as it went, and then they could make use of their teams? Yes.
42. Is there a strong desire on the part of the people of Moree for the railway? Not at the present time. They have obtained the line from Narrabri quite recently, and they seem to be a little indifferent at present.
43. Notwithstanding that, you believe the line would be an advantage to Moree? I should think so.
44. And it would encourage settlement around Moree? Yes.
45. *Mr. Roberts.*] To what extent are the people of Moree municipally rated? One shilling in the £.
46. Is the local council in a sound financial condition? Yes; we have no loan.
47. I notice that artificial water has been successfully tapped here? Yes.
48. What is the depth of the bore? Nearly 3,000 feet.
49. Is the water from it utilised in any way? Not at present.
50. Is it suitable for drinking or general domestic purposes? Yes; the report we have upon it is a very good one.
51. Do the Council contemplate coming to any arrangement with the Government with a view to supplying the people of Moree with water from the bore for domestic purposes? Yes. An engineer from the Water and Sewerage Department has been here, but his report has not been sent in yet; when it comes in the question as to the advisability of supplying the town with water from the bore will be brought before the Council.
52. Is it true that the Council contemplate lighting the town by electricity? Yes.
53. Have you considered where you will get the necessary power from? By engines.
54. Will the bore be of any use to you in that respect? We have had a report to the effect that there is not sufficient power. There is sufficient power to light a certain part of the town, but not sufficient to light the whole.
55. Is Moree in a fairly prosperous condition at the present time? Yes.
56. Is it likely to improve when the railway is opened from Narrabri to Moree? I think it will improve gradually.
57. I understand you are in favour of the proposed railway from Moree to Inverell? I am in favour as far as the Moree district is concerned.
58. What advantages do you think would be likely to accrue from Moree being connected by railway with Inverell? We should obtain produce from Inverell, which is an agricultural district.
59. Do you think it is likely that produce will be brought from Inverell to the people of the Moree district at a lower price than they are paying for it? I think so.
60. Can you say where the principal market for Inverell produce will be if the proposed railway is constructed? I think there will be a large market west. I will not say that the west will consume the whole of the produce.
61. Does "west" include Moree, which is due west of Inverell? Yes.
62. Do you think the produce will go still further west? I think so. I also think it would go north from here.
63. How far is it from here to Collarendabri? Seventy-five or 80 miles.
64. Would Inverell produce be likely to go there if the proposed railway were constructed? I do not know that it would go that distance.
65. Has there been a survey of the line from this district to Collarendabri? No. There has been one from Woollahra but not from Moree.
66. How far is that from Moree? Half-way between here and Narrabri—about 30 miles from Moree.
67. Do you know when that survey was completed? No; I think it is going on now.
68. Is this what may be termed a purely pastoral district? Yes.

69. I suppose the principal traffic from here to Sydney is in the shape of wool? Yes.
70. Are you in a position to say whether, if the proposed line is constructed, any additional traffic will come to New South Wales which now goes to Queensland? No.
71. Is any quantity of stock trucked from Moree at the present time? There has been stock trucked, but the facilities for trucking are not very good, on account of the Commissioners not having taken the line over. The yards have not been finished.
72. Is it likely that a large amount of stock will be trucked when the line is open to the public? I think so.
73. Is it a fact that the people of Moree are indifferent as to the construction of the proposed railway? I think they are.
74. Is that on account of the fact that Moree is now a terminus? I think that is one reason.
75. Is there a fear that some of the traffic which now comes to Moree may go to some other town? I think that is another reason.
76. Viewing the matter from your individual standpoint, you think it would be wise in the interests of the Colony to connect the town and district of Moree with the fine agricultural district of Inverell? I think it would.
77. *Mr. Clarke.*] Is the country about Warialda good agricultural country? I believe that parts of it are.
78. Is the land about Moree equal in quality to that at the eastern end of the proposed land? I think so.
79. I suppose the reason the land in the Moree district is not well adapted for agricultural purposes is the want of a regular fall of rain? Yes; the land is as good as any other, but the great drawback is the irregular rainfall.
80. Is there much traffic between Glen Innes and Moree? I do not think so.
81. Is there much traffic between Inverell and Moree? At times.
82. What does it consist of? Of produce from Inverell, such as chaff, flour, and corn.
83. I suppose that any surplus of produce, after the wants of the district and of the north and north-west have been supplied, will have to find a market in Sydney or Newcastle? I understand they are finding a market for it now on the Clarence and towards Grafton. I have no doubt they will still find a market there. The fact of the railway coming here will not stop that market.
84. If the line is constructed from Moree to Inverell, do you think it will be in the public interests to continue it to Glen Innes? No doubt.
85. If the line is constructed from Moree to Inverell will produce be sent to the coast? I think so.
86. Would the people obtain produce from the coast—such as sugar, &c.—in exchange for hay, corn, chaff, &c.? Probably.
87. Do you think the construction of the proposed line would induce the people on the Queensland border to send their wool to Moree or Inverell? It might meet the line between Moree and Inverell, but I could not say positively.
88. I suppose you are aware that the Queensland Government imposes an export duty of £2 10s. a ton on wool coming into New South Wales? I believe so.
89. Do you think very much wool will come from Queensland to this Colony under those circumstances? Not so long as the duty remains on.
90. In that case you would not get much wool except from the country between here and the boundaries of Queensland? Yes.
91. Do you think any portion of the wool produced west of Warialda would come to Moree or go as formerly to Tamworth *via* Manilla and Bingera? I think it would come to Moree.
92. Even if the proposed line to Inverell be not constructed a great deal of the wool would come to Moree as it does at the present time? Yes.
93. To where would any surplus which did not find a local market or a market on the coast go? It may find a market in Queensland; at the same time I am not in a position to answer that question.
94. Does not the water from the bore contain a great deal of soda or alkali? The report upon it is to the effect that it is fit for drinking purposes.
95. Do you think it could be used for irrigating grazing country? It might be.
96. Would the expense be great? Of course it would.

Mr. Colin James McMasters, Chairman of the Land Board, Moree, sworn, and examined:—

97. *Chairman.*] How long have you been in Moree? About eleven years, but I have been in the district for twenty years.
98. *Mr. Black.*] What is the nature of the holdings between Moree and Inverell? The whole of the pastoral leases have not yet expired. There is a number of selectors, some grazing farms and some agricultural farms.
99. Is there a good deal of freehold land? Yes, in the neighbourhood of Inverell.
100. How are the freeholds utilised? Principally for grazing.
101. In the event of a large influx of settlement due to the construction of a railway, will there be any difficulty in those interested getting land? There would be no difficulty. Of course the usual time would have to expire before the land would be thrown open.
102. That is eighteen months in some cases? Yes. They are falling in at different periods during the next four years.
103. Are you of opinion that any large quantity of land around Moree—say for 60 or 70 miles in the direction of Inverell—is likely to be used for agricultural purposes? Yes, you would get into the verge of the agricultural country 50 or 60 miles away.
104. I want to strike the verge of the country which ceases to be purely pastoral, and becomes agricultural? Following the projected railway you would get into agricultural country within 30 miles of Moree; but the margin between the agricultural and pastoral land does not run rectangularly across the line. The railway almost follows the course of the river, and the river flats within 20 or 30 miles of Moree are agricultural. When you get away from the river it is not so suitable for agriculture.
105. You think, then, it is the character of the soil more than the climate which controls its suitability for agriculture? To a great extent. The immediate banks of the river, to a small extent, are suitable for agriculture at Moree itself; but they are so limited that it is not worth taking them into consideration.

106.

Mr.
P. E. Stirton.
5 Oct., 1896.

Mr. C. J.
McMasters.
5 Oct., 1896.

- Mr. C. J. 106. Is not the soil about Moree sufficiently good for agriculture if you had a well-distributed rainfall? Yes; but we have not that, and we have not had it during my experience of the last eleven or twelve years.
- 5 Oct., 1896. 107. What is the average rainfall? Nearly 30 inches.
108. If they can grow wheat at Riverina with a rainfall of 20 inches, ought you not to grow it in Moree with a rainfall of 30 inches? I do not think the black soil is suitable for it.
109. Is there no red soil here? It is limited in extent.
110. The soil, I believe, is rather heavy, and not sufficiently friable for the growth of wheat? I think it cracks too much—it cracks right down, sometimes for 2 or 3 feet.
111. After you pass the limit of land unsuitable for agricultural purposes, which you fix at 30 miles eastward from Moree, do you not strike agricultural country? Yes; you strike wheat, and fruit-growing country.
112. Do you think the soil claims that character for the intervening 66 miles, from the point you named, to Inverell? I know it does.
113. And beyond Inverell to the other side? Yes, right up to Glen Innes.
114. Assuming there is a market for produce to be found readily, it is fair to believe that the construction of the proposed railway will incur its agricultural settlement along the route? I think it would. It would turn grazing lands into agricultural lands.
115. If that takes place, where do you think a market will be found for the produce? There will be a local market, and a market in the western districts.
116. Is it probable that there will be any local market further south than Narrabri? I think very little produce will go to Narrabri.
117. Would any go beyond it? I think not.
118. Then the area to be served by the Inverell produce would be bounded possibly by the Macintyre on the north, by the Barwon on the extreme west, and by Narrabri and Bundarra on the south? Yes, if the line came to Moree—excepting that, perhaps, some country in Queensland north of Mungindi would be supplied, but not to a great extent.
119. I suppose there might be a trade done with Queensland, about the border, unless that part of the country should be tapped by a railway from Warwick? Quite so.
120. I suppose, in any case, railway or no railway to Inverell, Moree will be the great distributing centre for most of the area, especially northwards? Undoubtedly. Any extension of the railway westward from Moree would very materially increase the market to Inverell.
121. Do you think it would be advisable to carry the line westward from Moree? I do not say that, but if it were carried westward there would be an immense market opened up for Inverell produce—I refer to an extension of the Barwon.
122. To any particular place? I think I know the best place to which a railway should go. It should strike the head of the navigation, and go through country most suitable for railway construction.
123. Do you think there is likely to be an objection on the part of the Railway Commissioners to connect the proposed line with the Barwon River? I cannot see how it would interfere with them; they would get the extra haulage of produce to the west which would otherwise not exist.
124. Do you not think that produce is likely to go west in any case? I do not think so.
125. Supposing Moree were connected by rail with a navigable river. Whilst that river is running, Moree is likely, instead of bringing her goods direct from Sydney, to take advantage of the cheap rate of carriage on the river, and convey them as far as the head of the navigation and send them along a short railway? It is possible that might take place.
126. Do you think the Commissioners would be likely to recommend a railway of that character? I am not looking at it from the standpoint of the Railway Commissioners; the extension of the line westward would make a tremendous market for the produce of the hill country, with the prospects of some return loading.
127. Are there any small centres in the vicinity of Moree, and towards the Barwon, which are likely to become places which would largely consume the products of Inverell? I do not think I could locate any centre. Of course there is considerable population between here and the Barwon. The holdings are occupied in a great many instances in areas of 2,660 acres.
128. There are no growing townships? No, and I do not think there are likely to be to any great extent. There is some settlement at Collarendabri.
129. Is there no prosperous township between Moree and Inverell? No, except off the line a little, towards Bingera, which is a prosperous centre. I do not think the line will tap any traffic south of Bingera.
130. It is not likely to tap any as far south as Barraba? No. You were asking me what would be done with the produce. I intended to say that new products would arise if the line were extended to Inverell. For instance, the dairying industry would be developed.
131. Where would be the outlet for the dairying products? The market of the world.
132. Do you think it would pay to carry dairying products to Sydney as a centre? Yes, I think so.
133. Do you think the people of Inverell, where I suppose we have one of the most suitable climates in the world for fruit growing, could direct their attention to fruit growing? They certainly could. There is an unlimited range of country suitable for fruit growing.
134. Would the proposed railway be much used for the carriage of stock? Stock would come through Moree from the Inverell district.
135. But would they come by railway or be driven? I think fat stock would be trucked. To a great extent that would depend upon the seasons.
136. Is there much feed, as a rule, on the stock route between Moree and Inverell? They are fairly well grassed.
137. I suppose, like most other stock routes, it is over-travelled? There is not a great deal of stock travelling between here and Inverell.
138. If it is not over-travelled, I suppose it is kept pretty bare by the people in the vicinity? I know it is not fenced off.
139. *Chairman.*] Are not these travelling stock routes let under annual lease? No; only in some few instances in the vicinity of the towns.

140. *Mr. Black.*] Has not the ordinary stock route as much herbage upon it as Macquarie Street? I do not think it applies to this district. There are good travelling stock routes from the Queensland border to this district in every direction.

141. I believe that in ordinary seasons, when there is no interference with the traffic, large numbers of cattle travel between here and Queensland? Yes; some come in here and some by way of Warialda.

142. Do you think they would be trucked? No; as a rule they are store stock which are sent here for fattening.

143. But eventually they will be carried over the railway? Yes. They are absorbed in this Colony as a rule.

144. I suppose there is a fall in the number of stock arriving here owing to the tick trouble in Queensland? I should think so?

145. What are the boundaries of the land district of Moree? The boundary between here and Inverell is about 18 miles this side of Inverell—the Big Plain. Then it extends northerly to the Queensland border, and follows the Queensland border and the Barwon.

146. How far west? About 150 miles from here. The Narran is the western boundary. The extreme southern boundary is the Macquarie. This district includes Walgett.

147. Is the whole of the country between Moree and Inverell taken up? No.

148. Is the best land taken up? I think the best land has been alienated.

149. What is the nature of the holdings? At present they are almost entirely pastoral holdings. Until you get near to Inverell the land is used almost entirely for grazing.

150. Are there many selections? Not many; they have changed hands in some instances and have been formed into large estates. Within 15 miles of Inverell the holdings are small, but on this side of that distance they are large, and the land is used for grazing purposes. Within 15 or 18 miles of Inverell they are used for agricultural and grazing purposes. Of course, east of Warialda you get into farming country within a few miles of the railway.

151. What are the chief products of the district near Inverell? Wheat and maize in equal proportions.

152. Is there much wine produced in the district? Yes; but not as much as there ought to be.

153. Is the district particularly adapted for the growth of the vine? Yes, and it makes a strong wine—something like an Albury wine.

154. If Inverell were connected with the railway system of the Colony, do you think the growth of vines would be encouraged to a large extent? I should think so.

155. Are you in a position to say that the want of railway communication has prevented the growth of vines to any extent? I could not say.

156. I presume you are thoroughly familiar with this district? Yes; I was a surveyor in the district for many years. I think I know the whole of the north-western part of the Colony very well.

157. Have you given any consideration to the proposal to connect the town of Moree with Inverell? Yes; not necessarily the town of Moree, but the district.

158. Do you think, in the interests of the Colony, this would be the preferable route along which to bring Inverell produce to market? Yes; I think the Inverell market is westward.

159. Towards Moree and west of Moree? Yes; it is a market, of course, which will have to be met; at present very little produce is used because people cannot afford to use it.

160. Is that owing to the cost of carriage? Not only to the cost but to the uncertainty of carriage.

161. Is that due to the bad state of the roads? Yes.

162. What is the state of the roads between here and Inverell? Fairly good now. The worst parts are metal, but the road is not a good one altogether for heavy traffic.

163. Has there been a large expenditure of money on the road between Moree and Inverell? Not much, but a considerable amount has been spent between Warialda and Inverell.

164. Would the character of the country between Warialda and Inverell, necessitate a larger expenditure on the maintenance of roads than it would between Moree and Inverell? Yes, the whole of that country would be required to be macadamised.

165. Can you give an opinion as to any increased traffic which would come if the railway were constructed? I do not think you would gain much. I think you would retain what you at present have rather than gain any new traffic.

166. Do you know whether any of the squatters resident on the New South Wales side of the Queensland border send their wool to Brisbane? I understand that several do. I have also heard that it is their intention when the Government take the Narrabri-Moree Railway over to send the wool this way. Some of them made their arrangements before they knew what the contractors terms were.

167. Then it is fair to assume that a large amount of traffic which now goes to Brisbane would come to Sydney by way of Moree or Warialda? Yes.

168. Of course it would depend on which would be the nearest railway station from the Queensland border? Yes, the greater part of it will come to Moree.

169. I suppose some would go to Inverell? I do not think any would go there.

170. Would there not be a large amount of stock trucked at Warialda? In certain seasons there would be.

171. Do the wet seasons of this district come at any certain periods of the year, or is it a rainfall that may be termed uncertain? It is a very uncertain rainfall. Sometimes the winters are wet, and sometimes the summers are wet.

172. In giving your opinion to the effect that you think it would be desirable to connect Moree and Inverell by rail, have you considered the other route which was suggested a short time ago, viz., a connection between Inverell and Glen Innes? Yes, I know that country very well.

173. And of the two you prefer a line by way of Moree? I think it would be better.

174. Do you come to that conclusion because you know there is a large market to the west of Inverell for Inverell produce? That confirms my opinion.

175. *Mr. Clarke.*] Are you aware that the proposed line will run more or less through alienated land? Yes.

176. Do you think the land-holders would be inclined to give the land required free of charge to the Government? I should think they would; I know what I would do if I were in the same condition.

177. Do you think the construction of the line would increase the value of their properties? Yes.

Mr. C. J. Masters.

5 Oct., 1896.

Mr. C. J.
McMasters.
5 Oct., 1896.

178. If the line is constructed the distance from Inverell to Sydney will be 512 miles? I believe so.
179. Do you think the produce grown here could compete with the wheat and the other produce grown in the Riverina district, from which district the carriage to Sydney is less? I do not think so.
180. Do you think many fat cattle and sheep would be sent from the west of Moree and Inverell to Newcastle or Sydney? I think so.
181. Do you think it would be cheaper than driving them? It would depend upon the seasons. If there were no grass on the stock routes they would truck them. In times of extreme drought there would be a certain amount of traffic from here to New England.
182. Do you think the construction of the proposed line will be the means of introducing more traffic for the seaboard, and from the seaboard to the tableland? I do not think it would very materially affect that traffic.
183. Are you aware that produce sent to Grafton and from Grafton to Inverell can be carried by teams at a lower rate than by the railway? I have heard so—for certain classes of goods.
184. Would that competition exist even if the railway were constructed? I think so.
185. Do you think the estimated loss upon the line of £2,800 per annum would be reduced in a reasonable period? I think so. If that is the first loss I think it will soon be overtaken, and the line be made to pay.
186. Are you aware of the proposal to construct a line from Tamworth to Manilla? Yes.
187. Do you think that line will take any traffic from the proposed line? I do not think it will materially affect it.
188. Do you think that line would take the traffic from Bingera? I think so. I think Bingera would be about the changing point.
189. *Mr. O'Connor.*] How far does the district over which you preside extend? 150 miles west, 230 miles south-west, 80 miles north, and about the same east.
190. What are the characteristics of the country? It is both pastoral and agricultural. The western portion of the district is purely pastoral, the eastern portion is agricultural.
191. What is the nature of the settlement? In the western portion it is all pastoral settlement. In the eastern portion there is a small extent of agricultural settlement.
192. And what is the character of the country between Moree and Inverell? It consists of rich alluvial soil on the flats, and red soil of basaltic formation on the hills.
193. Do you know anything of the country between Inverell and Guyra? Yes; I have not a very high opinion of it; it is not as good as the country on this side of Inverell.
194. Have you formed any opinion as to the necessity or otherwise of connecting this district with Inverell, with the object ultimately of continuing the line to the sea? I have thought over that matter, but the contingency is a very remote one—one which we cannot take into consideration at present.
195. Are you aware that 500,000 acres of land between Moree and 20 miles on this side of Glen Innes, will within the next three years be available for settlement? I am not aware of that fact.
196. What is your opinion of the land between Inverell and Glen Innes? It is a superior class of country.
197. It is well adapted for agriculture? A great portion of it is.
198. Is there any desire on the part of the people to acquire land for agricultural purposes between Moree and Inverell and between Inverell and Glen Innes? I have never heard an expression of opinion to that effect.
199. If land is available in this district within the next three years, will not the construction of a railway between Inverell and Glen Innes, or between Inverell and Guyra prove a great stimulant to men who are now apathetic? I think it will in time, but I do not think the time has arrived. There is no market for the produce at present. After the railway is constructed, I have no doubt there will be a rush for the land.
200. What is to prevent people in this district doing what they have done with such advantage elsewhere, where they have erected mills, and where thousands of acres of land have been taken up within the last three or four years? There is nothing whatever to prevent them.
201. What is your opinion with regard to the future of this district? I think there is a grand future for it.
202. Do you raise sheep or cattle principally? Sheep.
203. If a line were connected from Moree to the seaboard what is there to prevent the erection of slaughter-houses and chilling works, so as to enable you to export chilled meat to Europe? There is nothing to prevent it.
204. Could it be undertaken if the people had the facilities? I understand that something of that kind has been undertaken here now.
205. I suppose if the facilities are offered there is nothing to prevent people doing here what is done in other places? Certainly not. We lack enterprising people.

Mr. John McDonald, grazier, Moree, sworn, and examined:—

Mr.
J. McDonald.
5 Oct., 1896.

206. *Mr. Roberts.*] What is the area of your property and the nature of your holding? It is a pastoral holding—partly freehold and partly leasehold—about 8 miles from Moree. I have 35,000 acres of freehold, and about the same quantity of leasehold.
207. How many sheep do you run? 60,000.
208. To where do you send your wool? To Newcastle.
209. Do you truck from Moree? I have done so this year.
210. Is Newcastle your principal market? Yes, for exporting.
211. Is your wool shipped from Newcastle direct to London? Yes, it goes direct from Newcastle.
212. Does the proposed line run through your property? Yes, through part of it.
213. For what distance? Seven or 8 miles.
214. In the event of the line being constructed, would you be prepared to give the land required free of cost? No; I do not think I ought to be called upon to do so. I have paid for the land, and expect to get all the benefits out of it.
215. Can you form a rough estimate of the amount of compensation you would require? I scarcely think the line would touch any of my land. It goes through the leasehold belonging to the Crown.
216. When does the lease expire? In about two years.
217. Would the construction of the line be of any great advantage to you individually? I do not think it would, on account of me being within 8 miles of Moree.

218. If there were a station nearer than Moree, would you be likely to make use of it? Yes.
- 218½. Have you formed any opinion as to the desirableness of the State constructing the proposed line? Yes. I do not think it would be advisable to construct it.
219. On what grounds? I do not think it would pay.
220. When you say that, have you considered all the elements of traffic which might be brought to the line? I have only considered the traffic which I know has been in the habit of coming—not what may come. The last two years have been very bad seasons here, and a good deal of produce has come down; but prior to that little or no produce has come from Inverell. With the grass growing over the track between Moree and Inverell you would not see any traffic.
221. Are you familiar with the country between Moree and Inverell? Pretty well.
222. Is not the Inverell district remarkable for the fertility of its soil? Yes.
223. Do you think the time has arrived when Inverell should be connected with the railway system of the Colony? Yes; it should have been connected long ago.
224. By what route do you think it should be connected? From Tamworth *via* Manilla, Barraba, and Bingera.
225. In forming that opinion, have you considered the nature of the country between Barraba and Inverell? No. I have no doubt the construction would be costly.
226. You merely form that opinion on account of it being nearer the metropolis? Yes; and the country is more suitable for agricultural settlement.
227. Do you not regard the country between Warialda and Inverell as well adapted for agricultural settlement? No; not until you get about 15 miles from Inverell.
228. Is that one of the reasons why you do not view with favour the construction of the proposed line? Yes; that is my sole reason. I do not think the country is good enough for agricultural purposes.
229. But you are firm in your opinion that Inverell should have a railway? Yes.
230. If a railway from Inverell to Moree could be constructed at a lower cost than a railway by any other route, would you not think it desirable that such a railway should be constructed, in view of the large amount of agricultural produce which would come from Inverell? No; because the extra distance always to be travelled over would be a factor against the construction, even if it were cheaper.
231. You think the fact that the produce would have to be carried over 509 miles to Sydney is an objection? Yes.
232. Is it a fact that a large market for Inverell produce can be found to the west of Inverell without the necessity of sending to Sydney? No doubt a good deal of produce would come westerly; but the bulk of the produce hitherto has been coming from Bingera and that district.
233. How far is it from Moree to Bingera? 60 miles.
234. What produce do you get at Moree from Bingera? Flour, corn, bran, chaff, and potatoes. Whilst Bingera is only 60 miles away, Inverell is 100 miles away.
235. Would not that distance by road be too far to expect Inverell to send its produce this way with a view to finding a market? It is too far.
236. But if a line were constructed, would not a large market be opened at Moree, and west of Moree, for Inverell produce? No doubt it would.
237. In view of that fact, do you not think it would be wise to connect Moree and Inverell by rail? No. I think we can get produce at a reasonable price from Bingera and Tamworth, and from the settled district on this side, and east of Bingera.
238. Do you know the country between Warialda and the Queensland border? Yes.
239. Is it all good grazing country? Not all of it. There is a good deal of worthless scrub land.
240. Is there a large amount of wool coming from the stations near the Queensland border, on the New South Wales side? Three or four stations produce a fair quantity of wool.
241. Do you think if the proposed line is constructed any increased wool traffic will come by it? No, excepting what goes to the Great Northern line. If it came here it would not go on the Great Northern Line.
242. Is there not any wool on this side of the Queensland border which goes to Brisbane? I do not know of any.
243. When the railway is opened from Moree, will there be a large amount of fat stock going from Moree to Newcastle or Sydney? Not unless the season is bad; they will travel them.
244. Do they find a market in Armidale from this district? No; they all go to Sydney. In good seasons they would travel to Gunnedah, Breeza, and Quirindi—sometimes all the way. In dry seasons, when there is no grass, they would have to be put upon the trucks at the nearest railway station.
245. *Mr. O'Connor.*] How long have you been in the district? Twenty years.
246. When you say you are not favourable to the construction of the line you speak from a national standpoint? Certainly.
247. The want of the line will neither convenience nor inconvenience you? No.
248. Are you aware of any line in the Colony which paid when it was first opened? No.
249. Do you think the construction of the line will attract settlement? I think it will.
250. What is the character of the country between Moree and Inverell? Some good, some bad, and some worthless. The bad land is dense scrub country.
251. Could that be utilised? Yes; by spending capital upon it to clear it.
252. Do you think it would be an advantage for this district to be connected by railway with the sea? A great advantage.
253. If the cost of sending your cattle or sheep to market is reduced it will be a great advantage to you? Certainly.
254. *Mr. Clarke.*] You have stated you disapprove of the construction of the proposed line on account of the fact that it will not pay? Yes.
255. You think a line continued from Tamworth and Manilla through Barraba to Inverell would be better than the one proposed? I think it would serve the country better, and would go through a country which is more likely to have closer settlement than between here and Inverell.
256. Supposing the line be constructed to Inverell, would you approve of it going to Glen Innes and some part of the coast? I have not a knowledge of the country on the other side of Glen Innes.
257. Do you think it would be in the public interest for the coast district and the west to have an interchange of products? Certainly.

Mr.
J. McDonald.
5 Oct., 1896.

- Mr. J. McDonald.
5 Oct., 1896.
258. Would it be an advantage for direct shipment to be made from Grafton or Coff's Harbour, rather than from Newcastle or Sydney? Yes.
259. Are you aware that in the other colonies railways are constructed from the interior to the coast? Yes, particularly in New Zealand.
260. Do you consider that a good plan? Yes, although in some places they found it very expensive.
261. In view of the uncertainty of the rainfall, do you think it probable that agriculture would be entered into in this district to any great extent? I do not think it would.
262. Mr. Black.] Would not the construction of a line from Tamworth through Bingera, to Inverell, necessitate the erection of an expensive bridge over the Namoi at Manilla, another at Barraba, and lesser bridges *en route*? Yes, and one at Bingera.
263. Is not the country hilly after leaving Manilla? It is.
264. And is it not poor country after leaving Barraba? It is.
265. Then it is not likely there will be much freight from intermediate parts on a line between Barraba and Inverell unless it is of a metaliferous character? Generally, agricultural settlement follows a railway, and there ought to be a good deal around Bingera. They are at present growing produce very largely about Bingera.
266. Do you not think that over that country a railway would cost 100 per cent. more per mile than one constructed over this level country? I should not think it would cost as much more as that—probably 50 per cent. more.
267. And the cost of maintenance and haulage would be greater? Yes, the grades would be steeper.
268. Is it not a fact that the construction of a railway usually increases the value of land, particularly in the neighbourhood of a town? Yes.
269. And if the construction of the railway would increase your 35,000 acres of freehold 10s. per acre in value, which would be £17,560, and it were necessary for its construction that the State should resume 10 acres of your land, do you not think it would pay you to give the 10 acres? Yes, if your calculation were based on facts.
270. Would you be sufficiently grateful to the State to give them the land free, in return for it putting all that money in your pockets? Yes; I think I should be entitled to meet their views in that way.
271. The proposed railway runs through Crown land so far as you are concerned? Yes.
272. For what distance? Seven or eight miles.
273. Does it run through sheep-paddocks? Yes. All through sheep-paddocks.
274. Will it interfere with the access of your sheep to water? Not much.
275. Where do you send your stock to? The stock to Sydney and the wool to Newcastle.
276. Would you truck your sheep at Moree if the proposed line were constructed? Not if there is grass on which to travel them, because rates are too high.
277. You think the deterioration caused by travelling them long distances is compensated for by the saving in railway carriage? Yes.

Mr. William Henry O'Malley Wood, District Surveyor, Moree, sworn, and examined:—

- Mr. W. H. O'M. Wood.
5 Oct., 1896.
278. Chairman.] How long have you been a resident of the district? Since June, 1890.
279. Mr. Clarke.] Are you acquainted with the country along the route of the proposed railway? I only know the country as far as the Land Board District goes—that is a little beyond Warialda, at a point marked 395 miles on the railway survey.
280. What kind of country is it between Moree and that point? From Moree to Yagobe the country is pretty level; some of the soil is rich black soil. There is some red soil. Some of the country is scrubby and some open plain.
281. Is any portion of the land you have described fit for agriculture? I think the frontage lands to the Gwydir River would be fit for agriculture, but it would be rather too costly to clear in many places.
282. Is it adapted for agriculture in all seasons? Some seasons would be too dry.
283. Is the country more fitted for pastoral than for agricultural purposes? Yes; the open country is good grazing country in nearly all seasons.
284. Is it fitted for agriculture without a good rainfall? The average rainfall is good enough, but it is uncertain.
285. Although the land is good, the drawback is that you cannot depend on the rainfall? There are, however, some farmers this side of Yagobe who have made their living out of agriculture for some years past.
286. Do you think the country is adapted to irrigation? Yes, it is, between here and Yagobe.
287. Are you of opinion that irrigation would answer for grazing purposes? I should not think so.
288. Do you know that there is a large quantity of alienated land through which the proposed line would pass? Yes.
289. Can you say whether the landholders would be prepared to give the land through which the proposed line would pass free of charge to the Government? I cannot say. I might point out that in this district there is comparatively little alienated land. The chief part of the alienated land is at the Inverell end. There is some in the parish of Hadleigh.
290. Is it under lease at this end, or is it freehold? It is chiefly under lease. I should think they ought to give the land free of cost, but I do not know what the views of the holders are.
291. Do you think it would be possible for agriculture to pay up to the point you have described? I only spoke just now of the frontage country to the Melhi, extending as far as Yagobe. I think the frontage country would pay to grow maize and similar crops.
292. Even with the present uncertain rainfall? Yes; I do not think it pays very well, but still it does pay. A limited number of farmers have done very well out of it.
293. Do you think they would be able to compete with other portions of the Colony where they have a more abundant rainfall and a cheaper rate of carriage to Sydney? I do not think it would pay the people to send their produce from that particular part of the country to Sydney. It has paid owing to the high prices lately obtained locally, the consumption being wholly local.
294. Would the quantity grown on the route of the proposed railway be sufficient for the district north and south of Moree? I do not think until you get to the Inverell end you can grow enough to supply the present local market, and the local market must increase very largely.

Mr.
W. H. O'M.
Wood.
5 Oct., 1896.

295. In that case, there would not be much to send from Inverell? I do not know what the produce of Inverell is, but between here and Inverell there is not sufficient for the local market.
296. Considering that the probable loss on the proposed line will be £2,800 per annum, do you think its construction is justified? If that estimate has been based on existing figures, I think it is certain that within a few years' time the line must be a profitable one. I do not know what comes down at present, but I feel certain after the construction of the line it will be very largely increased.
297. What is the average rainfall of the district? Up to 1894, the mean annual rainfall for Moree for fifteen years was 25·93 inches. For 1893-94 it was 43·60 inches; for 1895 it was 17·01 inches.
298. What is the average rainfall? About 26 inches.
299. What is the average for Inverell? For seventeen years at Inverell it was 32·77 inches.
300. Do you think it would be fair to the large population on the coast—80,000 to 100,000—that a railway should be constructed from Moree to Inverell, and afterwards to Glen Innes? I can only speak of any extension easterly, from a geographical point of view. On looking at the maps, it seems to me there must ultimately be a railway from the coast through Inverell to the Barwon. I think Collymungle is the most suitable point to which a railway should be extended. I feel certain it would increase the traffic tremendously along the Moree-Inverell line.
301. Do you think goods would go from some portion of the proposed line to the west or north-west? Yes.
302. I suppose that the principal traffic from these parts would be wool and cattle? Cattle may go to the coast for export, and so would wool probably.
303. Do you think it would be advisable, in the public interests, to construct the proposed line? Yes. I think there can be no doubt about it. I think it is a line which must ultimately prove a public benefit.
304. Do you think it would ultimately be necessary to continue it to Glen Innes? I do not know. It would ultimately be necessary to continue it to some point on the coast when, of course, it would have to cross the main line.
305. If the greater portion of the produce grown on the proposed line is consumed locally, will the balance go to Newcastle or Sydney? I suppose it will. I think some of the produce which will come to Moree from the line will be carted even under the present conditions to the Barwon.
306. Do you know the country to Manilla, through Bingera and Barraba, to the route on the proposed line? I know it from Cobbadah, which is the edge of this district, to Bingera, but I do not know it southerly towards Manilla and Tamworth.
307. One of the witnesses states that he thinks the Bingera people will send their produce here even without the railway? We have received a lot of Bingera produce, it being closer to Moree than Inverell.
308. Do you think there will be any number of cattle and sheep, besides wool, brought from the proposed line into Moree or for export to Sydney or Newcastle? A certain amount of stock and wool will come on the line by routes which intersect it, for instance, the Yetman-Warialda route. There may be a great deal of wool and stock from the Upper Macintyre country, put on the railway between here and Inverell. There would be some Queensland stock also.
309. If the line were not constructed, would not a good deal of that produce go direct to Moree? I think some of it would, but I think there is some which would not. For instance, the Wollangra wool now goes to Glen Innes, and I do not think it would go to Moree; it would, I think, go to Warialda.
310. Would any wool from Queensland come into Inverell or Moree? I have doubts about it; but there is some wool from the neighbourhood of Boggabilla, and up the river from there, which now goes to Queensland, some of which will hereafter come to this line.
311. *Mr. Black.*] Do you know anything of the cost of sleepers on the Narrabri-Moree line? I hear they have been procured from 2s. to 2s. 6d.; they were mostly brought from the forests out of Narrabri.
312. Is there plenty of ironbark available? Yes.
313. How many stations do you think would be necessary on the line? I think three in this Land Board District ought to be sufficient. There should be one somewhere near Mungie Bundie, another between Ezy's Crossing and Yagobe, and another where the Warialda-Bingera Road crosses the line.
314. Is the line intersected at those places by a travelling stock route? Yes; but not at Muccabundi.
315. I suppose, if the proposed line is to serve as a pick-up for travelling stock, it will be necessary that the stations should be situated in proximity to stock routes? Yes.
316. Do you agree with the statement that in good seasons the stock will not be trucked here, but will be driven as far as the herbage will permit? I think the larger proportion will be trucked here. I think it will be found that the larger portion of the stock going to Narrabri is trucked there, and it will prove to be the case here.
317. Is the bulk of the unalienated land fairly good? There is a great deal of good land, but much of it is covered with brigalow timber.
318. There is less of it towards Inverell? Yes.
319. In fact, it is rare to find? Yes.
320. Would it be fair to presume from that, that it is the quality of the land which has induced settlement at the one end, and not the absence of a railway which has prevented it at the other? The leaseholds expired at Inverell before they expired here. We have Central Division leaseholds which will not expire for four years, and they have been locked up since 1884.
321. How do you think they will be taken up? As settlement leases principally.
322. In what direction will the energies of those who take them up be turned? I think the bulk of them will use the country at this end for pastoral purposes. Twenty miles from here suitable parts will probably be used for agriculture.
323. How far in the direction of Inverell will you have to go before you strike land where the conditions favour agricultural rather than pastoral pursuits? I think you will find frontage land within 20 miles of Moree, which in the near future will nearly all be used for agriculture.
324. Is there any quantity of it? It extends back a mile or two from the river.
325. How far is the river from the railway line? It is quite close. I was asked whether certain land was suitable for irrigation. The water could be conserved where the river runs between the hills above Yagobe, and distributed over the flat country below Yagobe by gravitation.
326. If the country is of a flat character it may not be suitable for irrigation by bore water? It is not perfectly flat; it is comparatively flat.

Mr.
W. H. O'M.
Wood,
(Oct., 1896.

327. Even admitting that the soil is good, do you think that the climatic conditions are favourable for the growth of cereals? I have made inquiries of late from the Department of Agriculture, and they say the rainfall during the winter and spring months is sufficiently good; but I think the difficulty in the way of any considerable amount of agriculture here is in working the black soil.

328. Is not the unfitness of the district for agriculture shown by the fact that none of the pastoralists have gone in for agriculture to any extent? I am not advocating this as an agricultural district. I think it is partly because there is very little market for surplus agricultural products, and partly because wool pays better as a whole.

329. If you say there is no market for agricultural products, then you say there is no reason for the construction of the railway? There has been no large local market hitherto, but the town has doubled its population in less than ten years.

330. We are asked to construct the proposed railway for the reason that the people of this district are dying to consume the products of Inverell. If you tell us there is no market for agricultural products you cannot be dying to purchase them? I do not say there is no market, but hitherto there has been a difficulty in carrying on agriculture successfully, and there is the difficulty that there is no get-away for the surplus produce in a good season.

331. Then you are reasoning in this way: The district does not produce agricultural products, because the climate is so variable, that to enter upon agricultural pursuits would favour somewhat of a lottery? Yes, it would be a risk.

332. Secondly, there is a market here for agricultural products from Inverell when the season here is not good? I do not say there is a market for the whole of the Inverell produce, but the market is a fairly large one now and it is a growing one.

333. But there is no market for fodder here when there is a good season? Not so much as when there is a bad one.

334. That is to say, you will not buy chaff when you have grass? There are many people who have no grass. In the town the horses are nearly all stabled.

335. If those two conditions are correct, then the market for Inverell produce will be most successful when you have bad seasons here? Yes.

336. In good seasons the amount of produce carried by train towards the west will be reduced in volume just as this district is prosperous? Yes, I think so. Flour and potatoes and things of that kind would always come this way.

337. What value is the proposed line likely to add to the Crown lands within easy access to it? I think it would increase them by fully 25 per cent., but it is very difficult to say.

338. I suppose in the case of town allotments the increased value in the event of the line being constructed would probably be greater than 25 per cent.? Yes.

339. Will the proposed line be subject to floods in exceptional seasons? I think very little—practically not at all.

340. The soil, I believe, is very soluble? The site selected for the line passes over about the soundest ground which could have been obtained. I do not think the flood-waters will trouble it. Some of it will pass over red ground.

341. Does not the red soil scour readily? Not so readily as the black soil.

342. If the rainfall were properly distributed, I suppose there would be no difficulty about agriculture? If it were to fall uniformly, or as required, it would be ample.

343. I suppose that, with a comparatively heavy rainfall, the roads in the country would be almost impassable for some time? The black soil country becomes impassable.

344. At such times, I suppose a railway would be in great request? Yes.

345. I suppose the teamsters, unless they have contracts, charge very much higher rates during such times? Yes.

346. What would be the increased cost of carriage under such circumstances? It would be more than double.

347. It is fair to presume that in wet weather the railway would be extensively used? I think so.

348. Are there any scrub lands? Yes. In Terry-hie-hie holding there is a large quantity of brigalow scrub; also on Slaughter-house Plains. The rainfall there is 2 or 3 inches better than it is here. The land on Slaughter-house Plains is now available for selection, partly as settlement leases, and partly as improvement leases. Terry-hie-hie will shortly be available as settlement and improvement leases, and also as homestead selections. It is being measured at the present time.

349. Do you think, if the line is constructed, Moree will still remain the depôt for the district? Yes.

350. You favour the construction of the line? I was in doubt before I heard the figures, as to whether the traffic was large enough to be as large as has been estimated. I feel certain the traffic will increase considerably. I had some doubt in my mind until I heard the Railway Commissioners' estimate, as to whether the line would go anywhere near paying at present.

351. You base your advocacy of the railway on figures supplied by the traffic manager? Partly on that, and partly on account of the geographical situation of the line right through from the coast.

352. Then you are in favour of an extension of the line from Inverell to Glen Innes? I believe Glen Innes and Guyra are rival routes. I am not in a position to judge as to the rival routes; but I think the extension should go eastward to the coast somewhere. I also think a western line to the Barwon will not only provide a market for Inverell, but for a lot of produce from the coast.

353. *Mr. Roberts.*] In what way do you think Moree would be benefited by the construction of the railway? There will be cheaper produce. Moree now is, and will be then, the centre of distribution for a large tract of country north and north-west. I think a large number of settlers in that part will be able to get produce, including flour, potatoes, and so on, at a lower price than they can get it now.

354. Where will the produce come from? From Inverell and neighbourhood, which is the nearest point of production.

355. Do you think any impetus will be given to agriculture along the route of the proposed line? A little, and perhaps a good deal at the Inverell end.

356. Will there be a great demand for Inverell produce to the west of Moree? Yes, greater than at Moree.

357. How far out will it go? I think the whole of the Western Division is really available for it.

358. Where does the agricultural produce required for Moree come from now? A good deal comes from Narrabri, and a great deal from Inverell. The cheapest we have had has come from Inverell.

359. Do you think a large quantity comes from Bingera? Some comes from there, but more from Inverell. Some of the local business people are Inverell men, and I think that has tended to open up business between here and there.

360. What constitutes the traffic on the railway from Moree, other than passengers towards Sydney? Wool. I might mention that the line has not yet opened for the carriage of stock; they are at present sent on to Narrabri.

361. Have you drawn any comparison between the different soils in the district? No. I had the black soil analysed a short time ago by the Department of Agriculture, but not any of the others.

362. What is the effect of the rainfall upon the two kinds of soil—the red and black soils? The black soil is gluey and adhesive, and holds the moisture; and the red soil generally absorbs some and throws the rest off. It is on the edges of the red-soil patches that we make tanks, as they usually form the best catchments.

363. Which soil could do with the minimum of rainfall? The red soil. The red friable soil responds to rain more readily than the black soil.

364. Has agriculture ever been tried in the district? Yes, I have tried it myself.

365. With any success? Yes; but this year I think the crops will be failures. I know, however, of one crop in the town which gave 5 tons of hay to the acre. It was very coarse. The black soil for oaten hay grows a very coarse hay.

366. The experiments have not been sufficiently encouraging? On the red soil some fine hay has been grown. In some seasons you get good crops, but in many you do not.

367. Although the average rainfall is 25 inches, the rain comes in heavy falls at one time? Very often there is a heavy fall in January and February, which is of no use at all for cultivation, unless it is for corn, and you cannot even rely upon it then.

368. Then it is either a feast or a famine as far as the rainfall goes? Yes.

369. *Chairman.*] Can you tell the Committee the effect the construction of the line from Narrabri to Moree has had upon the demand for land in this district? I think it has increased it tremendously. We have any quantity of men from the southern districts flock into the district, and a great many more would come if we had the land available.

370. I would like you to distinguish between the inquirers for land since it was determined to construct that line, as against the time when that question was undecided? I cannot tell to what extent it has increased the demand, but I believe it has materially increased it.

371. Have the applicants been able to acquire any considerable number of holdings? Yes. When we have any land which is even fairly good we have many ballots for it.

372. In what direction is the land which has been thrown open since the line was constructed? One lot of 100,000 acres is about 35 miles west of the existing line.

373. The proposed line would not be affected in the slightest by the settlement which has already taken place? No, not on the 100,000 acres just referred to.

374. The traffic from that settlement would go to the existing line? Yes.

375. Would any portion of the recent alienations be benefited by the construction of the proposed line to Inverell? Yes.

376. Much? Not very much of the recent alienations, because they are only a small quantity; but I think the Terry-hie-hie country would be benefited by it to some extent—not very much. It is more the country north of the line than to the south which will be benefited.

377. I believe all the country as it becomes available in this district is brought under alienation under the more recent legislation? Yes.

378. That is homestead selections, settlement areas, and improvement leases? Settlement leases mostly.

379. Does that system of land alienation enable the State to more accurately determine the unimproved value of the land. Hitherto all land in the Colony, good or bad, was valued at £1 per acre. Has the present system enabled you to arrive more definitely at the unimproved value? It has enabled us to class it, but not to arrive at its value. We always endeavour to fix capital values by sales which have taken place. Afterwards, the 1¼ per cent. interest upon that is a very easy rental. We have a good number of sales of conditional purchase and conditional lease land, which give us a fair index as to the saleable value of land.

380. Have you had anything to do with the valuation of the land resumed for railway purposes between Narrabri and Moree? No.

381. What is your estimated value of the alienated land on the proposed line? Taking the alienated land right through, from 25s. to 30s. per acre would be its value. The lands nearer Moree—such as Weebollabolla—would be higher. Taking the inferior with the good, it will average what I have stated.

382. Supposing you opened a homestead selection and the unimproved value is £2 per acre, if a man holds a freehold alongside of that, and the railway passes through it, the State cannot very well value his land at less than £2 an acre? No.

383. Then how do you fix your values at from 25s. to 30s. an acre? I do not think the homestead selections are fixed at £2.

384. You have already stated that the values put upon them are no indication as to their actual values? They are what we believe to be their value.

385. What price is being put upon the homestead selections? I cannot tell you from memory. I think it is something like £1 an acre on some of them.

386. Are there any as high as £2 an acre? I do not think so.

387. Would 30s. be the average? I do not think they go as high as 30s. an acre. That land itself is not a fair average either. There is better than that, and some worse, which the proposed line passes through. In the Inverell district it may exceed 30s. an acre.

388. Are these small holdings in your district held as *bonâ fide* selections or for speculative purposes? I think the majority of them are held as *bonâ fide* selections.

Mr.
W. H. O'M.
Wood.
6 Oct., 1896.

Mr. Alexander George Forbes Munro, grazier, Weebollabolla, sworn, and examined:—

- Mr. A. G. F. Munro.
5 Oct., 1896.
389. *Chairman.*] How far is Weebollabolla from Moree? Five or 6 miles.
390. How long have you been residing there? Twenty-three years. Altogether, I have resided in the district forty years.
391. *Mr. O'Connor.*] What is the extent of your holding? About 50,000 acres. 16,000 acres of that are freehold, and 15,000 are leasehold.
392. What do you produce? Cattle and sheep. I have 30,000 sheep and 1,500 cattle.
393. To where do you send your wool? Chiefly to Newcastle, and from there to London.
394. How do you send it? This year we have sent it by train from Moree.
395. What is your opinion about the proposed railway from Moree to Inverell? I am not in favour of it.
396. Why? I do not think it fair to the taxpayers of the Colony. I do not believe it will pay. It is also unfair to the Inverell people to fetch them 100 miles westward when they can go straight to Sydney by running another line instead of this one.
397. Where would you suggest the other line should be run? From Tamworth, *via* Manilla and Barraba, and straight on to Inverell.
398. Have you any idea what the distance is from Inverell to Manilla? Between 90 and 100 miles.
399. And what is the nature of the country? Between Barraba and Inverell it is rather inferior—a big proportion of granite country.
400. What is the distance between those two places? Fifty miles.
401. What is the balance of the country like? From Manilla to Barraba and its vicinity there is a good deal of agricultural country. Then for 20 miles from Barraba towards Inverell, the granite flats between The Hills are a mile or two in extent, and are fit for farming.
402. Do you know the country well? Yes; I lived in the vicinity where the survey went through.
403. Do you know the country about Moree and towards the Barwon? Yes.
404. Do you know the country between Moree and Inverell? Yes.
405. And between Inverell and Glen Innes? Only by travelling along the road.
406. You oppose the construction of the line on national grounds—because it will not pay? Yes.
407. I suppose you know that a railway usually attracts population? I do not know that it always does.
408. Mr. O'Malley Wood states that the railway from Narrabri to Moree has stimulated population here? It was the fact of the leases being thrown open that stimulated population here.
409. Do you know that within the next three or four years nearly 470,000 acres of land will be available for settlement between Moree and 20 miles on the western side of Glen Innes? No, I do not.
410. The quality of the land between Inverell and Moree being good, and such a large quantity being available for settlement within a few years, do you not think that hundreds of people will be attracted to take it up, especially if they have railway communication? I would think so were it not for my personal knowledge of the country. I know that already nearly the whole of the good land has been alienated and sold, and in the tract you speak of there is a great deal of inferior country.
411. Do you not think it would be to the interests of the district for an opening to be made for the people to communicate with the ocean and the world? Yes. I think what we have now is sufficient. I do not say it would not be an advantage, but we may perhaps have to pay too much for the advantage.
412. Why should the people of this district be compelled to send their produce to Sydney, if they can send it to the sea-coast on the east, and thence to Europe, without going to the extra cost of carriage to Sydney? Because the construction of another line to the coast would cost half as much as this one has done to Sydney and it is better to use what has already been expended, and make the most of it, than go to further expense and pay a tax for it as we would have to do.
413. With regard to the enormous tract of land which will be thrown open within two years—what is to become of that if there is no railway communication? A very big proportion of it will remain as it is even if you run a railway, because there is a great quantity of it which is perfectly worthless.
414. What would you think if an expert witness said that over 200,000 acres of it were fit for agricultural purposes? I should say he had made a mistake. I have been over nearly the whole of it. I have been on every run between here and Inverell and around Inverell.
415. I suppose a large portion of your land will have to revert to the Crown about the year 1900? Perhaps that is correct.
416. *Mr. Roberts.*] Where does your property lie from Moree? East and south, and it comes to the population boundary.
417. Does the proposed line run through your property? Part of it.
418. Does it run through any of your freehold? I believe it does.
419. Are you able to say for how many miles it runs through? $3\frac{1}{2}$ or 4—on and off.
420. In the event of the line being constructed, are you prepared to allow the Government to take it through your freehold property without compensation? No, not if I can help it.
421. What compensation would you require per acre for the land which would have to be resumed by the Government for railway purposes? Under present circumstances, I think that is hardly a fair question. I have sent in a valuation for taxation purposes, and the assessors have been out and have made a valuation, and the Court has not been held.
422. I understand you do not view the construction of the line with favour? I am not in favour of it.
423. Have you been in the Inverell district? Yes.
424. Is it not a very fertile district, and capable of still further development? Yes.
425. Would not a market for its agricultural produce be found to the west? Yes, for a considerable part of it.
426. That being the case, do you not think it would be wise to connect Moree with Inverell, so as to enable the people of Moree and west of it to get agricultural produce at a lower rate than they are getting it at the present time? I do not know that it would be a very great advantage. I thought, perhaps, it would reduce the value of land out here—reduce the value of the produce they could get from the land; and they would lose in that respect.
427. But there is no land in this district which has been used for agriculture? Yes; east from here towards Bingera, and up the Horton, there are a great many farms.
428. Are they able to bring all the produce required to this district? I think so.
429. Would they not be able to bring it cheaper from Inverell if the line were constructed? It is doubtful; the carriage from Inverell is about 2s. per cwt.

430. If the railway be constructed do you not think it will be of vast benefit to the people of Inverell in enabling them to get their produce to a market in the west, and if it benefits the people of Inverell it must benefit the Colony as a whole? Certainly, they would be able to sell more than they do at present, but when the roads are completed, I think road carriage will be almost as cheap as railway carriage. The road is nearly all metalled now from Warialda to Inverell.
431. But you do not wish to maintain that teams could bring produce from Inverell to Moree and further on at a rate which would leave a margin of profit to the Inverell farmer? I think so. I do not think there is such a difference between the railway freight and the teams' charges. Of course I do not know what concessions the Railway Department will make for the carriage of farm produce.
432. Have you considered whether Inverell ought to be connected with the railway system of the Colony? Yes; I think it was badly treated in the first instance, when the line was taken by Armidale instead of Inverell? I think Inverell is entitled to a railway.
433. Admitting that Inverell is entitled to railway communication, do you not think it would be wise to connect it with Moree? No; it is too far round from Sydney. It means 100 miles of additional travelling to people who want to go to Sydney.
434. Which route do you favour most? I would favour the one from Manilla if the line were extended from there to the table-land.
435. Have you made yourself familiar with what the cost of construction would be of that route? It would be heavy; but a great proportion of the country is table-land, and not so heavy as some people would imagine.
436. If the cost of constructing a railway by way of Bingera were 50 per cent. per mile more than it would be by the Inverell-Moree route, would you still adhere to your opinion? I think so. It would tap the Bundarra district, which is a good agricultural district, and also a great part of Bingera. I am not in favour of it going to Bingera, but from Barraba direct. It would cross the river 12 miles on this side of Bundarra.
437. Do you mean that you would go through Bundarra, and on to Kentucky? No; the line would be pretty nearly direct from Barraba to Inverell, and 10 miles west of Bundarra.
438. Even supposing Inverell were connected in the way you suggest, would Inverell get any wool from the north which at present goes upon the Queensland railway? Yes.
439. Would it get the wool on this side of the border? Not below Boggabilla. From Boggabilla and below it would come here.
440. Does it come through Moree now? Toooloona and Cobbanbilla even now sometimes send to Brisbane.
441. If there were a line to Inverell—I will not say from where—would any New South Wales wool which now goes to Brisbane come upon it? Yes; it would come to Inverell and here.
442. If Warialda were connected with the railway system of the Colony, would wool from Boggabilla go there? Yes, that is nearer than Inverell, but not nearer than Moree.
443. If a line from Moree to Inverell is made by way of Warialda, would there not be a large quantity of wool and stock come into Warialda which otherwise would come to Moree, so that the State would have the benefit of carrying the wool and stock between Warialda and Moree? Yes; it would go to Warialda.
444. Therefore, it would travel over the line between Warialda and Moree? Yes. What Inverell would drain if it had a railway, Warialda would get.
445. And if Warialda were connected, the large quantities of wool and stock, which when the line is opened will come to Moree, would be picked up at Warialda? Yes; north-east from here.
446. *Mr. Black.*] Do you think there is any kind of produce raised in Moree which is likely to be sent to Inverell? Not in the way of farm produce. Of course there are fat cattle and sheep.
447. Do not the graziers about Inverell fatten enough cattle for the use of the district? No.
448. Outside of that there is no product of this district which might be exchanged for the products of Inverell? I think not.
449. Then unless the trains are filled with goods from Sydney, they will most likely be running empty one way? I think so.
450. If the people of Inverell find it cheaper to bring their goods, as they do now, from Sydney *via* Grafton, and thence by team to Inverell—if they find that the teamster and the steamship owner can still undersell the traffic of the railway manager,—presumably goods will continue, despite the fact of the proposed railway being made, to come from Sydney to Grafton, and thence by road? Yes, they will go the cheaper way.
451. If that be so the railway is not likely to pay? That is my opinion; I do not think it will.

Mr. William John Stewart, grazier, Yagobe, sworn, and examined:—

452. *Chairman.*] How far is Yagobe from Moree? Twenty-eight miles.
453. And how far from Warialda? Twenty-two miles.
454. How long have you been living there? Four years.
455. Where were you before you came to that part of the country? At Moree. I was in the Moree district about eight years.
456. Does the railway survey pass through or near your property? Within a mile of it.
457. What evidence do you wish to offer? There is a creek called the Slaughter-house Junction, and I think the line should be deviated from the southern boundary of the Travelling Stock Reserve 17,482, so as to go due east to the south-eastern corner of Conditional Purchase Lease 202,345 miles.
458. What are your reasons for recommending that deviation? It is a good route, and I cannot see any obstacle in the way.
459. Are there any engineering difficulties? Not that I know of.
460. Why then was that bow made in the line? I asked Mr. Marshall, who was surveying at this end, why it was, and he said he did not know.
461. The object of the Railway Construction Branch, has been to obtain an easy grade, so as to enable large loads to be carried at a low rate? They have followed the river, and I think they could go through a gap and save two miles. I think they would have as good a grade on the deviation, and they would be free from flood water, besides having a shorter length of line to construct.

Mr. W. J.
Stewart.
5 Oct., 1896.

- Mr. W. J. Stewart.
5 Oct., 1896.
462. And it would suit you better? No; I am not speaking personally.
463. Do you produce wool? Yes.
464. How many bales a year? About 100.
465. Which way have you been in the habit of sending it to market? To Tamworth.
466. What does it cost you per ton to send it to Tamworth? It cost me £3 10s. a ton last year.
467. Are you aware of the possibility of a line being made from Tamworth to Manilla? Yes.
468. Would not that bring it very much closer to you? Yes; but not close enough.
469. Would it not make a difference of £1 a ton in carriage? Hardly.
470. Do you pay £3 10s. a ton dray carriage to Tamworth? Yes.
471. And then the railway carriage to Sydney? Yes.
472. In all what does it cost you? About £6 12s. a ton.
473. What will it cost you to bring your wool from your station to Moree? About £1 a ton.
474. Would you not be fairly well served with a railway line within 28 miles of you? Yes; we are sending our wool this year by way of Moree.
475. So that the construction of the line will make little difference to you? Very little in regard to wool; but it will in regard to live stock. At present we have a lot of fat lambs which we could send by rail, but we cannot do so now. We cannot drive them to Moree, because there are no trucking yards, but if we had a line within a mile we could send them on to Sydney and get rid of them.
476. Have you any neighbours? Yes.
477. What do you hold? Conditionally purchased and leased land.
478. Are you in favour of the construction of the line? Yes.
479. Do you think it will be of advantage to you and your neighbours? Yes.
480. Are you prepared to give a general expression of opinion on behalf of the residents of your district? I only know of one man who is against it, and I think the reason is because he is an hotel-keeper, and it will close his hotel up.
481. Are your neighbours living within easy distance of the line? Yes; almost upon it.
482. Do you do any cultivating? Yes; for my own use.
483. How do you get your supplies? From Sydney.
484. Your freight would be 100 bales of wool, a few fat lambs and sheep and cattle, and your return supplies? Yes.
485. And I suppose you are typical of the residents of the same class as yourself? I may mention that the sawmill proprietor lives near me, and there is a good deal of fine pine grown there. He has been doing a good trade with Moree, but he has not done any lately. I asked him how he lived, and he said that but for Inverell he would have to shut up. He is now sending his pine all the way to Inverell. There is no pine in the Inverell district. I think the line would also open up the dairying industry.
486. Is that not rather precarious in your district? I do not think so.
487. Are there not times when you suffer from very dry weather? No, not so bad as on the plains; we are on the hill.
488. But dairying on a small scale in a warm climate would be a difficult matter? I do not think so. If we could send out cream to a creamery or sell our milk, it would be better than growing wool.
489. To where would you look for a market? We would have to export it to the old country.
490. But without special refrigerating trucks, would it be possible to carry butter through this warm climate to Sydney? There would have to be a butter factory somewhere about Gunnedah, and there would have to be creameries along the line.
491. What distance is it by rail to Gunnedah? I should say it was about 120 miles.
492. Then unless the train is available at a particular hour of the day, will it not be impossible to send your cream away in the warm weather? I think by the use of separators the cream will keep.

TUESDAY, 6 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Moree, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.		HENRY CLARKE, Esq.
The Hon. DANIEL O'CONNOR.		GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Moree to Inverell.

Mr. Alexander McIntosh, storekeeper, Moree, sworn, and examined:—

- Mr. A. McIntosh.
6 Oct., 1896.
493. *Chairman.*] How long have you been a storekeeper in Moree? Eighteen years.
494. Amongst other things, you deal largely in produce? Not so largely in hay and chaff as in some other things, but I deal largely in flour.
495. Prior to the extension of the line from Narrabri to Moree, from where did you obtain your flour and produce? It depended on what cost it could be delivered here at. For the last sixteen years I have been importing on and off from Adelaide.
496. By which route? By steamer or sailing vessel to Newcastle; thence by rail to Narrabri, and thence by team.
497. Since the railway has been opened, do you still continue to get it by that route? No. With the exception of 27 tons I have got all my flour for the last twelve months from Bingera and Inverell. I have had 15 tons from Newcastle, 6 from Tamworth, and 6 from Glen Innes; all the rest has been from Bingera and Inverell.
498. What is the reason for dividing your purchases in that way;—is it because you obtain your flour cheaper from Bingera and Inverell than you could get it by railway to your own door? Yes.
499. What is the road carriage on flour, bran, and pollard from Bingera to Moree? Latterly, as low as 25s. a ton.
500. And from Inverell? £2 5s. during the winter. £2 latterly, and as low as 35s.

501. Therefore, you have been able to pay this considerable dray carriage and compete successfully with the imported Adelaide flour? Yes.

502. And you are doing it now notwithstanding the railway is at your door? At present, but we have not railway rates at our door.

503. Do you anticipate that as soon as the line is handed over to the Commissioners and the ordinary rates for this class of produce are fixed, you will be able to get your stuff from Newcastle cheaper than from Bingera and Inverell? Cheaper than we can get it from Inverell, decidedly. The highest I ever paid for freight from Adelaide was 5s. per ton, the lowest was 1s.; and the general rate was 2s. 6d. There is also 1s. a ton for loading the trucks at the wharfs. Last April the charge was 21s. 6d. per Imperial ton to Narrabri. Since April there has been an addition of 20 per cent. on that, which makes it £1 5s. 10½d.

504. Landed where? At Narrabri.

505. And from Narrabri here? When the Commissioners take over the line the rail carriage on flour from Newcastle to Moree will, I understand, be about 30s. a ton.

506. That leaves 4s. 2d. a ton from Narrabri here? Yes.

507. That being the case, you are not likely to take any stuff by dray from Inverell? Unless the flour is much cheaper there. When the Commissioners take over the contractors line flour can be landed in Moree from any Adelaide or Victorian port for 33s. 6d. a ton as against £2 5s. a ton from Inverell.

508. How does the first cost of the Adelaide flour compare with the cost at Inverell? The cheapest flour I ever had from Adelaide was obtained two years ago, when John Dunn and Company shipped 40 tons for me at Port Pirie for £5 5s., free on board.

509. Where was it landed? At Newcastle, and the freight was 2s. 6d. a ton. At that time there was £1 per ton duty.

510. But what is the highest value of flour at Port Pirie? I think from £10 10s. to £10 15s.

511. Can you get it down for 2s. 6d. a ton? Readily.

512. And the freight from Newcastle to Moree will be 30s. per ton? Yes.

513. Can you land your flour from Bingera or Inverell at the same price? Yes; I can land it from Inverell just now much more cheaply.

514. At how much? In the last three months I have had 70 or 80 tons from Inverell at a landed cost of £11 10s. per ton.

515. Now with regard to the other class of produce, such as chaff, corn, bran and pollard;—where do you usually get that from? From Bingera, with the exception of chaff, which we can get cheaper from Armidale, Uralla, or Walcha Road. At present the Inverell people are shut out of this market for chaff. I will give you an idea as to how they are handicapped, by exhibiting a way-bill:—

NEW SOUTH WALES GOVERNMENT RAILWAYS.

No. 771.

Mr. A. McIntosh,

Narrabri Station,
17 September, 1896.

DR. to Railway Commissioners of New South Wales for Trainage, &c.,

Charges on the undermentioned goods:—

Wagon number.	Station from or to.	No. of pkgs.	Description of Goods.	Marks and Numbers.	Weight—				Rate.	Paid on.			Amount.		
					Tons.	Cwt.	Qr.	lb.		£	s.	d.	£	s.	d.
1729	Armidale.....	...	Hay, Chaff	6	6	2	0	Truck.	2	13	9

That came in at £3 per truck by the contractor's train, making in all £5 13s. 9d. for 6 ton. 6 cwt. 2 qr. of chaff.

516. You paid the contractor's rates from Narrabri to Moree, which are considerably higher than the usual rates charged by the Railway Commissioners, and yet you landed your chaff here all the way from Armidale at the rate of under £1 per ton? Yes.

517. It would be impossible to land chaff from Inverell, by dray, to compete with that? Yes. Furthermore they can only bring a limited quantity of chaff. They must have bottom loading. They must have 2 tons of flour or 2 tons of corn in order to bring 2 tons of chaff, as it is so bulky.

518. Where do you usually get maize from? Twelve or thirteen months ago we had to draw from Sydney. I first drew from Singleton and Newcastle, and when the supplies became exhausted I drew from Sydney; at that time neither Inverell nor Bingera could supply us.

519. I presume they had not the stocks? They could not land it at the price.

520. What did you land it for? Two shillings and threepence at Sydney, and 27s. from Sydney to Narrabri by rail, and £2 per ton by road.

521. That would be £3 7s. a ton from Sydney to Moree? And 2s. 6d. for forwarding, making £3 9s. 6d. in all. In the figures I have given you there is 2s. 6d. for forwarding.

522. How many bags go to the ton? There are 40 bushels to the ton.

523. Then it cost you about 3s. 9d. per bushel to land it? Yes.

524. At those rates Inverell could not compete? Not last year; but at present Inverell is supplying this district at 2s. 3d. a bushel landed—that is 1s. 3d. for Inverell and 1s. for carriage.

525. Therefore Newcastle cannot compete with Inverell at the present time? No.

526. What about the grower at Inverell, at 1s. 3d. per bushel;—can he keep on at that rate? They would have a splendid market at Narrabri. Commercial travellers have told me that vast quantities of forage are at present coming up to Narrabri. If they had railway communication with Narrabri via Moree there would be a much larger demand, and the price would rise, say from 1s. 3d. to 1s. 9d., and the producer would get the benefit of it.

527. In other words, if you had railway communication you would have the advantage of cheaper railway rates, which would enable the Inverell people to compete more favourably than they can do now? They could deliver the corn here at 2½d. per bushel for carriage, and at Narrabri for about 3d. Therefore even allowing 2s. a bushel they could successfully compete with any part of the Colony in supplying Narrabri. They could land at Narrabri for 2s. 3d.

Mr.
A. McIntosh.
6 Oct., 1896.

528. What in your opinion is about the annual consumption of flour, chaff, corn, bran, and pollard of the Moree district? I should say, including Mungindi, Collarendabri to Walgett, Boggabilla, Goondiwindi, Kunopia, and Mogul, the consumption is 1,000 tons of flour a year.

529. You have taken a large area. Some portions of those places could be supplied direct from Inverell? That is true, only of course it would not pay Inverell to supply those places by team when the railway is running here. For Moree and the immediate neighbourhood the consumption would be about 500 tons per annum.

530. What would be the consumption of chaff? It is impossible to give an estimate. In a dry season there are immense quantities, and in a good season the demand is almost *nil*.

531. As a matter of fact, when the seasons are good here, the grass is so abundant that no one has to feed on chaff except those who have to keep their horses in the stables? Yes.

532. Would it not be a fair estimate to take the twelve months from the present date, when I believe the season has not been too favourable, and when there has been more than an average demand for fodder, which has been supplemented by the workmen's horses on the railway line? There have been very few horses employed on the railway.

533. Am I correct in my surmise that the year, as far as the supply of natural grasses is concerned, has been below the average? The period you speak of has been more than a fair average; it has been in favour of the producer.

534. Can you give an idea as to the approximate consumption of chaff for that twelve months? I should say about 100 tons—that is about the township.

535. About how many tons of corn do you think have been consumed during the same period? A very large quantity. Within the last month or so I have had 2,000 bushels myself. I should say that not less than 500 tons of corn has been consumed in Moree and within 20 or 30 miles of it. A great number of farmers come down with corn, and if they do not find a market here they take it on towards Mungindi.

536. Are bran and pollard large items of consumption? Yes, a good deal of it is used—I should say about 60 tons of bran and 30 tons of pollard.

537. Supposing you say 100 tons of bran and pollard;—is there any other item imported for the use of the place? Those are the principal items which are brought here from the Inverell district.

538. What about potatoes? Quantities are brought down, but I do not trade in them.

539. Would 100 tons cover the potatoes? I should say 150 tons.

540. What about hay or straw in bundles? Very little of that comes down.

541. That makes about 1,850 tons of goods, which, according to your evidence, appears to be the annual consumption of the district;—are we approximately correct in assuming that that will be about the consumption of the district? Yes, as far as my judgment goes.

542. If a line were constructed from Moree to Inverell would there be any interchange of products between the two places? Yes, there is at present. We supply Inverell and the Armidale district with fat stock, sheep and cattle in the winter.

543. How many trains a year would it take to convey the fat stock for consumption in Inverell? I could not say.

544. You do not produce anything other than stock which the people on the table-land wish to consume? No.

545. There the prospective freight for a railway from Moree to Inverell is very small? Of course, if there is railway communication the farmers will be more prosperous, and instead of maize being a glut in the market at 1s. 3d. a bushel it would fetch 1s. 9d. or 2s.

546. Is there likely to be any traffic going from Moree to Inverell other than stock? No, unless it comes through from Newcastle or Sydney.

547. That is in the shape of general goods? Yes.

548. Therefore a line between Moree and Inverell must depend upon its traffic from Inverell to Moree—not upon the amount of freight which will go from Moree to Inverell? That is correct.

549. Then the consumption of flour, chaff, corn, and bran is not likely to reach 4,000 tons;—would not that be a large estimate? Not if the Inverell people could command Narrabri, and that centre. Further, instead of paying 1s. a bushel carriage as at present, we should only have to pay 2½d.

550. And the cheaper the article the greater the consumption? The cheapness of the article would increase the consumption. The charge of 1s. a bushel carriage is a certain check upon consumption.

551. You desire us to understand that the cheap carriage would enable the Inverell farmers to trade as far as Narrabri? Yes, and as far as Gunnedah. The up transit rate from Inverell to Moree would be 8s. to Narrabri 10s. and to Gunnedah 11s. 6d. The down transit rate from Newcastle to Gunnedah is 18s. 1d. and 20 per cent.; and to Narrabri 21s. 6d. and 20 per cent. advance on that rate. If a line were constructed from Inverell to Glen Innes, Inverell would have up transit rates from Inverell to Werris Creek, 208 miles, at 11s. 6d.; then there would be down transit rates from Werris Creek to Gunnedah which would be 5s. and 20 per cent. added, or 17s. 6d. From Inverell via Glen Innes and Werris Creek it would be 17s. 6d. to Gunnedah, as against 11s. 6d. via Moree and Narrabri ditto ditto to Narrabri, 11s. 6d., 10s. 6d. with 20 per cent. advance or 24s. 1d. To Moree it would be 11s. 6d., to Werris Creek 15s. 7d. and 20 per cent. advance making 30s. 2d. If a line were constructed from Glen Innes it would cost to get produce here 30s. 2d. as against 30s. from Newcastle. With a connection this way it would cost them 8s. and give them an advantage of 22s. a ton over the Victorian and South Australian ports. I may mention that as a rule most of the flour coming here from Newcastle is the product of other colonies.

552. Is the Inverell flour of good quality? Yes, so is that of Bingera.

553. Is the Tamworth flour largely used? Not lately. It appears to me that Glen Innes does not grow sufficient wheat to keep its own mills going. Two years ago I was told by several commercial travellers that Mr. Utz had bought 10,000 bushels in the Inverell district. I know that Mr. Byrnes, of Bingera, bought a considerable quantity as well from Little Plain.

554. Do you think the Inverell district capable of producing quantities which might be disposed of in the western and north western district? Yes. Notwithstanding that they supplied Glen Innes with 10,000 bushels, and Bingera with a considerable quantity, they were so overloaded that Taylor and McIntyre offered to deliver me 200 tons at £8 10s. a ton out of which they had to pay £2 a ton for carriage. I took over 100 tons of it. That was the season in which Dunn & Co. shipped me 40 tons.

555. Would the construction of a line to Inverell shut out Bingera? I do not think so.

556. Or would it bring Bingera into touch with the line at a point which would enable it to take advantage of it like Inverell? The line would be within 20 miles of Bingera.
557. If there is a trade between Bingera and Moree at the present time by dray it is natural to infer that it will continue? Yes, and from up the Horton River the nearest market will be somewhere near the Peach-trees, where the proposed line will cross the river. That trade will come by train here also.
558. Do you favour the construction of the line? I do. I think it will be the very thing for the producers, and will give a better market for produce.
559. I want you to speak of it as a resident of Moree? I think it would add to the importance of the town, and enable us to get cheaper fodder in dry times and save stock which die in dry seasons.
560. I suppose you would concede the point that, as far as railway connection is concerned, Moree is already served as well as it can be served? Yes, but not as cheaply.
561. I mean by connection with the metropolis? Yes.
562. The only advantage the Inverell line could confer upon you would be by giving you a supply of produce at a lower rate than you could get it on the other side? Decidedly.
563. Do Mr. Utz's teams come down as far as Moree? He has sent me a truck-load.
564. Do they come down by way of Armidale and Werris Creek? Yes. There is no flour coming from Glen Innes by road that I am aware of.
565. I suppose the distance would be too great to send it by dray? Yes, about 140 miles.
566. It is not likely they could compete with Inverell halfway and Bingera halfway? No.
567. With regard to the prosperity of the district generally, have you seen during your term of residence here any large increase in the population? No, excepting in the town.
568. Has not the district increased in its production? Yes, enormously.
569. What are your views as to the future of this town as a centre? I think it will be a great trucking centre for fat stock. It is a great sheep district. There is an almost certain annual return from wool. The black soil, however, is so parched and dry here in hot weather that a shower of rain which would do good in Glen Innes will not make the grass grow.
570. May not the matter be summed up in this way: The district has been settled sufficiently long to establish cultivation if it could be properly carried on, but inasmuch as there is no cultivation here it must be accepted as a fact that the climate is unsuitable for it? I would not say that.
571. Could you set to work to-morrow to grow crops? I would not like to do it.
572. Is it not a fact that in a fine district like this, with fine soil, if cultivation could have been carried on, it would have been commenced years ago? I do not think it has ever been tried much. They have gone in more for wool-raising.
573. What did you pay last year for freight on forage, no matter from where you got it? About £500 freight on flour and forage. I may mention that I think the Inverell district is well adapted for the dairying industry, and if there were railway communication it would not matter whether it was *via* Glen Innes or Moree. It will be an important industry in the district. We get large quantities of butter here from Newcastle. I, myself, get £500 worth per annum from Newcastle.
574. And you think this district would offer a considerable market for a large quantity of butter? Yes; and so would Narrabri.
575. In other words, if it would offer a market for one class of produce it would offer a market for all classes? Yes. I should think the butter consumption of this town is about 100 lb. per month.

Mr. John Thomas Crane, stock and station agent, Moree, sworn, and examined:—

576. *Chairman.*] How long have you resided in Moree? Nine years.
577. Are you acquainted with the country around Warialda and Moree? Yes; I am a native of Warialda.
578. *Mr. Black.*] I think you were formerly Council Clerk here? Yes.
579. Do you think the construction of the proposed line from Moree to Inverell will increase the district trade of Moree? Yes.
580. In what way? The construction of the line will place Inverell in such a position that it will be able to land its produce here more cheaply than we can get it at present from Newcastle or other sources, and being cheaper, more will be consumed.
581. Will there be any exchange of products between Moree and Inverell? In my opinion the trade from Moree to Inverell will be very small indeed. Of course there may be a trade on the line, by Inverell getting goods from Sydney, which will go through Moree, but not from Moree.
582. Then, you agree with the last witness, who said that the products of this district which would go to Inverell would be fat stock during the winter months, when feed is scarce? I do not think you would get one truck a month to carry by train. I think they would all be driven.
583. Then, as far as the interchange of products is concerned, it is practically an unknown quantity? It would be very small from Moree to Inverell.
584. Then, in the event of the railway being constructed, unless the Inverell people import their goods from Sydney, the traffic on the railway will be practically all by the way? That is my opinion.
585. Do you know the country between here and Inverell? Yes.
586. We have evidence to the effect that the climate of the district is not suitable for agriculture, however favourable the soil may be, and until you get within 60 miles of Inverell there is little likelihood that the construction of a railway will divert any number of people to agricultural pursuits;—do you agree with that? Yes.
587. Are you acquainted with the surveyed line? Yes; I am acquainted with the country through which it runs very well.
588. Do you know of any route by which the railway could be taken which would avoid heavy grades, and at the same time pass through good land? No, I do not. I know there are many people in the district who argue that the connection with Inverell could be by a line more to the north; but I am not sufficiently acquainted with the country to express any opinion. By the north, I mean by way of the Gil Gil. At the same time I do not think it would serve the population which the other line would serve.
589. Supposing there is any great increase in the farming population between here and Inverell, and around Inverell, do you think they will be able to find a market for their products? I think the market in Moree is very limited at present; but there is a great market which might be opened up to the east of

- Mr. J. T. Oranc. 6 Oct., 1896. Moree, which at present takes very little produce on account of the trouble in getting it, beyond, of course, breadstuffs, which they have to get.
590. Supposing there were 2,000 in the Inverell district, and between here and Inverell, engaged in farming, and that number were doubled,—do you think this district, or two or three like it, would be able to consume all the produce they would bring into existence? I would not say all the produce; but there would be a good market for a large part of it.
591. Do you think there will be much stock trucked on the railway, if constructed between here and Inverell? Not a great deal. In the summer months there would be occasional trucks of sheep sent to the Sydney market; but when you get beyond Warialda there is not a great deal of fattening done.

Mr. Richard Ford Jenkins, Resident Engineer, Roads and Bridges Branch, Department of Public Works, Moree, sworn, and examined:—

- Mr. R. F. Jenkins. 6 Oct., 1896. 592. *Chairman.*] How long have you been stationed at Moree? About two years.
593. Where were you stationed prior to coming to Moree? At Warialda and Glen Innes.
594. Have you a good general knowledge of the country? Yes.
595. *Mr. Clarke.*] Can you give any idea as to the expenditure on the roads between Moree and Warialda, and as far as your district extends, including the roads to Bingera, and within a reasonable distance of the proposed line? The present expenditure on the Bingera road is £575 per annum, and on the Warialda road £325.
596. Can you give any idea of the amount of traffic on the road from Moree to Inverell and return? The traffic from Inverell has grown considerably of late. A year or two ago it was very limited.
597. Why has it increased? I think chiefly through the railway having been extended to Narrabri.
598. Is the traffic likely to continue to increase or diminish with further railway extension? If we have a railway extension between Moree and Inverell it will certainly increase.
599. By means of passengers or goods? Both.
600. What are the principal articles of produce about Inverell which find a market in Moree and to the west and north-west? Corn, flour, potatoes, and chaff in some seasons; and of course fruit, but not to a great quantity.
601. Have you any idea of the quantity coming down now? I estimate the quantity which has come from Inverell during the last twelve months at about 1,000 tons.
602. Including everything? Yes.
603. What would be likely to go from Moree to Inverell? I cannot say that it would be anything considerable; it would be very little.
604. Of what description of traffic? There would be very little except stock, and the traffic in that would not be large.
605. Would a large quantity of sheep and cattle be sent from the west and north-west, by that way, to be forwarded to the Sydney market? With a line only to Inverell I do not think so.
606. Which way would the stock come? It would come to Moree and go to Sydney by way of Narrabri.
607. Why do you say much would not go beyond Inverell? In the first place, when the stock get to Inverell, they would have to be driven from there to Glen Innes, over a road which is not a good stock-road, and upon which they would probably lose condition. Then they would have to be trucked there and taken 400 miles to Sydney, whereas stock going by Narrabri would probably be put on the trucks here.
608. Would the bulk of the produce raised at Inverell be consumed locally—that is, at Moree, and up to the west and north-west, toward the borders of Queensland? There would be a lot of produce consumed; but I do not think you could say the bulk of it would be.
609. You think then there would be a considerable quantity left for export to the Sydney or Newcastle market? I think so.
610. Would the greater portion of the wool grown in the district come to Moree? Yes.
611. Does any portion of the wool now grown about this district go to Queensland? Some of it does, but not so much of it will go now.
612. If the proposed line is constructed, will it not prevent the trade this way *via* Moree to Sydney? I think the train extension from Narrabri to Moree has already stopped the border traffic going to Warwick, or will very shortly stop it, and the railway from Inverell to Moree will not make any difference.
613. Do you think any wool grown in Queensland would come to Inverell or any portion of the proposed line of railway through Moree for transhipment to Sydney? There would be a little, but not a great quantity.
614. Why? Because of the situation of the line. All the traffic north-east of here will come to Moree under existing conditions, and there would only be a few stations, such as Wallangarra, and stations about halfway between here and Inverell, which would send their produce this way.
615. I suppose the principal objection is the tax imposed upon Queensland wool coming into New South Wales? I think a good deal of it would come here in spite of the tax.
616. When the roads between here and Inverell are wet, I suppose it is impossible for teams to come to Moree? Yes, it is practically impossible.
617. *Chairman.*] Have you noticed whether the completion of the line to Moree has altered the trend of the traffic at all? I think it has a good deal.
618. What has been the immediate effect;—has it been to draw the traffic here? It has to some extent, and it will to a greater extent. A great many of the stations are asking for direct communication with Moree by road, showing that they can get here. It also shows that they mean to bring their wool here.
619. If the trade about Warialda, which has for a number of years gone by way of Manilla to Tamworth, were to come here, would it be strong evidence, in your opinion, that the country within the same radius would be attracted to Moree? Yes.
620. That in itself would create a greater traffic on your road? Yes.
621. And may it to some extent account for the large traffic you have already mentioned as existing upon that road? I think it does.
622. Would you think 1,000 tons of produce has come along that road from Inverell during the last year? I think it is not far short of it, but, as I say, it has been a very exceptional year.

623. What is your opinion as to the effect the construction of the line will have upon the traffic? I think the chief effect it will have will be to create an outlet for Inverell produce and produce grown about Inverell.

Mr.
R. F. Jenkins.
6 Oct., 1896.

624. Whatever there is to be affected will be affected on the eastern side? Yes.

625. But on no other side? Not to any great extent.

626. Do you think there will be any tendency towards making Moree the depôt for the forage from the Inverell district and then distributing it throughout the west and north-western districts? Yes.

627. Do you think it might lead to a trade of that character? Yes, it probably would.

628. Do you know the surveyed route of the proposed line? Yes; I know most of it.

629. Is there any portion of the survey which you think could be improved upon? I think the survey is fairly satisfactory.

630. I suppose that through that country it would be quite possible to make many deviations without materially altering the line? Yes.

631. Do you think any portion of it will pass through flooded country? No; except, of course, just on the banks of the river, which you can hardly call flooded country? It passes over high country nearly the whole way.

Mr. John Munro, post and telegraph master, Moree, sworn, and examined:—

632. *Chairman.*] How long have you been at Moree? Nineteen years.

633. *Mr. O'Connor.*] How do the mails run between Moree and Inverell? Twice a week between Moree and Warialda. The mail matter, however, is very light between here and there by direct mail. We have a good many letters for Inverell, but we send most of them round by way of Werris Creek daily. We only send them direct to Inverell on one day a week.

Mr.
J. Munro.
6 Oct., 1896.

634. Will you describe the mail services which are connected with Moree? There is a mail twice a week to Warialda, run by a four-horse coach. There is also one twice a week to Bingera.

635. Does the service suffer at any time owing to bad weather? Not very much—not between here and Warialda. It is the best road in the district in good and wet weather.

636. I suppose if the proposed railway were constructed it would offer great facilities for the delivery of the mails? It would be of considerable benefit to the Inverell people. They would obtain their mails direct instead of having them going all round the country. We have to send them to Werris Creek four times a week.

637. You say the mail is not a heavy one either way? No, it is not.

Mr. John Sherman Skeet, journalist, Moree, made an affirmation, and was examined:—

638. *Chairman.*] What is your occupation? I am the librarian at the School of Arts, and I am also a journalist.

639. How long have you been living in the district? Four years.

640. What is the nature of the evidence you desire to offer? I desire to give evidence as a bushman and as a miner. I know the coast from Coff's Harbour to the Clarence, and from Coff's Harbour towards Guyra, also from the Clarence and Lawrance to Tenterfield; and I know the uninhabited bush country between. I also wish to give evidence in regard to the possibility of minerals being obtained by the opening up of the country between Moree and Inverell. I may state that potatoes and articles of that description have been at prohibitive prices. I have no doubt that with the opening of the line the demand for produce—potatoes, and so on—will be considerably increased.

641. I suppose you are in favour of the construction of the line? I am.

642. And you think it will have the effect of cheapening the transit of agricultural produce required for consumption in this district? Yes.

643. Now with reference to the minerals? The mineral district commences about 12 miles from here in a south-easterly direction.

644. What kind of minerals? Coal and ironstone. Within 30 miles the limestone appears in large quantities. The peculiarity about the limestone is that it is coral limestone.

645. What are the indications which would lead you to suppose that there would be a mining population settled in this district? The trade in lime and coal would do that.

646. At what depth does the limestone lie? It is on the surface in the form of coral limestone.

647. Now as to coal? The coal was struck in a well at 70 feet.

648. How far from Moree and how far from the proposed railway line? I should say about 2 miles from the railway line and 3 miles from the main road. How far the main road runs from the railway at Mungie Bundie, I could not tell you.

649. What is the value of the coal—has it been analysed? Yes; and the report states that it may have a local value, and it is probably a continuation of the Gunnedah seams. Mr. E. F. Pittman, Government Geologist, describes them as a continuation of the Ipswich coal measures.

650. Has it been worked in any way? No.

651. Would it be a possible source of freight for a railway? Yes; not exactly at that spot, but it continues all along the route of the line. There are several seams.

652. Now as to other minerals? I produce several specimens.

653. The specimens, excepting that they are of geological value, do not point to the fact that they will offer any traffic? The district has never been inspected or looked at.

654. Do you know of any mine going on within easy reach of the proposed line? Yes, about Gragin, and not very far from Warialda. I think the line ought very nearly to touch one of the mines near Warialda.

655. Are we correct in assuming that the proposed railway will bring several of the mining centres within easy reach of the metropolis? Yes.

656. And will afford an opportunity of getting ores to market and of obtaining cheap supply? Yes; and it will increase the population of the district.

657. Then you are of opinion that if the line is constructed it will, from a mining point of view, offer great convenience to the mining community? Yes.

Mr.
J. S. Skeet.
6 Oct., 1896.

Mr.

Mr. William Woods, butcher, Moree, sworn, and examined :—

Mr.
W. Woods.
6 Oct., 1896.

658. *Chairman.*] How long have you resided here? Fourteen years.
659. Where were you before coming here? At Inverell.
660. How long have you been in the Moree and Inverell districts? Since 1865.
661. *Mr. Roberts.*] Are you residing on your selection at present? No; my son is looking after it. I am in business in Moree as a butcher.
662. How long have you carried on that business? About a year and a half.
663. How far distant from Moree is your selection? About 23 miles west.
664. Do you graze sheep? Yes; between 5,000 and 6,000.
665. What is the size of your selection? 6,200 acres.
666. What is the grazing capability of the district? About a sheep to the acre in good seasons.
667. Do you cultivate at all? We have cultivated a small portion, but it has not been a success.
668. Did you try it as an experiment? Yes.
669. To what do you attribute your failure? The land is rich enough, but the rain does not come at the proper seasons.
670. Do you favour the construction of the proposed line? Yes; I think the Inverell district requires a railway. I lived in that district for eighteen years, and had an opportunity of cultivating the soil there all the time.
671. Have you considered the various routes which have been suggested with a view to connecting Inverell with the railway system of the Colony? Yes.
672. What decision have you arrived at? I consider this is the natural market for Inverell.
673. Would you prefer the construction of a line from Moree to Inverell to the construction of a line from Inverell to Glen Innes or from Inverell to Guyra? I should think a line from Inverell to Moree would be more suitable for the producers of Inverell.
674. What causes you to come to that conclusion? Knowing that the east of Inverell is a farming and producing district, there can be no market other than Sydney, and the railway carriage will interfere with the profit.
675. Do you consider the natural market for Inverell produce to be in the direction of Moree and west of it? Yes; west and north-west of Moree, along the Queensland border.
676. If the proposed line were constructed, how far to the north and west would you expect the produce to find a market? Right along the Barwon—near to Walgett. In droughty seasons there is no navigable river at Walgett, and they would have Walgett at the other end.
677. Is there a fair population to be served in the district you have named? There is a scattered population. Under the present Act homestead settlement has increased very much.
678. Does a large amount of produce come from Inverell to Moree? A very large amount has come this season. We, ourselves, use forage from Inverell for our horses.
679. Whom do you buy it from? I buy maize, chaff, and potatoes from the producers direct?
680. Do you find you can get it cheaper in that way than by any other means? Yes.
681. And if the line were constructed you would be able to purchase it at a lower rate? Yes. I may say that since I have been at Moree I, myself, have sent a few thousand fat sheep to Inverell.
682. Is there a good market there for them? Four or five years after I came here I had a very good market for them.
683. Do you think, if the line were constructed, a large quantity of stuff would be sent from Moree to Inverell? I do not know that there would be a large quantity, but there would be a considerable amount of fat sheep in some seasons.
684. *Chairman.*] How many in the course of a year? I, myself, have sent 1,000 sheep.
685. *Mr. Roberts.*] Can you form any opinion as to what other people would send? No.
686. Would there be a large amount of stock sent from Warialda to Inverell? It would depend upon the seasons at New England; with a bad season there a large number would go.
687. Do you know the country to the north of Inverell towards the border? I know the country about 150 miles around Inverell.
688. What is your opinion as to the increase of traffic there would be on the railway if Inverell were so connected? I think Warialda would get some of the Boggabilla wool which goes to Queensland, and it would come on to Sydney.
689. Is there a large quantity of wool and stock sent by way of Brisbane? I know of two or three stations which have sent their wool by way of Brisbane. I think that wool will come by way of Warialda.
690. Have you been over the route of the proposed line? I have been over the country several times.
691. What advantages will accrue to the people along the line if it is constructed? They will have a quicker communication with the markets of the world, and they will be able to face a market in which they will have very little competition.
692. Would it be likely to open up any new industry such as the dairying industry? I would not venture an opinion upon it. I do not think they could compete with the South Coast dairying.
693. You say that, of course, without a knowledge of the rates at which the butter might be carried by the Railway Commissioners? Yes.
694. Would not the country, after you get 30 miles out from Moree, or approaching Warialda, be suitable for dairying purposes? It might, possibly. The only disadvantage is the distance from the centres of population, which might prevent it being a profitable industry.
695. Is grazing principally carried on between Moree and Inverell? Yes; there is very little farming.
696. Where do farming operations commence? About 30 miles from here. They grow hay, maize, potatoes, and so on.
697. Where do they find a market? Partly in Moree and in the district.
698. Where does the wheat growing commence? About Warialda, and 20 miles on this side of Inverell. A good deal of wheat has been grown. There is more grown about Bingera. If you go south to Bingera you get into the agricultural farms.
699. Believing that a large market exists to the west of Inverell, you think it would be wise on the part of the Government to connect Moree with Inverell? Yes.

Mr.

Mr. Henry Joseph, manager, Gwydir Brewery, Moree, made an affirmation, and was examined :—

700. *Chairman.*] Are you acting as the secretary of the Railway League? Yes.
701. Have you had a long local acquaintance with the district? I have been in Moree for seven years.
702. How long have you been in the district? I have several times been to Warialda, Bingera, Mungindi, Goondiwindi, and to the Barwon.
703. *Mr. Black.*] Have you any figures with regard to the traffic between here and Inverell? No; I do not think there is much traffic—not to be compared with what there would be if there were a railway here.
704. I suppose the railway would be a great convenience to the people of Inverell and this district? Yes.
705. Do you apprehend it would be beneficial to the community at large? I think so. It seems a recognised fact that if agricultural interests are encouraged it is good for all classes; and the only way of encouraging them is by seeing that provision is made for export or inter-provincial trade.
706. Do you not think that the agricultural interests might be encouraged at too great an expense to the community? It is possible; but I do not think so in this case.
707. An artificially stimulated industry would not only be injurious to the country, but to the industry? If there were a severe loss to the community it would be injurious; but judging from the evidence of the Railway Commissioners who are best able to judge, it appears there will not be a severe loss in the present instance, and under the circumstances I think it would be of great advantage.
708. Do you think there will be a great consumption of the products of Inverell in this district? I think there will be, and from here to the Barwon. When produce is cheap people use a great deal more. For instance, I myself use double and treble what I used before—not because there is any actual necessity to do so, but because it is cheaper. In good seasons I have paid as much as 5s. 6d. for corn, and £11 for chaff. I think consumption would increase considerably if there were a ready means of supply.
709. Would it increase to such an extent that this district would be able to absorb the surplus products of the Inverell district? I am not in a position to say. I imagine from what I have heard that Inverell could supply the whole of the Colony if required—that is, if all the land were occupied.
710. If that be so, and if this district be not equal to that absorption, where will the Inverell produce find a market over the railway line? The Inverell produce finds more or less market now. The supply will increase and the market will increase; but to what extent I cannot say. I presume the supply will not increase so as to overrun the district.
711. The traffic would have to increase very greatly to make the line pay? Yes; but you do not depend upon the produce alone, there is the passenger traffic and the carriage of mails, wool, and sheep.
712. Do you think that would warrant the construction of the railway? If it costs very little, and if the line will pay anything like expenses.
713. When the Commissioners estimated the receipts and expenditure, I do not think they took into consideration the extension of the traffic in produce alone? They realised there would be a loss under existing circumstances.
714. With regard to the traffic in the other direction, would you send anything to Inverell beside fat stock? That is doubtful. I think it would make a little increase possible between here and Warialda, and possibly from here to Bingera. I have sent a few tons of beer to Warialda and I might increase the quantity.
715. Is there a brewery in Inverell? Yes; they might send it from there to Warialda, which they do not do now.
716. I suppose you send beer in other directions? Yes; I send it into Queensland and elsewhere, and down to Narrabri.
717. Where do you get your malt from? Sydney.
718. I suppose that is a product you might obtain from Inverell? No; it is hardly likely we would ever use so much as to induce the people to grow barley.
719. Where do you get your hops from? The demand would be so small that they would not grow for this market.
720. In the event of the railway being constructed, do you think it would be able to successfully compete with the carriers who now convey goods between here and Inverell? Decidedly.
721. In all seasons? Yes.
722. Even when there are good roads and plenty of grass? Yes. The carrier will be pushed out elsewhere. It is only when there is a number about, and the roads are very good, that they try to compete with the railway, and then only for certain classes of goods. I can land a certain class of goods from Sydney to Narrabri at less than £2 per ton.
723. You do not anticipate any increase of settlement from the construction of a railway contiguous to Moree? In a minor degree, it would mean more people living in Moree. Moree supports a larger number of people now than it would have done had the railway not been here; but I am not qualified to give an opinion about the settlement which is likely to be induced along the line.
724. Do you think the construction of a railway here would benefit the town? Yes, materially.
725. *Chairman.*] As secretary of the league, can you say whether there has been any concerted action to ascertain definitely what probable traffic there may be? No.
726. Have the people made themselves acquainted with the estimated cost of the line, the cost of maintenance, and the interest thereon? No.
727. Therefore your railway league appears to have been an assemblage of gentlemen who were, generally speaking, of opinion that the construction of the line would be an advantage to Moree, but who were not prepared with any data to support it? Our league was initiated in connection with the Narrabri and Moree line only. Afterwards we obtained the sanction of the public at a public meeting to advocate an inquiry into the Moree-Inverell line. We do not go further than that.
728. Is the league aware of the fact that the loss upon the proposed line will be equal to £2,800 a year? I do not know whether it has ever been brought before the notice of the league as a body. Some of us individually know it.
729. Are you aware as to how the estimated traffic was made up? Not in detail, but I have an inkling of Mr. Harper's practice.
730. Did he consult you when he was here? I gave some opinions to the Commissioners of which Mr. Harper was cognisant.
731. You supplied him with a certain amount of data? Yes, in a small way.

Mr.
H. Joseph.
6 Oct., 1896.

Mr. H. Joseph.
6 Oct., 1896.

732. What do you think would be the total tonnage of wheat, hay, straw, chaff, and flour, from Inverell, passing through Moree for consumption in Moree? I do not think I ought to hazard an opinion. It would only be a rough guess.

733. Do you think 4,000 would be an over estimate in regard to those particular items? If we got 4,000 tons here every year from Inverell I should imagine it would lessen the quality we should get from Sydney.

734. Is your consumption here equal to 4,000 tons a year? Yes, I believe it would be more.

735. Could you supply any data? The guard of the contractor's train told me a short time ago that they were carrying 10 tons a day each way between Moree and Narrabri.

736. Of hay, corn, chaff, and flour? No, of general merchandise.

737. But I am speaking of hay, chaff, bran, and flour? I cannot say anything with regard to those articles.

738. You know the population of Moree and of Inverell; what would you consider a fair passenger traffic from Inverell and Moree, and passing through Moree to Sydney, or intermediate stations and back again? I think for the first twelve months you would probably average ten passengers each way per day—that is, when the line was well established. I think that would be the minimum quantity.

739. That is about 6,240 a year in number? Yes.

740. What would you consider a fair passenger traffic from Warialda? I should think four or five a day would be the outside, and about the same from Bingera.

741. Would not the Bingera traffic join the line at Warialda? I think the commercial travellers from Tamworth and along that way would strike the line at Warialda. I think Brisbane and commercial people would take a trip this way.

742. If the estimate of revenue has been based upon the maximum capabilities of the produce of Inverell at the present time, and also upon the maximum of passenger traffic, it still shows a loss of £2,800 a year, how are you able to suggest that this loss would be pulled up and eventually the line made payable? I do not know that I can suggest anything which would recoup the loss, but I believe it would be recouped naturally in the course of time. I should imagine portion of the loss would be recouped by the fact that more traffic would be drawn over a greater length of line to Sydney. It would contribute to the existing line. Although the State might lose £2,800 directly, I think it might gain it indirectly. If the line started with a loss of £2,800 a year, I think it would be a payable asset in five years.

743. Did you ever take this view of it—that necessarily these estimates of revenue are based on the maximum of the produce of the country? I thought they were not. I thought they were based on the experience of some town under similar circumstances.

744. In the event of there being two good seasons in succession here, would not that reduce the importations from the Inverell district? It might slightly; but I think there would still be a large demand.

745. But would it not considerably reduce the demand? There would not be the same demand in a drought and in a good season.

746. If you have good grass seasons here, the demand for forage would not be so great? We have had good seasons here, and there has been a large demand for produce all the time, and it is becoming larger.

747. But your present demand would not be anything like equal to the production of Inverell? But the production of Inverell would, I think, increase to meet the demand.

748. But your consumption is not equal to the present production of Inverell;—therefore, if your seasons were to continue good, there would be no necessity to increase your importations? But by making this line you would add to their market by opening up the country beyond—from here to Walgett.

749. This link of the railway would offer a means of transit to the line south of it? Yes.

750. And you do not rely so much upon the absorbing portion of the Moree district? No.

751. If that is to increase largely, it can only come about, I presume, by natural causes, as population increases? Yes. Then there would be a market from here to Mungindi.

752. Do you think the proposal is warranted at the present time, or do you think it would be wise, in the interests of the country, to defer it? I think the line should be built at present.

753. *Mr. Black.*] Is your league also in favour of extending the railway from Moree to the Barwon? It was brought up for the consideration of the committee meeting the other day, and they decided to let the matter remain in abeyance until the Inverell line was dealt with. Personally, I have not gone into the merits of the matter. If it can be shown that it will pay, or that there is any likelihood of it paying, I shall be in favour of it.

754. To Goondiwindi also? If it would pay, although in that case it might injure Moree.

754½. Do you not think that if the league got all the railways it wanted, they would be sticking out from Moree like the spokes of a waggon-wheel? The only one we have agitated for in a marked manner has been the Moree-Narrabri line, and the present proposal. I might remind you of the fact that if a line were drawn from Bourke to Sydney, it would divide the Colony into two equal halves. The southern portion contains about 1,800 miles of railway, and the northern from 600 to 700 miles.

755. How is the population divided? I suppose the population might be greater down south.

756. Do you not think that railways should bear a greater proportion to population than to gum-trees? Decidedly.

757. *Chairman.*] Has your league kept in view the fact that if this line be constructed to Inverell, so far as the Inverell people are concerned, they would have to travel over the longest line in the Colony in order to get to Sydney? Personally, I am aware of that fact; but I know also that the Commissioners would sooner have the traffic round that way than round the mountains. I should imagine it quite possible that the producers could get their produce cheaper over a long length of line, than over a short length of line, in hilly and steep-grade country.

758. Supposing the ruling grade on the Great Northern line, and the ruling grade on the main north-western line, and to Inverell, will be governed at a point close to Sydney, viz., the Hawkesbury River, would your contention hold good then? Yes, to a modified extent.

759. Are you not aware that the ruling grade—1 in 40—is to be found at the Hawkesbury River,—therefore, no matter what the grade may be in the country districts, the ruling grade is close to Sydney. Whatever load you may draw over the country line, you will still have to negotiate the 1 in 40 at the Hawkesbury? Yes; but there may be circumstances which would modify that to a great extent. They may run a lot of trucks on the flat country, and shorten the train when they come to the heavy country.

760. But it is a maximum load with which you have to deal. A train-load is the amount an engine can draw? But supposing they start with twenty trucks and one engine, and travel 300 miles, and then divide the

the train into two, and travel a few miles. It would be much better than having two engines, and the greater quantity of waggons travelling the greater distance. It does not follow that because the steeper grade is at the Hawkesbury they would never draw from Inverell the trucks which would cross the Hawkesbury.

761. Is it probable that the traffic in Inverell will be sent round 509 miles to the metropolis, when they can get by rail 420 miles, and team carriage 40 miles? I have not sufficient data to enable me to judge.

762. Have you considered the point? No.

763. As a resident of Moree you only see the importance the line would be to Moree? Decidedly.

764. You leave the Inverell people to speak for themselves? Yes; if they can get a better route it should be built the other way.

Mr. Arthur Thompson, wool-scourer, Moree, sworn, and examined:—

765. *Chairman.*] How long have you resided at Moree? Twelve years.

766. Have you an extensive knowledge of the district? Yes; I have had for the last twenty-three years. Do you know the route of the proposed line? I have not an extensive knowledge of the route to Inverell. I know more of the country between here and Walgett, and out to Collarenebri.

768. *Mr. Clarke.*] What information do you wish to communicate to the Committee? I think one thing which has been overlooked is the stock traffic on the route.

769. Are you of opinion that there would be large stock traffic from the western and north-western country to Moree or Inverell? Where Moree is suffering at the present time is in having no climate in which to freeze meat and tin it.

770. Do you mean to say that freezing and tinning could not be carried out in a climate like that of Moree? Not so well as in a climate like that of New England. New Zealand proves that. Their mutton always brings a better value, because it is frozen and tinned in a much better condition than we can freeze and tin it in this warm climate.

771. Is it not done at Murrurundi at present? Yes, and it is done at Bourke; but the Bourke meats will not compare with the New Zealand meats.

772. Are you aware that the proposed line is intended to stop at Inverell? That may be; the Commissioners may intend that at present; but if it is found beneficial the line will be taken to some other place, such as Tenterfield or Glen Innes.

773. Do you think it would be advisable to carry the line on to Glen Innes? Yes. It is the thin end of the wedge to get it to Inverell.

774. You do not object to the line being constructed to Inverell, and at some future time to some part of the Great Northern Line? That, in my opinion, is the best plan.

775. What quantity of stuff do you think would be likely to go from any portion of the proposed line to Narrabri, and thence to Sydney? It depends on the seasons. When a former witness was giving evidence he seemed to think a bad season would be more beneficial to the line. My idea is that the line would reap a greater benefit in a good season than in a dry one, because we would have fat stock to send over the line in large numbers to be treated.

776. Are you aware of the nature of the land upon the proposed line? Yes; I have a fair knowledge.

777. What kind of land is it? The first portion of it is only fit for grazing—that is, the whole of it on this side of Warialda.

778. Is it fitted for agricultural purposes? Yes, for the growth of all kinds of cereals.

779. Do you think it would be in the interests of the people of Inverell and Moree that the line should be constructed? Yes, and not only to Inverell, but to the whole of the eastern side of the Colony. It would give Inverell a market. Apart from that, the climate of New England is the best for freezing and tinning works. It is also the best and cheapest climate for working people to live in.

780. The proposed line will not assist in the development of those works? But I do not think the line would stop at Inverell. I think it would ultimately be extended to Glen Innes.

781. Are you aware that the estimated loss on the line is £2,800 per annum? So it is estimated, but I do not know how they get at it. I do not see how they can compute the amount of forage and similar stuff which they would get rid of in this western district. For instance, it will be cheaper for the Walgett, Angledoon, and Mungindi people to get their forage from here.

782. Do you think there is any probability of the loss being reduced in time? I think there is by increased traffic.

783. Would the products of the Inverell district be more than sufficient for local consumption here and out north and north-west? They do not know what they will take out west.

784. The surplus, I suppose, would have to go to Newcastle or Sydney? Yes; I believe Inverell could supply this district and then have a surplus to go to Newcastle.

785. Are you aware that the Public Works Committee have recommended a line from Tamworth to Manilla? I have heard so.

786. Do you think it would be advisable to extend that line? For myself I do not think that line is required, but they are the best judges of that part of the country.

787. Have you any property along the proposed line? No.

788. Can you give any idea whether the public through whose lands the proposed railway will pass would be inclined to give that land free of cost to the Government? My opinion of the public is, that if they think there is a probability of the railway going there they will say they do not want it. At the same time they do want it. They do not like giving anything if they can get payment for it.

789. Then you do not think it is likely they will give the land? Some might, but I am doubtful about it.

790. *Mr. O'Connor.*] What is your opinion with regard to the increase or otherwise of the population between here and Inverell? Whether the line is constructed or not, I think the population in the next five years will be doubled.

791. Are you aware that nearly 500,000 acres of land will be thrown open between here and Inverell in the next four years? Yes.

792. Would not that attract population? It should do so. I may say there are thousands of hides annually wasted in this district. At present it is impossible to get the bark about here for the purpose of tanning, but if there were a railway we could get tanning-bark from Inverell, or the hides could be carried there.

Mr.
H. Joseph.
6 Oct., 1896.

Mr.
A. Thompson.
6 Oct., 1896.

Mr.

Mr. Samuel Lewis Cohen, land agent and auctioneer, Moree, sworn, and examined:—

Mr.
S. L. Cohen.
6 Oct., 1896.

793. *Chairman.*] How long have you resided here? Fourteen years.
794. I suppose you have a general knowledge of the surrounding districts? I do not know whether I have much knowledge of the country between here and Inverell, but I know the Moree district.
795. *Mr. Roberts.*] Are you an alderman of the Moree Council? Yes.
796. For how many years have you occupied that position? Four or five.
797. Are you well acquainted with the people of the district? Yes.
798. Would you like to say whether the people in the district are in favour of the construction of the proposed railway? I think, if they are alive to their interests, they ought to be.
799. But are they? I suppose there are some exceptions; but I think the majority of the people are in favour of it.
800. What advantages do you think would accrue to Moree, or to the Colony generally, if the line were constructed? Moree is a non-producing community, and Inverell is a producing community. All the surplus produce which could be grown in Inverell could be absorbed by Moree, thence on to Narrabri, and westward from Moree down the Barwon. I think the Inverell people would find a better market. They would have only 95 miles of railroad traffic; whereas if they send their produce to Sydney, they will have to compete with more favoured districts such as Orange, Bathurst, and Goulburn.
801. You think there is a large market for Inverell produce in Moree and out west? Yes.
802. And owing to the fact that Moree and the surrounding district would procure that produce at a lower price than they are obtaining it now, there would be an advantage to Moree if the line were constructed? Yes; now you can buy corn at Inverell from 1s. to 1s. 5d. per bushels, and it costs us about 1s. to land it here—that means 2s. or 2s. 5d. Judging by the rates on other lines, it would cost us about 3d. to land it here. In proportion to the decreased price of the commodity the consumption and demand will be greater.
803. How far west do you think the district from here would be benefited if the railway were constructed? Walgett. There is a large population springing up west. There is one run which has only recently been thrown open, which has thirty or forty families upon it. All the settlements are tending west, with the throwing open of the leasehold areas.
804. Is there a large, although scattered population that way? Yes.
805. Is much fat stock sent from Moree to Inverell at the present time, or would much be sent if a railway were constructed? I think there would be a good deal. This is a better fattening country than Inverell. I think we could supply them with fat cattle and sheep; but I do not know in what quantities, as I do not know what is the demand.
806. *Mr. O'Connor.*] Although not acquainted with the physical features of the country, I suppose you are acquainted with the desires of the people? Yes.
807. In the event of land being thrown open for selection about Inverell, do you think people would be found willing to take it up? I have not the least doubt about it.
808. Within the next three or four years nearly 500,000 acres of land will be thrown open between Moree and Inverell; if that is so, will it be taken up? It depends upon what sort of land it is, and the areas. If it is thrown open to settlement lease in 2,500-acre blocks, or homestead selections of 1,280-acre blocks of good land, I have no hesitation in saying the whole of it will be applied for.
809. Do you know the country towards the Barwon? I have not seen it personally; but I have been to Walgett from Narrabri.
810. Do you think it will in course of time be very much improved? I do not think there is a doubt of it.
811. *Mr. Clarke.*] Can you give any estimate as to the value of land generally between Moree and Inverell? I do not know the country well after you pass Binniguy, which is 22 miles from Moree. I have known conditional purchase land 14 miles from Moree, with the balance unpaid, to bring £2 10s. an acre. The land along the river frontages from here is very valuable up to Binniguy. There is land about the town—2 miles out—which was sold for a farm two years ago at £20 an acre. There were about 14 or 15 acres available.
812. Is it worth that now? I think so. I may mention that in addition to the railway being used for fat stock from here to Inverell, it will also be used in times of drought for deporting poor stock. I know that has been done in Riverina to a considerable extent. The Commissioners make concessions; and as they do not suffer so much from drought in the Inverell district as we do, the railway will be used considerably for sending impoverished stock there. I may mention there is a great demand for land in this district—a demand which cannot be satisfied.

Mr. Alexander George Forbes Munro, grazier, Weebollabolla, sworn, and further examined:—

Mr. A. G. F.
Munro.
6 Oct., 1896.

813. *Chairman.*] What is your idea of the value of the land which is likely to be resumed for railway purposes? The land is of such various values that it would come under three or four headings. Some of the evidence given has led me to believe that the witnesses imagine the land is worth 30s. an acre between here and Inverell, on an average. I think the very best land beyond 10 miles from Moree would be along the river angles, which I would value at 30s. an acre, and the black plains country, and the black hill country, which is black soil also, I would value at £1 an acre. The box and ironbark forests would be only worth about 10s. an acre, and the belah scrub, of which there is a very large proportion, would not be worth more than 5s., for the reason that it costs about 10s. an acre to put it into workable condition. In its present condition it grows nothing where the scrub is thick.
814. But the whole of the freehold land along the surveyed route has not been parted with by the Crown for less than £1 an acre? I am speaking of the land which has not yet been alienated.

THURSDAY, 8 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Warialda, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.	HENRY CLARKE, Esq.
The Hon. DANIEL O'CONNOR.	GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Moree to Inverell.

Mr. John Lanagan, commission agent, Warialda, sworn, and examined:—

815. *Chairman.*] How long have you been residing here? A little over three years. I was reared, however, within a distance of 15 miles from here.

816. Do you know the district east and west of Warialda? Yes.

817. Can you tell us what the prospective traffic would be for a railway between Moree and Inverell? Evidence as to the passenger traffic will be given by another witness. I have made out the stock traffic as near as possible from stock returns. I think the number of cattle which would leave the district by rail in the year would be 9,000; sheep, 76,200; wool, 10,146 bales.

818. You give us so many head of cattle and sheep—can you give us the number of trucks;—how many cattle are usually put into a truck? Ten. That makes 900 trucks. I believe the sheep trucks hold 200; but I am not clear on that point, and that would make 331 trucks. The cattle and sheep combined would make 1,281 trucks.

819. That would be for the stock leaving the district? Yes.

820. And from what parts would they come to be trucked here? I have gone 53 miles north to Yetman; south to Pal-lal, about 32 miles; and east to Reedy Creek, about 22 miles. That is in the direction of Inverell, and the station is within 3 miles of the proposed line.

821. This stock might be trucked at Warialda or wayside stations? Yes, and west to Gravesend—about 20 miles.

822. This stock might be trucked on the spot, or might go to Moree, or come to Warialda? I have gone into these figures believing they would be feeders for the line.

823. Your figures relate to outgoing stock;—there would be no stock coming into the place by train? Only in small quantities—say, for local consumption in a time of drought.

824. What do you mean by a time of drought? If we were short of fats we might get them from other places.

825. Does this district suffer in times of drought? Not to the extent it does further west.

826. Could the pasturage be depended upon here in a severe time so as to make a depôt for starving sheep from the western country? Not at all times.

827. If a drought occurs in the western country, I presume you very largely participate in it? Not very largely; our hilly country, of course, stands very much longer than the western plains.

828. How many bales of wool do you give? 10,146.

829. How many bales go to the ton? I have struck this number of bales by giving about 75 fleeces to the bale, from the number of stock.

830. Do you dump in this district? No.

831. I suppose there would be a little over 2,000 tons of wool which would be trucked from here? Yes.

832. How is the wool sent to market now? The chief part of it is sent by carriers to Tamworth by way of Bingera.

833. If the Manilla line be constructed, I suppose Manilla will be the depôt for it? Yes; if that line is constructed, and the Moree-Inverell line is not carried out.

834. What distance would that save you? Twenty-eight miles.

835. And you would have the convenience of having a better camping ground? Yes.

836. Taking Warialda as a centre, what will be the wool carriage from Warialda to Tamworth? About £3 5s. per ton. Some give 3s. per cwt. and others more. I think you could strike 3s. 3d. per cwt. as an average. In addition to the cattle I have mentioned, we very often have Queensland cattle coming past here in thousands. They often truck the fats to the nearest railway station.

837. Where do they cross the border? At Goondiwindi. That is the crossing for the chief part of the Queensland cattle which come through our district.

838. The usual route for the cattle crossing at Goondiwindi is *via* Warialda? I think it is about equally divided. Possibly we would have a little the best of it.

839. Is that accounted for by the establishment of the stock route? Yes; and I think the country is a little better watered, and the grass is better.

840. Where would they strike now, supposing they were going through? At Brecza.

841. How far is that from here? About 150 miles.

842. In that case the stock would strike the railway here and save travelling 150 miles? Yes.

843. But if they wished to go to the nearest railway station, and the proposed line were not constructed, they would touch it at Moree? Yes; crossing at Goondiwindi.

844. Or if they came by this route and thence to Moree it would be 55 miles longer? Yes.

845. I believe the Narrabri-Moree line has not yet been opened to the public? No.

846. And you do not know the effect it is going to have upon the travelling stock? No; that has yet to be learnt.

847. Do you supply the western country with store cattle? Yes; a good many are supplied for the western country.

848. Do they stand railway carriage? Not as a rule.

849. They would be more likely to travel by road? Yes; I do not think anything could be expected from the store cattle, because when the country is in such a state that you would have to truck, people would not be inclined to buy.

850. Do you think the quantity of wool here is likely to be increased? It should be increased; the return I have given is very much lower than the 1894 return.

- Mr. J. Lanagan.
8 Oct., 1896.
851. Is there room for much increase? Yes, at present there is.
852. What is your opinion as to the settlement of the district—has it increased or decreased during the last ten years? It has increased considerably.
853. In the number of people settled, and in the quantity of stuff produced? Yes.
854. Have you any reason to suppose that when the leases fall in and the areas are divided these figures will decrease? Not the slightest—I think the reverse.
855. You think if they get into the hands of the smaller men the quantities are likely to be considerably increased? Yes, judging from the experience I have had amongst stock. When land is cut into smaller holdings it carries more stock than larger holdings.
856. But the loss of so much of the leaseholds must necessarily reduce the number of stock on the stations? Yes.
857. You think that will be more than compensated for by the increased numbers on the smaller holdings? Yes.
858. You do not fear any retrograde movement in this district on that account? Not at all.
859. Is there any particular point which you would like to emphasise in connection with your evidence? I may state that for every piece of land which has been thrown open there has been a number of applicants. There is no doubt that people are thirsting for land. There is a large demand for it. I often have letters asking if there is any chance of securing land in the district.
860. Have any settlement leases or homestead selections been opened here? Yes, both.
861. What is the popular mode of holding the land? Where the land is fairly good each lot has been taken up. There have been as many as half a dozen or more applicants for each lot.
862. In what areas do the farming community hold their lands? The chief part of our farmers are conditional purchase holders of from 100 acres to 3,000 acres, and they farm portions.
863. What is the maximum for a conditional purchase in the Central Division? 2,560 acres.
864. Can you tell us whether the conditional purchase holders have held their land, or has there been much transfer? Very little transfer; the chief part of the old residents who took up the land are now on the soil.
865. From that would we be safe in assuming that they have been able to make a living on the land, and have held it? Yes. Many of the small holders—farmers—are also carriers, and some run stock, and between the lot they make a living.
866. I notice that the proposed railway station is some distance out of the town? Yes.
867. Is there any desire on the part of the people to have it closer? Yes; they would like to have it about a mile and a half away.
868. They would be better satisfied if it were brought closer to them? Yes.
869. You think it would tend to an increase of traffic? I do not know whether it would. Of course, landowners look to the likelihood of another town springing up, and values here must, consequently, go down. I have conducted the whole of our Crown land sales since I have been in business. Crown lands have sold readily.
870. Would the residents be satisfied to have the station erected upon the proposed site rather than none at all? I believe they would.
871. But you think it could with advantage to all concerned be brought closer? Yes.
872. Are you prepared to say whether there would be any engineering difficulties in getting out on the eastern side? I do not think the engineering difficulties are very great.
873. Or that they would increase the length of the line? They might increase the length of the line, but not very much.
874. Your contention is that Warialda, being the centre of population and an old established town, is entitled to be connected with the railway system? Yes.
875. And you know of no local reason why the proposed site should be put so far away? No.
876. And inasmuch as all the other towns of the Colony have the benefit of a railway station close to the town, you think Warialda has the right to a similar benefit, particularly when there are no engineering difficulties to be encountered? That is my contention.

Mr. Robert Kirkpatrick, Inspector of Stock, Warialda, sworn, and examined;—

- Mr. R. Kirkpatrick.
8 Oct., 1896.
877. *Chairman.*] How many years have you been in Warialda? Four years and six months.
878. I suppose your duties take you all over the district? Yes.
879. How far do you go in each direction? North, to Goondiwindi, which is 93 miles from here; south, to Cobbadah, which is 60 miles; east, about 35 miles—to within 5 miles of Inverell; and west, to Boolooroo Bridge, about 6 miles north-east from Moree, to the Big River.
880. *Mr. Black.*] Can you give the Committee a statement as to the number of acres of land there is in the district, and also as to the number of stock depastured in the district? Yes; there were at the end of 1895 3,092,795 acres in the district. The stock comprise 11,948 horses; 66,799 cattle; and 1,064,790 sheep. Those are the correct returns for 1895. The returns are made every year, in December.
881. I suppose the quantity of land under agriculture is, comparatively speaking, infinitesimal? Very small in comparison with the quantity used for pastoral purposes.
882. According to your figures you cover an area which does not really represent the extent of country which will be tapped through Warialda by the proposed railway? No. Of course, some of the traffic I daresay would come to Moree, some to Inverell, and some to Manilla.
883. Have you a knowledge of the character of the soil of the district? Yes.
884. What is your opinion of the soil in and around Warialda for agricultural purposes? I think it is very good soil for wheat-growing.
885. Is it chiefly red soil? Yes, about Warialda, and towards the south-west and partly north-west. It is ironbark country from 15 to 40 miles out, and then it is black soil.
886. Going out of the town towards Inverell—that is eastward—there is, I believe, some poor soil? Yes, for a few miles. It is sandy for about 6 miles, and after that the country is very good. It is a white-box country.
887. Are there not some steep grades there? Not very. There are little hills and valleys; it is undulating sort of country.

888. Lower down, along the route of the proposed line, is the country of better quality than it is after leaving the town directly by the road? Yes, all along the proposed line the country is better than near the town. Just about the town the country is sandy.

889. Do you avoid any of the ridges by taking the proposed line? I think there is a slight rise. The country is actually better along the proposed route—Kelly's Gully—although it is very rough through Kelly's Gully.

890. Are you aware that there is a large quantity of land around Warialda admirably suited for agriculture? Yes.

891. Is the climate also suitable for wheat-growing? Yes, it is very good for wheat.

892. What is the character of the rainfall here? The average for the last seventeen years is 29½ inches.

893. Do you have summer thunderstorms? Yes.

894. Do you have regular spring rains? The heaviest rains we get here are about the end of January or February. This year has been drier than usual.

895. *Chairman.*] Now that the Narrabri-Moree line is completed, do you think it is going to have any effect upon the travelling stock in this and the northern portions of this district;—will it divert the stock from the usual stock routes? It depends on the number which want to go. If great numbers went they would eat the stock routes out, and others would not travel.

896. Is it not natural that they will make for the nearest station, which will be Moree? They will, unless there is a trucking station here.

897. What effect would a trucking station have on travelling stock? Most of the traffic goes from here to Tamworth, and if there were a trucking station here I think they would use it, because very frequently the roads are not fit to travel on. I refer, of course, to fat stock. I think the store stock would be travelled to their destination, excepting in a severe year, when the railway authorities allow cheap rates for the carriage of starving stock.

898. Supposing the proposed line be made, and the line to Manilla be also made, do you not think it probable, Manilla being so much closer to Tamworth, that stock would travel to Manilla, and be trucked there in preference to being trucked here? It would, I think, depend upon the season. If there were grass on the roads they would most likely travel to Manilla—at least some of them would.

899. In a bad season they would be trucked? Yes.

900-1. Therefore, taking the average of the seasons, you must not depend on the whole of the stock being trucked here.

Mr. Frithiof Vaidemar Wikner, Resident Engineer, Roads and Bridges Branch, Department of Public Works, Warialda, sworn, and examined:—

902. *Chairman.*] How long have you been stationed here? Four years.

903. Are you prepared to give evidence as to the money expended upon the roads, and as to the state of the roads? Yes.

904. *Mr. Clarke.*] What are the boundaries of your district? I go to Boggabilla on the north; to Barraba on the south; half-way to Inverell—a place called McIntyre's—east; and to Yagobe on the west.

905. What is the state of the roads at the present time? They are pretty good just now. The last two weeks have been fairly dry, and they are in good condition.

906. Can you give any information as to the annual expenditure on the various roads under your supervision? Roughly speaking, about £5,500 per annum.

907. In the event of the proposed railway from Moree to Inverell being constructed, would it be necessary to have the same expenditure on the roads, or would there be a reduction of expenditure? I think there would be a slight reduction. On the main front road to Tamworth, the traffic would be less, and, of course, on the Inverell and Moree road it would be less.

908. I suppose it would be necessary to keep some of the roads—particularly the by-roads—in repair? Yes; they would have to be maintained.

909. Do you think any of the stock which now goes to Tamworth, *via* Manilla, would be put on the railway here instead of going to Manilla? I think so.

910. In the event of the line not being constructed, a portion, I suppose, will still go to Manilla, and some to Moree? Yes.

911. Can you give any idea of the tonnage of produce carried from Inverell to Moree? The tonnage up to the last fortnight has averaged, for nearly three months, about 100 tons a week.

912. Why do you confine yourself to the three months? I do not know the reason unless it is that they cannot produce anything in Moree in the shape of horse-feed, and they have had to resort to Inverell to get it. The traffic has been principally in horse-feed.

913. But is there no produce carried in the remaining nine months of the year? I have only noticed it recently. It has never been excessive until the last three months.

914. Would not there be some produce carried during the remaining nine months? Yes.

915. To what extent? I should think, at least, 100 tons a month.

916. That makes about 2,200 tons to the year? Yes; it includes horse-feed and produce generally.

917. Are you aware that Moree is sometimes supplied from Bingera? Yes; but I have only referred to the direct traffic from Inverell, which has to pass through Warialda.

918. I suppose that produce would be for consumption in Moree, and would be sent from here west and north-west? Yes.

919. In the event of a railway being constructed, would the traffic increase? I think it would be likely to do so. I think the market lies out west—Moree, and west of Moree.

920. Do you think more people would be engaged in the cultivation of the soil? I should think so.

921. Is there a large area of country around here fitted for the growth of cereals? I think so. I think the land will grow almost anything.

922. Do you grow maize in this locality? It can be grown, but not much is grown.

923. Is the land adapted for it? Yes.

924. Even the high land? No, that is stony in places; but it would grow wheat.

925. Are there any flour mills about Inverell? There are two, one of which I believe is working.

926. Have you any flour mills in Warialda? No.

927. Is there one at Bingera? Yes.

928. Do you think it would be to the public interests to construct the proposed line? Yes.

Mr. R.
Kirkpatrick.

8 Oct., 1896.

Mr.
F. V. Wikner.

8 Oct., 1896.

- Mr. 929. Are you aware that it would incur a loss of £2,800 per annum? I have heard so.
- F. V. Wikner. 930. Do you think the increased production in traffic would reduce that amount to such an extent that in a few years the line might possibly pay? I believe it would.
- 8 Oct., 1896. 931. Mr. Black.] Do you know the grades on the roads about here? Yes.
932. Do you know the proposed railway route? Yes.
933. Have you seen the deviation on the plan by which at one time it was proposed that the line should come through Warialda? Yes.
934. On which route is the best land situated? I should say the route south of Warialda.
935. Would the grade coming into Warialda be steeper than that proposed by the Railway Commissioners? There is no doubt it would be slightly steeper.
936. And going out of Warialda as well? Yes; going out towards Inverell.
937. Have you any idea what the grade would be going out? I cannot say what the railway grade would be; but the roads never exceed 1 in 10. That is where there are severe pinches on the roads. The grades on this road, with the exception of a few pinches, are, generally speaking, very easy. One in 10 is an excessive grade, but it includes gully-crossings.
938. Chairman.] Did you take any precaution to ascertain accurately the amount of traffic passing on the road to Moree? I questioned my maintenance-man.
939. Your figures for thirteen weeks are 1,300 tons;—have you any explanation to offer as to why that large amount should go over the road in so short a period? No; unless it is that there is nothing produced about Moree; a good deal of the produce is brought here from Inverell and is sold locally.
940. Is it not likely that owing to the bad season in Moree the demand for forage has been greater? Twelve months ago last winter they had the worst season they have had in Moree for some time.
941. Can you carry your memory to a period of three years ago, when the seasons at Moree were better—can you remember what the traffic in produce was then? I could not give you any accurate idea.
942. We should like to know whether this produce traffic is effected by the seasons about Moree and in that locality, the inference being that in good seasons the produce traffic would be less, and in bad seasons greater;—has there been a steady stream of produce to those points every year, or has it been erratic? I am inclined to think it depends to a certain extent on the seasons.
943. Therefore, the traffic, whether carried on drays or on the railways would depend very largely upon the demand, which would be regulated by the seasons? To a certain extent. No doubt the population will increase, and I think it is more likely to increase if there is a railway.
944. The fact, of course, remains that in that dry western country the demand for horse forage is largely regulated by the condition of the seasons there? I think so.

Mr. Arthur Ormonde Butler, Clerk of Petty Sessions and Crown Lands Agent, Warialda, sworn, and examined:—

- Mr. 945. Chairman.] How long have you resided here? About nine months.
- A. O. Butler. 946. Mr. Roberts.] Are you familiar with the country between Warialda and Inverell, and from Warialda to Moree? I have travelled from Inverell to Warialda, but not to Moree. My knowledge of the country would be obtained solely from the various notifications in the *Gazette*, setting apart the land.
- 8 Oct., 1896. 947. Do your official duties cause you to travel over any part of the country? No.
948. Can you give the Committee any information as to the transactions in land by the people of this district? I could give you the total areas of the various holdings. The total number of conditional purchases is 434, representing an area of 137,386 acres; additional conditional purchases, 411, representing an area of 69,453 acres; conditional leases, 326, representing an area of 196,837 acres; annual leases, 29, representing an area of 22,742 acres; settlement leases, 10, representing an area of 24,919 acres; homestead selections, 5, representing an area of 6,400 acres; total area, 458,237 acres. These represent solely land which has been confirmed to the applicants, and stands good on the books. There are a number of selections and other things which are not good, and which have not been confirmed to the applicant.
949. What are the boundaries of your district? It represents 116 parishes.
950. Does it go to the Queensland border on the north? Yes.
951. How far south? It is bounded by Moree on one side, Inverell on the other, and Bingera on the other. I take in part of Arawatta, the whole of Burnett, and portions of Stapylton.
952. Can you give us any information as to the revenue? The revenue in this office alone is, approximately, £16,000 a year.
953. Up to when is that return is made up? That is what I estimate for this year. Up to the end of September my revenue was over £12,000.
954. How does that compare with previous years? It is rather in excess by £3,000. The total last year was £13,000, and up to September of this year it is over £12,000, and there are from £4,000 to £5,000 outstanding.
955. The result appears to be highly satisfactory? Yes.
956. Do you find many selectors giving up their holdings through finding it impossible to make a livelihood? There have been three forfeited in the nine months since I have been here. I think they were forfeited on account of not being taken up *bona fide*—not on account of the people being unable to maintain themselves.
957. Are you able to give any information as to the success of persons establishing homes for themselves in this district, and as to whether they are able to make a comfortable livelihood? From the way in which they pay up their instalments I should say they were very successful. I look upon that as a good sign. There are very few applications for extension of time to pay, and I think that is a criterion to go by.
958. Can you tell me the approximate value of the land between Moree and Inverell;—I suppose it would vary very much? Yes, it would vary very much. Some of the land set apart is worth 5s. an acre; other parts are worth £2 or £3 an acre.
959. Is the whole of the land between Moree and Inverell taken up? No; there are thousands of acres available.
960. I mean land through which the proposed line will pass? There is a great deal of land still open. It is proposed to set apart during this year, between Inverell and Moree, 348,000 acres in settlement and improvement leases.
- 961.

961. What class of land is that? The settlement leases would be very good agricultural land, and the improvement leases would be infested with prickly pear.
962. How would you class the different lands along the route of the proposed railway, some of which I believe are very poor indeed? Yes; and other parts comprise first-class grazing country also suitable for agriculture.
963. About what percentage is what you would call first-class grazing land? About 50 per cent.
964. Have you prepared any statement which you would like to read to the Committee? The detailed area I have given does not include scrub leases, improvement leases, occupation leases, or special leases, which amount to a large item in this district.
965. Have you every reason to believe that the revenue from land in this district will increase? It is increasing every month.
966. Do you express any opinion as to the effect railway communication will have upon the district? I think it would open up more country. Some people have an objection to taking up land unless there is some means of getting their produce to market.
967. Has it come under your official notice that there is likely to be a large demand for land if the railway be constructed? Judging from the inquiries which have been made, I imagine I should get rid of at least 100 more settlement leases, which means 100 more families in the district.
968. What areas of land would that probably include? It depends. If it were for agriculture it would be 1,280 acres. That is the maximum for settlement leases for agriculture. If it were for grazing purposes it would be 10,240 acres.
969. Have you numerous inquiries? Yes, mainly from Victoria. A great many Victorian settlers come over here, and also write for particulars.
970. Do you think that is in view of the possibility of the line being constructed? I think it has a great deal to do with it—that is, judging from the remarks they make when in the office. It seems to be the general impression that if the line be constructed it will materially benefit them, and induce them to take up the land.
971. Is there much agriculture going on around Warialda at present? Very little, I think.
972. Are you able to say whether those who have embarked in agricultural pursuits have been successful? I think so.
973. Can you say whether they are enlarging the area of land under crop? Almost all of them have taken up additional conditional purchases and leases for the purpose of increasing their agricultural holding.
974. *Chairman.*] Do your books show that during the last ten or fifteen years the land has been held *bona fide*, and not for speculative purposes? Yes; it has been held *bona fide*. The number of transfers has been small; I do not think they average more than fifty a year, and the majority of those have been due to people obtaining small loans from the bank by way of mortgage and release.
975. With reference to the large area of 348,000 acres to be thrown open in a few years, is it a fixed thing that 1,280 acres is the maximum area for an agricultural settlement lease? Yes; that is provided for by the Land Act.
976. And the maximum for grazing 10,240 acres? Yes.
977. Have any settlement leases been thrown open here? Ten so far: seven of 2,560 acres; one of 1,094 acres; one of 1,723 acres; and one of 4,181 acres.
978. Therefore the 1,280 acres has been exceeded? Yes; that would be for grazing and agricultural purposes.
979. What, in your opinion, would be about the area adopted for the disposal of these 348,000 acres? I think it would be 2,560 acres each. There are 399,500 acres proposed to be set apart for settlement lease—that is, for the whole of the Moree district; but for Warialda the area is 66,800 acres.
980. Is that area likely to be dealt with by homestead selection or settlement lease? By settlement lease.
981. Of what area? About 2,560 acres.
982. If that were alienated in that way, how many people would it put upon the ground? About thirty-three families.
983. When the whole of that area is alienated under that system it will only put thirty-three additional families on the soil? Yes; but, of course, there is a lot of land at Bingera and Moree practically adjoining that.
984. I suppose the areas already held by the conditional purchase holders are sufficiently large to admit of an extensive increase in cultivation? Yes.
985. And although the prospective settlement is not likely to be large, it cannot guide the Committee in arriving at a conclusion as to what the aggregate agriculture is likely to be? No.
986. Are there many unsold allotments of Crown lands within the town boundaries? There are four; but I do not think people would have them at a gift; they are all stone ridges.
987. Is there any unmeasured portion of Crown lands within the town boundaries, other than reserves? Yes; there are 20 or 30 allotments which were surveyed for auction purposes, but in view of the proposed railway they were reserved from sale.
988. Therefore there is plenty of room for the extension of the town at Warialda on Crown lands? Yes.

Mr. Thomas Heydon, baker and seedsman, Warialda, sworn, and examined:—

989. *Chairman.*] How long have you resided at Warialda? For seventeen years; but I have resided in the district for twenty-two years.
990. *Mr. O'Connor.*] Do you know the country between Warialda and Inverell? Fairly well.
991. What is it fitted for? For 30 miles on this side of Inverell it is first-class agricultural land.
992. That is to say, that for 30 miles out of the 38 miles between Warialda and Inverell the country is fitted for agriculture? Yes.
993. Have you any idea whether, if the land were available for selection, it would be taken up? I think it would be.
994. Do you know anything about the land between Warialda and Moree? Yes; it is first-class grazing land.
995. And if facilities were offered for its acquisition, would it be taken up? Doubtless it would.
996. If there were a railway connecting Inverell, Warialda, and Moree, would it be a certainty that settlement would be stimulated? Decidedly; but I think more so to the north of Warialda. There is grand country to the north of Warialda, towards Queensland.

Mr.
T. Heydon.
8 Oct., 1896.

Mr.
A. O. Butler.
8 Oct., 1896.

- Mr. T. Heydon.
8 Oct., 1896.
997. Do you know the Warialda district? Fairly well.
998. Do you know the people who are settled on the soil about here? Yes.
999. Are they prosperous? I never saw people more prosperous than the selectors out north from here.
1000. I suppose those who come here have stayed here? Yes; and they have succeeded.
1001. And increased their holdings? They have paid me well, at any rate.
1002. Are your business transactions of a satisfactory character? Very. I was never in a town or district where I have been paid so promptly as I have been in Warialda.
1003. Are you of opinion that however the people may be now, railway communication would add to their prosperity? I should think so. It would stimulate the production of the country. It is of no good producing unless you can get a market. The production in Warialda is limited at present. When there is a certain amount in the town, it is well supplied, and you must take your produce somewhere else. I believe this would be a grand fruit-growing district. I have some trees which would bear comparison with anything I have ever seen in the old country or this. I refer to apple and pear trees.
1004. I suppose if there were means of sending fruit to market the industry could be enlarged? Yes.
1005. I suppose if there were facilities for meeting a ready market, the conditions of the country would be favourable for fruit production? Yes. I may mention there are beds of freestone in the district which would be of commercial value. The stone is all around Warialda, and it is of the finest description. Twenty-two years ago they used to cart it to Bundarra and Inverell. Although you are only 8 miles from the outcrop of the granite you have some of the finest freestone here. When the Bundarra bridge was being constructed, the contractor wrote to see if he could get freestone here, but at that time labour was scarce and the people who had the quarry wanted such an exorbitant price that he could not afford to take it. It would become a commercial commodity if we had cheap railway carriage.
1006. Mr. Roberts.] Where do you purchase from? Sometimes in Bingera, and sometimes in Inverell, just as the market suits me.
1007. Are you able to give an opinion as to the quality of the flour? Yes, I have seen as good flour produced in Inverell as in any part of the world.
1008. Are Inverell flour and Bingera flour very similar in character? They are. If anything, of the two the Bingera flour is a little shorter. It has not that amount of glutine in it which the Inverell flour has.
1009. Then you prefer the Inverell flour? Yes.
1010. Have you ever used South Australian flour? Yes.
1011. How does that compare with Inverell flour? I have had flour from Inverell which would equal any Adelaide flour, either for colour or strength.
1012. I suppose you can get your flour from Inverell cheaper than anywhere else? Yes; but in years gone by we had to go to Tamworth for it, but not now. We are well supplied from either Bingera or Inverell.
1013. You are never obliged to send out of the Colony for it? No; twenty-two years ago I baked Adelaide flour in Inverell.
1014. What is your average annual consumption of flour? About 24 tons in twelve months.
1015. Is there anyone else engaged in a similar business to yours? Yes, a woman.
1016. How much would she consume? About 10 tons.
1017. Would 30 tons of flour make bread for the whole of Warialda? No; numbers of people bake their own bread—at the public-houses, for instance. I depend principally upon people travelling through.
1018. Would it be of advantage to you to have Warialda connected by railway with Inverell? It would depend upon where the station was. I may state that the more frequently you handle goods the dearer they become. My opinion is that it would be a great mistake to have the station at Kelly's Gully. The carriage from there to Warialda means money. It would be no advantage to anyone in particular.
1019. Mr. O'Connor.] Where is the best site? Somewhere closer to the town.
1020. Mr. Roberts.] If the line were constructed, would you be able to get flour cheaper than you get it now? I presume so.
1021. What is the present carriage by team to Warialda? About £1.
1022. And how much from Bingera? £1; it used to be 25s.
1023. How far is it from Warialda to Bingera? Twenty-six miles.
1024. Is it a better road from there? Yes.*

Mr. Joseph Battersby Scholes, grazier, Ezzy's Crossing, Big River, sworn, and examined:—

- Mr. J. B. Scholes.
8 Oct., 1896.
1025. Chairman.] How far is Ezzy's Crossing from Warialda? Eleven and a half miles.
1026. How long have you been in the district? Two years, in December.
1027. Do you know the route of the proposed railway? I know it as far as Gravesend.
1028. Does it pass through your property? Yes.
1029. Does it pass through any of the freeholds? Yes, part of it.
1030. If the proposed line were constructed, what advantage would it be to you over and above the line you now have at Moree, and the contemplated line to Manilla? We should have the advantage of quick communication, and the advantage of getting fat stock from Sydney.
1031. What advantage is it to a grazier to have quick communication other than for his stock? There is always an advantage in having quick communication. It may not be a great advantage; but still there is an advantage, particularly with regard to stock.
1032. What does it cost you at present to send your wool to the nearest railway station? £3 per ton to Tamworth.
1033. If the line were constructed, to where would you send it? We should still have to send it to Tamworth.
1034. Would not you send it to Moree? We could not get over the river except under exceptional circumstances.
1035. Is it not possible to follow the river until you get to the regular crossing? Not without coming to Warialda.
1036. What extra distance would that involve? About 12 miles.
1037. That would be shorter than going to Tamworth? But the road is not nearly so good.
1038. But if you have to draw your stuff an extra 12 miles, as against 100, what then? I would have to draw 62 miles.

* NOTE (on revision):—I would like to add that the best freestone is all on Government ground.

Mr.
J. B. Scholes.
8 Oct., 1896.

1039. What distance is it from your place to Warialda, and thence to Moree? Sixty-two miles.
 1040. And what distance from your place to Tamworth? 120 miles.
 1041. Which route would you carry by? I would certainly carry by the cheaper route.
 1042. Would not the shorter route be the cheaper? Yes.
 1043. Then, so far as you are concerned, if the proposed line were not constructed you would still be 60 miles nearer to a railway than you were last year? Yes; but still at the present time it is as cheap to send to Tamworth as to Moree on account of the extra railway carriage. A man will take loading from about here to Tamworth for about 3s. per cwt., and to carry a short distance of 40 or 50 miles they want 1s. 6d. per cwt. Then there would be the additional railway freight from Moree to Tamworth. The present rate is about £4 from Moree to Sydney, and from Tamworth less than £3.
 1044. If it were £3 from Tamworth to Sydney, and £3 10s. from the station to Tamworth, it would be £6 10s. To Moree it would be 30s. and £4 by rail, which would be still cheaper? Yes; but I doubt very much whether men would undertake to carry it for that rate coming round by Warialda. They cannot take the load. The roads are bad and heavy.
 1045. But they are not likely to demand more than 25 to 30 per cent. extra? No.
 1046. But even that would put you on the same footing from Tamworth, and you would only have half the distance to carry? Yes.
 1047. What would be the special advantage to you if you had the railway and a siding at the station? The advantage would be in trucking stock.
 1048. So far as wool is concerned, that is all disposed of in a few weeks of the year? Yes.
 1049. And generally when the roads are good? Yes.
 1050. Stock are sent away all through the year? Yes.
 1051. How many fat stock would you be able to send away in a year? It depends on what kind I was raising. I think about 25 per cent. would be about the average of fattening stock.
 1052. In other words if you had 10,000 head of cattle you would be able to send away 2,500 head every year? Yes; provided the seasons are fair.
 1053. What would be the value of your freight to the railway in the course of the year? I am not prepared to say. I have only a small place.
 1054. How many sheep have you? 4,000.
 1055. What is the extent of your holding? 2,100 acres.
 1056. Would you be prepared to give your land free of cost to the Government if it were required for railway purposes? Yes, so long as they paid the cost of legal transfer.
 1057. You recognise, then, that the construction of a railway would enhance the value of your property? Very much so. There is any amount of beautiful land available all through the district.
 1058. You mean it will be available when the leases fall in? Yes; and it is available now.
 1059. If there is such an amount available now, how is it that it is vacant? The land is so classed that people have to go in more for agriculture than for grazing on most of those farms. They are heavily timbered, and require cultivation, and that will not do for raising stock.
 1060. Is it pastoral country you are speaking of? Agricultural country.
 1061. Is it likely to be settled on for that purpose? Yes.
 1062. There are 66,000 acres of land to be thrown open here, and that will settle thirty-three families? I believe so.
 1063. Therefore, the production is not likely to increase very largely? I think the present applicants would go in for cultivation. At present very little is done.
 1064. Can you tell us why they do not go in for agriculture? They have not the consumption. There is only one market.
 1065. Which is that? Sydney.
 1066. But inasmuch as Warialda is supplied by Inverell and Bingera flour, do you not think the Warialda district would make an effort to supply itself? It has been making an effort during the last three or four years.
 1067. Where is the wheat sent to? Inverell or Bingera.
 1068. Is it brought back in the shape of flour? Yes.
 1069. You are of opinion, then, that the possibilities of cultivation in the district are very much larger than they now appear? Yes.
 1070. And that railway communication will intensify them? Yes.
 1071. *Mr. Roberts.*] You say you would be prepared to give free of charge what land might be required by the Government for the construction of the railway? Yes.
 1072. Can you speak for other occupants of land along the route of the proposed line? No.
 1073. You do not know what opinions any of your neighbours have formed on the subject? No.
 1074. Is the land between Moree and Warialda fitted for agriculture? I cannot say, as I have not been further than Gravesend.
 1075. Do you know anything as to the character of the lands between Warialda and Inverell? Yes, nearly the whole of it is beautiful agricultural land. It is nearly all volcanic country, and the soil is black and red.
 1076. Is it all good land? Not all, but the greater proportion of it is beautiful black and red soil.
 1077. Is it adapted for the growth of wheat? Yes, and it is also adapted for the growth of fruit and maize.
 1078. *Mr. O'Connor.*] How did you acquire your land? I bought it.
 1079. Are you satisfied with your purchase? I am. I run two sheep to the acre.
 1080. If the proposed railway were constructed, do you think the settlement would increase? It would indeed. Most people who come to New England are surprised when they see the country.

Mr. William Butler Geddes, agent, Warialda, sworn, and examined:—

1081. *Chairman.*] How long have you resided at Warialda? I was born here.
 1082. Do you know the whole of the district? Yes.
 1083. *Mr. Black.*] Have you anything to do with the coach passenger traffic at Warialda? Yes, I am the agent from here to Tamworth.

Mr.
W. B. Geddes.
8 Oct., 1896.

Mr.
W. B. Geddes.
8 Oct., 1896.

1084. How long have you occupied that position? I have been engaged at it for about twenty years.
1085. Have you any knowledge as to the passenger traffic between Warialda and Glen Innes? No.
1086. If the railway were constructed, how many passengers do you think would be likely to travel by it daily from Warialda to Inverell? I do not think there would be many in ordinary times.
1087. Could you give any idea as to how many would be likely to leave for Moree? No.
1088. Do you think it would be two a day? It ought to be.
1089. Do you think it would be more? Yes.
1090. Would it be three a day? Probably.
1091. Would it be more than three? It is only guesswork. I have seen as many as five and six on the Moree coach.
1092. Do you know the conditions under which land is held in the district? Yes.
1093. I suppose you are aware that of late years it has been the practice of the Railway Commissioners to favour the construction of no lines which involve the expenditure of large sums of money for resumption? I understand they have set their faces against it to a certain extent.
1094. Do you think the landowners along the route of the proposed railway are likely, considering the benefits they will derive from its construction, to be prepared to hand over the land through which the proposed line will pass, if constructed, free of cost to the Crown? I should think they would, with the exception perhaps of that which you saw under cultivation yesterday. No one likes to have his wheat paddocks severed; but I think they would give ordinary grazing land.
1095. You have made no personal inquiry? No.
1096. Have the Progress Committee collected any statistics of that character? Not that I am aware of.
1097. I suppose you know that the proposed site of the railway station at Warialda is at Kelly's Gully, 4 miles from the town? Yes.
1098. And the Progress Committee desire to bring it within $1\frac{1}{2}$ mile of the town? Yes; that is 3 miles closer.
1099. Do you think that the reduction in distance would be a greater convenience to the inhabitants? Certainly; and it would save a large resumption of land.
1100. One of the witnesses has stated that the handling of goods is an important item; but I suppose there would not be any more handling if the station were 4 miles away than there would be if it were $1\frac{1}{2}$ mile away? That is so.
1101. Is the site selected by the Progress Committee on Crown lands? Yes; but it was not selected by the committee. The surveyors made a trial survey to that spot irrespective of the Progress Committee.
1102. Still the Progress Committee prefer it? Yes.
1103. How is the land held upon which the Commissioners propose to erect the station? It is conditionally purchased land, or it may be freehold.
1104. Is it cleared and under cultivation? Yes.
1105. What is it worth at the present time—I mean the piece upon which the Commissioners propose to erect a railway station? £10 an acre ought to be a fair price for a small portion, taking severance into consideration.
1106. A landowner at Moree has sworn that there is no land between Warialda and Moree worth more than 30s., and that the utmost value in most cases is 10s. an acre; would you consider that reliable evidence? I would not. Some of it may be worth only 10s.; but it is absurd to talk about land, with a growing crop on it, being worth only that. I am sure 30s. an acre did not clear it in order to prepare it for the plough.
1107. What is the land worth uncleared? Freehold land in that position would be worth from £2 5s. to £2 10s. an acre.
1108. Then it is pretty good land? Yes.
1109. With regard to the route which was at one time laid down by the surveyor, and with regard to the site of the railway station—does the bringing of the railway to that point involve any expense in connection with engineering difficulties, and does it involve running over grades which, for this district, are exceptionally severe? I have read the evidence taken in Sydney, and I notice that one of the Government officials says it will cost £10,000 to bring the line into Warialda. We do not see where that cost comes in for 3 miles of easy construction.
1110. Anyhow, your chief object is to get the railway station as near as possible without reference to expense? We should certainly like to have it as close as we can get it.
1111. *Mr. Roberts.*] What business are you agent for other than that to which you have referred? I am Secretary for the Show and for the Pastoralists' Stock Board. I also buy corn here for the coach horses.
1112. Do you purchase all the maize you require at Warialda? Yes; as it is cheaper, I buy it from Inverell. I have bought 105 bags since June from Inverell for our coach horses.
1113. Will there be a great increase in traffic from here if the proposed line be constructed? I think so, if only because of the time which will be saved.
1114. Have you any knowledge of the wool traffic? Not a great deal. I may mention that in the Pastoral and Stock Board district there were 1,500,000 sheep in 1895. During that year a great many were lost, but still I daresay that at the end of this year the number will be nearly the same.
1115. Where does the wool go to at present? To Tamworth, although this year some is going to Moree.
1116. What percentage will go to Moree when the line is opened? I only know of one large station which sent it there this year. They say there is a saving of 6s. 6d. a ton in carrying it from that particular station to Moree instead of to Tamworth. I do not think that will last, because I believe the carriers will cut the Tamworth rate. Every pound of loading which comes here comes from Tamworth. Tamworth is the railway station at present.
1117. Do all the storckepers get their supplies from Tamworth? Yes; excepting flour.
1118. What rate per ton do they pay for the carriage of their goods from Tamworth? £3.
1119. How far north does the wool come through Warialda? I should say from Tulloona. That is about 70 miles from here. I expect, however, that some of that wool went to Moree this year.
1120. You have spoken of some wool going to Moree at a saving of 6s. 6d. a ton; would that wool have come to Warialda if the proposed line were constructed? Yes; the place is only 20 miles from here.
1121. Would there be much trucking of stock here? I think there would be.

1122. Does most of the stock go to Tamworth at present? It is generally trucked at Breeza.
1123. Do you know of any wool which goes from New South Wales to Brisbane? I hear that some of the clips are at present going to Warwick.
1124. Do you think we should get a large quantity of the wool which now goes down to Brisbane if the proposed line were constructed? I would not go so far as to say that, but a portion would be obtained.
1125. Do you think all the wool which now goes to Tamworth would come to Warialda? Certainly.
1126. And, therefore, the railway would benefit by the carriage of an extra number of miles? Yes.

Mr.
W. B. Geddes.
8 Oct., 1896.

Mr. Robert Buist, proprietor, *Warialda Standard*, Warialda, sworn, and examined:—

1127. *Chairman.*] How long have you been in the district? Four years.
1128. *Mr. O'Connor.*] Do you know the district well? Yes; I have been in every part of it, and I know everyone in it pretty well.
1129. What is the distance between Warialda and Moree? Fifty-three miles.
1130. Is there much settlement between the two places? No; there is settlement from here down to the river, and then there is no settlement till you get to Maiden's public-house; and then there is none until you get to Biniguy.
1131. What is the character of the country? From here to the river it is good country; from there to the hotel—excepting on the river flats—it is moderately good; and on the flats it is good all the way to Moree.
1132. Do you know the country between Warialda and Inverell? Yes.
1133. What is your opinion of it? Along the road, going out for 8 miles, until you get to the White Gate, it is pretty sandy, and is not much good; back from the road it is good grazing land; but from the White Gate right to Inverell it is good agricultural land the whole way.
1134. Are you in favour of the construction of the railway between Moree and Inverell? I am.
1135. Do you think it would enhance the value of property in this neighbourhood and encourage settlement generally? I am quite satisfied it would enhance the value of landed property.
1136. Would it not encourage population? Certainly; the greater the facilities there are for conveying produce to market the more settlement will there accrue.
1137. Do you know how the land is held between Warialda and Inverell? I think it is mostly leasehold.
1138. Do you think, if the land were available, and if the leases were terminated—as they will be in the near future—it would be readily occupied? I am quite satisfied of it. The question was asked this morning why people did not now take up the land. That can be explained in this way: where there is a probability of good land being thrown open in the near future, people do not care to go upon moderately good land, especially when they can get better land by waiting for it. I have no doubt the land will be sought for if facilities are given for conveying produce to market. I believe, ultimately, there will be an extension to the coast, and I look upon the proposed railway as the first step towards it.
1139. Do you know the condition of the people of the district? They are considered very sound. I know they always pay me, and they generally pay the printer last of all. I am quite satisfied they are prosperous and progressive.
1140. Are they better off to-day than they were two years ago? I cannot say. It is possible the last drought cut them up a little.
1141. Were they well off twelve months ago? Yes, and they are well off now.
1142. *Mr. Clarke.*] Is the land near Moree fitted for the production of cereals? I do not think it is to the same extent as the land about Warialda and towards Inverell. In the first place, the rainfall of the Moree district is only 25 inches, and about Warialda it is 30 inches. The rainfall at Moree is not distributed over the year in the same way as it is here, and that militates very much against agriculture.
1143. But the character of the bulk of the land between Warialda and Inverell is suitable for agricultural purposes? Yes.
1144. *Chairman.*] Is there any special point you would like to bring before the Committee? No. You asked a question this morning from one of the witnesses as to whether agriculture was on the increase. Of course, the agricultural area here is very small. You also asked the question why it was so small. That can be explained in this way: that a man usually gets his living in the easiest way possible, and as long as he can get a good living from the sheep's back he will not bother about following the plough. Necessity of late has compelled some to do the latter. I think the increase in the cultivation of wheat this year over last year will be about 700 acres.
1145. Making a total of how many acres? About 2,000.
1146. What is the annual yield per acre? I cannot state positively; but I should imagine it is not less than 12 or 14 bushels.
1147. What sort of a crop had you last year? The farmers spoke highly of it.
1148. What has been the general prospect of the district during the last five or seven years;—has there been a tendency to settle and produce, or is the district one of those to which people come for a short time and then go away again? My experience is that when once they come here they stay. I do not know of one person who has come to this district and settled during the four years I have lived here who has left it.
1149. The conditions necessary to make settlement a success are, of course, climate or soil, and rainfall;—do you believe these conditions exist here in such a degree as to make settlement profitable? I do.
1150. Either for grazing or for agriculture? Yes.
1151. And if the land be offered by the State for settlement it will be readily availed of, and settlement and production will increase? Yes. I may point out that there is a number of settlers about here who are now going in for agriculture in a small way. Last year I was at a place where a man put in 5 acres as a trial. Yesterday I found he had broken up 50 acres to plant with corn.

Mr. R. Buist.
8 Oct., 1896.

Mr. George Hollinworth Gordon, grazier, Gragin, near Warialda, sworn, and examined:—

- Mr. G. H. Gordon. 1152. *Chairman.*] How far is Gragin from Warialda? 13 miles.
 1153. How long have you been in the district? I came here in 1865, and I have been living in the district since 1868.
 8 Oct., 1896. 1154. *Mr. Clarke.*] Do you know the nature of the land say from 20 to 30 miles on each side of the proposed railway? Yes, in many places.
 1155. What is it best adapted for? For grazing and agriculture mixed.
 1156. Large portions of land along the proposed line are adapted for agriculture? All the land from here Moree is agricultural land—that is, wherever the basaltic land comes in.
 1157. Is the black-soil country adapted for agriculture? Yes, for wheat; but it will not grow potatoes.
 1158. Is it adapted for the growth of wheat at all times? Yes.
 1159. We have it in evidence that the Moree district is adapted to the growth of cereals, but that the irregular rainfall prevents them being grown. We have a rainfall of 26 inches in Moree, and from 30 to 32 inches in Warialda.
 1160. And you think it would be possible, notwithstanding the irregular rainfall, to grow wheat? Yes, in ordinary seasons. There are seasons, of course, in which you cannot grow cereals.
 1161. I believe the country from Warialda to Inverell is more or less adapted to the growth of wheat and maize? Yes.
 1162. Are there any portions of inferior land along the proposed line? Yes, there are plenty of sandy ridges in places not worth sixpence an acre.
 1163. What area of land between here and Inverell—or for 20 miles on each side of the proposed railway—is adapted for agriculture? As a rule, there is splendid agricultural land, and next year a lot of it will be thrown open, and I feel sure every acre of it will be taken up.
 1164. Is there much land between Warialda and Inverell alienated? As far as I am concerned there is a small quantity, but it is proposed to surrender the alienated land by way of exchange, and therefore it will come back to the Crown. The land I shall be taking will be 15 or 16 miles further from the railway.
 1165. You would be prepared to give the land through which the railway would pass for nothing? I would not mind making a fair exchange. If a man gives up his land for the line he should get a fair proportion alongside in exchange.
 1166. We have it in evidence that there are one or two landholders who would not give up the land without being paid for it? I do not want payment.
 1167. Do you think the landowners, as a whole, would be prepared to give their land in exchange for land elsewhere? I think so.
 1168. According to the statement of the Railway Commissioners, there will be a loss of £2,800 per annum on the proposed line;—do you think it possible that loss might be reduced in the course of a few years' time, and the line made to pay? It depends what the carriage is to market. If the rates are very high, people will not use the line; but if the rates are within reach it is extremely likely the line will pay. I may state that I send my produce to Glen Innes, and thence to Sydney.
 1169. If the line were constructed, would you send your produce by it? Yes—that is, if it is carried more cheaply than it costs me to send to Glen Innes by team. I ship at Newcastle, not at Sydney.
 1170. Is Glen Innes the most convenient place to which to send your produce? Yes; it is the better road.
 1171. Do you think the produce grown on the good land at Inverell would find a market at Warialda and north and west of Moree? There is no doubt about it; it has been finding it for a considerable time.
 1172. Do you think the proposed line would carry wool from towards the Queensland border—beyond Moree? There is no doubt about it.
 1173. It would not be to the interest of the producer to send it to Queensland? I do not think so.
 1174. I suppose the neighbourhood of Moree is a grazing district? It has been.
 1175. Do you think that cereals grown in the neighbourhood of Inverell and Warialda would be able to compete with the South Australian wheat? It all depends on the carriage. If you carry the flour to this district so cheaply that it will not pay to grow here, of course there will be an end to it. It depends on what rate you carry into the country at. The rates ought to be higher into the country, and cheaper to the coast.
 1176. I suppose you know it is intended that the line should pass Warialda at a distance of 4 miles? Yes; I think it is a pity, in view of the small difference in cost; I think it may come here. The first cost is generally the smallest.
 1177. I believe the extra cost will be £10,000? I think you could make the interest on the money by bringing it to the township.
 1178. It has been suggested that it should come to within 1½ mile? If it comes within 1½ mile it is virtually within the town.
 1179. You think then, even in view of the extra cost of £10,000, it would be advisable to bring the line into Warialda? I think it would. I think eventually you would reap the benefit from it.
 1180. *Mr. O'Connor.*] Have you much land which you could put under cultivation at once? Yes, if there were anything to be made out of it.
 1181. If the railway rates would enable you to reach a market at which you could profitably sell your cereals, would you go in for further cultivation? Yes.
 1182. *Mr. Black.*] You say you do not view favourably the proposal that you should give your land for the construction of the railway? Yes.
 1183. Would you hold that opinion if it turned out that you derived a proportionate increase from every acre of your holding in consequence of the construction of the line? No. As far as I can see, it will cut off 900 acres from one side of my land on which there is no water, and there is plenty on the other side.
 1184. But what if it is not proposed to fence the line? If you do not fence it at present it is possible you may do so in the future. For instance, if you run night trains you may have to fence. I do not ask for compensation, but for an exchange for the land which I give to the railway. I would not be disposed to give up the land except on exchange, acre for acre.
 1185. If the people of the community said, "You cannot have a railway on such terms," what then? In reply to that I say the general public will suffer.
 1186. *Mr. Roberts.*] What is the size of your holding? The freehold land is 52,000 acres, including conditional

conditional purchase. The conditional lease is about 3,000 acres. The leasehold area is about 43,500 acres rented from the Crown, and the resumed area is about 28,000 acres—in all, about 126,500 acres.

Mr.
G. H. Gordon.
8 Oct., 1896.

1187. Is it all in one block? Yes, 13 miles east of Warialda.

1188. And the proposed line runs through your property? Yes. The Government are asking for a surrender of the greater portion along the proposed line. There will not be much of the line running through the purchased land. It will come through about 4,000 or 5,000 acres of it.

1189. Do you confine your attention to sheep? Yes, and cattle, and horses.

1190. How many bales of wool do you send away annually? About 600 to 800.

1191. Is Glen Innes your nearest railway station? It is the most accessible, although it is about 70 miles away, and it is about 71 miles to Moree.

1192. Will you continue to send your wool to Glen Innes after Moree is connected with Narrabri by rail? Yes, if the line does not come in further, because the road is too bad. We have the big river to cross, and there is no bridge.

1193. If the proposed railway were constructed, would you be a customer of it, and send all your wool by it? Yes, provided the rates were not higher than they are to Glen Innes.

1194. What do you pay by way of Glen Innes? £2 10s. a ton, and £2 17s. 6d. thence to Newcastle for wool—in all, about £5 5s. 6d. per ton for wool only.

1195. Do you ever send wool to Grafton? No. Some years ago I sent it from Strathbogie to Grafton.

1196. Would it not suit you to send it that way? No. I ship at Newcastle, and not at Grafton. I do not sell in Sydney.

1197. Would it cost you the same amount of money to send it by railway from Tamworth to Newcastle as it does to send it from Glen Innes to Newcastle? Exactly the same. I could send at the same now from here to Tamworth as from here to Glen Innes, but the carriers I generally employ run on the Glen Innes line.

1198. Where do you procure the stores you consume? I buy everywhere. I buy through Mr. Utz, of Glen Innes, also from D. Cohen & Co., Lassotter & Co., and Earp, Gillam & Co., of Newcastle; it depends on the price.

1199. Do you find it advantageous to buy at Glen Innes? It is an advantage to buy certain things there; we can get salt from Grafton and Glen Innes cheaper than we can get it brought up by rail from Newcastle.

1200. When you buy at Sydney, where do you stipulate for delivery? We stipulate for Wright, Heaton, & Co. to send it up in 6-ton trucks to Glen Innes. The freight on a 6-ton truck to Glen Innes is £3 10s.

1201. Have you given any consideration to the question of connecting Moree with Inverell? No.

1202. Individually, you do not think it will make much difference to you one way or the other? It depends on the rates we are charged. I should be very pleased to have the railway if I could send my goods away as cheaply by it as I do now by road.

1203. As one having an interest in the welfare of the Colony, do you think it would be wise on the part of the State to construct the proposed line? I do. I think railways ought to be constructed everywhere.

1204. Do you think it will lead to a large amount of settlement? I am sure it will.

1205. Would you like to offer an opinion as to the nearest market for Inverell cereals? There is no doubt it is west from Inverell. I get all my flour from Inverell. Hundreds of tons come through me every week to Moree in the shape of chaff, corn, and flour. They load with 7 tons when the road will carry only 3 tons. The result is that the roads have been ruined by the large loads which have been carried at nominal prices and the small rates of carriage, which make carriers overload.

1206. Do you know how far west the traffic goes from Moree? To Mungindi.

1207. Do you know that part of the country? I have been for some distance below Moree.

1208. Is there a large population between Moree and Mungindi? I cannot say it is large, but it is scattered.

1209. Do you think there is sufficient population between Inverell and Mungindi, and round about Mungindi, to consume the whole of the Inverell produce? Yes; the Inverell produce is not so large when you go into it.

1210. Is it the difficulty of getting produce to market which leads to a lot of land at Inverell not being under cultivation? Yes, that is the sole reason.

1211. Do you deem that Inverell, owing to its large settlement and fertility of soil, ought, without delay, to be connected with the railway system of the Colony? I do. In some way or other it ought to be connected.

1212. Would you like to express an opinion as to whether you think it is desirable to connect Inverell with Moree or with Glen Innes? I think, in the public interest, it should be connected west. The country between Glen Innes and Inverell is very rough, and when the line comes to Inverell it is only from 40 to 42 miles from there to Glen Innes, and the centre will be only 20 odd miles from either end.

1213. You believe that owing to the market of Inverell being westward it is in the public interest to connect Inverell with Moree? Yes.

1214. *Chairman.*] Can you give any figures as to the proportions of the stock traffic from Warialda;—what is your opinion as to the number of trucks of stock which can be sent from here? The Stock Inspector ought to be able to give you that information. I have never sent any to market. I have always sold them on the station.

1215. Do you think this particular centre has improved enough to provide 3,000 trucks a year? I cannot say.

1216. Do you think it will be wise in the interests of the country to carry the traffic west of the Great Northern line, *via* Moree, and thence to Sydney, in lieu of the Great Northern line ultimately connecting with the coast? I do not think it should be connected from Glen Innes to Inverell. If connected at all it should be further down the line—to Guyra, and it should then go to the coast. Inverell is exactly 42 miles from Glen Innes, and the people between there and Inverell could send to which place they liked.

1217. But the present proposal is in lieu of any coastal connection;—in other words, it is said that Inverell is the proper starting-point, and that there should be no connection between the main northern line and Inverell;—do you think that is a wise view to take of the matter? I do.

1218. Or do you take this view—you think at present a connection ought to be made from Inverell to Moree, but eventually should be made with the Great Northern line? No, I do not. I hold emphatically that the railway should start from Inverell and go west.

- Mr. G. H. Gordon. 1219. By doing that you put Inverell in this position: that it would be at the extreme end of the longest line in the Colony? I suppose some town must be there, and it is unfortunate, perhaps, that Inverell should be in that position.
- 8 Oct., 1896. 1220. And so closely situated to the Great Northern line that, as far as goods are concerned, the railway cannot carry them at all? They are carrying goods from Glen Innes to Inverell at 1s. and 1s. 6d. If teams can carry at that price I am sure the railway could not carry them very much more cheaply.
1221. If the teams continue to carry to Inverell at that price, from what source is the railway to get this traffic? It depends on the rates. If you fix your rates as high as the railways have them at the present time I do not think you can compete with land carriage.
1222. You are of opinion there will have to be a considerable reduction made? I think so. I know goods are coming from Grafton to Glen Innes and on to Inverell a great deal cheaper than they can be brought by the railway. I know the goods I buy in Glen Innes come that way. I was buying some sugar the other day in Sydney from Messrs. Lassotter & Co., and I told them the price I was getting it delivered at Glen Innes. They said that the railway could not take it at that price.
1223. In order to secure the Inverell traffic you hold that there will have to be some lesser rearrangement of the railway rates? Yes

Mr. John Dixon, farmer, Warialda, sworn, and examined:—

- Mr. J. Dixon. 1224. *Chairman.*] Where is your residence? Six miles from Warialda, on the southern side of the road.
- 8 Oct., 1896. 1225. How long have you been farming? About eleven years.
1226. How long is it since you commenced to grow wheat largely? About five years.
1227. How much have you usually grown? I have 150 acres of wheat under crop this year. Last year I had in 60 acres.
1228. How many bushels do you grow to the acre? Last season, which was a bad one, went about 15 bushels.
1229. What did you do with it? I took it to Bingera and got it ground into flour. If we have any large quantity we take it to Bingera and grind it, and then go to Moree and sell it.
1230. You take it there because you are your own carrier? Yes; if I did not I should have to pay someone else to do it.
1231. Has your success in farming been so great that you have been induced to go into it upon a larger scale? I have 50 extra acres cleared this year.
1232. Are you going to farm it? Yes, and I shall have 200 acres under crop next year.
1233. The cost of conveying your wheat to Bingera and getting it ground into flour, and then carting it to Moree must, in the aggregate, amount to a considerable sum? Yes, it does not leave you much profit.
1234. What do you consider a fair price per bushel for wheat? I think all the farmers I know of would be satisfied with 3s. and 3s. 6d.
1235. Can you live on that? Very well.
1236. That is, if you had a cheap rate of carriage to admit of your sending it to your only market? Yes.
1237. I suppose it would be of no use your growing larger quantities unless you had some market to which to send it? That is so.
1238. There is not much grown about Warialda altogether? I think there are about 1,250 acres under crop this year.
1239. And I believe the greater portion of that has come under cultivation in the last few years? Four or five years.
1240. Why has not cultivation been going on for some considerable time? When I came in 1869 there were no settlers about, only squatters. The people lived by grazing then and by labour.
1241. I suppose they find employment is scarce now, and sheep farming is not so profitable, and necessity drives them on the land? That is so.
1242. Do you think the proposed railway would help you much? I think it will help the farmers a great deal; the country here is not adapted generally for sheep. A great many would turn to farming if they had the means of getting their produce away.
1243. Supposing Inverell and Warialda produce more stuff than the western districts can absorb, what are you going to do with the balance? I think if there were a railway there would be more population in the country to consume it.
1244. Are you aware that Inverell at the present time is producing double the quantity of produce which can be absorbed by the north-western districts? No, I am not.
1245. You have no doubt that the close proximity of Warialda to Moree would afford a good market for Warialda, leaving Inverell to speak for itself? Yes.
1246. And you think that in the course of time it would quadruple the amount of cultivation? I am sure of it.
1247. Supposing the proposed railway be not made, but that one be made from Tamworth to Manilla, do you not think you will still have the market? I do not think the Manilla line will be of any benefit to the farmers generally. It is a long way to carry wheat to Manilla. I think it would be better to carry to Moree.
1248. If your produce should increase four-fold in the course of a few years, and the western market continues good, do you not think you could still continue to carry it there? If we do not get a railway we shall have to try to, but we can do so much better with a railway.
1249. Would it benefit this district in any other way? I think it would in many ways; for instance, if a man like myself had half a dozen bullocks, or a few sheep to send away, he could send them.

Mr. Thomas Lawson, storekeeper, Warialda, sworn, and examined:—

- Mr. T. Lawson. 1250. *Chairman.*] I believe you are a member of the firm of Lawson & Co.? Yes.
- 8 Oct., 1896. 1251. How long have you been in business in Warialda? Ten years.
1252. Have you ascertained the probable amount of imports and exports from this district? I can give you part of what we get in the town—not outside the district.
1253. *Mr. Roberts.*] Where do you get your merchandise from, as a rule? Sydney or Newcastle. Of course we do not get flour and produce from there. 1254.

Mr.
T. Lawson.
8. Oct., 1896.

1254. Does it come by any particular route? *Via Tamworth.*
1255. Do you find it cheaper to bring it that way than by any other route? *Yes.*
1256. What rate per ton do you pay for carriage? It varies according to the class of goods. Third-class goods cost £7 3s. 9d. a ton to Tamworth. We pay £3 a ton from Tamworth to Warialda. That includes hardware, drapery, and boots. They compose the bulk of the stuff we carry. The other stuff—iron and wire—does not cost so much, and we do not carry the same amount of it. Galvanized iron and wire would cost us £5 3s. 6d. to Tamworth, and £8 3s. 6d. delivered here.
1257. Do you get your goods in large quantities in order that you may get them at the lowest rate? *Yes. Third-class stuff costs us a shade less than truck lots—30s. less.*
1258. Do you get your goods at any stated period during the year? *Every month, and more frequently if we want them.*
1259. I suppose that by that means you are able to take a large quantity? *Yes; we send our own teams down and save time.*
1260. Do you give the carriers loading down? *Not unless we have anything—a few skins; but they go down without loading, as a rule.*
1261. Have you prepared any statement showing the quantity of goods coming in and out of the town? *We have not much going outwards at present.*
1262. How many other stores are there in the town besides your own? *Two large ones, and two or three small ones. I may state that we get about 310 tons of goods by rail from Tamworth. The amount of wheat, corn, chaff, hay, potatoes, and flour brought into the town is a little over 425 tons. That amount comes into the town for consumption. In addition to that the outside people buy their own stuff, I should think they will buy two or three times as much as the amount which comes into the town,*
1263. Could you form an estimate of the tonnage of goods supplied to people who do not do business with the storekeepers? *I could not. That information could be best obtained from the railway people.*
1264. You accounted altogether for 735 tons of goods of all descriptions other than wool? *Yes.*
1265. Mr. Harper, of the Department of Railways, estimates the amount at 1,000 tons? *Of course he includes the outside stuff.*
1266. Have you formed any estimate of the passenger traffic at Warialda? *No; but there will be more travelling by the railway, than travel by coach and other means at the present time.*
1267. Do the people about here travel to Sydney and other places? *Yes.*
1268. And I suppose a good many business people visit Warialda? *Yes.*
1269. Having brought the goods into the store, where, as a rule, do they go to;—how far does the influence of your business extend? *Up to about 60 miles.*
1270. In what direction? *Principally north and north-west.*
1271. If the railway should come here, to what extent would your firm be a customer? *If the freight were satisfactory we should get all our goods by rail direct; it would be a benefit to us in the saving of time.*
1272. Are you large purchasers of agricultural produce—flour and wheat for instance? *We get through about 50 tons of flour and 125 tons of produce without pushing.*
1273. Where do you purchase it? *Mostly in Inverell.*
1274. What is the freight for flour from Inverell to Warialda? *25s. to 30s. a ton. We have paid £2 until recently.*
1275. Can you get flour more cheaply from Bingera and Inverell than from Adelaide? *Yes.*
1276. Is it ever necessary for you to get Adelaide flour? *No. We get it from Inverell or Bingera, and we hope soon to have a mill here of our own.*
1277. Is business in a flourishing condition? *Yes, it is improving.*
1278. Are those engaged in agricultural pursuits doing well? *Yes.*
1279. Do you regard the district as a prosperous one? *I do.*
1280. And it is not in any way decreasing? *No; it has a future before it. It has not developed in any way yet.*
1281. Do you think the railway will tend to its advancement in a marked degree? *I do. It will give better facilities for getting produce away, and bringing stuff to the town.*
1282. Does the market for Inverell produce lie in this direction? *Yes.*
1283. You have no hesitation in saying that? *Not the slightest; there is no market the other way.*
1284. Do you know the Inverell road? *Pretty well.*
1285. Do you think it would be better, in the interests of the country, to bring the railway from Inverell to Moree than it would be to bring it from Inverell to Glen Innes? *I think it would be the most sensible line ever laid down.*
1286. What is your principal reason for saying that? *Because the market for Inverell is, without doubt, out west; there is no market anywhere else for Inverell stuff.*
1287. How many tons of flour come into Warialda for local consumption? *150 tons. At the present time the bulk of that comes from Inverell. In the early part of the year it came from Bingera. It all depends on the rate of carriage.*
1288. What is the quality of the flour? *They are both about the same. I can sell one equally as well as the other.*
1289. Is the Bingera or the Inverell flour preferred by your customers? *No; we can sell one just as well as the other.*
1290. Is there much agriculture going on around Warialda now? *Yes, and there has been for the last three or four years. 1,300 acres of wheat are in this year. Maize has also been grown.*
1291. Have those who have made the experiment reason to be satisfied with their venture? *They are clearing more land each year, and that is the best sign you can have of success.*
1292. Will large quantities of stuff be trucked if the railway comes here? *Yes.*
1293. Where does the stock go to now? *It has to be travelled to Brecza for trucking. It travels through Warialda to the trucks.*
1294. Does most of the wool go to Tamworth? *Yes.*
1295. Is that owing to the excellence of the road and the probability of better feed being obtained upon it? *The road is a good one; but I suppose they could land it more cheaply in Sydney that way than by any other.*

Mr.
T. Lawson.
8 Oct., 1896.

1296. Does it suit them better to go that way than by way of Moree? Some of the wool is going to Moree this year. All the wool going to Tamworth now will, if the railway be constructed, come here—that is, unless the freights are altogether too high.

1297. Assuming the rates to be moderate, there will be a large quantity of wool going to Warialda? Yes; the whole of the wool will go.

1298. And there is every probability that thousands of sheep will be trucked here? Yes.

1299. *Mr. Black.*] You say you consider the proposed line to be the most sensible line which could be laid down, because it will provide a market for Inverell produce;—would you still say that if the estimated annual loss became for many years a burden on the consolidated revenue? I do not think it could be a loss for long. It will ultimately do good. There is a large population in Inverell which has no easy market at the present time, and the people out west are not in a position to grow anything.

1300. Supposing all the surplus products of Inverell are carried over the railway to the west, for consumption there, would the railway pay? I think it should. I think it ought to be a paying line.

1301. Do you mean that the products consumed by the people of Moree can be carried over 96 miles of railway, and make that railway pay? I think so. If they can carry by team now, they ought to be able to carry better by rail.

1302. Do you think the line could pay when you know it is not possible for the Railway Commissioners to land Sydney-purchased goods in Inverell as cheaply as they can be brought by way of Grafton and thence by road? I think it is only third-class goods which are sent by way of Grafton. There is a lot of stuff which comes by the railway which could not be landed more cheaply by way of Grafton than by the railway. It will cost from £5 to £5 10s. to land at Inverell by Grafton; and we can land third-class goods at Warialda from Grafton at £6 10s.

1303. Is there any product to the west which the people of Inverell would be likely to exchange their goods for? That I could not tell you. It seems to be a pastoral country only.

1304. You never heard of any? No.

1305. Then, as far as Moree and Inverell are concerned, the traffic is likely to be one way? Except in regard to stock.

1306. Do you think the cereal products of the Inverell district—in the event of production being largely increased here—could successfully compete in the Sydney market with products grown under more favourable circumstances in regard to railway proximity and rainfall? I think the distance to Sydney is too great.

1307. *Mr. O'Connor.*] You think that in the course of time, by means of increased trade and settlement, the estimated loss on the proposed railway will vanish? Yes.

1308. *Chairman.*] What is the estimated carriage from Tamworth? On third-class goods it is £3 per ton.

1309. Does that apply to all classes of goods? Yes.

1310. It costs you £7 3s. to land third-class truck lots here? Yes.

1311. And it costs you £10 3s. 9d. to land third-class ordinary lots? Yes.

1312. As matter of fact, is it not always convenient for a country storekeeper to have truck lots? That is so.

1313. A fair proportion of your goods will cost you £10 3s. 9d.? Yes, fully one-half, or more.

1314. Therefore, if you get a train rate of £8 for a truck load, you will still be paying £1 a ton more than you are paying the other way? Yes. Still we would be able to run the stuff much more quickly. It takes a month from the time you send an order to the time you land your goods, which means that you have to carry heavier stock, and you could afford to pay a little more by rail in order to save the extra bulk of stock you have to carry.

1315. The third-class ordinary rate, to land at Warialda from Sydney by the proposed railway, would cost you £11 5s. 4d. per ton? Yes, and now it costs £10 3s. 9d.; that is a difference of £1 1s. 7d.

1316. If that should prove to be the case, the railway would prove of very little use in bringing goods to you? It would bring a certain amount even on account of the saving of time in transit.

1317. Competition would still go on by the dray, more especially as a line is likely to be near you at Manilla;—in view of the figures I have placed before you, would or would not the railway get the traffic? It would get a certain amount of it, I have no doubt; but I do not suppose it would get the whole of it.

1318. You are aware that in business the question of carriage is a most important item, and there are always incidental reasons why a little carrying should be done, and if there is a margin of £1 a ton in the carriage of goods it is reasonable to suppose there would be a considerable leakage from the railway? Yes.

1319. Do you not think that it is extremely probable that when there is a margin in favour of the dray traffic, at all events a certain proportion of that traffic will be continued? Yes, a certain proportion will.

1320. Could not very strong illustrations be given upon the road from Tenterfield to Grafton, and from Glen Innes to Grafton, where the dray traffic have been competing with the railways ever since they were opened? Yes; but they have had the water carriage too.

1321. Take Tenterfield as the most remote town in the north, being 120 miles from the sea-board. You are situated 120 miles from Tamworth. Tenterfield drays have been competing with the line ever since it was opened. Your outlet is by way of Tamworth; therefore, unless the Department of Railways can carry stuff from Sydney to Warialda at less than you can get it from Tamworth to Warialda, what will be the effect? The teams carry from Morpeth to Tamworth at a lower rate than does the railway even now, and still goods come by the railway.

1322. How long does it take a dray to come from Tamworth to Warialda? It varies—ten days, I think.

1323. Then, so long as the dray can compete in favour of the storekeeper, what will happen? The dray will get a certain amount of traffic, but not the whole of it.

1324. You have referred to the importation of 150 tons of flour;—is that the importation of the whole district of Warialda? No; only for the town.

1325. Would the importation for the town and surrounding district be 450 tons? I think so.

1326. In that case your wheat now under crop would supply yourselves? But we are increasing in population.

1327. But if you grow sufficient to supply yourselves only, you will have none to export; consequently, the railway consideration does not enter into the question at all? But if you grow more than you require to supply yourselves, the balance must go somewhere. There is every reason to believe a good deal more will be grown than we can ever use, unless something occurs which will bring further population into the town.

1328. You have 300 acres under wheat now, which will barely supply yourselves; it will be a large increase which will quadruple that? I suppose there must have been twice as much as that put in this year as last year.

1329.

1329. You expect, then, that in the near future the wheat production of Warialda will be sufficient for local requirements, and that there will be a surplus for exportation? Yes.

1330. And so far as the statement made by one of the witnesses is concerned, it is evident there are other considerations which suit this purpose in carrying to Bingera, and that a market could be found in Warialda if necessary? Yes.

1331. The mere fact of your having to pay 30s. a ton carriage from Inverell to Warialda will be so much more in favour of your cartage to Bingera for gristing purposes? Yes.

1332. What do you pay for carriage to Bingera? £1 a ton.

1333. I suppose you attach no value to the down-country markets, such as Newcastle and Sydney? None whatever; the distance is too far.

1334. You know that Tamworth competes very largely for the western trade? Yes, but they cannot compete with us. They have no market here now for wheat.

1335. Nor for anything else? No; there is no trade between Tamworth and Warialda except for merchandise.

1336. Would you look for a trade as far as Narrabri and Gunnedah? I do not think so. We should look more towards the Queensland border.

1337. Why do you attach so much importance to the Queensland border? They always do absorb the produce. It has always gone out there, and they have always consumed as much as was taken.

1338. Have you any idea of the amount of produce and flour sent to the Moree town and district from all sources every year? No.

1339. Would you be surprised to hear it is not half of what Inverell itself produces? I do not think the calculation has been very good.

1340. You are aware that the population of the Moree district is limited? Yes.

1341-2. Consequently the consuming power is limited? Yes.

1343. And the consumption of flour annually would be about the same, subject to its rational increase; but the consumption of fodder depends very largely upon the seasons. In a bad season a larger quantity will go in, while scarcely any will go in good seasons? Yes; but of course when it is dry there is nothing else but feed.

1344. Therefore, if Warialda and Inverell relied on the north-western market, they would find it would not be able to absorb their produce? Yes; but they have absorbed it so far.

1345. Supposing favourable climatic conditions there, they do not require any fodder at all;—what are you going to do with your surplus? It cannot go the other way. We cannot possibly compete with it. They can grow produce to the south of Queensland more cheaply than it can be grown anywhere.

1346. You say, then, that under those conditions the market will be an unfavourable one, and other places will have to absorb the produce? Yes.

1347. You are of opinion, however, that on the whole, the north-western district offers a very fair market for the produce of the higher lands? Yes, I am of that opinion.

1348. *Mr. Clarke.*] Did I understand you to say that 450 tons of flour were consumed in Warialda and district? Yes.

Mr. John Shelton, grazier, Warialda, sworn, and examined:—

1349. *Chairman.*] How long have you been living in this district? About twelve years.

1350. Is there any particular point which you would like to bring under the notice of the Committee? Mr. Lawson spoke of the consumption in the town and district. I think he has under-estimated the consumption. So far as I can understand the railway rates to Warialda, I think there will have to be a reduction made before the railway can get the whole of the traffic. Of course, it will depend upon the difference there between Tamworth and Warialda or some point on the line.

1351. That is, if goods can be obtained from Tamworth to Warialda more cheaply by road than by rail, they will come by team? Personally, I prefer getting them direct from the railway if I am near it.

1352. Supposing the bullocks and the horses were fat, and you wanted 4 or 5 tons of loading, and your dray was doing nothing, would you not be likely to put the bullocks or horses in the dray and carry to Tamworth, or would you pay the cost of carriage by rail? I think I would get my goods by rail. Of course, it all depends on the difference in the cost.

1353. But there are other reasons which govern one's actions in these matters? I think it will be a great advantage to myself and others to be able to send two or three trucks of fat cattle or sheep away if I have them.

1354. Then the great advantage the railway will be to you will be in enabling you to move a few fat stock about? Yes.

1355. You set more value upon that than you do upon the carrying of your goods? I set a certain amount of value upon the carrying of goods. If the rates are the same, or even a little more, I would prefer the railway.

1356. But if it comes to a difference of £1 a ton on your wire and salt, you would get them by the road? Yes, a difference of £1 a ton is too much. If, however, the difference is only 5s. or 7s. a ton, I should prefer the railway.

1357. *Mr. O'Connor.*] I suppose it is of great advantage to a man who has cattle to send to market to be able to send them by train? It is almost impossible to send them from here to Sydney by road.

Mr. George Freeman, manager, Gournama Station, sworn, and examined:—

1358. *Mr. Black.*] How long have you been manager of the Gournama Station? Twelve months.

1359. Are you favourably disposed to the construction of the proposed railway? I am.

1360. What benefit do you expect to derive from it? I think it will be a good thing for the district. As things are now, the Moree railway is of no use at all, and it is of little use to the people further north. If the line were constructed to Warialda, we would get a lot of the Queensland wool as well as a lot of the western wool.

1361. Do you not think that that would go to the railway at Moree in any case? It might; but it would be nearer for a lot of it to come here.

1362. But if in any case it would go to the railway, how would its coming to Warialda increase railway receipts? If the rates were higher from Warialda than from Moree to Sydney it would increase them.

1363.

Mr.
T. Lawson.
8 Oct., 1896.

Mr.
J. Shelton.
8 Oct., 1896.

Mr.
G. Freeman.
8 Oct., 1896.

Mr.
G. Freeman.
8 Oct., 1896

1363. If there are no differential rates on the railway, the wool leaving Queensland on the dray, being already on the dray would not in preference be brought to Moree instead of to Warialda, where they would pay an increased rate? It would depend on the distance they had to bring it. If they had to carry it a lesser distance on the dray they would have to pay a lesser carriage; therefore it cuts both ways.
1364. Do you think the difference of a few miles in road carriage would make up for a good many miles of difference on the railway? I think that a few miles on the black soil would make up for a lot.
1365. In what way would you make use of the railway? We send about 420 bales of wool away, and it would go from Warialda. As it is now, we send it to Tamworth. We can have the wool carted from Gournama to Newcastle at 6s. 4d. less than it can go by way of Moree.
1366. Where is your holding? Twelve miles north from here. I spent a lot of my time on the Barwon above Walgett. In 1884 it cost one station alone £800 for fodder. In 1893-4 and '95 it cost Angledoon £1,500 for fodder which came from Armidale. If we had a railway the products would go from here and from the Inverell district. We are 120 miles from Tamworth and 60 miles from Moree and yet we can have our wool taken cheaper by way of Tamworth than by way of Moree. That is owing to the bad road. It is difficult to take produce from here to Moree on account of the road.
1367. Does not that tell against your argument about the Queensland wool going from Warialda instead of Moree? No; because if the line were constructed here, the wool would come here instead of going to Moree, because it is so dry there. I can go within 24 miles of Warialda and find 10,000 acres of land equal to any agricultural land in Australia. The people owning that land are willing to let it on halves to farmers.
1368. Where would they find a market? Of course, it would come here eventually. If there were enough stuff grown in the district mills would be started here and flour would be made, and it would be taken on to the Barwon. Nearly all the southern Queensland people get their flour from, and send their wool to Narrabri.
1369. There being a flour-mill here, and enough flour being made in the district for the use of Warialda, would lessen the estimate of the traffic on the railway, which is largely made up of flour carriage to various places over the line? But they would be able to manufacture flour at Inverell and send it out also. We can fatten sheep here, but people cannot send them to market now because it is too far for the train.
1370. If you now send your wool to Tamworth—120 miles by road—in preference to 60 miles to Moree, would you, if the railway came to Warialda, use the line from Warialda? Undoubtedly, and Yalleroi station would do so also; but they are this year sending their wool by teams to Morpeth. All that wool is lost.
1371. Is there any guarantee that they would not continue to send it to Morpeth? Not if the rates were too high. If they have to cart it 120 miles by team, they might just as well continue another 50 miles to Morpeth.
1372. If the railway came here, how would you get your station supplies? By rail from Sydney.
1373. By the truck load? Yes.
1374. Supposing you could land them more cheaply here, even after the railway was constructed, *via* Tamworth and thence by team, or *via* Grafton and thence by team, would you, in spite of that, get them by railway? Yes; we would get them by rail if it only made a difference of a few shillings.
1375. If the difference were £1 a ton you would not use the railway? No; I do not think so. It would depend on whether we wanted our loading quickly or not.
1376. Is there much land at Gournama? We have 32,000 acres, and we have just exchanged 7,000 acres with the Crown which will be thrown open soon.
1377. Is it good agricultural land? Some of it is.
1378. How much of that land would be necessary for the support of one individual—the head of a family? Forty acres. They are living on that now. Any man can put in a crop of 40 acres and make a living out of it, that is if he did other jobs as well.
1379. Where would he get rid of this produce? He could sell it to the storekeepers.
1380. *Chairman.*] Where are the people who are living on that amount of land? Near the town.
1381. *Mr. Black.*] Supposing you cut up 7,000 acres in 40-acre blocks; that would settle about 170 people; you say that a man with a 40-acre block can live by selling his produce to the local storekeeper;—would the local storekeeper take the produce of 170 different people? I suppose so.
1382. *Mr. Roberts.*] Can you give me any information on the question of the trucking of stock from Warialda? I think a lot of fat cattle would be trucked from here. People now sell them on the spot, because it is too far to take them to a railway. Station people come round and buy them.
1383. Would they come from the north of Warialda? Yes.
1384. Are large quantities now going through Warialda to Tamworth? I should think that during the last six months 20,000 head of cattle have gone along here—not all fat stock.
1385. Do you know as a fact that 20,000 cattle have gone? More or less. I know they have had to pass through Gournama.
1386. *Mr. Clarke.*] Are you aware that there is an export duty of £2 10s. per ton on Queensland wool, and would not that prevent it coming this way? Certainly it would; but a new Government might come in and upset that.

SATURDAY, 10 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Inverell, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq., (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

HENRY CLARKE, Esq.

The Hon. DANIEL O'CONNOR.

GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Moree to Inverell.

Mr. Francis George Finley, Chairman, Local Land Board, Armidale, sworn, and examined:—

Mr.
F. G. Finley.
10 Oct., 1896.

1387. *Chairman.*] How long have you been connected with this district? Eighteen to nineteen years.
1388. Were you in residence in the Moree district for some time? Yes; I had the administration of land matters there for a short time.
1389. Have you a personal knowledge of the whole of the country which will be affected by the proposed railway? I have a fair general knowledge of it. I have not been in the Moree district for the last ten or twelve years, during which time I believe a considerable change has taken place; but I have a general knowledge of the district.
1390. How far does your district extend west? Fourteen or 15 miles to Little Plain.
1391. And east? Twenty-five miles east of Glen Innes.

1392. During your period of administration in the Inverell district, has the alienated land by way of conditional purchase and other forms of alienation been held as *bona fide* holdings, or in many instances for speculative purposes? I do not consider there is any district where land is held more generally for *bona fide* purposes than the Inverell district. I do not believe any land is held for speculative purposes.

Mr. F. G. Finley.
10 Oct., 1896.

1393. Consequently there has been a steady increase of *bona fide* settlement? There has.

1394. Is that likely to continue? Yes, as far as the unalienated lands are concerned. Of course the principal part of the district has been alienated, but still there is a number of reserves being thrown open daily, and under the improved conditions of the present land laws they are being rapidly taken up as they are thrown open. The area of Crown lands now available in the Inverell district is very limited.

1395. Is it the policy of your Department to continue the conditional purchase alienation, or the more recent forms—homestead and settlement leases? The trend of the administration of the law now is to throw the lands open for settlement leases and homestead selection. The conditional purchase and conditional lease is still in vogue and is largely availed of.

1396. If it is intended to throw open land for settlement or homestead, is it not the practice to reserve it prior to dealing with it in that form? Yes.

1397. Therefore it would not be available for conditional purchase? No; but there is a clause in the Act which does not prevent a man getting an additional conditional purchase, although it might be in the proclaimed area for homestead selection.

1398. That would be by a man who is already resident? Yes; it would not lead to original conditional purchases.

1399. Is there any fixed regulation which determines the area of settlement lease in this particular district? No; they are recommended by the District Surveyor, and those areas are supposed to support a man and his family.

1400. Have you dealt with any settlement leases in the district? One or two. I think they are on the borders of the Glen Innes and Tenterfield districts. A large number of homestead selections has been taken up here.

1401. Of what area? Small areas. The land is considered very good, and fit for agriculture; hence the areas are small.

1402. What do you mean by small areas? From 20 to 200 acres.

1403. Would the Committee be right in assuming that the land likely to become available in this district is likely to be dealt with in a manner which will lead to a large settlement by reason of the small areas which will be offered? Decidedly—the land is so good in this district. Of course every area means an additional resident, and I think it will lead to a largely-increased population, especially if the lands are thrown open.

1404. You have no reason to suppose that the district, as far as settlement is concerned, is going back? Decidedly not. If there is any change at all it will be towards an increase.

Mr. Robert Howard, Secretary, Moree-Inverell Railway League, Inverell, sworn, and examined:—

Mr. R. Howard.
10 Oct., 1896.

1405. *Chairman.*] What is your occupation? I am a miller at Inverell.

1406. How long have you been in Inverell? I have resided in the Inverell district for nearly six years.

1407. I believe you are occupying a prominent position in connection with the Moree-Inverell League? I have done so of recent date; formerly, Mr. McIntyre was the Secretary, and when he left the district, I was duly appointed in his place at a public meeting held for the purpose.

1408. The Committee will be glad to hear from you what evidence you have put forward either for or against the proposed railway? I have a statement prepared of the estimated traffic and returns on the proposed line from Moree to Inverell, compiled by our Committee, which I will put in, as follows:—

Estimated Traffic and Returns on proposed Line, Inverell to Moree.

		£	s.	
From Inverell to Moree	Flour or wheat, 100,000 bushels—2,500 tons at 8s.	1,000	0	
	Potatoes, chaff, and other cereals, 1,800 tons at 8s.	720	0	
	Corn, 50,000 bushels—1,250 tons at 8s.	500	0	
	Hides, tallow, &c., 150 tons at 15s.	112	0	
	Tin ore, 700 tons at 12s. 6d.	436	5	
	Miscellaneous, 150 tons at 17s. 6d.	131	5	
	Wool from 240,000 sheep, at 15 bales per 1,000, 600 tons at 17s. 6d. ...	525	0	
Passenger traffic, 4,000 1st class passengers at 15s.		3,000	0	
	Do, 2,000 2nd do. at 10s.	1,000	0	
Between Inverell and Warialda to Moree and vicinity.	Live stock, 300 trucks at 30s.	450	0	
	Mails	700	0	
	Flour, maize, and other products, 700 tons at 7s.	245	0	
	Carriage on wool from 1,503,510 sheep, at 15 bales per 1,000 sheep, 4,500 tons at 15s.	3,375	0	
	Hides, tallow, &c., 200 tons at 10s.	100	0	
	Miscellaneous, 150 tons at 12s. 6d.	93	15	
	Passengers, 2,000 1st class, to and fro at 6s.	600	0	
	Do, 1,000 2nd do. at 4s.	200	0	
	From Moree to Inverell.	Mails	500	0
		Live stock, 3,000 trucks at 25s.	3,750	0
To goods for Inverell, 1,800 tons at 12s. 6d.		1,125	0	
Supplies to stations and other consignees, 800 tons at 12s. 6d.		500	0	
Miscellaneous, 150 tons at 17s. 6d.		131	5	
Trucking stock		500	0	
Supplies to owners of 1,500,000 sheep and for town of Warialda and district, being about 50 per cent. return loading, 3,000 tons at 10s.		1,500	0	
Traffic on line within Moree district between western boundary of Warialda district and Moree, wool and general goods		500	0	
Estimated increase of traffic within two years of completion of line.		Flour, 1,000 tons at 8s.	400	0
		Maize, 300 tons at 8s.	120	0
	Hay and chaff, 300 tons.	120	0	
	General goods, 1,000 tons at 17s. 6d.	875	0	
	Passengers, 500 at 12s. 6d.	312	0	
		23,521	10	

Mr.
R. Howard.

I have also an approximate return of stock within the areas shown by the blue etching on a map which a witness will afterwards present. The return is as follows:—

10 Oct., 1896.

APPROXIMATE return of stock within area shown by blue etching on map.

Owners.	Sheep District.	Horses.	Cattle.	Sheep.
Large	Warialda	4,195	55,737	785,079
Small	do	8,491	17,613	720,461
Large	Moree	182	9,350	155,440
Small	do	118	650	5,060
Large	Glen Innes	462	4,290	143,329
Small	do	4,410	39,971	87,695

It is estimated by our committee that the amount of wheat or flour which would go down to Moree from Inverell for consumption in the western market would be 100,000 bushels, or 2,500 tons.

1409. Do you mean that that would be the direct traffic with Moree, or would it include the intermediate traffic? It is the direct traffic with Moree.

1410. That, you say, is equal to 2,500 tons? Yes. I may state that the mill I represent turns out at present about 1,000 tons of flour per annum. That mill is running during the daytime only. If it were running night and day it would turn out 2,500 tons. The production of wheat for the Inverell district, according to the police returns for 1894-5, is 134,318; but for the electoral district of Inverell it is 153,213 bushels for the same year.

1411. How far do the boundaries of the electorate extend? I think to Little Plain on the west.

1412. Do you believe that return of wheat to be correct? Yes; it is obtained from the Government Statistician's office.

1413. Would the whole of that wheat come to the town of Inverell to be gristed? A small portion has, in some years, gone to Bingera—from Little Plain, for instance; but we do not estimate that that would occur if we had a railway from Inverell, because Bingera would be situated 28 miles from the railway. Consequently, it would pay the farmer better to bring the wheat to Inverell, grist it, and send it by railway to Warialda or Moree as the case might be.

1414. Do you know what proportion of wheat would go to Bingera? I believe the quantity is so small that it would not be worth taking into consideration. At any rate, it would be small in the future. When the railway is constructed there will not be that inducement to take wheat to Bingera.

1415. Do you think 5,000 bushels would go to Bingera? I do not think any would go.

1416. How is the wheat usually disposed of? Our own consumption in the Inverell district amounts to something like 48,000 or 50,000 bushels per annum. There is a population in the electoral district of Inverell of close upon 9,000, and I estimate 6 bushels per head for consumption.

1417. That would give you about 1,000 tons of flour? Yes.

1418. And you think that would cover the consumption of the Inverell electoral district? It would.

1419. What about the balance? The balance would be about 103,000 bushels. The greater part of our flour which has gone out of the Inverell district during the time I have been here has gone westward. Some has gone down to Goondiwindi. In the year 1893, the mill I represent sent about 60 tons to Goondiwindi which paid £1 a ton over the border; but since that—in 1894-95—wheat has been very cheap here, and in consequence millers were able to push their flour out a much greater distance than they could in a year like the present, when, instead of wheat being bought for 2s. and 2s. 3d. a bushel, it averages from 4s. to 3s. 6d. I think the estimate for the crop in Inverell last year was something like 60,000 bushels, but that was owing to an adverse season—the only adverse season we have had since 1888. The whole of our surplus has practically gone westward. On some occasions it has been sent eastward. For instance, Mr. Utz did not buy much wheat in Inverell this year. In some years he buys a good deal. I believe he buys to the extent of 20,000 to 30,000 bushels in some years, but if he can get his wheat cheaper in other markets he does not come to Inverell.

1420. But had you a surplus last year? Yes, of about 10,000 bushels; but Mr. Utz did not come to get it, because he could get it cheaper elsewhere. He obtained something like 5,000 bags, or 20,000 bushels, of Californian wheat. In consequence of Mr. Utz bringing this Californian wheat from Newcastle, he could not sell his flour in Glen Innes under £10 a ton, unless he lost money. As a consequence of that some flour has gone from Inverell this year to Glen Innes, but not much. It has gone from the mill I represent, and I believe some has gone from Mr. Oliver's mill. I believe some has gone as far as Armidale. I would like to point out the reason of that. Carriers trading between Inverell and Glen Innes have been taking return loading for as low as 10s. a ton, and we have got bran and pollard from the mill I represent, up to Glen Innes as low as 6s. 8d. a ton, by carrier, return loading. I may say in explanation of that statement that that was done during the time the bridge was being built here. I think there was a good deal of competition, and that helped to cut the price down considerably. The reason the carriers are able to carry so cheaply is in consequence of the low price of feed, corn, &c. It is not bringing more than 1s. 3d. a bushel this year. I may say that if we had a railway to Moree it would only cost us 8s. a ton to send out flour from Inverell to Moree. Consequently we could practically command that market. If we do not get the railway, we shall lose the market entirely, because our friends in Tamworth can land their flour in Moree for about 14s. a ton, whilst we have to pay £2 and £2 5s. for road carriage. Therefore we are entirely shut out. It is not only Moree that we look at, but the whole of the western market. I have been given to understand that the line will probably go from Moree to Mungindi or Colleymongle. If the line does go to Colleymongle, we can probably send our flour there, and get it on the Barwon; and it can go to Byrock or Bourke.

1421. *Mr. Roberts.*] Do you wish to infer that the 103,000 bushels to which you have referred goes to Moree, or to Moree and districts beyond? To Moree and districts beyond.

1422. Have 103,000 bushels annually left Inverell for Moree and the western districts? No; I think 40,000 or 50,000 has gone; but we anticipate that, when we get the railway, we shall be able to compete with Adelaide. At present, Adelaide can land its flour in Moree 12s. a ton cheaper than we can.

1423. *Chairman.*] You are narrowed down now to a surplus of 100,000 bushels, equal to 2,000 tons of flour? Yes. 1424.

Mr.
R. Howard.
10 Oct., 1896.

1424. You say the bulk of that goes west? Yes.

1425. What is the next item? Potatoes, chaff, and other cereals, 1,800 tons.

1426. Does that also go west, or to Moree only? It goes west. Of corn, the estimated traffic from Inverell to Moree is 50,000 bushels, or 1,250 tons. In a dry season like the present there is a demand for a greater quantity of corn than that in the western district, but we strike an average, and say that 50,000 bushels will be required annually. Of hides, tallow, &c., the estimated traffic from Inverell to Moree is 150 tons. Of course, my pastoralist friends tell me I do not understand this subject much, but I know that in seasons when sheep are cheap a great deal of boiling-down is going on, and I believe a larger amount than 150 tons of hides and tallow would be sent away annually. Then we have tin ore, 700 tons of which we estimate will be carried. I understand that according to the returns of the Department of Railways for 1894-5 this is the amount which was sent from Tingha. We already have a mine here in the Elsmore district which has opened up a rich deposit of tin. From that and other sources we expect to keep the output of tin up to the quantity I have stated.

1427. Is that the output now? It is, I believe. Then we have miscellaneous items, amounting to 150 tons. There is also the wool from 240,000 sheep within the district. We estimate fifteen bales to 1,000 sheep, and the total comes to 600 tons. The sheep, according to the returns of the Inverell district, are put down at 583,361. The next item is the passenger traffic. We estimate that there will be 4,000 first-class passengers at 15s. per head, and 2,000 second-class passengers at 10s. a head.

1428. Where would these passengers go to? Between Inverell and Moree and Sydney, and other parts.

1429. But you are only calculating the value of them upon the proposed line? Yes. Then we have live stock—300 trucks at 30s. a truck. That is calculated between Moree and Inverell. That, I think, is a very moderate estimate. I have learnt since the estimate was made that there would probably be a greater amount. Then we have mails, £700 per annum. The charge for mails is £12 per mile, and that is the basis upon which we have reckoned it. The mails carried to the Moree-Inverell district total 2,200 tons annually.

1430. That is so far as Inverell and Moree are concerned;—now with regard to the trade between Inverell and Warialda and vicinity? Between Inverell and Warialda and vicinity the traffic in flour, maize, and other products would be 700 tons at 7s. a ton. There will also be the carriage on the wool from 1,505,540 sheep within the Warialda district. It is estimated that the traffic in hides, tallow, &c., between Inverell and Warialda and the vicinity will be 200 tons; miscellaneous traffic, 150 tons; passengers, 2,000 first class, and 1,000 second class. Then there will be live stock—3,000 at 5s. a truck. From Moree to Inverell there will be the following traffic:—To goods for Inverell, 1,800 tons at 12s. 6d. per ton. Since the return was made up we have found that that is a very low estimate indeed. The official reports for the year 1891 state that the traffic outwards and inwards west of Glen Innes was 5,112 tons. We have only put down 1,800 tons.

1431. You are reckoning, of course, that these will be the goods sent through Moree in transit to Inverell. Are you estimating that any portion of them will come from Moree? I suppose there would be the ordinary traffic on the line.

1432. What does Moree produce which she could send? I do not suppose she produces anything which would come under that category.

1433. I only want to know whether you intend your estimate to include the transit of goods from Moree? I intend to include goods which would be imported into the Inverell district by way of Moree. Then we have supplies to stations and other consignees, 800 tons at 12s. 6d. per ton. That would, of course, mean all kinds of station supplies obtained from Sydney direct by the owners themselves. Then we have miscellaneous traffic—150 tons at 17s. 6d. per ton; trucking stock, £500; supplies to owners of 1,500,000 sheep, and for town of Warialda and district, being about 50 per cent. return loading, 3,000 tons at 10s. per ton.

1434. What do you mean by that? It is estimated by pastoralists that for every ton of stuff they send out they import half a ton.

1435. In the second item of the Moree to Inverell estimate you refer to goods for Inverell—1,800 tons. Then you say, supplies to owners of 1,500,000 sheep, and for town of Warialda and district? That would come to Warialda from Moree.

1436. But have you not reckoned between Inverell and Warialda? We have it from Moree to Inverell.

1437. You mean that which you have referred to to include the return loading in the shape of store goods, &c.? We mean the supplies to refer to supplies to the owner of sheep in the Warialda district, and for the town of Warialda and district, being about 50 per cent. of the return loading. That would apply to the whole of the town and district of Warialda.

1438. What is the next item? Traffic on line within Moree district, between western boundary of Warialda district and Moree—wool and general goods, £500.

1439. You take credit for 1,500,000 sheep for Warialda? No; supplies for 1,500,000 sheep in the Warialda district.

1440. Then, you refer to the traffic on the line within the Moree district;—would any of the 1,500,000 sheep be included in the second estimate—that is, within the Moree boundary? I do not understand the question.

1441. You have 1,500,000 sheep in the district of Warialda? Yes.

1442. Then you estimate the weight of the goods to be consumed by the owners? Yes; 3,000 tons.

1443. Then you say, "Traffic on line within Moree district between western boundary of Warialda district and Moree—wool and general goods?" Yes.

1444. And you put flour down at 1,000 tons? That is in a lump sum. The traffic on the line within the Moree district is estimated at £500. Then we estimated the increase of traffic within two years of the completion of the line, and we put flour down 1,000 tons at 8s. a ton.

1445. That, I suppose, would mean from various points along the line between Inverell and Moree? Yes; principally from Inverell, because flour is produced at Inverell. We put down the estimated increase in the traffic in maize within two years of the completion of the line at 300 tons; hay and chaff, 300 tons; general goods, 1,000 tons; and passengers, 400.

1446. What does that bring the total tonnage to? I have not the amount of the tonnage.

1447. Roughly speaking, it would be about 21,000 tons. I have not added it up myself, and the money value of the freight to the railway would be £23,521 10s? Yes; that is the money value.

1448. Did you give any statistics to the Department of Railways when Mr. Harper was collecting information with regard to the line? No; but I believe the late secretary, Mr. McIntyre did. I know they were together. Mr. McIntyre was the secretary to the league at that time.

1449.

- Mr. R. Howard.
10 Oct., 1896.
1449. Do you think he was competent to give reliable information? Yes.
1450. Do you think any information he gave could be relied upon? I think so. He might be in error, of course, in the same way as any other man might. I do not take it upon myself to say that any information was given by Mr. McIntyre.
1451. Do you know of any other person who supplied Mr. Harper with information? I do not; I only heard that Mr. Harper was here.
1452. If your estimate of traffic is 200 per cent. in excess of Mr. Harper's estimate, which do you think is likely to be correct? Of course the Department of Railways is guided by the experience of other lines, but I think they always keep themselves well on the safe side.
1453. There is a discrepancy between your figures and those of Mr. Harper to the extent of over £7,000 a year? Yes.
1454. But you have taken into consideration an estimated increase of traffic in two years amounting to about £2,000? Yes; I think it is generally understood that the Department makes a practice of under-estimating. I wish to point out that a considerable amount of settlement would naturally take place along the proposed line, as there is a very large quantity of unalienated land, which will soon be thrown open.
1455. Have you any other figures to add to those which you have already given? I have a return to which I should like to call attention. It is as follows:—

STATEMENT showing tenure and acreage of lands, within 15 miles on either side of the proposed railway—Moree to Inverell.

Nature of Tenure.	Acreage.
Alienated—about	310,300
Conditional purchase	336,300
" lease	138,450
Reserved	359,170
Pastoral scrub and improvement lease	220,500
Settlement	4,283
Homestead selections	7,300
Crown lands available for settlement	270,880

1456. Who supplied these figures? They were supplied from the Lands Department through Mr. Cruickshank, from official documents. If the line were made to Glen Innes it would practically pass through four large estates having no land available for settlement, whereas on a line between Moree and Inverell there will be, within 15 miles on either side, between 800,000 and 900,000 acres of Crown land of which no less than 359,000 acres are reserved land. Taking an area of about 30 miles from the line on the south, and to the Queensland border on the north; there are no less than sixty-two runs containing something like 3,000,000 acres of Crown land, all of which would be affected by the railway.

1457. Have you any other documentary evidence to give? I should like to state that in connection with the Moree railway a petition was presented some months ago to the Secretary for Public Works. That petition contained over 1,100 signatures, and represented every interest in the district, and it prayed for the construction of the proposed line. I have referred to the flour mills in Inverell before, but I wish to say here that two fully-equipped roller flour mills are in Inverell. They contain the most modern machinery and appliances, and were erected at a total cost of about £10,000. They are capable of treating 250,000 bushels of wheat per annum;—that is, running day and night; or about 5,000 tons. The league desire to urge upon the Sectional Committee the advisability of considering the unusually heavy handicap which the producers of this district will sustain if they do not obtain railway extension to the west. As I have already stated, it will enable Tamworth to supply the western market at the low rate of 14s. a ton, compared with our rate of £2 from Inverell to Moree. If the line were constructed—the distance from Narrabri to Walgett being about equal—we would have the advantage of being in a position to supply the latter district, which is an extensive one. The large excess of area west over east, amounting to the large number of 9,991,090 acres, will, no doubt, provoke a sincere desire on the part of the Committee to recommend and Parliament to afford railway facilities, in order that settlement may take place.

1458. Do we understand that you are depending upon Moree, west of Moree and north of Moree—what we may call the Moree district, or the western district—for the absorption of the produce of which you have already given a return? With regard to the wheat;—I believe it would absorb that now.

1459. I suppose it would be fair to take your figures as to exportation, making a total of 6,250 tons;—are you depending upon the western district to absorb that, or do you intend to convey the idea that you may find a market on the railway line on Moree towards Narrabri, or do you intend us to understand that the western district alone can absorb this amount of produce? We probably could supply some of the market further west.

1460. But do you think the western districts will absorb 6,250 tons? I think so. I am given to understand that the present traffic is represented by 90 tons per week, but I do not know of my own knowledge.

1461. If that district were capable of absorbing the quantity you have mentioned, of course population would have to increase there to enable the extra quantity which you estimate will be exported there within two years of the opening of the railway to be consumed? Yes; but the district is an enormously wide and scattered one.

1462. But the population would have to increase in order to absorb 1,000 tons more flour, 300 tons more maize, and so on? I believe there is a large increase of population going on there.

1463. You understand that there will be an increase of population? Yes; but we would not consider ourselves excluded from the Sydney market. We could send wheat there for 4½d. per bushel.

1464. At the present low rate for the carriage of wheat to Sydney, do you think you would be able to send wheat or flour there at a profit? I do not think we should suffer under any greater disadvantages than some other parts of the Colony—Riverina, for instance.

1465. You are aware that if the line be constructed it will be the longest in the Colony—511 miles from Sydney? Yes.

1466. The Great Northern line to Glen Innes is about 420 miles from Sydney? About 422 miles.

1467. The gap between there and Inverell is 52 miles? Yes.

1468. Supposing it became a question of sending your produce, which would stand exportation, to Sydney, would it not be cheaper for you to get it over the shorter length of line? It would be to our advantage to the extent of about 1s.—for a 6-ton truck, by way of Glen Innes—that is all.

Mr.
R. Howard.
10 Oct., 1896.

1469. That is 2d. per ton? Yes. Then we understand, the country being flatter, the Railway Commissioners will carry the produce cheaper by way of Moree, and over the mountainous route the other way.
1470. I think you ought to be informed that the Commissioners say that upon the present estimate of traffic, and with present rates the line will show a loss of £2,800 a year. If there is any departure made from the rates upon which those calculations have been based it will increase the annual loss? Of course, that is a question for the Department of Railways themselves to consider. What we want to do is to test these figures, and to see if they are correct, and also to see whether access can be given to the district, which everyone admits ought to be connected with the railway system somewhere. You see the difficulty. Instead of gradually reducing the estimated loss, a reduction of the rates will increase it unless the quantity carried very largely increases. Of course, we rely upon a very large increase in the quantity, which would fully make it up.
1471. What is the rate of carriage on flour between here and Glen Innes? By carrier 10s. a ton.
1472. And the rate from here to Moree? £2 and £2 5s. a ton.
1473. Is the rate the same for chaff and maize? Yes; I believe the same rate applies.
1474. *Mr. Black.*] I understand you to say your figures are based on last year's traffic between Inverell and Moree? Yes.
1475. How have you compiled the quantities;—is it purely an imaginary record, based on the production of the district and the probable consumption of the Moree district? Yes; the Moree district has a deficiency of 95,000 bushels of wheat, and if we get the proposed line, then we know perfectly well we can supply it against any competitors.
1476. Where did you get your figures with regard to the number of sheep in the Warialda district? Through our Member, from the Chief Inspector of Stock.
1477. I see the return refers to Warialda and vicinity? Yes; it includes the surrounding country.
1478. I have the Warialda return, and your return exceeds it by 500,000? I think the area extends for 30 miles to the Queensland border, and 30 miles in a southerly direction.
1479. You make up a very large proportion of your return by giving 50 per cent. of return loading in the shape of supplies to the owners of 1,500,000 sheep? —
1480. In making that statement, in which you appeared to assume that the owners of stations get all their supplies independent of local storekeepers, have you taken into consideration the quantity of supplies which would be brought into the district by storekeepers? We do not imagine that all the station supplies would be got other than from storekeepers.
1481. You must have done so, because you say that the owners of 1,500,000 sheep will have 50 per cent. of return loading;—assuming that is a correct estimate you imagine that all their goods will be obtained direct? They must all be carried on the line whether they come to the storekeeper or to the squatter.
1482. No; but if you calculate that the squatters are going to bring up all their own supplies, and you make no reduction from the supplies obtained from the storekeepers on that account, you double a certain amount of supplies carried over the line, and to that extent you give an incorrect estimate and swell your return? I cannot see that.
1483. You estimate that there will be a certain quantity of hides and tallow carried between Inverell and Moree, and Inverell and Warialda;—do you not think they are able to produce all their hides and tallow in that locality? Yes, but the hides and tallow from Inverell and Warialda would be carried over the line.
1484. To where? For exportation to Sydney.
1485. But you do not say to Sydney;—you say “from Inverell to Moree, and from Inverell to Warialda? We assume that they will be exported.
1486. Why are the people of Warialda going to import hides and tallow of the freight value of £100 per annum from the people of Inverell. What possible use can they have for them? I do not know.
1487. *Chairman.*] I think you said in reply to a question of mine that your estimate of freight, although the heading of your return shows that freight to be from Inverell to Moree, or Warialda to Moree, was in regard to the freight at those particular points—that the articles were consumed there or passed through in transit to other markets? That is so.
1488. *Mr. Black.*] Do you assume that if you had direct railway communication with Sydney the whole of the supplies of your storekeepers and station owners would go by rail? Yes, if the railway commissioners carried them as cheaply as they can be carried by other routes.
1489. To what other routes do you refer? Grafton, for instance.
1490. Do you not think it is a strain on the imagination to suppose they will do anything of the kind? Of course they will conduct their business in their own way, and it is not for me to say what they might do. They might make special differential rates.
1491. Do you not know that Glen Innes is connected by rail direct with Sydney? I do.
1492. Do you not know that the Railway Commissioners do not carry goods to Glen Innes as cheaply as they can be carried there by other routes? I have been given to understand that they do not.
1493. Why should you suppose that they would make an exception in favour of Inverell? I suppose they would do so in order to get the traffic.
1494. Why is it that they do not do it in order to get the traffic in the case of Glen Innes. Is not that traffic as important for the Railway Commissioners as is the traffic of Inverell? But I understand that the Railway Commissioners estimate that the working expenses of a line to Glen Innes will be greater than the working expenses of a line *via* Werris Creek and Moree to Inverell, because the country is flatter and there are not the grades to contend with.
1495. The expenses, no doubt, are greater, but still there is a profit on all traffic carried over the line. The greater the amount of traffic, the less, proportionately, per pound, is the expense? Yes, of course.
1496. Is it not a fact that a great proportion of your Inverell goods is now brought *via* Grafton? No; I do not think a great proportion is.
1497. How do you get them? By rail to Glen Innes.
1498. What proportion do you think is brought by rail to Glen Innes? I am not in a position to answer.
1499. Then how can you say definitely that a great proportion comes from Glen Innes;—can you say whether two-thirds, one-half, or one-fiftieth comes from there? I should say two-thirds do.
1500. Have you any figures to support that statement? No.
1501. When you imagine that the storekeepers, station-holders, and farmers of Inverell will bring the whole of their Sydney-purchased goods, in the event of the railway being constructed, *via* Moree—which would

- Mr. R. Howard.
10 Oct., 1896.
- would be putting a severe strain upon their patriotism; are you aware that it has been estimated that the average cost of carrying goods over the line from Sydney to Inverell would be something like £8 7s. 6d. per ton—that is, unless some differential rate is established? I have heard so.
1502. At what cost can goods be landed in Sydney *via* Grafton? I have heard it stated that they can be landed as low as £4 15s. a ton in Inverell.
1503. Would £4 5s. to £5, according to varying circumstances be a fair average? I suppose it would.
1504. Do you think the Commissioners could successfully compete? If the Railway Commissioners cannot construct railways to compete with road carriage the best thing to do would be to shut up shop and give the traffic over to the carriers.
1505. It is a certainty the Railway Commissioners cannot compete with water-carriage over a short distance, and then with land carriage by teams, as against a rather circuitous railway route—that is so far as the matter of monetary payment is concerned. The question is whether the saving in time in the carriage of goods direct by rail, will be any compensation to those who obtain goods from Sydney;—do you think the saving of a fortnight or thereabouts in bringing goods direct from Sydney will sufficiently counterbalance an extra cost of carriage to the extent of £1 per ton and upwards? No doubt it would for a large percentage of goods—that is for goods required quickly. No doubt those would be obtained by rail even if they cost £1 to £1 10s. per ton more. With regard to bulk goods, the storckepers would get them by the cheapest route.
1506. I see you have provided in your estimate for increased traffic at the end of two years? Yes.
1507. How do you arrive at your figures? We assume that there would be a considerably larger area under cultivation if the line be constructed than there is at present, and we look for an increase of traffic on that account.
1508. But with such assumption of increased production you must also assume an increased consumption somewhere else;—is your imagination equal to making two such assumptions? I do not see that it would be impossible for a miller here to send flour to Newcastle—sometimes at any rate.
1509. But you think it would be possible for him when it arrived there to compete with flour made in close proximity to Newcastle? Probably not under a freetrade tariff.
1510. Do you think you could have a protectionist tariff which would shut out the flour of Tamworth from selling in Newcastle;—is that the sort of protectionist tariff which you are in favour of? I do not think Tamworth can compete with this district for one moment.
1511. Putting aside the competition of Tamworth, do you imagine you are going to have a duty imposed on flour for the purpose of protecting Inverell against the outside world? Probably at some future time, for protecting the Colony against the outside world.
1512. Deducting the estimated increase at the expiration of two years, your total estimate of traffic will, I presume, be £22,194 10s.? Yes, about that.
1513. *Mr. O'Connor.*] In the estimate you have prepared, have you taken into consideration the receipt of any produce from the east—say for 10 miles towards Glen Innes? Yes.
1514. Do you not think that any intelligent man can ascertain where the goods coming to this place are consumed? Certainly we can. There is a considerable trade between Glen Innes and Inverell, and between Grafton and Inverell as well. For instance, sugar comes up from Grafton.
1515. Do you know the country between Inverell and Moree? I know it as far as Warialda.
1516. What is your opinion about the quality of the soil? My opinion is—and I have had the experience of a man long resident in Victoria—that there is no better soil, either in South Australia or Victoria, than we have in this district.
1517. Are you aware that there is a considerable quantity of land to be thrown open for selection during the next two or three years? Yes.
1518. Is it your opinion that it will be availed of? Most decidedly. The last time any land in Moree was available it was simply rushed.
1519. Have you a mill? I am employed by Mr. Taylor, the owner of the mill. We have two roller flour-mills going here.
1520. If the proposed line be constructed would it be possible for a man to erect a mill between here and Moree? Of course it would. The millers buy the produce from the farmers, and grind it into flour, and then distribute it.
1521. I suppose that what could be done in Inverell, could be done in Warialda? Yes: if they can successfully grow wheat there, but we in Inverell do not think they can do so year by year.
1522. Could they establish a mill at Little Plain? Yes.
1523. The difference of carriage from there to Sydney then would be little less than from Inverell to Sydney? I suppose so.
1524. And that would enable the district to compete more successfully with the Sydney market? I should think so.
1525. *Mr. Roberts.*] In the event of the line being constructed, how far eastwards—that is, in the direction of Glen Innes—would the people be served by it? I should think for half the distance. They would be the best served people in the Colony. They would have a railway 21 miles on one side and 21 miles on the other.
1526. What is the distance from Inverell to Glen Innes by road? Forty-two miles.
1527. Would 21 miles be regarded as a fair distance for a farmer to bring his goods to market? A good many bring their goods as far as that already.
1528. Is it not generally understood that 12 miles is about the distance a farmer would be expected to travel? A good deal of the thickest of the farming community lives within that distance of the towns; but we have farms in the district fully that distance away from Inverell.
1529. And you think, if the line were constructed, people half the distance between here and Glen Innes would be well served by the railway, and the other half would probably send their produce to Glen Innes? Yes.
1530. Have you seen the estimate of traffic over the proposed line as prepared by Mr. Harper? I believe I saw it published in the local press.
1531. Are you aware that the total revenue from all sources is estimated to amount to £13,422? Yes.
1532. How would your figures compare with them. I want you to leave out for a moment any future traffic. Can you let me have your estimate on the same basis as Mr. Harper—that is, in regard to existing

Mr.
R. Howard.
10 Oct., 1896.

existing traffic? Our estimate would only be £7,000 more under those conditions, and I think, as I said before, that the railway officers generally keep about 10 per cent. below what they think the traffic will amount to.

1533. But what have you put down for increased traffic—assuming the railway to be constructed—for two years? About £1,900 per annum.

1534. What would that leave so as to compare the figures with those of Mr. Harper? It would leave a difference of £7,000.

1535. Then, in your opinion, the estimate of Mr. Harper has been greatly understated? I think so, judging from what I know of the district and its capabilities.

1536. If your estimate were realised the line would prove a paying one instead of a losing one? Just so.

1537. Can you tell me where the 153,213 bushels of wheat produced in the Electoral District of Inverell go to now? The greater part is ground into flour in Inverell. A little sometimes goes to Bingera.

1538. Where does the flour go? All about the district—Tingha, Bundarra, Warialda, Moree, and sometimes to Goondiwindi.

1539. How much goes to Moree? A large percentage—about eight-tenths of it probably. I have no actual figures. In July and August of the present year over 100 tons were sent from the mill I represent.

1540. Where was it sent to? To Moree.

1541. And from Moree it is, I suppose, distributed to districts west or north-west? The millers dispose of it to the storekeepers, and they dispose of it to their customers in the ordinary way.

1542. What is the freight to Moree at the present time? £2 5s. per ton.

1543. And if the railway were constructed the freight would be 8s. per ton? Yes.

1544. Therefore, from your point of view, it is fair to assume that if such a large quantity goes to Moree and districts paying a freight of £2 per ton, the demand for Moree and districts to the west will be very largely increased when the freight is only 8s. a ton? There is no doubt it would. We could practically, as I say, possess that market against any competitor.

1545. Is the population to the west of Moree sufficiently large to cause such a large demand for wheat and flour? There is a deficiency in wheat equal to the amount we have for exportation now—at least equal to the amount we had for exportation in 1894-5.

1546. Is that the best market you have—that is, to the west of Inverell? Yes; it always has been.

1547. Does any produce go to Queensland? Yes; we sometimes send flour to Goondiwindi. In 1893, 60 tons went from the mill I represent to Goondiwindi.

1548. By which route does that go? *Via* Gramin and down to Goondiwindi from Inverell. The distance is over 100 miles.

1549. Does it go all the way by team? Yes; and it pays a duty of £1 per ton on the Border.

1550. *Mr. Black.*] If you had a railway, would any more go in that direction? I think so most decidedly. I do not see how Queensland could compete with us down towards the border.

1551. But if you had the traffic how would the line aid you? Since the line has gone from Narrabri to Moree we have not got the traffic. We cannot compete with them. It is the general opinion of the agriculturists of the district that if the proposed line be not constructed they must lay their implements up to rust.

1552. If the line were constructed from Glen Innes, would it be the means of causing a large amount of Inverell produce to find its way to Queensland? I do not think so.

1553. Is not the wheat on the Darling Downs somewhat uncertain, owing to the uncertain rainfall? It is uncertain, no doubt, but generally they get a fair crop, and they have a vast area under cultivation—equal to the whole of New England, therefore, we could not hope to compete with them *via* Glen Innes.

1554. Is there any wheat going there at the present time—say as far as Toowoomba? I do not think so.

1555. And you do not think any would go if a line were constructed from Inverell to Glen Innes? I do not think so. I think they grow pretty well sufficient for their own requirements.

1556. Do you prefer the proposed route to any other which has been suggested? I do. I know from experience where most of the flour has gone from the mill I represent.

1557. You base your opinion principally upon the belief that a market for Inverell produce is to be found to the west? Most decidedly, I do.

1558. It has been, I believe, generally admitted by the various Committees that have inquired into the desirableness of connecting Inverell with the railway system of the Colony that such connection should take place? Yes; I believe that has been admitted for many years.

1559. The next question to decide is, in which way the connection should take place? Yes. That is not a very difficult question on the part of the inhabitants, for I think two-thirds of them are in favour of the Moree route.

1560. Has the line from Inverell to Guyra many adherents at the present time? Not in Inverell. There are some in Tingha. I daresay, however, there are many people in Inverell who would prefer that route to the one to Glen Innes.

1561. Opinions are divided as to the Moree line or the line to Glen Innes? I do not think there is much contention about it. Our friends on the other side contend that there is, but on every occasion on which the opinion of the people has been taken they have been badly beaten.

1562. *Mr. O'Connor.*] You ought to have tried the referendum? We did, at a public meeting.

1563. *Mr. Roberts.*] How far west do you think the first-class agricultural land which would be likely to be benefited by the railway exists? It would not all be fit for wheat-growing on the other side of Warialda, but from Inverell to Warialda it is good wheat-growing land in a fair season. But even at Warialda they cannot grow as much wheat on an average as we do in Inverell, because they do not get the rainfall.

1564. The best country in that direction is, I believe, within 20 miles from here? Yes; the best agricultural country is. Of course, there is some splendid pastoral country.

1565. Then if the line were constructed it would serve 20 miles of first-class country west, and 21 miles east towards Glen Innes? Yes; I think so.

1566. Do you think a very large area of land would be put under cultivation if the line were constructed? Yes; we have witnesses who can prove that, and who have stated in writing the increased amounts they are willing to put under cultivation.

- Mr. R. Howard.
10 Oct, 1896.
1567. What is the average yield per acre? In 1894-5 it was 18 bushels per acre. That is the average for the police district, but for the Electoral District it would be more, because there are farmers who can prove that they have grown as much as 40 bushels of wheat to the acre.
1568. What would be the average? The average given by the Government Statistician is 18 bushels.
1569. Is a large amount of wine produced in the district? There is.
1570. Have you any figures to show the area of land under vine-culture? I believe another witness has.
1571. Do you think the cultivation of the vine is in any way hindered by the want of railway communication? I believe there is an enormous amount of wines stored in the vineyard actually waiting for a railway to take it away.
1572. I believe the soil, in addition to being so remarkably fertile for the production of wheat, is also suitable for the production of fruit? Yes; all kinds of English fruit grow here to perfection.
1573. Are you able to find a market for it? Yes; a market has been found west for it until the line was opened from Narrabri to Moree. People who took fruit there now find that the Moree market is inundated with fruit from Sydney.
1574. Are you able to say that, if the line were constructed, it would pay you to send fruit to the Sydney market? I do not hope for that. I do not think so.
1575. I understood you to say just now that, if the line were constructed, you felt sure you could compete with Tamworth in supplying flour and wheat for the Sydney market; will you explain what causes you to come to that conclusion;—does your district produce more per acre than what Tamworth does? I think so. That is one reason, but we would enjoy an advantage of 20 per cent. in the railway rates on the up-journey towards Sydney, whereas if a Tamworth miller sent his flour to Moree, he would only enjoy that up-rate advantage as far as Werris Creek. Then he would be proceeding from Sydney, consequently he would be at a disadvantage of 20 per cent.
1576. In making out your estimate of traffic, did you consider the probability of getting any traffic from Bingera? Yes; the area we took in certainly included Bingera.
1577. *Chairman.*] It is included in the Warialda estimate? Yes; it is only 28 miles from Bingera to Warialda.
1578. *Mr. Roberts.*] How far is Bingera from Inverell? Forty miles, I think.
1579. *Mr. Clarke.*] How much flour has been sent to Moree within the last twelve months? I could not give you an accurate estimate, because I am not acquainted with the operations of the other mills, but I should think our mill sent 500 tons.
1580. Can you say what the other mills sent? I could not say definitely.
1581. Can you give any idea of the quantity of produce, such as chaff, bran, maize, and other kinds of horse-feed, sent from Inverell to Moree within the same period? I am given to understand that there has been an average of 90 tons per week, but other witnesses will prove that.
1582. I notice you have given a larger estimate than Mr. Harper of goods which will probably be carried over the line? That is so.
1583. The difference between Mr. Harper and yourself is nearly £10,000? Yes; but we take into consideration the enormous advance which will be made in the district.
1584. It is generally understood that the Government officials—particularly Mr. Harper—give the most favourable consideration in regard to the amount of the traffic which is likely to be carried over any proposed new line of railway? From the Railway Commissioners' point of view, I believe they do.
1585. And your estimate is far in excess of the Departmental estimate? Just so.
1586. If the line were constructed would much traffic come from Moree and north-west of Inverell? I should think so. There would be a passenger traffic, for instance. There would be traffic from Sydney *via* Moree.
1587. What is your opinion with regard to the passenger traffic? I think I have already given it as 4,000 first class, and 2,000 second class, with a revenue of £693 15s.
1588. Would you be surprised to learn that Mr. Harper's estimate is only £600 per annum? But with our local knowledge we take a more sanguine view of the matter than does Mr. Harper.
1589. Would you be surprised to learn that we have had evidence at Moree to the effect that the quantity of flour and other produce obtained from Inverell for Moree and district is only about 1,850 tons per annum;—your estimate is 6,550 tons? Yes; but that may apply only to the amount obtained by the witness who gave the evidence.
1590. No; it was evidence in regard to the absorption of produce by the whole of the Moree district? We are certain it is wrong, because there is a deficiency of 95,000 bushels in the district, which means 2,000 tons of flour.
1591. Your estimate is greatly in excess of the one to which I have referred? The deficiency to which I refer applies to the two districts of Narrabri and Moree.
1592. But your statement is in regard to Inverell to Moree? When I say Moree, I mean the western district.
1593. Narrabri is not to the west? But it is in the western deficiency.
1594. What is the rate of carriage from Grafton to Inverell? About £4 15s. is the lowest I have known.
1595. Is there a large production of various kinds coming from Grafton to Inverell? I think so. There is a good deal in the heavy class of goods, sugar for instance; but I do not think there are any general store goods.
1596. In the event of the railway being constructed, do you think it would be possible for the railway to carry as cheaply as you can by sea to Grafton, and thence by team to Inverell? It would if the Railway Commissioners were willing to make such differential rates as would apply to Inverell, which would get the traffic.
1597. But you would not expect them to make differential rates exclusively for the benefit of Inverell? They have done so in other parts in the past. They do it now, I believe, with regard to Glen Innes. You can get goods landed more cheaply in Glen Innes than you can in Armidale, and there is a difference of 60 miles.
1598. Do you know that the annual loss on the proposed line will be £2,800 per annum? Yes; but we do not think there will be any loss at all.
1599. You think that ultimately, if the line be constructed, the loss will be diminished? It will diminish altogether in the first year.

1600. And the line will ultimately pay? I believe it will pay the first year.

1601. What reason can you give for that statement? If the Commissioners can carry stuff as cheaply by the proposed line as by any other, there is nothing to prevent the production of this district being doubled even in one year.

Mr.
R. Howard.
10 Oct., 1896.

1602. Do you think, with good seasons at Moree, as much horse-feed would go there from here as goes in dry seasons? Perhaps not quite so much.

1603. I notice you refer to 700 tons of tin ore from Tingha? From Inverell. Of course, Tingha tin would naturally come here, Tingha being only 15 miles away.

1604. Hitherto it has gone to Tamworth? It went to Guyra originally until the differential rates caused the people to prefer Glen Innes to Guyra. Of course, it comes through Inverell as well.

1605. And then it is carried to Glen Innes? Yes.

1606. If the line be constructed, Inverell being the nearest railway station, it would come here? Yes; we expect the Railway Commissioners will make the general rates apply equally to Inverell and Glen Innes.

1607. Do you think it is possible for the Inverell district to grow wheat to compete with other districts, such as Riverina, where they have an abundant rainfall and better soil? We have a better rainfall here than they have in Riverina, and I think we can produce as good wheat here as can be produced in any part of the known world.

1608. You are aware that the freight between Adelaide and Port Pirie is very low? Yes.

1609. Could not the South Australian people send by sea to Newcastle, and then compete with you successfully? Probably, in some seasons, but they could not this year, because flour in Adelaide has been £10 10s. for most of the year, whereas we are selling it here for £9.

1610. Does not that arise from the fact that there was a drought both in Victoria and South Australia? I believe so; but the majority of the people here hope to see the duties put on some day.

1611. The duties have been taken off? But they will not last for ever—at least, I hope not.

1612. *Mr. O'Connor.*] Do you know that the most prosperous farmers in Australia are on the Riverina, and their average production of wheat all round is only 14 bushels to the acre? I believe so.

1613. *Mr. Roberts.*] Can you give me the figures of the Bingera traffic which you say you have included in your estimate? I have not included them, but probably I could supply them afterwards.

1614. I find that *Mr. Harper*, in his estimate of £13,422, does not include any traffic from Bingera, nor does he include any traffic towards Glen Innes? That is where the discrepancy between him and ourselves comes in.

1615. If you can supply the figures the estimates will be on a better footing for comparison than they are at the present time? Just so.

1616. You stated just now that you had a better rainfall than the Riverina district;—did you mean a heavier rainfall? Yes.

1617. In the case of wheat, is the heavier rainfall always the better rainfall? No; our rainfall is more regular, and can be relied upon year by year. It is far more than the rainfall of Riverina.

1618. Does not a heavy rainfall beat the wheat down? The only thing I have seen beat down wheat crops is hail.

1619. Have you not seen rain do it? I have seen rain do it, but the crops have generally got up again.

1620. How do you send your produce to Goondiwindi? It is sent by road all the way.

1621. In the event of the line being constructed from Inverell to Moree how will they be sent then? I do not know that there would be any nearer point on the line.

1622. Where, then, would be the advantage, so far as Goondiwindi is concerned? Putting aside Goondiwindi, we could supply the district down towards the border.

1623. You have stated that you have lost the Goondiwindi trade since the construction of the line from Narrabri to Moree;—how are you going to get it back by the construction of the proposed line from Moree to Inverell? What I said was that we would lose the Moree trade. I do not think I mentioned Goondiwindi; I did not intend to do so.

1624. How will the construction of the proposed railway between Moree and Inverell enable you to land goods in Goondiwindi to better advantage than you do now;—Goondiwindi wool goes to Moree, and always will, and the back loading will come from Moree? That is so.

Mr. Hugh Wyndham, grazier, Bukkulla, sworn, and examined:—

1625. *Chairman.*] How long have you resided at Bukkulla? Forty years.

1626. *Mr. O'Connor.*] Where is Bukkulla? 19½ miles due north from Inverell, towards the Queensland border.

Mr. H.
Wyndham.
10 Oct., 1896.

1627. I believe you are anxious to give the Committee some information? Yes; I represent a large freehold property of over 14,000 acres. If we get a line to Moree I am prepared to go in largely for agriculture.

1628. Then you are in favour of the proposed line? Yes, strongly, for this reason: I think it offers a market to the west for agricultural produce. It would also be as good a line as any other for reaching Sydney or Newcastle; therefore it would give us an outlet for wheat, and, perhaps, also, for other items of agricultural produce, equal to a line to Glen Innes, or any other line which could be made from here. The detour of 50 miles or so is not much, and the probabilities are that the Railway Commissioners would carry from here, *via* Moree, as cheaply as *via* Glen Innes, or any other way. In expectation of the railway being made I have not gone in for agriculture, although I have been waiting for years to do so. Hitherto, however, I have been afraid to cultivate, for fear that with others doing the same I should find the produce a burden on my hands. Given a railway, I do not see why we should not compete with Riverina, or any other part of the Colony, in Sydney or Newcastle.

1629. How many acres of your 14,000 are agricultural? About 9,000.

1630. How many would you be prepared to put under cultivation next year? I daresay I should put in 400 acres next year—that is, myself and some tenants. I have lately made an agreement with some responsible men who have leased 570 acres from me on thirds, and they intend to cultivate nearly the whole of it. Others are also applying to me for land on the same terms. Given a railway to Moree, I have no doubt I shall be able to let a great deal of land on those terms.

1631. Are you of opinion that within the next four or five years you will be able to sow the whole of the 9,000 acres? I hope so. There will be nothing to prevent me unless it be want of money. I shall put

Mr. H. Wyndham.
10 Oct., 1896.

in all I can. The line to Moree would certainly get all the wool of the district. A good deal now goes to Grafton. Mine goes to Grafton. Last year I sent about 300 bales to Grafton. It would certainly go to Moree if the line were constructed. The carriers could not compete with the railway. The present railway charge from Glen Innes to Newcastle is £2 17s. 6d. a ton for greasy wool. The carriers take it from here to Grafton for £3 10s. Supposing the railway were made from here to Inverell, our rate to Newcastle would be £2 17s. 6d., and they could not take it from here to Grafton for that amount, and then there would remain the steamer freight. The whole of the wool would certainly go to Moree.

1632. What do you pay for your wool delivered in Sydney;—£4 10s. a ton? If the line were constructed it would cost me about £3 at the most.

1633. *Mr. Black.*] At what return would it pay you to grow wheat? I have put the average as high as 20 bushels. I think the average of 18 bushels given by the Government is due in a great measure to some very bad farming. I know there are a great many farmers who do not deserve any crop at all. I know of one who scratches his ground $1\frac{1}{2}$ inch deep, and he expects to get a crop, and he will very likely get it, but that sort of farming brings the average down. Many more do the same thing. I think 2s. a bushel is the outside cost of the growth of wheat in this district, taking one year with another. Anything over that is profit, and, as a rule, there ought to be some profit on 2s. Therefore we say we can deliver in Sydney for 2s., plus the railway charges, which are about 6d.

1634. What do you expect for it here? No more than it would bring in Sydney, less the cost of carriage by railway.

1635. You have reduced your estimate since 1891 of what you thought it would pay to grow wheat at? No. I think 2s. was my estimate then; but it is likely we can do it cheaper now, because a good deal has been learnt about double-furrow ploughs and reapers and binders which we did not know then.

1636. I have no doubt the cost of production has been reduced? It has been since 1891.

1637. *Mr. Roberts.*] Have you gone in largely for the cultivation of the vine? Not largely, but to a moderate extent—25 acres.

1638. Can you give us any information as to the suitability of the soil for the production of wine? We have taken prizes with our wine in London and Paris and all over the world. There is no doubt that as good wine can be produced here as in any other part of the world.

1639. Does it pay you to produce wine at the present time? I do not think it is very remunerative at present. I have sold my share in a vineyard, but up to the time I sold it we made money out of it. I believe, however, that lately it has not paid very well.

1640. If the line were constructed, do you think it would lead to large areas of land being devoted to vine cultivation? Not immediately, but it ought to give a great stimulus to it. There is no doubt of the suitability of the climate, and everything else.

1641. I suppose the construction of the line would enable you to find a market? Yes; Sydney is the ruling market with London.

Mr. William H. Fleming, land agent, Inverell, sworn, and examined:—

Mr. W. H. Fleming.
10 Oct., 1896.

1642. *Chairman.*] What is the nature of the evidence you desire to give? It is statistical.

1643. Do you represent any organisation in Inverell? Yes—the Progress Committee.

1644. Which one? The one connected with the Inverell and Moree line.

1645. Will you kindly state the nature of your statistics? I represent the acreage in holdings of freehold land, the acreage under crop, the average yield, the increased area which will be put under cultivation should the Moree-Inverell railway be constructed, and the number of sheep and cattle held by the different farmers. I put in the information as follows:—

INFORMATION from Farmers, &c., favourable to Moree-Inverell Line.

Summarised, these statistics show that the acreage on holdings, freehold, and conditional purchase is 161,496 acres 3 roods; the acreage under crop is 9,757 acres; and the increased area to be put under crop should the Moree-Inverell line be constructed will be 9,240.

1646. Did you collect these estimates? Yes.

1647. Do you vouch for the signatures? Yes. I also hand in a list of schools on or near to Moree-Inverell railway route as follows:—

Locality.	Enrolment.	Locality.	Enrolment.
Ashford	27	Ross Hill	41
Brodie's Plains	47	Round Mount	25
Fernhill	41	Staggy Creek	28
Gilgai	62	Stannifer	55
Gooniwigall	43	Tingha	136*
Graman	29	Wallangra	28

Inverell	334*	Tim Pot	21
Little Plain	30	Oakwood	28
Mount Russell	21		
Pond's Creek	24		
Rob Roy	22		
			1,129

* Convent School also.

This list shows the number of children who will be affected by the proposed line.

1648. How will it affect them? I do not say it will affect them now, but it may do so in the future. My object is to show the population along the route.

1649. But the return only shows the children of school age? Yes; between the ages of 5 and 14 years.

1650. It gives no idea as to the population? I think it will give a fair estimate. I have also a return showing the total area under lease of preferential occupation license. It is copied from a return which was presented to Parliament, and we have it also from the chief officer of the Department of Lands. I may say that I have had dozens of applications for land out west. For the last eight years I have been putting selectors upon the ground upon every available piece of land, and now they are waiting for the ground to be thrown open west. I get letters by every post asking me for information.

1651. I suppose there has been a growing demand for land in this district for years past? Yes.

1652. And, I suppose, you have had many applications for land long before the proposed railway was suggested? I do not say the applications have been made on account of the railway having been suggested. People are looking for good land, and I am trying to put them upon it, and it will be available presently.

1653. Is it a fact that the season in the Moree district during the last twelve months has not been a very good one? It has not. I have been amongst the selectors of the district, and they say it will pay them to have a good agent in Moree to whom they could always send their produce.

1654. Is it reasonable to assume that when the season is bad on the Moree side the demands upon Inverell are much greater than when the season is good? Yes.

1655. Therefore, if we take last year's return of the trade between Inverell and Moree we shall take a return which indicates a bad period at Moree? Yes.

Mr.

Mr. Conroyd Bower, miner and selector, Tingha, sworn, and examined :—

1656. *Chairman.*] I suppose you know it is proposed to construct a line from Inverell to Moree *via* Warialda? Yes; I have given evidence on two previous occasions before a Sectional Committee in favour of the Guyra route from Inverell. At the same time, I stated then that west would be the natural market for Inverell. I am still of that opinion. For thirty years I used to go with teams carrying flour and potatoes from Armidale westward. I have been as far as St. George's Bridge and to within 20 miles of Brewarrina, and it is all beautiful country.
1657. If a railway were built to Moree, would it assist this district? I believe so.
1658. In what way? The producers would then get a ready market for their produce.
1659. For the whole of it? For the greater part of it; and if not, they would have the chance of going to Sydney with it.
1660. You are aware of the distance they would have to travel? Yes.
1661. Would that make any difference? It might make a little, but it depends on the carriage. With preferential rates it would not make much difference.
1662. Do you raise much tin at Tingha now? About 700 tons a year.
1663. Which way does it go to market? At present it goes through Inverell, and then on to Glen Innes.
1664. Does it go by the railway line or by teams to the coast? All by the railway line. Mr. Litchfield is the only buyer, and he sends it to Sydney.
1665. What is the carriage per ton from Tingha to Glen Innes? 2s. 6d. per cwt., or £2 10s. a ton.
1666. I suppose Tingha gets its supplies from Inverell? No; from Glen Innes.
1667. How many people are at Tingha at the present time? I think about 800 or 900 all told.
1668. Including the Chinese? There are not many Chinese—about 200.
1669. Do you include them in your estimate of population? No.
1670. Is there much cultivation there? Not at present. The ground is locked up and you cannot select it. It is a gold-mining reserve, and until it is thrown open there will not be much cultivation.
1671. I suppose that so far as Tingha is concerned it would not make much difference to the people whether the line went from Inverell to Glen Innes or Moree? Not a great deal.
1672. I presume they will always send their stuff by the cheapest way? No doubt.
1673. Is the population decreasing? Yes; the price of tin is very low now—£28 a ton.
1674. And it has ceased to pay a number of miners and they have left the district? Yes; but some of them have come back again.

Mr.
C. Bower.
10 Oct., 1896

Mr. Alexander M'Clymont, farmer, Little Plain, sworn, and examined :—

1675. *Chairman.*] How long have you been residing at Little Plain? Twenty-one years.
1676. Are you a conditional purchaser? Yes.
1677. How much land do you hold? 2,047 acres.
1678. *Mr. Roberts.*] What do you grow upon your land? Mostly wheat and corn.
1679. What is your average yield of wheat and corn per acre? About 25 bushels of wheat per acre, and from 25 to 30 bushels of corn.
1680. For how many years has your land turned out 25 bushels of wheat per acre? Seven or eight years.
1681. Are you troubled much with rust in this district? Not much.
1682. Are you able to make your farm pay well? Not very well during the last two or three years, although I have done fairly well.
1683. What is the reason of that? The low price of grain during the last few years.
1684. Where did you sell your wheat last year? Half in Bingera and the other half in Inverell.
1685. Did you get satisfactory prices for it? Yes; but it was a very light crop last year.
1686. Do you expect to get better prices if the railway is constructed? I think so.
1687. Will the construction of the proposed line be of any benefit to you and your neighbours? Yes; most of the wheat has to be carried towards Moree, and if we had lower freights we should get a better price. The difficulty is to get a market for the whole of our grain.
1688. Where is the best market for wheat produced in the Inverell district? Moree or Bingera. Of course you cannot send wheat to Moree; you must grind it first. As a rule, I send my wheat to the mills first.
1689. Do you know the country through which the proposed line will pass? I know the Inverell portion.
1690. Does any of the proposed line go through your land? Yes; a portion of it.
1691. Would you be prepared to give any land free to the Government in order to facilitate the construction of the railway? Yes. What ground is under bush I will give free, but for land which has been cleared and cultivated I would expect some small compensation for the clearing.
1692. Are you able to say whether the proposed line goes through any cultivated land of yours? Yes; about 30 chains of cultivated land, according to the present survey.
1693. And how much goes through land which has not been improved? Over a mile, in a straight line. Altogether, it will go through $1\frac{1}{2}$ mile of my land.
1694. So that the amount of compensation you would expect would not be large? No; only for the clearing.
1695. Would the proposed line suit you better than a line from Inverell to Glen Innes? Yes; I think we should have a better market for general produce, but we will be very glad to get either line. Personally, I should prefer the Moree line.
1696. What great advantage would the Moree line be to you? I think there is likely to be a larger settlement on the Moree line. They do not grow wheat there at all, and for a good many years there has been a large demand there for horse-feed, and there is no chance of that in Glen Innes, as there is better horse-feed and produce in Glen Innes.
1697. Do you look upon the west as your natural market? Yes.
1698. If the proposed line went through your property I suppose you would not have to carry your produce for any distance? That would be a benefit, but I am looking at the matter independently of that benefit, and in the general interests of the country. Even if I had to carry my produce to Inverell it would be the most suitable line so far as I am concerned.
1699. For how many miles does it suit a farmer to bring his produce to a railway? About 12 miles, so that you can go there and back in one day.

Mr. A.
M'Clymont
10 Oct., 1896.

- Mr. A. M'Clymont.
10 Oct., 1896.
1700. Do you look upon 12 miles as the maximum distance? Yes.
1701. Do you think, if the proposed line were constructed, that a larger area of land would be put under cultivation? I think so. I am prepared to say that a good deal more would be put under cultivation in our district.
1702. Do you think the progress of the Inverell district is at present retarded owing to the want of railway communication? Yes; very much so.
1703. Do you think the population would increase, larger settlement take place, and cultivation extend if there were railway communication from Inverell to Moree? I do.
1704. Has this district been progressing during the last few years, or has it been going back? I think it has been going back for the last three or four years.
1705. For what reason? Because of dull markets and the inability of the farmer to find a market for his produce. If we had a railway I and most of the people in the district would extend their cultivation.

Mr. Grosvenor Francis Lewin, orchardist and farmer, near Inverell, sworn, and examined:—

- Mr. G. F. Lewin.
10 Oct., 1896.
1706. *Chairman.*] Where is your residence? Six miles west of Inverell on the Warialda road.
1707. Have you resided there for any length of time? Yes, for twenty-three years.
1708. *Mr. Clarke.*] Do you think the construction of the proposed line would be of benefit to yourself and the farmers generally? Yes.
1709. Do you approve of the proposed line more than the one formerly proposed from Inverell to Glen Innes? Yes.
1710. On what ground? What I have not disposed of locally I have always sold in the west—at Bingera, Warialda, and Moree. I have not sold anything to the east of Inverell.
1711. What area of ground do you occupy? I have 990 acres, held principally under conditional purchase.
1712. What area have you under cultivation? Seventy acres of wheat, 30 acres of hay, 75 acres of orchard, and 3 acres of vines.
1713. Where is your principal market? In Inverell and west. I sold my wheat this year to Burns, of Bingera; he bought it at the door.
1714. Is Bingera a better market than Inverell? It has been this year.
1715. I suppose there is not much wheat grown at Bingera? Not much.
1716. Still there are two mills there? Yes.
1717. Would the construction of the proposed line induce you to cultivate more land than you cultivate at present? It would.
1718. Do you think the line ought to be constructed in the public interest? Yes, I think the western line would be better for the general public.
1719. Would you object to the construction of a line from Inverell to Moree first and then to Glen Innes? No, there is no doubt we could sell some wheat about Glen Innes. There will, I think, be a great sale of fruit out west.
1720. I suppose you can always find a market in Moree for fruit and everything else you can grow? Yes, I have always sold my chaff and corn in the west.
1721. *Chairman.*] I believe you gave evidence before a Sectional Committee in connection with the Glen Innes railway proposal? Yes.
1722. Were you in favour of that line? At that time I was.
1723. And now you are in favour of the Moree line? Yes.
1724. As far as your business is concerned—fruit producing—I suppose either the eastern, the northern, or the western market would suit you? The western market would suit me best. We grow fruit here, east, that will not grow in the west. Formerly we had no idea of the railway going from Narrabri to Moree.
1725. Supposing you had a choice of one of the two lines at the present time, which would you prefer? The Moree line.
1726. Because you think it will afford you the best market for your fruit? Yes.
1727. You are aware that the conditions at Moree have changed considerably compared with what they were two years ago? Yes.
1728. Do you not think that the extension of the railway to Moree will bring about great competition? I think we ought to be able to compete at 95 and 100 miles against fruit brought many hundreds of miles.
1729. I suppose the demand for wheat always rests upon the demand from other districts? Yes.
1730. And what may be a good market one year may not be a good market another year? No.
1731. Therefore we cannot accept it as a fact that the Bingera market is on the whole better than the Glen Innes market? No.
1732. *Mr. Black.*] Do you know anything of other parts of Australia? I know Moree.
1733. Do you know any fruit-growing district? I know Parramatta.
1734. Do you know any part of Australia better adapted for the growth of fruits than this? No; I have never seen fruits which are suited to the climate grow better than they do here.
1735. Can you grow currants here? No; the climate is too warm, but we can grow cherries, plums, apricots, peaches, persimmons, apples, pears, grapes, lemons, limes, citrons, &c.
1736. Have you ever considered the advisability of preserving the fruit? Yes; I planted a few trees, some time ago, to start with. Up to the present, however, I have always sold my fruit at satisfactory prices.
1737. If you had railway communication do you think you could find a market for preserved and dried fruits? I am not aware what trade would be done with other parts as I have not studied the matter. I believe, however, if we had railway communication there would be a good deal of that kind of trade. Several men have started in a small way and they have very good dried fruits.
1738. Have you ever sent any fruit to Newcastle or Sydney? No; under present conditions it would not pay.
1739. If you had railway communication do you think you could compete in the metropolitan market with the county of Cumberland? We might.
1740. I suppose the only way in which you would be able to compete with the metropolitan market would be by reason of the superiority of your fruit? Yes; I think we could sell apricots or pears in the metropolitan markets at a remunerative price.

Mr.

Mr. Robert Bevan Jones, farmer, King's Plain, sworn, and examined :—

1741. *Mr. O'Connor.*] Where is King's Plain? Half way between Inverell and Glen Innes.
 1742. Are you acquainted with the nature of the proposal under consideration? Yes.
 1743. How long have you resided in the district? Since 1857, with the exception of ten years on the Richmond River.
 1744. Do you know the country between Glen Innes and Inverell? Yes, to King's Plain and Wellin-grove especially.
 1745. Do you know the country between Inverell and Moree? Fairly well.
 1746. Are you in favour of a line of railway between Inverell and Moree? I have been in favour of it for thirty years.
 1747. Do you prefer that route to Glen Innes? I have always opposed the Glen Innes route.
 1748. I suppose you have heard that for agricultural purposes the land between Inverell and Moree is very superior? It is.
 1749. Do you believe that if railway communication were afforded the land now lying idle would be cultivated? I believe if we had communication between Inverell and Moree the district would ultimately be as great a wheat-producing district as the Berrigan-Jerilderie district, and the Riverina district.
 1750. What is the average yield in Inverell? When I was farming I had from 25 to 30 bushels per acre in a fair season, and in a dry season I have seen 30 and 35 bushels to the acre.
 1751. What is the rainfall? I do not know the exact amount; but wheat does not require much rain so long as we get it at the proper time. If you can get the land properly cultivated, the seed put in, and two or three good falls of rain after the winter, it is all right. The ground is so rich that if there were much rain the wheat would fall, and there would be rust.
 1752. Then you are prepared to say that the rainfall here is adequate for the growth of wheat? Quite as a rule.
 1753. And you are not aware that it has suffered from too little or too much rain? Last year, of course, was a terrible year for drought.
 1754. I suppose if the proposed railway is constructed it will give you a great market? I believe that this district will ultimately be a wheat-exporting district, and that the port of Sydney affords the best outlet for us. I may mention that Mr. Howard was asked if he could tell what quantity of loading came from South Grafton to Inverell. I think the quantity which came to Inverell last year was 432 or 433 tons of general merchandise, and the amount of tonnage of produce received at South Grafton from Inverell was 260 tons.

Mr.
R. B. Jones.
10 Oct., 1896.

Mr. Denis Joseph Lowe, farmer and grazier, Gragin, sworn, and examined :—

1755. *Chairman.*] Where is your residence? About 40 miles north-west from Inverell, and 20 miles north-east from Warialda.
 1756. How long have you been in the district? Thirty-five years.
 1757. *Mr. Black.*] What is your yield of wheat in good seasons? The last year I grew wheat I had 40 bushels returned to the machine, clear of all losses.
 1758. What was your total yield? I had 20 acres that year, and it averaged 40 bushels to the acre. Altogether, I had 800 bushels.
 1759. Had you any other kinds of products? I grew a considerable amount of lucerne upon which I fed stock.
 1760. Was that for local consumption? Yes. I had to knock off growing wheat as I was 40 miles from a market, and had no means of getting to it.
 1761. Are you growing wheat now? I am, and I would grow largely if I had a railway to carry it.
 1762. Would you expect to find a market in Moree? I should expect to find a large market there.
 1763. What price would it pay you to receive for your wheat landed at the railway station? I should consider I had a splendid price at 3s.
 1764. If the railway were constructed to Moree, would you increase your wheat-bearing area? Decidedly so.
 1765. To what extent? To 1,000 acres.
 1766. What would be your nearest railway station? I think there is likely to be a platform 6 miles south of the Gragin station.
 1767. If you could not get 3s. a bushel for your wheat would you grow it? Yes; I could produce it at 2s. 6d., and deliver it at the railway station at the point I speak of.
 1768. Do you think you could then compete with the agriculturists of Riverina who have many thousands of acres under crop, and who say they will be satisfied with 2s. a bushel? I could produce it at 2s. 6d. quite well.
 1769. Could you produce it below that price? I suppose I should have to do so if it came to that.
 1770. Do you know anything about the consuming capabilities of the Moree people? No. I hear that one storekeeper has taken 500 tons of corn this season from the Inverell district, and I know that many drays of chaff and corn have also gone down.
 1771. You have stated you had 1,000 acres under crop. Presuming that also produced 40 bushels to the acre, you would get 40,000 bushels? Yes; but I would not get that every year.
 1772. Reducing it by 25 per cent., you would get 30,000 bushels; are you aware that that would just about supply the people of the Moree district? It would not do so by a long way.
 1773. How do you know? I know by the flour that goes from here.
 1774. But we are not speaking about sending flour, but wheat? When we speak of wheat we mean wheat after it has been ground.
 1775. Do you base your calculations upon the consumption of last year? I could not go upon that very well. If there were a railway to Moree there would be a large population on the soil which would increase the consumption.
 1776. Do you not know that their consumption last year was increased from the fact that there was a railway being made there, and also because there was a drought? The extra consumption would only be because of the construction of the railway, because the Moree people are not producers. They are consumers.
 1777. You know that in good seasons the people there do not buy so much chaff as they do in bad seasons? They are for ever buying chaff and corn. Even the squatters buy it.
 1778. We have it in evidence from the people of Moree that in good seasons they do not buy feed unless it is for stabled horses? I know that a lot goes down, and someone must purchase it.

Mr.
D. J. Lowe.
10 Oct., 1896.

- Mr. D. J. Lowe.
10 Oct., 1896.
1779. But the question is—Is there enough going down to pay for the construction of a railway, and make a return to the State? I think there would be. We have a great deal going out westward and north.
1780. Could you keep a railway going with supplies which would keep the town and district of 2,000 or 3,000 inhabitants? If there were a railway the inhabitants would multiply very rapidly. Where we have not a soul now we would have hundreds of people.
1781. How is it that some of the towns through which railways have gone have not increased but have decreased? Possibly that is so. That may be because there are too many railways.
1782. Have you any other evidence to offer? I could get my wool down to Newcastle by the proposed railway 28s. a ton cheaper. At present I have to send it to Glen Innes, and then by rail to Newcastle, where it is dumped and sent to England.
1783. Then, if the line is constructed to Inverell, and you send it from Inverell to Moree, you would simply be robbing Peter to pay Paul, as far as the revenue of the country is concerned? I do not know that it would stop me sending it to Grafton.
1784. You send it to Glen Innes and thence to Grafton? Not at present; but I intend to do so as the railway is rather dear.
1785. Am I to understand that you have not sent your wool to Grafton yet, but that you have some intentions of that character? Exactly.
1786. What can you get your wool carried to Grafton for? About £4 to £4 5s. from Inverell.
1787. Is not that rather an over-estimate? I do not think so; but I am not quite sure what they were carrying for last year. I think it was about that.
1788. What would you expect to get it carried over the railway lines for—that is, if there were a line to Moree? About £3 10s. to Newcastle or a little less. I do not know what they would charge, but I know what they charge from Glen Innes.
1789. What is the charge from there? £4 2s. 6d. per ton.
1790. And what do you pay for road carriage? £3 per ton.
1791. That is, £7 2s. 6d. to Newcastle *via* Glen Innes? Yes.
1792. I think that you said the carriage to Grafton was £4 10s.? I think it is about that.
1793. What is the steamer rate? I believe it is 2s. 6d. a bale, but I am not quite certain.
1794. That would be about 12s. 6d. a ton? I think so.
1795. That makes £5 2s. 6d. According to that you would save £2 per ton in the carriage of wool by sending it *via* Grafton to Sydney, over sending it to Newcastle *via* Glen Innes? That is about the saving.
1796. If the Railway Commissioners carried it for you at £5 2s. 6d. per ton, or any sum approximating to that *via* Moree, you would send your wool in that direction? Yes; but it would not cost £5 per ton by the train. I should think it would only cost £3 10s.

Mr. Joseph Taafe, farmer, Little Plain, sworn, and examined:—

- Mr. J. Taafe.
10 Oct., 1896.
1797. *Chairman.*] Where is Little Plain? Twelve miles west from Inverell.
1798. You have heard the various witnesses give their evidence; on what particular point do you wish to enlighten the Committee? The only line which will save Inverell from going back to the position of a sheep-walk is the line from Moree to Inverell.
1799. Will you give your reasons for saying that? It is the wish of a large majority of the people of the district that the line should be constructed. At the meetings which have been held here we have always had a large majority in favour of the amendment for the construction of the Moree line,—that is, when the meetings were got up in favour of the Glen Innes line.
1800. When were those meetings held? Within the last twelve months three meetings have been held.
1801. How many people attended them? At the last meeting, which was the most representative, there were 300 people present.
1802. How many male adults are there in the district? I could not tell you; but at that meeting there were very few juveniles present.
1803. What do you do with your produce? Most of it goes west.
1804. In what form? I sell the wheat to the local millers, and it goes west.
1805. What about your hay? That chiefly goes west.
1806. Do you carry it? No, I sell it in town, and I know it goes west.
1807. What about your maize? It also goes west.
1808. Would the construction of the proposed line enable you to get your produce to Moree cheaper than you do at present? Yes.
1809. Are you prepared to swear that Moree, and the western portion of Moree, will absorb the whole of the surplus products of the Inverell district? No; but the surplus produce we can take to Sydney, and get the whole of the western supplies back from Sydney.
1810. And do you expect to send it round by way of Moree? Yes; in the event of the line being constructed. As soon as the first sod of the line is turned, sharp axes and forest levels will be brought to bear, and a large area of land will be brought under cultivation.
1811. Are you voicing the people of Little Plain? The farming community there hold the same opinion as I do.
1812. If you had a choice of lines—one from Inverell to Moree, and one from Inverell to Glen Innes,—which would you prefer? The one from Moree.
1813. Were you ever in favour of the eastern extension? Yes.
1814. Will the Committee be right in assuming that the people of Inverell have been so long disappointed over railway connection, that they are at present prepared to advocate a railway to any existing connection? The matter has been staved off so long that it is probable that some people would even advocate the construction of a line to the moon.
1815. I suppose you would bring your supplies from Sydney by the cheapest way? Yes.
1816. If you could get them back by way of Glen Innes £2 a ton cheaper than by way of Moree, which way would you bring them? No doubt by the cheapest way; and I believe that is from Sydney, *via* Narrabri, through Moree, and on to Inverell.

Mr.

MINUTES OF EVIDENCE—RAILWAY FROM MOREE TO INVERELL.

Mr. John Moore, farmer, Rob Roy, Bannockburn, sworn, and examined:—

1817. *Mr. Roberts.*] How many acres have you under cultivation? A little over 300 acres.
 1818. How much land do you own altogether—what do you grow principally? Wheat, corn, and hay.
 1819. What is your average yield of wheat per acre? For five years I have produced the following:—

Mr. J. Moore.
 10 Oct., 1896.

	Wheat.	Corn.	Hay.	Lucerne.
1891... ..	440 bags.	600 bags.	10 tons.	20 tons.
1892	500 "	400 "	30 "	20 "
1893.....	654 "	300 "	20 "	15 "
1894... ..	700 "	200 "	40 "	40 "
1895.....	390 "	110 "	100 "	40 "

I have now another crop of corn. The 1896 crop which I have just pulled from 110 acres, I estimate at 1,000 bags, but it has not been threshed. The total wheat for five years is, 4,680 bags; the total corn for six years is, 2,710 bags; the total hay for five years is 345 tons. The chaff sent to Moree in 1896—that is since the 1st January of this year—is 40 tons.

1820. Where did you sell that produce? In different markets. The year before last I sold a good bit of wheat at Glen Innes. It is the only thing I ever sold there, and I have been here for twenty-eight years.
 1821. Did you ever try on any other occasion to sell at Glen Innes? No, we know it is of no use.
 1822. But on the occasion of which you speak you got a higher price than anywhere else? Yes, Mr. Utz bought it.
 1823. Where do you generally look for a market? In Inverell; we sell to the millers.
 1824. And with that exception you have always sold to the millers of Inverell? Yes.
 1825. Have you always got a satisfactory price? No; sometimes we can scarcely sell at all.
 1826. Do you think if the proposed line be constructed you will find a better market for your produce? I am sure we shall.
 1827. Where would you look for it? To the west.
 1828. Do you think a large area of land would in the near future be put under cultivation? Yes; I could put 200 acres more under cultivation quite easily.
 1829. Is the reason you have so small a quantity under cultivation at present due to the difficulty you experienced in getting a paying price of what you produced? Yes, and now that the ports are thrown open we have no occasion to put any more in. We do not expect to go in for the farming industry now. We shall have to go in for sheep.
 1830. Do you favour the construction of the proposed line? I do.
 1831. Does the surveyed line of railway go through your property? No, but it goes close to it.
 1832. Do you think the people through whose land the line will go, would be likely to give the land to the Government? Some would; but it would not be fair to expect others to do so. With regard to my brother, I may state that the proposed line passes through his square paddock. It goes in at one corner and out at the other. It cuts the square cultivated paddock into two three-cornered pieces.
 1833. Is your property to the west of Inverell? Yes, on the Reedy Creek road.
 1834. You think you would always find a market for the whole of the products of your farm if the proposed line were constructed? Even if we did not, the line would be a great help.
 1835. If you knew the railway was to be constructed would you at once put in more seed? Yes, I would do it if I saw a chance.
 1836. Would you increase your area of cultivation? Yes; by 200 acres, and perhaps more.
 1837. *Mr. Black.*] In spite of the ports being open? No; I expect to see the ports closed again.
 1838. Can you tell me whether any of the wheat of this district finds a market in Queensland? I do not think it does.
 1839. If a line were made to Glen Innes would there be a market in Queensland? I am not sure. Some produce of course, goes to Goondiwindi, which is in Queensland.
 1840. I mean to the Darling Downs? I do not know anything of that part.

Mr. James Bryden, farmer, Nullamunna, Bannockburn, sworn, and examined:—

1841. *Chairman.*] Where is your residence? Fifteen miles on the north side of Inverell.
 1842. How long have you resided in the district? Thirteen years.
 1843. *Mr. Black.*] How much land have you? I have between 3,000 and 4,000 acres.
 1844. How much of that do you farm? 200 acres. I have only 70 acres in this year.
 1845. How many sheep do you farm? About 4,000.
 1846. At what price per bushel does it pay you to produce wheat? It depends on the crop.
 1847. I mean with a normal crop. At what price would it pay you to produce it? 2s. 6d. a bushel.
 1848. Do you mean by that the net return to you? Yes, in a good average season.
 1849. Do you think the construction of the proposed railway would be of benefit to you personally? Certainly, the carriage is killing us altogether.
 1850. Would it induce you to increase your area under crop? Yes, I should cultivate 600 acres of good agricultural land.
 1851. Where would you expect to find a market? To the west. Moree is the only place to which our flour and chaff go now. We rarely go to the south.
 1852. Do you agree with the other witnesses? Yes in general.

Mr. J. Bryden.
 10 Oct., 1896.

Mr. James Richard Hatcher, farmer, Byron, sworn, and examined:—

1853. *Chairman.*] Where is Byron? Nearly 12 miles due west from here.
 1854. Is your residence near the proposed railway line? It is about 3 miles away.
 1855. *Mr. Clarke.*] What area of land have you under cultivation? About 70 acres of wheat. We are getting some ground ready for growing corn. Of corn, my son grew 75 bushels to the acre last year.
 1856. Do you grow any other description of produce? Yes, I have 3 acres of potatoes in.

Mr. J. R. Hatcher.
 10 Oct., 1896.

- Mr. J. R. Hatcher. 1857. Where do you sell your produce? I have always sold mine in Inverell. I have not been a large grower.
- 10 Oct., 1896. 1858. Is it chiefly consumed in the district? I believe a lot of it goes westward.
1859. Is more grown at present than is required for local consumption? I do not think the locality could consume what is grown here.
1860. Where does the surplus go? Hundreds of tons of potatoes, corn, hay, and chaff have gone westward this year, to my knowledge.
1861. Does any go to Bingera? I have not sent any there. I believe that two or three years ago some wheat was sent to Glen Innes, but I have not heard of any going since. All the New England potatoes come this way to go westward.
1862. What is considered to be the average yield of wheat in the district, taking the good with the bad seasons? Twenty-five bushels. At the same time I could point to those who have grown 50 bushels to the acre.
1863. Has the yield decreased of late years? In many instances it has, on account, I believe, of the men being dilatory, and careless, because of their having no outlet for their crop. If we had a railway to Moree, and the smaller men combined together and hired trucks, they could keep a man at Moree to dispose of their produce there.
1864. What is the average rainfall? From 30 to 32 inches. Last year in some places, we only got 12 inches, whereas in February last, in some places, we had 13 inches in twelve days.
1865. Is there any dairying in the district? Yes, but it is not carried on extensively.
1866. Would it be possible to make dairying pay? I do not see why it should not. Years ago people used to milk cows and make a good thing out of it.
1867. In the event of over-production, where could you find a market? Moree, and the stations around. If the special areas are thrown open men will take them up and cultivate them, whereas now they are sheep-walks.
1868. Supposing the production grows to such an extent that you cannot find a market in Inverell and Moree, where will it be taken? We should have to take it to Newcastle and Sydney, so long as the Commissioners allowed us rates which would enable us to compete in those markets.
1869. Would it be a good thing for the farmers to have an interchange of produce with the people on the east coast? Certainly, but I do not think my children will ever live to see that.

Mr. Charles McDonnell Stuart, Supervising Engineer, Railway Construction Branch, Department of Public Works, sworn, and examined:—

- Mr. C. McD. Stuart. 1870. *Chairman.*] Have you personally examined the greater portion of the surveyed line between Inverell and Moree in company with the Sectional Committee? Yes.
- 10 Oct., 1896. 1871. Are you prepared to say if there are any points upon the surveyed line which can be altered and where deviations may be made with advantage? I do not think so.
1872. Do you notice from the map that the surveyed line passes through two of Mr. McClymont's properties at Little Plain. It enters into one, passes into another, and returns into the first one? Yes.
1873. Could a survey of that character be so altered as to lessen the severance? If it did not materially increase the expense it could be done, but not otherwise.
1874. What was the object of making that sharp turning in the survey? In order to get a lighter earthwork.
1875. Is the country from Moree to Slaughterhouse Creek fairly level? Yes.
1876. Is it from Slaughterhouse Creek towards Inverell that the rise takes place? Yes; it is all undulating broken country.
1877. And that is where the circuitous nature of the line comes in? Yes; that is occasioned by the broken nature of the country, and in order to maintain an easy grade and a surface line as nearly as possible.
1878. That is the reason the line has been lengthened? Yes.
1879. Supposing it were necessary to obtain a shorter line? You would increase the earthworks and the cost.
1880. Would you increase the grades? Not necessarily.
1881. Do you know the proposed site of the bridge across the Gwydir River? Approximately, it is a little east of Ezzy's crossing.
1882. Have you any reason to hold contrary opinions to your chief in the matter of the crossing of the bridge across there? No.
1883. Do you think the amount provided for will be sufficient to construct the bridge? I think so.
1884. That is, between £3,000 and £5,000? Yes.
1885. Will it not drain a large watershed? It will; but I do not think it will be any larger than the Namoi River at Narrabri, which has about the same sized bridge constructed with a timber superstructure.
1886. Do we understand that you provide steel cylinder piers and a wooden superstructure for the Gwydir River? I cannot exactly say what was provided for with regard to the Gwydir, but the Namoi bridge has wooden piers.
1887. Is it to be a timber bridge throughout, or a steel bridge with a timber superstructure? I shall have to get that information at the office. If there is any steel it will only be the cylinders.
1888. Have you seen the bridge across the Macintyre at Inverell? Yes.
1889. Will it be as large as that? It will be about the same size.
1890. Do you know the cost of that bridge? No.
1891. I am informed that it cost nearly £10,000? If that is the case, and the other has been estimated at £5,000, I have no doubt the piers will be of timber.
1892. Do you think a timber bridge will be suitable for that particular place? I think so.
1893. With reference to your alternate survey at Warialda—what was the extra cost provided for bringing the line closer to Warialda than is provided for in the permanent survey? I do not know exactly.
1894. Did you explore the country about Warialda? I explored the line through Warialda at the same time as I explored the whole of the line.
1895. Did you go through Little Plain on your tour? Yes.

1896. Would it not be possible to bring that line closer to the travelling-stock reserve? You would have a great difficulty in getting down to Inverell. We keep out from Little Plain in order to get as low a crossing of the high ground as possible, so as to work down in the shorter distance.
1897. Then, if there is to be any improvement in the line, it must be at the cost of increasing the construction? It will mean increased cost.
1898. The easiest grade which you can find has been obtained? Yes.
1899. I presume your instructions were to find a good grade? Yes.
1900. With the object of carrying heavy loads? Yes, certainly.

Mr. C. McD.
Stuart.
10 Oct., 1896.

Mr. Thomas Jenkin, farmer, Inverell, sworn, and examined:—

1901. *Chairman.*] Are you an old resident of Inverell? I have resided here for twenty-four years.
1902. *Mr. O'Connor.*] What area of land have you? 220 acres of freehold.
1903. What do you produce? Wheat, corn, hay, butter, fruit, and bacon.
1904. Have you any evidence to offer? I am in favour of the Moree-Inverell line.
1905. For what reasons? First, because it is an inexpensive line to construct, and it will run through splendid country, and it will benefit considerably the farming community. Moree, and the stations around, is our chief market. We find a ready market for our surplus flour, hay, corn, and fruit in that district.
1906. Have you ever considered the alternative route between here and Glen Innes? Yes; there is no prospect of getting a market at Glen Innes, to any extent, for our produce.
1907. You would not have the same market as you would have with Moree? No.
1908. Is it your opinion that a market in Moree would be more advantageous? Yes; I have proved it since I have been in the district. I have only once sent my wheat to Glen Innes.
1909. Where do you generally send your wheat? I have sent the team in a westerly direction for several years. On some occasions I sell my wheat in Inverell. Of course I do not know where it goes to after I sell it, but I think it chiefly goes to Moree. I am convinced we send about two-thirds of our flour in a westerly and north-westerly direction.
1910. I believe a great many farmers sell their wheat in Inverell? Yes; and the millers send it to Moree. I have never heard of any being sent to Grafton.
1911. Do you share the general opinion that if there were a line of railway between Inverell and Moree it would open up a rich country? I look upon it in this way: Moree is a progressive town; she has had no mining to assist her, and has merely lived as it were upon the surface, instead of under the surface; nevertheless it is a prosperous town—perhaps larger than Inverell. It is a large pastoral country, and I have no doubt a large amount of agricultural land could be brought under cultivation—that is, between Inverell and Moree.
1912. I suppose the construction of the proposed line would make the farmers more independent? Yes; there is a system of barter in this town. It is a market of exchange.
1913. I suppose you share the general opinion that a large population would be affected? Yes; a large population is settled around Moree at present.
1914. I suppose you know that a large quantity of land will be thrown open for selection in the course of a few years;—do you think the whole of that which is available for agriculture will be absorbed? Yes. I have no doubt there will be an increase in cultivation. Everyone, perhaps, will increase their cultivation.
1915. If you had a new outlet for your produce, would you immediately take advantage of it? Yes. There is one thing I should like to mention in reference to the survey of the line. At Mr. Weston's the line runs in a northerly direction. If it were carried in a southerly direction, and the terminus were brought to Ross' Hill, there would be a saving of £20,000 or £30,000.
1916. In what way? It would save 2 or 3 miles in distance; it would be an easy grade; and it would also save an expensive bridge over the Macintyre.
1917. But it is not proposed to go over the Macintyre? They must do so some day if they extend the line to Tenterfield or to Glen Innes. It will make a longer line, but it will be a very easy grade.

Mr.
T. Jenkin.
10 Oct., 1896.

Mr. Peter Balls Eddy, farmer and grazier, Eddy Park, Inverell, sworn, and examined:—

1918. *Chairman.*] Where is your residence? About 10 miles south-west of Inverell.
1919. How do you get to your property? By way of Gum Flat.
1920. How far are you from the main Warialda Road? About a mile.
1921. I understand you have a large holding? I have 6,260 acres. It consists of conditional purchase land and part freehold.
1922. I believe you are President of the Progress Committee at Little Plain? No; I am Chairman of the Moree Railway Extension League.
1923. I understand you have some returns which you would like to lay before the Committee? I wish to point out that in the four years from 1892 to 1896 I have produced the following:—flour, 320 tons; pollard, 48 tons; bran, 96 tons; total, 464 tons. That has passed through the mill, and with the exception of 10 tons, and a small quantity bought at Bingera, is my own produce. In 1896 I produced 12 tons 15 cwt. of potatoes. In the same year I produced 40 tons of hay and 130 tons of maize. All this was grown on my farm.
1924. Have you disposed of this? No, but I have disposed of part of it.
1925. Have you been farming for some years? Yes.
1926. How have you disposed of your produce? By getting my wheat ground into flour and by taking it west, principally to Moree, Goondiwindi, Boggabilla and Mungindi.
1927. Have you taken it to any place on the Inverell side of Moree? A little, but not much.
1928. Can you give us any idea of the amount you sent to the western country? I sent the whole of what I had produced, with the exception of what I require for my own consumption.
1929. How much would you take out of the 462 tons? Ten tons—that leaves 452 tons. In travelling in the western country I can see loaded waggons and drays coming into Moree from all directions. It is impossible for any man to estimate the consumption of the Moree district.

Mr.
P. B. Eddy.
10 Oct., 1896.

- Mr. P. B. Eddy.
10 Oct., 1896.
1930. If you defy any man to estimate the consumption of that part of the country, how can you say there is going to be a large market for you? I can only judge by the number of teams I saw with loading in that district.
1931. Can you give us an idea of the general traffic there? I cannot; it is impossible. We could supply Collarendabri, Walgett, and Bourke.
1932. I suppose you are aware it is very rarely that the river allows the steamers to trade between Walgett and Bourke? In some seasons it might do so.
1933. Do you know there has been a period, as long as three years, when they could not trade? Then that would not prevent us having the Narrabri market. There is no doubt, however, we can get the Narrabri market and the Walgett market in addition to the Moree, Mungindi, Collarendabri and Collymongle markets. Then we go up to Kunopia. I do not say the traffic would go to Goondiwindi if the line were built. It would go by teams unless in the wool season. No doubt in the wool season flour would be taken back very cheaply as return loading.
1934. You think it will offer a market at any rate for a great portion of your produce? For the whole of it for some time.
1935. If you contemplate having a market there for 5,000 or 6,000 tons you may be disappointed? I do not think so in view of the increased settlement which is likely to take place.
1936. It is estimated there will be 1,500,000 acres thrown open within the Moree land district in the course of a few years. Are you aware that the settlers must have a large area to live upon and are you aware that 3,000 acres is considered small enough? Yes.
1937. If you divide 1,500,000 acres by 3,000 you will not put more than 500 additional heads of families on the land, and, therefore, where is the enormous settlement to come from? But there is land to be settled upon between here and Moree.
1938. But there would be other producers closer to it than you might be? There might be.
1939. With regard to the question of the western absorption;—with these facts before you, would you attach the value to the western country as an absorbent which you appear to have done? I think there would be a large consumption there, and the surplus no doubt would go somewhere else.
1940. Then you are of opinion that the western country will offer a partial market to you? A good market.
1941. What market do you expect to reach with the balance? Newcastle.
1942. Do you think you will be able to send it that distance and compete with the farmers whom you will meet lower down the line? I do not see anything to stop us.
1943. Are you aware that with the line which is in existence from the north to Glen Innes, 420 miles from Sydney, and Tenterfield 420 miles, it is almost an impossibility for the farmers to send their produce to Sydney? I am not astonished at that, as the produce has to be hauled over Ben Lomond.
1944. Do you know that the grade on Ben Lomond is 1 in 40. Are you aware that it is not the grade on Ben Lomond which will stop the traffic to Sydney, but the grade on the Hawkesbury River of 1 in 40. If your traffic has to be hauled towards Sydney it will have to negotiate the stiff grade of 1 in 40 at the Hawkesbury River? In that case why not let the produce stop at Newcastle, and ship it from there.
1945. As a matter of business, would it not be cheaper for you to send your produce from here to Glen Innes and thence to Newcastle, that being shorter by several miles than the line proposed to be constructed? I think not.
1946. Do you think it would be cheaper to go by the longer route? Yes: the Commissioners have lowered the rate so much that they have enabled the farmers to reach Newcastle, or Sydney, or any place of consumption.
1947. Have you had a difficulty in any year, in disposing of your crops? No.
1948. You are aware that the opening of the line to Moree is likely to make a considerable difference in the supply of that district with every kind of produce? I think so.
1949. You are aware that the road from Narrabri to Moree used to be very bad and at times almost impassable? Yes.
1950. And they have a certain road in the railway now? Yes.
1951. Are you not more afraid of losing the trade you already have with the Moree district than of anticipating an increased trade in the future? I am afraid we are going to lose the trade we have, and that we should not be able to put down any more crops. I employ a good number of men, and if we are refused this railway I should at the earliest possible moment put my land under artificial grass and discharge my men.
1952. You necessarily use a good many supplies in the course of a year? Yes.
1953. Including farming implements? Yes.
1954. And stores which you would get with the railway? Yes.
1955. If you got them *via* Glen Innes £2 a ton cheaper than by the railway at the door, what then? I am prepared to take them by the cheapest way of course.
1956. If it should be discovered that there is a discrepancy of freight of that character there would be a probability of most of the return goods coming the other way on account of the cheapness? I think not. I have reason to think the Commissioners will make the rates so that we can land goods from Sydney here as cheaply as from Sydney to Glen Innes.
1957. You are aware that there is an estimated loss of £2,500 on the proposed line? Yes.
1958. That loss has been calculated upon the existing rates per mile. Consequently if differential rates were established, the earning power of the line must be reduced, although the convenience to the producers would be great? Yes.
1959. Supposing you were to get your stuff under the cheapest scale, namely the truck rate; if it would cost under the truck system—that is the 6-ton system—£8 7s. per ton to land general goods here, do you think you would be likely to use the railway? It would depend on what the goods were. If I could get them cheaper any other way I would use the other way.
1960. As a matter of fact, do you or do you not know you can get goods cheaper the other way at the present time? If the Commissioners say they will carry them to Inverell as cheaply as they would to Glen Innes we would get them this way, because it would save us the extra baulage.
1961. Supposing you find you can land your goods here at £5 a ton by the team, and it will cost you £7 a ton by the train, which would you use? I would use the carriers. Of course we must travel the cheapest

cheapest way. I hear there is an agitation for a railway from Inverell to Glen Innes, and from Glen Innes to the coast. I hold that Glen Innes has already got more than it is entitled to. A petition in favour of the line from Inverell to Moree was presented to Parliament by the Member for the district a short time ago. It contained 1,100 signatures.

Mr
P. B. Eddy.
10 Oct., 1896.

1962. I suppose you have found, in the course of your business relations with the western country, that in bad seasons there is greater demand for forage? Yes, and flour.

1963. I presume the last twelve months would be considered a bad season for Moree, but a good one for the suppliers? Yes, for fodder.

1964. Supposing they had a good season in that district, would not the demand fall off considerably? It would for corn and chaff.

1965. But there would be about the same demand for flour? Yes.

1966. I suppose that has really been the history of the business between the two places? Yes, I think so.

1967. *Mr. Black.*] In 1891, in giving evidence before a Sectional Committee, you expressed your belief that the trade between Inverell and the west would be limited except in time of drought;—what has caused you to change your opinion? That is for fodder.

1968. Then you hold the same opinion with regard to fodder? Yes; it is limited at times, except during drought.

1969. You do not agree with one or two witnesses who thought you would have always a large market there for fodder? Every man has an opinion of his own.

1970. And you do not agree with them? On some points I do, on others I do not.

1971. If you agree with them you have changed your opinion since 1891, and you have already said you have not changed it? I have already told the Chairman that there is a limited market there in good seasons.

1972. At that time you favoured the Glen Innes railway? I did.

1973. Now you think it would be an injustice to Inverell to give Glen Innes two railways, and Inverell only one? You will understand that we had no railway from Narrabri to Moree then, neither was the Central Division thrown open for settlement. Circumstances have altered cases.

MONDAY, 12 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Inverell, at 10 a.m.]

Present:—

CHARLES ALFRED JEE, Esq., CHAIRMAN.

The Hon. CHARLES JAMES ROBERTS, C.M.G.

HENRY CLARKE, Esq.

The Hon. DANIEL O'CONNOR.

GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Moree to Inverell.

Mr. John Sinclair, stock and station agent, Inverell, sworn, and examined.—

1974. *Chairman.*] How many years have you been residing in this district? Twenty-five years.

1975. Are you well acquainted with the various agitations in this district for railway connection? Yes.

Mr.
J. Sinclair.

1976. Are you conversant with all the routes which have been proposed? Yes.

1977. Have you a personal knowledge of the one at present under consideration? Yes.

12 Oct., 1896.

1978. *Mr. Black.*] If you prefer to make a detailed statement before being examined, you might assist the labours of the Committee? I should like to say I have always been opposed to any connection west of this place. I have been a consistent advocate for the nearest possible connection, which is by way of Glen Innes. First of all, it connects us with a splendid geographical centre, with a town with a similar population to our own, about 9,000, with which we have a considerable interchange of produce. Glen Innes is our only natural outlet to reach the markets which will give relief to this rich district. I am opposed to the Moree line on public grounds. I look to the future. They have no population there to take anything like the produce we grow at present. The population of the electoral district of the Gwydir is something over 8,000; of the Namoi, something like the same. If you get the whole of that trade they will only consume about 100,000 bushels. I will quote the population from the census of 1891. There may have been a little change since, but very little. The population of the district of the Gwydir, in 1891, was 8,281. I may tell you that is a very large electorate; it included part of the Horton River, above Bingera, and going to Collarendabri. The population of the electoral district of the Namoi is 8,486. The two combined make close upon 17,000 people. Any business man knows what consumption they want. I know from my experience of the district that many people are selling out; in fact, one man only last week sold 8,000 acres. The land has fallen into the hands of pastoralists, and I think that state of things will continue. Out beyond Moree will always be a pastoral country. My principal argument in favour of the line going to Glen Innes is, that we are a large grain-growing district, and Glen Innes is not. Neither New England nor Tenterfield grow anything for their own requirements. We have a considerable population to the east, where I consider our market lies. As a wheat-producing district we are nearer that market than any other district of the Colony.

1979. That is on the table-land and the coast? Yes; I find the population of the north coast, which includes Ballina, Bellinger, Casino, Grafton, Kempsey, Lismore, Macleay, Macksville, Murwillumbah, Macquarie, Taree, and Ullmarra—68,811. On New England, including Armidale, Bundarra, Barraba, Drake, Emmaville, Glen Innes, Hillgrove, Inverell, Manilla, Nundle, Tamworth, Tenterfield, Uralla, and Walcha—many of these towns are large producers of wheat themselves—the total population is 66,578. Of course, we do not claim to supply Tamworth, Manilla, and Barraba where they grow wheat. Now I will give you the population west of Inverell: Bingera, Boggabri, Collarendabri, Gunnedah, Moree, Narrabri, Quirindi, Walgett, and Warialda—28,880. You will observe that this western population also goes a long way down the northern line, taking in Quirindi, which is a wheat-producing place. The eastern population—

Mr. J. Sinclair.
12 Oct., 1896.

population—supposing you were to get them all—would want 812,000 bushels of wheat, but we do not claim that much. I am putting the consumption of both districts before you. West of Inverell they would require 173,000 bushels. I will now put before you the wheat grown in New England last year, 1895: Armidale, 18,211 bushels; Glen Innes, 25,968 bushels; Tenterfield, 15,000 bushels. That is a total of 59,179 bushels for New England. The population as I have already stated is 35,771. Calculating 6 bushels for each person, they would require 214,626 bushels per year for their own consumption. Taking off what they grow—59,070 bushels, it leaves 155,000 bushels, which they must import to supply themselves. The places I have enumerated are not over 100 miles from Inverell, and if we had a railway we should supply these districts before any other in the Colony. That is a market we can claim naturally. Mr. Utz buys 60,000 bushels a year, and is prevented getting it here by the excessive cost of carriage. He buys largely here—as much as circumstances allow—but he buys largely from other places, although he is within 42 miles of us. In addition to these, we look to supplying the coast districts in the future—those which are nearest—because they have to be supplied from somewhere, and if we get direct communication we are nearer to them than anyone else. If we send *via* Moree we have to go to Narrabri, Werris Creek, and Newcastle, and send from there by boat, which is almost an impossibility. Whilst dealing with the grain I should like to refer to another source of outlet which I consider we can command for some time, and that is Queensland. Many witnesses have ridiculed the idea of sending produce there. I have the wheat production of Queensland for the last ten years, which I wish to tender in evidence. Last year they only produced 109,947 bushels in the whole of Queensland. In Queensland they have a population of 460,550, so that their consumption should be 2,763,000 bushels. Last year they grew 123,000 bushels, which left them with 2,600,000 bushels to import. I find from the Customs in Queensland that they collected duty on 32,855 tons of flour in 1895, and on wheat 364,495 bushels. We are only 353 miles from Brisbane by way of Glen Innes and Tenterfield, and about 252 miles to Toowoomba. Although they have magnificent land on the Downs, the great uncertainty in regard to rust invariably prevents them having a big yield. Warwick is supposed to be one of the finest districts, and last year it only grew 16,000 bushels. I put in evidence the following return for the last ten years:—

WHEAT RETURNS.—TABLE NO. CLXXXVII.
Return for ten years.

Year.	Total extent of land sown with wheat grain	Total area mown for hay.	Total area reaped for grain.	Total area cut for green food.	Area unproductive.	Results.

1890. Have you anything further to say? I only wish to emphasise the importance of the Queensland market to us. We are within 200 miles of that great consumption, and I think we can claim that we are nearer to it than any other district of New South Wales. I always look upon that as a great outlet. In 1892 it was estimated that our revenue on the Glen Innes line would be £15,326. That is the estimated traffic between Inverell and Glen Innes. Mr. Harper did not think we should realise anything like that; nevertheless, in the same year—1892—the gross earnings at Glen Innes were £25,081.

1891. What do you mean by the gross earnings? The Commissioners' railway returns. The question is how much of that can we claim. I maintain we can claim two-thirds of it, because out of the 12,000 bales of wool which were trucked there all went west of Glen Innes. There is Dundee on the north, and Deepwater, and Glencoe, which are credited with any wool on that side. East of Glen Innes they are all cattle, so that that 12,000 bales went from here or west of Glen Innes. I maintain that if it did—and the earnings of that section at Glen Innes were £25,000—we are entitled to two-thirds, or £16,000. I have spoken to experienced men in Glen Innes about it, and they tell me I can claim credit for more; anyhow, it verifies the statement which has been put forth that if we had a railway the estimated revenue would be realised. In 1893 there were 13,963 bales of wool trucked from Glen Innes. At Tenterfield, in 1892, the railway earnings were £10,692. I think we are as productive as Tenterfield, and yet the previous estimate of the Department for this district was only £8,000. There were 237 bales of wool at Tenterfield that year.

1892. *Chairman.*] Practically nothing? No. I have compared this district with Mudgee. I find that in the same year the earnings at Mudgee were £29,825. I claim, judging by the takings of the Glen Innes railway station, that the figures, as put forward, were more than realised. I have not prepared any fresh statement of traffic, because I do not think there is any material difference. I have prepared a statement

MINUTES OF EVIDENCE—RAILWAY FROM MOREE TO INVERELL.

63.

as to the wool which I consider would be trucked if there were a railway constructed from Glen Innes to Inverell, and I wish to put it in. It is as follows:—

NUMBER of Bales of Wool that would be trucked at Inverell if connected with Glen Innes by rail.

Mr.
J. Sinclair.

* I hold the owners' certificates for this lot that they would send here if connected with Glen Innes.

1983. *Mr. Black.*] You rely, as the main factor in making a railway between Glen Innes and Inverell pay, upon the conveyance of wheat? Not wholly; there is a low freight on wheat, but it will be one of the principal products.

1984. Do you rely on wheat in conjunction with wool? Yes; we have large quantities of wool, which means a large return loading in salt.

1985. Your objection to the Moree line is that, in the first place, communication westward will provide you with an insufficient market? Yes.

1986. In addition to that, the distance to Newcastle and Sydney, *via* Moree, and the fact that between those points lie other districts more favoured geographically—producing the same things—would put you at a disadvantage in competition with them in the Newcastle and Sydney markets? Yes.

1987. On the other hand, you argue that by connection with the main northern line you will find a large market in postal towns which you enumerate;—would they depend upon connection with the coast? Many of them would. I do not think there are many of them without a railway.

1988. Then, for present purposes, we can dismiss the coastal towns, there being no connection with the Great Northern line? Yes.

1989. Then you may say that, as a matter of positive fact, you base your belief on the Glen Innes line on the fact that with New England you would have a large interchange of products, and would also find a market in the metropolis? Yes.

1990. With regard to the interchange of products with New England, you would send wheat there;—what would you get in return in good seasons? Potatoes. I do not think, however, we should get many potatoes, but we should get other goods back.

1991. If they did not come from New England you would not be exchanging products with New England;—I want to stick to the local exchange of products? Potatoes are sent in here.

1992. Anything else which is grown in New England? Oats are sent in, but not to any great extent.

1993. And in such a dry season as last season I suppose chaff would be sent? Yes; but not often.

1994. You do not often have bad seasons now? No.

1995. Then there would not often be an exchange of chaff for wheat? No.

1996. That is only a remote contingency? Yes.

1997. Would there be any consumption of Inverell mutton in the New England district? Yes.

1998. Would it be travelled, or sent by rail? It would be trucked if we had a railway. We always supply New England.

1999. Is not the stock route well grassed, as a rule? Fairly.

2000. You believe the earnings of a Glen Innes railway would be £15,000 per annum? I do.

2001. Do you anticipate that with such earnings the railway would run without loss to the revenue? We do not know what it would cost. At one time it was to cost £8,000 a mile, then £7,000, and then £6,000. The last estimate is £317,000 for the whole line, and I think we can pay on that.

2002. If we calculate that a line to Glen Innes will cost £300,000, which I suppose it would, and if we reckon interest on that at 3½ per cent. per annum, we should have about £10,700. The estimate of working expenses is, or was, £6,296. That will give a total of £16,996, showing a loss per annum of nearly £2,000;—would you, in spite of that loss, still be disposed to recommend the construction of the railway? Certainly.

2003. You think, then, that an initial loss of that character would soon be reduced or removed altogether? I think it would.

2004.

- Mr. J. Sinclair.
12 Oct., 1896.
2004. You are satisfied that if there is a loss at the beginning it will not be of a permanent character? I am.
2005. You appear to believe that one of the reasons for recommending the Moree line is that there will be a large trade done with the border towns of Queensland;—you appear to believe that if a line be carried to Glen Innes a very much larger trade will be done with Queensland by tapping centres of population than by dealing with the small and scattered towns on the Queensland border? We could not send wheat to Moree, and then to Goondiwindi by team. It is 80 miles to Goondiwindi, and we are only 110 miles from it here.
2006. And even after you get there the market is small? Yes; we command that market now, and always will do, I think, against the Moree railway.
2007. Do you think those towns are supplied now principally from Inverell rather than Moree? I do. I heard Mr. Howard give evidence on Saturday to the effect that the firm he represents sent 60 tons of flour there one year, and I am sure he is correct. It is only a small population.
2008. But Moree is nearer to Goondiwindi than Inverell? Yes; 30 miles nearer.
2009. Is there any difference in the road or the conformation of the country? It is a better road between here and Goondiwindi. It is not such a heavy road in anything like decent weather.
2010. Then you think, so far as Inverell is concerned, the construction of a line to Moree will not increase its traffic with Queensland? No, I do not think so.
2011. And you believe that if you have communication with the northern line you will be able to supply Queensland largely with wheat? I think the distance warrants it.
2012. Then you must believe that Queensland has little prospect of being able to supply her own wants with that cereal? I do. She has always had, in most favourable years, to import over 2,000,000 bushels to supply herself.
2013. Do you think the climate of the Darling Downs is not favourable to wheat-growing? No, it is not.
2014. The quality of the soil, of course, is suitable, but there is some factor in the climate—I suppose humidity—which renders wheat-growing there unprofitable? I cannot enter into the scientific part of the question. I do not know whether it is humidity or what, but it is a fact, nevertheless, that they do not produce it.
2015. Do you think you could supply that market in spite of import duties on wheat at a return which would pay the farmers of Inverell? It depends on the through rates to Sydney. Perhaps we could. £1 a ton is a big duty on flour. We do not anticipate that the duty will always exist. We send flour over now.
2016. If you had federation, and the removal of border duties, you would, I suppose, have a certain market there? I think we have every reason to expect it.
2017. Against all competitors? Yes; against the whole world.
2018. In your estimate of the earnings of the Glen Innes line, what proportion do you put down for the conveyance of goods from the metropolis? I have not the detailed statement now. Mr. McLean will give that evidence later on.
2019. You have no idea then what proportion of the £15,000 you put down for the conveyance of goods from Sydney, and you have no idea what proportion that sum bears to the total imports by the district? I can give you the tonnage in and out to Glen Innes.
2020. What is the total import of the district? The import in 1892 was 8,771 tons, and the total 13,298—that is, the in and out tonnage of Glen Innes.
2021. Of the tonnage of 8,771 tons of imports, what proportion do you think would come by rail in the event of you having communication with Glen Innes? We have taken credit for two-thirds, but I maintain the whole of it would come with the impetus which a railway would give to population here.
2022. Do you think that is a fair calculation? I think so.
2023. If the people of Glen Innes find, with direct railway communication, they will be 53 miles nearer to Sydney than you, and if they find that they can bring goods from Sydney to Glen Innes for £1 to £1 10s. a ton more cheaply *via* Grafton than by rail, and therefore avail themselves largely of the Grafton communication—do you think the experiences of the people of Inverell are likely to be any different? No, I do not suppose they will change. I have no doubt they would get the goods in the cheapest way if they were not in a hurry.
2024. If that be so, and if a large proportion of goods comes to you *via* Grafton instead of from Sydney direct through Glen Innes, what is the prospect of a railway paying? They would not carry them here by dray.
2025. Do you think that if they were landed at Glen Innes by teams from Grafton they would be transhipped there to the railway? I should hope so. We are paying a big rate of carriage between here and Glen Innes, and if we cannot get it done cheaper the railways are of no use.
2026. Is it not a fact that when carriers once get a load an extra journey of a few miles does not make much difference in the cost of carriage? I do not think 42 miles journey is a few miles.
2027. Supposing you were loading from Grafton to Glen Innes—a distance of 110 miles—at £2 10s. per ton, would not the carriers who carried the goods that distance for £2 10s. per ton be glad to bring them on to Inverell, say, for 12s. 6d. a ton extra? I do not think so. I think £1 is the through rate now from there.
2028. But you say they have no competitor at present,—under the stress of competition, do you not think they would be disposed to lower the rate? The railway rates are considerably under 12s. 6d.
2029. Then you have another point to consider. As far as I know anything about the matter, the teamster who carries goods for a storekeeper usually has some dealings with the storekeeper, and takes a certain quantity of his loading out in goods? That is so.
2030. Is it not possible that the storekeeper would pay the teamster a little more for carriage between Glen Innes and Inverell than he would pay the railway authorities, because he would increase his business by his transactions with the teamster, and because the cost of carriage for the whole distance from Sydney, in spite of the increase between Glen Innes and Inverell, would be to the advantage of the Grafton-Glen Innes team route? Yes; I think, probably, some of it would come as you suggest, but I do not know what proportion.
2031. *Mr. Clarke.*] You favour a line from Inverell to Glen Innes, instead of the proposed line from Moree to Inverell? Yes.

2032. Your principal reason is that you are desirous of continuing the trade to some point on the coast? Yes; and the northern and southern traffic as well.

2033. In the event of a railway from Inverell to Glen Innes being built at some future time, do you think it would give you a better market at both places? Yes.

2034. Would there be an interchange of products? Yes.

2035. And even if a line were not constructed to the coast, would a considerable trade still continue to be done by carriers from Grafton to Glen Innes? I suppose it would, but I cannot answer with certainty.

2036. We have it in evidence that from somewhere north of the Macleay and the Manning to the Tweed there is a population of 80,000 people? That is so.

2037. And you consider they are entitled to some communication from the table-land to the main line, and down to the coast, *via* Grafton, or Casino, or Coff's Harbour? Decidedly.

2038. You have already stated that the country from Inverell to Moree, and north and west of that towards the Queensland border, would not absorb the whole of the produce grown in this district? No; the population is limited.

2039. Therefore you must find a market for the surplus elsewhere? Yes.

2040. Where do you think that market would be found? After supplying the adjacent places I have mentioned, they will have to get to the seaboard somewhere—to Sydney or Queensland.

2041. Do you think that it would be possible for much wheat to go to Queensland at present? The £1 duty is a great difficulty, and there will not be any big trade whilst it exists. I am quite sure, however, that there will be a market for this district. There is a duty on flour whatever way it may come in.

2042. When federation arrives? Yes.

2043. Or when there is some alteration in the present tariff? Yes.

2044. Do you not think that Queensland could be supplied with flour and wheat by the seaboard from South Australia and Victoria more cheaply than from here? I do not think so, because wherever you bring it there must be some land carriage.

2045. Do you not think the people between here and Moree are entitled to some consideration, in view of the bad state of the roads and the existence of country in which it is very difficult to make roads? Yes.

2046. And supposing they have no railway? They could go to Moree and come here.

2047. By road? Yes. Their principal trucking is wool, which stands a little more carriage—more than anything else. That could go to Moree. The Warialda traffic would come here.

2048. If a railway were ultimately constructed from Inverell to Glen Innes, would it answer the purposes of the people between Moree and Inverell? It would answer them as far as Warialda. They would send their produce to Inverell.

2049. *Mr. Roberts.*] Is much agriculture carried on between Inverell and Glen Innes at the present time? A good deal.

2050. What is the area under cultivation at the present time? There is a considerable area.

2051. I was under the impression that it was principally devoted to pastoral purposes;—is that so? Parts of it are, but there is a large area of land under crop between here and Glen Innes.

2052. But, as a matter of fact, there is no farm of any importance at the present time between Inverell and Glen Innes? Yes; there is a good quantity of it. Ten miles from here, at Brodie's Plains, it is all farms.

2053. I believe there is any quantity of good land which would be suitable for agriculture? Yes; it is all agricultural land.

2054. Is it not held in large estates? Yes; there are four estates upon it.

2055. Can you say that if a line were constructed to Glen Innes those estates would be thrown open for the purpose of wheat-growing? I have no doubt they would. I am interested in one, and they can have that for wheat. I am quite sure the proprietors are only wishful to get the land under wheat; they have often expressed themselves to that effect.

2056. What value would you put on the land per acre for leasing it in small holdings? I should think about 3s. or 4s. an acre if it were cleared. It might be 5s. A good deal depends on the improvements. The mixed agricultural and grazing land lets for about 2s. and 1s. 9d. at present.

2057. Would that pay the owner of the land better than running sheep upon it? I do not know that 2s. would. They have an idea here of adopting the share system if railway communication be available.

2058. You mean the halves system? Yes. Some adopt the thirds system.

2059. How do the sheep run to the acre between Inverell and Glen Innes? About a sheep to the acre.

2060. What is the value of their fleeces? Three shillings.

2061. Was not the land valued higher than the quotation you have given some years ago? Yes.

2062. Is it owing to the general depression that you now quote a lower price? It is.

2063. You have stated that you opposed the Moree route on public grounds;—will you explain what you mean? I consider the distance is prohibitive of benefit to this district in any way, and if a line were built traffic would not go there, and there is no population to consume our produce.

2064. Do you mean that if money were spent in constructing the proposed line it would be a loss to the State? I do. I do not think it would pay, I think there would be a big traffic between here and the east, even if the line to Moree were constructed.

2065. With regard to the interchange of products between Inverell and Glen Innes, what would Glen Innes have to send to Inverell which Inverell would be unable to grow? I do not think Glen Innes can send much that we cannot grow, except, perhaps, potatoes and oats.

2066. Is it not a fact that the soil of Inverell is admirably adapted for the production of potatoes? Yes.

2067. And if a railway were constructed, would not there be a large market for potatoes in the west? There would be a market, no doubt, but it would be a limited one. I may mention that potatoes in Inverell do not carry like they do in Glen Innes. The colder the climate the better the potato.

2068. I understand you to look upon the eastern part of the Colony as the market for Inverell produce? Yes; east, north, and south.

2069. Do you discard the west altogether? No; only it is a limited market there.

2070. In making your estimate for the eastern market you said 812,000 bushels would be required? No; I explained that deductions would have to be made because of Tamworth.

2071. In the 812,000 bushels you included the towns of Grafton, Casino, Lismore, and others? I did.

Mr.
J. Sinclair.
12 Oct., 1896.

2072. How are you to get there? I do not expect to get there until there is a railway there.
2073. Is it a fair thing, in drawing a comparison between the two routes, to take that into consideration at all? I think it is if you are proceeding on national ground.
2074. You have taken into consideration, in the estimate of 812,000 bushels, several towns which produce large quantities of wheat—Armidale, Glen Innes, and Tenterfield;—is not Manilla a large wheat-producing district? Yes; but I explained about Manilla. Armidale, Tenterfield, and Glen Innes do not produce large quantities of wheat. They are large importers.
2075. Are you aware that a proposal to connect Tamworth with Manilla has been recommended to Parliament? Yes.
2076. If that railway be constructed, will not there be a great increase in the production of wheat in that district? I should think so.
2077. Then you could hardly claim Manilla as a market for Inverell wheat? I do not claim it at all.
2078. Then, in the western market, you mention Bingera;—is there a large production of wheat there? There is production there.
2079. But not very large? Not very large. There are one or two mills there.
2080. How about Boggabri? I do not think there is much grown there.
2081. How about Collarendabri? There is none grown there. There is a small population there.
2082. How about Gunnedah, Moree and Narrabri? There is a large mill going up at Narrabri.
2083. Is much wheat grown there at the present time? I do not think there is a great deal grown there, but I see they are going to stimulate it.
2084. What about Quirindi? Large quantities are grown there.
2085. Does it not appear to you that in the western market, there are many large centres where you admit there is not much wheat grown, and therefore there must be a market for Inverell produce? I mentioned those centres and told you they contained 28,000 people and I gave them credit for a consumption of 6 bushels per head.
2086. What I want to point out is that I think your comparison of your eastern and western markets was hardly on a fair basis? I am willing to explain.
2087. Do you admit there is an error on your part in putting down some of the eastern markets? No.
2088. I refer in the first place to the coastal towns, and Armidale, Manilla, Tamworth and Tenterfield? Those places I have mentioned, also Bingera, Boggabri, Collarendabri, Gunnedah, Quirindi, Walgett and Warialda. Allowing for 6 bushels per head they will take 173,000 bushels. I did not say they grew anything but they want that amount and it has to be supplied.
2089. What I want to point out is that in the western markets you gave non-producing districts, whilst the others produced wheat; therefore from my point of view they would not require produce whereas the western market would? I explained that Tamworth and Manilla were wheat-producing districts.
2090. But you put them down as a probable market for Inverell produce? No, I excepted them.
2091. *Chairman.*] You went on to say that the table-land required a certain amount? Yes, 150,000 bushels.
2092. *Mr. Black.*] You said their consumption exceeded their production by 150,000 bushels? Yes.
2093. That is Glen Innes, Armidale, and Tenterfield? Yes.
2094. They produce 59,000 bushels, and consume 150,000 bushels more? Yes.
2095. *Mr. Roberts.*] Will you admit that the 173,000 bushels which will be required in the west—at Bingera, Boggabri, Collarendabri, Gunnedah, Moree, Walgett, and Warialda—will be sent there by way of Inverell if the proposed line be constructed? No, I will not admit that, because Bingera already produces a certain quantity; so do Quirindi and Narrabri.
2096. If a railway to Moree were constructed there would be a large market for Inverell produce at Moree? I do not think it would be a large market, and I have been intimately associated with Moree for the last fifteen years.
2097. What about Walgett? That is 120 miles from Moree, over the worst roads in the country. Collarendabri is 80 miles from Moree. Mungindi is a small place on the Queensland border.
2098. What about Warialda? We look upon it as the twin-brother of Inverell.
2099. What is the last return you have as to the number of bushels of wheat grown within the electoral district of Inverell? Last year 60,000 bushels were grown in the police district. It was an exceptionally bad year. The year before the return was 130,000 bushels—one of the biggest we have had.
2100. Would not the whole of the 60,000 bushels of wheat find a market in the west? We want most of it for ourselves.
2101. Is it not a fact that hitherto farmers have found it impossible to get rid of their wheat? I do not think so. I think they get as good a price here as anywhere.
2102. Is not that one of the reasons why the construction of a railway to Inverell is advanced? No; I think one of the reasons is that they wish to increase their outlet, and they cannot see any means of doing so without the means of exit. I think 133,000 or 140,000 bushels of wheat is the largest return we have had here. A considerable quantity finds its way to the west, south, and north—wherever they can get a market for it.
2103. Do you not think that if a railway from Inverell to Moree be constructed, a very large area of land will at once be put under cultivation with a view of increasing the production? I do not think so.
2104. Would not there be a market for the surplus wheat in Newcastle? Yes, but I think the distance is too great.
2105. Would not that difficulty be got over in a great measure from the large production of wheat per acre;—does it not yield as a rule, up to 20 bushels per acre? Yes, the yields are good; but we want to get the nearest way to a market—not to be taken from it. If we go to Moree we go right away from our natural market.
2106. Does it pay at present to send wheat from Glen Innes to Newcastle or Sydney? Yes; it would at present prices.
2107. I understand you to say you anticipate a large market in Queensland? Yes.
2108. To what part of Queensland would you expect the demand to set in? The south-west—on this side of the main range.
2109. I believe a good deal of wheat goes out to Goondiwindi now? Some flour goes out.

Mr.
J. Sinclair.
12 Oct., 1896.

2110. I suppose you can hardly expect to tap the Brisbane market? If the rates were as favourable as they are on the southern side. It is 100 miles nearer, but I do not claim that; I claim that we can send large quantities to the south-west.
2111. Would you go down as far as Toowoomba? Yes, and south-west of Toowoomba. Toowoomba is the largest wheat-growing district they have. They grow 46,000 bushels last year.
2112. Is that owing to uncertain rainfall? No; I think it is due to the rust.
2113. How many miles is it from Inverell by way of Glen Innes to Toowoomba? 253.
2114. Is not Toowoomba exactly 100 miles from Brisbane? 102, I think.
2115. Does it not appear to you that it would be impossible to compete with wheat brought from California or South Australia to Brisbane? I am not claiming Brisbane.
2116. They would only have to take it 100 miles to Toowoomba, whereas you would have to take it 250 miles? I think it is quite possible to compete with them. Any wheat coming to Brisbane must bear a certain amount of land carriage wherever it comes from.
2117. *Mr. O'Connor.*] What is the country between Inverell and Glen Innes capable of producing? It is capable of producing any agricultural produce.
2118. For the whole of the distance? There is some hilly country, but it is all good on both sides of the proposed line.
2119. Have you any idea what quantity of land between Inverell and Glen Innes is held by private owners? I know there are four large holdings, but I do not know the amount.
2120. Are you aware whether the owners of these properties would be willing to give the land necessary for the construction of a line to Glen Innes? I am not aware. I have some land and I will not give it free, but I will give it at the upset price of £1 5s. an acre. If you resume 2 chains the whole of the distance between Inverell and Glen Innes, the upset price for the whole would not come to more than £1,200.
2121. *Chairman.*] Briefly then your contention is that, in the best interests of Inverell, railway communication should be made east and not west? Decidedly.
2122. You believe that if you were connected with the Great Northern line to the east you will have a choice of markets? Yes.
2123. Have you seen the gradual settlement of the western country? Yes.
2124. Is it ever likely to be thickly settled? I do not think it is particularly beyond Moree.
2125. Is it a class of country which admits of close settlement? No.
2126. Are you aware that the area of land to be alienated now is somewhat limited? Yes.
2127. And when it is alienated you cannot look for any rapid development? No.
2128. You have already told us that in your opinion the present population in the western district will not absorb the surplus produce from Inverell? That is so. An increase of produce must take place at Inverell, and the absorbing power is not in the west at the present time.
2129. What would be the prospect of getting rid of the surplus stuff by way of the Moree line to Narrabri, and then to other markets? I think the population along that route is pretty well supplied; we should have to get to the water before we got any market.
2130. Are there any intermediate markets between Armidale and Sydney? They do not grow any wheat north of Tamworth.
2131. Do you know whether there has been any interchange of produce between Tamworth and Inverell? No.
2132. Has there been any along the main northern line? Tamworth used to send wheat to Glen Innes and Armidale; we want to stop that.
2133. I believe the Inverell wheat is noted for its quality? Yes; it is.
2134. And when profitably brought in contact with the outside buyers there is no difficulty in selling it on the score of quality? It always brings the highest price.
2135. Do you think the proper way of dealing with the traffic which lies west of the Great Northern line is, by way of Moree and the north-western line? I do not think it is. I am more largely interested in Moree than I am in Inverell.
2136. What kind of interest have you? A pastoral interest—I have 30,000 acres about 25 miles from Moree. Personally, it would suit me to go to Moree better than anywhere else.
2137. I presume the quantity of produce going in that direction would vary according to the seasons? Yes.
2138. For instance, if they had a good season in the Moree district, would there be much demand for forage from here? I do not think so.
2139. Would you consider that the last twelve months in the Moree district have been an unfavourable season? Yes; the last six months have; and part of 1894 was unfavourable too. I may say that the consumption of produce last year, by Moree, was better than we have ever had it. Perhaps that was accelerated by the railway construction from Narrabri; but we sent more produce there last year than we have ever done.
2140. Therefore, a considerable discount may be taken off last year's estimated consumption? Yes.
2141. What development do you think is likely to take place in the shape of mining, between Inverell and Moree? I know of no mineral country there.
2142. Is there any on the eastern side? Yes; at Elmore, 12 miles on the east, there is a little mining town. One matter to which I wish to refer has reference to the number of sheep, which was given to you the other day, as being in the Warialda district, and which would support the railway. The number was estimated to be 1,500,000. The Warialda district is a very large one. I have made a calculation to the effect that there are 368,000 sheep there which are already benefited by the Moree line, and which would not go on any part of the proposed line. There is Wellbon, for instance, due north of Moree, with 100,000 sheep, which are included in Warialda. That is 24 miles from Moree, in the Goondiwindi direction, and the proposed line would not pick up a bale of wool from there. Neither would it pick up a single sheep from Tullooona nor Bulloeroo. I estimate that there are 368,000 of the sheep referred to, which are already benefited by the Moree line. I give way to no one in my knowledge of the stock of that district.

Mr. Hector McLean, storekeeper, Inverell, sworn, and examined:—

Mr.
H. McLean.
12 Oct., 1896.

2143. *Chairman.*] How long have you been in Inverell? For the last twenty-five years.
2144. Have you an extensive knowledge of the conduct of business and the carriage of goods? Yes.
2145. *Mr. Clarke.*] Have you any statement to make to the Committee? I may say that the construction of the proposed line would be a most fearful mistake for this town and the districts interested. Instead of cheapening carriage, and developing the resources of the district, the result will be otherwise. The mileage will be increased, and, consequently, the rate will be increased. Just now we are saving about one-third by using team carriage between Inverell and the east.
2146. Can you give any estimate of the quantity of wheat, flour, and horse-feed which at present goes from Inverell to Moree? In an ordinary season it is comparatively small. This season our firm has not sent more than 10 tons of stuff, and it was in 1886 when we sent anything previously. That was a very dry season. I know that a great deal of the produce sent to Moree is sent at a loss instead of a profit to those who are trading.
2147. Can you give any opinion as to what is sent by other storekeepers? There is only one other mill which is sending that way—Taylor and McIntyre—and I should not think they have sent more than 40 or 50 tons for the year.
2148. Can you say what quantity of horse-feed, fodder, and chaff has gone from Inverell to Moree? I should think 150 tons would cover it. It has been sent principally by the farmers themselves, and not through the storekeepers. About 50 tons of flour have also been sent.
2149. Are there any other goods which are sent? Nothing at all.
2150. Nothing in the shape of groceries? There is no trade of that kind with the west. Warialda is supplied from Tamworth, and the country between Warialda and Moree is supplied from Moree. The Manilla and Bingera merchandise would all come from Tamworth.
2151. We have it in evidence from a witness at Moree that 1,860 tons of goods of various kinds come from Inverell to Moree in a year? I think it is very much overstated. There is no kind of merchandise except produce, and in ordinary good seasons there is nothing sent in the way of produce except a little corn and oats to feed racehorses.
2152. But flour would go in any case? Yes; flour was sent last year, because it was so very cheap here, and even then it was sent at a loss. Mr. Taylor, of the firm of Taylor and McIntyre, was paying his firm what they were losing. He was making it good in order to get rid of the surplus. That was before Moree was connected with Narrabri.
2153. Is the country between Inverell and Moree adapted for agricultural purposes? Yes; the river flats of Moree would produce well.
2154. What about the rainfall? It is not so good as ours. In ordinary seasons there is plenty of grass about Moree and district, and then only small quantities of produce are required to be sent.
2155. Do you approve of the construction of a line from Glen Innes to Inverell? I do; I think it is the natural outlet of this district, and will tend to develop our resources by cheapening the inlet and outlet of merchandise and products.
2156. Do you not think the people between Inverell and Moree should have some consideration in order to get their produce to the best possible market, which they seem to think is Moree and north-west of Moree? I do not think there is sufficient outlet in that direction. There would be no railway traffic except local traffic. It would be impossible to bring merchandise from Sydney to Inverell by that route.
2157. I suppose the goods for the supply of Moree at present come from Narrabri? Yes; and Inverell will still continue to get its supplies east from Glen Innes or Grafton.
2158. Then you are of opinion that a line from Inverell to Glen Innes would suit the public generally better than the proposed line? Very much. It would be even better for the districts west. It would be cheaper for Warialda to get her supplies eastward than through Moree.
2159. Does not Warialda at present get a good deal of supplies from Bingera? Yes; Tamworth is her market.
2160. Are you aware that a line is to be constructed from Tamworth to Manilla? Yes; that is really the line which will serve Bingera and Warialda if it is continued.
2161. Have you any idea as to the quantity of goods which come from Grafton to Glen Innes and then on to Inverell? We get about two-thirds of our goods in that way by carriers. The carriers can go empty from here and bring back our loads.
2162. What does the two-thirds amount to in tons? About 200 tons a year come by way of Grafton, and thence by team. The remainder comes by rail from Sydney to Glen Innes, and thence by team; two-thirds of what we get by team never sees the railway.
2163. What is the rate of carriage from Grafton to Inverell? £4 a ton. It could be done for less, but that is what we allow the carriers who really go down empty.
2164. Do you send any goods from Inverell to Grafton? Yes; but in our line it is not a regular thing. We send hides and wool sometimes.
2165. Does much wool go to Grafton from Inverell *via* Glen Innes? We dealt considerably in wool last season, and sent it by way of Grafton.
2166. What is the reason for sending that away? There is a very considerable saving in carriage.
2167. Of course, you send goods the cheapest way? Yes.
2168. I understand that the land between Inverell and Glen Innes is mostly in the hands of a few individuals? There is a large farming and agricultural population between Inverell and Glen Innes.
2169. Is not the land held by a few individuals? No more than is generally the case around a town. There is a large number of small holders on the route.
2170. Do you know whether the people would be inclined to give the land required free of cost for railway construction? I do not know. Some years ago when the Glen Innes line was being mooted, the King's Plain estate offered to give a considerable quantity of land. The station has since changed hands.
2171. Do you think it possible if a line were made from Inverell to Glen Innes a portion of the land would be cultivated? Yes. I understand all the graziers are only too willing to go in for cultivation.
2172. Would they lease it? Yes. I may state that Mr. Campbell, of Inverell Station, has a number of small farmers on his estate on shares. The number would be increased threefold if the line were constructed.

Mr.
H. McLean,
12 Oct., 1886.

2173. If the line from Moree to Inverell be not constructed, do you not think it will be a great inconvenience to many people living along the route? No, I do not. I do not think a single passenger would avail himself of the opportunity of going by way of Moree if the line were constructed. I do not consider there would be any passenger or merchandise traffic to Sydney by that route. I think the passengers would go by way of Glen Innes, even if there were no railway. It is only six hours' journey in a light buggy. I cannot see that the proposed line will be used at all excepting by the people of Inverell who go to Moree on a little business, and *vice versa*. The proposed line to Manilla will certainly serve Warialda better.
2174. We have it in evidence that a good deal of the surplus produce—flour and wheat—will find its way to Queensland;—do you agree with that? Yes, if the border duties are diminished.
2175. If federation takes place, and there is intercolonial freetrade, will there be a market to Queensland for articles other than flour? Yes, we should use their sugar, and there would be a large interchange.
2176. Do you think that with produce being carried from Victoria, New Zealand, and South Australia to Brisbane, at a low rate of freight, you would be able to compete? Yes, with special rates for the carriage of our produce.
2177. *Mr. Roberts.*] How many stores are there in Inverell? Three general stores, besides our own.
2178. Do the other storekeepers hold similar views to your own on this subject? I have not obtained their opinion. The people have been told that the Moree railway is the only one they will get, and therefore they will support it.
2179. Do you know of any storekeeper in the town who is favourable to the construction of a line from Inverell to Moree? No.
2180. Do you get all your goods from Sydney? Yes, with the exception of sugar. At this season of the year we get a large quantity of Grafton sugar.
2181. Do all your goods come by way of Grafton? Yes, goods for which we are not in a particular hurry, and heavy goods. We use the railway for drapery, and goods of a special class, such as salt.
2182. In the event of a railway being constructed from Inverell to Glen Innes, would you not still get your goods by way of Grafton? There would not be the facilities for getting goods that way then.
2183. Why? If Inverell were a terminus from Glen Innes, the carriers who at present have nothing to do but trade between Grafton and Inverell would be taken up on the western route.
2184. Do you mean to tell me that if a railway were constructed from Inverell to Glen Innes the carriers would cease to run between Inverell and Grafton? Their occupation would be taken up to the north-west and west. I believe that with this railway we could develop a much greater trade, and that we could even supply Moree more cheaply than the railway.
2185. But you are assuming that the railway is to be built almost at once from Glen Innes to Grafton;—you say that if a railway were built from Inverell to Glen Innes the teamsters would cease to run on the road from Glen Innes to Grafton? No; if we were connected direct with Sydney by way of Glen Innes the facilities for landing stuff would be much greater than they are at present, because if we get merchandise from Sydney it has to be placed on the drays at the railway station at Glen Innes.
2186. And in the event of the railway being made to Glen Innes, would it not be still cheaper for you to get goods by sea to Grafton? The facilities would not be so great then. I do not think it would be cheaper then.
2187. There would only be a difference of 44 miles of carriage? Yes.
2188. Would you not still be likely to bring your goods by way of Grafton, and make a contract with a man to carry your goods from Grafton to Inverell, and ignore the railway altogether? I do not think so.
2189. Would you unload them at Glen Innes, put them on the trucks, and bring them to Inverell by rail? We would be more likely to use Inverell to Sydney direct by rail.
2190. Although you could bring them to Grafton for less money? The facilities would not be so great, because the carriers would be taken off that route. It would pay them better to travel to the Queensland border on the north, and down the Macintyre River.
2191. You are assuming that everyone would bring their goods all the way by rail by way of Glen Innes;—consequently, the occupation of the teamster between Glen Innes and Grafton would be for ever gone? It would be to a great extent—that is, as regards the Inverell trade, because it is simply Inverell carriers who are trading with Grafton. They are not Grafton or Glen Innes carriers, but our own carriers, and these men must have employment. They would be engaged in a trade for the north and west.
2192. If a railway were made from Inverell to Moree would you be a customer to it in any way whatever? I cannot say we could use it, unless for sending a little produce which would be required by Moree.
2193. But you would not use it to bring your general merchandise from Sydney? No; I cannot see how it would be of any use, because the time saved would be very little, and there would be the increased cost.
2194. But if a line were made to Glen Innes you would bring your general merchandise all the way by rail? Yes.
2195. Although you can bring it more cheaply by way of Grafton? If we saw a saving we should be bound to make use of it. There is no doubt that carriage *via* Glen Innes would be cheaper, because the distance is less.
2196. What sort of a road is there between Inverell and Glen Innes? Very good.
2197. If you brought goods from Sydney to Grafton and Glen Innes, would you be likely to take them off the team, put them on the railway, and bring them on to Inverell? No; I do not think that would be done at all.
2198. Do you purchase any wheat from the farmers? Yes; we are very large buyers.
2199. Are your transactions in cash? Yes.
2200. Do you exchange with goods to any extent? That which is done in the usual way of trade; but very often there are large cash balances to draw.
2201. Where is the wheat which you purchase produced? Within a radius of 12 or 13 miles of Inverell, in any direction east, west, north, and south.
2202. Is the Inverell district in what may be termed a flourishing condition? No; I believe a railway from the east would assist it very much, by giving us an outlet.
2203. You think it ought to be connected by rail with the Great Northern line? Decidedly; that is the only route which will be of any benefit to us.
2204. You do not think a connection with the west will be of any advantage? Not at present; it is the wrong end to commence at.
- 2205.

- Mr. H. McLean.
12 Oct., 1896.
2205. Do you know the rate of carriage from Inverell to Moree? About £2 to £2 5s. a ton.
2206. Would that probably account for the small amount of produce going from Inverell to Moree? It would, perhaps, since Moree has been connected by rail, but prior to that it would not, because we are almost as convenient as Narrabri.
2207. If the railway were constructed and flour could be taken to Moree for 8s. a ton, do you not think there would be a large demand for Inverell flour? I do not think there is the consumption. Then there are other districts which geographically are better situated for supplying Moree than we are, such as Tamworth, Gunnedah, and Narrabri. I do not think we would have any trade at all. The trade of those districts would be established with Moree before we had an opportunity of getting it.
2208. If a railway were constructed to Glen Innes would large quantities of wheat and flour be sent from Inverell? Yes.
2209. Where do you think the market for Inverell produce would lie? There is the whole of the eastern seaboard with a population of 100,000.
2210. But would it pay you to send it there by team? At present they are sending chaff from Glen Innes to Grafton.
2211. I want you to give me information without assuming that a railway is, or is likely to be constructed to Grafton; what other market have you got? We have South Armidale, and north to the Queensland Border, and the whole of the east coast.
2212. Does not Tenterfield produce wheat? Not to a very large extent.
2213. Does not Glen Innes? Not enough.
2214. And does not Armidale? I believe not. Tamworth supplies Armidale to a great extent and Glen Innes too, and usually we send a lot of wheat from Glen Innes to Inverell.
2215. Supposing you get rid of a good quantity in the direction you indicated, where would you find a market for the surplus? We could supply the west to Warialda. We should have an enormous market there. It would take in Warialda on the west, the east coast, Tenterfield on the north, and Armidale on the south.
2216. I understood you to say, there would be no market worth speaking of for Inverell produce in the west—that is, from Warialda to the west? You are asking me what we would do with the surplus.
2217. Yes, after providing for the local requirements of Inverell, and what you would send to Glen Innes, Armidale, and Tenterfield, what would you do with the surplus? We have all that country. Take Bundarra on the south, we have Warialda 40 miles west, and to the Queensland border. We have the trade of all that country just now.
2218. After supplying all that country there would still be something left to send away? It would require an enormous quantity of wheat to supply those districts—more than we can produce for a number of years, I think.
2219. Do you think a large area of land would be put under cultivation with the view of producing wheat if a line to Glen Innes were constructed? Yes, I feel quite confident of it.
2220. Then there would be a large surplus to be sent either to Queensland, Newcastle, or Sydney? We should gradually find markets, no doubt for it. We can always afford to sell surplus cheap. We should have to force a market if one were not at hand.
2221. Where does your trade for general merchandise come from;—within what radius have you customers? We trade on the north-west for 100 miles—that is following the Macintyre River, and the tributaries of the Macintyre, and to the Queensland border on the north-east.
2222. You do not think the proposed railway would be of any use to you in supplying your customers with merchandise? I do not think it would at all serve the inhabitants of this country towards the Queensland border.
2223. With regard to the conveyance of your goods, do you own any teams? No.
2224. Do you not prefer, as a rule, to have goods brought by the teamster, not only because of any advantage that you derive from reduced freight, but also because he takes a quantity of his loading out in goods? Yes.
2225. Would not you think that circumstance would tend against the construction of a railway from Glen Innes to Inverell? No; I think it is more than counterbalanced by the directness of trade.
2226. But if that were a circumstance, it would tell even more strongly against the Moree-Inverell railway? It would.
2227. *Chairman.*] You have already told us that the rate of carriage from Grafton to Inverell is £4 per ton;—does that include the steamer freight? No.
2228. What is the steamer freight? Twelve shillings and sixpence dead-weight.
2229. Measurement? It is calculated by the cwt. It would come out at 2s. per cwt.
2230. That would be £2 a ton by steamer, and 12s. 6d. dead-weight? Yes; but they are nearly all dead-weight goods that we carry *via* Grafton.
2231. What class of stuff do you get up by way of Grafton? Wire, galvanised iron, bar-iron, sugar—that is all dead-weight.
2232. Do you get any measurement stuff? Kerosene would come at a rate of so much per case. That is cheaper than the railway rate—1s. 3d. per case.
2233. Do you get any drapery that way? No.
2234. Crockery? No; crockery we get by railway.
2235. What is the average cost of landing goods from Sydney, *via* Grafton, at Inverell? The average cost would be about £6—that is, if we got everything that way.
2236. That would include measurement and dead-weight goods? Yes.
2237. At the present time, for the purposes of economy, you get dead-weight only? Yes.
2238. What does that cost you to land in Inverell? £4 10s. net.
2239. What does it cost you to land the goods you get by railway from Sydney to Glen Innes and thence by team to Inverell? The lowest rate we can do it is, by the truck-rate through Wright, Heaton, & Company. It costs us £7 per ton.
2240. Are you allowing for a fair and reasonable rate of carriage? Yes.
2241. Then, it is £6 by way of Grafton, and £7 by rail? Yes; but the rate by rail, if we had not the benefit of Wright, Heaton, would be £7 to Glen Innes.
2242. I want you to give me the truck-rate? That is the truck-rate.

Mr.
H. McLean.
12 Oct., 1896.

2243. It is well known that if you get goods up by the single ton the cost is much greater? Yes; that is for third-class goods.
2244. Is the third-class the highest class? The goods I have enumerated as dead-weight, by sea, would be carried at £24 a truck, to Glen Innes. That is a 6 ton truck. That is £4 a ton.
2245. And what would be the dray carriage across from there? £1 10s. a ton.
2246. That makes £5 10s. a ton? Yes.
2247. What does it cost you to get dead-weight goods by way of Grafton? £4 10s. net.
2248. Therefore the difference of £1 a ton, dead-weight, induces you to get your dead-weight stuff by way of Grafton? Yes.
2249. Is it to save £1 a ton that you do it? Yes, and to give the carriers employment.
2250. I suppose that many carriers are customers of the storekeepers? All.
2251. And you have to give them some loading to cut out their accounts? Yes.
2252. The margin of £1 a ton enables you to do so? Yes.
2253. Have you ever known any goods to be landed in Inverell from Grafton at £3 10s. a ton? Yes.
2254. That with 12s. 6d. steam freight makes £4 2s. 6d. a ton? Yes, that is as low as we have landed it.
2255. Supposing the proposal to construct the line from Inverell were carried out—making Inverell the starting point—to deal with the traffic west of the Great Northern line and to take it by way of Moree to Sydney—have you calculated what it would cost you to get your goods from Sydney by that route to Inverell? Yes. I have seen an estimate and I think it is £8. I think it would be higher. The rates on the north western line are much higher than on the Great Northern line. We have the advantage of the differential rates.
2256. If it were not for the existence of the differential rates to Glen Innes would you be able to land your goods that way at £7 a ton? No.
2257. We will take things as they are—£6 and £7 a ton. I believe that with truck rates you can put any class of goods you like into a truck? Into a miscellaneous truck you can. There is a special rate for sugar, rice, galvanised iron, bar-iron, and fencing-wire, but other classes of goods such as drapery come at a higher truck rate.
2258. Have you not as a storekeeper, having to deal with a general class of goods to arrange your trucks so as to be able to put a mixed class of goods into them? No, in the low rate truck we cannot do that.
2259. Wire and sugar of course you have in 6 ton lots in a special truck? Yes, that is the minimum truck rate.
2260. I believe you have to mix other goods in a truck to make a truck load. For instance you would not get 6 tons of drapery into a truck? No, we have to pay a higher rate for that.
2261. What is the higher rate? £30 a truck, or £5 a ton.
2262. That is £5 a ton to Glen Innes and £1 10s. a ton from Glen Innes—that is £6 10s., or 10s. lower than your previous estimate, which was £7? Yes; because we cannot take advantage of that truck. We get through Wright, Heaton, and it comes out at £5 10s., and £1 10s. from Glen Innes, which means £7.
2263. That includes Wright, Heaton's charges? Yes.
2264. You are not able to land them at less than £7? No.
2265. Will you tell us what the result would be if the sum of £8 7s. a ton were charged for bringing goods around from Inverell by way of Moree? The result would be that we could not use the line. It would be impossible.
2266. Of course, you would use it to a certain extent? It would be for something very pressing. At present we do not find it any inconvenience by using Glen Innes, and we should still continue to use Glen Innes.
2267. The perplexing question is, if the proposed railway were made, would it get the traffic;—would you get your goods from Sydney? In my opinion it would not get 1 lb. weight of our goods.
2268. Would a difference of £1 7s. a ton be sufficient to debar you from using that line? It would.
2269. Have you any idea what tonnage of store goods would come into Inverell in the course of a year? I could only guess. In the past twelve months my firm has got over 300 tons of merchandise. If you take the total tonnage at six times that it will give you 1,800 tons of merchandise.
2270. That would be from the town alone? Yes.
2271. It would not include the pastoralists and selectors who often get their wire and other materials direct? Yes.
2272. The whole of the purchases are not made in the town? No; the squatters would buy direct.
2273. You say that the difference of £1 7s. a ton would debar you from using the proposed line, consequently you could only use it for a portion of the 1,800 tons of goods, that is, the urgent, light, and expensive portion? Yes.
2274. Consequently, the traffic would go on as usual between Inverell and Glen Innes and Inverell and the coast? Yes; to the east.
2275. And the object of starting a line from this point to deal with that coastal trade would not be met? That is my opinion.
2276. Supposing the line were made from Glen Innes to Inverell; do you think there would be any danger of a dray competition setting up, between Grafton and Glen Innes, and thence transshipping to the railway? Not much. We should be in direct communication with Sydney, and as I explained this morning the carriers who are now employed between Grafton and Inverell would be diverted in other directions.
2277. In other words, if goods were put on at Grafton they could be brought to Inverell for very little more money than they could be by being transferred at Glen Innes? Yes; I think the carriers who are at present occupied in the trade between Grafton and Inverell would be engaged in delivering from Inverell to the north-east and north-west.
2278. If you were compelled to adopt the dray route, I suppose the next outcome would be some reduction in the cost of carriage by rail? Yes.
2279. And then would the teams be likely to still further reduce the cost of carriage? I do not think the teams could carry any lower or much lower. They might carry for 10s. a ton less.
2280. You deal largely in galvanised iron, wire, sugar, salt—big heavy items, but inexpensive? Yes.
2281. A profit of 10s. a ton on them is a big profit? Yes.

- Mr. H. McLean. 2282. And if you saw a margin of 10s. a ton in their carriage you would adopt the cheapest route, whether it be by road or rail? That would be our policy.
- 12 Oct., 1896. 2283. Would the country be safe in adopting the idea that a connection from the Great Northern line to Inverell would largely gather to it the trade which it now loses? It would in a measure.
2284. Are you aware that the estimated value of that trade is £7,000 a year? Yes.
2285. That is the estimated loss on the Great Northern line? I believe it is.
2286. Would the railway save that;—would it throw it into the coffers of the country? It would in a measure, and totally so in time, I think.
2287. Do you export anything from Inverell? Wool and hides, and also flour and maize to Glen Innes.
2288. Is there any other point you would like to bring before the Committee? The only traffic that I can see would be developed on the proposed line is a local traffic between the two points—Inverell and Moree. There would be no traffic to Sydney either in the shape of passengers or merchandise.

Mr. Arthur Stewart Menzies, station manager, Reedy Creek, sworn, and examined:—

- Mr. A. S. Menzies. 2289. *Chairman.*] Where is Reedy Creek? Twenty miles north-west of Inverell.
- 12 Oct., 1896. 2290. How long have you been in the district? Over twenty years.
2291. *Mr. O'Connor.*] What is the extent of your holding? About 40,000 acres freehold.
2292. How is it at present utilised? For pastoral purposes only.
2293. Have you any information to offer the Committee? I consider the proposed Inverell-Moree line as a rival or alternative line to the Glen Innes one. It would emphasise the curse of centralisation. It seems to me it would bar the direct railway to the coast, which, in my opinion, is the only suitable one for this district.
2294. Do you think, then, that an extension to Glen Innes would be better? Decidedly.
2295. Do you know the country between Glen Innes and Inverell? Yes, very well.
2296. What is your opinion of it? It is nearly all suitable for agriculture, as well as pasture.
2297. Do you know the country between Inverell and Moree? I have a general knowledge of it. It is mostly pastoral country. It is not to be compared, from an agricultural point of view, with the country towards Glen Innes.
2298. *Chairman.*] What do you do with your wool? It goes to Glen Innes, and thence by rail to Sydney.
2299. If the Moree line be constructed, will it bring you closer to Sydney? I do not think so. Unless the rates from Inverell to Sydney or Newcastle, by way of Moree, are such as to compete with the coast rates the wool will go to the coast. We can get the wool to Sydney or Newcastle now if we choose to use the coast line at £4 a ton.
2300. That is from your station? Yes. To Newcastle we pay £5 2s. 6d., and to Sydney £6 by rail.
2301. What is the dray carriage to Glen Innes? It includes that.
2302. If you sent it to Sydney by way of Grafton the saving would be £1 10s. a ton? Yes.
2303. Why do you not send your wool by way of Grafton if you can save this sum by doing so? I am the manager, not the owner, and my principals make their own business arrangements.
2304. A line which will afford you a saving in land carriage will be the one which will be most advantageous to you? I think so.

Mr. John Borthwick, solicitor, Inverell, sworn, and examined:—

- Mr. J. Borthwick. 2305. *Chairman.*] How long have you been practising in Inverell? About thirteen years. Besides being a solicitor, I am largely interested in station and farming land.
- 12 Oct., 1896. 2306. Do your family hold a large interest in the district? Yes, in many ways—in land, investments, and otherwise.

2307. Which railway are you in favour of? Of the one between Inverell and Glen Innes. I would like to submit schedules to you showing the areas of land held by producers who are in favour of the construction of a railway from Glen Innes to Inverell, and whose signatures are attached. These schedules are made in divisions, and show the land under cultivation, the land under grazing, and the total area:—

SCHEDULE showing areas of land held by producers who are in favour of the construction of a line of railway from Glen Innes to Inverell, and whose signatures are attached hereto:—

Taking the aggregate of those schedules, the land under cultivation is 11,924½ acres; the land under grazing is 124,130 acres; and the total area is 207,494.

2308. Would these people be benefited by the construction of a railway to Glen Innes? Yes.

2309. I suppose the people are not lying 50 or 60 miles out? No; these signatures are the signatures of farmers.

- Mr. J. Borthwick.
12 Oct., 1896.
2310. When were they collected? Quite recently—within the last few weeks. I should like to point out these schedules show an area under cultivation of 11,924 acres. Looking at the police return of the land under cultivation for the year 1895, I find it to be 13,827; that is within the police district.
2311. Would that include Little Plain? At any rate, it includes some on that side. Of course, it would not include all Little Plain. The difference between the 11,000 acres and the 13,000 acres is so slight that there is almost unanimity. One witness said that nineteen-twentieths of the people of this district were in favour of the construction of a line between Inverell and Moree, and yet the figures show that of the 13,827 acres under cultivation the owners of 11,294 acres are in favour of connection between Inverell and Glen Innes.
2312. Do you say that the last police returns show an aggregate cultivation to the extent of 13,827 acres? Yes; as furnished to me by the police.
2313. Are there any outside police-stations a short distance from here? They would all be returned by the officer in charge of the station here. They are collected from the surrounding stations.
2314. Are you quite sure your schedules are all embraced within the same area? To the north, to the east and south they are. I do not think there is any mistake in those figures; if there is I am not aware of it.
2315. If there are 13,000 acres of land under cultivation and the owners of 11,000 acres of that amount have practically signed a petition in favour of the Glen Innes line, it is difficult to understand why there is any evidence in favour of the Moree line? I understand exactly what you mean. The opposition to the Inverell-Glen Innes line comes almost from one quarter—that is Little Plain, and out that way. I would like to say, in order to show that there is settlement between here and Glen Innes, that there is a large farm of 420 acres owned by one man, which is all under cultivation. A little further on there is another farm owned by the same people, where they have 300 acres under cultivation. A little further there is another property owned by Mr. Griffin, where over 400 acres are under cultivation. The schedules I have put in will show that. Then, of course, there are smaller holders; there are several others of 100, 170, 140, 150, and 160 acres.
2316. *Mr. Roberts.*] Can you produce the original document signed by these owners of property? Yes; I have handed it in.
2317. That is valueless. There is nothing written upon it to show what they are actually signing. When were the signatures obtained? Within a fortnight and three weeks ago. Some of them came in within the last few days.
2318. *Chairman.*] Have you any other information? I should like to mention that there is a loss of a considerable sum upon the main northern line. That is a matter which should have been taken into consideration by Mr. Harper; I do not know whether he did so or not. There is, however, a loss on the northern line between Werris Creek and Wallangarra, and if the traffic, which has up to the present gone from these districts to Glen Innes, is diverted from the main trunk line it is a fair thing to take into consideration in estimating the earnings of a line from Sydney to Inverell by way of Moree.
2319. You think it will increase the loss? Yes; it will add to the estimated loss of £2,800 a year. Again, if, as was stated yesterday by some of the witnesses, the rates are differentiated, that should be taken into consideration also. The loss would be increased. That estimate is framed, I take it, upon the basis of £8 7s. a ton for carriage. If the rate is differentiated and brought lower, I think that loss should be taken into consideration.
2320. You mean that any departure from these figures will add to the loss? Yes.
2321. *Mr. Black.*] Further than that, you mean that the traffic, being estimated by the greatest amount possible to be carried over the Inverell-Moree railway, is not to be increased by any differentiation of rates; therefore, any reduction in the rate of carriage must be a loss which cannot be reduced by reason of increased freights? Just so; and it would, to my mind, be a burden to the taxpayer.
2322. When you obtained the signatures in favour of the route from Glen Innes to Inverell, was the question put to each individual as to which route he would prefer? I cannot say that.
2323. Because many men may sign a document such as that and not mind which way the line goes—whether to Glen Innes or Moree—provided Inverell gets a railway? The document is put in purporting to be a petition in favour of the Glen Innes line.
2324. *Chairman.*] I presume the people who signed it were not misinformed in any way? Not that I am aware of. Mr. McLean, who gave evidence a short time ago, gathered a number of the signatures.
2325. *Mr. Roberts.*] That document does not point out any of the advantages of the Glen Innes or of the Moree line? Those who collected the signatures are here. We had meetings of the committee, and representative men attended them, and they were deputed to obtain the signatures.
2326. I want to make it clear whether those who signed the document prefer the Glen Innes route to the Moree route? I cannot answer that, because I did not obtain the signatures myself. I was about to remark that much capital appears to be made out of the land which is to be alienated along the route of the proposed railway from Inverell to Moree. Anyone who knows anything of the land laws knows that from 1861 to 1884—a period of twenty-three years—the land was alienated in a wholesale manner, and all the good land was put together by landowners. When the Act of 1884 came into operation the holdings which were left were put into resumed areas and leasehold areas. Of course the resumed areas were open to selection, and the leasehold areas were reserved for a certain time, and some are still reserved to the holders. The impression is that all this large area of land which is to be alienated must be good. I think, however, it cannot be good or it would have been taken up long ago whilst the system of alienation was going on. I do not attach much importance to the fact that there is a large area of land available for settlement. The action of the Department of Lands in that part of the country shows very clearly to my mind that it will never be a population-carrying area, inasmuch as there are no small areas. They are all large areas of settlement leases and homestead selections. There are no such small areas as there are at Inverell.
2327. Then you think the additional settlement is not likely to be large? I do not think it is. In this district instances have come under my knowledge in which homestead selections have been brought down to an area of 40 acres—that is about 5 miles from town. Again, with regard to the western market I think it must be a limited market. I am fairly well acquainted with the country between here and Moree, and after going a certain distance west from Inverell I should say the country is all pastoral country, and not fit for agriculture. Eighteen or 20 miles west of Inverell you come into country which is pastoral country. 2328.

2328. Do we understand that you think there is not sufficient population at present to absorb your produce, and you view with much doubt the idea that additional population can be settled? Yes; then of course there is the objection to be encountered in the shape of the construction of the line from Narrabri to Moree. There are producers all along that line—at Gunnedah, Tamworth, and Quirindi. They must come into competition with producers here who look for other markets in that direction.
2329. You are, therefore, of opinion that a market exists elsewhere? I think we must be connected with the main trunk line, and look for our markets there. This is a local—one might say a parochial market.
2330. Have you ascertained whether the landowners would be desirous of giving the necessary land required by the Railway Commissioners for the construction of a railway? No.

Mr.
J. Borthwick.
12 Oct., 1896.

Mr. Hector McLean, storekeeper, Inverell, sworn, and further examined:—

2331. *Chairman.*] Did you obtain a number of the signatures which are attached to the document which has been put in by Mr. Borthwick? I am prepared to swear that the parties who signed that document knew exactly what they were signing.
2332. Did you obtain a number of the signatures? Yes.
2333. *Mr. Roberts.*] Are you prepared to say that the persons whose signatures are attached to this document are hostile? Those whose signatures I collected are, but I did not collect all the signatures.
2334. Were those signatures obtained by a paid collector? No.
2335. Were they obtained by the respective members of the committee? Yes.

Mr.
H. McLean.
4 Oct., 1896.

Mr. Casper Limberg, farmer, Inverell, sworn, and examined:—

2336. *Chairman.*] Where is your residence? Seven miles west of Inverell.
2337. How long have you been on your present holding? Since 1870; I have been in the district for thirty-five years.
2338. *Mr. Roberts.*] What is the extent of your holding? I have 1,000 acres.
2339. What area have you under cultivation? About 260 acres; I have added 50 acres during the last six months.
2340. Has the result of your labours been satisfactory? Yes, so far.
2341. Have you always been able to find a market for your produce? Yes.
2342. Where do you generally send your wheat? It is generally sold in Inverell; sometimes I sell to the millers, and sometimes to the storekeepers.
2343. What is the highest price you have obtained for your wheat? 12s. 6d. a bushel; the lowest price I have ever obtained is 1s. 9d.
2344. What price do you reckon is a paying one? Two shillings and sixpence.
2345. Are you anxious for Inverell to be connected with a railway? Yes.
2346. What do you think is the better route? To Glen Innes.
2347. Did you sign the document which has been presented by Mr. Borthwick? Yes.
2348. Did you sign it as preferring the Glen Innes route to the Moree route? Yes; and I collected other signatures.
2349. Does the surveyed line run through your property? Yes; through the centre of it.
2350. Why do you prefer the Glen Innes route to the Moree route? I have had a good deal to do with produce in Moree, and I find the market unsatisfactory. In 1888 I had a good market in Bingera; I sold something like £100 worth of produce there in that year which was a dry season. I sold £70 or £80 worth in Moree. Since that time I have only sent 1 ton to Moree. This year, however, I sent a fair quantity to Moree.
2351. What price do you pay for carriage? £2 a ton.
2352. Do you not think that Moree would be a good market for your produce if a railway were constructed, in view of the reduced rate of carriage? No; Moree only requires produce in a dry season.
2353. Did you ever sell any wheat in Glen Innes? No; if I had had teams I should have sold there. Mr. Utz, of Glen Innes, generally gives 3d. to 4d. a bushel more than they do at Inverell, but I could not get teams to send my stuff there.
2354. Why do you prefer the Glen Innes route? Because it opens to the south, north, and east. I think we could get a more extended market there. I may say the agricultural land at Bingera is first-class, and I believe it will grow better wheat than here.
2355. How many bushels do you get to the acre? The heaviest yield I have had is 33 bushels.
2356. What is your average yield? About 20 bushels.

Mr.
C. Limberg.
12 Oct., 1896.

Mr. Charles Munsie, farmer and grazier, Swanbrook, sworn, and examined:—

2357. *Mr. Black.*] How many miles are you from Glen Innes? Thirty-four.
2358. Do you do business with Inverell? Yes, Inverell and Glen Innes.
2359. Are you in favour of the Inverell-Moree railway? No.
2360. Do you favour a Glen Innes-Inverell railway? Yes.
2361. Why? Because we should then have a market north or south.
2362. Have you ever sent any wheat to Glen Innes? Yes, many times to Mr. Utz.
2363. Have you found any difficulty hitherto in disposing of your wheat crop? No. You can never sell a great amount about here, but you can always get a market at Glen Innes.
2364. What is your area under crop? We cultivate up to 400 acres. My brothers and I hold about 2,000 acres.
2365. Why do you not put the whole area under crop? We could not sell the produce. The limited character of the market would prevent it. If the railway were extended from Glen Innes to Inverell we could put three-fourths of the area under crop. I may say we should require four or five trucks a month to carry stock—such as pigs, sheep, or cattle to Sydney. I do not think it would pay us to send to Moree. We have sent little lots there, but they have never paid the carriage down. We have sent flour and potatoes there.
2366. Have you sent any there within the last twelve months? No.

Mr.
C. Munsie.
12 Oct., 1896.

Mr.

Mr. John Griffin, farmer and grazier, Swanbrook, sworn, and examined.—

- Mr. J. Griffin. 2367. *Mr. Clarke.*] What area do you cultivate? Along with my sons, 400 acres. I have 1,700 acres altogether.
- 12 Oct., 1896. 2368. Are you in favour of a line from Moree to Inverell? No; but I am in favour of a line from Inverell to Glen Innes. I have always found the best markets to the east.
2369. Were you a resident of the Colony prior to coming to this district? I came from Victoria with a family of sixteen. I have been a farmer ever since I can remember.
2370. Where do you sell your wheat? Last week I sold it in Inverell.
2371. I suppose you sell in the best market you can get? I could have sold better to Mr. Utz—at 4s. 3d. a bushel—but I missed the market.
2372. *Mr. O'Connor.*] How long were you in Victoria as a farmer? Seven years, and for thirty years I was in South Australia.
2373. Is the land about here as good as it is in Victoria? Yes; in some parts it is better.
2374. Are you doing better here than in Victoria? No; the money I made there I spent here.
2375. In what part of Victoria were you? The Wimmera.

Mr. Alfred Oliver, Mayor of Inverell, sworn, and examined:—

- Mr. A. Oliver. 2376. *Chairman.*] How long have you been in the town and district? Thirty-eight or thirty-nine years.
- 12 Oct., 1896. 2377. *Mr. O'Connor.*] Which of the two lines under consideration would be most beneficial to the district? It would be of no use me giving my evidence unless there was an extension of the line to a port such as Grafton, or some other place. I look upon that as a national line. A line from Inverell to Moree is a parochial one.
2378. Have you any objection to offer to the construction of a line between Inverell and Moree? Only one. The market is a very limited one, and always will be, more particularly as there is a line from Narrabri to Moree, which will materially affect our output there. I do not think the country is one which will ever be heavily populated.
2379. Do you know the country between Inverell and Moree? Yes; it is a fine country.
2380. Apart from your national aspirations, would you be unfavourable to the construction of a line between Inverell and Moree? Certainly not.
2381. Do you think it would benefit the country if there were a line between Inverell and Moree? Not so much as if there was a line from Inverell to the coast.
2382. Although a line to Moree would be beneficial, you think one to Glen Innes would be more beneficial? Yes, as a stepping-stone to the coast.
2383. *Chairman.*] Is there another mill in the town besides your own? Yes.
2384. What quantity of stuff do you forward to the Moree district? This year I have not sent any to Moree. In previous years I have sent an average of from 30 to 40 tons of flour—that is to Moree and down the Macintyre to Goondiwindi and Boggabilla. This season I have sent it the other way.
2385. Have you never sent more than 30 or 40 tons in one year? No.
2386. Do you forward any other kind of produce? No.
2387. Have you any general knowledge of the traffic between the two places? I have not. I know a lot of corn and other things go that way, but I cannot tell you to what extent. Since the 1st of September I have sent nearly 100 tons of flour to Glen Innes, and it has gone on from there to Armidale and Hillgrove. I have also sent flour to Tenterfield.

Mr. Josiah Rolfe, farmer, Swanbrook, sworn, and examined:—

- Mr. J. Rolfe. 2388. *Chairman.*] How long have you been at Swanbrook? Twenty-three years.
- 12 Oct., 1896. 2389. Are you near the main road? Two and a half miles from it.
2390. Are you near any of the old surveys? Yes; one passes on one side, and one on the other.
2391. Would a line to Moree suit you? No; because I found no market there.
2392. Could you not make a market if you had an opportunity of taking stuff there? A probable or providential market could be made.
2393. Would you not be able to get your produce to Moree and Narrabri cheaply by rail? As far as wheat is concerned, if a line were laid down to-morrow morning there would be a limited market in Moree for our flour.
2394. Which do you think is the market for this part of the country? I have sold nearly all my produce east.
2395. Naturally you would do that, because you lie so much closer to Glen Innes than to the western country? The eastern buyers have come down year after year and have given us as much at our doors as, and sometimes more than, we could get locally.
2396. You do not expect to do better than that if you have to take your produce west? No, nor as well.
2397. The only difference the railway, if constructed to Glen Innes, would make to you would be to give you a little cheaper carriage? Yes, both on our requirements and production.
2398. Did you ever take into consideration the idea that it is possible, in the future, that the production of Inverell may be so great that the eastern markets may be altogether swamped with it? I have thought that might be the case; but it will take time to produce that quantity, and if the line be extended further our market will go further.
2399. If the line be extended west will you not have a market there? But the population is so scattered and the market is so limited. I may state that I started late this year to try the Moree market, but on my son arriving at Warialda he ascertained that the market was so low that it would pay him better to let the produce go at Warialda at 7s. 9d. and 8s. a bag.
2400. I suppose if there had been a market with Moree you would have had your share there before now? I would have availed myself of it if it had been there.

Mr.

Mr. William John Goldman, farmer, Swanbrook, sworn, and examined:—

2401. *Chairman.*] How long have you been at Swanbrook? Since 1872.
 2402. *Mr. Black.*] How many acres do you hold? 186.
 2403. How many do you cultivate? 100.
 2404. Is the remainder suitable for cultivation? Portion of it.
 2405. Why do you not cultivate all the cultivable land? In the present state of the market I cultivate sufficient.
 2406. Are you in favour of the Inverell-Moree railway? No; I favour the Inverell-Glen Innes railway.
 2407. Have you any reason for being opposed to the Moree railway? Yes. I have always found a market for my produce east of Inverell.
 2408. Have you ever sent any produce to Moree? No; but I have sent a little maize to Warialda.
 2409. Cannot they grow maize crops there? I think they can grow some, but not a great deal.
 2410. Do you think the market there is limited? It is.
 2411. Why do you favour the Glen Innes route? Because I think there is a better market there for wheat than there is to the west. For the last fifteen years I have always sold for cash at Glen Innes to Mr. Utz.

Mr. W. J.
Goldman.

12 Oct., 1896.

Mr. John Archibald Anderson, grazier, Newstead South, sworn, and examined:—

2412. *Chairman.*] How long have you resided in the district? Twenty-seven years.
 2413. *Mr. Clarke.*] What is the extent of your holding? 20,000 acres of secured land, of which a large part is suitable for agriculture. I have 150 acres under cultivation on my own account and about 200 acres let to tenants.
 2414. If you had a suitable market would you cultivate to a greater extent? Yes.
 2415. Are you in favour of the proposed railway? No; I am in favour of a line to Glen Innes or Dundee. I do not think there is any outlet to the west. From what I know of the district I think the estimate of one man to 20 square miles is a fair one. It is a fine grazing district, but I do not think agriculture is possible; the seasons are unsuitable for it. The rainfall is sparse, and the heat is too great. Hitherto it has not been practised there.
 2416. If the proposed line were constructed, would you approve of carrying it on further to Glen Innes? Certainly.
 2417. Do you think it would be better, in the interests of the district, that a line should be constructed to Glen Innes instead of to Moree? Certainly. It would enlarge our market, and I think there are greater possibilities that way than on towards Moree. It would, in times of scarcity, give us a market in Queensland.
 2418. Do you think much flour would go to Queensland? That purely depends on the season, but that, I think, is merely a by-issue.
 2419. Could you interchange produce with Glen Innes and towards the coast? The coast, of course, is our ultimate goal. Personally, I am in favour of Dundee and Tenterfield.
 2420. *Chairman.*] In your opinion, then, everything points to the connection being made with the Great Northern line? Yes. As bearing that out, I may say that I am at present letting land on clearing leases.
 2421. Do you produce wool? Yes. I send it by teams to Grafton. It costs £3 a ton to send it there.
 2422. Do you find any special disadvantage in keeping your wool on the drays for any length of time? No.
 2423. Does the wool suffer in any respect? No; in the wet season it gains rather in weight.
 2424. The wool does not deteriorate by being for three weeks on a dray? No.
 2425. If the Glen Innes extension were made, would you save the cost of carriage as far as Glen Innes? Yes.
 2426. How much would that be per ton? Perhaps a shade over £1.
 2427. What is the total weight of your clip? It varies; but the average is 70 or 80 tons.
 2428. That means a difference in carriage to you of £70 or £80? Yes.
 2429. Do you get your station supplies back from the coast by the wool-drays? No.
 2430. Do you get them by train? No; I deal with Glen Innes—the nearest point. I may say that at present I am renting land to farmers, and if there were a greater output I could place a large area of land under cultivation. I would be prepared to let 4,000 or 5,000 acres if there were a proper outlet.
 2431. Have you any land suitable for agriculture which you could let in areas of 1,000 acres? I have.
 2432. I mean areas upon which you could cultivate on a large scale? Yes; I have been approached to let land for a steam-plough.
 2433. Are you aware that wheat is now being produced in the Colony in very large areas? I am.
 2434. Is there any possibility of that happening in this district? I think I have between 4,000 and 5,000 acres of land which are capable of producing wheat.
 2435. But I mean in large areas? Yes; the person by whom I have been approached to let the land to for the steam-plough was shown the land, and he was prepared to put the machinery on. He went to England however, and the matter fell through.
 2436. Do you view the possibilities of agriculture in this district as being very large? Yes.
 2437. And if once a market were established or opened, of necessity the area must increase? Very largely.

Mr. J. A.
Anderson.

12 Oct., 1896.

Mr. Henry Merewether, grazier, Arawatta, sworn, and examined:—

2438. *Chairman.*] How far is Arawatta from Inverell? Eight or 9 miles north.
 2439. *Mr. Roberts.*] How many acres do you hold? About 7,000 of secured land, and 3,000 secured which I rent—10,000 acres altogether.
 2440. Do you graze sheep? Yes; but there are over 200 acres of cultivation.
 2441. Do you cultivate the whole of the 200 acres? No; some of it I rent in farms on halves.
 2442. What rent per acre do you get for agricultural land? I would not like to say. I let it on the halves system, and I take it in produce.
 2443. Has the result been satisfactory? No; because my man has no market for his stuff. I get it from him, and I cannot dispose of it.
 2444. Then you do not get a fair price for it? No; I have to use most of it.

Mr. H.
Merewether.

12 Oct., 1896.

2445.

- Mr. H. Mercwether.
12 Oct., 1896.
2445. Where do you send your wool? To Newcastle, by way of Glen Innes. I have sent it by Grafton which I think is the cheapest road.
2446. Is there a difficulty in obtaining teams to convey produce to Grafton? I have found it so on two or three occasions when I have wanted it.
2447. What quantity of wool do you send down in twelve months? It all depends on the sheep you have on the place. Last year we had nothing. This year the quantity will be medium. Between 40 and 50 tons has been my biggest return.
2448. Do you send any fat stock away? I have sent them to Grafton.
2449. Do you get a market for them at Grafton? Yes, a great deal better market than locally.
2450. Which way do your station supplies come? From Sydney, by way of Glen Innes, and thence by team.
2451. Have you given any consideration to the different routes which has been suggested with a view of connecting Inverell with a railway system? Yes; I think there is only one line to go upon, and that is the line by way of Glen Innes. Personally, I would sooner have none than the other.
2452. Do you not regard Moree as the market for Inverell produce? No; and I have never known much go out there, but I have known a good deal to be bought from us on the other side.
2453. Then you think there would be a more extended market by way of Glen Innes? I think so. All my experience goes to show that our market is north, south, and east.
2454. If a railway were constructed from Inverell to Glen Innes would you be a large customer to it—that is, to the extent of sending your produce to Newcastle and Sydney, and getting your stores back? Yes; and we should do a great deal more in the way of opening up our land.
2455. Would you not continue to send your wool by way of Grafton? I cannot continue to do it, because I have not done it more than once. As a rule, I send it the other way, because there is less trouble in getting carriage.
2456. If teams were plentiful and you could send it more cheaply by Grafton, although there was a line from Glen Innes to Inverell, you would be tempted, I suppose, to send it by that way? One always looks for the cheapest route.
2457. If it were cheaper to send by way of Grafton you would undoubtedly send it that way? I would not say undoubtedly that way, because time might be an object.
2458. Do you think, if a line were constructed from Inverell to Glen Innes, a large area of land would be opened up for agricultural purposes? Yes.
2459. In which direction? Wherever the good cultivation is—in all directions around here.
2460. Do you think there would be much opened up between Inverell and Glen Innes? I think nearly all would be opened up.
2461. Do you think there would be a large area opened up 20 miles west of Inverell? No; at that distance I think the land becomes less suitable for growing wheat.
2462. Is it not a fact that for 20 miles west of Inverell there is first-class agricultural land? Due west I suppose there is.
2463. If Inverell were connected by rail with Glen Innes, would a large area of that land be put under cultivation? I suppose all good agricultural land here would be put under cultivation. There would be a market, and naturally a man would put it under cultivation and make the most out of it.
2464. If a line were constructed from Inverell to Moree, would not a large area be put under cultivation? I do not see what use it would be.
2465. Do you maintain there would be no market that way? I think not—at any rate, a very limited one.

Mr. James Campbell, grazier, Pinderoi, sworn, and examined:—

- Mr. J. Campbell.
12 Oct., 1896.
2466. *Chairman.*] How long have you been in the district? Many years.
2467. Do you know the surrounding country? Yes.
2468. *Mr. Black.*] Are you a joint holder of Pinderoi with your brother? Yes.
2469. What is the total area held by the family? I can only say as to T. C. and James Campbell—about 9,000 acres at Pinderoi.
2470. In what direction is Pinderoi? North-east.
2471. What area of the 9,000 acres is under cultivation? About 40 acres.
2472. What area is suitable for cultivation? 1,500 acres.
2473. Is there any desire on the part of the residents of the district to rent the land from you? It is fine agricultural land. I could rent it if there were a market for the produce.
2474. How do you think that market could best be obtained? By a line from Glen Innes to Inverell.
2475. Do you think that would open up a market for you in Glen Innes or the metropolitan district? In the eastern and southern district. It carries a larger population than the western district.
2476. Have you formed any opinion as to the Moree-Inverell railway? I know the Moree and western country, and Goondiwindi. I do not think it is a country that will carry a population which will consume any great amount of produce.
2477. How do you obtain your goods for station use? I generally get them in Glen Innes.
2478. In the event of the line being constructed to Glen Innes, I suppose you will continue to get them there? Yes.
2479. How do you send your wool to market? By train from Glen Innes.
2480. Have you ever sent it *via* Grafton? No. I have had offers to take it to Grafton, but I have never sent it to Grafton.
2481. What was your objection? I have always sent the wool to Sydney by way of Glen Innes; and another objection is that my shed is very small, and I have not much accommodation to stow wool away, and I would have to wait for some time for carriers.
2482. I suppose when you sent your wool to Glen Innes you got station supplies back in return loading? Yes.
2483. That would considerably reduce the cost of carriage? Yes.
2484. *Chairman.*] What is the cost of carriage from your station to Glen Innes? I have always paid £1 10s., and then £3 15s. a ton to Sydney. That is £5 5s.; and I had an offer this year of £2 10s. to deliver wool in Grafton.
2485. Did that offer involve any back loading? Yes, £3 a ton to the station. 2486.

2486. Those rates are lower than those which prevailed some years ago? Yes; £3 a ton lower.
2487. I suppose the construction of the Great Northern line is accountable to a large extent for the competition by drays? Yes.
2488. Is it possible that competition will become keener? I do not think so. They could not live at less.
2489. Supposing Inverell were made the starting-point of the line to go west, would you send your wool by it? No. I would send the wool to Grafton rather than by way of Moree, because that would mean carrying it all over the country.
2490. Would you not get it cheaper by drays to Grafton? Yes; at the present rate of road carriage.
2491. If it cost you £3 15s. per ton from Glen Innes to Sydney, the inference is that it would be more to Sydney by way of Moree? That is what I think. I consider the line, if built from Inverell to Moree, will be a great drain on the main northern line.
2492. It will be a sucker? Yes.

Mr.
J. Campbell.
12 Oct., 1896.

Mr. James Jackson Wray Gibson, grazier, Roseneath, sworn, and examined :—

2493. *Chairman.*] How long have you been in the district? Since 1863.
2494. *Mr. Clarke.*] What is the extent of your holding? 1,000 acres.
2495. Is it adapted for cultivation? A large quantity is.
2496. Do you think the proposed railway, or one to Glen Innes, would be most suitable for the public generally? I have only held one opinion about the railway policy of this district for twenty years, and that is that the only line to benefit Inverell would be one to Glen Innes. If we got to Glen Innes we should have a choice of markets for our produce. We should have the northern, southern, or eastern markets.
2497. Are you of opinion that the country towards Moree is unsuitable for agriculture? I should imagine so on account of the slight rainfall. There is some good agricultural land 10 to 15 miles westward of Inverell.
2498. I suppose a large population could not exist on that dry western country? No. A large population would have to follow agricultural pursuits, and that country is not fitted for agriculture. It is more fitted for grazing.
2499. What area of country about Moree and west of Moree would support a family? Perhaps 1,000 to 3,000 acres.
2500. In that case there would not be much more settlement? No; I do not think there could or would be.
2501. I believe the country in the neighbourhood of Warialda and towards Inverell is good? Yes, a large proportion there is suitable for agriculture.
2502. Is most of it taken up? Yes; most of the good land is alienated.
2503. Do you think those who hold the land would cultivate it themselves or let it out on shares? I think they would, they would find it more advantageous to them than grazing with sheep or cattle.
2504. Do you think the wool grown about here would go to Glen Innes or Moree if the line were constructed? I think it would go to Glen Innes. Our great idea is to become connected with the northern line, and then perhaps some day with the coast.
2505. *Chairman.*] I believe you have been connected with the railway agitation here for a long time? Yes; I remember Sir Henry Parkes being here in 1872, and saying this district ought to be connected with a railway in twelve months.
2506. You formed an opinion then that the connection should be with the Great Northern line? Yes.
2507. Have you had occasion to alter your opinion since that time? No, none whatever.
2508. Do you consider that if a line were taken from Inverell west, the question of a connection with the Great Northern line would be very remote? I think it would.
2509. It would mean then that for all time your traffic from Inverell would have to travel by way of Moree and Narrabri to get to the metropolis? If we made use of the railway it would.
2510. Supposing a line were constructed to Moree and in the course of time it were extended to Glen Innes, what advantage would that be to the country as a whole, or would it be any? I think it would be an advantage to the country.
2511. If that extension were made, and in the future an extension were made to the coast, the inference would be that the traffic would go direct from the west to the coast? The inference would be that it would go direct from the west to the coast, it being the shorter distance.
2512. If that occurred what would be the value of the piece of line between Moree and Narrabri? None whatever.
2513. Was not that line constructed in order to take the western and north-western trade? Yes.
2514. If there were a connection right through from Moree to Glen Innes would the traffic go to the coast or the other way? It would go to the coast if the line to the coast were a shorter distance from Moree than Newcastle or Sydney. I think if a line were constructed from the coast to Moree it would take a tremendous amount of traffic off the Great Northern line.
2515. Consequently it would take a great deal of traffic off the Narrabri to Moree line? That is only a short line.
2516. But it will carry a large quantity of wool? Undoubtedly.
2517. I suppose you are getting tired of this agitation and would be glad to get a line through almost anywhere? Excepting Moree.
2518. You think then it is better for the district to wait and do without a railway than have one which will be no good to you? I think so.

Mr. J. J. W.
Gibson.
12 Oct., 1896.

Mr. Arthur Robinson, farmer, Dinton Vale, sworn, and examined :—

2519. *Chairman.*] How long have you been in the district? Since 1889.
2520. *Mr. O'Connor.*] Where is Dinton Vale? Sixteen miles north of Inverell, on the Queensland route.
2521. What area of land do you possess? 3,000 acres. It is mostly conditionally purchased.
2522. What extent have you under cultivation? 400 acres.
2523. What do you produce? Wheat, corn, and lucerne.

Mr.
A. Robinson.
12 Oct., 1896.

- Mr. A. Robinson.
12 Oct., 1896.
2524. Where do you find a market for it? I found a good market from 1889, for three years, in Inverell, and after that there was no market. I sent some out to Mr. Utz, of Glen Innes. I got a good market at first, and after that Mr. Utz did not buy, but went to other places.
2525. What is your opinion of the proposed line of railway? My market, as far as I have gone, has always been in Glen Innes. Personally, I favour the Glen Innes route.
2526. Why? Because I can get a market in Armidale and Hillgrove.
2527. Knowing that, you are favourable to a line to Glen Innes, but are you sure you would not get a market to the west? I might, possibly.

Mr. William Nichols, farmer and storekeeper, Dinton Vale, sworn, and examined:—

- Mr. W. Nichols.
12 Oct., 1896.
2528. *Mr. Roberts.*] Where is your property? Seventeen miles north of Inverell.
2529. Do you go in for mining? Yes; at times.
2530. What do you find? The last we found was coal.
2531. Did you make any money out of it? No; but we are in hopes of doing so when we get a railway. We have lifted a good deal of coal lately, and we are selling a little in town. We are taking some to Queensland.
2532. How many tons have you raised? I can tell you what I have raised in the last two quarters. I have sold about 14 tons in one quarter, and 15 tons in the other.
2533. Do you employ many men in coal-mining? Only two I have working. We have 100 tons now lying on top of the shaft. According to the geologist's report, it is supposed to be as good as any in the Colony. The seam is 30 yards wide. We have sent some to Glen Innes on trial. If it suits we should have a market there.
2534. Which railway communication would suit you best? Glen Innes.
2535. I suppose you would have to cart your coal 17 miles before getting to the railway? The coal is further away than that; it is a good many miles on the other side of where I live. It will be about 36 miles due north of Inverell.
2536. If a railway were constructed from Inverell to Moree would it not go nearer your property? No, Inverell would be the nearest point.
2537. Is the coal suitable for domestic purposes? Yes, it is used in Inverell in the Bank of New South Wales, and in other places. It was burnt here last winter and the previous winter in the blacksmith's shops.
2538. Is it equal in quality to the Newcastle coal? Yes, the blacksmith says it is better.
2539. Could you supply coal in Inverell as cheaply as that which the people at present use? Yes, I am prepared to deliver any quantity in large quantities at 25s. a ton.
2540. Is that what the people are in the habit of paying for it? No, they pay more than that; we only sell small quantities and get £2 a ton. If I had a large order I would deliver it for 25s.
2541. Where would you expect a market for the coal? At different places, we can send it to Glen Innes, and in Inverell we could sell a great deal. Plenty of the coal is to be seen in the town.
2542. Do you favour the Glen Innes route principally on account of the coal? No, I have always favoured it on principle. I can see no outlet the other way. I think they will be able to grow as much as they want at Moree by means of irrigation.
2543. But they do not grow anything at Moree at present? No; but they will do.
2544. When? I have seen 50 bushels of wheat to the acre as far as Moree down the river.
2545. Are you prepared to deliver coal at Glen Innes if the line be constructed, at a lower price than the people are able to obtain it at Newcastle? I believe we can run it there as cheaply.
2546. Would you bring it by team to Inverell and put it on the line? I think we should bring it here first, but I cannot say at present. There is no doubt we should carry it the cheapest way whichever it is.

Mr. Thomas Mason, farmer, near Inverell, sworn, and examined:—

- Mr. T. Mason.
12 Oct., 1896.
2547. *Chairman.*] How far do you reside from Inverell? Thirteen miles north.
2548. *Mr. Black.*] What is the area of your holding? 150 acres, of which 80 acres are under cultivation.
2549. Is the balance suitable for agriculture? Yes.
2550. Have you any reason for not putting it to that use? If I cultivated any more I should have no market for it.
2551. Do you think a market can be best found by means of a railway? Yes.
2552. Which route do you favour? The Glen Innes route.
2553. What is your objection to the Moree route? Moree will be a limited market.
2554. Do you think the market supplied by railway to Glen Innes will be practically unlimited? It will, eventually, when it finds its course into Queensland. I look upon Queensland as a great market.
2555. Do you think the market will be unlimited if there is communication with the coast? I do.
2556. Would the railway go in the direction of your property? No; personally, I should like also to see a railway extended west—to Moree and Goondiwindi. A large amount of produce goes to Queensland at the present time that way.
2557. Do you think two railways—one west and the other east—would pay? Both could not pay.
2558. Would you favour the construction of a railway which would not pay? No.
2559. Would the Moree railway pay? I do not see how the inhabitants could consume sufficient produce to make it pay.
2560. Do you think a railway to Glen Innes would pay? I think it would, on account of there being so many markets open for it. I may say there are some tin mines 8 or 10 miles east of Inverell, which are becoming largely developed, and I think there is every likelihood of some silver-mines being developed.
2561. Do you mean in the direction of Elsmore? Yes.
2562. Do you think a railway would assist the development of the tin-mines? Yes; I have every reason to believe there is a large deposit of tin there.

Mr.

Mr. Benjamin Champion Martin, miner, Tingha, sworn, and examined :—

2563. *Chairman.*] On what point would you like to give evidence? I would rather see the Inverell-Glen Innes railway constructed than the Moree railway. It will just pass a silver lode which we are trying to open up 16 miles east of Inverell. Mr.
B. C. Martin.
12 Oct., 1896.
2564. What has been the result of your operations so far? We have not got our assays back yet. I have taken a promiscuous assay myself, and it went from 33 to 34 oz. to the ton. By treatment it could be brought to a higher pitch.
2565. Are you of opinion that if the Glen Innes line were constructed it would enable you to carry your ores to the big works at Newcastle or elsewhere? Yes.
2566. In order that that might be done I suppose the cost of carriage would have to be lower? Yes.
2567. Do you think the prevailing rates on the railway are such as to admit of your sending your ores to the markets? Yes, were it not for the carriage of teams.
2568. Is your lode a big one? Eighty feet wide, so far as we can see at present.
2569. Does it promise a large freight for a railway? Yes; with 240 men working below we can produce 15,000 tons of ore for the market annually, and if we could save 10s. a ton in the carriage, it would mean to our company £7,500 per annum.

Mr. Andrew Murray, pastoralist, Bannockburn, sworn, and examined :—

2570. *Chairman.*] Where is Bannockburn? North-west from here. Mr.
A. Murray.
12 Oct., 1896.
2571. *Mr. Clarke.*] What are your opinions as to the construction of a line from Moree to Inverell? I think it is the only line that will suit this district. Moree is the only market we have for agricultural products.
2572. Is the country around Moree suitable for agriculture? No, not in all seasons, because of the insufficient rainfall.
2573. Where is the best agricultural land?*
2574. You think west and north-west of Inverell would be your best market? Yes.
2575. Is the population large? †
2576. You do not approve of the construction of a line to Glen Innes? Not at present; it would be too expensive. The cost per mile would be more than the traffic would pay. The rates would have to be fixed so high that we could not send our produce that way. The line would cost more to work than the Moree line; the gradients would be steeper.
2577. Where do you send your wool? To Glen Innes at present.
2578. Would you send it to Moree in the event of a line being constructed there? Yes.
2579. Being nearer to Glen Innes, would it not suit you to send it there? If a line were constructed to Glen Innes I would very likely send there. Of course I would send by the cheapest route.

Mr. Peter Colin Campbell, grazier, Inverell Station, sworn, and examined :—

2580. *Chairman.*] How long have you been in the district? All my lifetime. Mr. P. C.
Campbell.
12 Oct., 1896.
2581. How many acres are there on Inverell Station? About 40,000, of which 30,000 are freehold.
2582. Is any of it cultivated? Yes; 500 or 600 acres.
2583. Have you had any applications for farming areas? Yes; we are letting it on terms—principally on thirds.
2584. What proportion is suitable for agriculture? About one-third of it. The reason that is not cultivated is the absence of a market.
2585. How would you best obtain a market? By a railway to the coast—from here to Deepwater and Lismore.
2586. You would not be in favour of a railway to Glen Innes? No. I do not think it will be of any benefit to us, unless it goes to the coast.
2587. If you had a railway to Glen Innes, and an extension to Lismore, would it satisfy you? Yes, so long as we got to the coast.
2588. Failing that railway, is there any other scheme which would be of benefit to you? No. The Moree line might be of benefit to us just now in getting rid of our produce. There is a good outlet there in times of drought.
2589. But in good seasons I suppose there is a limited market there? I think so.
2590. Do you think Moree would be a buyer of a large quantity of wheat from you if you had direct railway communication? I suppose they would require a lot of wheat by-and-bye when the country is thrown open.
2591. Do you think if the country is thrown open it will greatly increase the population? I do not know about that. I think it is principally grazing country.
2592. How many sheep will it carry to the acre? In an average season, I think it will want 3 or 4 acres to a sheep.
2593. Do you think a man could make a living out of grazing 500 sheep? Yes; but it would be hard living, no doubt.
2594. Supposing we say that each family requires 2,500 acres, a vast area of country would be necessary to settle 1,000 families? It would, indeed. I do not think it will ever be a vastly-populated place.
2595. As there are only about 1,500,000 acres to be thrown open during the next few years the country is not very likely to be thickly populated? No.
2596. Therefore, even if population is effected by the construction of a line to Moree, the market for Inverell is not likely to be greatly increased thereby? No, except in bad seasons.
2597. How do you send your wool to market? To Glen Innes, and then by train to Newcastle.
2598. Have you ever sent it to Grafton? I have sent a lot or two there. I prefer the other way.
2599. Why? I think the wool does not get so much knocked about as it does by being shipped at Grafton.

2600

* *Note (on revision)* :—Within a distance of 20 miles in a westerly direction from Inverell, thence about 35 miles north-west, thence to a point about 12 miles east north-east from Inverell, thence by a circular line east and south, thence by a westerly line passing to the south of Inverell, about 1½ mile west to point of commencement, will include the greater part of the best agricultural land in the district.

† *Note (on revision)* :—It is not thickly populated at present, but the extent of country is very large, and is rich grazing land. The population is increasing rapidly. Our surplus agricultural products have nearly all been marketed west and north-west for the past twenty-five years, also large quantities of potatoes from Glen Innes, Ben Lomond, and Guyra. Through climatic causes agriculture cannot be a success far west or north-west of Inverell.

- Mr. P. C. Campbell.
12 Oct., 1896.
2600. How do you obtain your station supplies? By the same route—by train and carriage.
2601. We may presume that if a railway be constructed to Inverell your wool would be trained for Sydney at Inverell, and your goods would be carried from Sydney by train to Inverell? Yes.
2602. *Mr. O'Connor.*] Do you send your wool to Newcastle? Yes; and thence to London.

Mr. Thomas Jones, selector, near Inverell, sworn, and examined:—

- Mr. T. Jones.
12 Oct., 1896.
2603. *Chairman.*] Where is your property? Sixteen miles south-east from Inverell, in the direction of Tingha, 42 miles from Glen Innes.
2604. *Mr. O'Connor.*] How long have you resided in the district? Twenty-three years. Six years of which I was Warden's Clerk and Mining Registrar.
2605. What extent of country do you occupy? I hold 186 acres under the Crown Lands Amendment Act of 1875.
2606. Which route of railway do you think would be better in the public interest? The Moree route. I think that will benefit the nation more. There is a large and growing population extending out towards Moree. Also out west in the vicinity of the townships of Warialda, Parramallowa, Mungindi, Boggabilla, and Goondiwindi, Moree being a distributing centre. I have traversed that country occasionally for the last twenty years, and I have traded backwards and forwards amongst the selectors and squatters surrounding Moree and its environs.
2607. Where do you find a market? In all the places I have mentioned; but the best market for fruit and produce is in the vicinity of Moree. I have seen potatoes grown and sold at Ben Lomond at 18s. a ton, and sold at 20s. a bag in Moree. I have sold grapes at Moree at 9d. per lb. late in the season, where but little fruit is grown.
2608. How much could you get at Glen Innes? About 3d., and a dull sale; the climate is cold.
2609. Then you think a line from Inverell to Moree would be the better one? I believe it will be better for the district and for producers at Inverell. I believe a line to Glen Innes will be the damnation of the fruit growing interests at Inverell.

Mr. Robert Howard, secretary, Moree-Inverell Railway League, Inverell, sworn, and further examined:—

- Mr. R. Howard.
12 Oct., 1896.
2610. *Chairman.*] I believe you desire to amend your evidence in some respect? Yes; with regard to the estimated traffic between Warialda and Moree. I believe one of the witnesses has stated that the number of sheep in the Warialda district is only 1,000,000. The Statistical Register for 1894 and previous years shows it to be 1,505,540. With regard to the item of estimated traffic between Inverell and Warialda and vicinity, I have to state that this item is meant to include the probable traffic from the important town and district of Bingera, which is situated about 28 miles from the town of Warialda. Assuming that a line of railway are constructed from Tamworth to Manilla, Warialda station, on the proposed line from Moree to Inverell, will not be more than one-half the distance from Bingera than Manilla is, consequently it is natural to assume that the trade of this district will all go to Warialda station. If so, we consider that we have under-estimated the traffic to and from that station. We have not got the population of Bingera and Upper Bingera towns, but would wish to point out that the population is on the increase rather than on the decrease, as it is a very rich gold and diamond mining district. There are also two roller flour-mills there, one of which runs full time, and puts through about 30,000 bushels per annum.

Mr. John Makim, farmer and grazier, Gum Flat, sworn, and examined:—

- Mr. J. Makim.
12 Oct., 1896.
2611. *Chairman.*] Where is Gum Flat? Twelve miles west of Inverell.
2612. *Mr. Roberts.*] How many acres of land do you hold? In conjunction with my two sons, about 4,500 acres.
2613. How many out of that are under cultivation? 100 acres; the remainder I use for grazing.
2614. Do you not find it to your advantage to cultivate more than 100 acres? No; I cannot get rid of the produce on account of the difficulty of finding a market.
2615. Have you been able to make farming pay up to the present? In recent years it has not paid; I have found it difficult to dispose of wheat in this town at 2s. a bushel.
2616. Where do you sell your wheat? At Inverell.
2617. Do you get cash for it? Part cash and part goods. For the last two years we got about 2s. a bushel for it, but of late it has been difficult to sell at that price. This year, however, the season has been dry, and we have got 4s.
2618. Does the surveyed route of the proposed line go through your property? No; it runs 8 miles north of it.
2619. Do you think the line would be of great advantage to you and your neighbours? Yes.
2620. Would you expect to find a market for your produce to the west? Yes; and we could send the surplus to Newcastle or Sydney.
2621. Do you prefer the proposed route to that *via* Glen Innes? I do; but would accept any route.
2622. Do you think a railway to Moree would result in a larger area of land being put under cultivation? I am sure of it. I myself would probably put in 500 acres more of wheat, potatoes, and corn. I have 1,000 acres of good agricultural land.
2623. Is the soil of the Inverell district well adapted for the growth of potatoes? Yes; it is hardly as suitable as that of Glen Innes, in consequence of the rainfall not being so much. It is not quite so moist here as it is at Glen Innes.
2624. Does not Glen Innes bear a reputation for the excellent quality of its potatoes? Yes; the crop is more certain there.
2625. If the line were constructed, do you think a large area of land would be put under potato crop? Yes.
2626. Where would there be a market for potatoes? West of Moree and district.
2627. Do you produce any wool? Yes; and I send it mostly to Sydney *via* Glen Innes.
2628. Do you ever send any by way of Grafton? I did on one occasion.
2629. Did you find it more advantageous to send it that way than to send it by rail? It depends on the state of the market. If we want to get it down quickly we send it by rail. When it goes by Grafton it is delayed on the road, and you often lose the sale of it in Sydney.
2630. If a line were constructed to Moree, would you send it that way? Yes, to Sydney or Newcastle.
2631. I suppose there would be no difficulty in laying down 500 acres under potato crop? No.

2632. What would the yield be per acre? Some of the land would yield about 10 tons to the acre, but the general yield would not amount to more than 5 tons, and in dry seasons about two.
2633. Do you think you could find a sale for 2,500 tons of potatoes in the Moree district? Hardly.
2634. Therefore, if you want to grow potatoes to supply Moree, you must not grow 500 acres? No.
2635. Would you not be likely to find a market for potatoes at Narrabri? Yes, and Walgett too. Twenty miles west of this place you cannot grow potatoes or wheat and make them pay.

Mr.
J. Makim.
12 Oct., 1896.

Mr. Peter McCarthy O'Sullivan, farmer and grazier, Bannockburn, sworn, and examined:—

2636. *Chairman.*] How long have you resided in the district? Twenty-four years.
2637. *Mr. O'Connor.*] In what direction is your holding? Fourteen miles due west from Inverell.
2638. What area do you occupy? 1,700 acres between my sons and myself.
2639. How have you been using it? Principally for grazing. We cultivate 170 acres.
2640. What do you cultivate? Wheat, corn, and potatoes.
2641. Where do you find a market? Out west principally for corn and potatoes; and we sell our wheat in Inverell.
2642. What do you mean by out west? Moree. I have also sent to Goondiwindi.
2643. What is your opinion with regard to the proposed railway? I think the line which will benefit the farming community is the Moree line. I have always found a market westward for potatoes, corn, and chaff in good and bad seasons.
2644. It would be better for you to send your produce to Moree, a distance of 82 miles, than to send it to Glen Innes, a distance of 56 miles? Yes; because we get no market in Glen Innes for potatoes and corn.
2645. If the railway were constructed to Moree, would it benefit others as much as yourself? In my opinion, it would. If it were constructed I would put 300 or 400 acres under crop, and many others would do the same.

Mr. P. McC.
O'Sullivan.
12 Oct., 1896.

WEDNESDAY, 14 OCTOBER, 1896.

[The Sectional Committee met at the Court-house, Glen Innes, at 10 a.m.]

Present:—

CHARLES ALFRED LEE, Esq. (CHAIRMAN).

The Hon. CHARLES JAMES ROBERTS, C.M.G.

HENRY CLARKE, Esq.

The Hon. DANIEL O'CONNOR.

GEORGE BLACK, Esq.

The Sectional Committee further considered the proposed Railway from Moree to Inverell.

Mr. Follet John Thomas, Mayor of Glen Innes, sworn, and examined:—

2646. *Chairman.*] How long have you been residing in Glen Innes? Twelve years; prior to that I was residing in Inverell.
2647. How long were you in Inverell? Eight years.
2648. Then your knowledge of the district extends over twenty years? Yes.
2649. Have you any detailed statement to place before the Committee? I have a detailed statement of the position of the Glen Innes Council and municipality, together with some short statistics as to the amount of acreage under crop, and the number of cattle, &c., in the district, the number of lands alienated, and the unimproved value of lands in the Glen Innes municipality. The population of the town and district of Glen Innes for 1891 was 9,353, and in 1896 it had increased to 11,000. When the last census was taken in 1891, it was 2,830 in the town—that is, within the municipality—and it is now 3,200, showing an increase, despite the fact that in portion of our district there has been a great exodus of people. That portion is the Emmaville district, where the means of livelihood is tin-mining, pure and simple. In consequence of the lodes being worked out in many instances, together with the low price of tin, there has been an exodus, but despite that fact we have a decided increase of population. The area of the district is 2,433,280 acres; the alienated lands are 429,000 acres. The portion under cultivation—that is, of course, for the past year—is 10,127 acres. I should also like to point out that in connection with the cultivated lands, in consequence of the fair price the farmers of this district were able to get for their produce in Sydney this year, the amount under cultivation for the 1896-7 year will show a material increase. The average size of the holdings in the Glen Innes district is 718 acres. The homestead leases recently offered here by the Government were all taken up on the day they were offered.
2650. Were there many of them? Eight or ten.
2651. What would be the area of each? From 40 to 150 acres. Those leases were within a distance of 4 to 5 miles from Glen Innes—the north-western portion of the town. The number of horses we have in the district is, 10,683; cattle, 89,526; sheep, 519,433. The capital value of unimproved lands in the municipality is £48,565, and the annual value of occupied lands is £18,896 7s. 6d. The number of acres we have under wheat is 1,808. The loan on our general revenue account is £5,000. I would also point out that this municipality has further loans than that, which will be shown by the *Government Gazette*, issued in the latter end of August. Those loans consist of one of £3,000 over the town hall, together with a loan of £6,000 over our gas-works; so that the total loans of the municipality are £14,000. The assets over the liabilities—published in the *Gazette* in the latter end of August—and which balance was made up to the 3rd August, 1896, show an actual balance of £1,894 2s. 11d. I should like to point out, in connection with this matter, that that asset over liabilities is over and above the amount of loan on general revenue. That is not taken into consideration at all. The amount of assets over liabilities is for rates calculated, or the actual cash value of works, together with the town hall and other assets we have here.
2652. You are aware that the proposal is to start the railway from Inverell, and to take it round by the west to Sydney? Yes.
2653. How is that proposal viewed by the residents of Glen Innes? It is viewed as a very great mistake, not only in the interests of Glen Innes, but in the interests of the country at large. It is considered by the people of Glen Innes that it would be a very great mistake indeed, for the reason that if it is constructed, it is primarily understood to assist the people of Inverell. I feel confident it will not effect this. We, in Glen Innes, hold that any railway to benefit the people of the Inverell district should be commenced at Glen Innes. We hold this opinion for the reason that Glen Innes is the natural centre from which the trade of Inverell must go. We are about 120 miles from the coast at Grafton.

Mr.
F. J. Thomas.
14 Oct., 1896.

There

Mr.
F. J. Thomas.
14 Oct., 1896.

There is a considerable amount of traffic at the present time direct from Grafton, through Glen Innes, to Inverell, and if the railway is made to-morrow from Moree to Inverell, it will not materially decrease that traffic, for the reason that the amount charged by carriers for carriage from Grafton is so small that the Railway Commissioners could not possibly compete by taking it over such an enormous mileage of railway to Inverell.

2654. Leaving out of view, for a moment, the possible connection with the coast by rail, you are of opinion that the starting of the trade from Inverell would not enable the Railway Commissioners to capture the trade they are now losing by way of the coast? That is so.

2655. Therefore, it would follow that the estimated traffic over the railway to Inverell would not be realised? That is my opinion.

2656. And instead of a loss of £2,800 per annum being shown, there is a probability of it being larger? I think so.

2657. You contend that a connection should be made between Inverell and Glen Innes? Yes.

2658. Would not that bring Inverell produce into competition with what you produce here? Not in a material degree. The Inverell district is essentially a wheat-producing district. Glen Innes is not essentially a wheat-producing district. This is essentially a hay-producing district.

2659. You say the total cultivation is 10,000 acres, of which 1,808 are under wheat? Yes.

2660. What is the balance under? Hay and potatoes, principally.

2661. Does the Inverell district produce largely of hay and potatoes? It does not produce largely of potatoes. This is essentially a tuber-producing district. The potatoes grown in this district keep very well. The potatoes grown in Inverell do not keep anything like the length of time the tubers grown here keep.

2662. Then you think that would be one source of exchange with Inverell? Yes.

2663. You have stated that owing to the facilities for getting produce to the Newcastle and Sydney markets, last year, there was considerable demand for produce here? Yes.

2664. Was that trade confined to last year, or has it been a growing one? I regret to say it was confined to last year.

2665. What brought it about last year;—was it a reduction of the railway rates, or scarcity in other parts of the Colony? The first reason was that there was a great scarcity throughout the country generally, whilst in Glen Innes we had one of the largest hay crops we have ever had. It was brought about through a very dry winter last year, and good rains in the early portion of the spring. Consequently, the lands were very arable, and we had a wonderful hay crop. The Railway Commissioners also made a concession to the farmers in the northern district. They lowered the price of produce to Sydney by 20 per cent., and increased the price of produce imported from Sydney into the country by 20 per cent. Thereby the farmers were able to send 6-ton trucks to Sydney at £3 12s. a truck.

2666. Then the hay produced was in excess of local requirements, and there was a large surplus to dispose of? Yes.

2667. Was there any market besides Newcastle and Sydney? The only other I know of was Grafton.

2668. But I mean on the railway line? Yes. I am aware that a good deal was sent to Newcastle and Sydney, and a little was sent to Narrabri.

2669. Supposing the farmers could not have got their produce down, owing to prohibitive railway rates, what would have been the result? There would have been an utter state of collapse.

2670. Could you have disposed of it in any other way? No. This departure on the part of the Glen Innes farmers in sending their produce to Sydney has only come about this year, and it has come about through want of production in other parts, and the excessive price they have been able to get in Sydney this year.

2671. If, in future years, the general produce of the country is abundant would you be able to compete? I think not.

2672. You can only compete under special conditions? Yes.

2673. That being the case, and the Inverell people being much larger producers than yourselves—presuming they had railway connection to Glen Innes—where would be their outlet? We consider that the outlet for the northern districts is in the north—the Queensland markets.

2674. Inverell is a very large wheat-producing district? Yes.

2675. I believe that both it and the flour are of excellent quality? The best possible.

2676. If Inverell were brought into touch with the railway system at a very low rate—say, 5s. or 6s. a ton—could they find a market between Glen Innes and Newcastle, or at Newcastle, for their flour? They can find a good market for a large quantity of their wheat in Glen Innes, and I also understand that there is a demand further south.

2677. Both flour and wheat will stand a higher carriage than hay? Yes.

2678. Is it possible to send produce by dray from Glen Innes to Grafton? A quantity has been sent this year.

2679. Would the carriage in ordinary seasons be too high? I think so.

2680. The class of stuff sent has to be moved about in large quantities? Yes.

2681. And to shift it by dray is a slow process? It is the excessive price this year which enables it to be sent to Grafton at a profit.

2682. But having in view the future general prosperity of the Colony, and with all the districts producing largely, what would be your market? We should be in the same position, if the railway system of the country is allowed to remain as it is, as we have been in past years, and that is that we have no market. It is the want of a market which has created so much distress amongst the settlers of the inland towns.

2683. We will put you for the moment in the same position as Inverell;—supposing the railway terminus were at Armidale, would you this year have been able to carry your stuff to Armidale, and then send it on by rail? No.

2684. Then it is only because you have a railway at your doors that you are able to take advantage of the market? Yes.

2685. As the object is to give an outlet for Inverell, you hold that if the connection were made with Glen Innes, it would put Inverell in touch with the whole of the railway system, and it would give them an outlet for their produce at market rates, whatever they may be? That is exactly my opinion.

2686. Has there been any organisation amongst the people in regard to giving land to the Railway Commissioners for railway purposes? No. As you are possibly aware, the most valuable land around Glen Innes which the railway to Glen Innes would pass through is a portion owned by the Haymarket Company. The secretary of that company is in town, and will give evidence on that point.

2687.

2687. I believe there is a strong desire here for connection with the coast? Yes.
2688. Provided there were no connection from Glen Innes with the coast, would the extension of a line from Inverell to Glen Innes give a better outlet for the Inverell people than a line taken from there westward by way of Moree? That is exactly my opinion.
2689. But providing there is never any connection between Glen Innes and the coast, would connection with Glen Innes give Inverell a better outlet and a better choice of market than a railway going west? I say most decidedly it would.
2690. *Mr. Black.*] Do I understand you to say that the natural Glen Innes market is to be found in the northern parts of the Colony and Queensland? Yes.
2691. For what produce? For the produce which is grown in the district—the hay crop and the tuber crop.
2692. To what part of Queensland would you send potatoes and chaff? If we had a railway to the coast, at present we would have an excellent market in Brisbane. In most years there is also an excellent market for Glen Innes products in the immediate south of Queensland—about the Warwick district.
2693. What prevents you getting to Brisbane at present? The excessive railway rates in Queensland.
2694. Have you any guarantee that if a coastal railway is constructed you will get your products to Brisbane cheaper than you could do now? It is only natural, I think, if we can get to the coast, we will be able to get to the markets, so to speak, of the world, at a reasonable rate of carriage.
2695. You mean that goods could be carried to the port, and shipped from there to Brisbane? Yes.
2696. Do you not think that the cost of taking the goods to a port, and transhipping them over such a small space, would be more than the through carriage? Not according to the present rates.
2697. Do you think it would benefit Glen Innes to be connected with Inverell by railway, if the line is not continued to the coast? It would give the Glen Innes people a chance of interchanging products with Inverell.
2698. Do you think where a town is not a terminus, the substitution of railway traffic for team traffic, with outlying towns is usually beneficial? I think that with the beggarly price which is accepted by teamsters at the present time for traffic, a town is almost better without it.
2699. If you were connected with Inverell by railway the products which came into the Glen Innes district for consumption would arrive by railway and be dumped here, and there would be little or no expenditure in connection with them;—if you have carriers coming to a town they must of necessity spend something, however small? I am aware of that, but I look at it in this way:—What we want in these districts is a greatly increasing population, and wherever a line of railway is constructed it brings population. A great portion of that population remains in the district. That was notable in the case of the construction of the line from Armidale to Glen Innes, and from Glen Innes North. We have people here now who but for the construction of that line would never have seen these districts.
2700. Do you think the carrying of the railway towards the Queensland border increased the population of Glen Innes? I am sure it did.
2701. In what direction is the energy of the people who were thus attracted to Glen Innes being directed? In the majority of cases they are working the soil, or are engaged in mining pursuits.
2702. What is the average of seasons in which Glen Innes has a good season, and the rest of the Colony has a bad one? Taking the Colony as a whole I suppose it would be very few indeed. But to look upon Sydney as a certain market for Glen Innes producers the freight from here to Sydney would have to be still further reduced.
2703. Where then is the inducement you offer to people to go in for agriculture here? We do not offer them any special inducement at the present time. We say that the Glen Innes district, as it at present exists, has not a certain market.
2704. How would the construction of a railway from Glen Innes to Inverell increase the population of the district? It will bring about a floating population some of which will remain. It will also, I believe, be the means of a greater portion of alienated land between Glen Innes and Inverell been thrown open to settlement.
2705. But you say that before there is any fixed market for Glen Innes products, there will have to be a great reduction in freight. You say further, that the products of Glen Innes as a rule only find an outside market, when there are good seasons here and bad seasons elsewhere. Then you speak of an increase of settlement brought about by the construction of a railway between Glen Innes and Inverell, whilst you admit that that would extend the market of Glen Innes? Under present conditions I hold that there is not a market which will guarantee those staying on the land any certain income, but under the conditions which we believe must come about in the near future there will be a good market for the producers of the north in the southern portion of Queensland.
2706. Then you mean that the construction of a railway to Inverell will bring a lot of people here who will gamble in a coastal connection? Not altogether that. Supposing the railway freights from here to the north and in the southern portion of Queensland are reduced, as they should be, it would enable the people of the northern districts to get at their natural market, which is northward. We have to pay a 20 per cent. advance in sending north, and a 20 per cent. reduction in sending south.
2707. I am surprised you do not quote another problematical circumstance which is federation and the consequent abolition of border duties? A good deal will be said to you about that by other witnesses.
2708. Another factor too, is the establishment of a sugar-beet mill in Tenterfield? I would like to allude to what I believe to be hard facts.
2709. But you do not call a coastal connection a hard fact? I hope it will be. If the Government are alive to the interests of the northern district it will be a hard fact in the near future. With regard to the sugar-beet industry, I should like to point out that representations were made to me by certain people in Sydney, and I called a meeting of farmers in the Glen Innes district during the last month. The result of that meeting was that no less than forty farmers are experimenting here this year in the production of sugar-beet. The areas put under crop vary from $\frac{1}{2}$ acre to 1 acre.
2710. I understand that a quantity of seed was distributed here last year, but I have not heard whether it came above the ground or not? It was distributed in 1 oz. and $\frac{1}{2}$ oz. packets then, and it is being distributed by the hundred weight this year. I should like to point out that the sugar-beet was grown at Red Range, in a small way certainly, but still it was most successful. I understand that one lot yielded a very fair average quantity of sugar. The result of the experiment this year will be such as to put beyond all doubt the possibilities of the soil for the production of sugar-beet.

Mr.
F. J. Thomas.
14 Oct., 1896.

- Mr. F. J. Thomas.
14 Oct., 1896.
2711. Do you think the farmers of the district, as a rule, turn their energies in the best direction? I suppose so.
2712. Is this climate adapted for the growth of onions? It is.
2713. Have they not been realising high prices on the Sydney market of late years? I understand so.
2714. Are there any grown in the district? A very small quantity, indeed.
2715. To what circumstance do you attribute the neglect of the farmers to grow it? A good deal to the neglect of the Government in not establishing in the country districts experimental farms to point out to the farmers the possibilities of the soil.
2716. How is it that in other districts where there are no experimental farms onions are grown? For the simple reason that they have been educated up to it, and here they have not.
2717. Then you think the farmers of this district are in their educational infancy? I think the majority of them are.
2718. Is the wheat product of the district equal to the flour consumption of the district? Nothing like it.
2719. Therefore the millers must be large importers of flour? Very large.
2720. Do you think it is probable, if a connection be made between Glen Innes and Inverell, it will be largely used by the squatters and storekeepers of Inverell in importing their goods from Sydney? I think it will.
2721. Is it not a fact that the bulk of the goods consumed in this district are brought *via* Grafton, and thence by team? Yes.
2722. Is it not a fact that all the goods consumed in the Inverell district are brought by water to Grafton, and thence by team to Inverell? A great quantity.
2723. If Glen Innes being directly connected with the railway, finds it profitable to bring goods from Grafton, is it not probable that when Inverell is connected she also will find it profitable to bring goods from Grafton? Yes, as far as Glen Innes. If the railway were constructed I presume it would not pay them to carry by team from Glen Innes to Inverell.
2724. Is it feasible that goods having been carried 110 miles by team, will be transhipped to a railway in order that they may be carried 42 miles? I think it is feasible. Anything is feasible when the rate is cheaper.
2725. Do you not think it is possible that the teamsters, in the face of the competition with the railway, rather than unload at Glen Innes, will be disposed to carry goods on from Glen Innes to Inverell at a very little higher rate, and that storekeepers and squatters, in order to save double handling—which always means destruction—will prefer to pay that slightly-increased rate? I do not think it is likely. I think the present rate of carriage for team traffic between Glen Innes and Inverell is as low as it is possible to be, and I think it will be possible, if the railway is constructed, to carry goods from Glen Innes to Inverell at a much cheaper rate.
2726. What is the ordinary rate of carriage by team from Glen Innes to Inverell? £1, and £1 10s. a ton in special instances.
2727. In the case of goods brought from Grafton, what would be the proportionate carriage between Glen Innes and Inverell? About £1.
2728. *Mr. Roberts.*] We have it in evidence that in 1895 there were 25,000 bushels of wheat grown in the Glen Innes district;—out of that quantity what portion would be required for local consumption? That question could be better answered by Mr. Utz.
2729. Have you seen the figures supplied by Mr. Harper in regard to the traffic on a line from Inverell to Moree? Yes.
2730. Are you prepared to point out any of the items in regard to which you think he has made a mistake? I think he has made a mistake in the item of general goods.
2731. Have you any figures to emphasise that statement? I would refer to the cost of carriage from Grafton to Inverell. I hold it would not be possible for the Railway Commissioners to fairly compete for the traffic between those places. Although it might be said that goods would be carried more quickly, still I do not think the Railway Commissioners could successfully compete with the traffic east.
2732. Does not the same possibility exist if a railway is constructed between Glen Innes and Inverell? I do not think so.
2733. If the storekeeper at Inverell can get his goods more cheaply by way of Grafton, is it likely he will use the railway from Glen Innes to Inverell? I think he would, but I could not answer for him with regard to Glen Innes and Sydney.
2734. Do you advocate the construction of a line from Glen Innes to Inverell, apart from any possibility of coastal connection? I do.
2735. Are you aware that there is a fair market for Inverell produce towards and beyond Moree? I am not.
2736. I understand you to say there would be large quantities of potatoes, oats, and chaff sent by rail from Glen Innes to Inverell? There would be large quantities of potatoes, but I would not like to commit myself by saying oats and chaff, because they are produced there.
2737. What is the probability of timber being sent from Glen Innes to Inverell? In my opinion there is likely to be a large market for timber in the Inverell district, from the fact that the timber forests in the Inverell district are pretty well worked out.
2738. What distance from Glen Innes do the timber forests exist? They are on the eastern slope. There is a mill about 22½ miles east of Glen Innes.
2739. Is the Glen Innes district at present in a flourishing condition? Yes; it will compare favourably with other districts throughout the Colony.

Mr. John Frederick Utz, merchant, Glen Innes, sworn, and examined:—

- Mr. J. F. Utz.
14 Oct., 1896.
2740. *Chairman.*] How long have you been residing in the district? I have been in business for the last thirty-one years.
2741. Have you been intimately connected with the agitations which have taken place for railway connection both west and east? I have.
2742. Are you in a position to give us an accurate statement, as to the rates of carriage which exist now and which existed some time ago? Yes.

Mr.
J. F. Utz.
14 Oct., 1896.

2743. *Mr. Roberts.*] Have you long held the opinion that Glen Innes and Inverell should be connected by rail? I have.

2744. Do you anticipate that a large trade would be carried on between those two towns? There would if there were railway connection.

2745. Would Inverell be able to find a market at Glen Innes, or would Glen Innes be, as it were, a distributing point for large quantities of wheat, flour, and other produce of Inverell? I consider Glen Innes would be a large distributing centre for Inverell farmers.

2746. Am I to understand from what you say that the Inverell farmers would be able to dispose of their produce at Glen Innes? They would be able to dispose of at least 40,000 bushels of wheat every year in Glen Innes proper.

2747. Would that be in addition to the 25,000 bushels of wheat which I understand are grown at Glen Innes? Yes. When I said 40,000 bushels would be disposed of, I intended to intimate that I myself require for my mill 80,000 bushels per annum. I bought 80,000 bushels of wheat this season.

2748. We had it in evidence in Inverell that in 1895 Glen Innes produced about 25,000 bushels? Thereabouts.

2749. How do you dispose of the 80,000 bushels of wheat which you say you have purchased? My market for the 80,000 bushels of wheat, after it is manufactured into flour, is from Stanthorpe on the north, as far as Quirindi, Gunnedah, Narrabri, and Moree. I sent a few truck loads to Mr. McIntosh, at Moree, a few days ago.

2750. Did you send it to Moree by rail? Yes.

2751. Was not that rather a roundabout way? Yes, but it would have cost 50 per cent. more to send it by team. The cost by rail from here to Moree is £1. 10s. a ton.

2752. Are you in the habit of sending large parcels of wheat or flour to Moree? No; this is the first trial I have had. I wanted to introduce my flour to the Moree district.

2753. Owing to the fact that Moree is purely a pastoral country, is not it and the district beyond a large purchaser of agricultural products? You may call it large, but I do not. There is only a population of about 8,000 people in that district, and 8,000 people do not require, on an average more than about 1,000 tons of flour per annum. Three farmers in the Inverell district, Messrs. M'Clymont, Eddy, and Wyndham, who say they could each put 1,000 acres under wheat, would supply the whole of that population with flour.

2754. I suppose the demand would be larger in times of drought? I do not know that they would eat more bread in a time of drought than at any other time.

2755. If Glen Innes and Inverell were connected, I suppose it would be fair to assume that large areas of wheat-growing land would be put under cultivation? Yes.

2756. Are you of opinion, that in view of the large production of wheat, if a railway were brought from Inverell to Glen Innes, a sure market would be found for it? Yes; I undoubtedly think so. I do not mean to say that Inverell, for example, would grow 1,000,000 bushels of wheat, and that the whole of it would be consumed in Glen Innes.

2757. Would it go into Queensland? In certain seasons a portion of it would. At present I am sending flour into Queensland to Stanthorpe, and am paying £1 a ton duty on the border. That is because the prices are high, but there are certain seasons when they can grow fair crops on the Downs, but only occasionally. Therefore a certain surplus of the Inverell district would find its way, at times, into Queensland.

2758. Although the Darling Downs produce wheat, you cannot look with certainty to them for a good yield? That is so.

2759. Have the farmers of the Darling Downs had a long experience of wheat-growing? Yes; flour mills have been established at Warwick for over 15 years.

2760. Would it be safe to say that once in five years the wheat crop on the Darling Downs is a failure? They get a good crop once in four years.

2761. What is the distance from Toowoomba to Brisbane? 130 miles.

2762. What is the distance from Glen Innes to Toowoomba? 200 miles.

2763. Do you think—in view of the long distance by rail from Glen Innes to Toowoomba, and the much shorter distance between Toowoomba and Brisbane—you would be able to compete with the sea-borne wheat of California or South Australia? That would entirely depend upon the universal price of wheat at the time. If wheat were cheap in California, South Australia, or Victoria, you would not be able to compete with sea-borne wheat in Brisbane.

2764. Are you in favour of a line being constructed from Inverell to Moree? I am in favour of a line being constructed from Inverell to Moree, provided it does not remain at Inverell. It is not good, from a national point of view, to make Inverell a terminus.

2765. Am I to understand you see no objection to the construction of a railway from Inverell to Moree? If it is intended to construct the line from Moree to Inverell, and leave it there for all time, it is undoubtedly a mistake.

2766. I am afraid it is impossible to say what may be done in the future. We are asked to report upon the desirability of constructing a line from Moree to Inverell? If you bind me down not to make any statement about the future, I say that a line from Glen Innes is undoubtedly the better of the two. The money of the State would be more advantageously spent on that line.

2767. Will you give your reasons why, and point out the disadvantages of the Moree connection, and the advantages of the Glen Innes connection? I have several reasons. If you build a railway from Inverell to Moree, with the intention of carrying the Inverell produce to the west to feed thousands of people there, I only say that those thousands do not exist. I maintain, from the knowledge I have gained from the people living there, that that part of the Colony will never sustain a thick population. A man could not go to the Moree district and live on 200 or 300 acres in the same way as he could in the more favoured districts to the east. They have not the rainfall. It is virtually a pastoral district, and I question very much whether it can ever be more. It is stated by some of the Inverell people that they expect to do business with Narrabri, Gunnedah, and other places. But how can the Inverell farmer compete with the Tamworth farmer at Narrabri, 160 miles from Inverell, when the distance from Tamworth to Narrabri is only 137 miles. It is well known that the Tamworth district, for wheat producing, is equally as good as, if not better than the Inverell district. Tamworth has a large area of wheat. Then you have the district from Tamworth

to

Mr.
• J. F. Utz.
14 Oct., 1896.

to Werris Creek, and a lot of good wheat land about Quirindi. I take it that it is the wish of the Parliament of the country to build railways on commercial lines, and that they expect them to pay. If a line is constructed from Inverell to Moree, the Commissioners, in order to compete for the coast traffic, may apply differential rates; but I ask whether it is advisable to build many railways under those conditions. Differential rates mean the running of railways for nothing. If they want to carry goods to Moree at differential rates, they will have to carry goods from Narrabri, passing Moree, and coming into Inverell, practically for nothing. But even then they cannot compete. I do not say you could build a line from Glen Innes to Inverell and make it pay at once; but still you would have only one railway running at differential rates instead of more than one.

2768. But you, as a business man, enjoy differential rates now? We do, but it would not be advisable to build another railway in that district to have further differential rates.

2769. In the event of a line being constructed between Glen Innes and Inverell, would not the business people look for differential rates as well as those who have them now? Glen Innes has differential rates, and, allowing that Inverell will also claim them, it can never get them. The traffic from Glen Innes to Inverell will average about 10s. a ton. They have nothing to fear. The carrier cannot carry at that price. Therefore there will be no necessity to make differential rates there.

2770. Have you any other statement to make with regard to the advantages of the Inverell-Glen Innes line? Yes. If the railway is built the connection should be at Glen Innes, for the simple reason that the population to be fed by the breadstuffs grown in the western districts undoubtedly lies on the eastern coast. There is a population there of 100,000 people, who must be fed.

2771. But how are you to get the breadstuffs down there? At present it is a difficult matter, although I may tell the Committee I am at present sending flour to within 20 miles of Grafton, even by teams. I do not say that you are obliged to construct a railway to Grafton, although I would do so if I had my choice. Nevertheless, the Glen Innes people will not be sorry if the connection is made further north—say, from Tenterfield to Lismore. We feel certain it will be of more benefit to the whole of that district than a line to Moree.

2772. Do you think the time has arrived when the table-land of New England should be connected with the coast? If it has not arrived it cannot be far distant. The present line, which passes our door, is not suitable for our requirements, nor for those of any part of New England.

2773. Do you get large quantities of merchandise from Sydney? Yes.

2774. Do you make all your purchases in Sydney? No; I buy more than three-fourths of my merchandise in the London market.

2775. Does it come by way of Sydney? No, it is shipped to Newcastle and Sydney. Whenever I have a convenient ship starting from London to Newcastle, the goods are landed in Newcastle.

2776. Then do they come by rail? Not at all times. I often tranship at Newcastle, and send by steamer to Grafton.

2777. Am I to understand that in every case, wherever practicable, you get your merchandise by way of Grafton, and thence by team to Glen Innes? Yes.

2778. I suppose that in cases of emergency, where you may run short of goods, you use the railway? Yes. I may also state that there are certain classes of goods which the Commissioners carry at a low rate, and of course we make use of the railway under those circumstances.

2779. You use the railway when it suits you best? I do.

2780. What is the usual rate of carriage for general merchandise, starting from Sydney to Grafton, Grafton to Glen Innes, and Glen Innes to Inverell? From Sydney to Glen Innes, third-class goods are carried, at present, at truck rates, at £30 a truck, or £5 a ton. Then, again, we have another truck rate for wire, sugar, galvanised iron, wire netting, and rice, which is carried at £24 a truck, or £4 a ton. First-class goods are carried at £5 5s. a ton, and second-class goods at about £6 a ton. I may inform the Committee there are very few goods which come under the heading of either first or second class. The bulk of the goods which come to the district are carried under the truck system of £24 or £30 a truck. Third-class goods include all goods packed in cases, casks, and so forth, namely, drapery, wines, spirits, groceries, oilmen's stores, and so forth.

2781. Do they come under the differential system? Yes.

2782. Then you really pay no more for your goods at Glen Innes than you would if you lived at Tamworth? The goods are a trifle more at Tamworth than they are at Glen Innes.

2783. Glen Innes appears to be on the same footing as Armidale? It is a little more favourably situated.

2784. How far is it to Armidale? Sixty-one miles.

2785. The rate of carriage by rail is apparently from £4 to £5 a ton? That is about the average.

2786. Is there any class of goods for which a higher rate of carriage is charged than that? Yes. For fourth-class goods—machinery—it is as high as £9 a ton; but there are very few tons of that class sent to any district. The exact distance, according to the rate-book, is 424 miles, and fourth-class goods would pay £9 15s. 11d. per ton.

2787. *Chairman.*] That is in single tons? Yes; they cannot come at truck-rates. There is no truck-rate in existence for fourth-class goods.

2788. *Mr. Roberts.*] What would a man of business in a small way, who did not want to truck, have to pay? For third-class goods in quantities of less than 6 tons the rate is £7 a ton.

2789. In all classes of goods, would the increase be correspondingly large? No; the increase would be in third-class goods only. There would be an increase of £2 a ton in third-class goods, and of £1 a ton in first-class goods—wire, sugar, iron, wire netting, and rice. These are items carried by the Commissioners at £24 a truck. If you get a single ton you will pay £5 for those articles.

2790. Are there any large quantities of salt brought from Sydney to Glen Innes? No; from Newcastle.

2791. What is the carriage on salt? £2 3s. 9d. from Newcastle, or £2 13s. 9d. from Sydney,—that is what they call the "B" rate.

2792. Do you always get your salt by rail? Nearly always; I have occasionally bought 100 tons at a time at Newcastle, and I have sent it by sailing ship to Grafton, and have carried it from there by team.

2793. What would be the carriage for coal? It comes under the heading of "Miscellaneous." The carriage of coal to Glen Innes would be £1 6s. a ton, which is the lowest classification the Commissioners have.

2794. What items, other than coal, are there, which come under that low rate? Timber, that is to say, pine and soft-wood timber. Drain-pipes would also come under that heading, and wood in its rough state for

Mr.
J. F. Utz.
14 Oct., 1890.

for felloes and wheelwright purposes. Manure would also come under that heading. The next classification is what the Commissioners call the "A" class, which includes such articles as farm produce. Oatmeal is carried in 2-ton lots. Grain of all descriptions, seed-oats, flour, oatmeal, maize, and goods of that class, come under the "A" class, the charge for which at present is 30s. a ton.

2795. What do you pay by way of Grafton? I am happy to say there is no differential rate between Grafton and Glen Innes. The charge between Grafton and Glen Innes is £2 10s. a ton, no matter what you get. It costs 10s. a ton to get goods to Grafton; then 2s. 6d. a ton is allowed by the steamship companies on large shipments. Roughly speaking, therefore, the charge from Sydney to Grafton is 8s. a ton, and the carriage by team £2 10s., which makes £2 18s. per ton.

2796. Is it not a fact that they charge some customers 16s. a ton? No, unless the goods are measurement goods.

2797. A man in a large way of business, like yourself, would get goods delivered for 8s. a ton? Yes, they allow 33 per cent. off large consignments, measurement included. As I have stated, the carriage from Grafton to Glen Innes is £2 10s. that makes £2 18s.

2798. Can you always rely on getting your goods, from one year's end to the other, at £2 18s. a ton from Sydney to Glen Innes by way of Grafton? Yes. I have done it for three years. In 1892, the ruling rate was £3 10s. a ton. Since then the rate has been gradually reduced, not by business people, but by carriers, who have offered to carry at lower rates. I may tell the Committee that the carriers almost worry the life out of me to get the carriage. From Monday morning to Saturday night the carriers are coming and asking for loads.

2799. Supposing that, instead of being at Glen Innes, your headquarters were at Inverell, how much additional carriage would you have to pay to get your goods to Inverell—I mean by way of Grafton? Fifteen shillings a ton additional rate—that is providing for a through rate—would have to be added to the £2 18s., which makes £3 13s. a ton.

2800. Do you recollect what the Railway Commissioners put down as the rate of carriage, by rail, from Glen Innes to Inverell, when the question of the construction of a railway between those two places was under consideration? Ten shillings a ton.

2801. What do the carriers charge at the present time for carriage from Glen Innes to Inverell? Starting from Glen Innes to Inverell they only charge £1 to £1 5s. per ton. Wire and heavy goods are carried at £1 per ton; parcels and cases at £1 5s. per ton. For miscellaneous small lots the charge is £1 10s. per ton.

2802. But in view of your large business, if you made a contract for the delivery of goods from Grafton to Inverell direct, you would not, I suppose, have to pay more than 15s. per ton? I am satisfied that I can land goods in Inverell from Sydney at £3 13s. per ton.

2803. Supposing for a moment that a railway from Glen Innes to Inverell were constructed, would it not be a fair thing to assume that the teamsters, knowing they had to compete with that railway, would be prepared, in your case—you being such a large customer—to carry your goods from Grafton to Inverell, say, at £3 8s. per ton, instead of £3 13s. per ton? No, I do not think so. The rates are as low as they possibly can go. If the rates come down any lower, it simply means that the carriers will be starved out, and they will have to give up carrying.

2804. Do you think that the rate of £3 13s. per ton is the bedrock charge? I do.

2805. Supposing goods arrived at Glen Innes from Grafton, and you wanted to take them off the team and put them on the railway trucks—with the view of landing them in Inverell—what would be the cost of handling goods in that way? One shilling per ton. That is what the Department of Railways charges.

2806. That would really make it 11s. per ton in addition to £2 18s.? Yes; it would be 14s. in favour of the railway carriage.

2807. Can you give me any estimate of the volume of traffic which would be likely to come to a railway constructed between Glen Innes and Inverell? I can. It may appear very strange to the Committee if I enlarge upon the figures given by the Goods Superintendent, and others, who gave evidence in 1892; but I say from my own knowledge of the goods which go into the different districts, and from my knowledge of the goods which I send myself, and which go from other points, that I have not exceeded the tonnage which goes into those districts. I will give you my estimate of the goods which are sent yearly from Glen Innes into the Inverell district—from a point starting at Guyra, to a point ending at Deepwater. I say that the tonnage which goes into that district is 7,000 tons per annum.

2808. What I want you particularly to tell me is, what goods would be carried on the railway? All those goods would be carried on the railway. For instance, if goods are unloaded at Guyra and are carried to Tingha, then Tingha will be within 12 miles of this railway at Brodie's Plains. Therefore, naturally, Tingha would not go to Guyra when it has a railway 12 miles away. Going towards Tingha, on the south side of Inverell, there are several small properties which get their goods from Guyra, and they would go to the railway if constructed. I claim 7,000 tons as the inward traffic. Four years ago the Department of Railways estimated the tonnage of goods going into that district at 4,000 tons; but the Department had in view the traffic which existed at Glen Innes only, and which was carried from the Glen Innes station to Inverell. They made no allowance whatever for the goods which were unloaded at Guyra, Dundee, or Deepwater; nor did they make any allowance for the goods sent by myself and others from Glen Innes to the Inverell district, of which goods, of course, the Railway Commissioners could not have any knowledge.

2809. Then what I understand you say is that, instead of only 4,000 tons of goods, as estimated by the Department of Railways, going into that district, you are prepared to prove there will be 7,000 tons of goods going there? I am.

2810. Will you show me, in detail, where the 7,000 tons of goods would come from? About 1,000 tons of goods are sent from Glen Innes into the western district. Of that quantity I send 750 tons myself. It goes as far as Warialda, and 14 miles beyond that place, and also to Boggabilla.

2811. Will you tell me the range of country to the north, south, east, and west, with which you do business? I do business as far as merchandise is concerned, only so far as the Black Mountain, 20 miles distant from Armidale. With regard to flour—I go as far as Quirindi, on the northern line, and Moree on the north-western line, and on the east as far as Grafton.

2812. I understand you to say that 1,000 tons of goods go from Glen Innes to Inverell, and the country west of it? Yes; another 500 tons of goods go from Grafton to Inverell direct, which the Railway Commissioners did not take into consideration in their estimate. That makes 1,500 tons.

Mr.
J. F. Utz.
14 Oct., 1896.

2813. Would that 500 tons of goods to which you refer go by team from Grafton to Glen Innes? Yes.
2814. Is it not a fact that, no matter what railway is constructed, those goods will always go that way, owing to the low rate of carriage? Not as far as Inverell is concerned. They might come as far as Glen Innes; but if there is an actual saving of £4 per ton by unloading the teams at Glen Innes, and carrying the goods on to Inverell, every man would, of course, take advantage of that saving. The Railway Commissioners would charge an average of 10s. per ton, and the cost by teams right through would be 15s. per ton. Allowing 1s. per ton for unloading at Glen Innes, there would still be a margin of 4s. per ton in favour of the railway, in addition to which you would get your goods two days quicker.
2815. You have now accounted for 1,500 tons of goods? That is so. Then there are 4,000 tons of goods which come from Sydney to Glen Innes by rail—making 5,500 tons. The other 1,500 tons—which would make up the 7,000 tons—include a portion of goods unloaded at Guyra, and which drift into the channel which the railway would pick up if it were built. There is also a portion unloaded at Dundee, and another portion at Deepwater. Some go to Fraser's Creek, Bangshawe, Wallangarra, Coolati, and other stations which at present send their wool to Deepwater Station, which is a nearer point to the Great Northern Railway than Glen Innes, and which is certainly more advantageous to bullock-teams, inasmuch as there are not so many metal roads there. Bullock-teams will not take a metal road if they can avoid it. For these reasons the teams prefer taking the side roads and unloading at Dundee, Deepwater, and platforms on the line. I make up the other 15 tons from various places.
2816. Do you not think that that is rather a large estimate? I do not think so. I may state that in addition to what I myself send from Glen Innes, I also send goods, in the wool season, by rail to Deepwater, water and also to Guyra. For instance, there is a squatter at Myall Downs, who gets his supplies from me.
2817. Then the 7,000 tons to which you have referred would represent the traffic inwards? It would.
2818. Have you prepared any estimate with regard to the outward traffic? I have.
2819. What about passengers? The passenger traffic I put down at £7,000 per annum; that is to say, 7,000 passengers at an average of 10s. each in and out.
2820. Do you base that estimate on the present coach traffic? Not altogether, because the coach traffic only shows about 5,000 passengers, but there are hundreds who come in on horseback and in private buggies, and they certainly would not travel in that way if a railway line were constructed.
2821. Is there a large passenger traffic at the present time between Glen Innes and Inverell? There is.
2822. *Chairman.*] I believe you have seen the development of passenger traffic which has taken place since the line has been extended from Armidale to Tenterfield;—for instance, on special occasions, such as races and shows, the running of special trains has moved the people about in hundreds where they used to move about in singles? That is a fact, but I have not taken advantage of that, for the simple reason that I based my figures on what I thought would be the actual traffic the moment the line was opened.
2823. *Mr. Roberts.*] Have you any other item of inward traffic which you wish to put before the Committee? Yes. You certainly must make a fair allowance on the mails, parcels, and so forth, for which the country pays the contractors. I put that down at £750—that is for mails and parcels inwards and outwards.
2824. That is 50 per cent. in advance of what Mr. Harper estimated it at in 1890? I admit that, but then six years make a material difference to two districts like Inverell and Glen Innes. Personally, I would be quite satisfied, as a business man, if the line were constructed, to give £750 for that item. In addition to that, I put down 1,000 tons of timber, which I estimate would be carried on the line from Glen Innes to Inverell.
2825. Where would the timber come from? From within 20 miles of Glen Innes. We have a saw-mill in the town; but the principal amount would come from the eastern slope about 20 miles from Glen Innes.
2826. What kind of timber is it? It is stringy-bark, tallow-wood, red gum, and spotted gum.
2827. Is there likely to be a large market for that class of timber at Inverell? Yes, for the simple reason that they have really no good hardwood there. They have timber there, but it is of an inferior quality.
2828. Then would it be fair to assume that if a line of railway were constructed from Glen Innes to Inverell, a large quantity of timber would be required to meet the wants of the increased population? Yes. I only put that item down at 1,000 tons, at 4s. 6d. per ton, or £225. That brings my earnings up to £8,000 for the inward traffic.
2829. Have you allowed for any agricultural produce, in the shape of oats, chaff, or potatoes, carried from Glen Innes to Inverell? No; I have allowed for nothing of that kind at all.
2830. Do you think there would be a large interchange of products between the two places? There is not the shadow of a doubt about that. As a matter of fact, there are potatoes and oats going there now from week to week. I myself send that kind of produce; but the earnings from it would not be large, because it is carried at "A" class of rates; and if you estimated 1,000 tons for it, it would not increase my figures very much, because of the low rates.
2831. Is it not a fact that the Inverell district can grow potatoes? Yes; they can grow them and use them for six or seven months out of the twelve. After that time, it being a hot district, the potatoes go soft. They are not of first-class quality, and they send to Glen Innes; it is a colder climate, and potatoes keep better and longer.
2832. What about the outward traffic? I put it down at 8,000 bales of wool, equal to 1,600 tons, which would be carried on the railway, starting at Warialda, and embracing the whole of that country which is north-west of Inverell, and right along from Inverell, picking it up along the line. It may have been argued that the Warialda wool will go to Moree; but I say it will not, and I can prove to the Committee why. I feel sure it would come to Inverell, and then to Glen Innes, for the simple reason that the distance is shorter, and another strong reason is that we have a differential rate existing from Glen Innes to Sydney, or Newcastle. The Railway Commissioners carry wool to Newcastle at £2 17s. 6d., or £3 13s. a ton to Sydney—the same price as they charge from Tamworth to Newcastle or Sydney. Therefore, they are not likely to establish the same differential rates at Moree if there is no connection with Inverell. They would have the usual rate for freight from Sydney to Moree, and Moree to Newcastle. Hence the rate must be larger starting from Moree than it would be starting from Inverell. Therefore, the Warialda wool must drift to Inverell if the railway is constructed from Inverell to Glen Innes.
2833. Is there any New South Wales wool at the present time sent to Brisbane? Not to my knowledge. I know that the stations along the borders of Queensland send their wool to Glen Innes.

2834. Are you able to say whether some of the wool which now finds its way to Brisbane would come to the Inverell-Glen Innes line? I do not think there is a shadow of a doubt about that.

2835. Is there not an export duty of £2 10s. per ton on wool coming from Queensland to this Colony? Presuming that there is, and presuming that the wool has to pay that export duty, there will be a rebate the moment it leaves the Colony. Export duty would only exist if the wool remained in New South Wales.

2836. Therefore, it would only come into New South Wales if it could be brought here free, and if the circumstances were favourable;—do you think if the line from Inverell to Glen Innes were constructed, any large number of people on the Queensland border, who now obtain their station supplies from Brisbane, would become customers to New South Wales? I think so—in fact, I am sure of it.

2837. And, consequently, they would make use of the Glen Innes to Inverell railway? Yes. My last item was 8,000 bales, or 1,600 tons of wool, which, at 10s. a ton, would be an earning for the railway of £800.

2838. I may point out to you that the Goods Superintendent estimates the outward traffic in wool at 2,200 tons? If so, he has enlarged upon his estimate since 1892.

2839. The estimate of the Department of Railways for wool is 2,200 tons, at 3s. 9d. per ton? I have based my calculation upon the existing rate of £2 17s. a ton from Glen Innes to Newcastle. For the 53 miles of railway from Glen Innes to Inverell, I take it that the Railway Commissioners would charge *pro rata*, in the same way as they charge now from Glen Innes to Newcastle. It would be as near as possible one-sixth of the mileage. To Sydney the charge is £3 15s. a ton, and as people principally ship at Newcastle for London, I take it that the wool would be landed at Newcastle.

2840. For the sake of comparison, I should like you to confine yourself to the wool between Glen Innes and Inverell; would you pay the Department 10s. a ton when you see that they framed an estimate at 3s. 9d. per ton? Under that estimate of 3s. 9d. per ton, I maintain the Department would have to carry wool at a lesser rate from Inverell to Glen Innes than they do between Glen Innes and Newcastle. They would have to make a special rate to carry it as low as that.

2841. Of course, it is impossible for me, in making a calculation as to the probable revenue, to accept any sum over what has been put down by the Railway Commissioners? All I can say is that it appears to me to be a gross mistake. I still maintain there is no wool carried in New South Wales at 4s. 6d. per ton for a distance of 50 miles. The freight from here to Newcastle—324 miles—is £2 17s. per ton. The Department would have to make a special rate to carry wool at 3s. 9d. per ton between Inverell and Glen Innes.

2842. *Mr. O'Connor.*] What is the lowest charge for the carriage of wool on any of the lines you know of? I do not know of any line in existence in New South Wales upon which they charge less than 10s. per ton for the carriage of wool a distance of less than 23 miles. The differential rates are already as low as they can go, and you would have to get a treble differential rate to carry wool at 3s. 9d. per ton between Inverell and Glen Innes.

2843. What is the lowest price you ever knew to be charged by a teamster to carry wool between Inverell and Glen Innes? £1 a ton.

2844. *Mr. Roberts.*] Have you made any estimate as to the outward traffic regarding the trucking of sheep? I have. I estimate that both inward and outward there will be at least 1,000 trucks of live stock per annum to be carried from Inverell to Glen Innes.

2845. I prefer you to separate the inward and outward traffic;—we are now dealing with the outward traffic? If you look back to Mr. Barling's evidence, to the report of the Railway Commissioners, and to the evidence of Mr. Barling, you will find that they estimate the traffic on the same basis as I do. They simply say, "Live stock—so many trucks per annum."

2846. The report of the Goods Superintendent shows that there will be 400 trucks of sheep at 12s. 4d. per truck? That compares with my figures very favourably; but that includes both inward and outward traffic for stock. It is assumed that the whole of the live stock would come from west to east; but there is a little trucking going on from east to west, in the shape of store stock. Store stock are often bought by the western people at New England for fattening purposes. I have no doubt that a portion of that 1,000 tons would be sent west. It is not a large item, but it is an item to be considered.

2847. How much of that 1,000 tons is outward traffic? 800 or 900 trucks.

2848. That is exactly double the estimate of the Goods Superintendent? It is not double according to the estimate for the year 1892, but it may be double now.

2849. Are you confining yourself to sheep? No, to sheep and cattle.

2850. What is the amount you have allowed for the trucking of sheep and cattle? 1,000 trucks at 12s. 6d. per truck, or £625—that is, inward and outward.

2851. Can you separate them? Yes, there will be 800 trucks outward and 200 trucks inward. The outward traffic would then come to about £500 in round numbers.

2852. You have stated that £8,000 would include everything; does it include the inward traffic and stock? No; I have included no inward stock.

2853. Do you wish to add to the £8,000? If you wish me particularly to take the £125 from the outward traffic, and put it in the inward traffic, I will do so.

2854. I am anxious that you should place your figures in as favourable a light as possible? All I can say is that, judging from the report which has been given by the Department of Railways, the authorities have included the whole of the stock—inward and outward—as I have done. I have followed their example in order to simplify matters.

2855. Would prefer me to put down £625 for the stock traffic and leave the £8,000 intact? Yes.

2856. Is it not a fact that the £8,000 includes everything for the inward traffic? No. There is no stock included in that amount.

2857. I am putting the stock down at £625; does the £8,000 include the stock? It includes passengers and coaching, and all merchandise, but it does not include stock.

2858. Now we come to wheat, maize, and potatoes, of which the Goods Superintendent estimates that there will be 3,300 tons at 1s. 6d. per ton, giving a total of £262 10s.; how does that estimate compare with your figures? I estimate that there will be 5,000 tons at 5s. a ton, and I will prove it to you. There is no part of the Colony in which you have 53 miles of railway where produce is carried at 1s. 6d. per ton. I will give you an example: I buy wheat from Tenterfield, on which I pay 6s. a ton for 60 miles of carriage.

Mr.
J. F. Utz.
14 Oct., 1896.

Mr.
J. F. Utz.
14 Oct., 1896.

carriage. I also buy wheat at Armidale upon which I pay 6s. per ton for 60 miles of railway carriage. I also buy wheat in Tamworth upon which I pay 14s. 8d. per ton for 130 miles of railway carriage. How then is the Goods Superintendent able to say that he can carry wheat from Inverell to Glen Innes, a distance of 53 miles at 1s. 6d. per ton. If the Department does that it must bring an entirely new merchandise rate into existence.

2859. What is your total estimate for wheat, maize, hay, and potatoes—outward traffic? 5,000 tons at 5s. per ton, or £1,250.

2860. Would that include hay? No.

2861. Then we come to the "B" class of goods—250 tons at 4s. 6d. per ton, or £56 5s. Do you wish to criticise that? I put down 500 tons for the following items: hides, tallow, skins, wine, and fruit. I average that lot of goods at 500 tons at 4s. 6d. per ton, or £110 12s. 6d., which I do not think is above the mark—in fact, I am positive in my own mind that in a district like this it is under the mark.

2862. Your estimate appears to be exactly double that of the Goods Superintendent? Then all I can say is that he has a very poor opinion of the district if he thinks it cannot turn out more than 500 tons of that class of goods.

2863. *Mr. O'Connor.*] I suppose the Goods Superintendent is not an expert in the same sense as yourself? I would not give way in my knowledge of the district to that gentleman.

2864. *Mr. Roberts.*] Now we come to tin ore—1,000 tons at 4s. 6d. per ton, or £225? That is what I have put down.

2865. Would any tin ore be carried at the present day? Yes, it is carried every other day now. Tin ore is obtained at Tingha; it is also obtained at Stannifer and Elsmore. There are two or three tin-mines within a distance of 2 or 3 miles of the proposed railway, and the furthest one away is Tingha, which is 12 miles from the nearest point.

2866. Is it not a fact that tin-mining in the Glen Innes and Inverell districts, compared with what it was a few years ago, is now a dead-letter, owing to the low price of tin? It is true we do not get one-fourth of the tin that we got ten years ago; but we still get 1,000 tons, in spite of the low prices and everything else combined. There are still 1,000 tons got per annum out of the three mines I have mentioned.

2867. According to your figures the inward and outward traffic will amount in round numbers to £11,010? Yes.

2868. Can you recollect what, in the year 1890, when the construction of a line of railway between Glen Innes and Inverell was first considered, was the estimated cost per mile? £8,000.

2869. I suppose you know that since then it has been reduced to about £6,000 per mile? Yes.

2870. From a return furnished by the Railway Construction Branch, in the early part of this year, a further reduction has been made, giving the total length of line between Glen Innes and Inverell as 52½ miles, and the estimated cost £317,908. I have made a hasty calculation of what the interest on £318,000 will be at 3½ per cent., and it comes to £10,335. The working expenses of the line, for the sake of calculation, I have put down as follows:—Traffic branch, £1,756; locomotive branch, £1,500; permanent-way branch, £3,040; making a total of £6,296;—which, added to the interest on the capital cost, gives a total annual cost of £16,631. Then we come to the revenue, and for the sake of endeavouring to arrive at a conclusion, and in order to give you every facility in proving your case, I will, for the moment, adopt your figures. The revenue, including coaching, mails, and inward goods, would come to £8,000, and the outward goods to £3,010, making a total of £11,010. That would leave a difference between the expenditure and the revenue, according to my calculation, of £5,621? About that. I consider, of course, that the interest of 3½ per cent. is rather excessive in view of the way in which money is going at present.

2871. For the sake of argument we will knock off the odd £620, and say £5,000;—I have adopted all your figures in order to arrive at as favourable a conclusion as possible, and the line would then show a loss of £5,000 a year? Just so—that is to start with.

2872. In view of the long experience you have had in the district, and of your commercial knowledge as a business man, would you be prepared to name any time in which you think that loss would be likely to be wiped out, or nearly wiped out? I venture to say that before three years had elapsed the earnings would be £16,000 a year.

2873. Therefore, if your anticipations were realised, in three years' time the revenue would come up to the expenditure? I certainly think so.

2874. With regard to the market for wheat—I am not perfectly clear as to how you are going to get rid of all the wheat which Inverell would probably grow when she is connected with the railway system of the Colony. You have spoken of a market in Queensland, but you have admitted that a market would only be found there when the crop failed on the Darling Downs? Just so.

2875. What other market have you to look to;—do you look to the Sydney market at all? If railway communication is cut off at Glen Innes, undoubtedly the Sydney and Newcastle markets will be the markets for the time being; but I have already stated I look to something in the future. There are 100,000 people on the eastern slopes of the Colony to be fed with breadstuffs.

2876. But there is no railway there? I admit that. Therefore, until you connect that portion of the Colony with a railway, I admit that the only outlet of the surplus wheat must be Sydney and Newcastle.

2877. If a railway were constructed from Glen Innes to Inverell, would Inverell find a payable market in Newcastle or Sydney? Inverell would not find a payable market if wheat were sold at its present ridiculously low price in the neighbouring colonies. I have, however, on former occasions, said that occasionally, notwithstanding the long carriage from Inverell to Sydney, Inverell wheat would find a profitable market in Sydney or Newcastle. If you give Inverell a railway at all, the producers must still have an outlet for their surplus wheat, and they have a better chance by coming to Glen Innes and connecting there, than they could have by connecting with Moree. I am only arguing that Glen Innes must undoubtedly be the choice of route, whether they want to reach a connection to the coast, or to sell in Sydney, or on the line to Queensland. There is no population west, and in my opinion there never will be to any great extent. The country is not suitable for a large population.

2878. *Mr. O'Connor.*] Do you know how many bushels of wheat go to the ton? Thirty-seven bushels and 20 lb.

2879. What is the import duty in Queensland? On wheat it is 4d. per bushel, and on flour £1 per ton.

2880-1. How many bushels do you usually produce to the acre? The average during the last ten years has been about 18 bushels.

2882. Are you aware that the consumption of wheat in Queensland is over 2,000,000 bushels, and that their production is only 123,000 bushels; consequently they require to be supplied with over 1,000,000 bushels? I know it.

Mr.
J. F. Utz.
14 Oct., 1896.

2883. Could you not find a market there and pay the import duty? I have already stated that under certain circumstances we would have a ready market in Queensland, but when I was challenged upon the cost of the sea-borne wheat I said that probably we would have a hard tussle to compete against that sea-borne wheat.

2884. *Mr. Roberts.*] With regard to the market on the eastern coast, at such places as Grafton, Lismore, Kempsey, and other towns, would it not be possible for that market to be served by sea-borne wheat;—is there not a good entrance at the Clarence River to which steamers from South Australia could come? Eight shillings per ton is the lowest maximum for which they carry goods from the Clarence River. Therefore, if a connection were made to the Clarence River, according to the present rate of charges, you could land wheat there from Inverell—a distance of about 150 miles—for about the same money.

2885. Do you mean to tell me that you could land wheat at Grafton from Inverell, overland, at the same price as wheat could be landed from South Australia? Not without railway communication.

2886. Could it be done with railway communication? Very nearly for the same money. There are 140 miles of carriage from Tamworth to Glen Innes, and the charge is 14s. 8d. per ton. Allowing the charge to be 8s. per ton from Sydney to Grafton, you have an advantage with the sea-borne wheat from Sydney to Grafton to the extent of 6s. 8d. But how does it come to Sydney. They do not grow wheat there. therefore, if it comes from South Australia or Victoria something must be charged for bringing it as far as Sydney.

2887. But is it not probable that, with improved harbour advantages at the Clarence River, steamers from all the wheat-producing countries of the world would make their way to Grafton if they believed there was a market to be found there;—and would a railway from Inverell be able to compete with them, even if there were a line to the coast? I certainly think it would. Allowing your argument, that the harbour was good enough to allow vessels to come in, to hold good, nevertheless there is not a sufficient volume of trade to induce those vessels to come to Grafton. It would be an occasional vessel only which would come in with bread-stuffs. Therefore, if an occasional vessel only comes in, the competition is not likely to be so great as it would be in a large port such as Sydney, to which you have 100 shipping companies sending their ships from all parts of the world. Therefore, I do not think they would land wheat or flour in Grafton within 1s. or 2s. a ton more than it would be carried from Inverell to Grafton for.

2888. But is it not a fact that "within 1s. or 2s. a ton" would not suit a keen business man such as yourself? That may be.

2889. Or even 3d. per ton? A keen business man would, of course, look at that. We must not lose sight of the fact, however, that there is a surplus of wheat in that district, and that surplus must go somewhere. Whether it is the business man or the farmer who sells the surplus it must go out of the district year by year, although he may not get such a profit for it as he would if he were able to sell it at his own door.

2890. We have been told that if a railway line is constructed from Glen Innes to Inverell a large area of country will be immediately put under cultivation, and consequently the production of wheat will be largely increased;—is it not a fact that when this wheat came to Glen Innes there would be a great difficulty in finding a market for it, unless it happened to come at a time when the wheat crop on the Darling Downs in Queensland had failed? There would be a difficulty in disposing of it at Glen Innes, providing that you could not go any further by rail east.

2891. As a matter of fact, your principal market would be on the eastern coast of the colony, namely, Lismore, Grafton, Kempsey, and other towns; is not that the real market? There is not the shadow of a doubt in my mind that that is the natural market of this part of the Colony.

2892. And until a railway is constructed there, what would be the use of bringing a line from Inverell to Glen Innes? It will be of some advantage. If you give Inverell a railway at all, you will be in a better position than you will be if you take it from Moree.

2893. But what would be the use of constructing it to Glen Innes unless you could get your goods to the coast, where you say you have your natural market. At present there is no railway there; therefore you must blot it out of consideration? If you are not going to construct the line to the coast at all, and if you wish that Inverell should for all time deal with Sydney, then, as a business man, I say "For goodness sake do not make a line to Glen Innes at all."

2894. In other words, it comes to this—that unless the Government are prepared to give you closer connection, it is absolutely impossible for a line of railway between Glen Innes and Inverell to be worked at a profit? It is absolutely impossible to work it at a profit unless you have that connection.

2895. Unless you have a connection with the coast where will you find a large market? But still you would get a better profit on a line from Inverell to Glen Innes than on a line from Inverell to Moree.

2896. Because you do not regard with favour a line from Inverell to Moree it is no argument why an equally satisfactory line should be constructed from Inverell to Glen Innes. According to your own showing Grafton and the other coastal towns form the natural market for Inverell produce, and unless Parliament sanctions a line from Glen Innes to Grafton, what earthly use is there in bringing wheat from Inverell to Glen Innes, because you must admit there is no market for it? I will not admit there is no market.

2897. Then there is no satisfactory market? I say there is a better market at Glen Innes than there can possibly be at Moree, but still I say that if they grow 1,000,000 bushels of wheat, there is not a market for it in Glen Innes any more than there would be at Moree.

2898. *Mr. Clarke.*] You are clearly of opinion that the Moree to Inverell line would not suit the public requirements? I do not think it would.

2899. And that a line from Inverell to Glen Innes would suit the public best? I think so.

2900. You have expressed the opinion that the surplus products of Inverell would find a better market in Glen Innes? Yes, because we have a larger population here than there is on the western side of Inverell.

2901. And do you think the population of the Moree district would only absorb a portion of the products of the Inverell district? Only a small portion.

2902. Independent of the question of connection with the coast, are you of opinion that a market for the surplus products will be found if a line is constructed from Inverell to Glen Innes? I am quite of that opinion. I think it can be found.

Mr.
J. F. Utz.
14 Oct., 1895.

2903. Where? A good portion of the market will start at Uralla to the Queensland border. Uralla does not grow half enough for its own consumption, nor does Armidale. Hillgrove, a mining town, requires wheat. All the places as far as Glen Innes require it. Glen Innes only grows one-third of its consumption. Emmaville does not grow any, nor do Dundee and Tenterfield. If you still have a balance you can send it on to Newcastle or Sydney.

2904. I suppose it is not possible at present to find much of an outlet for either wheat, flour, or chaff, in Queensland? Not a great deal. I have sent flour to Toowoomba during the last month or two. I have sent potatoes both to Toowoomba and to Warwick and have paid the duty.

2905. In the event of federation you would have a better market still? There is not the shadow of a doubt about that. It will be an open market then.

2906. You say that large quantities of potatoes are grown here, and are sent to Inverell? During some portions of the year Inverell grows potatoes as well as Glen Innes, but their potatoes would only keep about seven months out of the twelve. For the remainder of the twelve months they must get them from a colder climate than their own.

2907. I suppose the black-soil grows good potatoes, but they will not keep? Yes; they get black, hollow, and soft.

2908. And there would be a good market for them in Inverell? Yes, for four out of the twelve months.

2909. You say you have sent flour to Queensland? Yes; but not of course to a great extent.

2910. Would there, in ordinary seasons, be any market in Queensland? As long as Queensland requires breadstuffs we can compete at all times as far as Toowoomba. I think Brisbane is too far away in a good season.

2911. Do you think a line from Glen Innes to Inverell would benefit the producers of both districts more than the proposed line from Moree to Inverell? I think it would do the greatest good to the greatest number.

2912. Are you aware that it is proposed to construct a line from Tamworth to Manilla? Yes.

2913. Is that a good wheat-producing district? Yes.

2914. Would a portion of the produce of that district go to Warraldra or Moree? A portion from the head of the Manilla would find its way to Moree. There are already two flour-mills at Bingera which buy up the wheat, and I know of my own knowledge that the millers send their flour out to Moree.

2915. Can you form any opinion as to the object of the Railway Commissioners in proposing the construction of the Moree-Inverell line and stopping there? I can form a very good opinion. The simple reason is that the Railway Commissioners want to get away from the coast traffic as far as they can. By connecting Inverell with the Moree district they think it will drive the traffic in that direction, and that they will not have this keen competition which is going on at Glen Innes. As I have pointed out, however, there will be a keener competition when they get to Inverell than there would be if there were a line from Glen Innes to Inverell.

2916. Then you think that, some time or other, in the interests of the public and of a population of 100,000 on the coast, there should be railway communication with the coast? I think so.

2917. Notwithstanding the fact that connection with the coast would be carried out at heavy expense? Notwithstanding that. If there is one-tenth of the population of New South Wales concerned they should be considered.

2918. We have evidence that the proposed line from Moree to Inverell will cost about the same amount as a line from Inverell to Glen Innes;—taking that fact into consideration, are you of opinion that a line from Glen Innes to Inverell should be constructed in preference to the one proposed? I am.

2919. Would it give a better market to the whole of the people of the district? I think so.

2920. *Mr. Black.*] You have told the Committee that lately you have been sending breadstuffs to Narrabri, Gunnedah, and Moree, by way of Werris Creek? I have.

2921. If a railway were constructed between Inverell and Moree, would you not be able to land your breadstuffs more cheaply in the places indicated? Not by sending them by Inverell—that would be a longer distance—certainly not as far as Moree is concerned; but it will be a longer distance going to Gunnedah by way of Inverell.

2922. Possibly the half way point would be about Narrabri? Yes; but Tamworth is the nearest wheat-producing district to Narrabri.

2923. You have stated that the Inverell farmer could not compete in Narrabri with the Tamworth farmer? Not successfully, because there is a difference in distance of 37 miles.

2924. If a railway were constructed from Inverell to Moree, do you think it would draw much traffic from the Great Northern Railway? There is no doubt the existing line must lose a great deal of traffic under such circumstances.

2925. Then, in addition to the £2,800 which the Railway Commissioners estimate would be the yearly loss on the Moree-Inverell line, there would have to be added the additional loss on the Great Northern line, owing to the traffic being diverted? Some consideration should be given to that.

2926. And if no consideration is given to that, the estimate of loss is not a full one? And it is not a fair one either.

2927. What proportion of your goods do you now bring *via* Grafton? Within the last year I brought 700 tons from Grafton to Glen Innes. I consume about 1,800 tons of goods altogether. I may say I am a very large consumer of salt, which I buy in large quantities. It is carried at "B" rates from Newcastle to Glen Innes at £2 3s. 9d. per ton. I buy 100 tons at a time, and in the majority of cases it comes by railway.

2928. Do you agree with the evidence of Mr. Thomas, who appeared to think that if the Glen Innes-Inverell Railway were constructed, goods coming to Grafton, intended for Inverell, would be transhipped from the teams to the train? There is no doubt about it. It would be a saving of 4s. per ton.

2929. Do you think the carriers would make a reduction in their terms rather than tranship? The carriers are already down to bed-rock prices, and they could not possibly reduce their carriage. If they did so they would be wiped out of existence.

2930. Questions have been asked you with regard to the competition with wheat from the adjoining colonies;—do you not think there is a tendency to estimate the cost of wheat landed here from adjoining colonies solely upon the shipping weight, and to leave out of consideration the fact, that wheat grown in the other colonies is not grown on the wharfs, but must be taken from the farm to the railway station, and possibly from the railway station to the ship's side? Possibly so. 2931.

2931. If those matters are taken into consideration, do you think the Inverell district will be placed at such a disadvantage in competition with intercolonial wheat in the seaports of the Colony? I do not think they will be placed at a very great disadvantage if all the chances are taken into consideration. Before the wheat is put on the ship there must be a certain amount of handling and that handling will not take place in this instance. It will be put by the farmers upon the railway trucks and it will be delivered wherever it has to be delivered at or from the nearest railway station.

Mr.
J. F. Utz.
14 Oct., 1896.

2932. Is the soil in South Australia superior to that of the Inverell district? I should imagine there is not the slightest comparison between the productiveness of the two places. The average yield in South Australia is not half what it is in the Inverell district.

2933. Is the cost of labour in South Australia smaller or greater? That is a question I could not answer, because I do not know the rate of wages, but if the rate of wages there is equal to that of Inverell the cost should be equal.

2934. If the soil is more productive in Inverell, and if the cost of wages is no greater or very little greater, and if the expenses incurred in bringing the wheat to the South Australian ports are somewhat similar to those incurred in bringing Inverell wheat to a New South Wales port, then a good deal of this fear about the South Australian bread-stuffs must be illusory? There is no doubt about that, unless they have an enormous surplus in South Australia, and sell it at a very much lower rate in our Colony than they would in their own.

2935. It is only when the diminished returns begin to operate that we are in fear of South Australian competition? Certainly.

2936. And that would be true of any other port in the world? Just so. London regulates the prices. If wheat were at a fair price in London they would probably send there before sending to our Colony.

2937. *Chairman.*] I presume the average charge from Sydney to Inverell, by rail to Glen Innes, and thence by dray to Inverell would be £4 19s. 1d. per ton? That would not be a fair average, inasmuch as there is a great proportion of the lower grades of goods carried.

2938. Is not the charge of £3 13s. per ton from Sydney to Grafton and thence to Inverell a low one? It is the existing rate. Goods are being delivered at that price now, and the charge includes the steamer's freight.

2939. The charge from Grafton to Glen Innes is £2 18s. per ton, and if there were a railway to Inverell, an additional charge of 10s. would bring it to £3 8s. If the proposed railway from Moree to Inverell be constructed, are you aware what the Department's estimate of the cost of carriage by the truck rate would be from Sydney to Inverell? I should think nothing under £7 per ton to Inverell, a distance of 513 miles.

2940. If the rate were £3 7s. per ton do you think the storekeepers there could possibly use the railway? Certainly not.

2941. In face of the fact that they could land their stuff there from Grafton at £3 13s. per ton, or by train to Glen Innes, and thence by dray at £6 5s. per ton? They would not use it because the competition would be so keen from the eastern side.

2942. Would not this be the position; if the storekeepers were patriotic enough to pay an extremely high rate for carriage would you not be able, at Glen Innes, to compete with them, and undersell them? Undoubtedly.

2943. Then they are not likely to allow that? I do not think so.

2944. What would happen there would be what has happened in every other place. An enterprising man would commence to get his goods by the cheapest way and everyone else would follow suit? Precisely.

2945. If there were an endeavour on the part of the Railway Commissioners to compel the storekeepers to use the line, by giving them a differential rate, there would, I presume, be a loss to the revenue? Yes.

2946. Therefore, from whatever point you look at the matter, the line promises to show a loss so far as the inward goods are concerned? Yes.

2947. You maintain that it would be impossible for the railway to carry the inward goods to Inverell whilst there was this cheaper and competing route from the east? It would be impossible.

2948. You are aware that the Railway Commissioners admit that notwithstanding the differential rate, they cannot capture the whole of the traffic of the northern line? Yes.

2949. You know there is a loss of between £6,000 and £7,000 a year in the shape of freight in connection with the northern line? Yes.

2950. If the Railway Commissioners have been unable, under a differential rate, to capture that traffic at a point 422 miles, how are they going to capture at a point 511 miles? They could not possibly do it. They would be in a worse position than they are at present.

2951. Your contention is first, that the construction of a line west would be a mistake because there would not be sufficient population to absorb the produce of Inverell? Yes.

2952. Your next contention is that the line should come east to the Great Northern line, where the traffic from Inverell would be able to take advantage of whatever markets could be obtained north or south along the railway line? That is so.

2953. And you believe the proper thing to do is to go to the coast? Yes.

2954. Leaving the coast line out of consideration altogether, do you still hold that, even if that line is never made at all, a connection should be made from Inverell with the Great Northern line? I emphatically think so.

2955. Are you aware that it is proposed, as a matter of railway policy, that the line should start from Inverell to take the traffic west, by way of Moree, to Sydney, in lieu of any future connection with the coast? I consider it is a ridiculous proposal.

2956. Do you see the possibility of any large population in the future establishing itself anywhere along that route who would offer a better and more immediate market for the produce of the table-lands of New England than the existing market on the Great Northern line? I do not think there is the slightest chance of any large population in those western districts.

2957. Once a railway is brought to the Great Northern line, and a connection is made to the coast, they would be points equally as suitable for the transmission of goods to the coast, and whichever was adopted would suit the purposes of your argument? Yes, if the line is connected here it can be continued to the coast north or south.

2958. Supposing no line were constructed from the table-land to the coast, and that a line were made from the seaboard along the coast, starting, say, from Grafton, and going along the coast to Morpeth;—would that in any way relieve the table-land traffic or Inverell traffic? I do not think it could possibly assist them.

2959.

Mr. J. F. Utz. 2959. Then, in your opinion, nothing will ever remove the difficulty with reference to the traffic, nor give an outlet such as is suitable to the producers in this part of the Colony except a coastal connection? That is my opinion.

14 Oct., 1896.

2960. But your evidence at the present time is not based entirely upon the future? No.

2961. Whether that becomes a fact or not, you are still of opinion that the northern line is the line to which to bring the western traffic, and that it should not be taken west? That is so.

2962. Mr. O'Connor.] What is the quality of the flour produced in this district? It is equal to anything in New South Wales.

2963. Mr. Roberts has asked you as to what would be done with the balance of the wheat after you had supplied your natural markets:—are you aware that the distance from Berrigan to Sydney is only 440 miles, and that Glen Innes is only 420 miles away? Yes.

2964. I understand that in the Berrigan district they are producing tens of thousands of bushels of wheat; there are hundreds of thousands of acres of land to be thrown open immediately, and they will be put under cultivation; the production there is not nearly as great as yours; and we have it in evidence from one man in the district that he is able to meet the flour of Adelaide or America and beat it—can you not do the same here? If he can do it we can.

Mr. Robert Burfield Barton, manager, Haymarket Building Company, Sydney, sworn, and examined:—

Mr. R. B. Barton.

14 Oct., 1896.

2965. Mr. Black.] In the event of a railway being run through the property of the company you represent, would that company be disposed to give the land required, free of cost to the Government? I am authorised by the Board to state that the company will convey to the Government, free of cost, the land they own, which may be required for railway construction. I understand it is about 24 acres in extent.

2966. Do you anticipate any accession of settlement should a railway be constructed to Inverell? I have no doubt there will be, because the land is very suitable for farming. We have already been the means of bringing farmers there, and we should do all in our power to assist them.

Mr. Hugh McDonald, pastoralist, Glen Innes, sworn, and examined:—

Mr. H. McDonald.

14 Oct., 1896.

2967. Mr. O'Connor.] What area of land do you occupy? About 2,000 acres.

2968. Where is your land situated? Between Glen Innes and Gloucece.

2969. Have you any information which you wish to supply to the Committee? I may state that I have had experience from a pastoral point of view, of the Inverell district, but I can add nothing to the evidence of Mr. Utz.

2970. I suppose if a railway were constructed to Inverell from Glen Innes, it would be the means of attracting settlement? I think so. At the same time we have railway communication already, with Sydney, although it is not very profitable. We can produce too largely for local consumption. Our markets are east, and with the world. I know the Inverell district intimately. It is unlimited in its resources, from an agricultural point of view, but as far as connection westward is concerned, I am certain the area already under cultivation, is ample for requirements in that direction. The only outlook is to the coast.

2971. Then on national grounds you think a railway should be constructed from Inverell to Glen Innes? Certainly.

2972. Mr. Black.] You have heard the evidence of Mr. Utz with regard to the conveyance of stores for fattening, from Glen Innes to Inverell;—in the event of the railway being constructed in that direction; would you, as a pastoralist, if you desired to send sheep for fattening purposes to Inverell, and the opportunity were offered, prefer to truck them rather than travel them? Under certain circumstances I would, but I do not apprehend there would be any large traffic in that direction.

2973. Is it not more usual to truck fat sheep, and travel lean ones? Yes: it is more profitable to do that.

2974. Chairman.] If, in the future, a line were constructed from Moree to Glen Innes, would it not operate considerably against the earnings of the line from Moree to Narrabri? It would.

2975. Then there can be no wise policy in constructing a line from the northern railway system to the existing system at Moree? No; it would be a competing line, and would rob the other.

2976. If a connection were made then, it should be made equi-distant, and Inverell happening to be the producing centre, would be a safe place from which to make a start; but the line should go east instead of west? That is so.

Mr. James Osborne, grazier, Glen Innes, sworn, and examined:—

Mr. J. Osborne.

14 Oct., 1896.

2977. Mr. Clarke.] Have you considered the proposal to construct a line of railway from Moree to Inverell? Yes.

2978. Do you think it would be beneficial, from a national point of view, to construct such a line? No; I think a line from Inverell to Glen Innes would be better for the country. I think it would eventually be a good paying line.

2979. Would the produce of Inverell come to Glen Innes? I think so.

2980. Is the neighbourhood of Moree chiefly of a pastoral character? Yes.

2981. Can you say whether it is fit for agricultural purposes? Only from hearsay.

2982. Are you aware that the land in the neighbourhood is fit for agriculture? I know the whole of it between Inverell and Glen Innes is fit for agriculture.

2983. What do you grow yourself? I go in for dairying. I do not grow produce for exportation. I cultivate about 60 acres of my own every year.

2984. Do you think dairying will be a profitable pursuit in this district? It is a good dairying district.

2985. Is it equal to the south coast? I would rather be there; but as a summer dairying district it is as good as any place I have ever been in; but that is counterbalanced by the severity of the winter.

2986. I suppose the difficulty you experience is the long distance you have to travel? The freights to Sydney are rather heavy, but I have a good local market. Sometimes I send to Queensland, Narrabri, Moree, and Inverell.

2987. Can you compete with the north coast? By watching the Sydney market I can make money. I should like to state that £50 per mile is spent upon the main road from Glen Innes to Inverell, and in the event of the line between these two places being constructed, I do not think it would be necessary to spend more than £25 per mile upon it.

2988. There would, of course, still be the necessity for by-roads? Yes.

Mr.

Mr. John Wetherspoon, farmer, Glencoe, sworn, and examined:—

2989. *Chairman.*] How long have you been living in this district? Forty-three years.

2990. What do you think of the proposed line? It would be an injury to the country. The only line of any use to us would be a connection between Inverell and Glen Innes. It has already been passed by a previous Committee.

2991. Since then a line has been constructed to Moree, and in view of that fact have you had occasion to change your opinion? No. I still think the Inverell trade and the western trade should be drawn in to touch the Great Northern line. It would then have a number of markets. Inverell produce going *via* Moree would be trained into the centre of the country. The distance is 412 miles to Newcastle, and by way of Glen Innes it would be only 376 miles. I am certain no passengers to Sydney would ever take the train from Inverell to Moree in preference to coming to Glen Innes. They can reach the Great Northern line within six hours from Inverell and be in Sydney the same evening; whereas if they went by the Moree line, considering the difference of rate of speed, it would take them a great deal longer to reach Sydney. I cannot see how goods can pay going *via* Moree to reach the eastward. The only line which would be suitable for Inverell is one connected with Glen Innes. It will have Sydney on the south, and Brisbane on the north, with the chance of eastern traffic as well. There is no district more productive than Inverell, and no district has been more neglected by the railways. It is no good diverting traffic to the western districts where there will be no population. With regard to the loss on the northern line I may mention that Glencoe is on the northern line, and I have figures to show you that eventually there will be no loss on the line to Glen Innes. For the first six months of 1895, we despatched 567 tons from Glencoe. During the period—January to August—the amount had increased to 946 tons. If it does that in one instance it will do it in another. If the Inverell people have a connection with the main trunk line I am satisfied more land will be cultivated.

2992. Would Moree be of any value to the Glen Innes district for a market? None whatever, with the exception of a few potatoes. Again, the main trunk line having been put down, it would be wise for the country to construct branches which would be feeders to it and not to establish a competing line.

Mr. J.
Wether-
spoon.

13 Oct., 1896.

Mr. William Hodges, grazier, Glen Innes, sworn, and examined:—

2993. *Chairman.*] How long have you resided in Glen Innes? Thirteen years.

2994. *Mr. Roberts.*] What is your occupation? I occasionally slaughter cattle, and send them by the refrigerator truck to Sydney.

2995. In which direction is your establishment from Glen Innes? It is 2½ miles on the Tenterfield side of Glen Innes.

2996. Have you any area of land under occupation? Yes; 70 or 80 acres. Altogether I hold 560 acres of conditional purchase, and 260 freehold, besides conditional leases—in all 2,000 acres.

2997. Do you grow wheat? Yes.

2998. Have you any difficulty in obtaining a market? There has been no difficulty since I have grown it, in finding a market in Glen Innes for it.

2999. At paying rates? The last season has been a paying one.

3000. How many sheep do you run? At the present time I have only about 100; but I have 300 or 400 head of cattle.

3001. I suppose you find grazing and the boiling down business pay better than cultivating the land for wheat production? I do.

3002. If a railway were constructed from Glen Innes to Inverell, do you anticipate any advantage to your property, or can you see any advantage to the country generally? I see an advantage to my business. No doubt cattle and sheep would be sent here for boiling down purposes, as well as slaughtering, for the Sydney market, in the cool months of the winter. It would also be of advantage to the railway traffic. If I had 1,000 sheep in Inverell I could get them brought down for 12s. 6d. a truck. I should prefer that to driving them on the road.

3003. Do you know anything of the country between Moree and Inverell? Not further than Warialda.

3004. If a railway were constructed from Inverell to Moree touching at Warialda, could you give an opinion as to the trucking of stock at Warialda? If the railway came there I should prefer to drive them to Inverell and truck them to this direction. The heat, going around by way of Moree and Narrabri is so excessive, that it has an injurious effect on stock travelling that long distance.

3005. Do you think the extreme heat would make an impression upon the passenger traffic to the metropolis? I think so. I know if I lived in Inverell I would prefer to go by way of Glen Innes, even if I had to coach it. Should the railway be constructed from Glen Innes to Inverell there would be refrigerating works erected at Inverell. For six months of the year there would be two refrigerator trucks running each week, which would give £1,200 per year to the railway. It would be more desirable to send meat in the refrigerator trucks this way than the other way. I doubt whether the ice in the trucks would last the other way.

3006. If you had a refrigerator truck, would it not be equally as beneficial on the Moree line as on the Glen Innes line? The ice would not last so long that way. You would require to put fresh ice in on the road.

3007. Are you able to make that statement from practical experience? During last winter I had the ice put in at Sydney. It was during the cold weather. It just lasted the journey there and back. It was freezing all the time in New England, and had it been hot weather I know I could not have done it.

3008. From the statement you have made I understand you do not view with any favour the construction of a line from Inverell to Moree? From a national point of view I do not. I cannot say it would make any material difference to me personally.

3009. You think the money of the State would be expended to better advantage by connecting Glen Innes with Inverell? I do.

Mr.
W. Hodges.

13 Oct., 1896.

Mr. Fredrick Lewis, saw-mill proprietor, Big Hill, sworn, and examined:—

- Mr. F. Lewis. 3010. *Chairman.*] Where is Big Hill? Twenty-five miles east of Glen Innes.
 13 Oct., 1896. 3011. What is your opinion with regard to the proposal under the consideration of the Committee? I may state that when I was at Inverell twenty-six years ago there was plenty of timber, and it is now nearly cleaned out. We have to supply them with timber. I have sent some down, and I have many applications in all directions. It is quite certain we shall supply Inverell with timber. We consume 300,000 feet, and in Inverell they will consume more.
 3012. How many men do you employ? Six at present. I can increase the number of men and the quantity I turn out threefold if I wish.
 3013. Do you think the timber trade would become an important industry? Yes.
 3014. Have you a large supply of timber? Yes, sufficient for the next 100 years.
 3015. What can you afford to pay for the carriage of timber to Inverell? At present it costs about £3 10s. for 1,000 superficial feet. If the railway were constructed the charge would be less.
 3016. How far do you live from town? Twenty-four miles; and we supply timber at Inverell for 7s. per 100 feet. If a line were constructed it would be 2s. less per 100 feet.
 3017. If a line were constructed you would take advantage of it? Yes; I should send my orders by the railway. According to the orders coming in now we might expect to supply in Inverell something like 300,000 feet in a year, or 1,000 tons.

Mr. Richard Alcock, coach proprietor, Glen Innes, sworn, and examined:—

- Mr. R. Alcock. 3018. *Mr. Black.*] Would you like to make any statement to the Committee? I can tell you what the passenger traffic has been from Warialda to Inverell from the 1st of June to the end of last July, during which time I have had the contract. The receipts from passengers travelling from Warialda to Inverell were as follow:—January, £28 19s. 6d.; February, £27 6s. 6d.; March, £9 1s. 6d.; April, £13 9s.; May, £4 12s.; June, £14 5s.; July, £13 9s. The receipts from passengers travelling from Inverell to Warialda stand as follows:—January, £5 5s. 6d.; February, £5 10s. 6d.; March, £3 14s.; April, £8 6s. 6d.; May, £5 0s. 6d.; June, £3 2s. 6d.; July, £3 17s. That is a total, between Warialda and Inverell, of £111 2s. 6d., and of £34 16s. 6d. between Inverell and Warialda.
 3019. Have you the figures from Glen Innes to Inverell? Where there is one passenger on that line there will be about fifteen or twenty here.
 3020. The total sum between Warialda and Inverell, inward and outward, is £145 19s. 6d., or £20 16s. per month? Yes. It has not averaged that during the last six months. There have only been two good months between Glen Innes and Inverell since I have had the contract, and they were January and February.
 3021. *Chairman.*] Can you give us the number of passengers travelling between Glen Innes and Inverell, and between Inverell and Glen Innes; also between Inverell and Warialda, and Warialda and Inverell? Yes, as follows:—

1895.		<i>List of Passengers.</i>						
July	{	Glen Innes and Inverell	87	
	{	Inverell and Glen Innes	69½	
August	{	Glen Innes and Inverell	79	
	{	Inverell and Glen Innes	67	
September	{	Glen Innes and Inverell	81	
	{	Inverell and Glen Innes	59	
October	{	Glen Innes and Inverell	91	
	{	Inverell and Glen Innes	73½	
November	{	Glen Innes and Inverell	84	
	{	Inverell and Glen Innes	64	
December	{	Glen Innes and Inverell	107	
	{	Inverell and Glen Innes	113	
1896.								
January	{	Glen Innes and Inverell	109	
	{	Inverell and Glen Innes	98	
February	{	Glen Innes and Inverell	65	
	{	Inverell and Glen Innes	79	
March	{	Glen Innes and Inverell	96½	
	{	Inverell and Glen Innes	93	
April	{	Glen Innes and Inverell	79	
	{	Inverell and Glen Innes	67	
May	{	Glen Innes and Inverell	73	
	{	Inverell and Glen Innes	61	
June	{	Glen Innes and Inverell	77	
	{	Inverell and Glen Innes	68	
1896.		Bicycle traffic, 50 per month; buggies and other traffic, 220 per month.						
January	{	Warialda and Inverell	36	
	{	Inverell and Warialda	17	
February	{	Warialda and Inverell	26	
	{	Inverell and Warialda	15	
March	{	Warialda and Inverell	11	
	{	Inverell and Warialda	9	
April	{	Warialda and Inverell	6	
	{	Inverell and Warialda	9	
May	{	Warialda and Inverell	8	
	{	Inverell and Warialda	5	
June	{	Warialda and Inverell	6	
	{	Inverell and Warialda	7	
July	{	Warialda and Inverell	9	
	{	Inverell and Warialda	9	

3022. *Mr. Black.*] From your figures, the trade with Warialda is largely made up of people going through from Glen Innes to Warialda? Yes; we take as many from here right through as we do from Inverell to Warialda. They go round this way to get to Warialda in preference to going to Tamworth.
3023. Does your experience lead you to imagine that if a railway were constructed from Moree to Inverell, the passenger traffic from Inverell would go that way? No; I believe three-fourths would come this way—that is, judging from the conversations I have had with Inverell people.
3024. That is to say, that all those people who are going to Werris Creek would continue to go by the Great Northern line, and only those would take the Inverell-Moree railway who had business between Inverell and Narrabri? No doubt they would go that way; but then there is the Queensland traffic, also that of Tenterfield, and the people up the rivers. They would not run past Werris Creek and Narrabri to get to Inverell. They would run across here in about six hours, and they would not go that way in less than twelve or fourteen hours. No traffic would go that way from here.
3025. You do not think the line would be successful as a means of carrying passengers between Inverell and the metropolis *via* Moree? I certainly do not.
3026. It would not only be much further, but the rate of speed would be slower, and the discomfort of passing through the hot belt greater? Yes; and you could come round from Sydney to Glen Innes, and get to Inverell quicker.
3027. Is not the road between Glen Innes and Inverell very good? Yes.
3028. And any passenger traffic offering between Inverell and New England to go down, possibly as far as the Moonbi, on the one side, and any passenger traffic to go to or coming from Queensland, or to go to or coming from the coast, on the other side must of necessity be compelled to go by the coach along the Glen Innes route, even if the proposed line is constructed? Yes.
3029. As a matter of fact, if it came to a question of competition, would you not be able to do the distance between Glen Innes and Inverell in less time than you are doing it now? I think I would. Of course, I would have to do it then. I would have to compete then with the railway.
3030. And how would your rates compare? I should run with the present rate.
3031. I presume if it were necessary the mails could be delivered between the two points in a shorter time than they are delivered now? Yes; I could deliver them as quickly as you like by being paid.
3032. Are you ever stuck up on the road in wet weather? No.
3033. As a matter of fact, it is a bicycle road? It is, unfortunately.

*Mr.
E. Allcock.*
13 Oct., 1896.

Mr. James Healey, auctioneer and produce merchant, Glen Innes, sworn, and examined:—

3034. *Mr. Clarke.*] How long have you resided in the district? Fifteen years.
3035. Are you acquainted with the country between Moree and Inverell? No; but I am acquainted with a portion of the country about Warialda and between Glen Innes and Inverell.
3036. Have you anything to say with reference to the proposed line from Moree and Inverell? If such a line were constructed it would be a national mistake. If a line were constructed from Inverell—and no doubt in the future it will be—I think it should go to the north of Moree altogether, and then it would not be a competing line with the present line.
3037. But if the line went north it must connect with the line from Narrabri to Moree in some way or other? Not necessarily; you could keep it more north to the Queensland border, to Goondiwindi.
3038. Such a line as that would not benefit the people between Moree and Warialda and Inverell? It would not benefit them, but it would benefit the residents to the north of Warialda.
3039. Are you aware that the country about Moree and down to Warialda is of a pastoral character? I have heard so.
3040. Do you approve of the construction of a line between Glen Innes and Inverell in preference to the other? Yes. I think lines should be built with an eye to the future, and the east coast must be tapped from the table-lands of New England. Apart from that, a line from Inverell to Glen Innes would open up a magnificent country. I think some consideration should be given to the large population residing between here and the coast.
3041. Do you think there would be an interchange of produce? Yes; if a line were constructed to the coast even at the present time, thousands of tons of potatoes and oats could go down into the coastal climate. They cannot grow them themselves.
3042. What would you get in return? Sugar and other tropical products.
3043. In the event of a line not being carried to the coast, are you of opinion that a line should be carried from Inverell to Glen Innes? Yes; I am perfectly satisfied it would be almost a paying line from the jump. I believe it would be one of the best paying lines the country would have.
3044. Would it give the people east and west of Inverell an opportunity of getting to a good market? Yes. They would have the privilege of the southern and northern markets. With federation, no doubt they would have dealings with Queensland.

*Mr.
J. Healey.*
13 Oct., 1896.

Mr. John Rule, storekeeper, Glen Innes, sworn, and examined:—

3045. *Chairman.*] How long have you been in Glen Innes? Since 1883. I wish to state that within the last two months I have gone through 70 tons of flour from the Inverell district. It has been sent to me because there was no market west. It has gone to Emmaville, Hillgrove, and Armidale.
3046. Which mill did you get it from? Oliver's.
3047. Is that a trade which has been going on for some years? I have done considerable business with Inverell millers in flour this year. It has been larger than usual.
3048. Then the Inverell millers have been able to pay land carriage across here to compete with the locally-made flour? Yes.
3049. And it left a margin to admit of its being exported as far as Armidale and Hillgrove? Yes, and even to Tenterfield.
3050. May we infer that if you had cheap carriage such as you would get from a railway, you would be able to get it in larger quantities and send them greater distances? I should certainly think so. Of course, the freight would be less than the freight by teams.
3051. Is the quality of the flour such as you can readily find a market for? It is.

Mr. J. Rule
13 Oct., 1896.

- Mr. J. Rule. 3052. We should also have to presume that there was a congested market at Inverell, and the flour was sent this way? I should think so.
- 13 Oct., 1896. 3053. Inasmuch as Inverell is midway between Moree and Glen Innes, if a better market existed there, it would have gone there in preference? Possibly.
3054. I suppose you know there has never been much business connection between Glen Innes and Moree? There has not.
3055. That trade is touched from another point altogether? Yes.
3056. And now the line has been constructed to Moree, it is not very likely that you can expect to have any trade between Moree and Glen Innes? I do not think so.
3057. Whatever is the development it must be between Inverell and Glen Innes? Yes.

PARLIAMENTARY STANDING COMMITTEE ON PUBLIC WORKS.

Railway from Moree to Inverell.

SECTIONAL COMMITTEE.

APPENDIX.

A

[To Evidence of Mr. W. H. O'M. Wood.]

CROWN LANDS IN MOREE LAND DISTRICT.

Telegram from W. H. O'M. Wood, D.S., Moree, to C. Lync, Esq., Secretary, Parliamentary Standing Committee, Sydney.

AREA of Crown lands, exclusive of camping and travelling-stock reserves, in Moree Land District is 1,710,674 acres.

[One plan.]

1897.

LEGISLATIVE ASSEMBLY.
NEW SOUTH WALES.

GORDON RAILWAY STATION.
(RETURN RESPECTING.)

Printed under No. 2 Report from Printing Committee, 6 May, 1897.

RETURN to an *Order* made by the Honorable the Legislative Assembly of New South Wales, dated 20th October, 1896, That there be laid upon the Table of this House a Return showing,—

- “1. The names of Owners from whom land was acquired for railway construction, 10 chains on each side of the Gordon Railway Station.
- “2. The areas required in each case.
- “3. Whether acquired by gift or resumption.
- “4. What amounts were paid (if any) in each case.
- “5. To whom was the money paid?
- “6. Were the titles freehold or Torrens’.”

(*Mr. Howarth.*)

RETURN showing the names of Owners, &c., from whom land was acquired for Railway Construction at Gordon Station, from 4 miles 63½ chains to 5 miles 3½ chains.

Name.	Area Resumed.	How Acquired.	Amount Paid.	To whom Paid.	Title.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

NORTH COAST RAILWAY.

(RETURN RESPECTING.)

Printed under No. 16 Report from Printing Committee, 19 August, 1897.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 15th July, 1897, That there be laid upon the Table of this House,—

“ All papers and official reports in connection with the proposed North Coast Railway.”

(Mr. F. Clarke.)

SCHEDULE.

* Omitted by the Printing Committee.

NO.	PAGE.
*1. Extracts from sundry newspapers—Advocating construction of North Coast Railway. 1882
*2. J. H. Young, M.P., to Minister for Public Works—Respecting an interview for a deputation <i>re</i> line from Maitland or Morpeth northwards (date for interview fixed). 6 September, 1882
*3. Extracts from Parliamentary Votes and Proceedings—Three extracts <i>re</i> line; also report <i>re</i> deputation which waited on Minister for Works, September, 1882. 24 January, 1883; 1 May (2)
*4. Paper—Copy of Petition presented to Parliament. 1 May, 1883
*5. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> line. 31 May, 1883
*6. Extract from <i>Sydney Morning Herald</i> —Report <i>re</i> deputation to Minister for Public Works <i>re</i> line, North Grafton to Tentersfield, with branch to Richmond River (attached copy of letter signed “C. H. E. Chauvel.”) 25 August, 1883
*7. Extract from <i>Telegraph</i> —Report <i>re</i> above deputation. 25 August, 1883
*8. Extract from Votes and Proceedings, Legislative Assembly—Question and reply <i>re</i> surveys. 12 October, 1883
*9. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> numbers of surveyors employed, &c. 18 October, 1883
*10. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> numbers of surveyors employed, &c. 27 November, 1883
*11. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> surveyors employed and route to be adopted. 24 January, 1884
*12. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> trial surveys and surveyors employed thereon. 18 March, 1884
*13. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> trial surveys and surveyors employed thereon. 24 June, 1884
*14. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> completion of trial survey, West Maitland to Grafton. 31 July, 1884
*15. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> completion of trial survey, West Maitland to Grafton. 26 August, 1884
*16. H. Palmer to Engineer-in-Chief for Railway Construction—Application for additional surveyor. 29 August, 1884
*17. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> date of completion of trial survey. 8 October, 1884
*18. Departmental report <i>re</i> deputation—Report of proceedings at interview granted to deputation. 31 October, 1884
*19. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> completion of surveys, &c. 20 March, 1885
*20. Wm. Johnston, J.P., Chairman of Public Meeting held at Clarence Town, to Minister for Works—Petition asking that the proposed line be not constructed <i>via</i> Seaham, but above Clarence Town. 1 April, 1885
*21. H. Kieck, Coff's Harbour, to Colonial Secretary—Letter advocating construction of line of railway. 2 April, 1885
*22. E. W. Rudder, Chairman of Public Meeting held at Kempsey, to Minister for Public Works (copy)—Letter respecting the construction of the line. 9 April, 1885
*23. O. Lloyd to Engineer-in-Chief for Railways—Report on line, Manning to Camden Haven. 29 April, 1885
*24. Wilton Stack to Engineer-in-Chief for Railways—Letter advocating route across river above Clarence Town. 27 June, 1885
*25. Extract from <i>Herald</i> —Report of proceedings at an interview between a deputation and the Minister for Works <i>re</i> line. 1 August, 1885
*26. Extract from Votes and Proceedings, Legislative Assembly—Question and reply, <i>re</i> trial survey. 10 September, 1885

NORTH COAST RAILWAY.

No. 39.

Minute Paper.

Subject:—North Coast Railway.

Department of Public Works, Sydney, 17 June, 1886.

A DEPUTATION, introduced by Mr. J. H. Young, M.P., and consisting of Messrs Abbott, Abigail, Burns, Brunker, H. H. Brown, Butcher, Creer, W. Clarke, Cass, Davis, Dawson, Ewing, Fletcher, Gibbs, Hogan, Humphery, Kethel, Lysaght, O'Sullivan, Purves, Roberts, See, Slattery, Targett, H. Taylor, Wisdom, and Vaughn, waited upon me this morning to urge upon the Government the necessity for taking early steps to proceed with the North Coast railway, extending from about Morpeth, or any convenient point on the Northern railway, to Grafton, there to connect with the line already approved of to the Tweed. They urged that the districts that such a line would pass through were the most fertile in Australia, already largely settled and giving large returns—statistics of which are enclosed. At the present time communication with the coast district is very much hindered on account of the defective facilities that exist owing to the uncertain nature of the bar harbours, the produce being in some cases entirely destroyed and profitable markets very often lost through the delay in having produce forwarded. It is pointed out that above the navigable portion of the rivers where large quantities of splendid land, which would, if a railway were constructed, be brought under cultivation and assist to supply the requirements of the Colony in regard to breadstuffs, whereas at the present time we had to send to other colonies for much of the produce used.

Railways were in course of construction to the Southern Coast districts, and, without wishing to make any invidious comparison, they considered that the Northern Coast districts were as much entitled to a railway.

The Government had to spend large sums in improving the entrances to the rivers; but it was considered that the necessity for the large expenditure would be obviated if a railway were made to afford the people direct communication; and it was urged that our railway system would be incomplete without a line running along the North Coast. The value of a railway was shown in the increase in population and products that followed the construction of the railway up the Hunter Valley. The soil along the Northern Coast rivers was equally as rich, and equally as good results would follow the construction of the line. They would not advocate any particular route, but would leave it to the Government to say which would be the most direct and the best in the interests of the Colony. It was further pointed out that there was a large expenditure for roads in the Coast districts which was entirely unproductive; but a railway would do away with the necessity for the large expenditure on the main roads. It was also mentioned by Mr. Abbott that in proposing the North Coast railway they might at the same time revise previous proposals; and, in his opinion, the construction of the Coast railway would do away with the necessity for the railway from Grafton to Glen Innes.

In reply I stated I recognised the great importance and influence of the deputation, representing so largely both sides of the Assembly; and I had listened with pleasure to the remarks made descriptive of the Northern Coast district. Unfortunately, I had not the pleasure of visiting the district; but I hoped before long to do so. I was desirous to further the extension of railway communication in all directions where occasion required.

I thought it should be our policy to extend our railways wherever there was a fair chance of getting a return there would be no loss to the Colony; but railway extension under proper conditions must be of great gain. The railways were constructed out of borrowed money, and wherever we could get a return equal to the interest to be paid, it was a great gain to have the railways to convenience the people and open up the country.

It was the custom to spend large sums in making and maintaining roads; but, as was pointed out, the advent of a railway would do away with the necessity for these main roads, and if the North Coast railway were to be undertaken, the sooner it was constructed the better it would be. I had noticed some instances where large sums had been spent on roads before a railway had been made; but a railway was afterwards made in the locality running parallel to the road, and the consequence was the road was rendered almost entirely useless, and the money spent on it thrown away. The proposal for this North Coast railway would have to stand on its own merits. I could not agree with Mr. Abbott; but its construction would do away with the necessity for a Grafton to Glen Innes railway, because it seemed to me necessary that a line should be made to connect with the coast from the main Northern railway; in the first place, to allow an interchange of commodities and to provide for the Queensland trade, as otherwise we would not be able to compete for it. The question of doing away with the necessity for improving our bar harbours, if the railway were made, was an important one, and it seemed to me that if a railway were made, it would to a great extent obviate the necessity of going to the expense of large sums to open the entrances to the rivers, although, no doubt, the rivers would have to be kept open to a great extent.

I would be glad to recommend any railway if it would pay, and give facilities to the farmers so as to enable them to bring produce to market. I would give every consideration to their statistics and their arguments, and would submit the matter to the consideration of my colleagues.

I could not at the present time make any further promise.

W.J.L.

What further is to be done in this matter;—is it to be submitted when the Government Railway proposals are brought forward?—D.C.McL., 23/7/86. For Minister's decision.—Ch.A.G., 7/7/86. Have *précis* of particulars, statistics, &c., prepared, to be included in a minute for consideration of Cabinet.—W.J.L., 12/7/86. The within statistics in print, prepared by those interested, should be verified at the Registrar-General's Office. Please see that this is done, and *précis* prepared.—Ch.A.G., 12/7/86. *Précis* herewith.—C.A.B., 31/7/86.

No. 41.

No. 41.

Minute Paper.

Subject :—North Coast Railway.

THE following is *précis* of the papers, which it must be admitted are rather meagre, and appear to commence in *in medias res*, but I am assured that these are the only documents we have.

On the 21st February, 1886, Mr. Secretary Garrard stated in the House, in reply to Mr. Thompson, that the surveys of the proposed Coast line of railway were not completed, that the Engineer-in-Chief had not recommended any particular route, that the line Morpeth to Manning River had not been surveyed, and that estimates had not been prepared.

In further reply to Mr. Thompson, Mr. Secretary Lyne stated in the House (7th April, 1886) that the surveys of the line in question were completed, that the plotting of the plans and sections was far advanced, and that when this was finished the estimates would be prepared.

On the 17th June, 1886, a deputation, consisting chiefly of Members of the Legislature, waited upon Mr. Secretary Lyne to urge on the arrangements for the construction of the North Coast railway. The deputation represented in strong terms the extent and fertility of the districts through which the proposed lines would pass, and the isolation from the metropolis and from suitable markets to which the large population was condemned. Many of the farmers, they said, could find no suitable market for their produce in consequence of the rivers, their only present means of conveyance being closed by bars, and it was no uncommon thing to see thousands of bushels of corn rotting on the wharfs, because there was no means of carrying it away. All this would be remedied by the construction of the proposed railway. The deputation further stated that there was a large extent of cedar brush and good valuable land which only required communication with a market to render it capable of sustaining a large population. This railway was, in fact, a national undertaking, and it ought to be constructed without delay, so that people might be encouraged to settle on the land. They were quite prepared to leave the choice of route to the Government, in full confidence that the best route would be selected. In support of their representations the deputation quoted certain statistics, the particulars of which are not given in the report, but, doubtless, they were of the same purport as statistics which had previously appeared in the *Manning River Times*. From the figures there given (as verified by the Statistical Department), it would appear that the proposed railway would tap districts containing an area of 16,060 square miles, and a population of 51,782 souls, distributed as under :—

	Area in square miles.	Population without shipping.
Durham	910	5,945
Gloucester	2,099	5,643
The Hastings and Manning	2,908	9,309
The Macleay	2,662	7,123
Grafton	2,166	7,744
The Clarence	840	6,752
The Richmond	4,480	9,266
making a total of	16,060	51,782

The population as here given is that shown by the Census of 1881, and one-fourth (say, 13,000) may, it is said, be added for augmentation, by natural increase and other causes, making the figures 64,782.

The live stock and agricultural returns of the same districts for the year 1885 give the following figures :—42,657 horses, 290,522 horned cattle, 10,709 sheep, 39,863 pigs, 132,904 acres in cultivation, with a produce of 2,847,379 bushels of maize, 75,972 gallons of wine, and 369,510 cwt. of sugar—figures which will be very largely increased for the current year, it is said.

The article referred to further furnishes figures on an extensive scale, illustrative of the extent and importance of the manufactures, and of the trade carried on in these districts; and it is shown that at the several outlets, in spite of the obstacles and disadvantages, there is a large import and export business, the latter chiefly in timber.

The article winds up by maintaining that, in view of all these facts, the North Coast railway could not fail to be self-supporting.

It ought to have been mentioned in the proper place that one member of the deputation suggested that the construction of this Coast railway would do away with the necessity for the line from Glen Innes to Grafton.

Mr. Secretary Lyne, in replying to the deputation, stated that he had not had the pleasure of seeing the district referred to, but hoped before long to visit it; that he believed our true policy was to extend our railways wherever there was a chance of getting a return; that the railways were constructed with borrowed money, and wherever a return could be obtained equal to the interest to be paid it would be a gain to the State to have the railways for the accommodation of the people, and to open up the country. Large sums of money were spent in making and maintaining main roads; but the introduction of a railway rendered a main road unnecessary, and if this North Coast railway were constructed, the sooner it was done the better. He knew of instances where, after large sums of money had been spent on a road, a railway had been constructed running parallel with such road, the latter being thereby rendered almost useless, and the money expended on it thrown away. If money were to be expended on common roads, it should only be on such as brought traffic to the railways. He did not agree with one speaker, who thought this line would obviate the necessity for the Grafton-Glen Innes railway. On the contrary, he held that there must be a line from the Great Northern railway to connect the table-land with the coast, both for interchange of commodities and to secure the Queensland trade. It seemed to him that if a railway were made it would to a great extent obviate the necessity for spending large sums in keeping open the entrances to the rivers, although they would, no doubt, have to be kept open to some extent. The Minister concluded his remarks by stating that he would gladly recommend any railway that would pay and afford facilities to producers;

producers; that he would give full consideration to the statistics quoted, and to the arguments employed by the deputation, and lay the matter before his colleagues for consideration; and that he could not promise anything beyond that for the present.

C.A.B., 31/7/86.

No. 63.

T. R. Firth to The Acting Engineer-in-Chief for Railways.

North Coast Railway.

Sir,

Taree, 1 July, 1889.

In reply to your telegram, which I received on my arrival here, I have to report that I have examined the route as surveyed from the Clarence River to the Dawson River, and also the route suggested *via* the Orara Valley. When in Grafton I examined the site of the terminus of the Grafton-Tweed line, as regards the position of the station arrangements and connection with wharfs on the river, and, as the present terminus is not in a favourable position for crossing the river and connecting with the southern portion, I examined the river on both sides for the most suitable crossing. This I find to be about 6 miles from North Grafton, and by placing the station where I propose in South Grafton, the lines can be joined, and also the Glen Innes line if required. Details of the plan will be submitted on my return.

Instead of starting the line from Wilson's Hill, on the bank of the river (coming south), I would have the terminus at or near Vere-street, and nearly parallel with it, so as to be out of the reach of floods; a line can then be run by a branch on a sharp curve and steep gradient nearly along the surface over the flooded portion of the flat, and then by a cutting round Wilson's Hill, on the eastern side, parallel with the river and a wharf to be built. By this scheme about $1\frac{1}{2}$ mile of viaduct required by Mr. Mansfield's survey will be dispensed with and about £10,000 to £50,000 saved, and the service of the public equally as well carried out, because during high floods when my proposed line will be covered with water Mr. Mansfield's terminus would also be inaccessible.

The route taken by Mr. Mansfield is, generally speaking, the cheapest one; some slight improvements can be made in final staking. By this route, *via* Corindi and Woolgoolga, to Coff's Harbour, there is not much valuable land for agriculture, and if jetties are erected at the two latter places, and for which I am told there is great promise, the railway traffic will not be great from this district. The Orara Valley route would be a little shorter, starting from near Coff's Harbour, and joining the surveyed line again at 11 miles (about) from Grafton; but the works would be heavier and cost more per mile, principally from the difficulty in crossing the dividing range at the head of the Orara River eastern branch. Another practicable route, and, I think, cheaper than the last-mentioned, would be to enter the valley farther down by the Bucca Bucca Creek. Of course, this would not take in the whole of the valley, but it would be the means of getting produce away from it. At the present time the selectors or settlers cannot get their produce to a market and compete with those on the banks of the rivers navigable, or on the coast where wharfs exist. The soil in the valley is very rich and the timber is abundant; and I believe that a line through the valley will pay better than the cheaper line along the coast, and would certainly recommend that a trial survey should be made before a final decision is arrived at. The scrub and timber is very dense, and, of course, presents great difficulties to a surveyor.

From Orara to the Lausdowne River only some trifling alterations can be made. At this river the line crosses below the navigable waters, and I think if the line was made to cross near the road bridge, the cost in bridge construction saved, and compensation for land, would pay for the slight extra cost of the line.

I may mention that an agitation is being got up by a small portion of the Graftonites to have a line connected with the Great Northern railway, near Armidale or Guyra, and a portion of this route would be along the Orara Valley.

To-morrow I examine the lines and rivers Dawson and Manning, and afterwards go on to Gloucester, &c.

I have had very considerable difficulty in tracing the line or even finding it at important points, partly from pegs having been knocked out and tree-marks grown over. If the system of blazing trees adopted when I was in charge of surveys had been carried out here, I should have been saved miles and hours of riding. At present there is nothing to distinguish a railway blaze from a selection or a public road, and it is only after following one through scrub and brush for some distance that I can tell what it is, and if I happen to lose it I have great difficulty in coming to it again.

I have, &c.,

THOMAS R. FIRTH.

H.D., 24/7/89. Mr. Aelxander.—W.H.Q., 24/7/89. Noted.—S.H.A., 25/7/89.

The rule with licensed surveyors is to cut two marks on each tree blazed—one on each side—so that a mark is facing each way up and down the line. Mr. Firth's system is to cut one mark only on each tree. This mark faces the centre line. By this system, I am told that a person can see the blaze only when close to the tree, supposing that he is travelling along the centre line. By the licensed surveyors' system the blaze can be seen from a long distance away.—S.H.A., 25/7/89.

Just the other way about. Licensed surveyors' marks can only be seen when nearly in a line with them. My system shows the blazes when parallel as far as the eye can see—either right or left.—T.R.F.

No. 65.

T. R. Firth to The Acting Engineer-in-Chief for Railways.

North Coast Railway.

Sir,

Gloucester, 15 July, 1889.

I beg to report that during the last fortnight I have not been able to make as good progress with my inspection of the various routes as I wished to do, partly from bad weather, my horse having a sore back, and from having an attack of diarrhoea myself. I examined the district of Taree, where two lines have been surveyed; and also between Wingham and Taree, where some improvements can be made.

I also examined the position for stations at both these places. I followed the line up to the crossing of the Manning River, which is a very bad one, but as I could not cross without making a considerable detour, I followed along the river to a distance of about 15 miles, then crossed and struck the Barrington River, which I followed up to within a few miles of Gloucester, and then struck across the range on to the surveyed line near the river Avon. I believe this route will be some 3 or 4 miles shorter, and will in no place attain such a height as the one over Baker's Hill and Brushy Mountain. There will be less tunnel, but probably two bridges over the Barrington. The Manning will be much easier to cross, but Dingo Creek will have to be crossed, and is flooded to a good width in some places; but I have no doubt by a careful examination a narrow crossing may be found. As I shall have to return to Wingham by the Bulladelah survey, I intend to make a closer examination of this portion.

As I had to sell my horse, I made a trip by coach, *via* Stroud, to Hexham and back, so as to get an idea of the country, as the maps I have show no roads whatever, and not all the rivers. I have had great difficulty in getting guides, and have chiefly had to be assisted by gentlemen. The young fellows who know the country seem to think I cannot do without them, and, after arranging overnight to come with me, very frequently refuse to start in the morning, unless I will pay for horse hire and feed, in addition to 10s. per day for themselves. This has occurred several times, and consequently put me to great inconvenience and loss of time.

Had weather permitted, I should have started to-day for Maitland *via* Dungog. If possible, I leave here to-morrow, and shall be in Maitland on Friday night, examine about Maitland on Saturday, and on Monday start on the lines from Morpeth, *via* Seaham, Clarencetown, Bulladelah, &c., to Wingham, returning from Wingham *via* Gloucester and Stroud.

I have, &c.,
THOMAS R. FIRTH.

H.D., 24/7/89. Mr. Alexander.—W.H.Q., 24/7/89. S.H.A., 24/7/89.

No. 66.

T. R. Firth to The Acting Engineer-in-Chief for Railways.

North Coast Railway.

Sir,

Clarence Town, 29 July, 1889.

I have the honor to report that during the past fortnight I have examined the surveyed route from Gloucester, *via* Wisemantles, Dungog, and Paterson, to Maitland; and also the two routes at Maitland. I also examined the two lines some distance from Morpeth—one through Phoenix Park and the other through Hinton. I have been very much delayed and harassed by wet weather. Several days I could not get out, and when I have started it has begun to rain, so that I could see nothing, which necessitated me going twice over the same route. To-day I have examined the line several miles towards Seaham, having come from Dungog this morning. To-morrow I start, *via* Bulladelah, for the Manning, which I hope to reach by the end of the week; but, as there is no regular road, I may probably be delayed by the swollen rivers and creeks, and have to make long detours to cross them. With favourable weather I expect to be back in Maitland, *via* Gloucester and Stroud, and complete my examinations by the end of next week.

I have, &c.,
THOMAS R. FIRTH.

H.D., 31/7/89. Mr. Alexander.—W.H.Q., 31/7/89. Noted.—S.H.A., 2/8/89.

No. 71.

T. R. Firth to The Acting Engineer-in Chief for Railways.

Sir,

Railway Department, Construction Branch, Sydney, 17 September, 1889.

In accordance with instructions received from the Engineer-in-Chief to examine and report on the various projects proposed for the North Coast railway, between the Hunter and the Clarence Rivers, I beg to inform you that I have examined the routes already surveyed, and also several routes or deviations that have been recommended by persons presumably acquainted with the districts through or near which any line of railway to connect the abovenamed rivers must pass, as well as several portions where the nature of the country induced me to try for an improved line; and I have now the honor to report the result of my investigations.

The lines already surveyed are as follows:—

1. From the Morpeth branch a line *via* Seaham, Bulladelah, and Larry's Flat, to the Manning River, at Wingham.
2. From Maitland, *via* Paterson, Dungog, and Gloucester, joining the first line at Larry's Flat, then on to Wingham.
3. A line branching from the first named line at Seaham, going round by Clarence Town, rejoining the said line; and then, after being identically the same for $4\frac{1}{2}$ miles, goes by Booral and Stroud, and joins the second line at 11 miles from the latter place and 16 miles from Dungog, and on by same route through Gloucester, to Larry's Flat and Wingham.
4. A line was proposed by Mr. W. H. Holmes, leaving Morpeth, going west of Clarence Town and Stroud, joining No. 2 line for some distance, and eventually passing over the ranges *via* Larry's Flat on to Wingham the same as the No. 2 line.
5. I also examined a proposed route from Gloucester to Wingham, by way of the Barrington River, and to cross the Manning about 15 miles above the present crossing.

As the Manning is navigable up to Wingham, and the river flats widen out very much below the town, it is evident the river ought not to be crossed below Wingham, and also that the line must go through the town, from the Manning to Coff's Harbour the general direction of the surveyed line must be taken. Some minor deviations will be referred to later on.

From Coff's Harbour the line keeps close to the coast as far as Wolgoolga; it crosses the range near Corindi, and on to South Grafton, terminating at Wilson's Hill, on the bank of the Clarence River.

Another route examined by me is from Coff's Harbour, by way of the Orara Valley, to Grafton.

1st.

1st.—*Morpeth to Wingham via Bulladelah.*

Although I take this as one line, two different starting points have been surveyed, one, which I will call A, leaves the Morpeth branch line at 2 miles 40 chains from East Maitland (before reaching the Morpeth station), crosses the Hunter above the Morpeth wharfs, goes through Phoenix Park, and then crosses the Paterson River and on to Seaham. The other, or B line, is a prolongation of the Morpeth branch line; it crosses the Hunter below the punt, and goes through Hinton, joining A line in about 5 miles.

From the natural position of Morpeth, it can scarcely ever attain to an important changing place, or the headquarters of a railway, except at a very great expense, therefore the real starting-point in train mileage would be from East Maitland, but in cost of construction, from the point of junction with the line already made. A line would be about $\frac{1}{2}$ of a mile, the shortest would cross the Hunter and Paterson Rivers and Phoenix Park, all of which during high floods is one sheet of water, about 4,300 yards in width, or nearly $2\frac{1}{2}$ miles, and very near all this width of waterway must be kept open, and the line, however, would not go to the Morpeth station.

B line would only have one river to cross—that is, the Hunter—below the junction of the Paterson, and the length of openings required would be about 3,670 lineal yards. Although the actual distance under water would be considerably more than the other line, a large portion of it is chiefly from back water, and I think small openings would be sufficient. The advantages of line B over A line are: less cost—about £25,000—and utilising Morpeth station as at present built. The disadvantages are: total stoppage of navigation of both the Hunter and Paterson Rivers above Hinton (unless that very objectionable feature, a movable bridge, is provided, and which would, of course, reduce very considerably the difference in cost). As a movable bridge is really not a work of absolute necessity in this case, I cannot recommend that one should be built. Then, if the navigation is to be blocked at Hinton, the compensation to be paid for existing interests, and the loss to numbers of people now more or less receiving benefits from the present arrangements, would not be covered by the difference in cost of the two lines; therefore I should take the line across Phoenix Park, referred to as the A line; from this point to Seaham the earthworks are light; some creeks are, however, crossed, which from their position would require wide waterways.

At Seaham—a small township, apparently dependent on itself—the river Williams would be crossed; it is about 170 yards wide within the banks, and the flooded ground is about $1\frac{1}{4}$ mile. Of this, about 2,427 lineal yards of waterway must be provided. Again, in this river comes the question of impeding navigation. Steamers and schooners go as far as Clarence Town for timber and farm produce. If the line crosses at Seaham this will be stopped unless a movable bridge is provided. The works after leaving Seaham are rather heavy; there are several large creeks to be crossed before reaching the Karua River, and the line makes a considerable detour to get above the wharf, and also to get a narrow crossing. It then makes a bend eastward to get over the main range. Still this will necessitate tunnels and some heavy cuttings on each side. From Seaham to Bulladelah the formation is chiefly hard shales; and altogether the earthworks cannot be considered very heavy, nor the gradients very bad, but bridges will necessarily be expensive.

The Myall River is crossed close to the punt at the town of Bulladelah. There is no steamer traffic on the river above where the line crosses that will be interfered with. The line then runs down a narrow street parallel with the main street. There are a few unimportant buildings in the way. The town is mainly supported by the saw-mills on the river and a few farmers on its banks. Some alum works have been started close to the town, but at present are not being carried on. There is very little business done of any kind; the present outlet is by the Myall River and Port Stephens or by road to Booral and Raymond Terrace.

The line follows up the valley of the Myall River for about 12 miles above Bulladelah, and then begins to rise over the Manning Range, which is crossed by very heavy earthworks and a tunnel 125 yards long, and which, I think, on further examination, it will be advisable to lengthen so as to reduce the deep cuttings or steep sidling formations. The gradient at present over the range is 1 in 40 for $1\frac{1}{4}$ mile ascending, and 1 in 40 for 1 mile descending, and 1 in 65 for another mile down to Wang Wauk River. This, which in heavy rains is a mountain torrent, is crossed several times, and it will require large waterways. The Walamba River is also a good size. From this to Larry's Flat there is only one creek of any importance to cross; it here joins the line *via* Stroud and Gloucester, and *via* Maitland, Dungog, and Gloucester. After leaving the Hunter the soil is of a poor description generally, and land suitable for agriculture is very limited in quantity, and for grazing purposes is not good. There is some good timber on a portion of it, but from its close proximity to the coast; the timber has been very much thinned. The only towns it would pass through are Seaham and Bulladelah, and be about 12 miles from Stroud; passing, as it does, so near to the coast the land on that side is limited in area, and for a considerable distance it has mountain ranges on the other side, with only small patches of really good land on the immediate banks of the rivers, so that a proper return for the capital required in its construction seems very doubtful, and as a connecting line direct with the Manning River district, if taken through Seaham direct, it will, although shorter than *via* Dungog and Gloucester by a few miles, actually cost more per mile, by about £260; but by deviating at Seaham and going through Clarence Town, the distance will be increased by 5 miles 17 chains; yet about £56,000 will be saved in crossing the Williams River, and navigation will not be interfered with. It will also get nearer the direction from where traffic is likely to be produced. On this line, *via* Bulladelah, there will be about 1,500 lineal yards of tunnel, and, as at present laid out, there is over 9 miles of 1 in 40 grade, the longest portion being 145 chains. Of gradients between 1 in 40 and 1 in 70 there are 14 miles.

No. 2.—*From West Maitland.*

No. 2 line has been tried from two points of the Great Northern railway, a short distance beyond West Maitland station. The first one crosses the Victoria Bridge, and is then nearly parallel with the road to Oakhampton. The earthworks would be very light, but it crosses a number of streets, and would be liable to damage by floods, and the land and property to be taken would be expensive. The other line leaves the main line about half a mile further from West Maitland, and takes the high ground by Cambell's Hill, and at the back of the waterworks, crossing the Hunter about 20 chains higher up than the line previously referred to. This will be a much better line, and although the works are heavier I do not think the total cost will be greater.

It then crosses the Hunter at Oakhampton, above the point where the late flood broke over, keeps near the main road, and passes through the townships of Paterson and Dungog, within 11 miles of Stroud, and half a mile of Gloucester; then crosses the Brushy Mountain Range and Baker's Hill, and connects with line No. 1 at Larry's Flat, and then on to the Manning River, about 3 miles above Wingham, crossing the river at Brungle.

The rivers Paterson, Hunter, Williams, and Karua are crossed much more easily than by the other routes, and no river traffic at all will be interfered with, the earthworks will be much heavier, and as there are the Walarobie and Monkerni Ranges, the Brushy Mount, and Baker's Hill to be crossed, all of which will have to be tunnelled, giving a probable length of 3,180 lineal yards of tunnel. As laid out at present, it gives nearly 8 miles of 1 in 40 grade, and about 12 miles varying from 1 in 40 to 1 in 70. The total cost of the line will be much greater than any of the others, and the one *via* Clarence Town and Bulladelah would cost the least; then the one *via* Seaham and Bulladelah comes next in total cost, but is more expensive at per mile.

The Maitland-Gloucester line is through by far the best land, and will produce much more traffic, and it would be a great inducement for some of the rich lands now used for grazing purposes being turned into agricultural farms. It heads all the navigable rivers; hence there will be no competition. It passes through townships already of some importance, and to which places the roads from distant localities all tend. It will be within 10 miles of Gloucester, and give great facilities for the Upper Barrington district. In the matter of gradients, although it rises the highest, it has slightly better gradients than Bulladelah line.

There is very little difference in the distance from Newcastle, whether the North Coast line should start from the Morpeth branch or from West Maitland, but the advantages in station facilities for working the trains are all strongly in favour of West Maitland as the starting-point; and, in taking the line *via* Cambell's Hill, there would very probably be a good traffic with stock if cattle sidings were made at Rutherford, where the line would pass close to the cattle sale-yards.

Taking into consideration the disadvantage and inconvenience of leaving the main line *via* the Morpeth branch, the long length of iron and timber bridges that would be required, with their attendant constant expense of wear and tear, and liability to accident from floods, and also from this line having to compete to some extent with river trade, I consider that the line leaving West Maitland, *via* Dungog, although very much more costly, will give a better return, at a probably less annual cost for maintenance and repairs; it will be through better country, and, therefore, must create more traffic, and being at the head of all navigable rivers, it must take all the trade.

The line proposed by Mr. Holmes would be less expensive to make; but, in the first place, it starts from Morpeth, with the necessary costly works referred to on the No. 1 line; secondly, it avoids all townships, thus new roads would have to be made to the different stations, diverting all traffic for some considerable distance from its usual route, and it would not pass through any country that is likely to be more benefited or more productive of traffic than the one *via* Dungog.

I believe a line from Gloucester, along the Barrington River to the Manning, and crossing the latter about 15 miles above Wingham, would be a shorter, cheaper, and easier-worked line than the one surveyed over the ranges. It would also go through better land, and, taking the Manning so much higher up, would give facilities for farmers still further up the river than they can at present work at a profit.

If this line can be adopted, then the whole distance from the Hunter to the Manning may be said to pass through good land, and a large quantity fit for agriculture. Of course, a considerable portion of it will be through the A. A. Co.'s property, but no line connecting the rivers Hunter and Manning can avoid the company's property.

The price for earthworks and tunnels will probably be high, as the material, if in deep cutting, will be very hard. Timber is plentiful within easy distance of the line; ballast will not be expensive, but will have to be broken. Sandstone of a fair quality is found at Tocai and Clarence Town, and bricks can be made all along the line.

After leaving the Manning, the line has to go nearer the coast, as the ranges run down, and are too heavy to think of crossing at the present time. In all the distance, however, the line has been kept as far inland as practicable, and the rivers crossed as high as possible. Wingham is the first township on the Manning, and has a population of about 600. It has just been incorporated, and appears to be progressing. It is the head of navigation. The line passes through one side of the town, taking a few allotments of land, but not many buildings; it then crosses Cedar Party Creek, which rises to a good height during floods.

Taree is another small town on the river, and has more traffic with it than Wingham, from which it is distant by road 8 miles. Here two lines have been surveyed. One comes right to the edge of the town, taking a few allotments; the other would cause the station to be a little over a mile from the centre of the town. The line coming into the town will have to cross Brown's Creek, which is tidal, and rises to a great height during a big flood. It would also be 1 mile 18 chains longer, and I estimate the extra cost of the deviation at about £9,000.

The Dawson River, which is tidal, is next crossed, and then the line is very easy to the Lansdowne River. This, at the crossing, is also tidal. The land between the rivers is good for grazing, and in the neighbourhood of the Lansdowne there are a number of good farms. The line passes about 2 miles from Cundle at its nearest point.

After crossing the Lansdowne the line bears nearly east for some distance, and skirts along only a few miles from the coast until Camden Haven River is reached. Between these two there are a good many farms, with good soil. Timber is plentiful, and the earthworks are not very heavy; but timber openings will be required to a great extent, especially at Stewart's River and Stoney Creek. Both are tidal, and must be prepared for the teredo.

Camden Haven River is not navigable, although tidal, at the crossing. The floods cover a large width on the north bank. From this river to the Hastings the line passes over a high range, and the earthworks will be heavy, with necessarily steep grades. The spurs are very steep and sideling, and the formation volcanic; the land chiefly good for grazing. On the southern bank of the Hastings, where the line crosses, a new township has sprung up of late, named Wauchope. This appears to be the head of navigation. There are good farms on the banks of the river, and plenty of timber close to the line. A long timber viaduct will be required on the northern bank of the Hastings.

From the Hastings to the Wilson the country is undulating, and the works need not be heavy, except for waterways, and as the teredo is very bad in all these tidal creeks and rivers, I would advise that where the foundations are not deep concrete piers be built to level of high water to carry the superstructure, which in most cases can be of timber. The Wilson River is crossed near to Telegraph Point, and is about 85 yards wide, but during floods it spreads out to nearly 500 yards.

Between the Wilson and the Macleay Rivers, Cooperabong, Piper, and Smith's Creeks are all tidal, and, as they drain large areas of country, will require big openings. The earthworks will not be very heavy, and good timber is plentiful. From the Hastings to the Macleay good first-class is scarce.

The Macleay is crossed at West Kempsey, and is above the principal point of navigation. A very good site for station can be got alongside one of the streets. Kempsey is the largest town between Grafton and the Great Northern railway. It is 185 miles from Maitland and 120 miles from Grafton. There is very good land in its vicinity. The river is about 200 yards wide at ordinary level, and from borings made by the Roads Department near the proposed crossing, rock is found at 22 feet below level of water; the southern bank shows the rock nearly up to the surface. The highest known flood is 28 ft. 4 in. above ordinary level. If it is intended to build a road-bridge a large saving would be made if the one bridge was made to suit both railway and road as at Penrith. The station would also serve for both sides of the river.

After leaving Kempsey the works will be fairly light for some distance. The Yarrabindinni and Doughboy Swamps will only require a few openings, as, although the floods rise several feet, it is chiefly backwater, and the embankments can be made from side cutting. The Yarrahapinni Range is reached by a grade of 1 in 53; the descent to near Nambucca River will be rather heavy in earthworks, and two large bridges will be required over Worrall and Snake Creeks; both are tidal, and rain a large area. From Kempsey to Nambucca ballast will not be plentiful, the formation being clay and shale; good timber is plentiful. It is a good agricultural district, and fairly well settled along the direction of the line.

The line passes close to the small town of Nambucca, and crosses the river about half a mile below a small wharf which is situated near the centre of the town, and to which small steamers and droghers trade. There is a public road parallel with the river, and close to it, which must be provided for, is the erection of the bridge, either by keeping the latter high enough for the road to pass under railway, or by keeping the formation low enough for a level-crossing. The former will be most suitable, and would still allow the droghers to trade up the river. There is room for an easy grade to get down to the station.

The Nambucca River is about 220 yards wide, but during a flood it is nearly half a mile.

From Nambucca to the Bellinger the works will not be heavy, except from a number of creeks that will require long bridges and a few large culverts. Deep Creek is tidal, and when in flood is a great width. At a few miles from the creek some good specimens of gold and antimony have been lately found, and it promises to be a very prosperous mining township if only a small portion of present expectations are realised.

The south arm of the Bellinger is crossed very near the punt. There is no traffic on this river; therefore, the height of floods can determine the kind of bridge most suitable. From the south arm to the main branch of the river the country is flat, and only low embankments with ample provisions for waterways will be necessary. The Bellinger is crossed at Ralceigh, and is about 150 yards wide. The northern bank is high, but on the southern side a large portion seems liable to be inundated. Small steamers sometimes go up to Fernmount, about 6 miles; but the traffic is chiefly by drogher. The valley of the Bellinger is very fertile, and is occupied by farmers a long way up, and it ought to return a fair amount of traffic by the railway.

From the Bellinger to Coff's Harbour there is a large number of tidal creeks to be crossed, otherwise the line would be fairly light. On this portion of the line ballast will be scarce. The formation appears to be clay and shale. There is plenty of good timber.

Coff's Harbour Creek is about 60 feet wide, and openings of about that width ought to carry off the water.

The town of Coff's Harbour is seen on plans only at present. It is situated about a mile from the harbour, and the line goes through the township; from thence for a few miles the works will be rather heavy, then on to near Woolgoolga very light earthworks, as the line is keeping close to the coast, and the country is nearly flat; but a large number of tidal creeks, with their usual inhabitants, the teredo, will make the erection of bridges rather costly.

I may here state that the residents from Coff's Harbour to Woolgoolga and its vicinity seem to be more anxious to have jetties erected at their ports than to have the railway, probably thinking it easier to get the smaller item first.

A few miles from Coff's Harbour is the first sugar-cane, and in some places it seems to be cultivated successfully. Maize is also grown.

The line then goes on near the coast to Corindi, where it crosses the creek, and then begins the ascent of the dividing range, which is accomplished by a gradient of 1 in 40 (with sharp curves) for $1\frac{1}{2}$ mile, and the earthworks fairly heavy. From the top of the range to South Grafton the line follows to a great extent a dividing spur, and the works will not be heavy. There is good timber, ballast, and brick-clay. The soil is not of a first-class quality generally between Corindi and Grafton, although some small lots on the creek are producing fair average crops.

I propose that the line should end at or near the pound-yard in South Grafton, just above the highest known flood, and that it should be laid out so that, if desirable, it can be continued on to Glen Innes, or the line can be carried out of flood-level to connect with the Grafton-Tweed line, about 6 miles above Grafton—this being the narrowest point for crossing the Clarence River above the head of navigation. From the station in South Grafton I propose to run a branch line, as near as possible level with the surface, down to the edge of the river to a wharf to be erected at the foot of Wilson's Hill. This branch can be taken so as not to interfere with any valuable property; and, by dispensing with the viaduct, as required by the present survey, about £40,000 will be saved. If the viaduct was made, it could not be used for goods traffic during a flood; therefore a line on the surface and under water will be quite as useful, and the access to the passenger station would be the same in both positions—it could only be approached by boats in flood-time by passengers from North Grafton, as well as the majority on the south side of the river.

The

The district which will receive most benefit by a railway, and also give the best returns, in connection with the North Coast railway, would be the Orara Valley, and I propose that a trial survey should be made from a point on a spur near Coff's Harbour, and cross the dividing range, follow down the eastern side of the river, and connect with present line at about 11½ miles from Grafton. This will no doubt be an expensive route. An easier one would be found, which would also be of great benefit (but not to the same extent), by leaving the present survey at about 50-mile peg, crossing the range at a lower elevation, then follow down Bucca Bucca Creek until it joins the Orara River, then along the river as stated above to its junction with present line at 11½ miles. This line would also be more costly than the present one, but it would certainly give better returns; and in the event of the line being made, as suggested, from Grafton to Guyra, about 30 miles of this line would serve for both, as I believe the Guyra line would go through Glenrigh. The valley is very rich in soil and some of the finest timbers in the Colony. The line would also be within a few miles of Nana Creek gold-fields, and near Glenrigh there is a small seam of coal visible in one of the creeks.

I append herewith a detailed statement of alterations which I consider advisable to make in the surveys when the permanent staking is done. I have also marked them on the 10-chain plans in green colour. Of course I could not examine every portion of the survey, as in some cases the marks, if ever made, are entirely obliterated, and in others the scrub is grown so thick that it cannot be penetrated without cutting a way through.

I have, &c.,
THOMAS R. FIRTH.

Minute, 89-558, 5/10/89. H.D., 8/10/89. Under Secretary.—B.C., 8/10/89. Minute to Under Secretary, 1/12/92.

APPENDIX.

Railway Department, Construction Branch, 17th September, 1889.

From Maitland via Dungog and Gloucester.

THE upper line, starting from 20 miles 60 chains, I consider the best. The curve leaving Great Northern railway can be made much flatter, and the works taken into the hillside so as to provide for cattle sidings at Rutherford. The line east of the tannery should be adopted. After crossing the Hunter the line should not cross the Paterson-road. From 26 miles 60 chains to the Paterson River, level-crossings will be avoided, and flooded land from backwater at 27 miles 15 chains which has been known to rise 6 feet above the road. A much better and more direct line will be got near Tocal House by the proposed alteration and a much shorter line.

The line can be improved for site of Paterson station, and also to get higher ground north of the river.

Careful cross-sections should be taken over the Walrobie Range. I think it is possible to shorten the tunnel or ease the gradient.

At 37 to 38 miles, if the line is straightened it will improve the section.

From 44 to 49½ miles a better line can be got by keeping west of the road to the head of Hanley's Creek; crossing this creek much higher up than at present, and above the reach of floods from the river Williams, it will cost much less for land.

A slight alteration of the centre line at Dungog will improve the station site and reduce the cost. The line should be a little nearer the mill at the northern end of the straight portion, and a little more east at the southern end.

In crossing the Monkraai Range it should be well cross-sectioned before final staking. The ridges are very steep, and to guard against slips deep cuttings should be avoided, the strata being very much broken up. I think it will be no more costly, and far safer, if one long tunnel is made instead of the three at present proposed, and thus take the hill more at right angles. I am sure a thorough examination of this range will repay the trouble.

From this point to about 65 miles the works are heavy, and where it is such steep sideling I believe the ultimate cost will be no more if instead of contouring and making deep cuttings, that a more direct line, with, perhaps, a short tunnel be got between 65 and 66 miles.

Between 66 and 67 miles a flatter curve will give better work.

Avon Creek is crossed at 78 miles 60 chains and again at 85 miles. At both these places the flooded ground is very wide; but in the former it will not be necessary to have flood-openings the full width; at the latter it is not so wide, but there is greater depth and more rapid current. Mr. Holmes proposes to keep east of the river altogether. I don't think there would be any gain by it, and if a line is tried *via* the Barrington River, then the line should keep high ground past Gloucester township, and leave the present survey at about 83-mile peg.

The works between 85 and 100 miles are very heavy, and it may be advisable to reduce the radii of curves from 15 to 12 chains, not only as a matter of first cost, but also to lessen the danger from slips after the works are finished. The ridges and spurs are very steep and sideling; therefore, deep cuttings are to be avoided as much as possible, and, although skirting along the sidelings may give apparently the best section, they are in reality often very expensive, and in many cases it is mistaken economy to try to get the highest point by circuitous sideling route, and thus tunnel only through the crest of a range: sometimes a longer tunnel at a lower level will be the cheapest, especially when the formation is broken up. If the strata is compact and is horizontal, of course slips are reduced to a minimum, and the slopes of cuttings can be nearly vertical.

At 96 miles I think it will be advisable to try for another line with one tunnel instead of two.

From Baker's Hill down the work is all on sideling, and deep cuttings must be avoided.

At 104 miles (11 to 13 miles on plan) the line will be improved and shortened by keeping east of the main road, and then crossing by an overbridge at about 11 miles 30 chains.

The crossing of Koriback Creek will be better a little lower down; at the present crossing there is a tendency for the banks to be washed away.

The Koribac Range is ascended by deep sidelings, and deep cuttings must be avoided, as the strata is very much broken up. On the northern side is very similar, and the line is very close to the creek. The tunnel will probably be through hard strata.

Manning River.—If the line does not go by the Barrington River, a much better crossing can be got of the Manning about 1½ mile higher up, but it will also have to cross Dingo Creek. However, this can be crossed about 20 chains below the road-bridge, and both these crossings will cost no more than the one at present surveyed, and we get a better line. The river will be crossed at right angles, then follow along the Killawarrz flats to a narrow point on Dingo Creek, cross the main road near the summit of the range, which will be much lower than the present one, then follow down the watershed to near the pound-yards; by this line a much better position can be got for a station for Wingham without taking so many allotments.

A flatter curve at 118½ miles (9 miles) will improve the section, and the line can be kept west of the road up to 12 miles. From 12 miles 10 chains to 14 miles 40 chains a great improvement can be made by keeping to the right, and, instead of rising over the range, skirt alongside, crossing the Taree-road by an overbridge, thus saving a rise of at least 50 feet in the line, one level-crossing and some road deviations. The line can then connect with either of the lines to Taree.

If it is decided to take the line into Taree (at a cost of about £9,000) it can be improved between 15 miles 30 chains and Brown's River, so as to have about 15 chains straight for station purposes, by having two curves of 20 chains radius, one at each end. After crossing Brown's River the line can be improved, shortened, and straightened. If the line does not go through the town the survey can be improved so as to bring the station on a short piece of straight.

The crossing of the Dawson can be more at right angles, and a new survey should be made to the Lansdowne River, crossing the latter near the present road-bridge. At this place the river is clearly defined, fresh water, and above navigation. The land passed through north of the river is of less value, and no floods to be provided for; the line may be a little longer, but it will be better, and at no greater cost, by the proposed diversion. Three 42-foot and two 20-foot spans will be enough, instead of crossing in tidal waters and requiring long flood-openings.

Some

Some slight improvements can be made between 136 and 138 miles (28 miles on plan) by keeping higher ground and easing the curves—in fact, from the next 6 to 8 miles the line can be considerably improved. It ought not to cross the main road from Cooperbrook to Port Macquarie, but save two level-crossings, and avoid a large piece of swampy ground liable to inundation, and get a better crossing of Pipeclay Creek. Stewart's Creek will require a long bridge or viaduct.

From 147½ to 148½ the line will be better if taken farther west, and get higher ground.

The crossing of Stoney Creek at 150½ miles can be shortened at the expense of earthworks, and will be better.

The curves south of Camden Haven River can be made easier with better section.

Descending the range to the Hastings River the curves can be modified, and, as the spurs are very steep, and of volcanic formation, deep cuttings must be avoided along the sidelings.

As several buildings have been erected at Wauchope since the line was surveyed, it will be advisable to cross the river a little higher up; this will not add to the cost, and will give room for station arrangements without encroaching on the buildings too much.

On leaving the river-flat high ground is reached abruptly, but the gradient can be eased and line slightly improved on final survey.

Wilson River should be crossed about 4 chains lower down, and then nearly avoid the deep lagoon on the south side of the river. On the north side the ridge runs close to the river. This must be cross-sectioned and the work made as light as possible.

Cooperabung Creek crossing can be slightly improved by keeping higher ground on the approach.

Smith's Creek and Piper's Creek crossings can be better, and some minor improvements made all the way to Kempsey. At Kempsey the line should be a little more eastward of the street, so as to give sufficient room for station buildings, and it may be advisable to avoid taking the hotel at the corner. The deviation will also improve the section at (33 m.) 200 miles.

Higher ground can be got between 41 and 43 miles, which will give a better section.

From 45 to 50 miles, cross-sections will show that a better line can be got, and the same may be said along the Unkya Creek; in place of having deep cuttings, in some places it will be better to divert the creek.

The crossing of Wurrul and Snake's Creeks would be better if a little higher up.

The crossing of the Nambucca River should be about 8 or 10 chains higher up—to get high ground sooner on the northern bank.

The line can be improved on final staking between the river and Deep Creek. The crossing of this creek will be better about 2 chains further down than the present survey, and higher ground should be got on the northern bank, which is low and swampy. Sandstone is showing on the southern bank.

From Deep Creek to the Bellinger the curves can be eased without adding to the cost of the work.

The approaches to Bellinger River can be improved. Provision must be made for a station at Raleigh.

From the Bellinger to Pine Creek the sharp curves can be modified considerably.

Bungle Creek can be crossed at right angles and the curves improved.

Between 59 miles and 61 miles the line can be shortened and improved by extending the straight line from 59 miles 25 chains about half a mile, crossing a low gap in the range not far from the main road, keeping higher ground and avoiding a swamp.

From 58 miles to 55 miles 10 chains the line can be improved and shortened, and a better site for a station at Coff's Harbour (Breilsford).

From 55 miles to 50 miles the works are heavy, but the line can be shortened and improved without increasing the cost.

Pine Creek can be crossed lower down.

From 44 miles to 42 miles the line runs along between a sand-drift and a swamp, and crosses Finneman's Creek; the sand-drift is gradually encroaching on the line, and with heavy rains the swamp is flooded. A deviation can be made from 46 miles to 41 miles by straightening the line passing west of the lagoon and west of the swamp and round the head of Finneman's Creek.

Skinner's Creek will be crossed much higher and the unsightly curves dispensed with; it will make a better line and about 66 chains shorter. Between 36 miles and 33 the line can also be shortened and improved. Corindi Creek should be crossed about 15 to 20 chains higher up. The crossing of Half-way Creek will be improved by introducing reverse curves.

At 19 miles the curve should be reversed.

At 14½ miles by flattening the curve a better section, easier grade, and lighter works can be got.

From this point to South Grafton great improvement can be made; there is no need to cross the road so many times, and the curves can be reduced very much. At 5 miles flatter curves can be used, and there is no need to cross the range or road at this place. Provision should be made for a station here.

The deviation into South Grafton should be from about 2 miles, crossing Musk Creek near Foley's and running to the pound-yards, with provision for station arrangements and also for continuation of the line to Glen Innes. It need not connect immediately with the staked line, but can join it further on; it can also be so laid out that if necessary it will skirt alongside the flooded ground south and west of the Clarence River to a suitable crossing place at Waterview, about 6 miles from North Grafton.

Morpeth via Seaham and Bulladelah.

If this line is adopted very considerable improvements can be made in finally staking out. The direction is fairly good for the easiest line; but a great number of impossible curves require striking out. The section will not be improved; but the present line approaches to contouring without regard to angles or reverse curves.

The approach to the Karuah River is very bad, and an alteration must be made. The reverse curves are not necessary. The object appears to be to get high ground and avoid a lagoon, but, as the high ground is below flood-level, it will probably be no worse for the line to cross the lagoon and get a better approach to the river. Both Saltwater Creek and the Karuah River are tidal, and the teredo must be provided against.

The line, if adopted, will require slight alterations all the way to the Myall River at Bulladelah. The main range especially should be well cross-sectioned before the tunnels are finally fixed.

The Myall River should be crossed about half a chain lower down. It will give more room for a proposed road-bridge. The whole of Mr. Mansfield's work will require the absurd reverse curves rectifying.

At 20½ miles the line can be improved and shortened. The cutting can be made very light (from 19 miles to 15 miles the works are very heavy, including tunnel 825 yards in length). The portion between 19 miles and 17 miles 30 chains should be well tried. I think the line can be shortened, and the sidelings cannot be much worse than at present, and although the line crosses at the lowest part of the range it may still be possible to get a safer, and ultimately cheaper, line by avoiding the sidelings, and making a longer tunnel. The ascent up one watercourse and descent down another with such steep sides, and either big diversions of the creeks or large waterways to be provided, must entail heavy cost, and at the same time in this broken formation be far from safe. Therefore, a more extended examination is absolutely necessary before the final survey is made. I may state that during my examination of this portion the weather was very bad, and from the unfavourable opinion I formed of the comparative utility of making this line I did not spend my time by going over it a second time to find out what minor improvements could be made in the final survey.

Morpeth via Seaham, Clarence Town, and Stroud.

The crossing of Burnim and Stoney Creeks can both be improved. They are both tidal, and liable to heavy floods.

The Williams River at Clarence Town should be crossed 6 or 7 chains nearer the road-bridge. It will give a shorter crossing. The river is tidal, and the teredo bad.

I think a shorter line can be got from Clarence Town to Stroud than the one staked, with no heavier works; this line having been made to connect with the through line to Seaham too soon. The direction is not good. It should go through Black's Camp and join near Booral. The crossing of Limeburners' Creek can be improved and shortened.

At 22 miles it will be advisable to divert the main road, and from 19 miles to 17 miles 20 chains, if the line is kept nearer the road, it will give a better section.

At 12 miles a flatter curve will be an improvement.

At

At Stroud the line should be diverted so as to cross Mill Creek lower down. This will give a much better and shorter crossing, and the station can be placed so as to interfere less with the buildings, and by present existing roads can have two entrances.

After leaving Stroud, and arriving at Johnson's Creek, the watercourse might be followed up to its head, where it is known as Ward's River, where it could join the line to Gloucester from Dungog. It would be more direct, and as good a section got as the present one. From this onward is the line previously referred to as from Maitland, *via* Gloucester, to Wingham.

THOMAS R. FIRTH.

No. 75.

Minute Paper.

Subject :—North Coast Railway (Mr. Firth's Report).
Department of Public Works, Railway Construction Branch,

Sydney, 27 February, 1890.

MR. FIRTH'S report is in two parts. The first, or report proper, deals with the question of the railway generally, and the second contains observations on the location of the line in detail, and will be of service when giving instructions to the surveyors who revise the present surveys.

The North Coast line seems naturally to fall into three sections :—

1. Between the Hunter and the Manning.
2. From the Manning to Coff's Harbour.
3. From Coff's Harbour to Grafton.

Section No. 2.—Between the Manning and Coff's Harbour there are no rival routes to be considered, and the trial survey practically represents the best line. The country generally is fairly good. Some very good land exists on the river flats, particularly on the Macleay and Bellinger, and the railway would be an easy one to construct were it not for the river and creek crossings, which will add largely to the cost.

Section No. 1.—Between the Hunter and the Manning the surveys follow two main routes :—

No. 1 starts from Morpeth and proceeds *via* Seaham, Bulladellah, and Larry's Flat to Wingham.

No. 2 starts from Maitland *via* Patterson, Dungog and Gloucester, Larry's Flat and Wingham.

There is also a connecting line between these two, commencing at Seaham, on No. 1, passing through Stroud, and joining No. 2 between Dungog and Gloucester.

In addition to these, Mr. W. H. Holmes has recommended a line which passes through the same district as No. 2 but seems to avoid all townships, and on that account is not recommended.

Mr. Firth has examined a deviation at the farther end of No. 2, starting from Gloucester, proceeding down the Barrington, and crossing the Manning 15 miles above the surveyed crossing.

With regard to the two main routes, it appears that although the construction of No. 1 may probably be cheaper than that of No. 2, there are these serious objections to it, *viz.*: that the Hunter must be crossed at a point where it is navigable, and the traffic would be blocked unless such an unobjectionable structure as an opening bridge were built; river traffic at Seaham would be interfered with for the same reason; and the country generally that the line passes through is poor, with only a few small patches of really good land.

No. 2 route starts from West Maitland and crosses the Hunter above navigation; it should proceed by Campbell's Hill and span the Hunter at Oakhampton. The rivers Paterson, Hunter, Williams, and Karua are crossed more easily than on the route No. 1, and navigation is not interfered with. If the cost of the line is greater than that of No. 1, it has the advantage of serving towns which are already of some importance, and it passes through country of the best description, and will give better traffic returns. No. 2 route, therefore, in general direction is to be recommended for adoption.

As before mentioned, Mr. Firth proposes a deviation from this route after leaving Gloucester. From that point the line would follow down the Barrington and cross the Manning 15 miles higher than the present surveyed line. From an engineering point of view this alteration would, I have no doubt, be a great improvement, and the traffic returns would be better, as the railway would tap the good land which exists on the Manning above Wingham. This deviation will be surveyed as soon as surveyors can be spared to send into this district, which will probably soon be the case.

Section No. 3.—Between Coff's Harbour and Grafton, Mr. Firth proposes a deviation from the present line so as to follow down the Orara Valley. I am of opinion that even in the event of the cost proving greater, the Orara route would be the best, as the country along it is superior in character. Part of this deviation is now under survey in connection with the line from Guyra to Grafton.

Mr. Firth makes some recommendations in regard to the Grafton terminus, and shows how the site of the latter may be determined so as at some future date to facilitate the connection by rail with Glen Innes, and with the Grafton to Tweed line. These observations are of much value, and will be duly taken into consideration when fixing the position of the terminus at South Grafton.

H. DEANE.

Sketch plan, with the routes marked thereon, wanted by Minister.—J.B., 1/3/90. Map herewith.—W.H.Q., 11/3/90. Under Secretary.

No. 95.

Memorandum to The Acting Engineer-in-Chief.

Subject :—North Coast Railway.

Engineer-in-Chief's Office, Sydney, 30 June, 1891.

I BEG to report on the proposed North Coast railway, Maitland to the Manning River, Parliamentary plans, sections, books of reference, and estimate of which will be forwarded to you as soon as they are ready.

The route for this proposed line leaves the Great Northern railway at 20 miles 57 chains from Newcastle, and crossing the Hunter River at 24 miles 50 chains, follows up the valley of the Paterson River, which it crosses at 33 miles at the township of Paterson. At 37 miles the Merari Creek valley is followed up to the Wallarobba Range, at 42 miles 20 chains, which is pierced by a tunnel 327 yards in length. The road to Dungog is now followed to 48 miles, after which the survey runs up the valley of the Williams River to Dungog at 53 miles. At 54 miles 7 chains this river is crossed, the line adjoining the Dungog and Stroud Roads to 57 miles 40 chains. The course of Cherry-tree Creek is then taken up to

to the Monkerai Range, to cross which a tunnel 647 yards in length will be required. Beyond this range the line enters the drainage area of the Karuah River, the bed of which is reached at 66 miles 13 chains by the valley of the Ramstation Creek, which is crossed in three places, viz., at 63 miles, 63 miles 14 chains, and 65 miles 31 chains. After crossing the Gloucester Road, Johnson's Creek is closely followed up to its junction with Ward's River, at 74 miles 53 chains, which is crossed at this point; the line then takes the east side of the river, recrossing it at 76 miles 45 chains, and crossing the Gloucester Road at 77 miles 73 chains, follows the west side of it along and past the Avon River, which is passed at 84 miles 6 chains. The low ridge between the Avon and Gloucester Rivers is then taken, and passing through the township of Gloucester at 91 miles 13 chains, and the Avon near its junction with the Gloucester River at 93 miles 13 chains. Skirting the foot of a high ridge, the line strikes the Barrington River at its confluence with the Gloucester, and thence following generally the course of the Barrington River in a north-westerly direction, meets another high ridge at 95 miles 53 chains. At this point the river turns sharply to the north, and the route leaving it some 2 miles to the west, traverses some broken country until it meets Tugrabakh Creek at 96 miles 53 chains. The line now follows a high range, which breaks off abruptly in the river at a point known as the Tugrabakh Hill. Rising by easy grades over the range at its lowest point, at about 97 miles 63 chains, the railway crosses Little Ghanghad Creek, and, following it down in a northerly direction, meets the Barrington again at a point where another high range, bearing almost east and west, runs into it. A short tunnel will be required at 99 miles 73 chains. Onwards, the line follows the river, which takes a sharp bend to the west, contours round the ranges, and slopes down to fairly level country at 101 miles 13 chains. From here the course of the Barrington is closely adhered to, crossing a very high bluff at 103 miles 23 chains. At 107 miles 33 chains the river is left, the line bearing away in an easterly direction, and crossing a low gap in the range dividing the drainage of the Barrington River and Baker's Creek, following the latter northwards, crossing it at 109 miles 79 chains. It then follows its east bank down to its junction with the Manning, and, after skirting the south bank of this river, crosses it at 112 miles 13 chains, about a quarter of a mile below its confluence with Washpool Creek.

The route then takes a northerly direction towards the main road to the Upper Manning, thence almost due east, running generally parallel to and crossing it twice, until Charity Creek is reached at 119 miles 23 chains, about 1 chain south of the road bridge. Just beyond this the line again crosses the main road, and makes a detour to the north, to avoid deep sideling ground near Rocky Falls Creek, meeting the main road again at 119 miles 29 chains at Big Hill Gap. From this gap the route follows along the northern side of the main road, which it intersects at 124 miles 45 chains, and taking a southerly direction, crosses Dingo Creek at 124 miles 71 chains. Thence bearing away in a northerly direction, recrossing the road and running along it, it enters the township of Wingham close to the pound-yard. After passing through some town allotments the route crosses Cedar Party Creek at 127 miles 39 chains, at about 20 chains north of the road bridge, Wingham to Taree. It now follows the main road, crossing it at 129 miles 45 chains, bearing in a south-easterly direction to 132 miles 13 chains, and skirting the Walla Hill. The line then bears easterly in a fairly straight direction to the junction of the Walla, Wingham, and Taree roads, crossing the latter at 132 miles 40 chains. It then bears south-easterly to 134 miles 43 chains near Taree township, where the line terminates at 134 miles 44 chains 35 links.

Owing to this line being within about 30 miles of the coast, and the rough nature of the country, the larger bridges and tunnels are numerous. Besides the Hunter, Paterson, Williams, Karuah, Avon (which is twice crossed), and Manning Rivers, for which large bridges are required, there are no less than thirty-seven smaller bridges over 50 feet in length, some of which, such as those over Ramstation Creek, Ward's River (two crossings), Tugrabakh, creeks between 104 and 105 miles and 106 to 107 miles, Baker's, Charity, Rocky Falls, Dingo, and Cedar Party Creeks, will be of very considerable dimensions, some as regards height and others as to length.

Tunnelling will be necessary at 42 miles 20 chains, 54 miles 15 chains, 99 miles 62 chains, 105 miles 17 chains, 118 miles 5 chains, and 119 miles 25 chains, the aggregate length of which will be 1,577 lineal yards.

The earthworks are generally heavy.

Thirteen stations are provided, five of which accommodate the townships of Paterson, Dungog, Gloucester, Wingham, and Taree, and eight the districts between them.

The ruling grade is 1 in 60, and the sharpest curves are 12 chains radius, with 4 chains straight between reserves.

Good timber, chiefly ironbark and mahogany, is plentiful as far as Wingham; beyond this it is nearly exhausted, but can be obtained at the head of Cedar Party Creek.

Rock ballast is obtainable up to the Gloucester River, where granite and diorite are intermixed with the sandstone, beyond which the gravel of the river beds, which are numerous, must be relied on.

Clay for bricks is generally available on the first 70 miles, and also between Wingham and Taree.

Permanent water is plentiful throughout.

The soil between Maitland and Paterson and through the Australian Agricultural Company's Estate, from 60 miles to the Manning River at 112 miles 13 chains, and along both banks of the Manning above Wingham, especially the latter, where it is very rich, is good for agricultural purposes. However, it is mostly used for pastoral purposes at present, and entirely so through the Company's grant.

Beyond Wingham the soil is generally suitable for grazing only.

C. O. BURGE.

No. 103.

Memorandum to The Engineer-in-Chief for Railways.

Maitland to the Manning.

Department of Public Works, Railway Construction Branch,

Engineer-in-Chief's Office, Sydney, 3 September, 1891.

HEREWITH, as verbally requested, I forward estimates of the above, divided into three sections, viz. :—

1. West Maitland to Dungog.
2. Dungog to Gloucester.
3. Gloucester to Taree.

C. O. BURGE.

Amount

Amount per mile required.—H.D., 7/9/91. Not quite complete yet. Mr. Holmes,—Please have outer columns showing cost per mile added and made to agree with the aggregate.—J.H. Mr. Burge,—Also, please send summary of the through estimate, West Maitland to Taree. Done.—C. O. BURGE.

Estimates for Single Line.

Section 1.—West Maitland to Dungog; length, 32 miles 63 chains; estimated cost, £382,869, or £11,677 per mile.

Section 2.—Dungog to Gloucester; length, 39 miles 40 chains; estimated cost, £419,519, or £10,621 per mile.

Section 3.—Gloucester to Taree; length, 41 miles 30 chains 80 links; estimated cost, £576,537, or £13,931 per mile. Total for the whole line, £1,378,925.

Engineer-in-Chief's Office, Public Works Department.

Sydney, 29 August, 1891.

No. 104.

Minute Paper.

Department of Public Works, Railway Construction Branch, Sydney, 11 September, 1891.

Subject :—North Coast Railway—Maitland to Taree.

I HAVE the honor to forward herewith, for the information of the Railway Commissioners, tracings of plan in three parts, tracings of section in three parts, diagram map, together with estimate in three sections, and three copies of printed description of the proposed North Coast Railway Extension, West Maitland to Taree, and request that they may be returned to this office when done with.

H. DEANE.

Commissioners.—H.D., B.C., 15/9/91. One month, 3/11/91. Mr. Harper's report is before the Commissioners, 11/12/91.

Sir,

29 September, 1891.

With reference to your inquiry relative to the inspection of the first section of the North Coast railway by the Commissioners, I am directed to say that the Commissioners have arranged for the line to be gone over by one of their principal officers preparatory to their inspection, and this officer will leave Sydney for that purpose in a few days.

I have, &c.,

The Under Secretary, Public Works Department, Sydney.

H. McLACHLAN,
Secretary.

NORTH COAST RAILWAY.—WEST MAITLAND TO TAREE.

Description.

THIS line starts at a point on the Great Northern line west of West Maitland Station, distance 20 miles 57 chains from Newcastle; thence it takes a northerly direction crossing the Hunter River at 24 miles 50 chains, passing through the township of Paterson at 33 miles; thence crossing the Paterson River at 33 miles 25 chains; thence following the valley of that river up to the Mirari Creek; thence in a north-easterly direction, crossing the Wallarobba Range at 42 miles 30 chains by a tunnel; thence continuing in the same direction until it reaches Maxwell's Creek; thence in a northerly direction to Dungog at 55½ miles; thence crossing the Williams River at 54 miles 5 chains; thence in a north-easterly direction, passing by a tunnel through the Monkerai Range at 59 miles 30 chains; thence in the same direction to a crossing of the Karua River at 65 miles 14 chains, the northern side of which will be the nearest point for a station for Stroud (which is distant about 6 miles); thence traversing the valley of Johnstone's Creek and the Ward River in an almost due northerly direction, and crossing the Avon Creek at 84 miles 6 chains to Gloucester, which is reached about 92 miles; thence crossing the Avon again near its junction with the Gloucester River; thence following the valley of the Barrington passing through short tunnels at 99 miles 65 chains and 105 miles 25 chains to about 108½ miles, whence it crosses over in an easterly direction to the valley of Baker's Creek; thence following down this creek to a crossing of the Manning River at 112 miles 20 chains; thence traversing the north bank of this river in an easterly direction to Wingham, passing this township at 127 miles 30 chains, passing through short tunnels at 118 miles 10 chains and 119 miles 27 chains, and crossing Dingo Creek, an important tributary of the Manning, at 124 miles 70 chains; thence in an easterly direction to Taree to its termination at 134 miles 44 chains.

The greater part of the country passed through, although of a very broken and undulating character (making the line expensive to construct), is a good quality of grazing land, and the river flats are suitable for cultivation. The roughest portion of the line is from Gloucester down the Barrington and for some miles on the northern side of the Manning.

Stone suitable for ballast can be obtained along the route, the mountain ranges in the vicinity of the Avon, Gloucester, and Barrington being composed of quartzite.

Ironbark timber suitable for sleepers and girders can be got along the line, notably about 73 miles. The general direction of the line is about as short as can be obtained, taking into consideration it goes through fairly good country the whole way, crosses the main rivers above their navigable points, and picks up the greatest number of important townships, notably, Paterson, Dungog, Wingham, and Taree.

29 August, 1891.

Estimates for Single Line.—Length, 113 miles 53 chains 80 links.

Section 1.—West Maitland to Dungog; length, 32 miles 63 chains; estimated cost, £382,869, or £11,677 per mile.

Section 2.—Dungog to Gloucester; length, 39 miles 40 chains; estimated cost, £419,519, or £10,621 per mile.

Section 3.—Gloucester to Taree; length, 41 miles 30 chains 80 links; estimated cost, £576,537, or £13,931 per mile. Total for the whole line, £1,378,925.

Sydney, 29 August, 1891.

No. 112.

No. 112.

The Secretary, Railway Commissioners, to The Under Secretary for Public Works.
North Coast Line.

Office of the Railway Commissioners of New South Wales,

Sir,

Sydney, 21 December, 1891.

With reference to the request that the Railway Commissioners would report upon the proposal for the construction of the North Coast line, West Maitland to Taree (estimated cost £1,378,923), I am directed to say that the matter has been carefully inquired into, a responsible Railway officer having gone over the route proposed, but there would appear to be no prospect of the line for many years being remunerative. As the personal inspection of the proposed line by the Commissioners would involve much loss of time and expense, and it is probable the Government may determine to postpone the matter for the present, I return the papers herewith, and shall be glad of further advice.

I have, &c.,

H. McJACHLAN,
Secretary.

Submitted.—J.B., 22/12/91.

Seen.—W.J.L., 24/12/91.

Put with papers.—J.B.

No. 121.

Minute Paper.

Subject:—Deputation—The proposed North Coast Railway.

Department of Public Works, Sydney, 21 October, 1892.

A DEPUTATION, representing all the coastal districts between Sydney and the Queensland Border, consisting of Messrs. J. H. Young, H. McKinnon, McFarlane, Hart, Garvan, Stevenson, Dangar, Boves, and Perry, M's.P., waited upon the Minister to-day to urge the submission of the proposal for the construction of the first section of the North Coast railway to the Public Works Committee. Mr. Ruthven, of the North, and Mr. Heywood, Mayor of Port Macquarie, were also amongst those present.

Mr. YOUNG said the deputation desired to impress upon the Government the great necessity for the construction of the North Coast railway, so as to establish direct communication between Sydney and Queensland. He need hardly point out that the present route used was a three-cornered one; while he believed the line they asked the Minister to consider would reduce the distance between Sydney and Brisbane by about 150 miles on the present route. He pointed out that all along the north coast there were large centres of population; that the soil was so rich and the rainfall so regular that the coastal districts would make homes for millions of people; that population would increase much more rapidly than it was doing if the railway were constructed; and that the transmission of produce by sea was found to be dearer in many cases than it would be by rail—where entrance to harbours and rivers was bad. Either from Port Macquarie, the Manning, or the Richmond the expense of sending goods by water was more expensive than it would be by rail. The residents of the coastal districts had for many years past paid their fair share for the construction of lines in other parts of the country; but the benefit they received was only indirectly felt. He desired to point out that, under the system which the Minister was introducing in the Public Works Act—namely, an improved betterment principle—the cost of the line would be small. The deputation thought it would be better for the whole line to be submitted to the Public Works Committee, instead of in sections, so that they should see the advantage the line would be to the country, although they did not ask that it should all be undertaken at once. It should be placed before the Public Works Committee as a great national trunk line between Sydney and the North. This line would for one thing save an ascent of 5,000 feet over Ben Lomond. A great deal had been said against the line because it would pass through the large estate owned by the A. A. Company; but, if the amendment to the Public Works Act was passed, improving the lines of the betterment principle, the cost in respect of that matter would not be very large to the country, as the A. A. Company would have to pay for the increased value given to their property by the construction of the line.

Mr. McKinnon, Mr. Dangar, Mr. Hart, Mr. Stevenson, and Mr. Ruthven also spoke in support of the submission of the proposal to the Public Works Committee; and it was represented that the residents of the districts interested were willing to sink all differences as to the route of the railway, and leave everything in the hands of the Government.

The MINISTER, in replying, said the proposal of the deputation appeared to be rather in opposition to the sentiments recently expressed by Sir George Dibbs, as well as his own, concerning curtailment of loan expenditure. It must be understood that it would be practically impossible to undertake this line with any probability of completing it under many years. He had obtained a rough estimate of the cost of the proposed line, and, so far, it was put down at about one and a quarter millions to take it to Taree. The distance from Taree to Grafton was 200 miles, and that would mean another two millions of money, so that it would cost three and a quarter millions to take the line to Grafton. They might allow £700,000 for the section from Grafton to Lismore, and, altogether, the line would cost about four millions, as there were a great many bridges to construct; so that the deputation would see how useless it would be to expect the line to be constructed for a considerable time. Personally, he was in favour of the line, and had, six years ago, expressed himself so, and did what lay in his power to assist in the survey, which survey was now practically completed. There was one thing which made him hesitate before recommending the line as a whole (and he thought it would be better that it should be submitted as a whole, to disclose the merits of the proposal and decide upon the general policy; it could afterwards be constructed in sections annually), because one's action was so likely to be misunderstood. If he were to submit this line at the present time to the House, they would find the morning and other papers denouncing it as extravagance. If the line were submitted, he would have to make it clearly understood beforehand that it was submitted as a whole simply to establish the principle of its construction, and that only a certain amount would be spent each year—extending, perhaps, over a period of ten to fifteen years—in the construction of the line by

by degrees. Roughly speaking, to complete the line in ten years would mean an expenditure of £400,000 per year. He was pleased to hear Mr. Young support the betterment principle embodied in the new Bill, providing for the area in the neighbourhood of such works being assessed on a graduated scale. The case of the North Coast railway was one in which the principle would apply admirably, as, for one thing, the A.A. Company, through whose land the line would pass, would be called upon to contribute towards its cost in return for the increased value which the line would give to their property. He thought, when the amendment passed (he had every hope that it would pass), that it would be a great step towards this and other lines being submitted to the Public Works Committee. He would not think of submitting the proposal before that amendment was passed. Referring to comparisons made as to water and overland carriage, the Minister said he was rather inclined to join issue with Mr. Young in his statement that water carriage was not cheaper than railway carriage. He always thought that where they had such water carriage as on the northern coast, railway carriage must be dearer; but the great aim was to get produce to market quickly, and he could well understand that it was a matter of great importance to have certain produce in the market by a certain time to meet certain sales, whilst water carriage was unreliable as to the length of time it would take. As regarded the richness of the soil through which the line would pass, he thought it scarcely worth while to try to impress the fact upon anyone, as it was generally recognised that the soil was excellent. He knew it would carry millions of people in time. One argument in support of the proposal had been that the people of the coast had contributed towards the construction of lines in other parts of the Colony without being benefited. He did not think that deserved too great consideration. The residents on the coast had the advantage of water communication, while the people in the interior had not, and the latter therefore deserved first consideration. With reference to the route of the line, he might tell them that the surveyors had been instructed to obtain the best possible, and he thought they were judicious in saying that they must leave that matter entirely in the hands of their engineers. He would consult the Cabinet on the matter, because it was a very important question. The principal trouble was money. Referring to Loan expenditure, the Minister said he would set his face against any Loan Funds being expended on any works but railways and bridges.

Put with the other papers. Let Mr. Deane see.—J. B., 24/10/92. Seen.—H.D., 31/10/92.

No. 124.

Memorandum to The Engineer-in-Chief.

North Coast—Taree to Kempsey.

Department of Public Works, Railway Construction Branch,

Engineer-in-Chief's Office, Sydney, 23 May, 1893.

I BEG to forward, herewith, general report with diagram map, and estimate, of above with abstract.

This length begins near Taree at 134 miles 43 chains 41.5 links from Newcastle, this figure being a corrected one by a reduction of 93.5 links from that entered as the termination of the Maitland to Taree section, in the general report of that length, Rs. 91-365, it being found, on subsequent revision of plans, that this correction, due to deviations, was necessary.

The line crosses the main road to Port Macquarie at 134 miles 53 chains, and adjoins it to Brown's Creek, which is passed over at 135 miles 9 chains. The road from Wingham and Taree to Cundletown is crossed at 135 miles 33 chains, and undulating country is intersected to Dawson River at 137 miles 20 chains. Some low ridges are now crossed and also the Port Macquarie Road at 140 miles, Sundial and Pontobark Creek being cut near it, on each side. This road is now followed, being twice crossed, at 143 miles 65 chains and 144 miles 21 chains, the Lansdowne River being proposed to be bridged close after the last crossing.

The line, which had, up to this point, a generally northerly bearing, here trends to the east, following down the river for about 5 miles, to avoid a high ridge, in the course of which Saltwater and Koolah Creeks are crossed at 145 miles 50 chains, and 146 miles 40 chains.

At Two-mile Creek, at 152 miles, the line partly recovers its general direction, bearing N.N.-E., crossing the main Port Macquarie Road at 153 miles, and then passing through low-lying land about a mile east of Moorfield. Pipeclay Creek is crossed near 155 miles, and the main road is adjoined from 156 miles 20 chains to 157 miles 60 chains. John's, also called Stewart's, River is to be bridged at 160 miles 25 chains, and the line again adjoins the main road at 160 miles 40 chains, following it closely to 165 miles and crossing it there, having previously left Watson Taylor's Lake on the east, and curving up the valley of Camden Haven River westerly from 164 miles to 166 miles 40 chains, closely skirts the river at 165 miles 40 chains. The river is crossed at 168 miles 12 chains, above head of navigation close to the proposed township of Kendall. The Port Macquarie Road is crossed at 169 miles 52 chains, and followed at a varying distance of about a quarter of a mile to near Heron's Creek, where, at 172 miles, it is again crossed and left to the right hand, the creek crossing being at 172 miles 23 chains. The line, which still keeps its general northerly bearing as it does from the Camden Haven to the Wilson River, 24 miles northward, now rises from Heron's Creek along a spur of the Broken Bago Range, surmounting the latter about at 175 miles 14 chains. King's Creek is now followed down on the northern side of the range, the creek being crossed four times between the summit and 178 miles. At the next mile fairly level country is met with, and the line is fixed through the rising township of Wauchope to suit the alignments of the streets, and the station requirements, crossing the main road from Port Macquarie to New England at 181 miles 51 chains.

Immediately after passing the township, the river Hastings is crossed at 182 miles 6 chains with its flood channels; also local roads at 183 miles 20 chains, 184 miles 34 chains, and 186 miles, the line making a detour between the two latter points to avoid rising ground, Stony Creek being crossed at 186 miles 15 chains. Some ridgy country is now traversed to a second creek called Saltwater at 188 miles 32 chains, and the Wilson River is reached at 192 miles 10 chains.

From here the railway bears north-easterly, following down the left bank of the river till near its confluence with the Maria River and Cooperabung Creek, passing over latter at 195 miles 28 chains. after

having crossed the main Port Macquarie to Kempsey Road at 193 miles 40 chains. About half a mile beyond the creek the northerly direction is resumed, ridgy country being now encountered. Smith's Creek, Piper's Creek, Maria River, and Scrubby Creek are successively passed at 202 miles 10 chains, 203 miles 15 chains, 207 miles 9 chains, and 207 miles 68 chains, from whence the ascent is made to the watershed between the Hastings and the Macleay at 209 miles 40 chains.

The Boat Harbour Creek valley is adopted for the fall to the Macleay, the main road being crossed at 211 miles, 50 chains, about half a mile south of the junction of the proposed amended Trial Bay survey at 212 miles 17 chains 40·5 links.

The river is crossed at 212 miles 45 chains, close to the line of the original survey, and, after crossing Belgrave-street, the Kempsey station ground is entered nearly parallel to Kemp-street.

The choice of station site is fully referred to in report, E. in C. 92/3,966, and that of the bridge site, which then awaited result of borings, has been selected as the most direct; and this is now confirmed by those results which are more favourable to the crossing now adopted, than to that suggested at Central Kempsey.

This section of the North Coast railway ends at the north end of Kempsey station ground, at 213 miles 26·895 chains from Newcastle, being a length of 78 miles 63·48 chains.

The maximum gradient is 1 in 70, and sharpest curve 12 chains radius. It was expected, 92/3,966, that the 1 in 70 grade could only be got up to the Hastings; but the completion of the survey, since that report was written, shows that this grade can be obtained up to Kempsey. It was mentioned in that report that the alteration of one short grade between Wingham and Taree, now 1 in 62, to 1 in 70, could be made without much extra cost. If that is done, and as about 24 miles of the next length north of Kempsey is ruled by 1 in 70, a length of about 100 miles will thus be under that limit.

The works generally, as far as earthwork and culverts and small bridges are concerned, are of medium character. One tunnel of 92 lin. yards is necessary, however, at 177 miles 20 chains, which is on the heaviest portion of the line. The proximity to the coast of this length renders some large river bridges unavoidable, the mileage cost of these being over £1,000. The Dawson, Lansdowne, John's, Camden Haven, Hastings, Wilson, and Macleay Rivers have to be bridged; and, up to date, the borings are only complete of some of those—viz., Dawson (of which the borings on the original line, not far off, are assumed to be applicable), Wilson, and Macleay, with its alternative Central Kempsey crossing.

In all the tidal rivers, piles must be protected from the torpedo, &c., and this is provided for in the estimate.

Main line, 71½-lb. rails are provided for.

Stations are allotted at suitable places, averaging about 8½ miles apart, Kendall and Wauchope being the principal intermediate ones.

Ballast, sandstone, soil suitable for bricks, and good timber—including ironbark, tallow-wood, black-butt, and mahogany—are fairly plentiful along the line. Water, as in all the Coast Districts, is practically unlimited in quantity.

The formation of country throughout is volcanic or alluvial, and the greater portion traversed is forest land, with dense undergrowth of but small value for agricultural purposes; the remainder, however, is alluvial brush land of high fertility along the banks of the rivers. The latter is extensive on the coast side of the line, narrowing up inland, the Mauning, Hastings, and Macleay being the valleys which are more largely under cultivation. The conditions of the bars of all the navigable rivers render their use as outlets generally uncertain.

Except for the produce of these valleys, timber-getting is the chief industry.

The valley of the Macleay between Kempsey and the sea is extraordinarily rich and, for this country, closely populated—Mr. Price, in his report on the Trial Bay line, giving the number of the inhabitants of the valley as 7,280 in 1891. Nearly 25,000 acres were under maize cultivation, 20,000 bushels per week being sent away during the season; while the export of swine and other products is very considerable. Drainage would still further increase production and population; and this valley would no doubt provide a considerable passenger, as well as goods, traffic.

A very considerable quantity of Crown lands exist in the districts traversed.

C. O. BURGE.

NORTH COAST RAILWAY—TAREE TO KEMPSKY.

ESTIMATED Cost of a single line of railway. Main line, 78 miles 63·48 chains; sidings, 2 miles 54·318 chains.
Total, 81 miles 37·798 chains.

Memorandum to The Engineer-in-Chief.

North Coast Railway—Kempsey to Coff's Harbour.

Department of Public Works, Railway Construction Branch,

Engineer-in-Chief's Office, Sydney, August, 1893.

IN continuation of Rs. 93-167, I now forward estimate, abstract of ditto, diagram, plan, and report herewith of above.

This section begins at 213 mile 26.895 chains from Newcastle, at north end of Kempsey station ground, the line running parallel, except for a short detour in the 215th mile, to Kemp-street, on its east side, to 215 miles 65 chains, crossing Christmas Creek at this point. The road to Frederickton, on the Lower Macleay, is passed on the level at 216 miles 75 chains, and crossing the range at 217 miles 26 chains, between the last-mentioned creek and the Clybucca Swamps, the line is about a quarter of a mile west of the main north road, which is crossed at 219 miles 16 chains.

The edge of the Clybucca Swamp is now generally skirted for several miles, Trial Bay Creek being crossed at 220 miles 78 chains, and Tan Ban Creek at 224 miles 25 chains. The main road, which, up to this, is not far off on the west, here diverging north by west, the line bearing north by east up to 227 miles. The line then takes a rectangular bend, and is more tortuous, being in rougher country, for some miles. The drainage area of the Nambucca is entered at 229 miles 60 chains, and the line adjoins Warrel Creek at 233 miles 50 chains, following its east bank down, at varying distances, to its crossing at 240 miles 21 chains, the neighbourhood of the main road being again approached at 235 miles. Snaky Creek is crossed at 241 miles 12 chains, and a north-easterly direction taken to 242 miles 50 chains, where the line heads for Macksville, the main road being adjoined at 242 miles. A suitable site for station ground being intersected, the line will pass under the main road at 244 miles, close to the village. Crossing Tilly Willy Creek at 244 miles 18 chains the Nambucca River is bridged at 244 miles 52 chains above head of general navigation, which is Macksville pier. The navigation question is dealt with in 92-3,966 and 92-4,497.

The north arm of the Nambucca, called Bowra River, is followed up to 247 miles, where the line takes a more easterly bearing, crossing at 247 miles 25 chains, the dividing range between Bowra River and Newre Creek, and the latter creek at 248 miles 54 chains. Approaching the main road at 249 miles, the watershed between the Nambucca and Deep Creek waters is crossed at 250 miles 20 chains at the intersection of the Bowraville Road.

Cedar Creek is now descended and crossed at 251 miles 54 chains, and the T.S.R. No. 101, with which the Main Northern road generally coincides for some miles here, is then run along to 252 miles 70 chains. Deep Creek is crossed at 253 miles 67 chains, and the T.S.R. is again adjoined to 256 miles 20 chains.

Here, after skirting down Oyster Creek and up Rock Creek for about $2\frac{1}{2}$ miles, the line approaches the ocean from which up to the crossing of the Bellinger River south arm at 262 miles 58 chains it is not generally distant more than a quarter of a mile, crossing Hungry Creek at 259 miles 78 chains and the main road to Bellinger Heads at 262 miles 46 chains in this interval.

The south arm is wide and shallow, not being navigable except for small craft and the proposed bridge will be about 10 chains below the road ferry. The line now follows up the river bank which is very tortuous for nearly a mile, the road being between, thence across to the northern arm at 266 miles 37 chains, after passing on the left the surveyed township of Raleigh.

This arm, which is the one chiefly in use for navigation, is also to be bridged close to the ferry which is only 2 chains above, the main road having been crossed and recrossed at 266 miles 19 chains and 266 miles 34 chains at bank of river. The wharf is about 5 chains below bridge on the south bank.

The question of heading the navigation here is referred to in 92-3966 and also in 92-2443.

The main road is now close on the left for about a mile and a half, the branch roads to Bondagen Heads and to Pine Creek being intersected at 268 miles and at 268 miles 77 chains. The latter creek is crossed at 270 miles 22 chains, and Bonville Creek at 272 miles 15 chains. The line now bears towards the coast again, which it skirts closely, after passing Boambu Creek at 275 miles 5 chains for about a mile; then it heads straight for the surveyed township of Brelford.

Here the length under report ends at 278 miles 76.39 chains at the southern bank of Coff's Harbour Creek, forming a total length of 65 miles 49.49 chains. The section includes a branch with double junction at 278 miles 55.70 chains and at 278 miles 76.39 chains, to Coff's Harbour jetty, including rails to end of pier, which is 25 chains in length.

The section of this length might generally be considered of an average character, inclining to rather heavy work at intervals, against which may be partly set the flatter lengths near the coast. One tunnel only, of 132 yards, is required.

Large bridges are necessary over the Nambucca and North and South Arms of the Bellinger Rivers, while there are included several considerable timber bridges over the other creeks and rivers enumerated. Nearly £1,700 is included in estimate for sheathing piles exposed to sea water on these. Near Kempsey, at Trial Bay Creek and the Nambucca, considerable lengths of ground liable to flood are unavoidably crossed. Eight stations, all third and fourth-class, are provided in the 65½ miles.

The ruling grade is 1 in 60, but though unavoidable south of the station at 256 miles 30 chains, covering 43 miles, north of that $22\frac{1}{2}$ miles, it might, occurring as it does in a few places only, be cut down to 1 in 70 on the permanent survey without large expense.

The sharpest curves are 12 chains radius, and in the heavier portions they are frequently avoided of. $71\frac{1}{2}$ lb. steel-rails are estimated.

First-class timber is to be had throughout the district suitable for piles, girders, and sleepers—ironbark, black-butt, and tallow-wood principally.

Suitable clay for brick-making purposes can be had all along the swamps at Kempsey and at Macksville.

Ballast must be chiefly from the rock; gravel is scarce.

Water is plentiful throughout.

The country generally is of the same character as the previous section, the valleys, which are generally rich in soil, being the only centres of population and agriculture, such as the Macleay and Clybucca

Clybucca district, Warrel Creek, Macksville, Deep Creek, a mining centre, and the Bellingen, the intermediate country being chiefly forest reserves. The only actual townships, properly so called, on or near the route, are the small ones of Macksville and Fernmount. Wilson, Raleigh, and Bulsford are paper towns only.

C. O. BURGE.

NORTH COAST RAILWAY.—KEMPSEY TO COFF'S HARBOUR (INCLUDING BRANCH AND FORK TO JETTY).

ESTIMATED Cost of a single line of railway with 7½-lb. rails. Length of main line, 65 miles 49·497 chains; length of branch, 1 mile 47·95 chains; length of sidings, 2 miles 37·727 chains. Total, 69 miles 55·174 chains.

No. 126.

Memorandum to The Engineer-in-Chief.

North Coast—Coff's Harbour to Glenreagh.

Department of Public Works, Railway Construction Branch,

Engineer-in-Chief's Office, Sydney, 7 September, 1893.

IN continuation of Rs. 93-229, I forward herewith estimate, abstract of ditto, diagram map, and report hereunder of above.

This portion begins at 278 miles 76·39 chains from Newcastle, at the south bank of Coff's Harbour Creek, crossing at 278 miles 78 chains that stream, which is very inaccurately shown on the parish map from which the diagram map annexed is prepared, it being a narrow and deep channel at the point of crossing. The line then follows close to the coast, generally almost due north, up to 286 miles, where the line turns inland leaving altogether the original coast line survey, which hitherto had been more or less through the same line of country from Taree. The main road, Coff's Harbour to Grafton, is crossed at 287 miles 11 chains, and the Bucca Creek-road, which leads to Grafton *via* Glenreagh, at 287 miles 36 chains. After a right-angled S curve west and north is made, this latter road is again crossed at 289 miles 11 chains, and the valley of Bucca Creek entered, the coast range being crossed here.

The line now follows down the valley of this creek, adjoining it closely at 291 miles 30 chains, and from 292 miles 30 chains to 296 miles 60 chains, entering the main Orara River valley at 299 miles. From here the line runs along east bank of that river to the junction with the Guyra to South Grafton survey, at 303 miles 23·53 chains north-coast mileage, and 423 miles 0·12 chains mileage *via* Guyra from Newcastle.

As to the cross-over junction of the surveys shown in the map, this will have to be altered in the permanent survey. The matter is dealt with in my report, after inspection, of the survey—(see 92-3,966).

The north-coast survey is common to the Guyra to South Grafton from Glenreagh to Grafton, where a junction is made about half-a-mile short of the Clarence River, with the amended survey Glen Innes to South Grafton, on which latter plans the approach to the latter town from all these routes is shown.

As to the works—after the first 1½ mile from Coff's Harbour, which is light, the section becomes moderately severe, a tunnel of 153 yards being met with at 280 miles 66 chains, and several promontories, which project into the sea, having to be cut through, being too sharp to go round. Another tunnel of 92 yards through one of these occurs at 283 miles. From 284 miles the works are easier up to the beginning of the ascent from the coast at 287 miles. This ascent comprises some of the heaviest work on the North Coast line, two more tunnels of 189 and 253 yards long being met with at 289 miles 8 chains and 289 miles 44 chains, with several deep cuttings and high banks.

The coast range being surmounted when the 290th mile is reached, the Bucca Creek Valley gives a gentle descent to the Orara River; but the backwater flooding of this valley is so high, that formation in the depressions has to be kept from 15 to 25 feet above surface, and the spurs have thus to be cut through to furnish material for these long and comparatively high banks. The work, therefore, which might otherwise have been lightened by closer grading to surface and more curvature, is moderately heavy right up to the junction.

The

The Coff's Harbour Creek, and some minor ones, require moderate bridges, but this class of work is not heavy on this length. Two fourth-class stations are provided, Coff's Harbour station being already comprised in the previous length, and Glenreagh in the Guyra to South Grafton (part No. 5); but junction arrangements and turn-table at Glenreagh are now included in the estimate herewith. Should some other connection with the New England tableland be preferred to the Guyra one, this latter expenditure would be unnecessary.

A ruling grade of 1 in 50, which occurs only on this length between Newcastle and Grafton, is unavoidable in the ascent to the coast range. Curves of 12 chains radius are used, but, with a minor exception, they are confined to the mile at the summit level.

71½ lb. rails are estimated for.

Good timber for all structural purposes is to be had throughout.

Ballast must come from the rock cuttings.

Water is plentiful.

The country is sparsely settled, except immediately close to the line down the Bucca Valley; but the soil generally is above the average in quality, and a considerable population might be supported on it throughout.

There are no actual townships passed through.

C. O. BURGE.

No. 127.

Memorandum to The Engineer-in-Chief.

North Coast.

Department of Public Works, Railway Construction Branch,

Engineer-in-Chief's Office, Sydney, 8 September, 1893.

IN sending in report Rs. 93-248, and estimate of the last link of the above, I have computed, assuming no material alteration in the estimates of the recent lengths now under your approval, that the total cost from West Maitland to Lismore, exclusive of Clarence River crossing, will be £3,782,380, or £9,643 per mile, the length being 392 miles 21 chains, and the total length, Sydney to Brisbane, about 664 miles, as against 723 miles *via* present Wallangarra route.

C. O. BURGE.

NORTH COAST RAILWAY.—Particulars of estimates, &c.—West Maitland (20 miles 57 chains from Newcastle) to Lismore.

Division	Length.	Single or Double.	Weight of ail.		Depth of ballast under sleeper.	Ruling grade.	Sharpest curve.	Estimate.	Cost per mile.	Surveyor.	Remarks, &c.

* Length exclusive of 1 mile 47-95 chains, branch to pier.

† The length given is that estimated. The Parliamentary plan, subsequently amended by alteration at Alunny Creek, Grafton, is 30 chains shorter. 18 miles 78-95 chains of this length is in trial survey form, the rest is permanent staking; but local alterations on the latter have been approved but not surveyed.

‡ Only one short curve of 12 chains, which might be made 15 chains—the sharpest otherwise on the length.

1897.

LEGISLATIVE ASSEMBLY.

NEW SOUTH WALES.

COAL USED BY THE RAILWAY DEPARTMENT.

(RETURN RESPECTING.)

Printed under No. 20 Report from Printing Committee, 28 October, 1897.

RETURN to an *Order* of the Honorable the Legislative Assembly of New South Wales, dated 19th October, 1897, That there be laid upon the Table of this House, a Return showing,—

- “(1.) The number of tons of coal annually used by the Railway Department.
 “(2.) The number of tenders accepted by the Railway Department for the supply of coal for the year 1897.
 “(3.) The names of the coal companies whose tenders were accepted.
 “(4.) The price paid for the coal supplied by the various companies.”

(Mr. Edden.)

RETURN showing the number of tons of coal used annually by the Railway Department, the number of tenders accepted for the supply of coal for the year 1897, the names of the coal companies whose tenders were accepted, and the price paid for the coal supplied.

Number of tons of coal used annually by the Department	Approximately 300,000 tons.
The number of tenders accepted for the supply of coal	Five tenders were accepted for the annual supply ending 30th June, 1898.
The names of the coal companies whose tenders were accepted	Lithgow Coal Association, including the Eskbank Zig Zag, Lithgow Valley, Vale of Clwydd, Hermitage, and Oakey Park Mines. East Greta Coal Mining Co. South Greta Coal Co. Centenary Coal Co. Gunnedah Coal Co.
The price paid for the coal supplied by the various companies	For the year ending 30th June, 1898— Lithgow Coal Association ... 4s. 3d. per ton. East Greta Coal Co. ... 4s. 11d. " South Greta Coal Co. ... 4s. 10d. " Centenary Coal Co. ... 7s. and 7s. 6d. " Gunnedah Coal Co. ... 7s. 9d. " Delivered in Commissioners trucks at the colliery sidings.
